Subject: Preliminary Geotechnical Investigation Results

Attention: Mr. Nicholas W. Burkhead
Sr. Project Engineer

The purpose of this letter is to present the results of the preliminary geotechnical investigation for the Hermosa Wind project. This investigation was performed to provide limited geotechnical characterization of the Phase I portion of the project site.

INTRODUCTION

Field exploration activities were performed on July 21 and 22 to obtain preliminary information on the subsurface conditions at this site. Selected samples obtained during the subsurface investigation were tested in the laboratory of our subcontractor, Professional Services Industries, Inc (PSI), to provide data on the classification and engineering characteristics of the on-site soils. The boring logs as prepared by PSI as well as the laboratory tests results are included as attachments to this memorandum. Additional description of the boring locations is provided in the Cultural Resource Inventory prepared by Cultural Resource Analysts Inc. (CRA Project No.: C09B002, dated August 20, 2009, not provided in this letter). The results of this preliminary exploration are presented herein.

SITE CONDITIONS

The site is located in Southern Wyoming near the small town of Tie Siding, approximately 5 miles north of the Colorado/Wyoming border. No preliminary records were reviewed or previous investigation data were reviewed as part of our study, however it appeared that structures constructed in the vicinity of the planned project – mainly farm and ranch related structures – were constructed on shallow foundations and are lightly loaded structures.

GEOTECHNICAL INVESTIGATION

The field exploration program was performed to obtain information on subsurface conditions. Six (6) test borings were drilled, logged, and sampled as part of the investigation. Subsurface

B&V Project 163577
September 8, 2009

explorations were directed by PSI with drilling and sampling performed by Dakota Drilling, both of Denver. A B&V representative was present to monitor the investigation. Selected samples obtained during the subsurface investigation were tested in PSI's laboratory to provide data on the geotechnical classification and engineering characteristics of the on-site soils. Utilities were cleared by PSI before drilling commenced.

Boring Drilling and Sampling

The subsurface conditions were investigated by drilling six borings (B1 through B6) on July 21 and 22, 2009. The approximate locations of the test borings are shown on attached Figure 1. Test borings are listed in Table 1.

Boring Number	Location	Elevation (feet MSL) ⁽¹⁾	Depth (feet)	Notes
B1	N41.01720 W105.48875	7880	30.0	Possible bedrock @ 8'
B2	N41.03159 W105.51687	8002	7.5	Bedrock @ 2.5'
B3	N41.04748 W105.52630	7850	30.0	No bedrock encountered to 30'
B4	N41.06596 W105.55490	7750	24.0	Bedrock @ 18'
B5	N41.06471 W105.57387	7888	24.0	Bedrock @ 12'
B6	N41.07768 W105.56418	7700	19.0	Bedrock @ 5.5'

Notes : ¹⁾ Elevations were provided by CRA in the Cultural Resources Inventory Report

Drilling was performed by Dakota Drilling of Denver, Colorado, under subcontract to PSI. A PSI and BV geotechnical engineer supervised the drilling, collected soil samples, logged borings, and supervised installation of monitoring instrumentation. A cultural resources scientist from Cultural Resources Analysts, Inc., of Ft. Collins, Colorado, monitored cultural and archeological aspects during all field activities. The test borings were drilled using a rubber-tired, truck-mounted Central Mine Equipment Model 55 (CME-55) drill rig. The test borings were advanced using 4-inch outside diameter solid-stem augers.

The test borings were continuously sampled in the upper 10 feet and at 5-foot intervals thereafter. The borings were sampled using a 1-3/8-inch inside diameter split spoon sampler in all holes with the exception of B2. Due to damage to the split spoon sampler, a California tube sampler (3.0" inside diameter) was used on test boring B2. Standard Penetration Tests (SPTs)

Shell Wind Energy, Inc
Hermosa Wind Project

B&V Project 163577
September 8, 2009

were performed which involved driving the samplers using a 140 pound hammer falling 30 inches and recording the number of blows required for each 6 inches of penetration. The SPT resistance (N-value) of the soil was calculated as the number of blows required for the bottom 12 inches of penetration. If high penetration resistance prevented driving the total 1.5 foot length of the sampler, the penetration resistance for the partial penetration (limited to 50 blows for less than 6 inches of penetration) was recorded. The N-values are shown on the attached boring logs. These N-values provide a measure of the relative density of granular soils and relative consistency of cohesive soils. It should be noted that for the SPT performed with the California sampler, a general correction factor of approximately 0.6 should be applied to the recorded N-value to correct for the larger sampler diameter.

SUBSURFACE CONDITIONS

Field Observations

As observed from the test borings performed at the site, the general subsurface materials consist of clayey and silty sand (SC and SM materials) overlying bedrock. The bedrock, when encountered, consisted of sandstone or siltstone. With the exception of boring B2, the bedrock was generally weathered enough to allow the augers to penetrate to at least 10 feet deep. Bedrock was noted in all holes except B1 and B3. It should be noted that based on the high N-values (greater than 50) in boring B1, bedrock may have been as shallow as 8 feet. In the holes where bedrock was encountered, the thickness of the overburden soils ranged from 2.5 feet to 18 feet. In boring where bedrock was not encountered the observed soils remained relatively consistent, classifying as either clayey sand or silty sand (SC and SM). Standard Penetration Test (SPT) ranged from the mid teens to the mid 30's in the upper zones. In the lower zones it was common for the sampler to be unable to be driven the full 12 inches. The upper zones of soil is defined as the upper 10 to 15 feet and the lower zones of soil is defined as anything deeper than 15 feet.

Groundwater was encountered in only one test boring, B3, at 28 feet below the ground surface. The hole was immediately backfilled after drilling so long-term groundwater conditions were not monitored.

Laboratory Testing

Index testing of the soils encountered in the borings indicates that the soils are fairly consistent classifying as either clayey sand or silty sand (SC and SM). Fines contents were generally less than 20 percent and liquid limits indicating low plasticity soils. One laboratory compaction test was performed indicating a reasonable compaction curve and also suggesting that soil tested was rather dry compared to the optimum moisture content for compaction. The results of the one thermal resistivity test of one sample are presented in Attachment B.

GENERAL CONCLUSIONS

Based on the conditions encountered, it is B&V's option that the subsurface conditions at the Hermosa site are suitable to support the planned wind turbine development. Typical gravity type wind turbine foundations with dimensions of 50 to 60 feet in diameter with depths of approximately 7 to 8 feet are reasonable given the investigation findings. Based on the boring locations, depth to rock appears sufficient to allow relatively easy excavation to the wind turbine foundation depths. For substation and other structures, typical shallow footings below the frost depth appear to be acceptable. Our experience indicates the bearing capacity of this material will support design loads of between 2,000 and 4,00 psf for shallow foundation systems. Based on the laboratory testing (generally low fines and low plasticity), the surface soils do not appear to present swelling soil issues. Based on the borings, the drillers were able to auger to at least 7.5 feet deep so trenching to install the collection system should not present too much difficulty provided that the depth to hard rock does not become too shallow. The surface soils observed are acceptable for road construction based on the generally medium dense, sandy soils.

It is important to note that these conclusions are generated from our experience on past projects involving similar, but not identical, subsurface conditions. As such, an expanded geotechnical investigation is required to investigate additional locations at this site and perform more extensive laboratory testing and engineering analyses from which more definitive foundation and geotechnical engineering recommendations can be generated.

One item of interest for the investigation is that the bedrock encountered was mainly sedimentary bedrock (siltstone and sandstone). Based on the initial geologic maps that were compiled for the site, the borings in the southern portion of the site should have encountered granitic bedrock. The soil/bedrock conditions for the granitic bedrock areas will likely be significantly different from the conditions where the sedimentary rocks are exposed. There is still some concern that in the areas where granitic bedrock is found, there may be relatively shallow rock that could present issues with constructing a gravity foundation (mainly a concern of excavation).

Additional investigations should attempt to provide wider coverage of the site. Based on the field observations, access to areas not on roads should not be an issue during good weather conditions. Additional investigations should also locate the borings at the proposed turbine locations. With the generally shallow bedrock conditions, dynamic stiffness of the subgrades for the turbine foundations should not be a major concern. However, including some geophysical testing would be beneficial to confirm that dynamic stiffness criteria are not a concern.

LIMITATIONS

**Subject: Report of Subsurface Investigation
Hermosa Wind Project, Wyoming
PSI Project No.: 532-95028**

Dear Mr. Liljegren:

Professional Service Industries, Inc. (PSI) is pleased to present our Report of Subsurface Investigation for the referenced project. PSI performed a field investigation for the subject project on July 21 and 22, 2009. The field investigation was performed using a CME-55 drill rig to advance 4 inch, solid stem, continuous flight augers. The site was generally vacant ranchland. This report includes our boring logs and laboratory test results.

We appreciate the opportunity to perform the geotechnical engineering services for this project and look forward to continued participation during the design and construction phases of this project. If you have any questions pertaining to this report, or if we may be of further service, please contact our office.

Respectfully submitted,

PROFESSIONAL SERVICE INDUSTRIES, INC.

The borings were advanced using a CME-55 truck mounted drill rig equipped with 4-inch diameter solid-stem continuous-flight auger. Soil samples were recovered at selected depths during drilling with the truck-mounted drill rig using a Standard Split Spoon sampler or a modified "California" sampler driven by a 140-lb. weight free falling 30 inches. The stratification lines represent the approximate boundary between soil types and the transition may be gradual. The location of the borings were approximately determined by GPS coordinates or measuring from known structures or topographic features. The location of the borings should be considered accurate only to the degree implied by the method used. Water level readings have been made in the borings at times and under conditions stated in the report. However, it must be noted that fluctuations in the level of the groundwater may occur due to variations in precipitation, temperature and other factors such as landscape irrigation and leakage from underground utilities.

**Re: Thermal Analysis of Native Soil Samples
Hermosa Wind Project**

The following is the report of the thermal dryout characterization test conducted on the native soil sample sent to our laboratory for testing.

Thermal Resistivity Tests:

For thermal dryout characterization, the sample was tested at **95% of the Standard Proctor density (117pcf) and at 11.5% moisture content.** The testing was conducted in accordance with the IEEE Standard and the thermal dryout curve is presented in *Figure 1*.

Test Results:

Sample Location	Sample Description	M/C (%)	Dry Density (pcf)	TR (C-cm/W) Wet	TR (C-cm/W) Dry
BV-03 & BV-04 @ 0' - 5'	Red sandy clayey SILT	11.5	111	54	127

Subject: Second Geotechnical Investigation Results

Attention: Mr. Nicholas W. Burkhead
Senior Project Engineer

The purpose of this letter is to present the results of the second geotechnical investigation for the Hermosa West Wind project. This investigation was performed to provide additional geotechnical characterization of the Phase I portion of the project site. The investigation supplements the initial investigation that was performed by Black & Veatch in July 2009.

INTRODUCTION

Field exploration activities began on October 26, 2009 with a preliminary walk-down of the site locations and cultural resource surveying of each boring location. Due to weather issues (early snow storm), drilling was forced to be delayed until the following week. Field exploration activities were continued on November 2, and completed November 5.

Geotechnical field investigation work was performed by Professional Services Industries Inc. (PSI), of Thornton, Colorado. Tasks performed by PSI included soil boring and rock coring, geotechnical logging and photography, boring log preparation, geophysical surveying, and laboratory testing. Black & Veatch developed the investigation program as well as provided site supervision during the investigation. Cultural resource monitoring was performed by Cultural Resource Analysts Inc. (CRA) of Longmont, Colorado, also under contract to Black & Veatch. The PSI geotechnical report is included as an attachment to this memorandum. The CRA report is also included as Attachment C.

The results of this second geotechnical investigation are presented herein.

SITE CONDITIONS

The site is located in Southern Wyoming near the small town of Tie Siding, approximately 5 miles north of the Colorado/Wyoming border. No preliminary records were reviewed or previous investigation data were reviewed as part of the study; however, it appeared that structures constructed in the vicinity of the planned project – mainly farm and ranch related structures – were constructed on shallow foundations and are lightly loaded structures.

GEOTECHNICAL INVESTIGATION

The field exploration program was performed to obtain information on subsurface conditions. Six additional borings were drilled, logged, and sampled as part of this investigation. Soil drilling, rock coring, and geophysical testing were performed by PSI. A Black & Veatch representative was present to monitor the investigation. Selected samples obtained during the subsurface investigation were tested in PSI's laboratory to provide data on the geotechnical classification and engineering characteristics of the onsite

Shell WindEnergy Inc.
Mr. Nicholas W. Burkhead

B&V Project 163577
January 15, 2010

soils. Utilities were cleared by PSI before drilling commenced. A cultural resources scientist from CRA monitored cultural and archeological aspects during all field activities.

The planned investigation, as shown in Attachment A, consisted of seven soil boring and rock coring locations (B-7 through B-13) and geophysical testing at five locations (B-3, B-5, B-9, B-12, and B-13). Rock coring was to be completed a minimum of 10 feet into sound rock at each boring location up to a maximum depth of 50 feet. Due to access limitations related to snow cover, two of the planned test locations (B-3 and B-12) were not accessible during the investigation. As a result, drilling at the B-12 location was not completed and the geophysical testing that was to be performed at locations B-3 and B-12 were changed to B-8 and B-11.

Boring Drilling and Sampling

The subsurface conditions were investigated by drilling six additional borings (B7 through B11 and B13) on November 2 through 5, 2009. The approximate locations of the additional test borings are shown in Attachment A. Photos of each of the test locations are included in the CRA cultural resource report (Attachment C). Test borings are listed in Table 1.

Boring Number	Location	Elevation (feet MSL)	Depth (feet)	Notes
B7	N41.00722 W-105.5834	7840	20.0	Sandstone @ 10'
B8	N41.0476 W-105.5547	7939	23.0	Sandstone @ 9.0'
B9	N41.0723 W-105.5453	7715	45.0	Granite @ 34.0'
B10	N41.0622 W-105.5338	7832	20.0	Sandstone @ 6.0'
B11	N41.0074 W-105.5355	8090	20.0	Highly Fractured Granite @ 5.0'
B13	N41.0121 W-105.5070	7935	31.5	Granite @ 28.0'

The test borings were drilled using a rubber tire, truck-mounted Central Mine Equipment Model 55 (CME-55) drill rig. A photo of the drilling equipment is included in the CRA report (Attachment C). The test borings were advanced using 6-inch outside diameter solid-stem augers and NX double tube core barrel.

The test borings were continuously sampled to the top of bedrock using a 1-3/8-inch inside diameter split spoon sampler. Standard Penetration Tests (SPTs) were performed that involved driving the samplers using a 140 pound hammer falling 30 inches and recording the number of blows required for each 6 inches of penetration. The SPT resistance (N-value) of the soil was calculated as the number of blows required for the bottom 12 inches of penetration. If high penetration resistance prevented driving the total 1.5 foot length of the sampler, the penetration resistance for the partial penetration (limited to 50 blows for

Shell WindEnergy Inc.
Mr. Nicholas W. Burkhead

B&V Project 163577
January 15, 2010

less than 6 inches of penetration) was recorded. The N-values are shown on the attached boring logs. These N-values provide a measure of the relative density of granular soils and relative consistency of cohesive soils.

Rock coring was started at the top of bedrock as determined by auger bit refusal. Core runs were limited to less than 6 feet long to limit damage to the core during drilling. All cores were measured for percent recovery and rock quality designation (RQD) and photographed. The rock core photographs are included in the PSI report (Attachment B). With the exception of boring B-13, all boring locations were cored 10 feet. Boring B-9 was only cored 3-1/2 feet. The coring was stopped early because of the excessive time it was taking to advance the drilling, likely due to extremely hard rock. Boring B-11 was unable to retrieve core during the coring. Field notes for the boring indicated that highly fractured granite was encountered at 5 feet to the termination of the boring.

Geophysical Investigation

Geophysical investigation was performed by PSI at five locations designated by Black & Veatch. Details of the methodology and results from the geophysical testing are discussed in the PSI report (Attachment B). A summary of the results is presented in Table 2.

Test Number	Location	Depth to Bedrock (feet)
B5	N41.00722 W-105.5834	Bedrock @ 10 to 15' deep
B8	N41.0476 W-105.5547	Bedrock @ 5 to 15' deep
B9	N41.0723 W-105.5453	Bedrock @ 25 to 30' deep
B11	N41.0074 W-105.5355	Bedrock @ 25 to 30' deep
B13	N41.0121 W-105.5070	Bedrock @ 22 to 38' deep

SUBSURFACE CONDITIONS

Field Observations

As observed during the previous investigation, the general subsurface soils consist of clayey and silty sand (USCS classification SC and SM) overlying bedrock. The bedrock consisted of either sandstone in the north or granite in the south portions of the site. The thickness of the overburden soils ranged from 5.0 to 34.0 feet, which is relatively consistent with the previous investigation. Descriptions of the sites included in the CRA cultural resource report indicated that locations B-12 and B-13 showed abundant granite bedrock outcroppings in the area (Attachment C). Overburden at the boring locations appeared to be residual soils with composition varying, depending on the underlying bedrock. In borings where sandstone was encountered, the overburden generally consisted of clayey sand to sandy clay (SC to CL). N-values in this overburden ranged from mid-twenties to the upper-forties. In borings where the granite bedrock was encountered, the overburden consisted of gravelly soils, which is consistent with the more

Shell WindEnergy Inc.
Mr. Nicholas W. Burkhead

B&V Project 163577
January 15, 2010

weathering-resistant parent material (granite). N-values within this overburden were generally greater than 50 blows per foot with SPT refusal occurring at most test depths.

Sandstone bedrock was generally described as cemented and fractured to highly fractured. Rock RQD values ranged from zero to as high as 72 with a general trend of increasing RQD with depth. Based on the geophysical testing, test location B-8 had shear wave velocities ranging from 3,500 to 6,500 feet per second (fps) with some softer zones, suggesting portions of the sandstone are highly weathered or uncemented.

Granite was generally described as fractured in parts with RQD values ranging from 20 to 60. Geophysical testing at yielded shear wave velocities that were slightly higher than the sandstone with values ranging from 4,000 to 8,000 fps.

Groundwater was encountered in only one test boring, B13, at 27.5 feet below the ground surface. This groundwater was observed at the soil/bedrock interface. All of the borings were immediately backfilled after drilling so delayed water levels were not measured.

Laboratory Testing

Index testing of selected soil samples verified that the overburden soil is generally classified as either clayey sand or poorly graded sands. Fines contents varied between approximately 10 to 60 percent liquid limits indicating low plasticity soils. Compaction testing (Standard Proctor) was performed on four bulk samples obtained from the upper 5 feet of the boring. Maximum dry densities varied between approximately 115 and 130 pounds per cubic foot with optimum moisture contents between 8 and 13 percent. Natural moisture contents of the soil are slightly dry of the optimum moisture content by 2 to 7 percent. It should be noted that moisture content of the soil is expected to vary throughout the year. Chemical test results of two soil samples resulted in chlorides content less than 9.4 milligrams/kilogram and a pH of approximately 9. Unconfined compression testing of the sandstone and granite bedrock indicated the strengths generally ranging between 1,000 and 2,000 pounds per square foot. The results of the one thermal resistivity test are presented in Attachment B.

GENERAL CONCLUSIONS

Based on the conditions encountered, the results of this investigation are consistent with the previous investigation. It is Black & Veatch's opinion that the subsurface conditions at the Hermosa West Wind Project site are suitable to support the planned wind turbine development. Typical gravity type wind turbine foundations with dimensions of 50 to 60 feet in diameter with depths of approximately 7 to 8 feet are reasonable given the investigation findings. The results of geophysical testing should be used to confirm that the manufacturer specific foundation stiffness requirements can be met at this site. Based on the boring locations, depth to rock appears sufficient to allow relatively easy excavation to the wind turbine foundation depths. For substation and other structures, conventional shallow footings bearing below the frost depth appear to be acceptable. Based on the laboratory testing results (generally low fines and low plasticity), the surface soils do not appear to have swelling characteristics. Based on auger penetration depths greater than 7.5 feet deep at both the previous and current investigations, trenching to install the collection system can be accomplished with conventional backhoe equipment, provided that the depth to hard rock does not become too shallow. The near surface soils observed can be used for road construction based on the generally medium dense, sandy soils.

As was noted in the previous geotechnical investigation, granite bedrock was expected in the southern portion of the site (Attachment A). During this recent investigation, the granitic bedrock was encountered in borings B-9, B-11, and B-13. As expected, the overburden in the areas where the granite was encountered was different from the areas where the sandstone bedrock was encountered. Fortunately,

Shell WindEnergy Inc.
Mr. Nicholas W. Burkhead

B&V Project 163577
January 15, 2010

based on the borings and the geophysical testing, the thickness of the overburden in the granite bedrock area is thicker than expected and based on the boring locations, shallow bedrock is less of a concern than was previously thought. Based on the CRA observations of abundant rock outcroppings at the B-12 and B-13 locations, the possibility of shallow bedrock and difficult excavation should still be considered in the design of this project.

It is important to note that these conclusions are generated from Black & Veatch's experience on past projects involving similar, but not identical, subsurface conditions. As such, an expanded geotechnical investigation is required for final detailed design of the project. As is typical of wind turbine projects, it is recommended that all turbine sites be investigated by boring or geophysical investigation and supported by more extensive laboratory testing and engineering analyses from which final design foundation and geotechnical engineering recommendations can be generated.

LIMITATIONS

The opinions in this memorandum were prepared solely for the benefit of Shell WindEnergy Inc. ("Client") by Black & Veatch Corporation ("Black & Veatch") under the terms and conditions of the written agreement between Client and Black & Veatch ("the Agreement") and is based on information not within the control of Client or Black & Veatch. Neither Client nor Black & Veatch has made an analysis, verified data, or rendered an independent judgment of the validity of the information provided by others. WHILE IT IS BELIEVED THAT THE INFORMATION, DATA, AND OPINIONS CONTAINED HEREIN WILL BE RELIABLE UNDER THE CONDITIONS AND SUBJECT TO THE LIMITATIONS SET FORTH IN THIS MEMO, CLIENT AND BLACK & VEATCH DO NOT GUARANTEE THE ACCURACY THEREOF. EXCEPT AS EXPRESSLY ALLOWED BY THE AGREEMENT, THIS MEMO MAY NOT BE USED BY ANYONE WITHOUT THE EXPRESS WRITTEN AUTHORIZATION OF BLACK & VEATCH, AND SUCH USE SHALL CONSTITUTE AGREEMENT BY THE USER THAT ITS RIGHTS, IF ANY, ARISING FROM THIS MEMO SHALL BE SUBJECT TO THE TERMS OF BLACK & VEATCH AUTHORIZATION, AND IN NO EVENT SHALL USER'S RIGHTS, IF ANY, EXCEED THOSE OF CLIENT UNDER THE AGREEMENT. USE OF THIS MEMO BY UNAUTHORIZED PARTIES SHALL CONSTITUTE AGREEMENT OF SUCH PARTIES TO DEFEND AND INDEMNIFY CLIENT AND BLACK & VEATCH FROM CLAIMS AND LIABILITY ARISING FROM SUCH UNAUTHORIZED USE.

Thank you for the opportunity to work with you on this project and please call if you have any further questions.

Sincerely,

BLACK & VEATCH

**Subject: Report of Second Subsurface Investigation
Hermosa Wind Project, Wyoming
PSI Project No.: 532-95048**

Dear Mr. Ang:

Professional Service Industries, Inc. (PSI) is pleased to present our Report of Second Subsurface Investigation for the Hermosa Wind Project. PSI previously performed a field investigation for this project and provided results on September 2, 2009. We performed a second field investigation for the subject project on November 2, 2009 through November 5, 2009. Activities were performed in general accordance with Black & Veatch Task Order dated October 16, 2009. The field investigation was performed using a CME-55 drill rig to advance 6 inch, hollow stem augers and rock cores. Geophysical testing was also performed at 5 locations. The site was generally vacant ranchland. Conditions during drilling included temperatures from 20 to 50 degrees. Also, snow drifts were encountered in several areas due to a previous snowstorm. This report includes our geophysical results, boring logs and laboratory test results.

We appreciate the opportunity to perform the geotechnical engineering services for this project and look forward to continued participation during the design and construction phases of this project. If you have any questions pertaining to this report, or if we may be of further service, please contact our office.

Respectfully submitted,

PSI Project Number 532-95048**

Dear Mr. Ang:

As authorized, Professional Service Industries, Inc. has performed geophysical testing for the proposed Hermosa Wind Project near Tie Siding, Wyoming. This study was performed in general accordance with the Black & Veatch Task Order dated October 16, 2009.

Subsurface Exploration

To generally characterize the nature of subsurface conditions at the specified locations, we conducted a series of geophysical soundings within the property. For this project, PSI used the Refraction Microtremor (ReMi) method, which is a form of Multi Channel Analysis of Surface Waves (MASW). The ReMi method is described in Louie, 2001 (Louie, J, N., 2001, Faster, Better: Shear-wave velocity to 100 meters depth from refraction microtremor arrays: Bulletin of the Seismological Society of America, v. 91, p. 347-364). The method uses standard P-wave recording equipment and ambient noise to produce average one-dimensional shear-wave profiles.

Five specific array locations were used to evaluate conditions within this site. The lines at each location were 345 feet in length and incorporated 24 geophone locations. Data was recorded in 20 second sample intervals, with a 2 millisecond sampling rate per channel. The lines used a geophone spacing of 15 feet. Once collected, the data were checked for their fidelity. To assure that a robust profile was being made, both individual recordings and multiple summed (stacked) recordings were evaluated.

Each individual profile location correlates to a soil test boring that was performed by PSI. For example, Profile Line B5 was started Boring 5 and continued north for the length of the array. PSI ran the profiles in a way so that the surface elevation changes were as minimal as possible. Surface elevations were taken on site using a GPS device.

Geotechnical Assessment

The results of the geophysical testing are presented on two dimensional profiles generated from the geophysical soundings (Figures 1 through 5) that indicate variations in shear wave velocities with depth below the ground surface (approximately 60 feet below the existing grades) along the length of each array.

Summary

The following analysis for each profile is based on PSI's familiarity with similar soil and bedrock along with the published information in the Caterpillar Performance Handbook.

Line B5

The profile from Line B5 shows low shear wave velocity material (500 to 1,000 ft/sec) to depths of approximately 10 to 20 feet below grade. PSI interprets this as overburden sandy material. Below this, moderate shear wave material (2,000 to 4,000 ft/sec) overlies high shear wave velocity material (greater than 4,000 ft/sec). PSI interprets this as sandstone or siltstone bedrock that may be highly fractured within the upper 20 to 30 feet. Rippability within the overburden material and the upper highly fractured zone of the bedrock should be easily excavated using conventional excavation equipment similar to a D9 Caterpillar Dozer or backhoe with rock excavation teeth. However, a heavier dozer and an automatic hammer might be needed for excavations below 30 feet of rock.

Line B8

The profile from Line B8 shows 0 to 5 feet of low velocity material and low to moderate shear wave velocity material (500 to 2,000 ft/sec) to depths of approximately 5 to 15 feet below grade. PSI interprets this as silty sand overburden material. Below this, moderate to high shear wave material (3,500 to 6,500 ft/sec) is found with zones of moderate shear wave velocity material (2,000 to 3,500 ft/sec). PSI interprets this as sandstone bedrock that contains zones of uncemented sands. This interpretation was confirmed in our soil borings. Rippability within the overburden and bedrock materials should be easily excavated using conventional excavation equipment similar to a D9 Caterpillar Dozer or backhoe. However, a heavier dozer and an automatic hammer might be needed in areas of highly cemented sandstone for example, shear wave velocities in excess of 4,000 ft/sec.

Line B9

The profile from Line B9 shows low to moderate shear wave velocity material (500 to 2,000 ft/sec) to depths of approximately 25 to 30 feet below grade. PSI interprets this as silty sand and gravel overburden material. Below this, moderate to high shear wave material (4,000 to 6,500 ft/sec) is found extending to the termination of the profile. PSI interprets this as granite that is fairly uniform in depth and consistency. This interpretation was confirmed in our soil borings. Rippability within the overburden materials should be easily excavated using conventional excavation equipment similar to a D9 Caterpillar Dozer or backhoe. However, a heavier dozer and an automatic hammer will likely be needed within the granite bedrock.

Line B11

The profile from Line B11 shows low to moderate shear wave velocity material (500 to 2,500 ft/sec) to depths of approximately 25 to 30 feet below grade. PSI interprets this as sand and gravel overburden material which may be very dense in areas. Below this, moderate to high shear wave material (3,000 to 5,500 ft/sec) is found with zones of moderate shear wave velocity material (2,000 to 3,500) at the overburden/bedrock interface. PSI interprets this as granite bedrock that may be highly fractured within the upper 10 to 20 feet. Rippability within the overburden and bedrock materials should be easily excavated using conventional excavation

equipment similar to a D9 Caterpillar Dozer or backhoe. However, a heavier dozer and an automatic hammer might be needed in areas of competent granite bedrock. Bedrock surfaces appear to be somewhat irregular.

Line B13

The profile from Line B13 shows low to moderate shear wave velocity material (500 to 2,000 ft/sec) to depth of approximately 20 to 35 feet below grade. PSI interprets this as sand and gravel overburden material. Below this, high shear wave material (4,500 to 8,000 ft/sec) is found extending to the termination of the profile. PSI interprets this as granite bedrock that is generally dipping to the northwest. This interpretation of soil and bedrock type was confirmed in our soil borings. Rippability within the overburden materials should be easily excavated using conventional excavation equipment similar to a D9 Caterpillar Dozer or backhoe. However, a heavier dozer and an automatic hammer will likely be needed in areas of granite bedrock.

Void areas were not detected within the profiles.

We appreciate the opportunity to serve as your consultant for this project. Should you have any questions, please feel free to call at your convenience.

Respectfully submitted,

Re: Thermal Analysis of Native Soil Samples
Hermosa Wind, Project # 535-95048

The following is the report of thermal dryout characterization tests conducted on the two (2) native soil samples for the referenced project received at our laboratory. These were bulk samples taken in plastic bags.

Thermal Resistivity Tests:

For thermal dryout characterization, the samples were re-compacted at the 'in-situ' moisture contents and at 80% of standard Proctor density. A series of measurements were made in stages, with moisture contents ranging from moist to the totally dry condition. The thermal dryout curves are presented in **Figure 1**.

Sample ID, Description, Moisture Content, Dry Density and Thermal Resistivity

Sample ID	Visual Description	Thermal Resistivity (°C-cm/W)		Moisture Content (%)	Dry Density (pcf)
		Wet	Dry		
B-7 @ 0' – 5'	Red clayey SAND	177	310	7.9	93
B-10 @ 0' – 5'	Red sandy lean CLAY	163	297	6.6	99

EXECUTIVE SUMMARY

Cultural Resource Analysts, Inc., was sub-contracted by Black and Veatch for Shell WindEnergy Inc. to conduct a Class III cultural resource inventory and monitoring for seven geotechnical bore holes associated with the Hermosa Wind Project in Albany County, Wyoming. The project is located on private and Wyoming state lands. During the course of this project, no previously recorded cultural resources were impacted, and no new cultural resources were recorded.

I. INTRODUCTION

Cultural Resource Analysts, Inc. (CRA), was sub-contracted by Black and Veatch for Shell WindEnergy Inc. to conduct a Class III cultural resource inventory and monitoring for six geotechnical bore holes in Albany County, Wyoming. The project is located approximately 4 mi southwest of Tie Siding, Wyoming (Figure 1).

This inventory complies with the National Historic Preservation Act (16 USC 470) and the National Environmental Policy Act (42 USC 4321). This report complies with the requirements and protocols for Class III cultural resources inventories provided by the Wyoming State Historic Preservation Officer (SHPO).

Project Description

This project is a follow up to the original Hermosa Geotechnical Bores Holes Project, conducted by CRA in July of 2009. The original project included inventory and monitoring for six geotechnical bore locations (B1 through B6). The current project added inventory and monitoring for seven additional geotechnical bore locations (B7 through B13). Due to access issues caused by inclement weather, no work was conducted at bore location B12. The holes are 8 inches in diameter. The disturbance was limited to the actual drilling and sampling of each hole, and disturbed only the area directly around the drill point. CRA inventoried 30 acres including at least 2.5 acres around each bore site and a 60 m wide access corridor from existing roads (Figures 2–4). The project is located in Township 13 North, Range 73 West, Sections 25, 26, 28, and 35; Township 12 North, Range 73 West, Section 13; Township 12 North, Range 72 West, Section 18; and Township 12 North, Range 73 West, Section 30; Albany County, Wyoming. The purpose of this project is to provide cultural resources support to the collection of geotechnical data to assist with the engineering and planning for the future Hermosa Wind Project energy installation. This was accomplished by inventorying for cultural

resources in the project area, monitoring drilling, and relocating any geotechnical bore holes as needed to avoid cultural resources.

Fieldwork was conducted on October 26 and November 2–5, 2009, by S. Tosh McKetta under an Office of State Lands and Investments Permit issued to CRA on July 20, 2009. The CRA project number is C09B003.

II. ENVIRONMENT

The project area lies in the southern portion of the Laramie Basin Physiographic Province (Love and Christiansen 1985), approximately 18.7 mi south of Laramie, Wyoming, and 12.4 mi northeast of Eaton Reservoir, Colorado. It is located on a low, flat area between U.S. 287 to the northeast and a series of higher and steeper ridges to the southwest (Figure 5). The topography of the project area consists of gentle north and west facing slopes with interspersed drainages. The main drainage in the area is Willow Creek, located within the project area.

The surface geology of the north half of the area consists primarily of Permian Age sedimentary deposits of the Casper Formation generally consisting of thick bedded sandstone with some claystone, mudstone, and conglomerate underlain by interbedded sandstone and limestone. The southern half of the project area is dominated by Middle Proterozoic Sherman Granite and Early Proterozoic metasedimentary formations. (Love and Christiansen 1985). The elevation of the project area ranges from 7,500 ft to 8,100 ft above mean sea level (AMSL).

The project area vegetation is currently in use as pastureland. It is primarily shortgrass prairie community. Dominant species include threadleaf sedge (*Carex filifolia*), blue grama grass (*Bouteloua gracilis*), buffalo grass (*Buchloë dactyloides*), slender wheatgrass (*Elymus trachycaulus*), and western wheat grass (*Elymus smithii*), with a number of common grassland forbs. Sagebrush (*Artemisia tridentate*) occurs as scattered individuals throughout the grassland (Knight 1994).

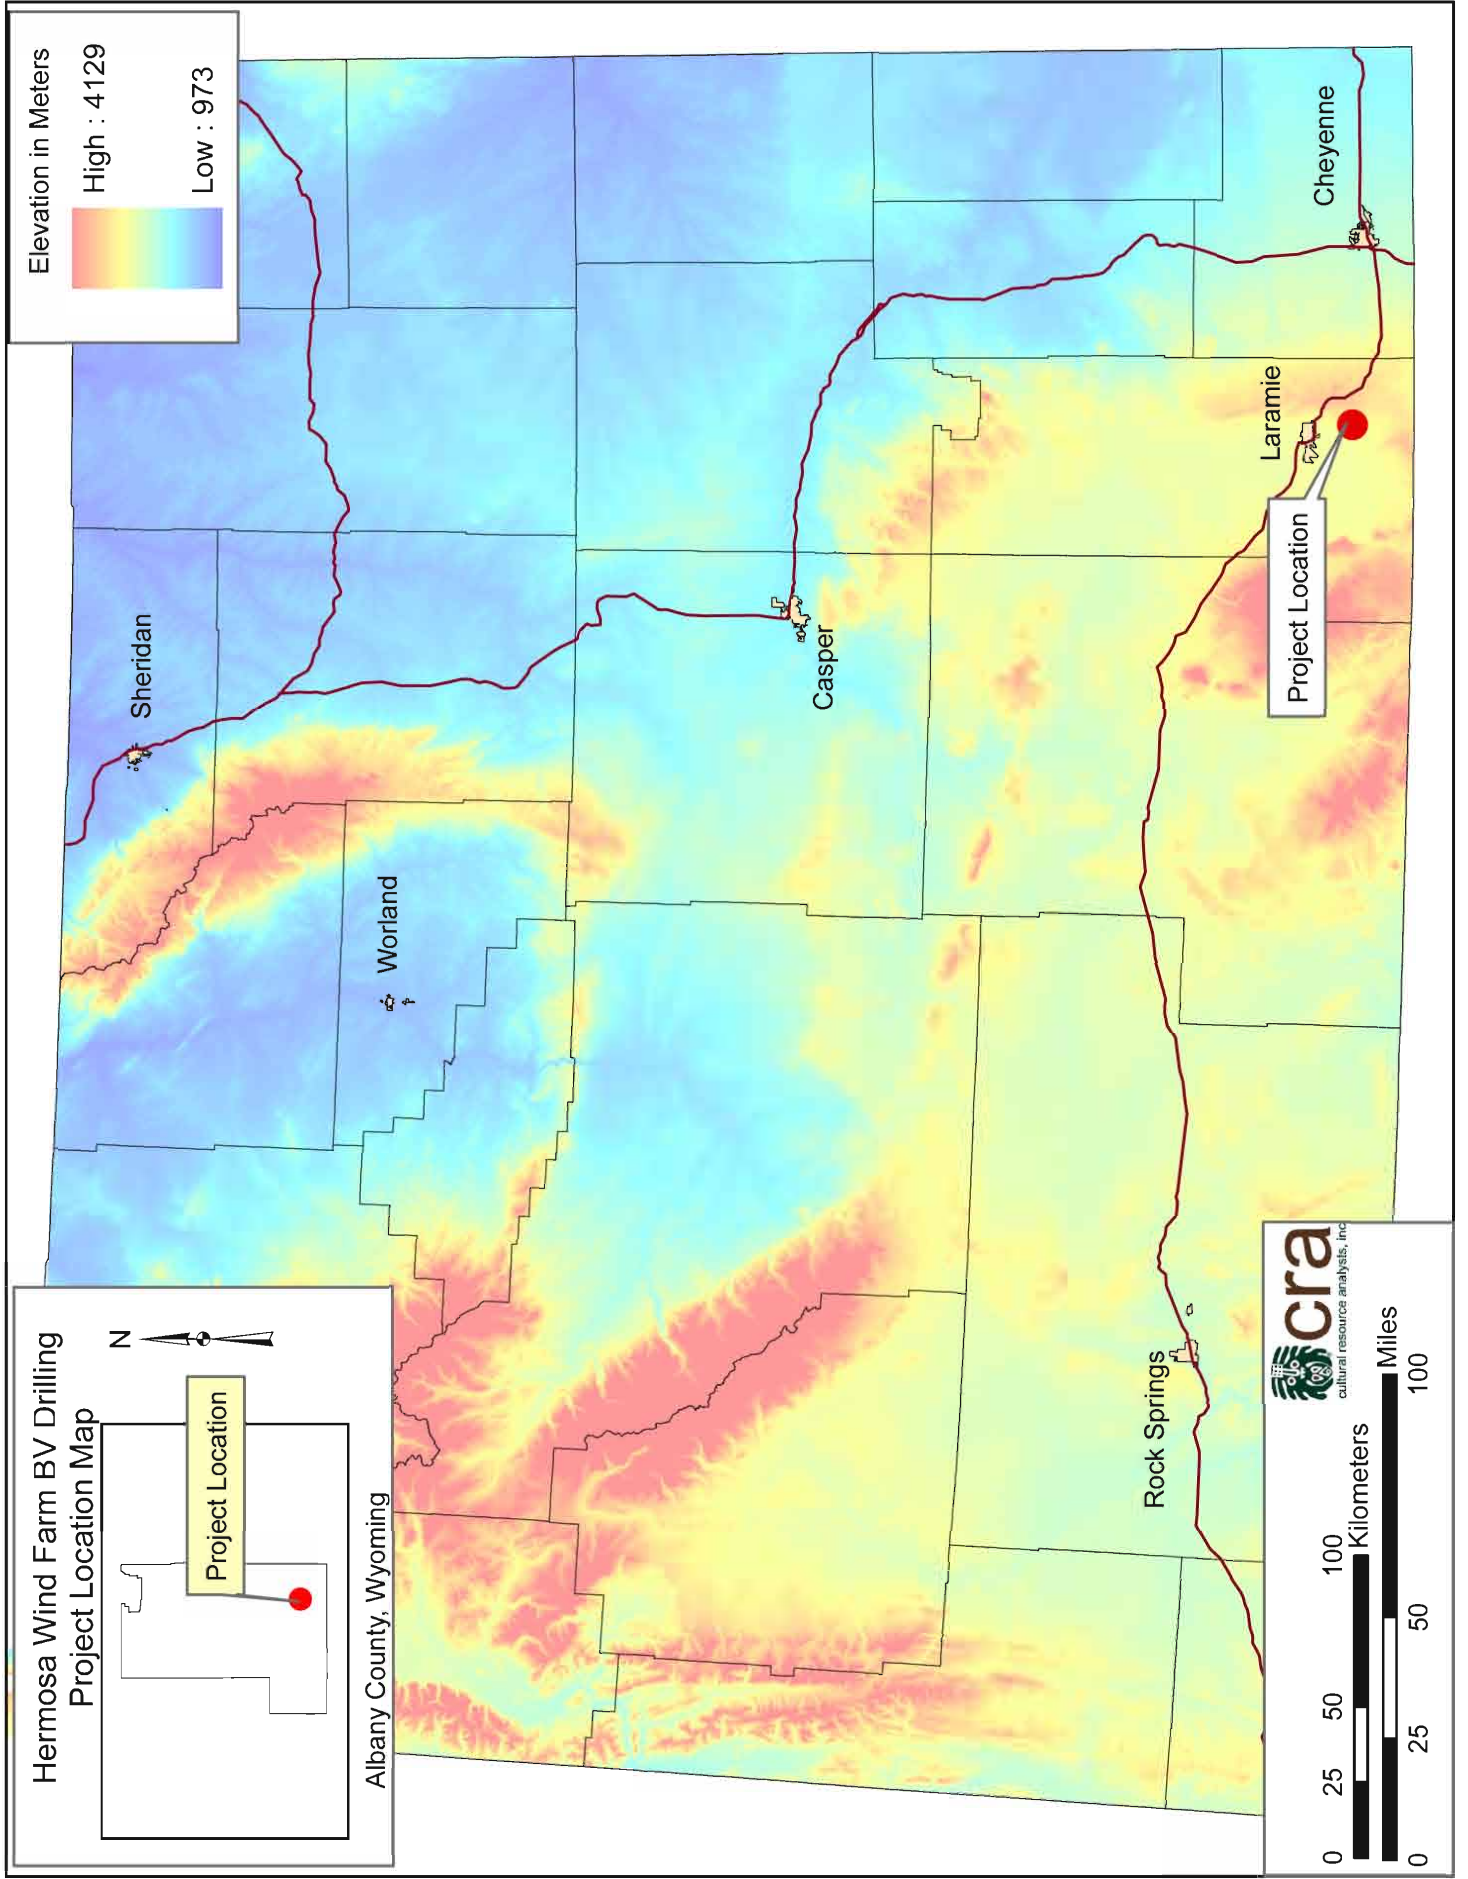

Figure 1. General project area location map.

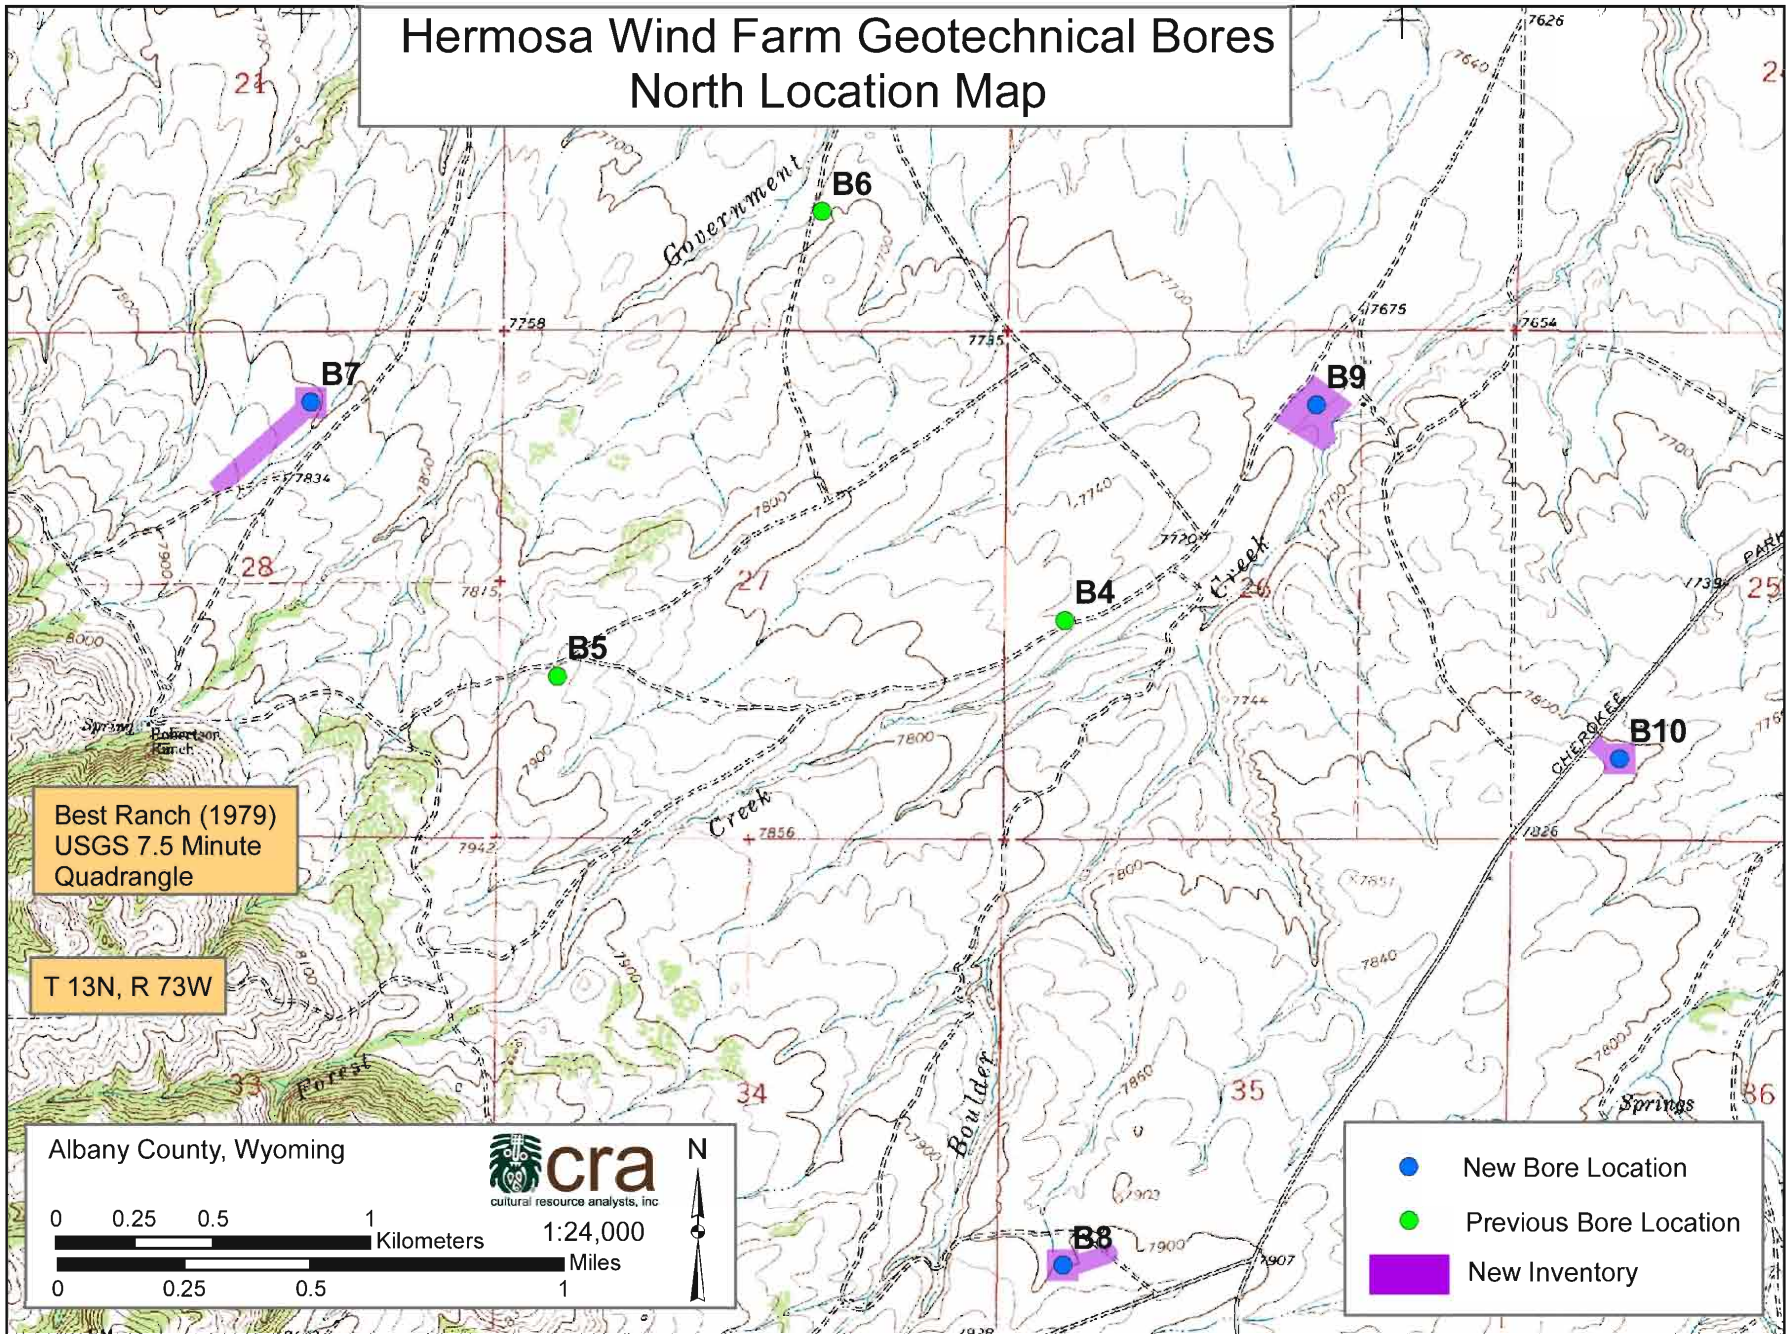

Figure 2. 1:24,000 Scale map indicating the location of geotechnical bore holes B7 through B10.

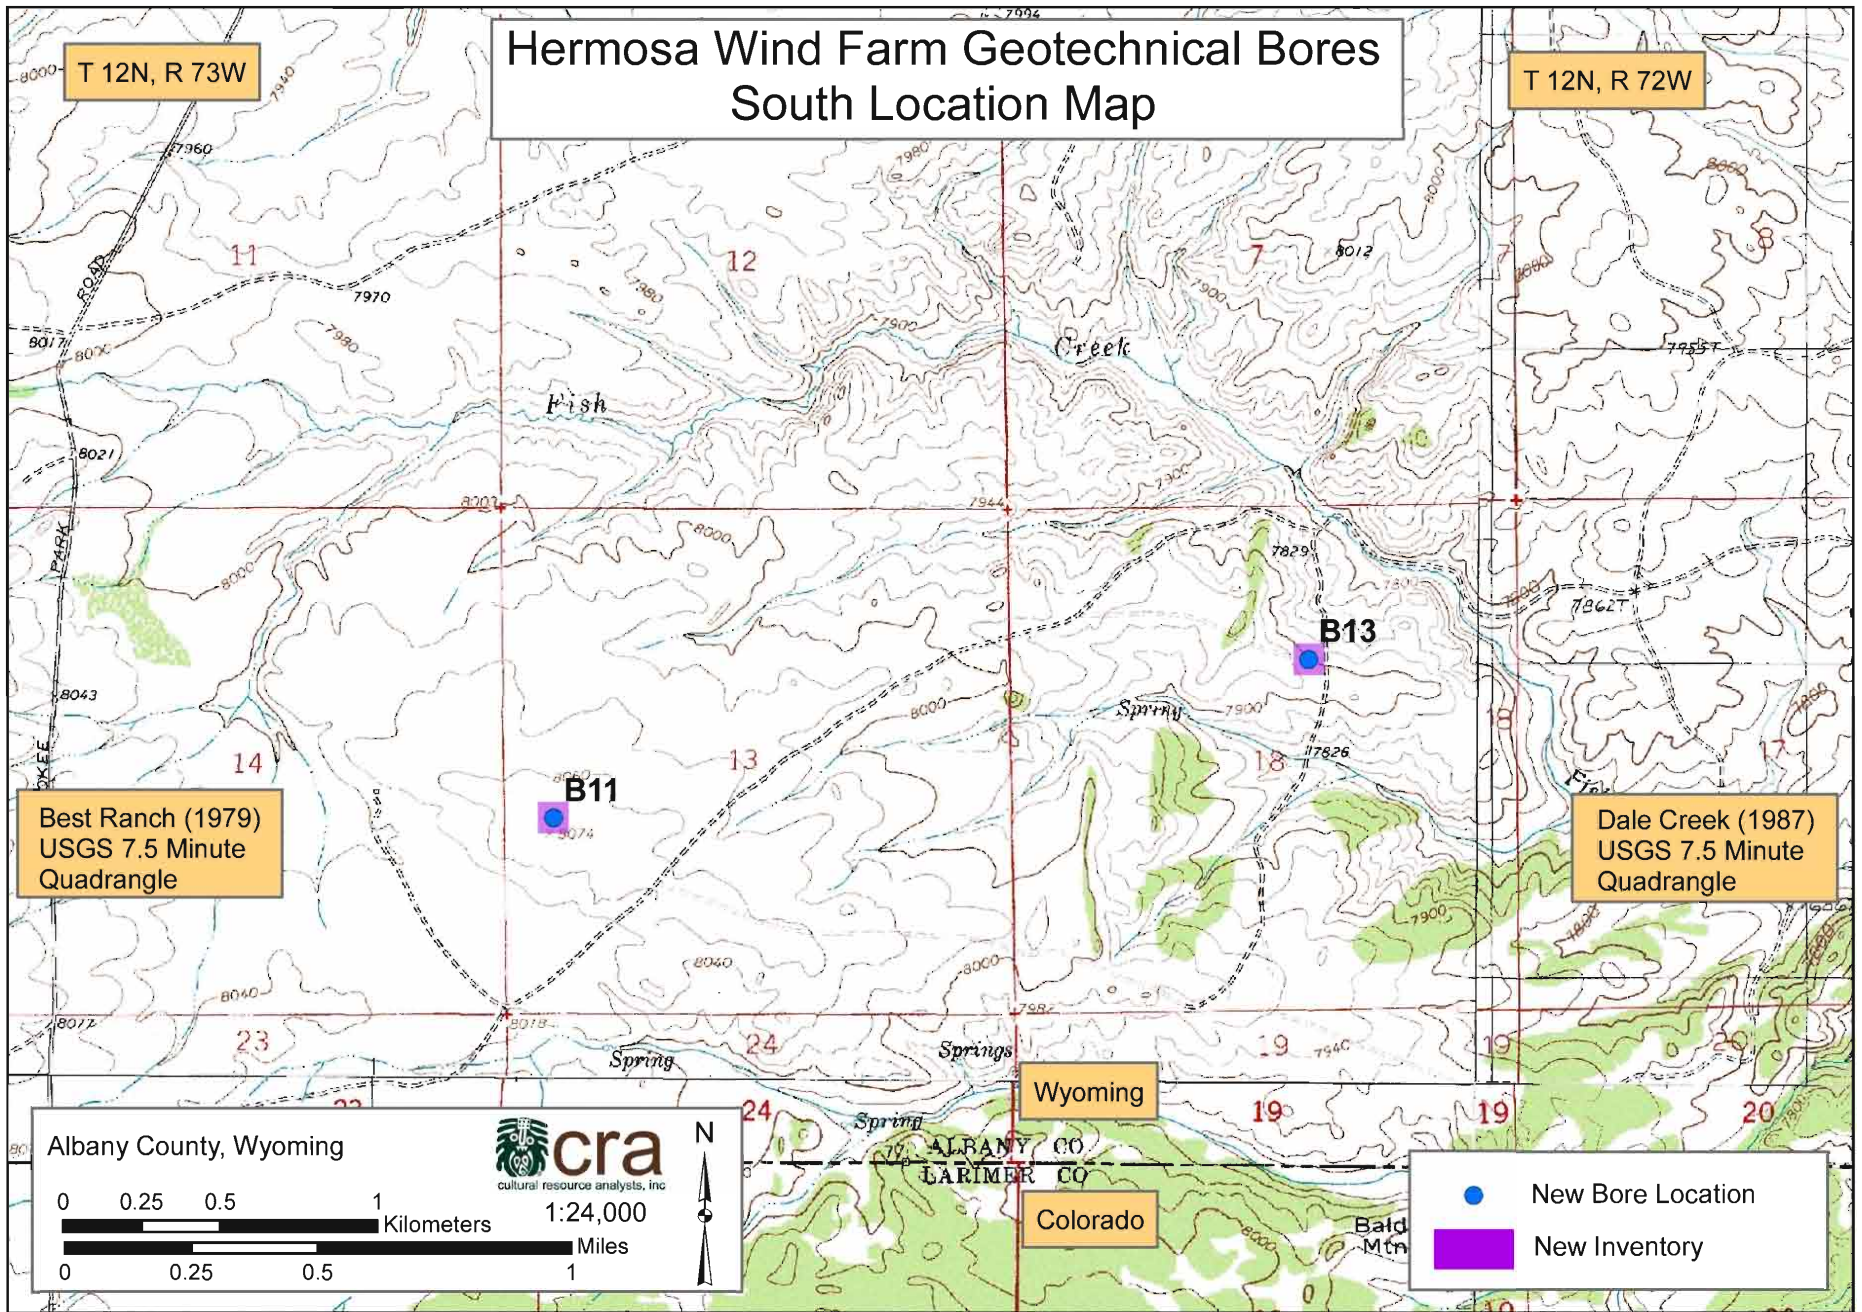

Figure 3. 1:24,000 Scale map indicating the location of geotechnical bore holes B11 and B13.

Hermosa Wind Farm Geotechnical Bores East Location Map

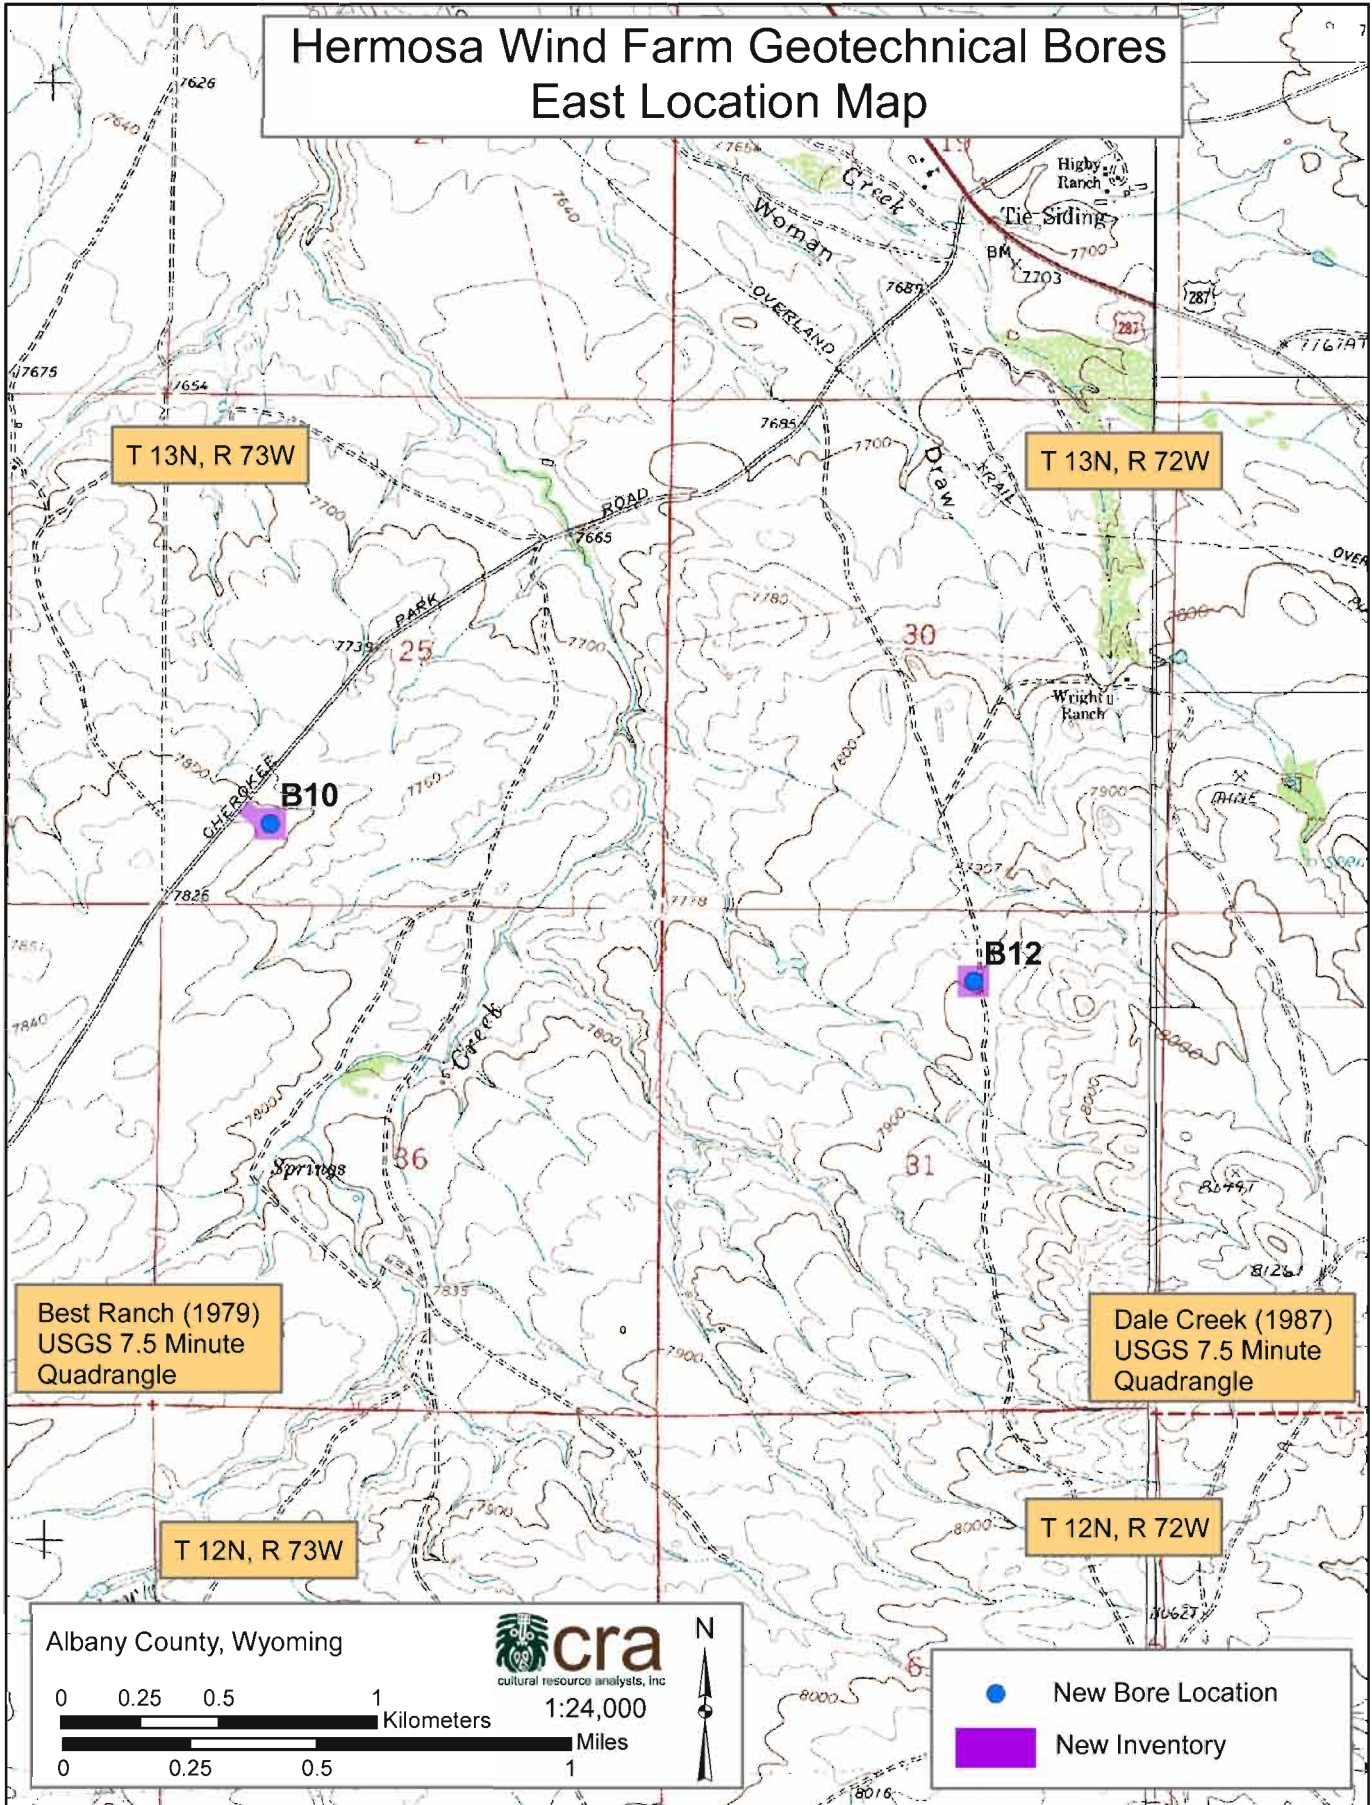

Figure 4. 1:24,000 Scale map indicating the location of geotechnical bore holes B10 and B12.

Figure 5. General area overview, taken near bore B11 in Township 12N, Range 73W, Section 13, facing northeast.

The project area is home to a variety of fauna, many of which would have been utilized by prehistoric populations. American pronghorn (*Antilocapra americana*) and Elk (*Cervus canadensis*) are prevalent in the project area, mule deer (*Odocoileus hemionus*) are also present but in smaller numbers. There are many bird species present including golden eagles (*Aquila chrysaetos*), horned larks (*Eremophila alpestris*), western meadowlarks (*Sturnella neglecta*), and mourning doves (*Zenaidura macroura*). Small body mammals include black-tailed prairie dogs (*Cynomys ludovicianus*), desert cottontails (*Sylvilagus audubonii*), white-tailed jack rabbits (*Lepus townsendii*), and black-tailed jack rabbits (*Lepus californicus*). There are also several predatory species within the project area including American badgers (*Taxidea taxus*), red foxes (*Vulpes vulpes*) and coyotes (*Canis latrans*) (Knight 1994). Cattle (*Bos taurus*) are also prevalent.

III. CULTURE HISTORY AND PREVIOUS WORK

File and Records Search

File and records searches were conducted with the Wyoming SHPO on October 21st and 23rd, 2009 (Appendix A). The only cultural resource report from the project area is the original Hermosa Geotechnical Bore Project conducted by CRA in July of 2009. No cultural resources were encountered during the project. There are no recorded sites, or isolated finds in any of the sections where the bore holes were drilled.

Only one previously recorded cultural resource was located within one mile of the bore locations. This site (48AB34), recorded in 1955 by Carling Malouf, is located in T13N, R73W, Section 36. This is a prehistoric site containing five stone circles, a jasper knife, and lithic debitage located on a southeast facing terrace. This site was not

reinvestigated because it is well outside of any area affected by the geotechnical boring.

Cultural Context

Paleoindian Period

The Paleoindian Period began in the Great Plains around 11,500 B.C. and extended to 6,400 B.C. In the early part of this period, the climate was cool and moist with alpine glaciation. By 7,500 B.C., a general warming trend is evident. The Paleoindians represent the first inhabitants of the North American continent beginning in the late Pleistocene. The first 2,000 years of this period encompass the Clovis, Goshen, and Folsom traditions. The dominant attributes of early Paleoindian assemblages are the use of lanceolate projectile points and the hunting of megafauna, including mammoth and extinct forms of bison, by highly mobile residential groups (Kelly and Todd 1988).

The later part of the Paleoindian period is best described by the Foothill-Mountain tradition. This tradition was developed by Frison (1992). In this tradition, later Paleoindian groups in the foothills and mountain ecological zones employed a different subsistence strategy than Plains-oriented bison-hunting Late Paleoindian groups. Settlement was more restricted and projectile point styles became more diverse and were often made of local materials (Frison 1992; Pitblado 1994, 2003). Bison were hunted, but so were many other game animals. Foothill-Mountain groups also exploited a wider range of plants than Plains-oriented groups.

Archaic Period

The shift from the Paleoindian period to the Archaic period is marked by the change from stemmed and lanceolate points to side-notched varieties and a change in subsistence practices (Francis 1983:49; Frison 1991:79; Larson 1997). Frison (1991) breaks the Archaic into three periods: Early (8,000-4,000 BP), Middle (4,000-3,000 BP), and Late Plains Archaic (3,000-1,500 BP). There is

evidence of an increase in the use of floral resources and a decrease in the overall reliance on communal hunting and bison. This change could also be produced by a change in the temperature, reducing either the amount or the range of bison, necessitating a broader based subsistence pattern. Whatever the cause, there is a noticeable broadening in the resource base utilized through the Archaic period. This is supported by the gradual increase in ground stone tools, indicating plant processing, and the increasing use of smaller game and secondary resources. Stone circles, often called tipi rings, begin to appear in the archaeological record at this time. One stone circle site (48AB34) has been recorded near the project area. Stone circle sites continue to be a large part of the archaeological record in the area until the historic period. It is expected that additional cultural inventories in the area will encounter more stone circle sites. Also evident during the Archaic period was the use of house pits (Shields 1998).

Late Plains Prehistoric Period

The transition between the Late Archaic and the Late Plains Prehistoric (1,500 BP–AD 1720) appears to represent an overlap of technological traditions complicated by the continuation of a hunting and gathering way of life (Frison et al. 1996:26). The Late Plains Prehistoric period was marked by a change in projectile points related to the adoption of the bow and arrow. There is evidence for some corner-notched dart points reducing in size for use with a bow (Frison 1991). The use of ceramics (Frison 1991:111) is another marker of the Late Plains Prehistoric period, though ceramics started to appear near the end of the Late Plains Archaic period (Frison 1991:116). The end of the Late Plains Prehistoric period is the result of contact with Euro-American material culture. The changes resulting from contact and the subsequent disease and dispossession affected settlement and subsistence patterns.

Protohistoric Period

The Protohistoric Period, between AD 1720 and 1800, encompasses the time between

the arrival of Euro-American material culture and the arrival of the Euro-Americans. During this time, the area was utilized by a number of different groups the Arapaho, Comanche, Cheyenne, Crow, and Shoshoni Native American tribes. The introduction of the horse via the Spanish in the southwest (Ewers 1955) was likely one of the most significant cultural changes for the populations residing in this area (Frison 1991:122). Many aspects of life changed because of the horse. Subsistence was no longer limited to the needs of humans and finding a place where the horses would survive was a possible concern. Protohistoric sites are rare and characterized by trade goods including seed beads, glass trade beads, and metal projectile points. These goods are often found in burial contexts.

Historic Period

French explorers were the first Europeans likely to have migrated into this area. By the time these trappers arrived in Wyoming, the local Native Americans had already acquired horses (Ewers 1955) and some European goods. The fur trade in Wyoming expanded after the early part of the eighteenth century, with a number of rendezvous occurring in southern Wyoming (Goetzmann 1966). After the fur trade era, some of the trappers became guides for the emigrant trails that sprang up throughout the area. The major two trails in this area are the Overland Trail and the North and South Branches of the Cherokee Trail. The South Cherokee Trail is the closest to the project area. The path of the Cherokee Trail in the area begins three mi north of Tie Siding and trends southwest towards Chimney Rock. The Overland Trail in this area follows the same general route as U.S. 287 (Whiteley 1999).

The function of these trails changed as the railroad worked its way westward across Wyoming in 1867 and 1868. The coming of the Union Pacific Railroad marked the beginning of intensive Euro-American movement into this area. Many towns were established along the route of the railroad, such as Laramie and Tie Siding. Many

railroads followed the routes of the old trails closely.

The town of Laramie, Wyoming, is located north of the project area, and is the home of the University of Wyoming. Laramie was founded in the 1800s as a stop along the Union Pacific Rail Road. There are many historic and modern activities that were, and are, taking place within the vicinity of the project area including alternative energy exploration, cattle grazing, agriculture, recreation, and hunting.

Agriculture has been, and still is, important in Wyoming as a whole and this area in particular, but the livestock industry brought only sparse settlement to Wyoming. The agricultural development of Wyoming's arable land was necessary to provide the impetus for population growth. In 1916 the Wyoming Board of Irrigation encouraged the use of dry farming to attract a new wave of homesteaders. Dry farming agricultural techniques increased production; however, it also severely undermined the system of small farm agriculture. The Stock Raising Homestead Act of 1916 allowed for patentees to enlarge their homestead tracts.

The agricultural and energy industries in the state suffered financially during the 1920s. The Depression in the 1930s would serve to further depress the economy. Over 100 banks had failed in Wyoming during the 1920s and 27 more failed during the Depression (Fraser 2006). Conditions were made worse by a severe and prolonged drought that began in 1926 and continued well into the 1930s. One of the first relief agencies established by the Roosevelt Administration was the Public Works Administration (PWA). Started in 1933 under the National Industrial Recovery Act, the PWA allocated \$400 million in funds for specific projects that were designed solely to put people to work at predetermined wage rates (Fraser 2006).

After World War II, both the American economy and its population boomed. The Eisenhower administration began the construction of the interstate highway system. Modern gas and oil drilling and exploitation became very economically important in Wyoming. As times change, there is an increasing amount of alternative energy development, mainly wind farms, occurring in the area. Cattle continue to be part of the economic system in the area and are present in the project area.

IV. METHODS

The intent of this inventory was to locate, record, and evaluate the National Register of Historic Places (NRHP) eligibility of all cultural resources in the Project area. The guidelines set forth by the Wyoming SHPO were followed to ensure that all applicable

federal and state standards for cultural resource investigations were met.

Class III Methods

An intensive pedestrian Class III cultural resource survey was conducted over 100 percent of the project area encompassing 30 acres of private and Wyoming state land. An area of at least 2.5 acres was inventoried at each location and any necessary access was inventoried using a 60 m wide corridor from the nearest existing road. The drilling of the geotechnical bore holes was monitored by an on-site archaeologist. All seven bore locations were inventoried on October 26, 2009. Monitoring was conducted on the six accessible bore holes between November 2–5, 2009. There was little disturbance to the areas bored because the drill rig is designed to have little impact on the bored location (Figure 6).

Figure 6. Showing drilling equipment and its minimal impact. Photo taken near B7 in Township 13N, Range 73W, Section 28.

No weather conditions or access issues impeded the inventory, but monitoring occurred less than a week after a snow storm. Although each bore location was snow free, during monitoring drifts covered some low elevation areas and prevented access to B12. The geotechnical bore holes, labeled B7 through B12, are in Township 13 North, Range 73 West, Sections 25 (B10), 26 (B9), 28 (B7), and 35 (B8); Township 13 North, Range 72 West, Section 31 (B12); Township 12 North, Range 72 West, Section 18 (B13); Township 12 North, Range 73 West, Section 13 (B11).

The geotechnical bore holes were outlined and drilled by Professional Service Industries, Inc. (PSI). The project area is crossed by ranch two-track roads and barbed wire fences. The survey blocks were grazed pastureland and ground visibility was good in all areas. Global Positioning System (GPS) technology was utilized on the project to locate and record each bore hole. CRA uses Trimble GeoXT handheld GPS units. These units have sub-meter accuracy from the true horizontal position after differential correction.

V. RESULTS

During the course of this inventory no cultural resources were recorded or reinvestigated. Each bore location will be addressed individually in the order that bore numbers were assigned.

B7

This bore hole is located at approximately 7,800 ft AMSL on a gently sloping area with a northeast aspect (Figure 7). Just to the south of the bore location is a small intermittent drainage that made access impossible for the drill rig. This led to the inventory of a 375-x-60-m strip to the nearest allowable access road. No cultural resources were located in this additional inventory area. The sediments at this location were gravel filled sand 10 ft deep. These sediments lay on top of sandstone bedrock. The vegetation at this location shows evidence of grazing and has some low grasses and interspersed forbs across it. The nearest permanent water is Government Creek, 0.3 mi to the southwest.

Figure 7. Overview of B7, facing east.

B8

This bore hole is located at approximately 7,900 ft AMSL on a small rise in the center of a wide rolling plain (Figure 8). Vegetation here consisted of low grasses and forbs with conifers visible in the drainage to the northwest. The sediments at the location are a gravel filled sandy loam is 8 ft deep. Underneath the sediments is a friable sandstone bedrock. The nearest permanent water is Boulder Creek, located 0.6 mi to the north.

B9

This bore hole is located at approximately 7,720 ft AMSL on a flat overlooking Boulder Creek less than 0.1 mi to the south (Figure 9). The sediments here were a packed residual granitic gravel 35 ft deep. These overlaid an orthoclase-rich granitic bedrock. Proximity to water and lack of slope made this landform a higher probability area for cultural resources

than any of the other bore locations. Because of this, the inventory area was extended for this location. No cultural resources were encountered despite the larger inventory area. Vegetation at the location consisted of low grasses and forbs.

B10

This bore hole is located at approximately 7,810 ft AMSL located on a rounded rise that slopes to the east (Figure 10). The sediments at this location consisted of 10 ft of compacted sandy clay with gravel in it. This high concentration of clay was not seen anywhere else in the project area. The underlying bedrock was sandstone and was easily cored. There was very little vegetation at this site. This could be due to the group of pronghorn that we saw near the location on several occasions. There was almost no grass left and only intermittent forbs growing in the bore area. The nearest permanent water is Willow Creek, 0.5 mi to the southeast.

Figure 8. Overview of B8, facing northwest.

Figure 9. Overview of B9, facing south.

Figure 10. Overview of B10, facing northwest.

B11

This bore hole is located at approximately 8,070 ft AMSL on the center of a small rise. The sediments were residual and sandstone derived (Figure 11). These sediments were less than 5 ft deep. These sediments overlaid a highly fractured sandstone bedrock that no core sample could be recovered from. Vegetation consists of highly grazed low grasses with some forbs. The nearest permanent water is an unnamed spring located 0.75 mi to the southeast.

B12

This unused bore location is located at approximately 7,900 ft AMSL on a flat to the west of a significant unnamed ridge with abundant rock outcropping (Figure 12). This bore location was inventoried, but not drilled since remnant snow drifts from the previous weeks storms precluded access. Vegetation at

the locale is sparse and shows evidence of grazing. Only low grasses and small forbs were visible. Visible sediments were loamy and contained angular gravel. The nearest permanent water is Willow Creek, 0.76 mi west.

B13

This bore hole is located at approximately 7,900 ft AMSL on the north side of a small ridgeline above Fish Creek (Figure 13). The area has outcropping granitic rock to the east, southeast, and west. The vegetation is Low grasses and Forbs, with pine trees on the knolls to the east and west. The sediments are 27 ft deep in the bore location and overlay a very dense, orthoclase-rich granitic bedrock. Sediments are sandy and compacted with high concentrations of granitically derived gravel. The nearest permanent water is Fish Creek, 0.2 mi to the northeast.

Figure 11. Overview of B11, facing northwest.

Figure 12. Overview of B12, facing northwest.

Figure 13. Overview of B13, facing northeast.

VI. SUMMARY AND CONCLUSIONS

No cultural resources were recorded in the project area. Grazing and previous cultivation activities have disturbed large areas of the open pastureland. The small size of this investigation limited the potential for encountering cultural resources. It is likely that cultural resources are in the vicinity and further work will require more intensive and inclusive cultural resource inventories.

Notice

This technical report is presented for Shell WindEnergy, Inc. its agents, successors, and assigns. Though legal and/or regulatory information may be contained herein, said information is not intended to constitute legal advice or opinion and, to the extent such legal advice or opinion is required, Shell WindEnergy, Inc. is advised to seek the advice of legal counsel. The findings contained herein are limited by the scope of the field activities specified in the report and the quality and type of information provided and/or made available to Ecology and Environment, Inc. (E & E) for review and is subject to revision if additional or more definitive information becomes available.

1

Introduction

Ecology and Environment, Inc. (E & E) was retained by Shell WindEnergy, Inc. to perform an Environmental Site Assessment (ESA) for the Hermosa Wind Energy Project (hereinafter referred to as the Project Area). The Project Area encompasses approximately 26,865 acres of land located in the south-eastern area of Albany County. The Project Area boundary is depicted in Figures 1-4. The majority of the Project Area is located on private lands; however, there are approximately 6,316 acres of state owned public lands in the central, northeastern and southeastern portions of the Project Area. Please see the Project Area Lease Map provided in Appendix B for property ownership references. The Project Area is located approximately 18 miles to the southeast of the City of Laramie, Wyoming, and abuts the State of Colorado on its southern boundary.

The proposed wind energy facility will likely occupy narrow bands of acreage along proposed access roads, existing roads, and proposed transmission and connection lines. A map of the Project Area delineating the layout of the associated windpark facilities and proposed features was not provided by the client prior to the site visit. It is understood that only a relatively small portion of the entire Project Area will actually be developed for wind energy development.

The towns of Hermosa and Tie Siding in Albany County, Wyoming are located just outside of the north-central border of the Project Area. U.S. Highway 287 bisects the northern half of the Project Area running northwest-southeast; and in the southern half of the Project Area forms a portion of the eastern border. A Union Pacific Railroad runs east-west through the northern half of the Project Area. The Project Area is located within the Laramie River (perennial) drainage. The Laramie River is located approximately 12 miles to the northwest of the Project Area at its closest point. The Hutton Lake National Wildlife Refuge (NWR) is located approximately 10 miles to the northwest of the Project Area. Regulatory database searches were conducted using the Project Area boundary provided by Shell WindEnergy.

This report presents the findings, opinions, and conclusions made as a result of assessing this property.

1.1 Purpose

The purpose of this ESA is to identify actual and potential environmental liabilities associated with the Project Area and to provide recommendations to reduce those liabilities. This ESA was prepared in support of due diligence efforts being made by Shell WindEnergy, Incorporated in preparation for development of the proposed wind energy facility. Except as noted, this assessment was conducted in accordance with American Society for Testing and Materials (ASTM) standard practice E1527-05. As such, this assessment addresses recognized environmental conditions (RECs) that indicate an existing release, past release, or material threat of a release of any hazardous substance or petroleum products into structures on the property or into the ground, groundwater, or surface waters. Recognized environmental conditions do not include de minimis conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate government agencies. This site assessment did not include a chain-of-title search, an environmental lien search, building interior reconnaissance, an asbestos survey, or a lead-based paint survey. No sub-surface investigation was conducted for the purposes of this ESA.

1.2 Detailed Scope of Services

This site assessment consisted of the following efforts:

- A review of current aerial photos and topographic maps; and a screening level survey of the of the entire Project Area;
- A windshield survey of the Project Area in order to ground-truth the information obtained during the desktop studies. The survey was performed in conjunction with environmental studies and covered areas where a potential for a release of hazardous substances or petroleum products was identified by local agency review and/ or interviews and as a result of a regulatory database search (see Section 4.1). The windshield survey covered all county roads and several private roads, drives, and trails within the Project Area. In addition, E & E traversed the full extent of the stretch of railroad bisecting the northern portion of the Project Area;
- Interviews with the county clerk, the local volunteer fire department, and the county planning department;
- A database search and review of readily-available state and federal records.

The site survey was conducted on May 27th of 2009. Mr. Joseph K. Grieser and Mr. Jason A. Zoller of E & E surveyed the aforementioned portions of the Project Area using the property boundaries provided by Shell WindEnergy Inc. A map of notable site observations is provided as Figure 4 and photographic documentation is provided in Appendix C.

The database search of federal and state standard environmental record sources was conducted prior to the site visit and all properties identified in the database search were surveyed during the site visit. The results of the database search are described in Section 3.1 of this report and are presented in Appendix A. The areas surveyed and photographed in this report were mapped using the global positioning system (GPS) and presented in Figure 4.

The findings, opinions, and conclusions reported herein are based on information collected from records reviewed, observations made during the site visit, and interviews.

1.3 Abbreviated Site History

The Project Area encompasses approximately 26,865 acres of land located in Albany County, Wyoming (see Figure 1). It is located on both private and state owned land. The primary land uses of the Project Area are rangeland for cattle grazing, transportation, and stone quarrying. Much of the Project Area is unused grassland.

The Hermosa Project Area is located primarily on lands that were purchased from the Bureau of Land Management (BLM) by private entities, as well as approximately 6,316 acres of state owned public lands in the northeastern, central and southeastern portions of the Project Area. Four small parcels of BLM land border the Project Area; two on the northeast and two on the east side of the Project Area. According to the United States Geological Survey (USGS) Landcover Inventory, the Project Area contains no range or agricultural lands, however, E & E observed pastures for cattle grazing throughout the Project Area, primarily on private lands. According to aerial imagery and topographic maps, there appear to be no cities located within the Project Area boundaries. One residence was observed during the site survey within the Project Area on property owned by Bath Family Ltd. Partnership, just south of Point #13 on the Site Observations Map (Figure 4). Two towns, Hermosa and Tie Siding, are located just outside of the north-central border of the Project Area. According to the USGS Topographic Map (Figure 2), there are two ranches adjacent to the Project Area. One ranch is located to the west of the northeastern portion of the Project Area near Dale Creek. The other ranch is located immediately to the west of the entire Project Area. Two former mines are also depicted in the topographic map, outside of the Project Area and east of Route 287. In addition, E & E observed an active quarry in the Project Area near Point #18 (Photograph #21 and #22) in Figure 4 of this report.

A Union Pacific Railroad crosses the Project Area from east to west through the northeastern portion of the property. Portions of the Project Area boundary are adjacent and parallel to the railroad line. According to boundaries provided by Shell WindEnergy Inc., portions of the railroad are located within the Project Area. There are three natural gas pipelines that run from east to west that are lo-

cated on the far northeastern portion of the Project Area (Appendix A). The Medicine Bow Pipeline is owned and operated by Sinclair; the other two pipelines are operated by Colorado Interstate Gas. Both of the Colorado Interstate Gas pipelines are owned by the El Paso Corporation. The southern portion of the Project Area is transected by a transmission corridor that runs east to west. Another pipeline was identified during the database review, and runs along Route 287 to/from Tie Siding (Appendix A: EDR Database Radius Map).

1.4 Reason for Performing the Phase 1 ESA

E & E conducted this ESA as part of Shell WindEnergy Incorporated's due diligence in preparation to build a wind energy production facility and associated ancillary facilities on leased property within the Project Area.

1.5 Limitations and Assumptions

Field observations that provide the basis of this ESA were limited to just those parts of the Project Area accessible and/or observable from existing roads, areas of potential concern identified in state and local records, areas identified by local agency review and/or interviews, and areas identified as suspect during the database review (Appendix A). Subsurface conditions were not investigated during this effort. E & E relied upon the environmental records reported by Environmental Data Resources, Inc. (EDR) to provide state and federal environmental records. E & E did not visit state agency offices, as state records are address specific, and no address is applicable to the entire Project Area. However, E & E was able to review state records concerning an adjacent site in Tie Siding, Wyoming. This site has been documented by the Wyoming Department of Environmental Quality (WDEQ) and is further discussed in Section 3.2 of this report.

E & E visited local offices of Albany County, including the Albany Planning Office in order to obtain any information regarding the issuance of permits and documentation of any potential activity and use limitations (AULs). However, given the overall size of the Project Area, it was not practical to review records listed by physical addresses. E & E also contacted a member of Tie Siding Volunteer Fire regarding department responses to any fires, chemical spills, or other incidents within the Project Area.

E & E contacted the Wyoming Department of Environmental Quality (WDEQ) in order to identify any potential environmental concerns regarding the Project Area. E & E was informed of an adjacent leaking underground storage tank (LUST) site by the WDEQ underground storage tank (UST) department. This LUST site was not identified in the regulatory database. This site is further discussed in Section 3.2 and relevant documentation is provided in Appendix D. In addition, E & E

searched the internet database of the Wyoming Oil and Gas Commission (WOGC) in order to identify documented oil and gas production activities within the Project Area. E & E identified two plugged and abandoned oil wells located in the vicinity, but outside the Project Area boundary. These wells are discussed in Section 3.2 and are documented in Appendix D.

E & E did not evaluate radon and vapor intrusion issues regarding the Project Area. Releases from these sources are generally associated with confined spaces such as residential basements in areas where there is subsurface soil contamination. Therefore, they are not expected to be an issue in the construction or operation of a wind farm due to the open nature of a typical facility layout.

E & E did not review historical aerial photographs and historical topographic maps as part of our ESA review. After review of current aerial maps, current topographic maps, database search results, and other desktop analyses, E & E determined that the review of historic aerial and topographic maps for the study area was not warranted.

2

Site Review

2.1 Location and Ownership of Property

The Project Area is located within Albany County, Wyoming (Figures 1-4). The typical landscape of the region is low mountain slopes and nearly level flood-plains. The City of Laramie lies approximately 18 miles to the northwest of the Project Area, while the towns of Hermosa and Tie Siding, Albany County, Wyoming are located just outside of the north-central border of the Project Area. U.S. Highway 287 bisects the northern half of the Project Area running northwest-southeast; and in the southern half of the Project Area forms a portion of the eastern border. A Union Pacific Railroad runs east-west through the northern half of the Project Area. The Project Area is located within the Laramie perennial river drainage. The Laramie River is located approximately 12 miles to the northwest of the Project Area at its closest point.

The Project Area encompasses property owned by six separate private landowners and also the State of Wyoming. A map showing Project Area landowner lease boundaries, created using information provided by Shell WindEnergy Inc. of the current property owners, is included in Appendix B. Interviews of landowners prior to the site visit were not conducted, as the only industrial land usage identified in the immediate vicinity was stone quarrying and railroad operation. E & E visited the known quarry on-site and traversed all portions of the aforementioned railroad that transect the Project Area.

2.2 Site Designation

The entire Project Area is located within Albany County, Wyoming. The southern border of the Project Area abuts the State of Colorado border.

2.3 Current Use of the Property

Land usage within the Project Area was evaluated using the United States Geological Survey (USGS) Land Use/Land Cover base maps, interpretation of recent topographic maps and aerial photographs, and information gained during the site

visit. The primary land uses of the Project Area are rangeland for cattle grazing, transportation via road highway and railroad, and stone quarrying. In addition, much of the Project Area is unused grassland. Areas of the southern portion of the Project Area are forested (Figure 2), predominantly by Ponderosa Pine, and may be harvested for timber. There are several private residences located on parcels of land that are not within the project boundaries but are directly adjoining to or between the project boundaries. In addition, one residence was observed within the Project Area on land owned by the Bath Family Ltd. Partnership.

The aforementioned Union Pacific railroad spur runs from east to west through the northern portion of the Project Area. Three trains were observed passing through the Project Area during the site visit. Two railroad switches were observed along the railroad.

Two transmission line corridors pass through the Project Area. One transmission corridor is located in the southern half of the Project Area and runs east to west. The other corridor intersects the southwestern corner of the Project Area and runs northwest to southeast.

Based upon maps provided by EDR and the WOGC; there are three natural gas pipelines used to transport petroleum products. The pipelines transect the northeastern portion of the Project Area. Portions of these pipelines were observed during the site visit and photographic documentation is provided in Appendix C. No evidence of a release was identified or observed during the site visit. In addition, another pipeline runs along the Project Area boundary and along Route 287 to/from Tie Siding. This pipeline is depicted in a database map provided in Appendix A.

2.4 Past Uses of the Property

Based upon interviews with local residents, topographic maps, and field observations, it appears that historical land usage of the Project Area is the same as or similar to the current usage. Historical aerial photographs and historical topographic maps were not used in the preparation of this report, as previously arranged with the client.

2.5 Site and Vicinity Characteristics

The Project Area is located within the Laramie River drainage basin. The Laramie River is located approximately 12 miles to the northwest of the Project Area at its closest point. The Hutton Lake National Wildlife Refuge (NWR) is located approximately 10 miles to the northwest of the Project Area and encompasses five lakes and 1,408 acres of greasewood and grassland upland habitat. This NWR is managed for migratory birds, and participates in the captive breeding program of the Wyoming Toad (USFWS 2009a). The Snowy Range Area of the Medicine Bow National Forest (NF) is approximately 20 miles to the west of the Project

Area, and the Pole Mountain Area of the Medicine Bow NF is approximately 5 miles to the northeast of the Project Area. Medicine Bow NF is a popular recreational area, provides livestock grazing range, timber, and wildlife habitat, and is an important water source for the area (USFS 2009).

The majority of the Project Area is located within the Mid-Elevation Forests and Shrublands (Level IV) of the Southern Rockies (Level III) Ecoregion, while the northwestern portion of the Project Area is located within the Laramie Basin (Level IV) of the Wyoming Basin (Level III) Ecoregion (Chapman *et al.* 2004; Griffith *et al.* 2004). The Mid-Elevation Forests and Shrublands Level IV Ecoregion ranges from 7,500 to 9,000 feet in elevation, and is characterized by low mountain slopes and outwash fans with moderate to high gradient perennial streams throughout. This ecoregion receives an average of 18 to 26 inches of precipitation per year. Temperatures range from 4° to 32° Fahrenheit (F) in January and 40°F to 80°F in July. The dominant vegetation communities in this ecoregion are lodgepole pine forests and Douglas-fir forest with some limber pine. Forests have an understory of grasses, forbs, and shrubs. Some aspen forests occur in the Sierra Madre range, while ponderosa pine woodlands occur in the Laramie Mountains (Chapman, *et al.* 2004).

The Laramie Basin Level IV Ecoregion is a high elevation valley (7100 to 7900 feet) characterized by nearly level floodplains and low terraces. This ecoregion receives an average of 10 to 16 inches of precipitation per year, and temperatures range from 8° to 32°F in January and 44°F to 80°F in July. The Laramie Basin is dominated by mixed grass prairie (Chapman, *et al.* 2004).

2.6 Surrounding Property Uses

The regional land uses are generally rural and characterized by range land, and sparse rural-residential usage. There is some small and scattered commercial usage along transportation corridors such as Rte. 287 and the Union Pacific railroad.

3

Records Review

3.1 Standard Environmental Record Sources

3.1.1 Database Description

E & E subcontracted Environmental Data Resources, Inc. (EDR) to perform a search of reasonably ascertainable government records. EDR conducted a site records search compliant to the requirements of ASTM D1527-05, which included searching a prescribed array of federal and state databases. EDR's search of government records, dated March 25, 2009, did not identify any mapped sites either on the target property (Project Area) or within the minimum search distances provided below in Table 3-1. Mapped database results are presented in Appendix A.

Table 3-1 Search Distances

Federal Database	Search Distance Radius (miles)

Tribal Sites	1.000

Note: See Attachment A, “Government Records Searched/Data Currency Tracking” for definitions of the acronyms used in this table.

3.1.2 Database Search Results

EDR’s database search identified no sites within the Project Area boundary. A total of 24 sites were identified that had insufficient electronic geo-referencing to be plotted. These sites, called orphan sites, were identified in the database because they are located within the same ZIP codes or counties as those of the Project Area. The majority of these sites were listed as ASTs/USTs with no reported releases or state registered landfills with no documented violations. Descriptions of the orphan site database findings, including which database was the source of the finding, are provided in the EDR radius report (Appendix A). During the site visit, it was noted that none of the 24 orphan site listings have addresses located within the Project Area boundary. Descriptions of all the databases searched are provided in the EDR radius report in Attachment A and an additional summary is presented below.

Federal Standard

- CERCLIS: CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA). CERCLIS contains sites which are either proposed to be or are on the NPL, and sites which are in the screening and assessment phase for possible inclusion on the NPL. A review of the CERCLIS list, as provided by EDR, did not identify any facilities within the search distance radius.
- CERCLIS-No Further Remedial Action Planned (NFRAP): As of February 1995, CERCLIS sites with a designation of “NFRAP” have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or contamination was not serious enough to require federal Superfund action or NPL consideration. A review of the CERCLIS-NFRAP list, as provided by

EDR, has revealed that there are no CERCLIS-NFRAP listed facilities within the searched radius.

- **National Priority List (NPL):** Also known as Superfund, the NPL database is a subset of the Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) and identifies over 1,200 sites for priority cleanup under the Superfund program. The United States Environmental Protection Agency (USEPA) is the source of this database. A review of the NPL listings, as provided by EDR, has revealed that there are no NPL listed facilities within the searched radius.
- **Emergency Response Notification System (ERNS):** ERNS records and stores information on reported releases of oil and hazardous substances. USEPA is the source of this database. A review of the ERNS list, as provided by EDR, has revealed no ERNS data within the searched radius.
- **RCRA Corrective Action Sites (CORRACTS):** CORRACTS lists the hazardous waste handlers with Resource Conservation and Recovery Act (RCRA) corrective action activity. A review of the CORRACTS list, as provided by EDR, has revealed that there are no geo-referenced sites listed in the CORRACTS database.
- **RCRAInfo:** RCRAInfo is EPA's comprehensive information system, providing access to data supporting the RCRA of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS). A review of the RCRAInfo database revealed that there are no geo-referenced RCRA sites within the searched radius.
- **Federal IC/EC:** The IC/EC list sites that have either engineering controls or institutional controls. The contaminated media and the type of control implemented are also included in the data. A review of the Federal IC/EC database revealed that there are no IC/EC sites within the searched radius.
- **Delisted from NPL:** The National Oil and Hazardous Substance Pollution Contingency Plan (NCP) establishes the criteria that the USEPA uses to delete sites from the NPL. In accordance with 40 Code of Federal Regulations (CFR) 300.425 (e), sites may be deleted from the NPL where no further response is appropriate. A review of the database revealed that there were no delisted NPL sites within the search radius.
- **U.S. Brownfields:** Included in the Brownfields Sites listing maintained by the USEPA are Brownfields properties addresses by cooperative agreement recipients and Brownfields properties addressed by targeted Brownfields

assessments. USEPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities – especially those without USEPA Brownfields Assessment Demonstration Pilots – minimize the uncertainties of contamination often associated with Brownfields. A review of the database revealed that there were no US Brownfield areas within the search radius.

State Standard

- **Solid Waste Facilities/Landfill (SWF):** SWF-type records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. Depending on the state, these may be active or inactive facilities, or open dumps that failed to meet RCRA Subtitle D Section 4004 criteria for solid waste landfills or disposal sites. The database search indicated that there are no landfills within the search radius of the Project Area. Eleven [11] solid waste landfills (SWLs) were listed as orphan sites. Addresses for all of these sites showed them to be located in the City of Laramie and outside the search radius.
- **Leaking Underground Storage Tank Database (LUST):** LUST is an inventory of reported leaking petroleum storage tank incidents. A review of the LUST list, as provided by EDR, has revealed that there are no LUST facilities within the search radius of the site. Two [2] LUST sites were listed as orphan sites and based upon address information, are located more than 20 miles to the south in the City of Livermore, Colorado.
- **Underground Storage Tank (UST):** The UST database contains registered USTs. USTs are regulated under Subtitle I of RCRA. A review of the database revealed that there are no UST facilities within ¼-mile of the searched area. Three [3] UST facilities were listed as orphan sites. These facilities are located in the City of Laramie and outside the search radius.
- **Aboveground Storage Tank (AST):** The data in the AST database are from the TCEQ. A review of the AST list, as provided by EDR, has revealed that there are no geo-referenced AST facilities within the search radius of the LWP site. One [1] orphan AST site was identified, but it is located in the City of Laramie and outside the search radius.
- **Voluntary Cleanup Program (VCP):** The VCP sites database lists sites involved in a voluntary remediation program. A review of the VCP database revealed that there are no listed VCP sites within the searched radius.

3.2 Additional Environmental Record Sources

State Record Sources

Wyoming Department of Environmental Quality

On March 30, 2009, E & E contacted the Wyoming Department of Environmental Quality (WDEQ) in Cheyenne, Wyoming to obtain any known information in connection with the Project Area, regarding reported violations, hazardous substances, reported spills, and registered UST/ASTs. Correspondence was conducted via e-mail with Ms. Laura Laughlin, Executive Secretary, WDEQ (Appendix D). E & E was informed that WDEQ does not have an automated filing system and that a file search could only be conducted on-site in their office in Cheyenne, Wyoming. Given the absence of evidence to suggest a release had occurred and difficulties experienced in the past in trying to conduct meaningful reviews of agency files that are not organized, it was determined that a review of this data was not practical. E & E did, however, contact the WDEQ UST Department via telephone to obtain any known information in connection with the Project Area, regarding registered USTs. E & E interviewed Mr. Bob Lucht, of the WDEQ UST Program. Mr. Lucht was only aware of one site in proximity to the Project Area, in Tie Siding, Wyoming that had undergone remediation in the past for leaking gasoline USTs. This site is located adjacent to the northern Project Area boundary at the west side of the intersection of Rte. 287 and Hermosa Road (Rte. 222). A photograph of the site is provided in Appendix C and the site is located near Point # 22 (Photograph #25) in Figure 4. According to Mr. Lucht, the site had three 1,000-gallon capacity gasoline USTs, which were installed January 1, 1963 and removed from the ground on March 31, 1990. The WDEQ Facility ID number for the site is #0-000834 and it is owned by Ms. Glow E. Serrano, P.O. Box 61, Tie Siding, Wyoming. All three tanks were of steel construction with steel lines. The site was closed June 27, 1990 and is documented as “permanently out of use”. E & E was informed by Mr. Lucht that the tanks leaked gasoline into the fractured granite subsurface, and that the site had undergone remediation. Five monitoring wells were installed and a drinking water well on-site was reported to have been impacted. Mr. Lucht stated that the State of Wyoming assumes all responsibilities for cleanup, as long as the necessary fees were paid by the facility owner. According to Mr. Lucht, the owner, Ms. Serrano, was currently in good standing with the WDEQ and there were no reported violations or outstanding fees as of March 30, 2009. Mr. Lucht noted that contaminants from the Tie Siding UST site had been detected in a drinking water well at the site. Mr. Lucht provided copies of available documents from the WDEQ, which are provided in Appendix D.

Because this site has undergone remediation under the WDEQ UST Program, it is considered to be de minimis and does not constitute a recognized environmental

condition. Mr. Lucht was unaware of any other sites in the vicinity of the Project Area that would be of any environmental concern.

Additionally, on August 6, 2009, E & E contacted Mr. Lucht regarding a potential railcar spill within the Project Area. He informed E & E that it is very unlikely that the WDEQ has spill information records for an incident that occurred in 1979. This potential spill is discussed in detail below in Section 3.3.

Wyoming Oil and Gas Commission

On May 4, 2009 E & E accessed the internet database of the Wyoming Oil and Gas Commission (WOGC) concerning oil wells in the vicinity. Two wells were identified. Both of these wells were located more than one mile northwest of the Project Area and have been plugged and abandoned, according to the WOGC (Appendix D). The well names are Klink and Meary 1 and were plugged and abandoned in 1950 and 1961, respectively, with no reported releases or violations.

3.3 Local Record Sources

Local Fire Department

On March 23, 2009 and on March 30, 2009, Mr Joseph Grieser of E & E contacted the Albany County Fire Warden, Mr. Scott Davis, via telephone regarding department responses to any fires, chemical spills, or other incidents within the Project Area vicinity. Mr. Davis was unaware of any chemical spills or other incidents in the vicinity of Tie Siding or Hermosa, Wyoming and provided E & E with the number to contact Mr. Ernie Rowe, Volunteer Fireman of Tie Siding, Wyoming.

Mr. Grieser of E & E contacted Mr. Ernie Rowe of the Tie Siding Volunteer Fire (department) via telephone on March 30, 2009. Mr. Rowe has been a resident of the area for more than 20 years and has worked for Tie Siding Volunteer Fire for more than 10 years. According to Mr. Rowe, the fire department responded to a fire in the vicinity of the Project Area in January of 2009. The fire involved a rail switch heater and a pile of rail road ties near the Town of Hermosa. During the site visit, E & E observed a pile of rail road ties near Hermosa and outside of the Project Area boundary. No evidence of the aforementioned fire was observed within the Project Area boundary. According to Mr. Rowe, the local fire department has not responded to any other fires, any chemical spills, or other incidents within the Project Area boundary or immediate vicinity. Based upon information gathered while traversing the railroad during the site visit, the incident is not expected to represent a significant environmental concern regarding the client's proposed use of the Project Area.

Local Planning Department

The planning department for Albany County is located in Laramie, Wyoming. E & E contacted the Albany County Planning Department (ACPD) via telephone on March 30, 2009. Ms. Susan Adler of the ACPD office informed E & E that any files, building permits, and/or violations regarding properties within the vicinity of Tie Siding and Hermosa would be reviewable in person at their office in Laramie, Wyoming. On May 27th, Mr. Grieser visited the ACPD in order to identify the presence of any AULs associated with the Project Area. No records regarding any addresses located within the Project Area were available or reviewed.

Interview with Landowner / Other Local Resources

On July 31, 2009, E & E was informed by Shell WindEnergy that a spill had occurred along the railroad right of way (ROW) and on the property owned by Nancy Bath. E & E contacted Nancy Bath via telephone on August 5, 2009 regarding the spill. Ms. Bath informed Mr. Grieser of E & E that a train derailment had occurred in 1979 and that solid phosphorus had spilled from at least one railcar and had burned for a few days. The spill occurred near the Project Area boundary, east of Point # 17 and west of the small body of water near Point # 12 in Figure 4 of this report.

E & E was unable to obtain any agency records regarding the spill, including the Cheyenne, Wyoming office of the WDEQ, the National Transportation Safety Board (NTSB) database, and the National Technical Information Service (NTIS) database. E & E contacted Mr. Lucht of the WDEQ, as mentioned above in Section 3.2. E & E also searched the NTIS and NTSB online databases for any rail car derailments or spills that occurred in Wyoming in 1978, 1979, and 1980. No information regarding the 1979 spill information was available with the NTIS or NTSB. However, Ms. Bath was able to provide a newspaper article from the Laramie Boomerang, dated January 24, 1979, and two pages from a sampling report regarding the spill (McCraken 1979). One of the pages from this report is a detailed sampling map of the spill location and the other is a summary of phosphorus sampling results and mitigation recommendations. A copy of both of these documents is provided in Appendix D. Ms. Bath also provided E & E with the name and contact information of the author of the report. E & E was unable to review the entire report, but was able to interview the author, Mr. Stephen E. Williams, Professor of Soil Biology and Biochemistry at The University of Wyoming. A summary of E & E correspondence with Mr. Williams is provided in the following pages.

On January 22, 1979, a Union Pacific Railroad train derailed at milepost 545 near a water reservoir on the property owned by both Union Pacific and Nancy Bath. This derailment involved between 25 and 30 rail cars. Three of the derailed cars were tank cars carrying white powdered elemental phosphorus. Two of the tank cars carrying the phosphorus were breached and the contents were spilled. One of

the tank cars remained intact and the contents were not spilled. Each of the breached cars were carrying approximately 13,000 gallons of phosphorus, according to the Laramie Boomerang newspaper. One of the cars was breached upon derailment, and the other was breached with explosives by a demolition team from Ft. Bliss, in order to cause the phosphorus to spill out of the tank car and burn away quickly. The tank cars were operated by Union Pacific and the phosphorus was owned by Monsanto, according to Mr. Williams. Most of the phosphorus burned upon contact with the atmosphere, and continued to burn for a few days, according to Mr. Williams and Ms. Bath (Bath 2009, Williams 2009).

Elemental phosphorus quickly oxidizes to non-combustible phosphates upon exposure to oxygen. According to the aforementioned report, elemental phosphorus posed no threat to nearby water supplies, and would not migrate from the surface horizon without becoming oxidized to phosphates. Phosphates, in high concentration, lower the pH of the soil medium to acidic levels, potentially affecting nearby water bodies downstream. During the spill incident, a containment ditch and temporary dams were created to control the spread of the spilled material, according to both the 1979 sampling report and the Laramie Boomerang (Appendix D, McCracken 2009). Results of sampling showed that phosphates existed in high concentrations near the center of the derailment site, west of and up-gradient relative to the reservoir. The average pH of the surface soil with elevated levels of phosphates was 6.125. The sampling report also concluded that phosphates were moving slowly out of the surface horizon, but that this could be mitigated by liming the soil to near pH 8.0 with the application of approximately 12,000 pounds of calcium carbonate per acre. A copy of the report recommendations is provided in Appendix D.

On August 17, 2009, E & E contacted Mr. Williams via telephone regarding the spill and the sampling report. According to Mr. Williams, the report was prepared in cooperation with Dr. P. L. Stageman, Environmental Engineer of Union Pacific railroad. There was also interaction with a WDEQ geologist, named Mr. Tony Mancini, during the preparation of the sampling report. Mr. Williams was informed by Union Pacific that the affected soil had been limed according to the sampling report recommendations. During a follow up conversation with Mr. Williams on August 24, 2009, he reported that he had visited the site more than 13 years ago and found no obvious signs of elemental phosphorus at the spill site. He also mentioned that the nearby pond, or reservoir, located immediately east of the spill site, showed no signs of eutrophication and that the pond was populated by fish and other biota (Williams 2009).

Based upon the ability of elemental phosphorus to readily oxidize to phosphates, involvement of the local regulatory agency (WDEQ), the results of post-spill sampling, the mitigation activities conducted during and after the spill (liming of the site, trenching, etc.), the amount of time passed since the spill occurred, and in-

formation obtained during interviews; the January 22, 1979 phosphorus spill has been determined to be a de minimis condition that does not present a threat to human health or the environment and that it would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies at this time. As such, it is not considered a *recognized environmental condition*.

3.4 Physical Setting Sources

Topographic data was obtained from the current USGS 7.5-minute topographic maps (see Figure 2) showing the site and surrounding area. E & E identified two mines located outside the Project Area boundary on the topographic map. Both mines were located to the east of Route 287 on the map, and were not located during the site visit. According to maps provided by Environmental Data Resources, Inc., a fault line crosses the western portion of the Project Area in a north-south direction, parallel to the mountainous area immediately west of the Project Area.

3.5 Fire Insurance Maps

Given the rural nature of the site and land within the Project Area boundary, Sanborn Fire Insurance maps were not available for any lands located within the Project Area.

3.6 User Provided Information

Title Records

No title records were provided to E & E to review.

Environmental Liens Records

There were no records concerning environmental liens provided to E & E and an environmental lien search was not requested by the client.

Specialized Knowledge of the Property

There was no specialized knowledge of the property provided to E & E by the client.

Other Records

A map of six landowners, in addition to State of Wyoming was provided to E & E by Shell WindEnergy Inc. This map is provided in Appendix B. In addition, E & E was informed by Shell WindEnergy on July 31, 2009 that a potential spill had occurred along the railroad on the property owned by Nancy Bath. This spill was discussed above in Section 3.3 of this report.

4

Site Reconnaissance

4.1 Exterior Observations

Site reconnaissance of the Project Area was conducted by Mr. Joseph K. Grieser of E & E in order to obtain information indicating the likelihood of recognized environmental conditions as specified in ASTM Standard Practice E1527-05 Sections 8.4.2, 8.4.3 and 8.4.4. The observations made during the site visit discussed in this section covered those areas of the Project Area accessible and/or observable from existing roads, areas of potential concern identified in state and local records, areas identified by local agency review and/ or interviews, and areas identified as suspect during the database review (Appendix A). A windshield survey was conducted in order to ground-truth the information obtained during the desktop studies. The windshield survey covered all county roads and several private roads, drives, and trails within the Project Area. In addition, E & E traversed the full extent of the stretch of railroad bisecting the northern portion of the Project Area. All areas mentioned below are photographically documented in Appendix C and mapped as numbered GPS points in Figure 4. The survey revealed the following:

- Aboveground Storage Tanks (ASTs): Two (2) propane tanks were observed in the Project Area. One was observed at near a rail switch in “Dale Junction” along the railroad at Point # 16 (Photograph #17, #18, and #19) in Figure 4 and next to a cellular telephone tower at Point # 25 (Photograph #27 and #28). No evidence of a release was observed at either of these tanks.

E & E observed an AST used for water storage and cattle grazing operations. This water filled AST was located at Point # 20 (Photograph #23).

E & E observed a diesel fuel trailer/tanker, which was parked next to quarrying equipment near Point # 18 (Photograph #21 and #22). This portable petroleum container was not observed closely, due to on-going quarrying activities. However, based upon the portable and temporary nature of the tanker, it is not expected to represent a significant environmental concern.

- Debris, drums, containers and scrap: A pile of trash and debris, empty barrels/containers, empty 55-gallon drums, metal conduits, wire, appliances,

4. Site Reconnaissance

abandoned farm equipment, and scrap metal was observed during the site visit at Point # 29 (Photograph #32, #33, #34, #35, and #36) on property owned by Gene and Marylynn Fischer, within the Project Area. The debris was piled in a ditch along an access road. Three unmarked empty drums and one empty pesticide drum were observed in this pile. In addition, several empty containers and metal buckets were observed. However, no odors, staining of the ground, stressed vegetation, or evidence of a past release was observed in this area. Photographs of this pile are provided in Appendix C. Based upon these observations and the lack of evidence of a significant release, the presence of the trash pile is not expected to represent a significant environmental concern. However, it does represent a general housekeeping concern and a physical hazard.

E & E observed several five-gallon cans within the Project Area. Two full containers were observed next to the railroad at Point # 14 (Photograph #16) on a palette. The unmarked contents were presumed to be switch oil for railroad operations. No staining of the ground, stressed vegetation, odor of petroleum, or evidence of a release or product mishandling was observed. In addition, several empty cans of similar appearance were observed at Point # 17 (Photograph #20). No staining of the ground, stressed vegetation, odor of petroleum, or evidence of a release was observed. The empty cans appeared to have been discarded next to the railroad after being emptied. Based upon these observations and the lack of evidence of a significant release, the presence of the containers is not expected to represent a significant environmental concern.

- Oil and Gas Facilities: As discussed in Section 2.3 above, three (3) natural gas pipelines transect the Project Area. In addition, one pipeline follows the Project Area boundary along Route 287 in Tie Siding (Photograph #40). Photographic documentation is provided in Appendix C. No evidence of a release from these pipelines was observed during the site visit. In addition, no oil or gas wells were identified or observed within the Project Area.
- Railroad ROW: E & E traversed the entire portion of the railroad ROW that passes through the Project Area and all portions immediately adjacent to the Project Area. E & E did not observe any signs of a past release or spill along the ROW within the Project Area.
- Electrical or Mechanical Equipment Likely to Contain Fluids: Nine (9) pole-mounted transformers were observed within or adjacent to the Project Area. Two of the transformers are shown in Photograph #19. Toxic polychlorinated biphenyls (PCBs) were commonly used historically in electrical equipment such as transformers, lamp ballasts, and capacitors. Pursuant to U.S.C 2605(e)(2)(A), the manufacture, process, or distribution in commerce or use of

4. Site Reconnaissance

any PCB in any manner other than in a totally enclosed manner was prohibited after January 1, 1977. The observed transformers are not known to be PCB containing and appeared to be in good condition. No spills, staining or leaks were observed on or around any of the transformers. Based upon the condition of the equipment and observations, the presence of the transformers is not expected to represent a significant environmental concern.

E & E did not observe any evidence of corrosion; strong, pungent or noxious odors; pools of unidentified liquid; drains, sumps or clarifiers; pits, ponds (other than naturally occurring) and lagoons; stressed vegetation or stained soil; waste water discharges; wells; evidence of septic systems; or evidence of fill materials.

4.2 Interior Observations

Structures and buildings associated with farming, ranching, and railroad operations were observed within the Project Area boundaries. These structures were not accessed by E & E personnel during field observations.

5

Conclusions

E & E has performed an ESA in general conformance with the scope and limitations of ASTM Practice E1527-05 for the Shell WindEnergy Inc. Hermosa Project Area in Albany County, Wyoming; proposed for the development of a wind energy facility. This assessment has revealed no evidence of recognized environmental conditions (RECs) in connection with the proposed use of the Project Area to be developed by Shell WindEnergy Inc.

Signature and Qualifications of Environmental Professional Conducting Site Assessment

7.1 Signature of Environmental Professional

Mr. Joseph K. Grieser of E & E prepared this site assessment report under the direction of Mr. Joseph Forti, the senior reviewer. By signing this report, the senior reviewer declares that, to the best of his or her professional knowledge and belief, he or she meets the definition of *Environmental Professional* as defined in 40 CFR Part 312, Section 312.10.

Joseph K. Grieser

Date

7.2 Statement of Assessor's Qualifications

Mr. Forti is an environmental scientist with over 20 years' experience conducting site assessments and regulatory compliance audits to support property transfers, site remediation, and environmental program management. He has performed audits at industrial plants, hospitals, military installations, power plants, and brown-field sites.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

FEDERAL RECORDS

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 09/29/2008	Source: EPA
Date Data Arrived at EDR: 10/10/2008	Telephone: N/A
Date Made Active in Reports: 11/19/2008	Last EDR Contact: 01/26/2009
Number of Days to Update: 40	Next Scheduled EDR Contact: 04/27/2009
	Data Release Frequency: Quarterly

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991	Source: EPA
Date Data Arrived at EDR: 02/02/1994	Telephone: 202-564-4267
Date Made Active in Reports: 03/30/1994	Last EDR Contact: 02/16/2009
Number of Days to Update: 56	Next Scheduled EDR Contact: 05/18/2009
	Data Release Frequency: No Update Planned

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 10/07/2008	Source: EPA
Date Data Arrived at EDR: 10/16/2008	Telephone: 703-412-9810
Date Made Active in Reports: 12/08/2008	Last EDR Contact: 01/30/2009
Number of Days to Update: 53	Next Scheduled EDR Contact: 04/13/2009
	Data Release Frequency: Quarterly

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Date of Government Version: 12/03/2007	Source: EPA
Date Data Arrived at EDR: 12/06/2007	Telephone: 703-412-9810
Date Made Active in Reports: 02/20/2008	Last EDR Contact: 03/16/2009
Number of Days to Update: 76	Next Scheduled EDR Contact: 06/15/2009
	Data Release Frequency: Quarterly

LIENS 2: CERCLA Lien Information

A Federal CERCLA ('Superfund') lien can exist by operation of law at any site or property at which EPA has spent Superfund monies. These monies are spent to investigate and address releases and threatened releases of contamination. CERCLIS provides information as to the identity of these sites and properties.

Date of Government Version: 11/20/2008	Source: Environmental Protection Agency
Date Data Arrived at EDR: 12/23/2008	Telephone: 202-564-6023
Date Made Active in Reports: 03/16/2009	Last EDR Contact: 03/03/2009
Number of Days to Update: 83	Next Scheduled EDR Contact: 05/18/2009
	Data Release Frequency: Varies

CORRACTS: Corrective Action Report

CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

Date of Government Version: 09/11/2008	Source: EPA
Date Data Arrived at EDR: 09/19/2008	Telephone: 800-424-9346
Date Made Active in Reports: 10/16/2008	Last EDR Contact: 03/03/2009
Number of Days to Update: 27	Next Scheduled EDR Contact: 06/01/2009
	Data Release Frequency: Quarterly

RCRA-TSDF: RCRA - Transporters, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 11/12/2008
Date Data Arrived at EDR: 11/18/2008
Date Made Active in Reports: 03/16/2009
Number of Days to Update: 118

Data Release Frequency: Quarterly

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

Date of Government Version: 11/12/2008
Date Data Arrived at EDR: 11/18/2008
Date Made Active in Reports: 03/16/2009

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

Date of Government Version: 11/12/2008
Date Data Arrived at EDR: 11/18/2008
Date Made Active in Reports: 03/16/2009
Number of Days to Update: 118

Last EDR Contact: 03/25/2009
Next Scheduled EDR Contact: 05/18/2009
Data Release Frequency: Varies

RCRA-NonGen: RCRA - Non Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

Date of Government Version: 11/12/2008

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

US ENG CONTROLS: Engineering Controls Sites List

A listing of sites with engineering controls in place. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health.

Date of Government Version: 10/06/2008	Source: Environmental Protection Agency
Date Data Arrived at EDR: 10/17/2008	Telephone: 703-603-0695
Date Made Active in Reports: 12/08/2008	Last EDR Contact: 12/29/2008
Number of Days to Update: 52	Next Scheduled EDR Contact: 03/30/2009
	Data Release Frequency: Varies

US INST CONTROL: Sites with Institutional Controls

A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

Date of Government Version: 10/06/2008	Source: Environmental Protection Agency
Date Data Arrived at EDR: 10/17/2008	Telephone: 703-603-0695
Date Made Active in Reports: 12/08/2008	Last EDR Contact: 12/29/2008
Number of Days to Update: 52	Next Scheduled EDR Contact: 03/30/2009
	Data Release Frequency: Varies

ERNS: Emergency Response Notification System

Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

Date of Government Version: 12/31/2007	Source: National Response Center, United States Coast Guard
Date Data Arrived at EDR: 01/23/2008	Telephone: 202-267-2180
Date Made Active in Reports: 03/17/2008	Last EDR Contact: 01/30/2009
Number of Days to Update: 54	Next Scheduled EDR Contact: 04/19/2009
	Data Release Frequency: Annually

HMIRS: Hazardous Materials Information Reporting System

Hazardous Materials Incident Report System. HMIRS contains hazardous material spill incidents reported to DOT.

Date of Government Version: 09/30/2008	Source: U.S. Department of Transportation
Date Data Arrived at EDR: 10/16/2008	Telephone: 202-366-4555
Date Made Active in Reports: 11/19/2008	Last EDR Contact: 01/30/2009
Number of Days to Update: 34	Next Scheduled EDR Contact: 04/13/2009
	Data Release Frequency: Annually

DOT OPS: Incident and Accident Data

Department of Transportation, Office of Pipeline Safety Incident and Accident data.

Date of Government Version: 05/14/2008	Source: Department of Transportation, Office of Pipeline Safety
Date Data Arrived at EDR: 05/28/2008	Telephone: 202-366-4595
Date Made Active in Reports: 08/08/2008	Last EDR Contact: 02/24/2009
Number of Days to Update: 72	Next Scheduled EDR Contact: 05/25/2009
	Data Release Frequency: Varies

CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Date of Government Version: 07/01/2008
Date Data Arrived at EDR: 10/31/2008

Next Scheduled EDR Contact: 03/23/2009
Data Release Frequency: Quarterly

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Date of Government Version: 10/01/2008
Date Data Arrived at EDR: 11/14/2008
Date Made Active in Reports: 12/23/2008

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

CO TRUST: Lust Trust Sites

Reimbursement application package. The 1989 Colorado General Assembly established Colorado's Petroleum Storage Tank Fund. The Fund reimburses eligible applicants for allowable costs incurred in cleaning up petroleum contamination from underground and aboveground petroleum storage tanks, as well as for third-party liability expenses. Remediation of contamination caused by railroad or aircraft fuel is not eligible for reimbursement. The Fund satisfies federal Environmental Protection Agency financial assurance requirements. Monies in the Fund come from various sources, predominantly the state environmental surcharge imposed on all petroleum products except railroad or aircraft fuel.

CO AUL: Environmental Real Covenants List
Activity and use limitations include both engineering controls and institutional controls. The Colorado Department of Public Health and Environment to approve requests to restrict the future use of a property using an enforceable agreement called an environmental real covenant. When a contaminated site is not cleaned up completely, land use restrictions may be used to ensure that the selected cleanup remedy is adequately protective of human health and the environment.

CO UMTRA: Uranium Mill Tailings Sites

There were nine uranium mill tailings sites in Colorado designated for cleanup under the federal Uranium Mill Tailings Radiation Control Act. These nine sites, know commonly as UMTRA sites, were remediated jointly by the State of Colorado and the U.S. Department of Energy during the late 1980's and early 1990's. Mill tailings were removed from 8 of the mill sites and relocated in engineered disposal cells. A disposal cell is designed to encapsulate the material, reduce radon emanation, and prevent the movement of water through the material. At one site, Maybell, CO, the tailings were stabilized in-place at the mill site. After remediation of the tailings was completed, the State and DOE began to investigate the residual impacts to groundwater at the mill sites. The groundwater phase of the UMTRA program is on-going.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR PROPRIETARY RECORDS

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

NY MANIFEST: Facility and Manifest Data

Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a TSD facility.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.
Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

Source: National Institutes of Health
Telephone: 301-594-6248

Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools

Source: National Center for Education Statistics
Telephone: 202-502-7300

The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Subject: RE: Open Records Search
RE: Freedom of Information Request

Dear Mr. Grieser:

Per your request, all files in the Wyoming Department of Environmental Quality (DEQ) are open to the public unless they are found to be confidential under W.S. 35-11-1101. However, we do not have a method to rapidly retrieve information on companies, individuals or particular subjects. Very little of our data is automated. You or your representatives may search our files, and our office will make the appropriate arrangements, including provisions for copying documents. You may contact the UST Program at 307-777-7095 to schedule this. Absent such an arrangement we are unable to provide the information you have requested.

Sincerely,

Laura Laughlin, Executive Secretary

Subject: Open Records Search

To whom it may concern,

I would like to know the preferred method of how to make an open records search with your agency. I am interested in finding any spill/release/leaking UST/reported violations information regarding a large area of land southeast of Laramie, WY.

Please let me know how to proceed.

Thank you. Respectfully,

Joseph K. Grieser

Subject: RE: Past Railroad Spill

I doubt very much that this department has any record of a spill in 1979. The department was set up in 1975, and until very recently, there was no centralized database of spills of any kind. Even records from two years ago are not in any form that can be easily accessed.

Nancy,

Do you know who did the sampling and wrote the report that you have sent part (map plus one page of recommendations) of to me? Any more information about the report would be greatly appreciated, as I was unaware that any sampling had occurred. Also, do you have a copy of the whole report?

Please let me know.

Respectfully,

Joe

Follow Up Flag: Follow up
Flag Status: Red

Joe:

Here is information and the contact information you requested regarding the work I did on the 1-22-1979 phosphorus spill at Tie Siding (Mile Post 545).

First, there were two tank cars of white, elemental phosphorus involved in the incident.

Second, the person I dealt with the most was with Union Pacific out of their Omaha Office, although I also worked with one of their legal experts too.

Dr. P. L. Stageman (Phillip)
Environmental Engineer
Union Pacific railroad
1416 Dodge Street
Omaha, Nebraska 68102

I do not have a phone number for Dr. Stageman.

C. Barry Schaefer
V.P.- Law
Same address as Stageman.

Third, I worked also with Darrell Detterling in the UP Cheyenne office. I do not have an address for him but his phone number then was 307-634-4421.

Fourth, there was some interaction with DEQ through a Geologist with them named Tony Mancini. I have no contact information for him.

Fifth, my recollection is that someone did treat the areas with lime according to my recommendations fairly shortly after I completed my study. I did not witness this treatment, but I recall an individual from UP indicating they had followed up on this and done the treatment.

Lastly, I really cannot say with much certainty or credibility as to the disposition of elemental phosphorus or phosphates at the milepost 545 site, since I have not done any analysis of the site since the original work done in 1979.

It would be fairly straight forward to revisit the site, take some soil samples (including subsurface samples) and determine phosphates and pH. Determination of elemental phosphorus would be a little more involved, but Monzanto, who owned the elemental P involved in the incident, did the elemental P analysis and it is likely they still do this sort of analysis.

I wish I could provide email addresses or even FAX numbers for the individuals above, but this work was done before either of these modes of communication had come into usage.

DENSE WHITE SMOKE continues Tuesday evening to pour from the scene of a Union Pacific freight train derailment near Tie Siding. Investigating and cleanup crews are waiting for the blaze to burn itself out so that the cause of the derailment may be determined and the tracks—along one of the UP's major

transportation arteries—cleared. Demolition experts Tuesday morning blew a hole in one end of a tank still burning, in hopes of dissipating the chemical and allowing it to burn more quickly so track clearing and repair operations may begin.

(Boomerang photo by Stoesz)

Carter Calls for 'New Foundations'

WASHINGTON (UPI) — President Carter said Tuesday Americans are enjoying greater prosperity than ever but must build "a new foundation" for the 21st century by beating inflation and supporting a new U.S.-Soviet SALT accord.

In his second State of the Union address, Carter said inflation can be controlled without recession and promised he will only sign a strategic arms pact that leaves the United States with "overwhelming" nuclear strength.

Assembled in joint session for the annual, nationally televised pageant, Congress gave the president the customary, long standing ovations as he entered and left the House chamber, and interrupted him about 25 times to applaud his 33 minute address.

He marked the halfway point of his presidency with a speech devoted more to inspirational passages than specific proposals—except for hard assurances on SALT treaty terms—and departed only occasionally from the text he had been moulding for weeks with White House advisers.

One ad-lib, however, provoked one of the longest and loudest bursts of applause, when he rounded out a promise to control inflation by adding, "That's our most important domestic issue, and we must do it together."

Early reaction was predictably mixed and much of it appeared geared more in response to the pared-down, \$31.6 billion federal budget proposal Carter announced Monday than to the State of the Union address.

Rep. John Brademas of Indiana, the House Democratic whip, reflected the view of Carter's congressional allies in saying his speech "concretely sets forth the major problems of the nation and outlines the difficult course we must pursue to reach our twin goals of peace and prosperity."

But House Republican Leader John Rhodes called the speech "a non-message" that failed to address specific issues, and Senate Republican Leader Howard Baker offered only faint praise, saying, "It wasn't the most inspiring speech I ever heard, but it probably wasn't the worst."

Sen. William Roth, R-Del., hit harder for the opposition. "Carter's 'New Foundation' is built on economic quicksand," he said. "He talks less government while promising more."

With Mrs. Carter and daughter Amy looking on from the gallery, the president reviewed familiar policy positions and repeatedly stressed one inspirational slogan—"building a new foundation"—as if he hoped to make it the hallmark phrase of his presidency.

Carter said that foundation must be anchored on "a strong economy with lower inflation" and no recession at home, and on U.S.-Soviet nuclear disarmament agreements abroad.

And he told Americans that, despite the woes of inflation and a decade of social upheavals, many of them have never had it so good.

"Tonight, there is every sign that the state of our Union is sound," he said. "Our economy offers greater prosperity to more of our people than ever before."

"Real per capita income and real business profits have risen substantially. Farm exports are setting all-time records, and farm income last year was up more than 25 percent."

"Our liberties are secure. Our military defenses are strong and growing stronger. And more importantly tonight, America is at peace."

Saying American society faces "more subtle, more complex" challenges now than the meat-and-potatoes economic and social issues of the past, he said:

"The challenge to us is to build a new and firmer foundation for the future—for a sound economy, for a more effective government, for political trust, and for a stable peace—so that the America our children inherit will be even stronger and better than our own."

Surprisingly, Carter devoted more time to drumming up support for the prospective U.S.-Soviet SALT II accord than he did discussing the specific economic issues now troubling Americans. But he hit the inflation issue first and hard.

Explosives Used at Derailment Site

by Mike McCracken
 Boomerang Staff Writer

An Army demolition team Tuesday morning blew a hole in a burning railroad tank car of phosphorous derailed southeast of Tie Siding in an effort to speed the dissipation of the chemical, on fire since the accident occurred early Monday.

Union Pacific tracks, part of a corridor running from Idaho to

Nebraska, have remained completely blocked by an estimated 25 to 30 of the derailed cars.

Thick smoke and fumes and the possibility of explosion from seven propane gas tanks in the vicinity have kept investigating and cleanup crews at bay and prevented an accurate estimation of the number of cars involved and the damage caused by the accident.

Railroad crews early Tuesday morning prepared a trench to catch the burning phosphorous—used in making military smoke bombs—released by the detonation.

Carried in a tank car and covered with a layer of water, the granular phosphorous leaked from the ruptured tanker, spreading flames and smoke along the steep embankment at the side of the accident scene.

There was confusion Monday as to how many of the three tankers carrying the chemical were actually on fire, but it was discovered Tuesday that two of the cars—each carrying 12,000 gallons of phosphorous—had been ruptured.

Phosphorous burns upon contact with the air, and railroad officials said around the chemical leaked off after the tanks were ruptured, the fire started.

The two-person demolition team, from Ft. Bliss, Tex., used three pounds of plastic explosives to form a shaped charge used to blow open the unruptured end of the tank car still burning, so the phosphorous would spill into the prepared ditch and burn more quickly.

The two-person team, headed by Lt. Debbie Magee and also including Spec. 4 Dale Gjerming, approached the derailment site wearing gas masks to prevent breathing the irritating fumes.

They detonated the explosives from a distance of one mile, and according to United Press International wire reports, an observer about two miles from the scene said the explosion sounded like a whoosh of wind.

Speed Limit Legislation Clears Second Hurdle

By E.T. McCLANAHAN
 CHEYENNE, Wyo. (UPI) — Legislation to defy the federal government and raise Wyoming's speed limit to 65 mph passed another hurdle in the Senate Tuesday and exuberant supporters began talking about a groundswell of support from other Western states.

The measure received initial ap-

proval Monday on a 16-13 vote, won second-reading approval Tuesday and was scheduled for final consideration in Wednesday's session.

The chief backer of the bill, Sen. Cal Taggart, said it should gain even more support before Wednesday's roll-call vote. Sixteen votes are needed for final approval in the 30-member Senate.

"We've been on the phone all day

today (Tuesday) with about every state in the union," Taggart said. "They say they're 100 percent behind it."

Taggart said he has received calls from officials and lawmakers in Washington state, California, Oklahoma and New Mexico. The Republican from Lovell, Wyo., a small town in Wyoming's Big Horn Basin, also said he had been interviewed by newsmen from Idaho, California and had spoken to talk-show hosts in Chicago, Los Angeles and New York.

Sen. Dick Sedar, D-Natrona, said the bill's chances in the House depend on the support it gains in Wednesday's final Senate vote.

"The chances are better now, though," he said. "They tell me that since this hit the West Coast it's bigger than (Proposition) 13."

Sedar said the initial effort to increase the speed limit began three years ago in a meeting of the National Conference of State Legislators, when Wyoming, Nevada, Oklahoma and Texas attempted to push through a resolution urging Congress to eliminate the ceiling on speed limits.

"I think that after this maybe Washington might begin to get the idea," Sedar said. "If not this year then maybe next year."

The chief obstacle to the proposal is the federal threat of a cutoff of highway funds. In a recent memo to Taggart, a state highway official wrote: "According to federal law, the Secretary of Transportation shall not approve any project in any state which has a maximum speed limit on any public highway greater than 55 mph. Federal funds for fiscal year '79 which would, therefore, be jeopardized are about \$31.7 million." Backers of the bill said the state would sue the federal government if the highway money was cut off.

Although Taggart and Sedar were sketchy about the bill's fate in the House, it will be received coolly by at least one member: House Speaker Warren Morton, a Natrona County Republican.

Herschler's position on the issue has so far been clouded. In a recent news conference, he said he opposed the idea of federal directives but at the same time the thought of losing the state's highway money was "like watching your mother-in-law drive your new Cadillac off a cliff."

Plans Under Way for Chinese Premier's Visit

By HELEN THOMAS
 UPI White House Reporter

WASHINGTON (UPI) — Parts of the Broadway musical "Eubie" and the popular ballet "Rodeo" will be the featured entertainment at the gala planned Monday night in honor of Chinese Vice Premier Teng Hsiao-

The President and Mrs. Carter have requested the special performance at the Kennedy Center following the White House state dinner in honor of Teng and his wife on their first night in Washington.

Producer George Stevens said Tuesday the two performances were selected because they are "good... and each represents a piece of American culture."

Teng is the first Chinese leader from the mainland to visit the United States in 30 years and Stevens was besieged with suggestions on what would best entertain him.

Stevens said there will be other acts besides "Eubie" and "Rodeo" but they have not yet been chosen.

The show will be televised live at 9 p.m. EST by the Public Broadcasting System and will be relayed by satellite to China Monday night or the following day. It will be the first such broadcast from the United States to China.

"Eubie," which will be performed by the Broadway cast, is a musical based on the life of 93-year-old black composer-musician Eubie Blake. It includes blues, gospel music and dance.

For a change of pace, the Robert Joffrey Ballet Company will perform a "brand new" version of "Rodeo."

The glittering Kennedy Center performance will substitute for the East Room entertainment that traditionally follows a state dinner. The Carters and the Tengs will ride to the center — just blocks from the White House — in a motorcade and will sit in the presidential box.

Most other guests attending the black tie dinner will ride buses to the center. One exception is expected to be Richard Nixon, who is likely to be given special transportation.

Winds Rip Midwest

By United Press International

High winds ripped through the nation's midsection Tuesday, stirring up dust clouds in western Texas and pushing a major snow storm into the blizzard-weary Midwest.

The storm dumped up to 10 inches of snow on southeastern Minnesota, now dubbed the land of 10,000 frozen lakes. Up to nine inches covered parts of northern Wisconsin and four inches fell in six hours at Park Falls, Wis.

Chicago, hit with nearly 67 inches of snow this winter, braced for another four inches by Wednesday.

Snow stretched across the Texas Panhandle, through most of Oklahoma and eastern Kansas, into the northern half of the Mississippi Valley and the Upper Great Lakes.

At least two deaths were blamed on the ice-slicked roads of northwest Missouri. One accident involved three tractor-trailer trucks near Liberty in Clay County.

Wind gusts in excess of 40 mph ranged from the Texas Panhandle to southern Kansas and blizzard warnings were issued for those areas. At Texas' Guadalupe Pass, the wind exceeded 70 mph and nearby El Paso was hit by gusts of 60 mph.

School Board To Meet

The Albany County School District Board of Education meets tonight at 7:30 p.m. in the Administration Office Building, 1948 Grand, to consider the following agenda items:

- report on program for special services. Curriculum Coordinator Mack Clark and Director of Special Services Chuck Griffen will present a report on the District's special services, including resource rooms in elementary schools, speech therapists, audio specialists, how students with special needs are identified and how the District meets those needs;
- report from Band Uniform Committee. This committee was formed by the Board earlier this school year and was requested to study the condition of current uniforms for the Laramie High Marching Band, new styles available, and to suggest a plan to replace the uniforms, many 20 to 30 years old;
- resignations and appointments; —audience and communications; —approval of payroll.

House Kills Strike Ban

CHEYENNE, Wyo. (UPI) — A proposed constitutional amendment to ban strikes by public employees and impose stiff fines for violators — a measure backed by a member of the legislative leadership — was defeated Tuesday in the House.

The measure failed by seven votes to receive the required two-thirds majority of 42, but the sponsor, House Speaker Warren Morton, R-Natrona, said he was not surprised at the outcome.

Morton maintained opponents of the measure generally were those who also favored legislation allowing collective bargaining for public employees, and he said they had hurt chances for their own measure by blocking the proposed amendment.

"I think it is rather foolish for the advocates of public negotiation to block this proposal," he said. "I know of many people who will not vote for a public negotiation bill without a constitutional provision against strikes."

Morton's measure would have prohibited public employees from engaging "in any manner in any strike" and also said union representatives could not "direct or otherwise encourage or sanction the involvement of any public employee in any strike."

The proposal would have imposed penalties for violators: employees refusing to work would have faced fines at least equal to one day's pay for each day of violation, and union agents would have been fined an amount equal to the number of workers striking times their average daily salary.

"There were a number of people who said they did not want this incorporated in the constitution," said Rep. Bill Curry, R-Natrona, a retired

educator. "I think it's up to the local authorities whether to put anti-strike clauses in their contracts."

In other action during Tuesday's session, the House:

- Gave preliminary approval to a 100-page "Uniform Condominium Code" by Rep. Walter Urbigkit, D-Laramie.
- Defeated a measure by Rep. Bill Edwards, D-Laramie, to allow examinations for Wyoming high school graduates planning to attend colleges in the state. Current law provides for

automatic admission without examination in in-state high school graduates, and Edwards sought to allow testing for "counseling, advising and placement by the institution." His measure failed on a 30-32 vote.

- Defeated a bill requiring highway patrol pursuit lights to be placed on top of patrol cars. The measure was sponsored by Rep. Esther Eskens, R-Big Horn, who opposed the installation of pursuit lights inside the patrol cars, a practice she said was becoming more prevalent.

Council, Developer Hold Work Session

by Ron Franck
 Boomerang Staff Writer

A recommended policy developed nearly a year ago has come back to haunt the City Council, the City Manager, the City Engineer and a number of local developers.

The policy, which outlined how developers were to reimburse the City for improvements made on undeveloped properties, came under considerable fire from the developers at Tuesday night's City Council work session.

City Manager Frank Hoadley explained that the policy was drawn up and agreed upon by the Council during February 1978, after the City obtained an Economic Development Administration grant for the purpose of constructing curbs, gutters, sidewalks and storm sewers on a portion of Reynolds Street between 18th and 30th Streets, and a portion of 30th Street. The grant covered 85 percent of the cost, while the City provided the remainder.

According to the policy, developers of property abutting Reynolds Street would be required to reimburse the City for 100 percent of the street and sewer improvements. The City, in turn, would purchase land from the developers for the purpose of constructing storm runoff retention ponds.

That's where the carefully planned policy hit a snag.

Developer Paul Greaser, accompanied by attorney Don Prehoda, explained to the Council that it is now necessary for him to construct an elaborate means of channeling storm runoff to a retention pond which is not even with in his development.

At the same time, the development adjacent to Greaser's contains two retention ponds located in such a manner that very little channeling is needed. Greaser feels the situation is entirely inequitable.

Explosives Used

(Continued from Page 1)

UP spokesman Barry Combs told the Laramie Daily Boomerang from his Omaha office Tuesday afternoon that he had been told by Lt. Magee

bccommittee Announced

ing Planning Office in the Albany
any County Courthouse by no-later
sion than Feb. 20.

The vacancy was created by
the recent appointment of
former member Dean Otte to
the Planning Commission to fill
the expired term of rancher
Nat Smith.

The seven-member Zoning
Subcommittee, appointed by
the Planning Commission
more than two months ago, has
been given the task of
developing a draft of a county-
wide zoning plan.

The plan will be used by the
Planning Commission in
preparing a recommendation
on zoning for the Albany
County Board of Com-
missioners, the group with the
ultimate responsibility for
accepting or rejecting the
controversial zoning issue.

Current members of the
committee, appointed at the
Planning Commission's
Monday, Nov. 20 meeting, are:
Chairman Leah Talbott,
Commission member; Vice-
chairman Chuck Bradenburg,
Commission member; L. G.
"Duke" Dueweke, Valley View
resident; Jim Deaver, Albany
County School District
representative; Ted Nelson,
Rock River mayor; and Cary
East Alburn, local attorney and
member of the Brees Field
Airport Board.

that the detonation was "not
particularly loud" nor large.

As a precaution, an am-
bulance had been dispatched to
the scene, and Federal Avia-
tion Administration officials
were alerted to insure that
airways were clear, wire
reports said.

Area ranchers, some of
whom had been evacuated
from the vicinity the day
before by law enforcement
officials fearful that the fumes
from the phosphorous were
toxic, were warned to stay
away from the scene.

Combs said representatives
of the State Department of
Environmental Quality and the
Federal Environmental
Protection Agency were at the
scene for the detonation.

"There's some fire in the
car, but most of it is in the
trench," said Richard Lohr,
UP spokesman, in a wire story.
"It looks like it was suc-
cessful."

Noting that the fire had not
been burning fast enough
before the blast further opened
the ruptured tank car, Lohr
said, "We've got to get our
main line open. It's already be-
closed 24 hours. We've got to
start moving some trains."

But Combs pointed out that
even after the phosphorous is
all burned up, the railroad still
faces an estimated 10 to 12
hours of repair work in getting
damaged tracks ready for use.

Railroad officials have been
unable to determine the extent
of the damage because thick
white smoke from the burning
chemical has shrouded the
scene.

"It's really a function of the
time it will take the fire in the
one car still burning to burn
itself out," Combs said when
asked for a ballpark estimate
on when the tracks might be re-
opened.

"Until we start the process of
rebuilding the line, it is very
difficult to say when we will be
done."

Combs said crews were able

to get close enough to the scene
Tuesday morning to begin
moving some of the cars in-
volved in the derailment out of
the way.

He said 40 to 45 cars of the
original 118-car freight train
were located at the derailment
site, although the smoke
prevented crews from
determining exactly how many
cars were actually derailed.

Immediately after the ac-
cident, the train crew managed
to move more than 70 cars
away from the scene, ac-
cording to Combs. In addition
to the three phosphorous
tankers, the freighter included
empty cars and cars carrying
lumber, coal and di-
ammonium phosphate—a
chemical used in producing
fire retardants for portable fire
extinguishers.

Combs said that the three
phosphorous cars involved at
the fire scene included one
loaded with 25,000 gallons of
the chemical, and two with
13,000 gallons each. It is these
13,000-gallon tankers which
have been burning, he said.

Lohr said that only one of the
three phosphorous cars was on
fire when the demolition team
approached the scene. While
emergency crews had
ascertained that a second car
had already burned completely
out, the status of the third car
could not be determined since
it was obscured by smoke from
the car still burning.

Combs said he has been
receiving hourly reports on the
situation from UP official Joe
McCartney, dispatched to the
scene from the Omaha office,
headquarters for the company.

A spokesman from the DEQ,
William Garland, told UPI
reporters that while the smoke
from the fire could cause
irritation to the eyes and lungs
it is not toxic, as had been
feared by law enforcement
officers who evacuated the
area after the accident oc-
curred at 4:15 Monday morn-
ing.

Figure 3 Map and soil phosphorus survey of derailment of Jan. 22, 1979.

Note: 1 meter = about 1 yard.

Recommendations

1. Elemental P will not migrate from surface horizons without becoming oxidized to PO_4 . Elemental P poses no threat to nearby water supplies.
2. Phosphates (PO_4) exist in high concentrations near the center of the derailment site. There is evidence that these are moving out of surface horizons, but are moving very slowly. It would be a reasonable precaution to assure that PO_4 does not move out of surface horizons. This could be accomplished by liming the soil from its present pH (average 6.125 in contaminated surface soil) to near pH 8.0. Addition of 12,000 pounds $CaCO_3$ per acre to the immediate site would attain this soil pH. The area which should be limed is an area indicated in Figure 3.

Subject: RE: Open Records Search
RE: Freedom of Information Request

Dear Mr. Grieser:

Per your request, all files in the Wyoming Department of Environmental Quality (DEQ) are open to the public unless they are found to be confidential under W.S. 35-11-1101. However, we do not have a method to rapidly retrieve information on companies, individuals or particular subjects. Very little of our data is automated. You or your representatives may search our files, and our office will make the appropriate arrangements, including provisions for copying documents. You may contact the UST Program at 307-777-7095 to schedule this. Absent such an arrangement we are unable to provide the information you have requested.

Sincerely,

Laura Laughlin, Executive Secretary

Subject: Open Records Search

To whom it may concern,

I would like to know the preferred method of how to make an open records search with your agency. I am interested in finding any spill/release/leaking UST/reported violations information regarding a large area of land southeast of Laramie, WY.

Please let me know how to proceed.

Thank you. Respectfully,

Joseph K. Grieser

Order No.: 0008088

Dear Lee Dlug,

GEO Analytical, Inc. received 2 samples on 8/24/00 for the analyses presented in the following report.

Analyses and all data for associated QC met EPA or laboratory specifications except where noted in the Case Narrative.

If you have any questions regarding these tests results, please feel free to call.

RE: Tie Siding - Facility 0-000834

Order No.: 0009002

Dear Lee Dlug,

GEO Analytical, Inc. received 2 samples on 9/1/00 for the analyses presented in the following report.

Analyses and all data for associated QC met EPA or laboratory specifications except where noted in the Case Narrative.

If you have any questions regarding these tests results, please feel free to call.

RE: Underground Storage Tank Notification #0834

Dear Mr. Tucker:

On June 27, 1990, personnel from the Wyoming Department of Environmental Quality/Water Quality Division (WQD) inspected the removal of three underground storage tanks (USTs) from the above referenced site. A copy of the UST Contaminated Site Inspection Form has been attached for your reference. Hydrocarbon contamination was found at the excavation during this inspection. Water samples were collected from the old drinking water well to be analyzed for the presence of hydrocarbons. The water analysis report shows there is hydrocarbon contamination in the groundwater. Both State and Federal regulations require the cleanup of sites contaminated by hydrocarbons.

The Wyoming "Water Pollution from Underground Storage Tanks Corrective Action Act of 1990" established a State fund supported by tank registration fees and a fuel tax to be used to fund corrective action taken at sites contaminated by releases of hydrocarbons from UST's. The corrective action fund can be used to by WQD to investigate the extent of contamination and to clean up contaminated sites.

In order to become eligible for the use of corrective action funds at your site, you must have paid the annual tank registration fee(s) due while the UST's were in use, and your UST system must have been in compliance with the applicable federal requirements. Furthermore, after the UST' have been removed you must continue to pay a \$200 annual Site fee until the cleanup is completed.

Once your eligibility has been established, your site will be placed on a priority list. The State will take corrective action at UST contaminated sites based on a ranking system; the sites posing the greatest risk to public health, safety and welfare or the environment will be addressed first. So you will not be held liable for all investigation and cleanup costs at your site, you must become eligible and remain eligible for the State corrective action program.

Bill Tucker
July 12, 1990
Page 2

If you have not already done so, please complete the enclosed Notification for Underground Storage Tanks form, showing these tanks have been removed from this site, and send the form to the Water Quality Division. Also enclosed is a copy of the original Notification for Underground Storage Tanks form which was completed for this site in 1986. Please refer to this form so you can complete the I.D. Number and Location of Tank(s) sections the same way on the new form.

Your cooperation in properly abandoning this site is appreciated. Please feel free to contact me at (307) 777-5877 if you have any questions.

Sincerely,

David Montague
Groundwater Engineering Evaluator
Water Quality Division

06-27-90 Tie Siding General Store

Tie Siding

Arrived 8:50 Am

Met with Bill Tucker

The three 1,000 gallon gasoline UST's were removed yesterday.

An inspection of the tanks did not show any apparent holes or leaks.

Soil samples were collected from under each tank. There is no apparent hydrocarbon staining, but there is hydrocarbon odors in the south and middle samples.

Sample	HW Reading
North	0
Middle	32
South	40

Mr. Tucker said about 24-27 years ago the old UST's were removed, and they were leaking. He also said there is gasoline in the old water well, located inside the house/store. I collected two 40ml vials for BTEX analysis. The water has a very strong product odor. It is expected the depth to bedrock is about 50', and the groundwater is perched on the bedrock. Since there is gasoline in the groundwater, I will not at this time attempt to determine the vertical extent of contamination.

This site will be placed on top of the priority list and addressed with those procedures.

Left site 9:50 Am

CERTIFIED

Serrano, Glow E
P O Box 61
Tie Siding, WY 82084

RE: Facility #0-000834 Located at P O Box 61, Tie Siding

Dear Glow Serrano:

You are being sent this letter because the annual Contaminated Site Fee for this facility has not been received by this department. Payment of the contaminated site fee is voluntary; however, those who elect not to pay are subject to the following requirements:

1. Within 60 days:

- A. Submittal of a written "Initial Abatement Measures and Site Check" to this department describing actions that have or will be taken to provide for the cleanup and restoration of the contaminated site as required by W.S. 35-11-1426 and Section 24 of Chapter 17, Water Quality Rules and Regulations. This written description would include the following:
 1. Methods to continue to monitor and mitigate any fire and safety hazards posed by vapors or free product that have migrated from the underground storage tank excavation zone and entered subsurface structures (i.e., sewers or basements);
 2. The remedy of hazards posed by the contaminated soils that are excavated or exposed as a result of release confirmation, site investigation, abatement, or corrective action activities. If these remedies include treatment or disposal of soils, the owner/operator must comply with the applicable department requirements;
 3. The investigation to determine the possible presence of free product AND begin the free product removal as soon as practical and in accordance with Section 24(d), Chapter 17, Water Quality Rules and Regulations.
- B. Submittal of an "Initial Site Characterization." Owners/Operators shall assemble information about the site and the nature of any release, including information gathered while confirming the release or completing the initial abatement measures required above. This would include:

1. Data on the nature and estimated size of any release;
 2. Data on impacted surrounding populations, water quality, use and approximate location of wells affected by the release, subsurface soil conditions, location of subsurface sewers possibly affected by release, and land use of affected areas;
 3. Results of free product investigations required by Section 24(b), Chapter 17, Water Quality Rules and Regulations, to be used by owner/operators to determine whether free product must be recovered under item B above;
 4. Submit the information collected as required by Section 24, Chapter 17, Water Quality Rules and Regulations, to the department in a manner which demonstrates its technical adequacy and applicability.
- C. Submittal of a report detailing the investigation for soil and groundwater cleanup and corrective action as required by Chapter 17, Section 24(e) and Section 24(f), Water Quality Rules and Regulations.
2. Until all fees are current, you are not covered by the Wyoming Underground Storage Tank Program and must show financial responsibility as required by Water Quality Rules and Regulations, Chapter XIX, Section 6. This section requires that each owner of a contaminated site which is not covered by the state's corrective action program show financial responsibility of \$1,000,000.00 (One Million Dollars).
 3. Those not covered are also subject to U.S. Environmental Protection Agency enforcement action for not complying with release cleanup requirements in specified time frames. Details on the cleanup requirements and the time frames are contained in 40 CFR 280.60 through 280.67 (CFR is the Code of Federal Regulations).

All costs of remediation will be at your expense.

Next year, this agency will initiate formal enforcement action against owners of contaminated sites who are not covered by the program and who have also not complied with the above requirements.

If you have any questions, feel free to call the office at 307-777-7095.

Sincerely,

Robert Lucht, P.E. & P.G.

August 1, 2003

Dear Underground Storage Tank Owner / Operator

As of this date, the underground storage tank fees for your tank(s) or the contaminated site fees for your contaminated site(s) for Fiscal Year 2004 are overdue by 30 days. These fees are due by statute on July 1 of each year. Payment of these fees, on time, is one of the statutory requirements to remain eligible for the State of Wyoming Corrective Action Account which pays to clean up your site if a release occurs, and to remain eligible for the State of Wyoming Financial Assurance Account which covers your liability if a judgement is rendered against you as a result of a release. Your failure to pay these fees on time threatens your eligibility for these two important benefits. Please pay the invoice which was sent to you in May immediately.

If you have any questions concerning these fees, or any thing else concerning underground storage tanks, please do not hesitate to call me at (307) 777-7095, by FAX to (307) 777-5973 or by internet to blucht@state.wv.us.

The Underground Storage Tank program is set up to prevent some very serious problems caused by leaking tanks. Our program is focused on preventing leaks through proper maintenance of cathodic protection systems and liners, and detecting leaks before they become to serious through monthly and annual leak detection tests. Potential problems which can be caused by leaks include contamination of domestic water wells, fires and explosions caused by vapors accumulating in basements and utility spaces, and serious health affects caused by exposures to toxic vapors. Your cooperation with our program is sincerely appreciated.

Sincerely,

Robert Loch, P.E. & P.C.
UIC and AUST Program Principal
Water Quality Division

Dave Freudenthal,
Governor

CERTIFIED

Serrano, Glow E
P O Box 61
Tie Siding, WY 82084

RE: Facility #0-000834 Located at P O Box 61, Tie Siding

Dear Glow Serrano:

The Department of Environmental Quality is considering legal action and penalties in order to collect delinquent Above/Underground Storage Tank fees.

You are being sent this letter because the annual Storage Tank registration fees for this facility are delinquent.

MARCH 15, 2003

1. You must pay the delinquent fees by , or face a formal enforcement action. As part of such an action, this department intends to propose penalties.
2. Until all fees are current, you are not covered by the Wyoming Underground Storage Tank Program and must show financial responsibility as required by Water Quality Rules and Regulations, Chapter 19, Section 6. This section requires that each owner of a contaminated site which is not covered by the state's corrective action program show financial responsibility of \$1,000,000.00 (One Million Dollars).

Those not covered are also subject to U.S. Environmental Protection Agency enforcement action for not complying with release cleanup requirements in specified time frames. Details on the cleanup requirements and the time frames are contained in 40 CFR 280.60 through 280.67 (CFR is the Code of Federal Regulations).

SCANNED

All costs of remediation will be at your expense.

Participating in the Wyoming UST Program by paying all your fees provides you with two benefits:

CERTIFIED

Serrano, Glow E
P O Box 61
Tie Siding, WY 82084

RE: Facility #0-000834 Located at P O Box 61, Tie Siding

Dear Glow Serrano:

The Department of Environmental Quality is considering legal action and penalties in order to collect delinquent Above/Underground Storage Tank fees.

You are being sent this letter because the annual Storage Tank registration fees for this facility are delinquent.

MARCH 15, 2003

- You must pay the delinquent fees by ~~March 15, 2003~~, or face a formal enforcement action. As part of such an action, this department intends to propose penalties.
- Until all fees are current, you are not covered by the Wyoming Underground Storage Tank Program and must show financial responsibility as required by Water Quality Rules and Regulations, Chapter 19, Section 6. This section requires that each owner of a contaminated site which is not covered by the state's corrective action program show financial responsibility of \$1,000,000.00 (One Million Dollars).

Those not covered are also subject to U.S. Environmental Protection Agency enforcement action for not complying with release cleanup requirements in specified time frames. Details on the cleanup requirements and the time frames are contained in 40 CFR 280.60 through 280.67 (CFR is the Code of Federal Regulations).

All costs of remediation will be at your expense.

Participating in the Wyoming UST Program by paying all your fees provides you with two benefits:

February 19, 2003

Page 2

Corrective Action Account

Cleanup of the site is done with money from the account. A very small cleanup of contaminated soil can cost \$10,000 to \$20,000. Large contamination problems may exceed \$75,000 per site. If the LUST site owner/operator is eligible for the state program, he/she pays none of the cleanup costs.

Remediation is done in order of the department's prioritized ranking system for contaminated sites from the most contaminated area to the least contaminated area.

Financial Responsibility Account

Contamination from a site could cause third party personal or property damage. For example: The contamination infiltrates a neighbor's well; the neighbor files a court action against the LUST site owner; and the neighbor is awarded \$50,000 damages by the court. If the procedures listed in the statute have been followed, the owner would be responsible for \$30,000 of the judgement, and the state's financial responsibility account would pay the balance up to \$1 million. Legal costs are not covered by the account.

In summary, this facility is not in compliance with the Wyoming Above/Underground Storage Tank Program. The division will give you until November 15, 2003, to remit the amount owed or submit proof of remediation.

Based upon the benefits of the Wyoming UST Program, it would be to your advantage to participate.

If you feel that there are any discrepancies or oversights, or if you have any questions, feel free to call the staff at the Cheyenne office. The AUST staff is Oma Gilbreth at 307-777-7097, Con Bratton at 307-777-7619, or Bob Lucht at 307-777-7095.

Sincerely,

Robert Lucht, P.E. & P.G.

October 30, 2002

CERTIFIED

Serrano, Glow E
P O Box 61
Tie Siding, WY 82084

RE: Facility #0-000834 Located at P O Box 61, Tie Siding

Dear Glow Serrano:

You are being sent this letter because the annual Contaminated Site Fee for this facility has not been received by this department. Payment of the contaminated site fee is voluntary; however, those who elect not to pay are subject to the following requirements:

1. Within 60 days:
 - A. Submittal of a written "Initial Abatement Measures and Site Check" to this department describing actions that have or will be taken to provide for the cleanup and restoration of the contaminated site as required by W.S. 35-11-1426 and Section 24 of Chapter 17, Water Quality Rules and Regulations. This written description would include the following:
 1. Methods to continue to monitor and mitigate any fire and safety hazards posed by vapors or free product that have migrated from the underground storage tank excavation zone and entered subsurface structures (i.e., sewers or basements);
 2. The remedy of hazards posed by the contaminated soils that are excavated or exposed as a result of release confirmation, site investigation, abatement, or corrective action activities. If these remedies include treatment or disposal of soils, the owner/operator must comply with the applicable department requirements;
 3. The investigation to determine the possible presence of free product AND begin the free product removal as soon as practical and in accordance with Section 24(d), Chapter 17, Water Quality Rules and Regulations.
 - B. Submittal of an "Initial Site Characterization." Owners/Operators shall assemble information about the site and the nature of any release, including information gathered while confirming the release or completing the initial abatement measures required above. This would include:

October 30, 2002

Page 2

1. Data on the nature and estimated size of any release;
 2. Data on impacted surrounding populations, water quality, use and approximate location of wells affected by the release, subsurface soil conditions, location of subsurface sewers possibly affected by release, and land use of affected areas;
 3. Results of free product investigations required by Section 24(b), Chapter 17, Water Quality Rules and Regulations, to be used by owner/operators to determine whether free product must be recovered under item B above;
 4. Submit the information collected as required by Section 24, Chapter 17, Water Quality Rules and Regulations, to the department in a manner which demonstrates its technical adequacy and applicability.
- C. Submittal of a report detailing the investigation for soil and groundwater cleanup and corrective action as required by Chapter 17, Section 24(e) and Section 24(f), Water Quality Rules and Regulations.
2. Until all fees are current, you are not covered by the Wyoming Underground Storage Tank Program and must show financial responsibility as required by Water Quality Rules and Regulations, Chapter XIX, Section 6. This section requires that each owner of a contaminated site which is not covered by the state's corrective action program show financial responsibility of \$1,000,000.00 (One Million Dollars).
 3. Those not covered are also subject to U.S. Environmental Protection Agency enforcement action for not complying with release cleanup requirements in specified time frames. Details on the cleanup requirements and the time frames are contained in 40 CFR 280.60 through 280.67 (CFR is the Code of Federal Regulations).

All costs of remediation will be at your expense.

Next year, this agency will initiate formal enforcement action against owners of contaminated sites who are not covered by the program and who have also not complied with the above requirements.

If you have any questions, feel free to call the office at 307-777-7095.

Sincerely,

Robert Lucht, P.E. & P.G.

Ms. Glow Serrano
P.O. Box 61
Tie Siding, WY 82084

RE: Tie Siding Leaking Above, Underground Storage Tank (LAUST) Remediation Project

Ms. Serrano:

As you're aware, the Wyoming Department of Environmental Quality, Water Quality Division - LAUST Program (WDEQ) has installed 5 new wells and tested all available wells at the Tie Siding General Store (site). We discussed some of the findings of these activities during my visit with you and Gary last week. You had requested more information on the results for your existing drinking water supply well, which we have identified as Tucker #1.

I've attached 3 pages to this letter to help summarize the results for recent and historical testing at Tucker #1. The first page is a map of the site showing the location of three wells installed in 1994 (MW-1 through MW-3), the location of the 5 new wells (MW-11 through MW-15), and the location of the two domestic wells, Tucker #1 and Pickel #2. The second page shows the concentrations of all wells sampled this summer. The third page shows results for samples collected from MW-1 through MW-3 in 1994. Please note that MW-1 cannot be analyzed due to the presence of free product on top of the water table.

In summary, the significant findings of the subject project are as follows:

1. No fuel contaminants were detected in the Tucker #1 well in 1994 or 2002.
2. MW-2 fuel contaminants levels detected in 1994 are significantly lower in 2002.
3. Product thickness in MW-1 has decreased over time (3.2 feet in 1994, 1.1 feet in 2002).
4. MW-10 and MW-15 will be monitored to ensure that fuel contamination from in front of the store does not migrate towards Tucker #1.
5. Additional free product removal activities at the site are scheduled quarterly into 2004.

I hope that this letter provides the information that you requested. Also, I'd like to take this opportunity to remind you that contaminated site fees (\$200.00) are now due for fiscal year 2003 (July 1, 2002 through June 30, 2003). Current payment of contaminated site fees allows WDEQ to continue remediation efforts at the site. I've attached a two-page invoice (one page is for your records) for your convenience.

)
Ms. Serrano

Mr. James Windham
910 Bedford
Midland, TX 79701

**RE: Wyoming Leaking Above/Underground Storage Tank (LAUST) Program
Tie Siding LAUST Subsurface Remediation Project**

Dear Mr. Windham:

The Wyoming Department of Environmental Quality - Water Quality Division, LAUST Program (WDEQ) is initiating a project to investigate a hydrocarbon release from at least one suspected leaking underground storage tank site in the Tie Siding area. Property ownership records at the Albany County Assessor's Office list you as the owner of 618.79 acres of land, Geolocator #1372-19-3-00-01300, as shown on the enclosed drawing (abbreviated to '01300'), which may have been impacted by this release.

WDEQ intends to complete a subsurface investigation to delineate hydrocarbon contamination that has been previously identified at the Tie Siding General Store site. Activities associated with this investigation include (1) installing up to twenty soil borings and five monitoring wells; (2) removing free-floating hydrocarbons (if observed) from these five wells on a quarterly basis for up to two years; (3) completing annual sampling/analyses for these five wells, as well as for two existing wells (see drawing), for up to two years. WDEQ anticipates starting this investigation on April 8, 2002, weather permitting, and that field activities will take 1 to 2 weeks to complete.

In accordance with Wyoming Statute W.S. 35-11-1422 and Water Quality Division Rules and Regulations Chapter 17, Section 12(a), WDEQ requests your agreement to provide department staff and/or its contractors access to your property to complete the above investigation. An 'Access and Use Easement' has been enclosed with this letter. Please have an authorized person sign the easement and return it to me in the enclosed self-addressed envelope.

Also enclosed please find a 'Duplicate Sample Waiver' form. Please complete, sign, and return the form to my attention if you DO NOT wish to have someone present on site to receive duplicate soil and/or groundwater samples when they are collected. If we do not receive the signed waiver, we will assume that you will have a representative present to take custody of duplicate samples.

Mr. James Windham

Tie Siding, WY 82084

**RE: Wyoming Leaking Above/Underground Storage Tank (LAUST) Program
Tie Siding LAUST Subsurface Remediation Project**

Dear Mr. Pickel:

The Wyoming Department of Environmental Quality - Water Quality Division, LAUST Program (WDEQ) is initiating a project to investigate a hydrocarbon release from at least one suspected leaking underground storage tank site in the Tie Siding area. Property ownership records at the Albany County Assessor's Office list you as the owner of 1.00 acres of land, Geolocator #1372-19-4-00-00300, as shown on the enclosed drawing (abbreviated to '003'), which may have been impacted by this release.

WDEQ intends to complete a subsurface investigation to delineate hydrocarbon contamination that has been previously identified at the Tie Siding General Store site. Activities associated with this investigation include (1) installing up to twenty soil borings and five monitoring wells; (2) removing free-floating hydrocarbons (if observed) from these five wells on a quarterly basis for up to two years; (3) completing annual sampling/analyses for these five wells, as well as for two existing wells (see drawing), for up to two years. WDEQ anticipates starting this investigation on April 8, 2002, weather permitting, and that field activities will take 1 to 2 weeks to complete.

In accordance with Wyoming Statute W.S. 35-11-1422 and Water Quality Division Rules and Regulations Chapter 17, Section 12(a), WDEQ requests your agreement to provide department staff and/or its contractors access to your property to complete the above investigation. An 'Access and Use Easement' has been enclosed with this letter. Please have an authorized person sign the easement and return it to me in the enclosed self-addressed envelope.

Also enclosed please find a 'Duplicate Sample Waiver' form. Please complete, sign, and return the form to my attention if you DO NOT wish to have someone present on site to receive duplicate soil and/or groundwater samples when they are collected. If we do not receive the signed waiver, we will assume that you will have a representative present to take custody of duplicate samples.

Mr. Billy Pickel

**RE: Wyoming Leaking Above/Underground Storage Tank (LAUST) Program
Tie Siding LAUST Subsurface Remediation Project**

Dear Dr. Tucker:

The Wyoming Department of Environmental Quality - Water Quality Division, LAUST Program (WDEQ) is initiating a project to investigate a hydrocarbon release from at least one suspected leaking underground storage tank site in the Tie Siding area. Property ownership records at the Albany County Assessor's Office list you as the owner of 0.500 acres of land, Geolocator #1372-19-3-00-00200, as shown on the enclosed drawing (abbreviated to '002'), which may have been impacted by this release.

WDEQ intends to complete a subsurface investigation to delineate hydrocarbon contamination that has been previously identified at the Tie Siding General Store site. Activities associated with this investigation include (1) installing up to twenty soil borings and five monitoring wells; (2) removing free-floating hydrocarbons (if observed) from these five wells on a quarterly basis for up to two years; (3) completing annual sampling/analyses for these five wells, as well as for two existing wells (see drawing), for up to two years. WDEQ anticipates starting this investigation on April 8, 2002, weather permitting, and that field activities will take 1 to 2 weeks to complete.

In accordance with Wyoming Statute W.S. 35-11-1422 and Water Quality Division Rules and Regulations Chapter 17, Section 12(a), WDEQ requests your agreement to provide department staff and/or its contractors access to your property to complete the above investigation. An 'Access and Use Easement' has been enclosed with this letter. Please have an authorized person sign the easement and return it to me in the enclosed self-addressed envelope.

Also enclosed please find a 'Duplicate Sample Waiver' form. Please complete, sign, and return the form to my attention if you DO NOT wish to have someone present on site to receive duplicate soil and/or groundwater samples when they are collected. If we do not receive the signed waiver, we will assume that you will have a representative present to take custody of duplicate samples.

RE: Wyoming Storage Tank Program Requirements; Contaminated Site Fee For Facility #0-000834, Located at Tie Siding

Dear Ms. Serrano:

As you are aware, the Wyoming Department of Environmental Quality/ Water Quality Division's (WQD) Above and Underground Storage Tank Program (AUST) is initiating a project to investigate and remediate soil and ground water impacts related to releases from at least one suspected leaking underground storage tank site and third party affected properties in the Tie siding area. WQD anticipates that work on this project will commence during the spring of 2002, possibly as early as April 1, 2002.

Wyoming Statute 35-11-1424 (e) requires that the owner of a contaminated site pay an annual fee of \$200.00 for a period of ten years, at which time the fee lapses until the beginning of corrective action. The fiscal year (July 1 through June 30) in which corrective action commences triggers the re-initiation of the annual fee, which continues until corrective action is finished. The initial ten year payment requirement was satisfied with the fiscal year 2000 payment.

Because corrective action work will begin before the end of this fiscal year (FY 2002), the annual fee is now due and payable. Attached please find an invoice for the \$200.00 fee. To remain eligible for the Corrective Action Program, the annual fee must be paid through the end of corrective action work. Please include your facility ID number on your check.

Please call me at 307-777-5877 should you have any questions.

Sincerely,

Paul Hildenbrand, P.G.
Southeast District Supervisor

Re: Tie Siding area Leaking Underground Storage Tank (LUST) Project
Pre-bid Contractor's Tour of Impacted Sites

Dear Ms. Serrano:

As you have been made aware through past personal visits, phone calls, and written correspondence, the Wyoming Department of Environmental Quality (WDEQ) Aboveground and Underground Storage Tank (AUST) Program will be initiating a project to investigate soil and ground water impacts related to releases from approximately one (1) suspected leaking underground storage tank (LUST) site and third-party affected properties in the Tie Siding area.

As the first step toward actually initiating the subsurface investigation work the WDEQ will conduct a pre-bid tour for contractors that will be bidding on the work. All interested parties will meet at 10:00 in the morning **Friday, August 10, 2001** in the parking lot of the Tie Siding General Store at 1741 US Hwy. 287, Tie Siding Wyoming. A discussion of the scope of the project will start the meeting, any questions or concerns the bidders may have will be answered, then the group will be taken to some of the various areas so that they can assess the working conditions for themselves prior to submitting work plans and bids. The effort will be made to visit all of the critical areas. Please do not be alarmed if a large group of people show up on your property that day! We will be careful not to disrupt your business any more than is absolutely necessary.

If you have questions concerning the Tie Siding Project please contact me at the Cheyenne WDEQ office, at (307) 777-7073.

Sincerely,

Lee Dlug

RE: Well Water Sampling; Facility 0-000834, Located at 1741 US Hwy. 287, Tie Siding, Wyoming

Dear Ms. Serrano:

The Wyoming Department of Environmental Quality, Water Quality Division (WDEQ/WQD), has completed it's review of the analysis results from water samples collected from the water supply at the former underground storage tank (UST) facility referenced above. You may wish to keep this letter and enclosures in your files as record of the well history for this location.

The samples were collected to confirm that well waters contain fuel concentrations that are below the regulatory limits. The samples were submitted to an approved laboratory for testing of total petroleum hydrocarbons (TPH), benzene, toluene, ethylbenzene, and xylenes (BTEX), MTBE, and for total lead, cadmium, and chrome. All laboratory test results indicate that there is no contamination within the well waters. Photocopies of the laboratory reports are enclosed.

If you have any comments or questions, please feel free to call me at (307) 777-7073.

Sincerely,

Lee Dlug
Sr. Environmental Analyst
LAUST Program
Water Quality Division

Re: Contaminated site fees for facility 834

Mr. Bill Tucker:

The enclosed invoice for \$200.00 is for the tenth annual contaminated site fee that was due July 1, 1999. This is for the contamination found when the under ground storage tanks were removed from the Tie Siding General Store located in Tie Siding, Wyoming. The fees will stop after this payment. When active remediation begins they will resume at the rate of \$200.00 annually and continue until the remediation is complete.

Payment of the fee by Mr. Bill Tucker was stipulated in the contract for sale of this property. This letter is to request that said payment be forth coming.

Failure to pay this fee will remove you from the state remediation program and will make you responsible for the complete cost of remediation for this site.

If you have any questions feel free to contact me at 307-777-7619.

Sincerely,

David "Con" Bratton

RE: Subsurface Investigation: Tie Siding, #0247-Z
Facility ID # ~~860~~ 834

Dear Mr. Windham:

Throughout the next few months, the Wyoming Department of Environmental Quality, Water Quality Division (DEQ/WQD) will be conducting an investigation into subsurface hydrocarbon contamination at several sites located in Tie Siding, Wyoming. The investigation will involve the installation and sampling of groundwater monitor wells and soil borings. Since your property located at Tie Siding, Wyoming has been identified as being possibly contaminated with petroleum hydrocarbons, wells and/or soil borings may be needed on your property to fully characterize the extent of contamination.

Enclosed is an easement form which, when signed by you, will allow the DEQ/WQD to drill bore holes and install monitoring wells on your property. The DEQ/WQD will conduct all drilling in a manner so as to minimize any disruptions to your property or business. The groundwater samples taken from groundwater monitoring wells will be analyzed in a laboratory to determine the types and concentrations (amount of chemical contaminants) present. The information gathered will be most beneficial in designing and developing a system to remove these contaminants from the soil and groundwater.

Page 2

Pursuant to Wyoming's corrective action program, "Water Pollution from underground storage tanks (USTs) Corrective Action of 1990", we are required to provide you, should you so desire, a duplicate sample of the groundwater we will sample from water wells on your property.

You will be provided a copy of the laboratory result from the sample we will be taking whether you sign a duplicate sample waiver or not. However, if you choose to request a duplicate sample analysis, you will be responsible for any costs associated with the necessary lab work. If you do not wish to have a duplicate sample taken, please read and sign the enclosed "Waiver of Duplicate Sample" form, and return it to me at the DEQ/WQD, Cheyenne.

If you have any questions, please contact me at (307) 777-7073.

Sincerely,

Roland Peterson

ACCESS AND USE EASEMENT

For and in consideration of the mutual benefits to be derived by the parties to this access and use easement, and for other valuable considerations, James Kennard Windham, hereinafter referred to as the Grantor, hereby grants to the Department of Environmental Quality, hereinafter referred to as the Grantee, the right to conduct, operate and maintain a soil and groundwater contamination remediation recovery and stabilization system on the following described lands located in the State of Wyoming, to wit:

A tract of land in Section 19, Township 13 North, Range 72 West of the 6th P.M., Albany County, Wyoming.

The access and use easement hereby granted being more particularly described as follows:

Beginning at a point whence the Northwest corner of Section 19, Township 13 North, Range 72 West bears North $41^{\circ}22'$ West 3364 feet; thence South $36^{\circ}22'$ East 521.78 feet along the West boundary line of the right of way of State Highway No. 287 to a point at the Northeast corner of the one acre tract; thence South $36^{\circ}22'$ East 208.71 feet; thence South $53^{\circ}38'$ West 208.71 feet; thence North $36^{\circ}22'$ West 208.71 feet; thence North $53^{\circ}38'$ East 208.71 feet to the Northeast corner of the one acre tract.

EXCEPTING THEREFROM

Beginning at a point on the Westerly right of way line of U.S. 287, which bears South $89^{\circ}08'07''$ East, (previously shown as South $89^{\circ}11'00''$ East) 540.68 feet and south $36^{\circ}26'00''$ East) 3551.95 feet from the Northwest corner (a well set granite stone) of said section 19; thence south $36^{\circ}26'00''$ East, 169.29 feet along said right of way to the beginning of a $1^{\circ}54'59''$ circular curve concave Northeasterly having a radius of 2989.79 feet and a delta of $32^{\circ}17'$; thence along said curve, a distance of 43.61 feet, the chord of which bears South $36^{\circ}51'05''$ East, 43.61 feet; thence South $54^{\circ}40'01''$ West, 211.12 feet; thence North $35^{\circ}35'4''$ West, 205.57 feet; thence North $52^{\circ}39'26''$ East, 207.75 feet to the point of beginning.

PHASE I - Installation of borings and/or monitoring wells at the locations shown on Figure 2 attached to this agreement. Exact locations of the borings and wells will be agreed upon by an authorized representative of the Grantee and the Grantor.

PHASE II - Installation and operations of a petroleum hydrocarbon contamination remediation system. Exact location will be agreed upon by an authorized representative of the Grantee and the Grantor.

Grantor grants the right of ingress and egress to and from the said land for any and all purposes necessary and incident to the exercise by the Grantee, and its employees or independent contractors, of the rights granted by this conveyance.

Grantor will not attempt to interfere with the Grantee in the conduct of its operations for any purpose whatsoever; that exclusive use is hereby granted to the Grantee.

This easement is granted only upon the express condition that the Grantee shall have the responsibility of properly plugging and capping any drilling holes it has drilled as part of this easement when it has finished collecting any and all data from said drilling holes, removal of all above ground structures and equipment when soil and groundwater contamination remediation is complete, and repair all damage to sidewalks and paved areas caused by Grantee to Grantor's satisfaction.

The Grantor does not, by this easement, require that the Grantee waive its sovereign immunity by entering into this easement. The Grantee fully retains all immunities and defenses provided by law with regard to any action based on this easement.

RE: Subsurface Investigation: Tie Siding, #0247-Z
Facility ID # 863

Dear Mr. Windham,

860 834

Throughout the next few months, the Wyoming Department of Environmental Quality, Water Quality Division (DEQ/WQD) will be conducting an investigation into subsurface hydrocarbon contamination at several sites located in Tie Siding, Wyoming. The investigation will involve the installation and sampling of groundwater monitor wells and soil borings. Since your property located at Tie Siding, Wyoming has been identified as being possibly contaminated with petroleum hydrocarbons, wells and/or soil borings may be needed on your property to fully characterize the extent of contamination.

Enclosed is an easement form which, when signed by you, will allow the DEQ/WQD to drill bore holes and install monitoring wells on your property. The DEQ/WQD will conduct all drilling in a manner so as to minimize any disruptions to your property or business. The groundwater samples taken from groundwater monitoring wells will be analyzed in a laboratory to determine the types and concentrations (amount of chemical contaminants) present. The information gathered will be most beneficial in designing and developing a system to remove these contaminants from the soil and groundwater.

Pursuant to Wyoming's corrective action program, "Water Pollution from underground storage tanks (USTs) Corrective Action of 1990", we are required to provide you, should you so desire, a duplicate sample of the groundwater we will sample from water wells on your property.

July 20, 1993

Page 2

You will be provided a copy of the laboratory result from the sample we will be taking whether you sign a duplicate sample waiver or not. However, if you choose to request a duplicate sample analysis, you will be responsible for any costs associated with the necessary lab work. If you do not wish to have a duplicate sample taken, please read and sign the enclosed "Waiver of duplicate Sample" form, and return it to me at the DEQ/WQD, Cheyenne.

If you have any questions, please contact me at (307) 777-7073.

Sincerely,

Roland Peterson

RE: Subsurface Investigation Site Visit, Tie Siding General Store,
Tie Siding, Wyoming. UST Facility ID #834.

Dear Ms. Serrano,

The contracting procedure for the subsurface investigation has commenced for the Tie Siding General Store leaking underground storage tank (LUST) site. This procedure involves, among other things, an on-site visit by potential contractors of the project. This visit, involving visual observation, is done to familiarize the potential contractors with the site conditions. This letter is to inform you that the site visit is scheduled for 10:00 am, April 1, 1993, at the Tie Siding General Store.

If this presents any problems, or if you have any questions, please call me immediately at (307) 777-7073.

Sincerely,

Roland Peterson

RE: LUST Annual Contaminated Site Fee for Facility ID 0000834

Dear Sir:

The purpose of this letter is to request payment of an annual \$200 per site fee associated with a contaminated site caused by an UST registered in your name with this department. The Water Pollution from Underground Storage Tanks Act, W.S. 35-11-1424, created a corrective action account which provides for financial assurance coverage required by federal law and is to be used by the department to take corrective actions in response to releases from UST facilities.

The department has established a priority list of sites contaminated by USTs, and your site is included on this list for future cleanup at state expense. The \$200 annual site fee payment is due to the department on or before July 1 of each year until such time that site has been fully remediated. Sites will be remediated according to their position on the priority listing which primarily considers potential toxicological impact to nearby occupied structures or public utilities and potential contamination of groundwaters of the state. If your site has been determined by the state as being contaminated and you also have an UST system which is currently in use at the same location and you are paying your annual \$200 per tank registration fee, you do not have to pay the contaminated site fee.

In Summary:

1. The 1991 site fee of \$200 per site (check or money order payable to the Wyoming Department of Environmental Quality, Water Quality Division) is due to the Water Quality Division on July 1, 1991, and, on or before July 1 for each following year, until the site has been successfully remediated by the state. Please return a copy of the site fee invoice with your payment. Payment will not be accepted without the invoice and check or money order.

2. If there is new information which would change the status or affect information contained on the UST Registration/Notification Form previously submitted to the department, please provide the updated information on a new form which may be obtained by telephoning 307-777-7783.
3. If you have already been notified of the requirement to pay the "1990" site fee and have not paid the fee, please call 307-777-7783 at once.
4. If you have an existing UST system for which you are currently paying annual tank fees on the same site, only pay the tank registration fee.
5. If, after reading this letter, you have further questions, please contact the department by telephoning 307-777-7783.

Sincerely,

Leroy C. Feusner, P.E., DEE
UST Program Supervisor
Water Quality Division

LCF/CWP/pjb

Department of Environmental Quality

RE: Facility #0-000834 Located at P O Box 61, Tie Siding

Dear Glow Serrano:

You are being sent this letter because the annual Contaminated Site Fee for this facility has not been received by this department. Payment of the contaminated site fee is voluntary; however, those who elect not to pay are subject to the following requirements:

1. Within 60 days:

- A. Submittal of a written "Initial Abatement Measures and Site Check" to this department describing actions that have or will be taken to provide for the cleanup and restoration of the contaminated site as required by W.S. 35-11-1426 and Section 24 of Chapter 17, Water Quality Rules and Regulations. This written description would include the following:
 1. Methods to continue to monitor and mitigate any fire and safety hazards posed by vapors or free product that have migrated from the underground storage tank excavation zone and entered subsurface structures (i.e., sewers or basements);
 2. The remedy of hazards posed by the contaminated soils that are excavated or exposed as a result of release confirmation, site investigation, abatement, or corrective action activities. If these remedies include treatment or disposal of soils, the owner/operator must comply with the applicable department requirements;
 3. The investigation to determine the possible presence of free product AND begin the free product removal as soon as practical and in accordance with Section 24(d), Chapter 17, Water Quality Rules and Regulations.
- B. Submittal of an "Initial Site Characterization." Owners/Operators shall assemble information about the site and the nature of any release, including information gathered while confirming the release or completing the initial abatement measures required above. This would include:

1. Data on the nature and estimated size of any release;
 2. Data on impacted surrounding populations, water quality, use and approximate location of wells affected by the release, subsurface soil conditions, location of subsurface sewers possibly affected by release, and land use of affected areas;
 3. Results of free product investigations required by Section 24(b), Chapter 17, Water Quality Rules and Regulations, to be used by owner/operators to determine whether free product must be recovered under item B above;
 4. Submit the information collected as required by Section 24, Chapter 17, Water Quality Rules and Regulations, to the department in a manner which demonstrates its technical adequacy and applicability.
- C. Submittal of a report detailing the investigation for soil and groundwater cleanup and corrective action as required by Chapter 17, Section 24(e) and Section 24(f), Water Quality Rules and Regulations.
2. Until all fees are current, you are not covered by the Wyoming Underground Storage Tank Program and must show financial responsibility as required by Water Quality Rules and Regulations, Chapter XIX, Section 6. This section requires that each owner of a contaminated site which is not covered by the state's corrective action program show financial responsibility of \$1,000,000.00 (One Million Dollars).
 3. Those not covered are also subject to U.S. Environmental Protection Agency enforcement action for not complying with release cleanup requirements in specified time frames. Details on the cleanup requirements and the time frames are contained in 40 CFR 280.60 through 280.67 (CFR is the Code of Federal Regulations).

All costs of remediation will be at your expense.

Next year, this agency will initiate formal enforcement action against owners of contaminated sites who are not covered by the program and who have also not complied with the above requirements.

If you have any questions, feel free to call the office at 307-777-7095.

Dear Underground Storage Tank Owner / Operator

As of this date, the underground storage tank fees for your tank(s) or the contaminated site fees for your contaminated site(s) for Fiscal Year 2004 are overdue by 30 days. These fees are due by statute on July 1 of each year. Payment of these fees, on time, is one of the statutory requirements to remain eligible for the State of Wyoming Corrective Action Account which pays to clean up your site if a release occurs, and to remain eligible for the State of Wyoming Financial Assurance Account which covers your liability if a judgement is rendered against you as a result of a release. Your failure to pay these fees on time threatens your eligibility for these two important benefits. Please pay the invoice which was sent to you in May immediately.

If you have any questions concerning these fees, or any thing else concerning underground storage tanks, please do not hesitate to call me at (307) 777-7095, by FAX to (307) 777-5973 or by internet to blucht@state.wv.us.

The Underground Storage Tank program is set up to prevent some very serious problems caused by leaking tanks. Our program is focused on preventing leaks through proper maintenance of cathodic protection systems and liners, and detecting leaks before they become to serious through monthly and annual leak detection tests. Potential problems which can be caused by leaks include contamination of domestic water wells, fires and explosions caused by vapors accumulating in basements and utility spaces, and serious health affects caused by exposures to toxic vapors. Your cooperation with our program is sincerely appreciated.

Sincerely,

Robert Loch, P.E. & P.C.
UIC and AUST Program Principal

CERTIFIED

Serrano, Glow E
P O Box 61
Tie Siding, WY 82084

RE: Facility #0-000834 Located at P O Box 61, Tie Siding

Dear Glow Serrano:

The Department of Environmental Quality is considering legal action and penalties in order to collect delinquent Above/Underground Storage Tank fees.

You are being sent this letter because the annual Storage Tank registration fees for this facility are delinquent.

MARCH 15, 2003

1. You must pay the delinquent fees by ~~██████████~~, or face a formal enforcement action. As part of such an action, this department intends to propose penalties.
2. Until all fees are current, you are not covered by the Wyoming Underground Storage Tank Program and must show financial responsibility as required by Water Quality Rules and Regulations, Chapter 19, Section 6. This section requires that each owner of a contaminated site which is not covered by the state's corrective action program show financial responsibility of \$1,000,000.00 (One Million Dollars).

Those not covered are also subject to U.S. Environmental Protection Agency enforcement action for not complying with release cleanup requirements in specified time frames. Details on the cleanup requirements and the time frames are contained in 40 CFR 280.60 through 280.67 (CFR is the Code of Federal Regulations).

SCANNED

All costs of remediation will be at your expense.

Participating in the Wyoming UST Program by paying all your fees provides you with two benefits:

CERTIFIED

Serrano, Glow E
P O Box 61
Tie Siding, WY 82084

RE: Facility #0-000834 Located at P O Box 61, Tie Siding

Dear Glow Serrano:

The Department of Environmental Quality is considering legal action and penalties in order to collect delinquent Above/Underground Storage Tank fees.

You are being sent this letter because the annual Storage Tank registration fees for this facility are delinquent.

MARCH 15, 2003

1. You must pay the delinquent fees by ~~March 15, 2003~~, or face a formal enforcement action. As part of such an action, this department intends to propose penalties.
2. Until all fees are current, you are not covered by the Wyoming Underground Storage Tank Program and must show financial responsibility as required by Water Quality Rules and Regulations, Chapter 19, Section 6. This section requires that each owner of a contaminated site which is not covered by the state's corrective action program show financial responsibility of \$1,000,000.00 (One Million Dollars).

Those not covered are also subject to U.S. Environmental Protection Agency enforcement action for not complying with release cleanup requirements in specified time frames. Details on the cleanup requirements and the time frames are contained in 40 CFR 280.60 through 280.67 (CFR is the Code of Federal Regulations).

All costs of remediation will be at your expense.

Participating in the Wyoming UST Program by paying all your fees provides you with two benefits:

February 19, 2003

Page 2

Corrective Action Account

Cleanup of the site is done with money from the account. A very small cleanup of contaminated soil can cost \$10,000 to \$20,000. Large contamination problems may exceed \$75,000 per site. If the LUST site owner/operator is eligible for the state program, he/she pays none of the cleanup costs.

Remediation is done in order of the department's prioritized ranking system for contaminated sites from the most contaminated area to the least contaminated area.

Financial Responsibility Account

Contamination from a site could cause third party personal or property damage. For example: The contamination infiltrates a neighbor's well; the neighbor files a court action against the LUST site owner; and the neighbor is awarded \$50,000 damages by the court. If the procedures listed in the statute have been followed, the owner would be responsible for \$30,000 of the judgement, and the state's financial responsibility account would pay the balance up to \$1 million. Legal costs are not covered by the account.

In summary, this facility is not in compliance with the Wyoming Above/Underground Storage Tank Program. The division will give you until November 15, 2003, to remit the amount owed or submit proof of remediation.

Based upon the benefits of the Wyoming UST Program, it would be to your advantage to participate.

If you feel that there are any discrepancies or oversights, or if you have any questions, feel free to call the staff at the Cheyenne office. The AUST staff is Oma Gilbreth at 307-777-7097, Con Bratton at 307-777-7619, or Bob Lucht at 307-777-7095.

Sincerely,

Robert Lucht, P.E. & P.G.
UIC / AUST Program Principal
Water Quality Division

October 30, 2002

CERTIFIED

Serrano, Glow E
P O Box 61
Tie Siding, WY 82084

RE: Facility #0-000834 Located at P O Box 61, Tie Siding

Dear Glow Serrano:

You are being sent this letter because the annual Contaminated Site Fee for this facility has not been received by this department. Payment of the contaminated site fee is voluntary; however, those who elect not to pay are subject to the following requirements:

1. Within 60 days:
 - A. Submittal of a written "Initial Abatement Measures and Site Check" to this department describing actions that have or will be taken to provide for the cleanup and restoration of the contaminated site as required by W.S. 35-11-1426 and Section 24 of Chapter 17, Water Quality Rules and Regulations. This written description would include the following:
 1. Methods to continue to monitor and mitigate any fire and safety hazards posed by vapors or free product that have migrated from the underground storage tank excavation zone and entered subsurface structures (i.e., sewers or basements);
 2. The remedy of hazards posed by the contaminated soils that are excavated or exposed as a result of release confirmation, site investigation, abatement, or corrective action activities. If these remedies include treatment or disposal of soils, the owner/operator must comply with the applicable department requirements;
 3. The investigation to determine the possible presence of free product AND begin the free product removal as soon as practical and in accordance with Section 24(d), Chapter 17, Water Quality Rules and Regulations.
 - B. Submittal of an "Initial Site Characterization." Owners/Operators shall assemble information about the site and the nature of any release, including information gathered while confirming the release or completing the initial abatement measures required above. This would include:

October 30, 2002

Page 2

1. Data on the nature and estimated size of any release;
 2. Data on impacted surrounding populations, water quality, use and approximate location of wells affected by the release, subsurface soil conditions, location of subsurface sewers possibly affected by release, and land use of affected areas;
 3. Results of free product investigations required by Section 24(b), Chapter 17, Water Quality Rules and Regulations, to be used by owner/operators to determine whether free product must be recovered under item B above;
 4. Submit the information collected as required by Section 24, Chapter 17, Water Quality Rules and Regulations, to the department in a manner which demonstrates its technical adequacy and applicability.
- C. Submittal of a report detailing the investigation for soil and groundwater cleanup and corrective action as required by Chapter 17, Section 24(e) and Section 24(f), Water Quality Rules and Regulations.
2. Until all fees are current, you are not covered by the Wyoming Underground Storage Tank Program and must show financial responsibility as required by Water Quality Rules and Regulations, Chapter XIX, Section 6. This section requires that each owner of a contaminated site which is not covered by the state's corrective action program show financial responsibility of \$1,000,000.00 (One Million Dollars).
 3. Those not covered are also subject to U.S. Environmental Protection Agency enforcement action for not complying with release cleanup requirements in specified time frames. Details on the cleanup requirements and the time frames are contained in 40 CFR 280.60 through 280.67 (CFR is the Code of Federal Regulations).

All costs of remediation will be at your expense.

Next year, this agency will initiate formal enforcement action against owners of contaminated sites who are not covered by the program and who have also not complied with the above requirements.

If you have any questions, feel free to call the office at 307-777-7095.

Sincerely,

Robert Lucht, P.E. & P.G.
UIC / AUST Program Principal

Tie Siding, WY 82084

RE: Tie Siding Leaking Above, Underground Storage Tank (LAUST) Remediation Project

Ms. Serrano:

As you're aware, the Wyoming Department of Environmental Quality, Water Quality Division - LAUST Program (WDEQ) has installed 5 new wells and tested all available wells at the Tie Siding General Store (site). We discussed some of the findings of these activities during my visit with you and Gary last week. You had requested more information on the results for your existing drinking water supply well, which we have identified as Tucker #1.

I've attached 3 pages to this letter to help summarize the results for recent and historical testing at Tucker #1. The first page is a map of the site showing the location of three wells installed in 1994 (MW-1 through MW-3), the location of the 5 new wells (MW-11 through MW-15), and the location of the two domestic wells, Tucker #1 and Pickel #2. The second page shows the concentrations of all wells sampled this summer. The third page shows results for samples collected from MW-1 through MW-3 in 1994. Please note that MW-1 cannot be analyzed due to the presence of free product on top of the water table.

In summary, the significant findings of the subject project are as follows:

1. No fuel contaminants were detected in the Tucker #1 well in 1994 or 2002.
2. MW-2 fuel contaminants levels detected in 1994 are significantly lower in 2002.
3. Product thickness in MW-1 has decreased over time (3.2 feet in 1994, 1.1 feet in 2002).
4. MW-10 and MW-15 will be monitored to ensure that fuel contamination from in front of the store does not migrate towards Tucker #1.
5. Additional free product removal activities at the site are scheduled quarterly into 2004.

I hope that this letter provides the information that you requested. Also, I'd like to take this opportunity to remind you that contaminated site fees (\$200.00) are now due for fiscal year 2003 (July 1, 2002 through June 30, 2003). Current payment of contaminated site fees allows WDEQ to continue remediation efforts at the site. I've attached a two-page invoice (one page is for your records) for your convenience.

)
Ms. Serrano
September 4, 2002

**RE: Wyoming Leaking Above/Underground Storage Tank (LAUST) Program
Tie Siding LAUST Subsurface Remediation Project**

Dear Mr. Windham:

The Wyoming Department of Environmental Quality - Water Quality Division, LAUST Program (WDEQ) is initiating a project to investigate a hydrocarbon release from at least one suspected leaking underground storage tank site in the Tie Siding area. Property ownership records at the Albany County Assessor's Office list you as the owner of 618.79 acres of land, Geolocator #1372-19-3-00-01300, as shown on the enclosed drawing (abbreviated to '01300'), which may have been impacted by this release.

WDEQ intends to complete a subsurface investigation to delineate hydrocarbon contamination that has been previously identified at the Tie Siding General Store site. Activities associated with this investigation include (1) installing up to twenty soil borings and five monitoring wells; (2) removing free-floating hydrocarbons (if observed) from these five wells on a quarterly basis for up to two years; (3) completing annual sampling/analyses for these five wells, as well as for two existing wells (see drawing), for up to two years. WDEQ anticipates starting this investigation on April 8, 2002, weather permitting, and that field activities will take 1 to 2 weeks to complete.

In accordance with Wyoming Statute W.S. 35-11-1422 and Water Quality Division Rules and Regulations Chapter 17, Section 12(a), WDEQ requests your agreement to provide department staff and/or its contractors access to your property to complete the above investigation. An 'Access and Use Easement' has been enclosed with this letter. Please have an authorized person sign the easement and return it to me in the enclosed self-addressed envelope.

Also enclosed please find a 'Duplicate Sample Waiver' form. Please complete, sign, and return the form to my attention if you DO NOT wish to have someone present on site to receive duplicate soil and/or groundwater samples when they are collected. If we do not receive the signed waiver, we will assume that you will have a representative present to take custody of duplicate samples.

Mr. James Windham

**RE: Wyoming Leaking Above/Underground Storage Tank (LAUST) Program
Tie Siding LAUST Subsurface Remediation Project**

Dear Dr. Tucker:

The Wyoming Department of Environmental Quality - Water Quality Division, LAUST Program (WDEQ) is initiating a project to investigate a hydrocarbon release from at least one suspected leaking underground storage tank site in the Tie Siding area. Property ownership records at the Albany County Assessor's Office list you as the owner of 0.500 acres of land, Geolocator #1372-19-3-00-00200, as shown on the enclosed drawing (abbreviated to '002'), which may have been impacted by this release.

WDEQ intends to complete a subsurface investigation to delineate hydrocarbon contamination that has been previously identified at the Tie Siding General Store site. Activities associated with this investigation include (1) installing up to twenty soil borings and five monitoring wells; (2) removing free-floating hydrocarbons (if observed) from these five wells on a quarterly basis for up to two years; (3) completing annual sampling/analyses for these five wells, as well as for two existing wells (see drawing), for up to two years. WDEQ anticipates starting this investigation on April 8, 2002, weather permitting, and that field activities will take 1 to 2 weeks to complete.

In accordance with Wyoming Statute W.S. 35-11-1422 and Water Quality Division Rules and Regulations Chapter 17, Section 12(a), WDEQ requests your agreement to provide department staff and/or its contractors access to your property to complete the above investigation. An 'Access and Use Easement' has been enclosed with this letter. Please have an authorized person sign the easement and return it to me in the enclosed self-addressed envelope.

Also enclosed please find a 'Duplicate Sample Waiver' form. Please complete, sign, and return the form to my attention if you DO NOT wish to have someone present on site to received duplicate soil and/or groundwater samples when they are collected. If we do not receive the signed waiver, we will assume that you will have a representative present to take custody of duplicate samples.

**RE: Wyoming Leaking Above/Underground Storage Tank (LAUST) Program
Tie Siding LAUST Subsurface Remediation Project**

Dear Ms. Serrano:

The Wyoming Department of Environmental Quality - Water Quality Division, LAUST Program (WDEQ) is initiating a project to investigate a hydrocarbon release from at least one suspected leaking underground storage tank site in the Tie Siding area. Property ownership records at the Albany County Assessor's Office list you as the owner of 2.00 acres of land, Geolocator #1372-19-2-00-00100, as shown on the enclosed drawing (abbreviated to '001'), which may have been impacted by this release.

WDEQ intends to complete a subsurface investigation to delineate hydrocarbon contamination that has been previously identified at the Tie Siding General Store site. Activities associated with this investigation include (1) installing up to twenty soil borings and five monitoring wells; (2) removing free-floating hydrocarbons (if observed) from these five wells on a quarterly basis for up to two years; (3) completing annual sampling analyses for these five wells, as well as for two existing wells (see drawing), for up to two years. WDEQ anticipates starting this investigation on April 8, 2002, weather permitting, and that field activities will take 1 to 2 weeks to complete.

In accordance with Wyoming Statute W.S. 35-11-1422 and Water Quality Division Rules and Regulations Chapter 17, Section 12(a), WDEQ requests your agreement to provide department staff and/or its contractors access to your property to complete the above investigation. An 'Access and Use Easement' has been enclosed with this letter. Please have an authorized person sign the easement and return it to me in the enclosed self-addressed envelope.

Also enclosed please find a 'Duplicate Sample Waiver' form. Please complete, sign, and return the form to my attention if you DO NOT wish to have someone present on site to receive duplicate soil and/or groundwater samples when they are collected. If we do not receive the signed waiver, we will assume that you will have a representative present to take custody of duplicate samples.

RE: Wyoming Storage Tank Program Requirements; Contaminated Site Fee For Facility #0-000834, Located at Tie Siding

Dear Ms. Serrano:

As you are aware, the Wyoming Department of Environmental Quality/ Water Quality Division's (WQD) Above and Underground Storage Tank Program (AUST) is initiating a project to investigate and remediate soil and ground water impacts related to releases from at least one suspected leaking underground storage tank site and third party affected properties in the Tie siding area. WQD anticipates that work on this project will commence during the spring of 2002, possibly as early as April 1, 2002.

Wyoming Statute 35-11-1424 (e) requires that the owner of a contaminated site pay an annual fee of \$200.00 for a period of ten years, at which time the fee lapses until the beginning of corrective action. The fiscal year (July 1 through June 30) in which corrective action commences triggers the re-initiation of the annual fee, which continues until corrective action is finished. The initial ten year payment requirement was satisfied with the fiscal year 2000 payment.

Because corrective action work will begin before the end of this fiscal year (FY 2002), the annual fee is now due and payable. Attached please find an invoice for the \$200.00 fee. To remain eligible for the Corrective Action Program, the annual fee must be paid through the end of corrective action work. Please include your facility ID number on your check.

Please call me at 307-777-5877 should you have any questions.

Sincerely,

Paul Hildenbrand, P.G.
Southeast District Supervisor

Re: Tie Siding area Leaking Underground Storage Tank (LUST) Project
Pre-bid Contractor's Tour of Impacted Sites

Dear Ms. Serrano:

As you have been made aware through past personal visits, phone calls, and written correspondence, the Wyoming Department of Environmental Quality (WDEQ) Aboveground and Underground Storage Tank (AUST) Program will be initiating a project to investigate soil and ground water impacts related to releases from approximately one (1) suspected leaking underground storage tank (LUST) site and third-party affected properties in the Tie Siding area.

As the first step toward actually initiating the subsurface investigation work the WDEQ will conduct a pre-bid tour for contractors that will be bidding on the work. All interested parties will meet at 10:00 in the morning Friday, August 10, 2001 in the parking lot of the Tie Siding General Store at 1741 US Hwy. 287, Tie Siding Wyoming. A discussion of the scope of the project will start the meeting, any questions or concerns the bidders may have will be answered, then the group will be taken to some of the various areas so that they can assess the working conditions for themselves prior to submitting work plans and bids. The effort will be made to visit all of the critical areas. Please do not be alarmed if a large group of people show up on your property that day! We will be careful not to disrupt your business any more than is absolutely necessary.

If you have questions concerning the Tie Siding Project please contact me at the Cheyenne WDEQ office, at (307) 777-7073.

Sincerely,

Lee Dlug

RE: Well Water Sampling; Facility 0-000834, Located at 1741 US Hwy. 287, Tie Siding, Wyoming

Dear Ms. Serrano:

The Wyoming Department of Environmental Quality, Water Quality Division (WDEQ/WQD), has completed it's review of the analysis results from water samples collected from the water supply at the former underground storage tank (UST) facility referenced above. You may wish to keep this letter and enclosures in your files as record of the well history for this location.

The samples were collected to confirm that well waters contain fuel concentrations that are below the regulatory limits. The samples were submitted to an approved laboratory for testing of total petroleum hydrocarbons (TPH), benzene, toluene, ethylbenzene, and xylenes (BTEX), MTBE, and for total lead, cadmium, and chrome. All laboratory test results indicate that there is no contamination within the well waters. Photocopies of the laboratory reports are enclosed.

If you have any comments or questions, please feel free to call me at (307) 777-7073.

Sincerely,

Lee Dlug
Sr. Environmental Analyst

Re: Contaminated site fees for facility 834

Mr. Bill Tucker:

The enclosed invoice for \$200.00 is for the tenth annual contaminated site fee that was due July 1, 1999. This is for the contamination found when the under ground storage tanks were removed from the Tie Siding General Store located in Tie Siding, Wyoming. The fees will stop after this payment. When active remediation begins they will resume at the rate of \$200.00 annually and continue until the remediation is complete.

Payment of the fee by Mr. Bill Tucker was stipulated in the contract for sale of this property. This letter is to request that said payment be forth coming.

Failure to pay this fee will remove you from the state remediation program and will make you responsible for the complete cost of remediation for this site.

If you have any questions feel free to contact me at 307-777-7619.

Sincerely,

David "Con" Bratton

RE: Subsurface Investigation: Tie Siding, #0247-Z
Facility ID # ~~860~~ 834

Dear Mr. Windham:

Throughout the next few months, the Wyoming Department of Environmental Quality, Water Quality Division (DEQ/WQD) will be conducting an investigation into subsurface hydrocarbon contamination at several sites located in Tie Siding, Wyoming. The investigation will involve the installation and sampling of groundwater monitor wells and soil borings. Since your property located at Tie Siding, Wyoming has been identified as being possibly contaminated with petroleum hydrocarbons, wells and/or soil borings may be needed on your property to fully characterize the extent of contamination.

Enclosed is an easement form which, when signed by you, will allow the DEQ/WQD to drill bore holes and install monitoring wells on your property. The DEQ/WQD will conduct all drilling in a manner so as to minimize any disruptions to your property or business. The groundwater samples taken from groundwater monitoring wells will be analyzed in a laboratory to determine the types and concentrations (amount of chemical contaminants) present. The information gathered will be most beneficial in designing and developing a system to remove these contaminants from the soil and groundwater.

Pursuant to Wyoming's corrective action program, "Water Pollution from underground storage tanks (USTs) Corrective Action of 1990", we are required to provide you, should you so desire, a duplicate sample of the groundwater we will sample from water wells on your property.

You will be provided a copy of the laboratory result from the sample we will be taking whether you sign a duplicate sample waiver or not. However, if you choose to request a duplicate sample analysis, you will be responsible for any costs associated with the necessary lab work. If you do not wish to have a duplicate sample taken, please read and sign the enclosed "Waiver of Duplicate Sample" form, and return it to me at the DEQ/WQD, Cheyenne.

If you have any questions, please contact me at (307) 777-7073.

Sincerely,

Roland Peterson
Senior Environmental Analyst
Water Quality Division

Enclosures: Access and Use Easement, and Waiver of Duplicate Samples forms

xc: Clay Rowley, SE District UST Supervisor

ACCESS AND USE EASEMENT

For and in consideration of the mutual benefits to be derived by the parties to this access and use easement, and for other valuable considerations, James Kennard Windham, hereinafter referred to as the Grantor, hereby grants to the Department of Environmental Quality, hereinafter referred to as the Grantee, the right to conduct, operate and maintain a soil and groundwater contamination remediation recovery and stabilization system on the following described lands located in the State of Wyoming, to wit:

A tract of land in Section 19, Township 13 North, Range 72 West of the 6th P.M., Albany County, Wyoming.

The access and use easement hereby granted being more particularly described as follows:

Beginning at a point whence the Northwest corner of Section 19, Township 13 North, Range 72 West bears North $41^{\circ}22'$ West 3364 feet; thence South $36^{\circ}22'$ East 521.78 feet along the West boundary line of the right of way of State Highway No. 287 to a point at the Northeast corner of the one acre tract; thence South $36^{\circ}22'$ East 208.71 feet; thence South $53^{\circ}38'$ West 208.71 feet; thence North $36^{\circ}22'$ West 208.71 feet; thence North $53^{\circ}38'$ East 208.71 feet to the Northeast corner of the one acre tract.

EXCEPTING THEREFROM

Beginning at a point on the Westerly right of way line of U.S. 287, which bears South $89^{\circ}08'07''$ East, (previously shown as South $89^{\circ}11'00''$ East) 540.68 feet and south $36^{\circ}26'00''$ East) 3551.95 feet from the Northwest corner (a well set granite stone) of said section 19; thence south $36^{\circ}26'00''$ East, 169.29 feet along said right of way to the beginning of a $1^{\circ}54'59''$ circular curve concave Northeasterly having a radius of 2989.79 feet and a delta of $32^{\circ}17'$; thence along said curve, a distance of 43.61 feet, the chord of which bears South $36^{\circ}51'05''$ East, 43.61 feet; thence South $54^{\circ}40'01''$ West, 211.12 feet; thence North $35^{\circ}35'4''$ West, 205.57 feet; thence North $52^{\circ}39'26''$ East, 207.75 feet to the point of beginning.

PHASE I - Installation of borings and/or monitoring wells at the locations shown on Figure 2 attached to this agreement. Exact locations of the borings and wells will be agreed upon by an authorized representative of the Grantee and the Grantor.

PHASE II - Installation and operations of a petroleum hydrocarbon contamination remediation system. Exact location will be agreed upon by an authorized representative of the Grantee and the Grantor.

Grantor grants the right of ingress and egress to and from the said land for any and all purposes necessary and incident to the exercise by the Grantee, and its employees or independent contractors, of the rights granted by this conveyance.

Grantor will not attempt to interfere with the Grantee in the conduct of its operations for any purpose whatsoever; that exclusive use is hereby granted to the Grantee.

This easement is granted only upon the express condition that the Grantee shall have the responsibility of properly plugging and capping any drilling holes it has drilled as part of this easement when it has finished collecting any and all data from said drilling holes, removal of all above ground structures and equipment when soil and groundwater contamination remediation is complete, and repair all damage to sidewalks and paved areas caused by Grantee to Grantor's satisfaction.

The Grantor does not, by this easement, require that the Grantee waive its sovereign immunity by entering into this easement. The Grantee fully retains all immunities and defenses provided by law with regard to any action based on this easement.

RE: Subsurface Investigation: Tie Siding, #0247-Z
Facility ID # 863

Dear Mr. Windham,

860 834

Throughout the next few months, the Wyoming Department of Environmental Quality, Water Quality Division (DEQ/WQD) will be conducting an investigation into subsurface hydrocarbon contamination at several sites located in Tie Siding, Wyoming. The investigation will involve the installation and sampling of groundwater monitor wells and soil borings. Since your property located at Tie Siding, Wyoming has been identified as being possibly contaminated with petroleum hydrocarbons, wells and/or soil borings may be needed on your property to fully characterize the extent of contamination.

Enclosed is an easement form which, when signed by you, will allow the DEQ/WQD to drill bore holes and install monitoring wells on your property. The DEQ/WQD will conduct all drilling in a manner so as to minimize any disruptions to your property or business. The groundwater samples taken from groundwater monitoring wells will be analyzed in a laboratory to determine the types and concentrations (amount of chemical contaminants) present. The information gathered will be most beneficial in designing and developing a system to remove these contaminants from the soil and groundwater.

Pursuant to Wyoming's corrective action program, "Water Pollution from underground storage tanks (USTs) Corrective Action of 1990", we are required to provide you, should you so desire, a duplicate sample of the groundwater we will sample from water wells on your property.

July 20, 1993

Page 2

You will be provided a copy of the laboratory result from the sample we will be taking whether you sign a duplicate sample waiver or not. However, if you choose to request a duplicate sample analysis, you will be responsible for any costs associated with the necessary lab work. If you do not wish to have a duplicate sample taken, please read and sign the enclosed "Waiver of duplicate Sample" form, and return it to me at the DEQ/WQD, Cheyenne.

If you have any questions, please contact me at (307) 777-7073.

Sincerely,

Roland Peterson
Senior Environmental Analyst
Water Quality Division

Tie Siding, WY 82084

RE: Subsurface Investigation Site Visit, Tie Siding General Store,
Tie Siding, Wyoming. UST Facility ID #834.

Dear Ms. Serrano,

The contracting procedure for the subsurface investigation has commenced for the Tie Siding General Store leaking underground storage tank (LUST) site. This procedure involves, among other things, an on-site visit by potential contractors of the project. This visit, involving visual observation, is done to familiarize the potential contractors with the site conditions. This letter is to inform you that the site visit is scheduled for 10:00 am, April 1, 1993, at the Tie Siding General Store.

If this presents any problems, or if you have any questions, please call me immediately at (307) 777-7073.

Sincerely,

Roland Peterson
Senior Environmental Analyst
Water Quality Division

RE: LUST Annual Contaminated Site Fee for Facility ID 0000834

Dear Sir:

The purpose of this letter is to request payment of an annual \$200 per site fee associated with a contaminated site caused by an UST registered in your name with this department. The Water Pollution from Underground Storage Tanks Act, W.S. 35-11-1424, created a corrective action account which provides for financial assurance coverage required by federal law and is to be used by the department to take corrective actions in response to releases from UST facilities.

The department has established a priority list of sites contaminated by USTs, and your site is included on this list for future cleanup at state expense. The \$200 annual site fee payment is due to the department on or before July 1 of each year until such time that site has been fully remediated. Sites will be remediated according to their position on the priority listing which primarily considers potential toxicological impact to nearby occupied structures or public utilities and potential contamination of groundwaters of the state. If your site has been determined by the state as being contaminated and you also have an UST system which is currently in use at the same location and you are paying your annual \$200 per tank registration fee, you do not have to pay the contaminated site fee.

In Summary:

1. The 1991 site fee of \$200 per site (check or money order payable to the Wyoming Department of Environmental Quality, Water Quality Division) is due to the Water Quality Division on July 1, 1991, and, on or before July 1 for each following year, until the site has been successfully remediated by the state. Please return a copy of the site fee invoice with your payment. Payment will not be accepted without the invoice and check or money order.

2. If there is new information which would change the status or affect information contained on the UST Registration/Notification Form previously submitted to the department, please provide the updated information on a new form which may be obtained by telephoning 307-777-7783.
3. If you have already been notified of the requirement to pay the "1990" site fee and have not paid the fee, please call 307-777-7783 at once.
4. If you have an existing UST system for which you are currently paying annual tank fees on the same site, only pay the tank registration fee.
5. If, after reading this letter, you have further questions, please contact the department by telephoning 307-777-7783.

Sincerely,

Leroy C. Feusner, P.E., DEE
UST Program Supervisor
Water Quality Division

FROM: Vince Green, Modeling Specialist and Ignacio Carballo, Project Manager
DATE: October 23, 2009
RE: **Hermosa Viewshed Analysis**

Summary

AWS Truewind, LLC was requested by Shell to complete a viewshed analysis on a proposed turbine layout with a hub height of 80m and a rotor diameter of 101m. This analysis was run for a 10 mile buffer of the turbine layout and five key observation points (KOP) identified by Shell. Included in this memo are a map of the viewshed results for the entire area of interest, a map for each KOP, a table identifying the number of turbines visible at each KOP, and a brief description of methodology.

Background

As growth in wind energy development continues it has become increasingly important to assess the impacts of these developments on surrounding communities. Among the most significant of impacts may be a farm's visibility from any given point on the landscape. One method of quantifying visual impact is through viewshed analysis.

Viewshed analysis is a visual impact assessment tool performed in a Geographic Information System (GIS). It can be used to identify visibility between two features on the landscape or identifying exposure of one feature across the landscape. This analysis utilizes a digital elevation model (DEM) combined with a feature layer of observation points. Several variables may be applied to the calculation to control for the characteristics of the features in question. Figure 1 below illustrates each of these variables. Two offsets may be used to define the height of the features in the viewshed. Offset A (OF1) represents the height of the observer while Offset B (OF2) represents the height of the feature considered for visibility. The user can control both, horizontal and vertical scan with AZ1-2, and V1-2 respectively, while also defining the search distance with R1-2.

Figure 1. Source: ESRI, ArcGIS Help Files, "Performing a viewshed analysis", Version 9.3.1, 2009

When the appropriate parameters have been defined the model computes the visibility of the observation points for each pixel in the raster. It is important to note that this operation does not consider the obstruction of visibility due to vegetation. In order to evaluate the influence of vegetation the elevation model must be manipulated to account for the increased height of the vegetation. Vegetation was not considered in this analysis.

Methodology and Results

This viewshed analysis was run using the Spatial Analyst extension in ArcGIS 9.3.1. The scenario assumed a non-vegetated condition with a turbine structure height of 130.5m and an observer eye height of 1.5m. The turbine structure height of 130.5m assumes a hub height of 80m and a rotor radius of 50.5m (101m rotor diameter). Elevation data was provided by Shell at a resolution of 5m for the area immediately surrounding the proposed turbines, which was merged with 10m USGS National Elevation Data (NED) data. The 10m resolution data was resampled to 5m in order to retain the precision of the higher resolution data near the turbines. The following table lists the number of proposed turbines that would be visible from each KOP, assuming a non-vegetated landscape.

Key Observation Point (KOP)	ID	# of Turbines Visible
20-acre Ranchettes	1	219
Priority Residential Growth Area	2	200
Ames Monument	3	164
Fish Creek Ranch	4	99
Virginia Dale	5	48

Table 1. Key Observation Points and number of turbines visible.

A map showing the viewshed of the proposed turbine layout over the entire study area is shown in Figure 2. Maps showing each of the KOPs are provided in Figures 3-7.

The results of the viewshed analysis are a modeled simulation and assess a worst-case scenario without vegetative cover. This analysis does not account for obstructions due to vegetation or man-made structures. It is important to note that the above values in Table 1 represent the visibility at the center point of each KOP, assuming a generalized elevation dataset. The number of turbines visible at each point may vary based on local terrain character not captured by the elevation dataset, the presence of intervening vegetation, and atmospheric conditions that impact visibility distance.
