VTP Fuel & Lubricant Technologies

Energy Efficiency & Renewable Energy

May 15, 2012 VTP Annual Merit Review

Kevin Stork, Team Lead

VTP Fuel & Lubricant Technologies

Mission

Enable advanced combustion through improved understanding of fuel-property impacts, evaluate next-generation biofuels & develop efficiency-improving lubricants

Activities

- Chemical and physical fuel property exploitation
- Next-generation biofuel fit-for-service evaluation
- Lubricant additives and base oil development
- Open, bench-scale lubricant testing methodology
- Fully-formulated oil fit-for-service evaluation
- Supporting analytical work

Funding in millions	FY 2011 .	FY 2012	FY 2013
	Approp.	Approp.	Request
Fuel and Lubricant Technologies	\$10.7	\$17.9	\$11.6

Goals

- By 2020, demonstrate expanded operational range of advanced combustion regimes to 75% of LD Federal Test Procedure
- By 2015, demonstrate cost effective lubricant with 2% fuel economy improvement

Recent Competitive Awards

- 4 Fuels Awards
 - Ford: Fuel properties to enable lifted-flame combustion
 - MIT: supplementary alcohol injection for improved SI efficiency
 - NREL: evaluate various oxygenates for suitability as drop-in fuel components
 - Univ. Wisconsin: Optimize fuel-based combustion control of novel combustion strategies in light- and heavy-duty vehicles

- 4 Lubes Awards
 - Ford: RD&D on polyalkylene glycol (PAG)-based engine oil technology to reduce engine friction relative to current mineral and synthetic oils
 - MIT: segregated engine parts with tailored lubricants for each
 - ORNL: Ionic liquid multifunctional (anti-wear and friction modifier) lubricant additives to enable higher VI oils
 - ANL: Boron-based lubricant additives for improved efficiency and durability

Efficiency and emissions opportunities for enabling low temperature combustion

Enables efficiency improvement and load expansion for Spark Assisted HCCI

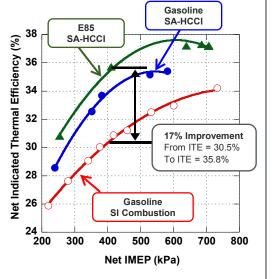

- Efficiency improvement attributed to differences in thermochemical properties
- Load expansion attributed to higher octane for more optimized combustion phasing with acceptable pressure rise rates

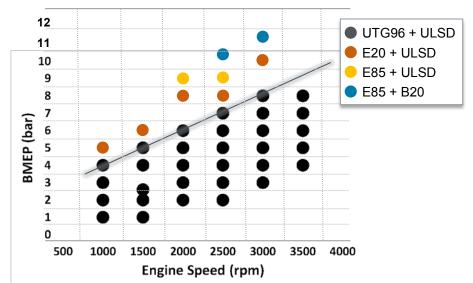

Enables load expansion with RCCI combustion in a multi-cylinder engine

- Higher reactivity stratification for reactivity controlled compression ignition (RCCI) multi-fuel approaches
- Demonstrated efficiency, emissions, and load expansion improvements with ethanol and bio-diesel blends

Research engine with fully flexible valve system, boosting, and EGR system.

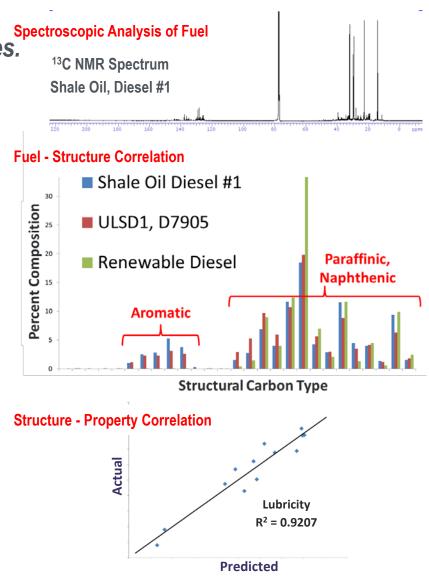

Structure-Property Correlations for Unconventional Fuels

U.S. DEPARTMENT OF

Energy Efficiency & Renewable Energy

- *Improved understanding of fuel chemistry is essential to best utilize unconventional fuel sources.*
- Fuels from unconventional sources
- Shale oil, oil sands, renewable diesel, etc.
- Vary in molecular structure
- Differ in their performance properties
- Correlating fuel molecular structure with performance
- Generate spectroscopic data to quantify fuel component types
- Reduce data sets to facilitate correlations with performance data
- Assemble lubricity, seal swell, and soot formation performance data
- Derive structure property relationships

Energy Efficiency & Renewable Energy

U.S. DEPARTMENT OF

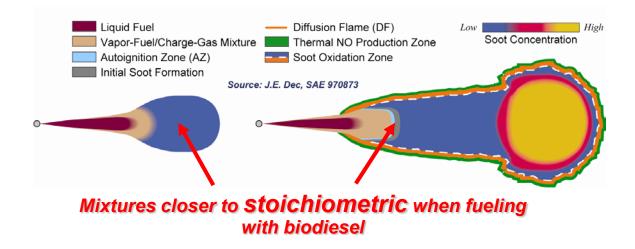

ENERGY

□ Why does biodiesel tend to increase engine-out NOx emissions?

- Understanding will help tailor combustion to mitigate NOx increase

□ Accomplishments:

- Showed that primary factor leading to the NOx increase appears to be ignition and combustion of mixtures that are closer to stoichiometric than for diesel fuel
 - Longer residence times, higher temperatures \rightarrow more thermal NOx formation

SAE John Johnson and SAE Arch T Colwell Awards for outstanding research

Improved Biofuel Utilization

Increased utilization with legacy fleet

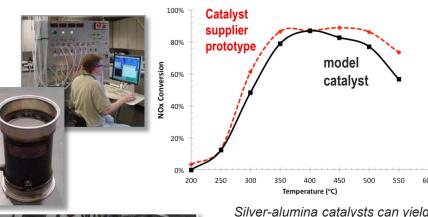

- Intermediate ethanol blends studied since 2007
 - \$44M effort
 - SNREs, Vehicles, Infrastructure materials compatibility, etc
- Vehicle emissions testing and aging at three sites
 - 86 vehicles, >6.5 million miles
 - >300,000 gallons of fuel
 - Approximately 1000 emissions tests
- EPA cited DOE Studies in partial waiver

Enabling lean NOx control with nonplatinum metal

- Silver-alumina very effective with oxygenated reductant
- Lean-burn with biofuels for improved fuel economy and biofuel utilization

Silver-alumina catalysts can yield >90% NOx conversion under lean conditions (ethanol reductant in this experiment)

European lean-burn BMW 120i

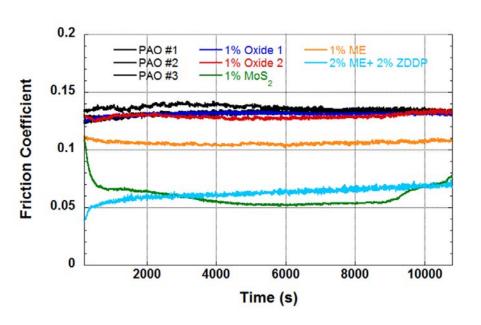

Lubrication Strategies/Tasks

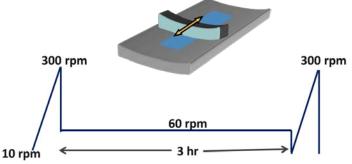

- **ENERGY** Energy Efficiency & Renewable Energy
- Predictive modeling Integration of (continuum) component parasitic friction loss models into subsystems and vehicle level packages – 'what if' parametric studies
- 2. Develop Science/Mechanistic Based Models of Parasitic Losses and Durability/Reliability
- **3. Lubricant Technology Development** Develop advanced lubricants (basefluids and additives) that reduce frictional losses while maintaining or exceeding other performance metrics (durability, reliability, corrosion, deposits, etc.
- 4. Engineered Surface Technology Development Develop advanced engineered surfaces (textures, designs, materials and coatings) that mitigate parasitic losses from a systems approach. Go beyond current ferrous based tribological systems.
- 5. Validation of Modeling and Technologies Develop protocols to improve the fidelity of models and technologies. Improve correlation between labscale tests and engine/vehicle tests. Develop high fidelity databases for models and simulation of parasitic losses. Lab-Rig-Engine-Vehicle Validation Studies

Energy Efficiency & **ENERGY Renewable Energy**

Developing common set of test protocols to evaluate frictional behavior of advanced additives (friction modifiers)

Common test protocols to evaluate frictional behavior of low-friction additives using ring-on-liner configuration

U.S. DEPARTMENT OF

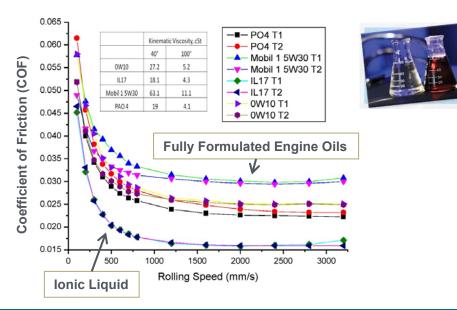

- Comparison of nanoparticulate additives and chemical additives show significant impact on friction response
- Characterization of surfaces in-progress to determine differences in surface finishes and formation of tribofilms

New Lubricant Technologies

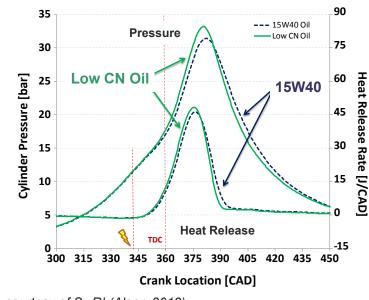

New classes of lubricants and additives based on ionic liquids (IL)

- More effective boundary lubrication up to 40% friction reduction compared to fully formulated oils (lab scale)
- Enhanced engine durability due to superior functionality via forming a protective surface boundary film
- GM CRADA, FOA-239 with Shell

Low reactivity lubricants for more efficient operation

- Shown to mitigate spark-ignition gasoline engine knock
 - Allows for improved combustion phasing at higher loads
 - Use of higher compression ratio
- CRADA under development with Southwest Research Institute
