

DOE Office of Indian Energy Renewable Energy Project Development Training: Curriculum Overview

**National Congress of American Indians
Annual Meeting: November 1, 2011**

Tracey A. LeBeau, Director, DOE Office of Indian Energy
Pilar Thomas, Deputy Director, DOE Office of Indian Energy
Dan Beckley, Jeff Bedard, and Liz Doris,
National Renewable Energy Laboratory
Matt Ferguson and Joe Cruz, The Reznick Group

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

DOE Office of Indian Energy

Mission: Direct, foster, coordinate, and implement energy planning, education, management, and programs that assist tribes with energy development, capacity building, energy infrastructure, energy costs, and electrification of Indian lands and homes.

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

Why Are We Here?

Indian Country contains a significant portion of United States energy resources

- **Tribes:**

- **Energy development can provide foundation for increased economic development and support Tribal sovereignty**

- Attracts trade and investment

- Indian Country capital markets interested in clean energy investment

- Traditional project finance/tax equity models can be challenging in Indian Country

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

The Situation

- Fewer than five renewable energy (RE) power plants in operation, with a combined capacity of less than 60 megawatts (MW)
- Lands in Indian Country have the resources to produce:
 - 1.3 million megawatt-hours (MWh) of wind (**about 148,000 homes**)
 - 9.2 million of solar photovoltaics (PV)
 - 4 million MWh of biomass
- Federal incentives reduce net capital cost for biomass, geothermal, wind, and solar projects **by about 30%**
- Interest expressed gaining access to DOE's unique expertise on how traditional renewable energy projects are financed - requested during Office of Indian Energy's National Tribal 2011 Tribal Roundtables and Energy Summit

Purpose of the Training Series

- Provide technical assistance directly to Tribes regarding the development of renewable energy projects on tribal lands
- Train tribal leaders and executives on the options for renewable energy development on tribal lands by:
 - Outlining a framework for project development
 - Describing commercial renewable energy technologies and where they may best be developed
 - Describing and giving examples of ***proven*** financing structures

Office of Indian Energy Project Development Training Curriculum

- **100 Series:** Project Development Framework
- **200 Series:** Market and Situation Analysis
- **300 Series:** Tribal Role and Associated Financing Options

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

Purpose of Today's Workshop

- Provide an overview of the training series
- Give an overview of the opportunity, framework, and ownership structures for project development
- Solicit feedback on training series usefulness and identify further tribal needs for assistance in project development

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

Timeline for Training Series

November 1, 2011:
NCAI Workshop Overview

January/February 2012:
Full In-Person Multi-Day Training

April 2012:
E-Learning Trainings

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

100 Level Training Series

Project Development Framework: BEPTC™ and SROPTTC™

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

What You Know

- Opportunity exists for renewable energy development on tribal lands
- You have an existing electrical demand
- You would like to make money

What You Will Learn

- Project development process and common pitfalls
- What you need for success
- How to say NO!

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

Intent

This methodology serves the intent of **actually** building “the project” at the end of the day, and driving to that conclusion while managing risk.

Who?!

Me?

Or? Hey *that doesn't make sense!*

YOUR FAULT

Project Development
Finance?

And

&

Project
FINANCE

WHEN?!

“and then”

Finance

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

Key Concept ♦ **Project Development**

THERE ARE TWO CONCEPTS TO DEVELOP

- Market Context (**BEPTC**)
- Project Development Framework (**SROPTTC**)

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

Key Concept ♦ Project Motivation

Project Motivation

- Developing project concepts into reality requires a strong foundation of drivers to overcome challenges, uncertainty, and maintain forward momentum.
- In a commercial application, this is first established in a market analysis; if a public entity is involved, it is not the same thing (or even appropriate), but the effect has to be achieved.

Project Motivation

If the opportunity is big and resilient enough, it will motivate the effort and investment needed to overcome the challenges, continue the investment, and mitigate the risk.

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

Project Motivation: Market Context

I'm motivated already! How do I do it?

- **Baseline:** existing energy “reality”
- **Economics:** fundamental driver(s)
- **Policy:** create conditions for success
- **Technology:** what, when, where, how many?
- **Consensus:** establish, advance, defend

Establish and maintain motivation within this framework

BEPTC

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

BEPTC – Project Motivation Framework

| Baseline | Economics | Policy | Technology | Consensus |
|--|---|---|--|---|
| Your Energy Reality | Fundamental Drivers | Conditions for Success | What, when, how many... | Defend, defend, defend... |
| <ul style="list-style-type: none"> • Define energy • Unit and point of measure • Source of fuel • Vulnerabilities • Impact to economy • Industry structure • Regulatory structure | <ul style="list-style-type: none"> • Understanding costs AND benefits • Dominant input to energy economics • Relationship between inputs and results • Ratepayer perspective • Social cost/benefit | <ul style="list-style-type: none"> • Market Policies • Regulatory Policy • Economic Development • Jobs • Energy Security • Environmental Policy | <ul style="list-style-type: none"> • What is real? • What is experimental? • Which one is right for my system/location? • How much is here? • How much can be used? • Integration/reliability? | <ul style="list-style-type: none"> • Communicate • Create a forum • Defend fundamentals • Build consensus • Raise the level of conversation • Lather, rinse, repeat |

Key Concept ♦ **Process Discipline**

SROPTTC

Site

Resource

Off-take

Permits

Technology

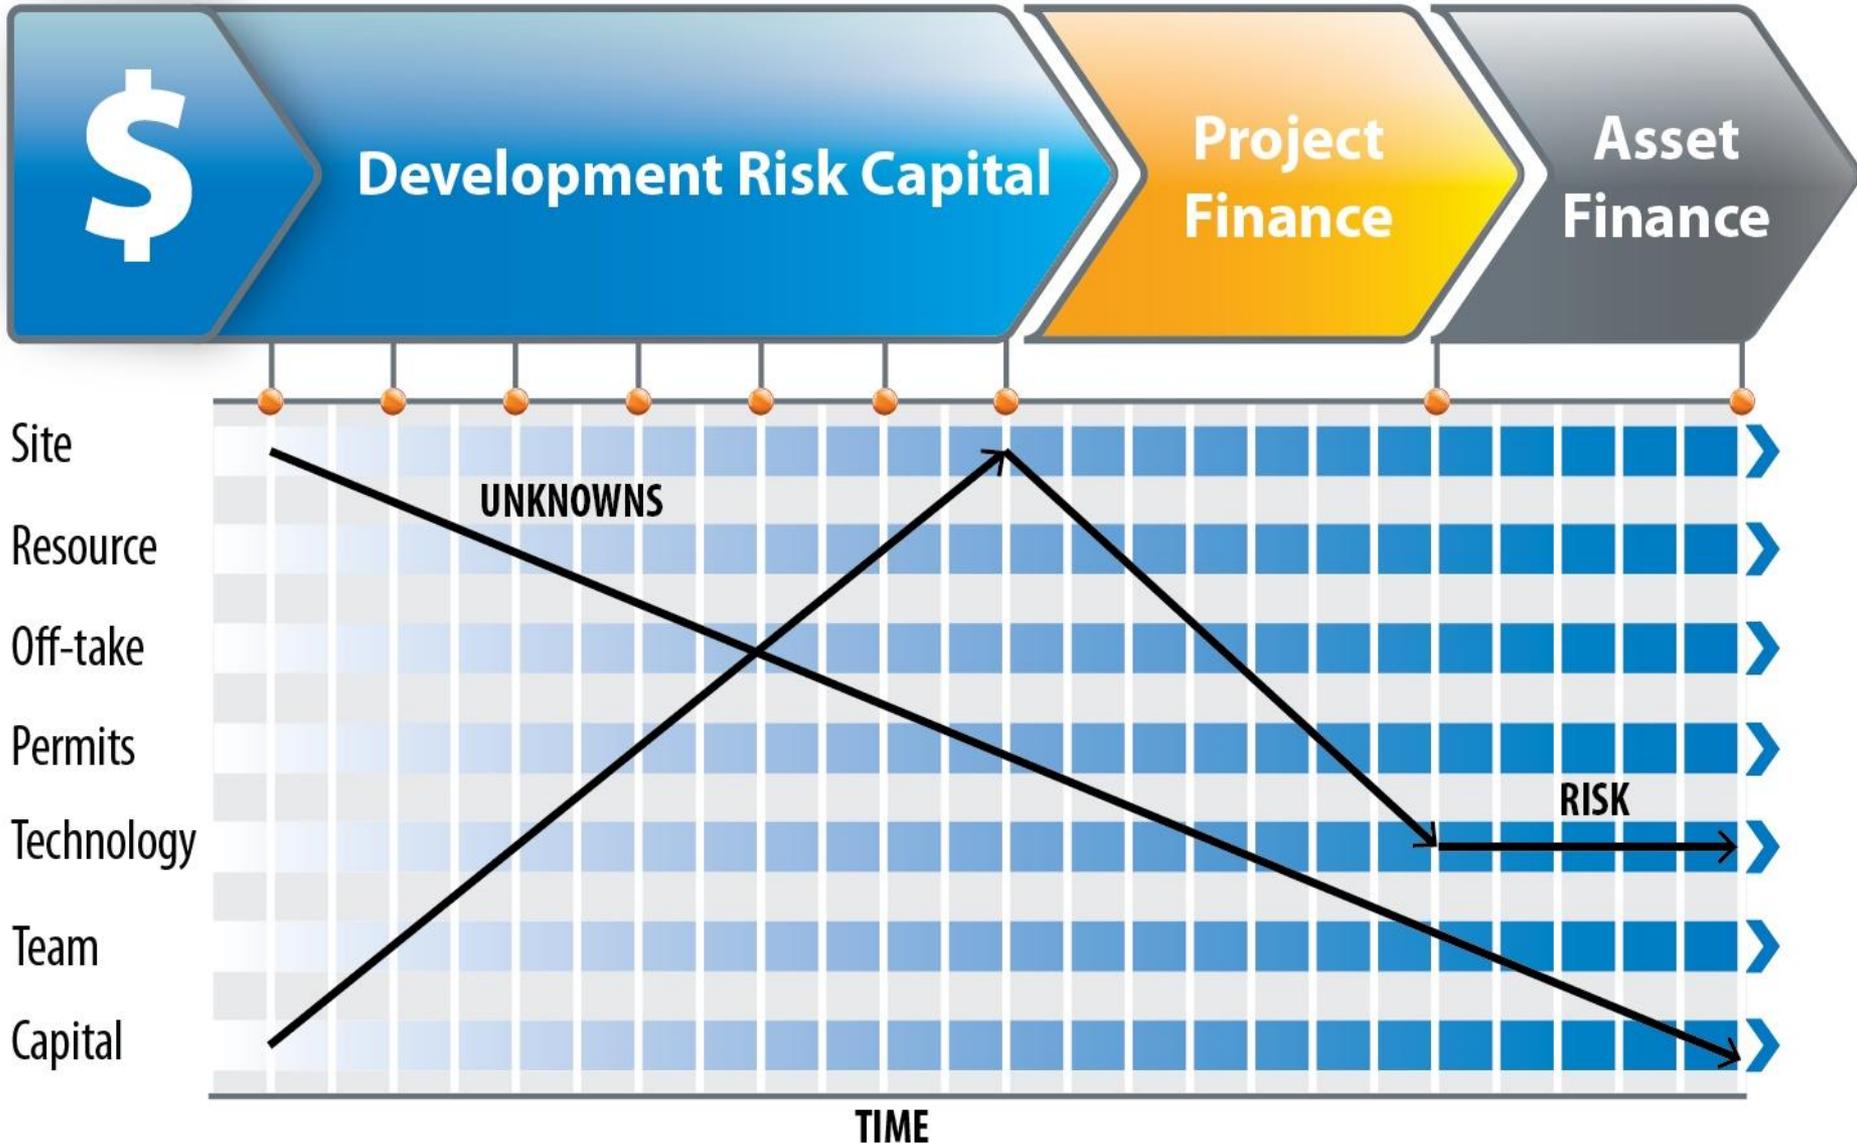

Team

Capital

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

Process Discipline: SROPTTC

Using this framework to visualize the development process:

- Best practice: process is iterative; each iteration aims to find a fatal flaw and end project – manage development risk.
- Best practice: not making the GO/NO GO decision until the end; incremental decisions followed by incremental investments, managed investment risk.
- Best practice: focus on (invest in) pro forma inputs incrementally, maximizing yield on every dollar invested.

Pitfalls:

- (1) Mistaking each iteration for final “go/no go”, vs. “go forward/stop”
- (2) Not getting out early enough on bad projects (even if investment would be lost)
- (3) Not investing for fear “it won’t work”; BEPTC probably not fully developed, which may indicate that doing nothing is riskier than investing under uncertainty.

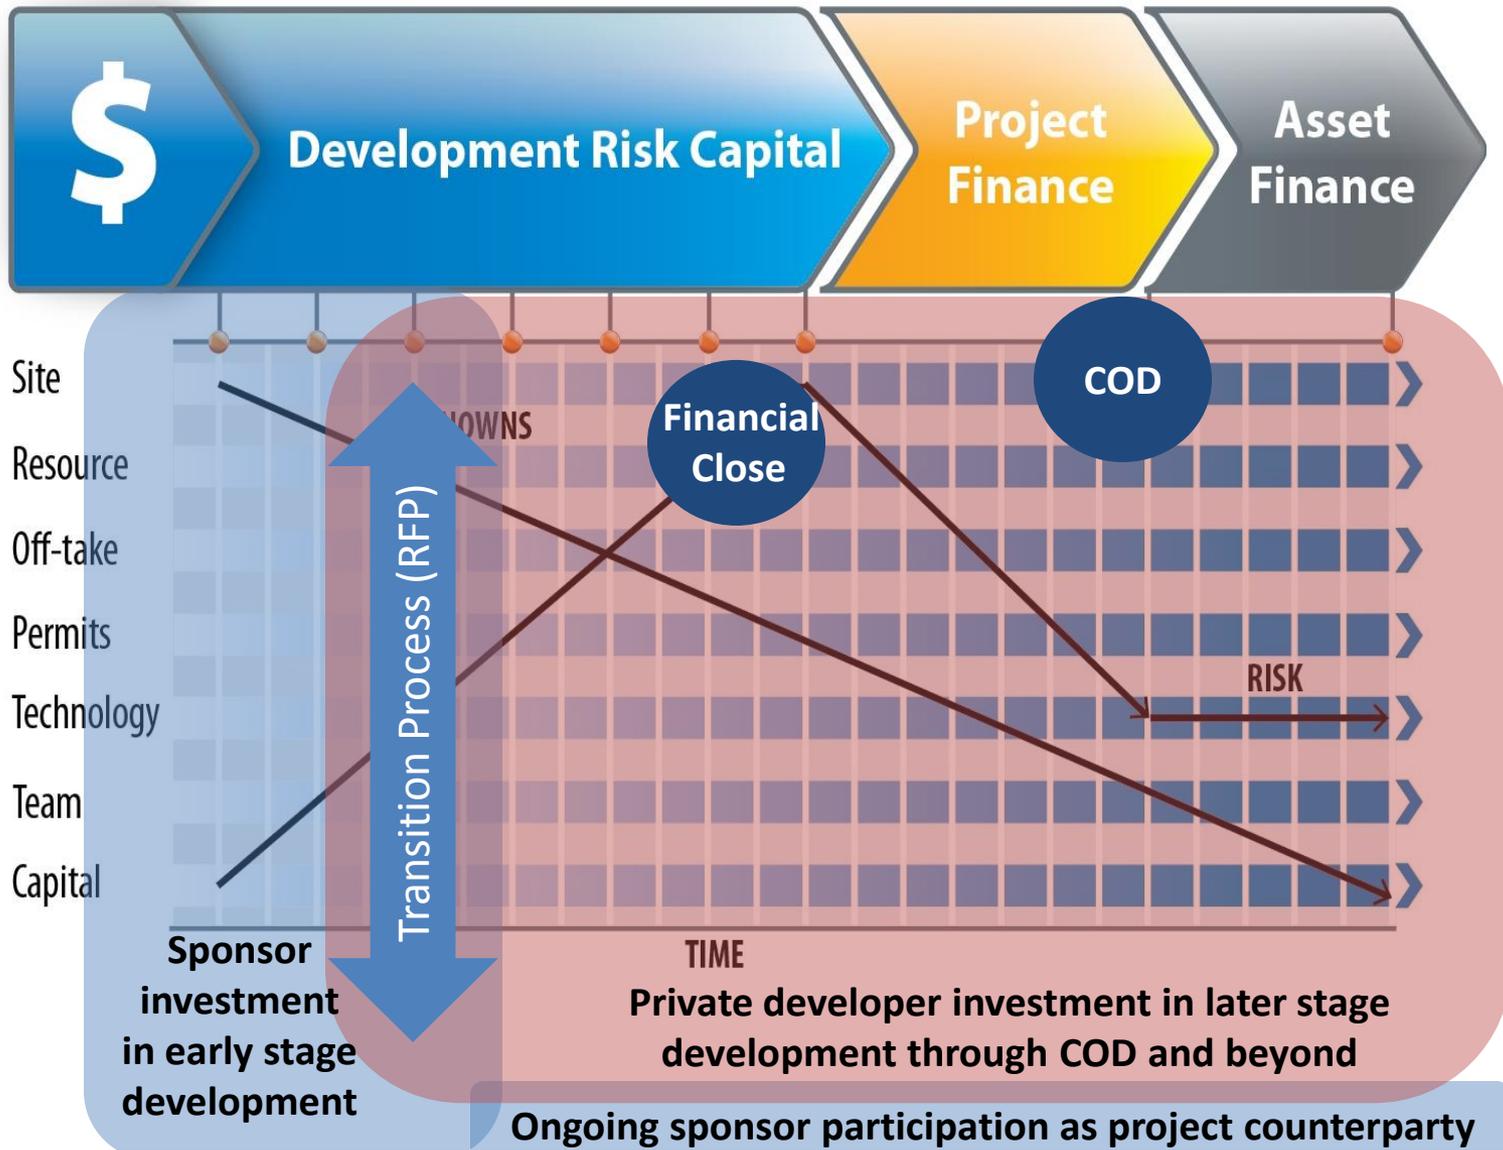

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

SROPTTC – Project Development Framework

| Site | Resource | Off-Take | Permits | Technology | Team | Capital |
|--|---|--|--|--|--|---|
| No Site, No Project | Engineering Assessment | Off-take Contract – (Revenue) | Anything that can stop a project if not in place... | Engineered System | Professional, Experienced, Diverse | Financing Structure |
| <ul style="list-style-type: none"> • Site control • Size and shape • Location to load and T&D • Long-term control • Financial control • Clear title • Lease terms • Collateral concerns • Environmental • Access • O&M access • Upgradable | <ul style="list-style-type: none"> • Volume/Frequency • Variability • Characteristics (power/speed) • 24-hour profile • Monthly, seasonal and annual variability • Weather dependence • Data history • Std. Deviation • Technology suitability | <ul style="list-style-type: none"> • Credit of counterparty • Length of contract • Terms and conditions • Reps and warranties • Assignment • Curtailment • Intercon • Performance • Enforcement • Take or pay • Pricing and terms | <ul style="list-style-type: none"> • Permitting/entitlements • Land disturbance • Environmental • Cultural impacts • Resource assessments • Wildlife impacts • Habitat • NEPA, EIS • Utility inter-connection • Other utility or PUC approvals | <ul style="list-style-type: none"> • Engineering design plans • Construction plans • Not generic solar panel and inverter • Engineered resource/conversion technology/balance of system designs • Specifications • Bid set | <ul style="list-style-type: none"> • Business management • Technical expertise • Legal expertise • Financial expertise • Utility interconnection expertise • Construction/contract management • Operations • Power marketing/sales | <ul style="list-style-type: none"> • Development equity • Project equity • Project debt • Mezzanine or bridge facility • Tax equity • Grants, rebates, other incentives • Environmental attribute sales contracts (RECs) • Bond finance • Non-recourse project finance |

| | Project Debt | | | Tax Equity | | Lease Equity | DOE |
|---------------------------|---|---|---|--|---------------------|------------------------------------|----------------------------|
| | Bank | Private Bond | Term Loan | Levered | Unlevered | | |
| Investor Universe | Commercial Banks | Private or 144A Offering | Institutional investors w/energy focus | Financial investors and some corps. with tax appetite. | | Lease equity market, institutional | DOE supports 100% or 80% |
| Target Rating | “Investment Grade” no rating needed | BBB-/NAIC 2 | B is doable; BB is preferred | NA (Investment Grade Offtaker) | | NA (Invest. Grade Offtake) | NA |
| Market Capacity | Up to \$1 Billion; up to 1.0XDSCR in Low Case | +\$1.0 Billion | \$750 Million | Sized to target IRR | | Sized to 20-49% of Capital Stack | No Limit |
| Indicative Pricing | L+250-350 2007: 100-150 +fees 1.5-2.0% | 7% Area; T + 5%-6% Fixed | L+250-500; 425 - 450 Libor floor; | 11-13.5; IRR by Flip | 9-10.5% IRR by Flip | 9.0-12.5% after tax yield | T+75-100 bps |
| Tenor | 5-7 years typical, up to 15 | Term of PPA (20-25); Prepayment Penalty | Up to 7 years | Target IRR reached by year 10 with PTC; 6-7 with ITC | | 80% of Useful Life | Up to 30 years |
| Sizing Profile | DSCR Requirements 1.30-1.40X; lockbox; PPA ‘Tail’; EPC with credit support; LIBOR Swaps; Reserves | | 1% amortization with cash sweep | Downside flip dates: +3 years in downside; +6 years in severe downside | | 1.30-1.40 “RSCR” Like Project Debt | Driven by required Ratings |

100 Series Summary

- Project development is iterative—it's about identifying and moving forward on the most likely successful projects
- Use BEPTC to verify feasibility, identify, and define motivation for a project
- Use SROPTTC to work through project development process

| SD | 10% by 2015 | 10 MW | No |
| NE | 10% by 2015 | 25 kW | 25 kW |

Percent Consumers served by Utility Type in Region

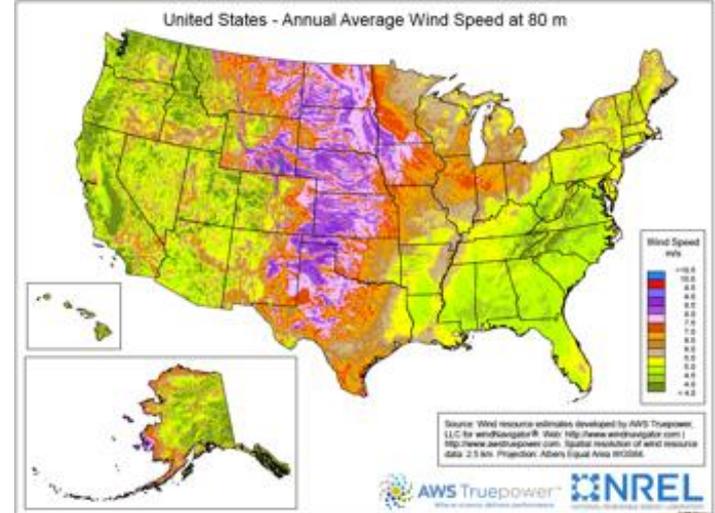

| Energy Prices | Region | U.S. |
|-----------------------------|------------------------|--------------------------|
| Electric (¢/kWh) | 2.6-14.2 (Avg. 7.1) | 0.01-123.2 (Avg. 9.8) |
| Kerosene (\$/gal) | NA | 2.68 |
| Heating Oil (\$/gal) | 2.11 | 2.39 |
| Propane (\$/gal) | 1.69 | 1.78 |
| Natural Gas (\$/mcf) | 8.98 | 12.14 |

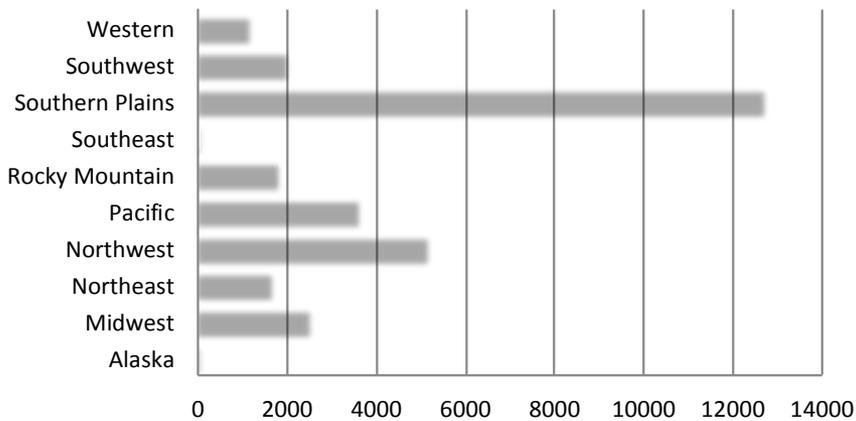

Wind Energy

- Capture kinetic energy using propeller-like blades on a shaft
- When the wind makes the blades turn, the shaft spins a generator to produce electricity
- Towers above 30 meters capture faster and less turbulent wind

Installed Capacity by Region (MW)

U.S. total = 42,432 MW

Energy Technology Costs

Installed

\$1.20-2.34/Watt

Levelized (LCOE)

6-12¢/kWh

| Natural Gas (\$/mcf) | 9.43 | 12.14 |

| Policy | Limit/Goal |
|-----------------|-------------|
| RPS | 33% by 2020 |
| Interconnection | No Limit |
| Net Metering | 1 MW |

Solar Photovoltaic (PV) Energy

- Solar cells convert sunlight into electricity
- Technology Options:
 1. Traditional: efficient, flat-plate
 2. Thin-film: flexible, micro-thin layers
 3. Solar inks, dyes, and conductive plastics: expensive, but efficient

| Energy Technology Costs | |
|-------------------------|------------|
| Levelized (LCOE) | 18-43¢/kWh |

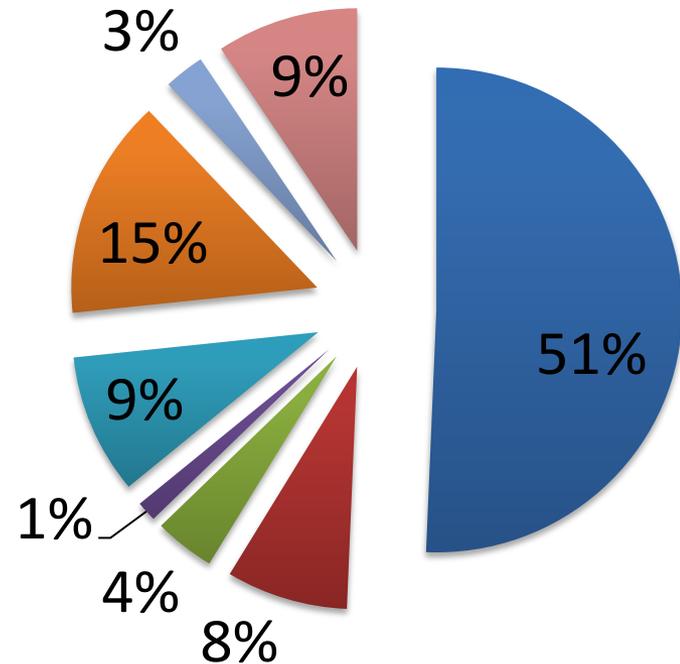

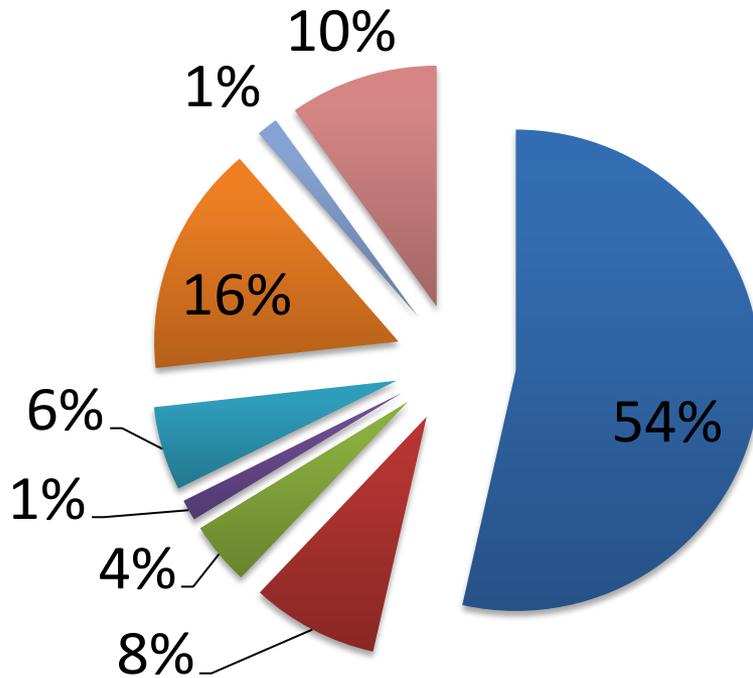

- Top States**
- California
 - New Jersey
 - Colorado
 - Arizona
 - Florida

Solar PV Installed Cost Breakdown

Ground Mount – \$3.50/Wdc

Roof Mount - \$3.75/Wdc

- Module
- Electrical Installation
- Structural Installation

- Inverter
- Site Preparation
- Business Processes

- Wiring/Transformer
- Racking

A survey of modules 300, 301, 302, 310 & 410

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

Objective

- For tribal nations with natural resource wealth to:
 - Learn about existing sources of renewable energy project **capital**
 - Learn **proven** renewable energy project finance structures so that decision makers and advisors are informed about the financial and economic implications of transaction structures

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

- You Know

- How to identify economically viable renewable energy projects
- That renewable energy project development can be an economic development tool
- That there are a range of roles that tribal nations can play in a renewable energy opportunity

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

- You Will Learn
 - About common renewable energy project organization models and financing structures
 - How to assess varying tribe roles within organization models, general risks, and returns in renewable energy opportunities
 - About general economic drivers of renewable energy project finance structures

Training Series

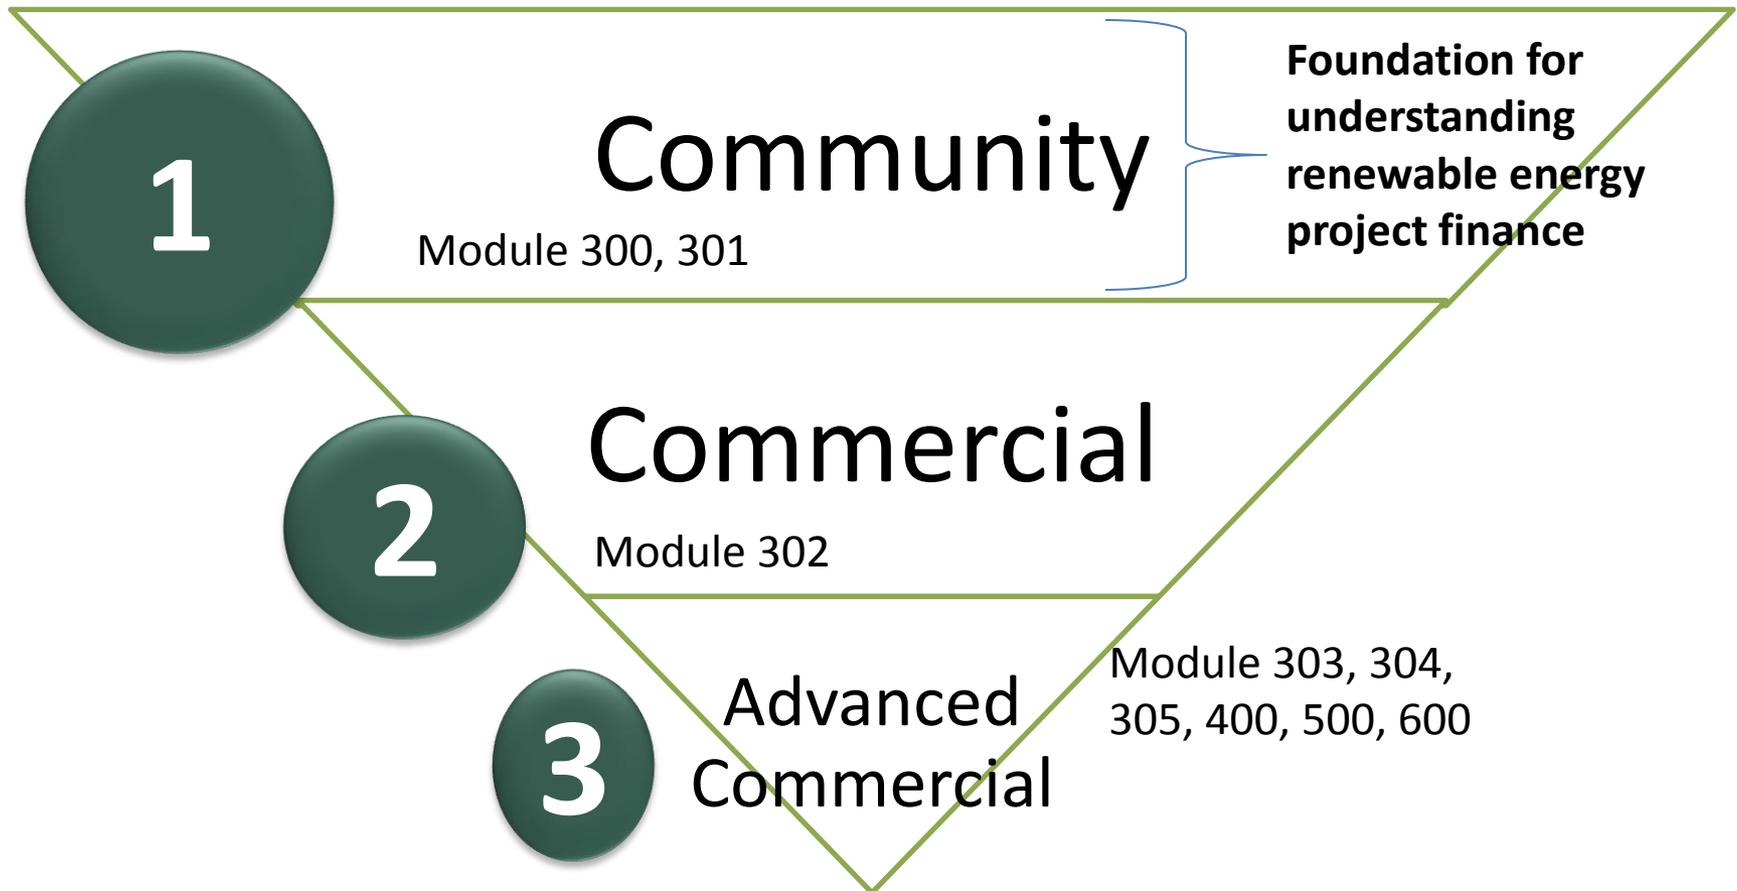

| Module | Description | Case Study |
|--------|--|---|
| 300 | Finance Series – Introduction to public, private partnership of renewable energy project finance | Overview of Community & Commercial finance structures |
| 301 | Detail for lawyer, manager, finance responsible party | Community Project |
| 302 | Detail for lawyer, manager, finance responsible party | Commercial Project - Partnership Flip |
| 303 | Detail for lawyer, manager, finance responsible party | Commercial Project - Inverted Lease |
| 304 | Detail for lawyer, manager, finance responsible party | Commercial Project - Sale/Leaseback |
| 305 | Detail for lawyer, manager, finance responsible party | Public/Private Structure Analysis & Strategy |

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

Building Blocks of Curriculum

Agenda

- **Quick Overview**
 - **Recap relevant principles Series 100 & 200**
- Case Studies
 - One: Community (Solar)
 - Two: Fundamental Commercial (Solar)
- Financial Structures & Models
- Case Study Three: Advanced Commercial (Wind)
- Conclusion

Value of Energy

- What is the demand for energy?
- Selling electricity = revenue
- Electricity basics
 - Power markets
 - Retail price, wholesale vs. cost of production
 - Renewable Energy Credits
 - Independent system operators, etc.
 - Transmission → “gotta get to buyer”
 - Closed vs. open (regulated vs. unregulated)
 - California vs. North Dakota
- Levelized Cost of Energy (LCOE)
- Tax Credits and other subsidies

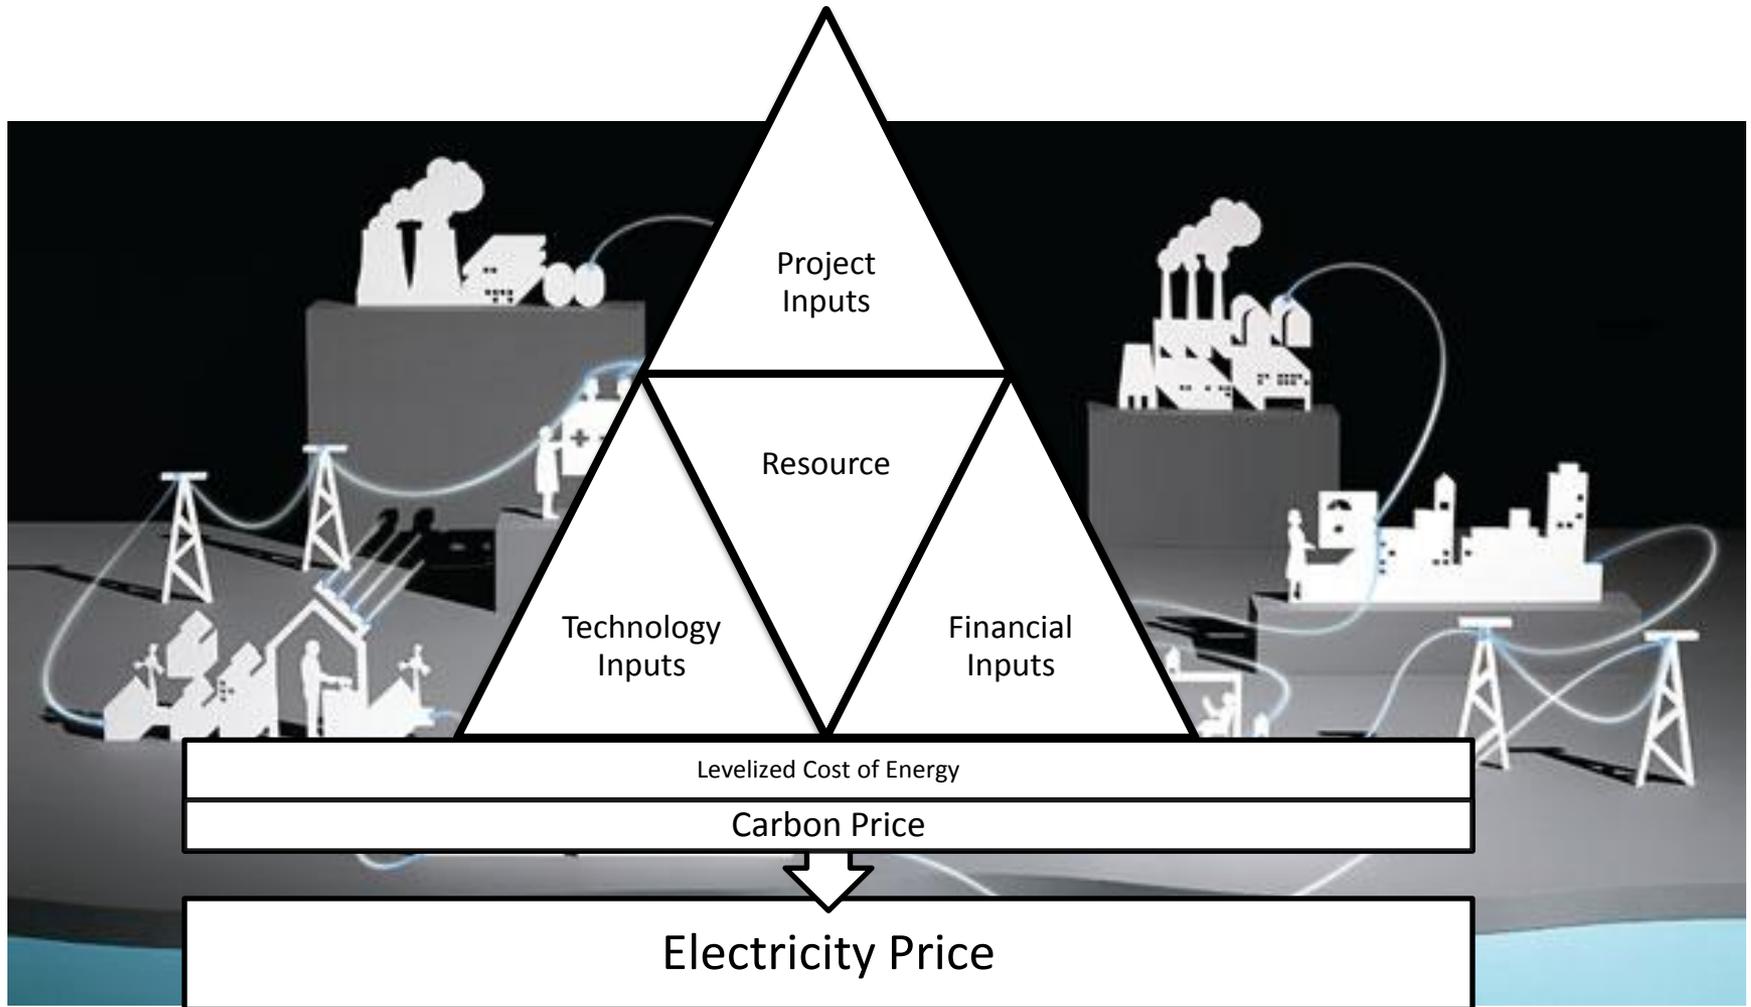

LCOE/Cost of Energy Controls EVERYTHING

U.S. DEPARTMENT OF
ENERGY

Two Paths

- Community
 - Install solar equipment for electricity cost management
 - Government center, casino, hotel, school
- Commercial
 - Install utility scale solar or wind for revenue generation
 - Contracted sale with a utility
 - Contracted sale with a large electricity user

1

Solar Community

- Self Use
- Capital Budgeting Decision

2

Fundamental Commercial

- For Sale
- Business Decision

3

Advanced Commercial

- For Sale
- Business Decision

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

Case Study One: Community Project

1

Solar Community

- Self Use
- Capital Budgeting Decision

- Solar PV
- 1 MW
- \$3,500/kW or \$3,500,000/MW installed cost
- Inspiration
 - 1 MW PV system that provides power for HVAC system for tribal casino hotel
 - 1 MW PV system – powers a significant portion of the total energy needs for tribe's business operations
- Quick application
 - Begin feasibility for existing use – government, enterprise or residences
 - Solar tax credit expires 2016

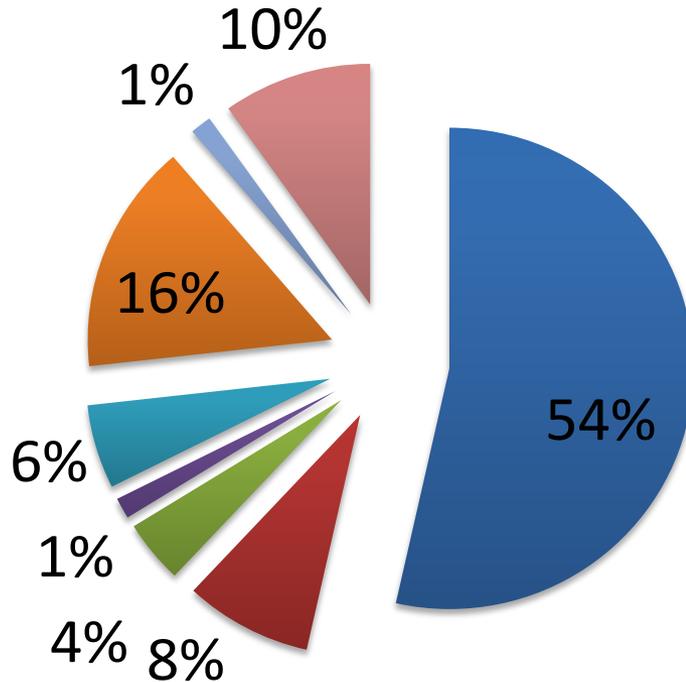

U.S. DEPARTMENT OF
ENERGY

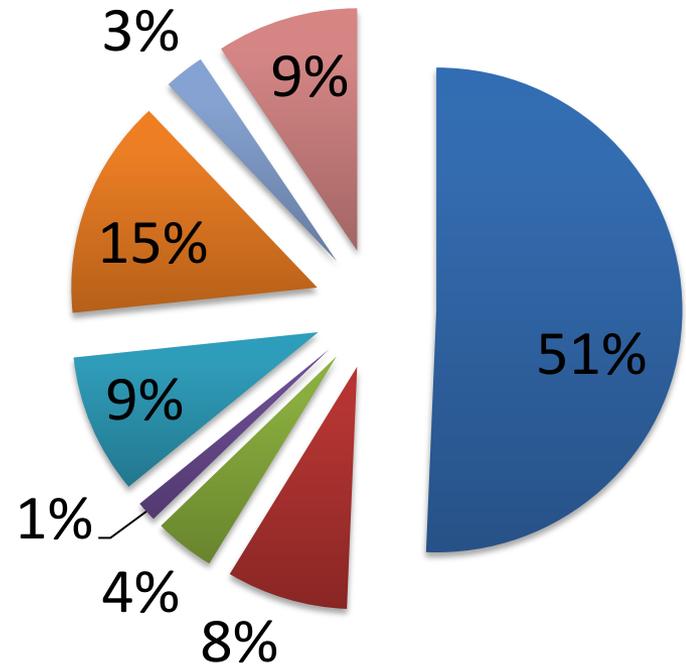

Office of
Indian Energy

Solar Installed Cost Breakdown

Ground Mount – \$3.50/Wdc

Roof Mount - \$3.75/Wdc

- Module
- Inverter
- Wiring/Transformer
- Electrical Installation
- Site Preparation
- Racking
- Structural Installation
- Business Processes

Data Source: RMI 2010: <http://www.rmi.org/Content/Files/BOSReport.pdf>

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

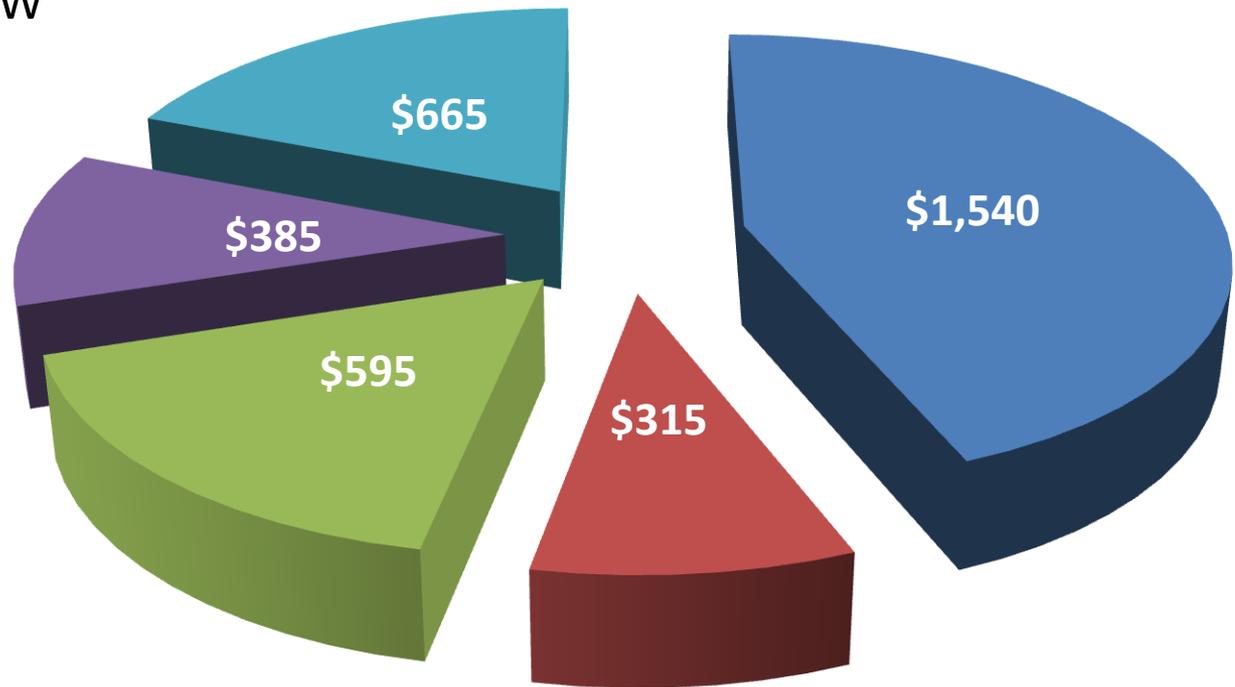

Case Study One: Community Project

Example System Cost Breakdown

Solar PV System Cost (000)

Total Cost/Watt: \$3.50
System Capacity: 1 MW

- PV Modules
- Inverter
- Installation/Labor
- Balance of System
- Soft Costs

Total system cost \$3.5 million

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

Case Study One: Community Project

1

Solar Community

- Self Use
- Capital Budgeting Decision

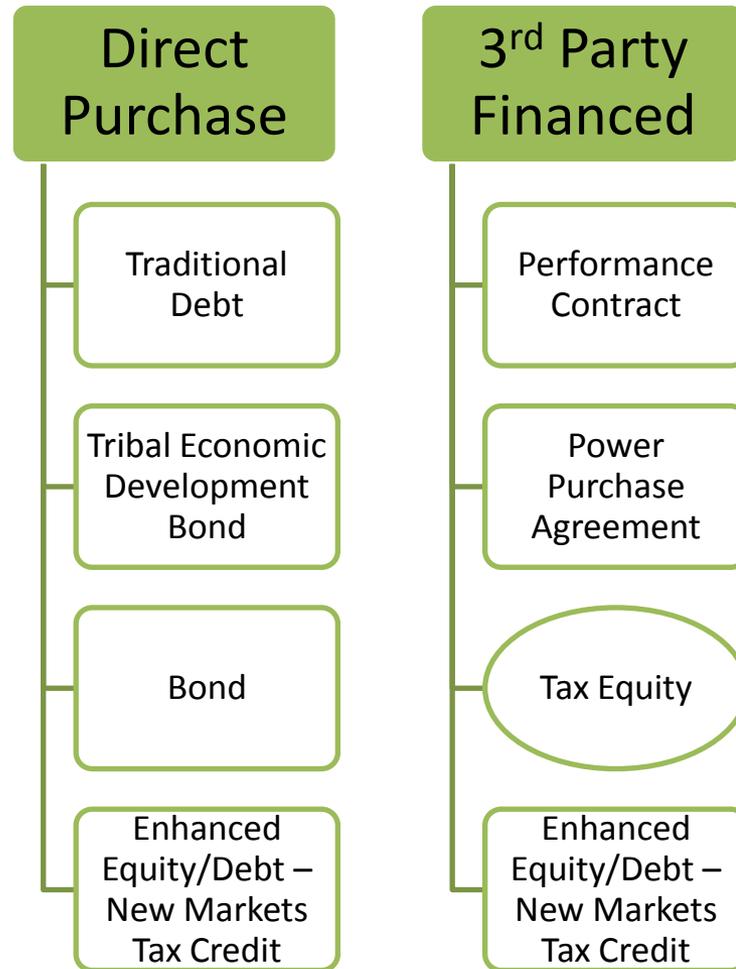

- Electricity access and connection
 - Yes - Replacement, substitution, or complement
 - No - Originating necessary resource
- Source of fuel has broad implications
 - Coal
 - Hydroelectric
 - Natural Gas
- Existing electricity price
- Forecasted electricity and energy prices

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

Capital for tribal community project

Case Study One: Community Project

1

Solar Community

- Self Use
- Capital Budgeting Decision

- Sources & Use of Project Capital
 - Sources of payment
 - Grants, Tribal Nation's money, debt
 - Use of capital for project equipment/development
 - Engineering, Procurement & Construction (EPC) Agreement
- Project economics & financial model
- Operating costs
 - Operations & Maintenance Agreement
- Financial details
 - Payback
 - Retail rates

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

Case Study One: Community Project

Range of Cost for Solar PV System

1

Solar Community

- Self Use
- Capital Budgeting Decision

- 40 – 55% Solar panels
- 6 – 10% Inverter
- 12 – 25% Installation/labor
 - includes racking hardware
- 5 – 10% Balance-of-system
 - wiring, electrical hardware, interconnection, kiosks, etc.
- 15 – 25% Soft costs
 - permitting, accounting, legal, developer fee, etc.

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

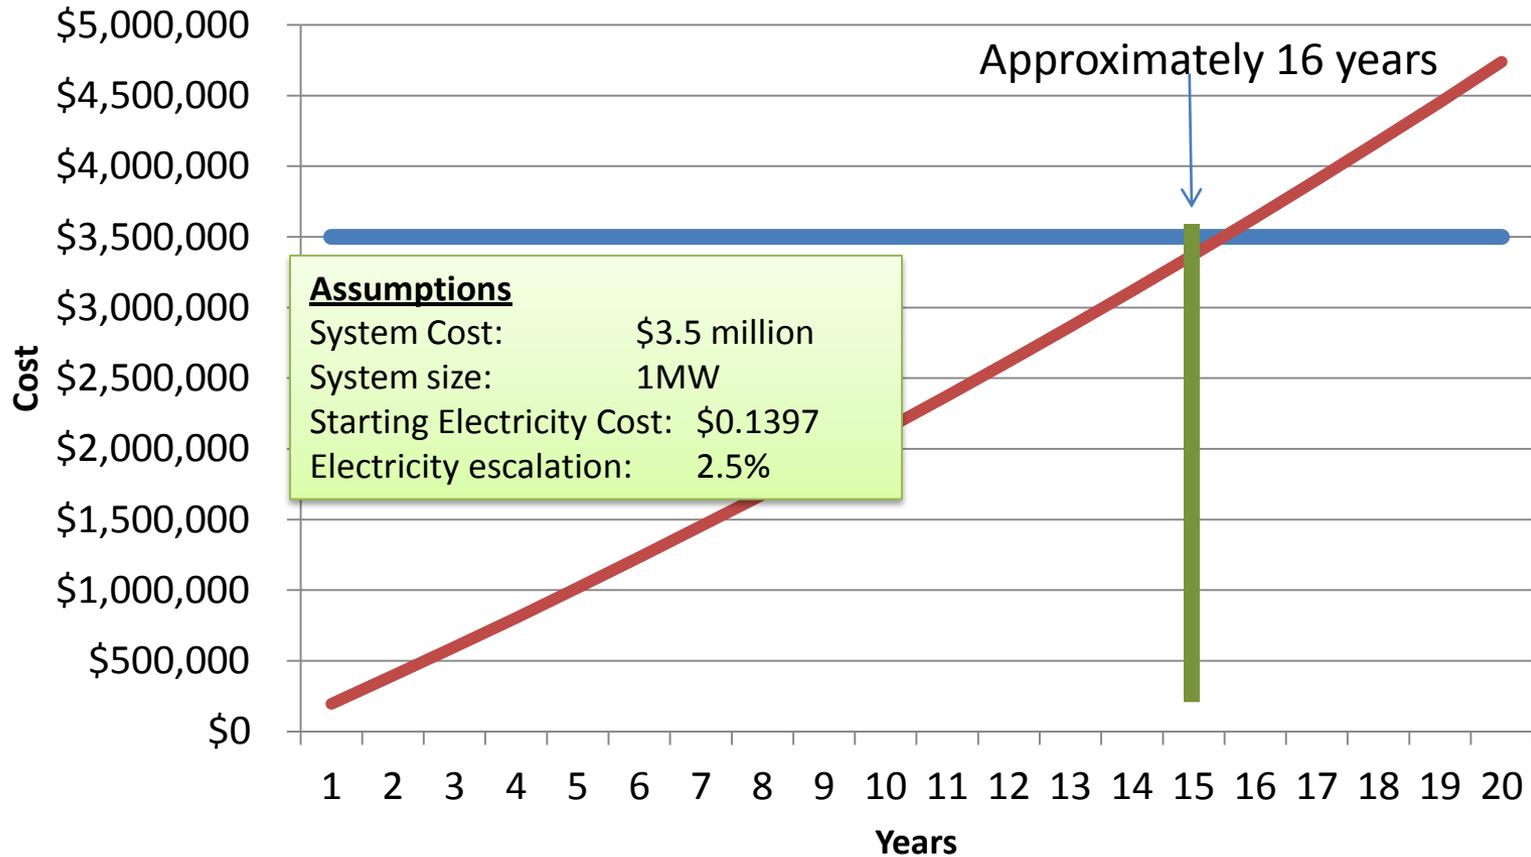

Case Study One: Community Project

Solar Project Payback

1

Solar Community

- Self Use
- Capital Budgeting Decision

Assumptions

System Cost: \$3.5 million
System size: 1MW
Starting Electricity Cost: \$0.1397
Electricity escalation: 2.5%

Excludes Federal Incentives

— System Cost

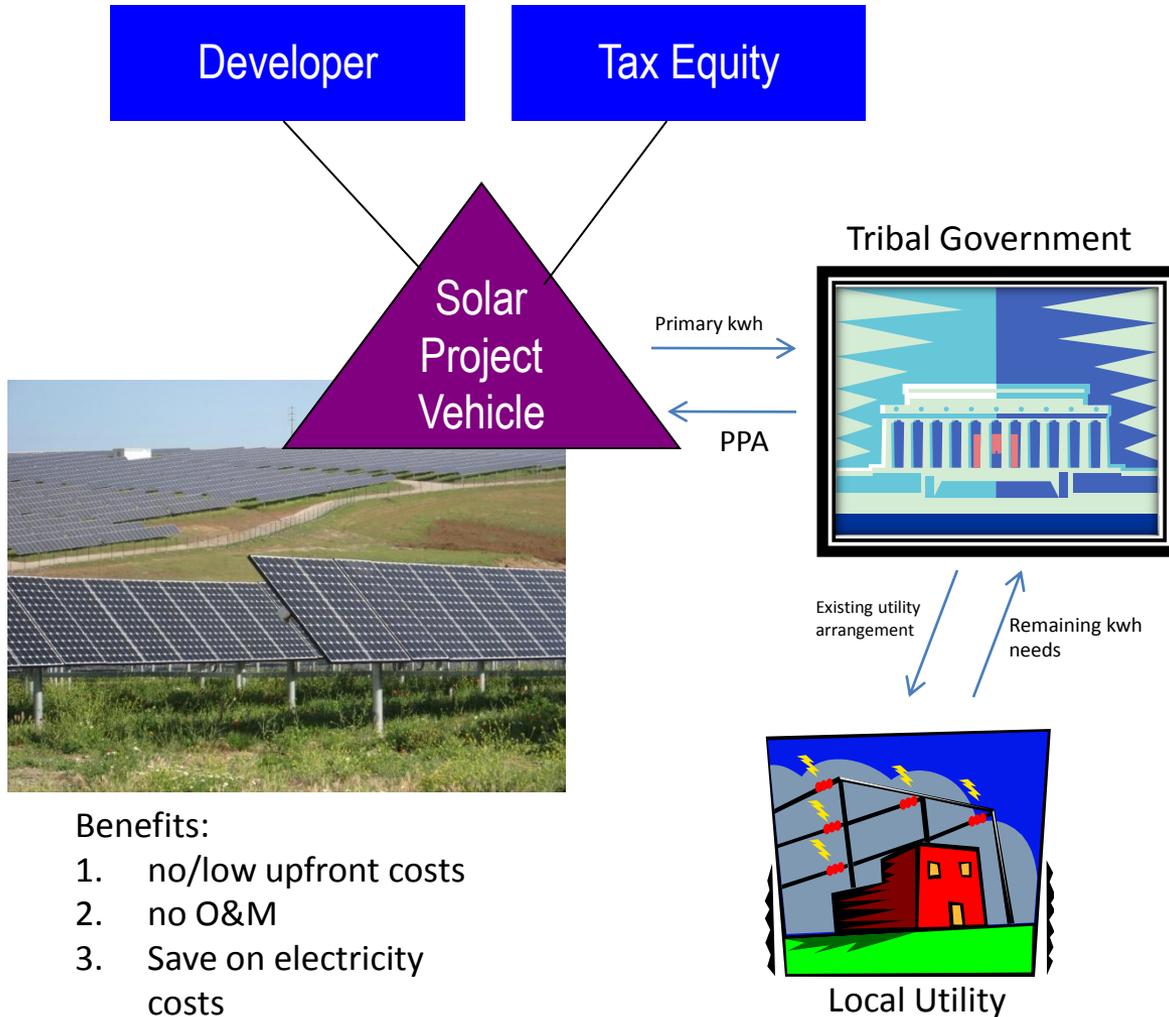

— Avoided Electricity Cost

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

Tribal PPA Solution

Step 1 – Instead of purchasing system, tribe hosts system and buys electricity from SPV via a power purchase agreement (PPA)

Step 2 – Upon flip or expiration of risk period tribe exercises option and purchases pre-owned system

- Benefits:
1. no/low upfront costs
 2. no O&M
 3. Save on electricity costs

Wind Commercial

- For Sale
- Business Decision

Case Study Two: Solar Commercial Project

2

Fundamental Industrial

- For Sale
- Business Decision

- Federal Tax Credits reduce the capital cost of renewable energy projects for taxable entities only
- Tribes are tax exempt; therefore, financing the is renewable energy project with a non-tribal entity (i.e., tax equity investor) is compelling
- Tax Equity Investors = passive investors, limited partners that own the renewable energy project and primarily get their investment return through federal and state income tax benefits (tax deductions and tax credits).

Module 302

Agenda

- ✓ Overview
- ✓ Case Studies
 - ✓ One: Solar Community
 - ✓ Two: Fundamental Commercial
- **Financial Structures & Models**
- Case Study Three: Wind Commercial
- Summary

Considerations

- Partners

- Tribes are tax exempt: need a partner that can use tax credits
- Use of Federal subsidies creates a “marketable/bankable” project

- Motivational Factors

- Develop a low cost project with a competitive LCOE
 - A competitive LCOE translates into the ability to sell power and make a profit
- Be MORE than a landlord
- Extract more value/money out of the project than when pursuing it independently, or alone isn't lucrative

Legal Entity Refresher

- Renewable energy assets/projects generally held in special purpose vehicle (SPV)
- Pass-through entity
 - Partnership
 - Limited Liability Company
 - IRS considers all “partnerships”
 - Excluding single member LLC with election
- Partnership tax law applies

Capital Structure: Sources and Use

| | Sources | Roles of Parties |
|-----------------------|--|--|
| Flip | General Partner (GP) Limited Partner (LP) | GP – Project Developer LP – Tax Equity Investor (Tax credit, Depreciation) |
| Inverted Lease | Developer Equity Investor | Developer – Lessor (Depreciation) Equity Investor – Purchaser, Lessee (Tax Credit) |
| Sale Leaseback | Developer Equity Investor | Developer – Seller, Lessee Equity Investor – Purchaser, Lessor (Tax credit, depreciation) |

Use: Construction and Equipment Costs

**Project IRR @
20 Years = 10%**

U.S. DEPARTMENT OF
ENERGY

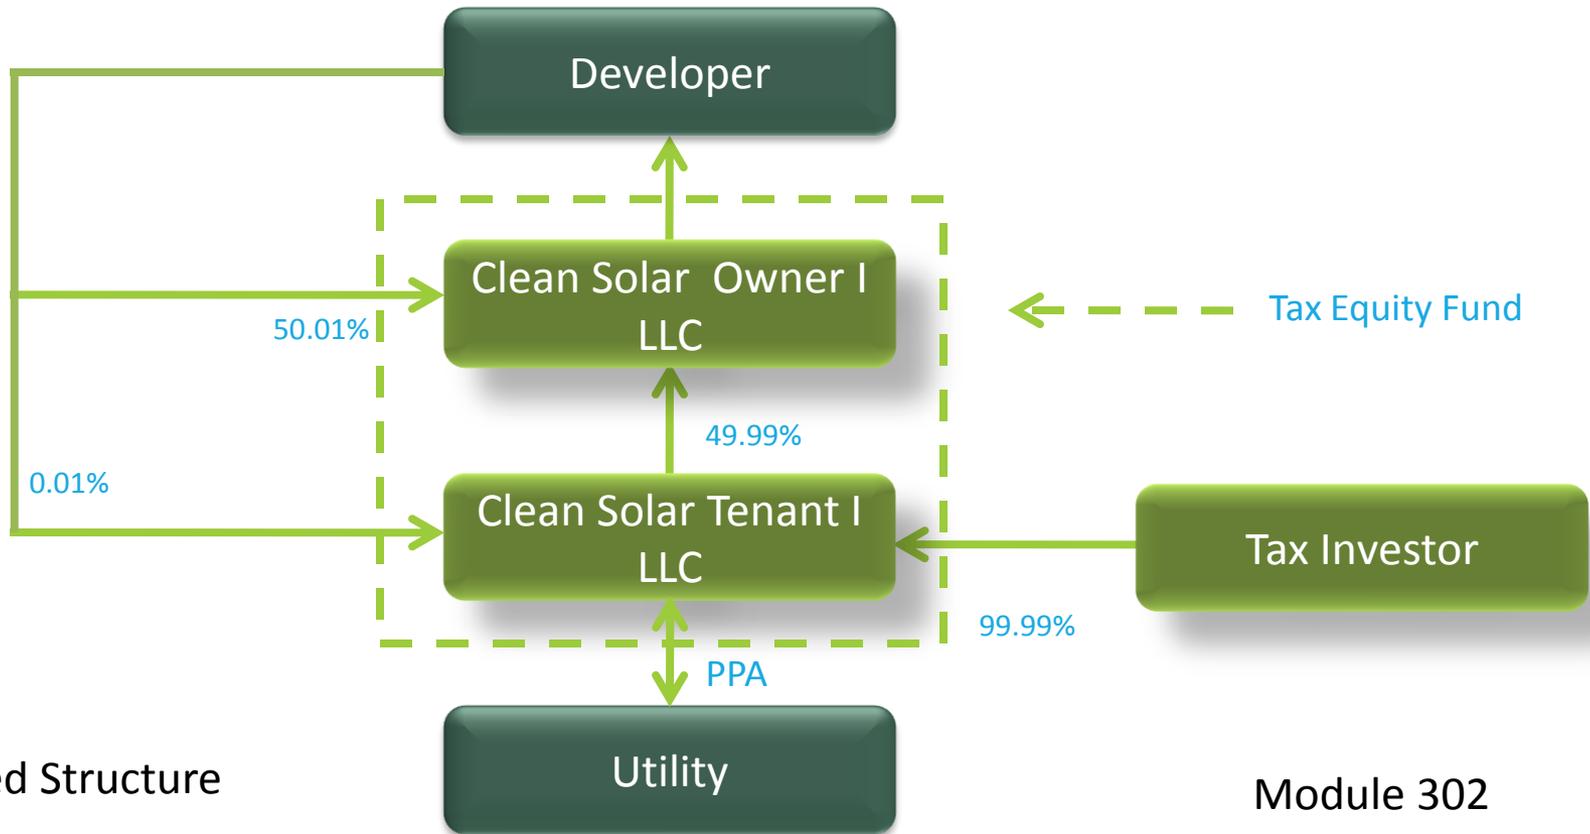

Office of
Indian Energy

Tribal Ownership

- Total tribal ownership is feasible post flip
- Investor owns a small interest post flip (e.g., 5%)
 - Efficient for tribe to buy out investor
- Legal and beneficial ownership cash flow
 - Tribe is paying self:
 - Rent/royalty
 - Tribal taxes
 - If project was subject to non-tribal taxes – full tribal ownership reduces likelihood of taxability.

Inverted Lease Structure

Inverted Lease Structure

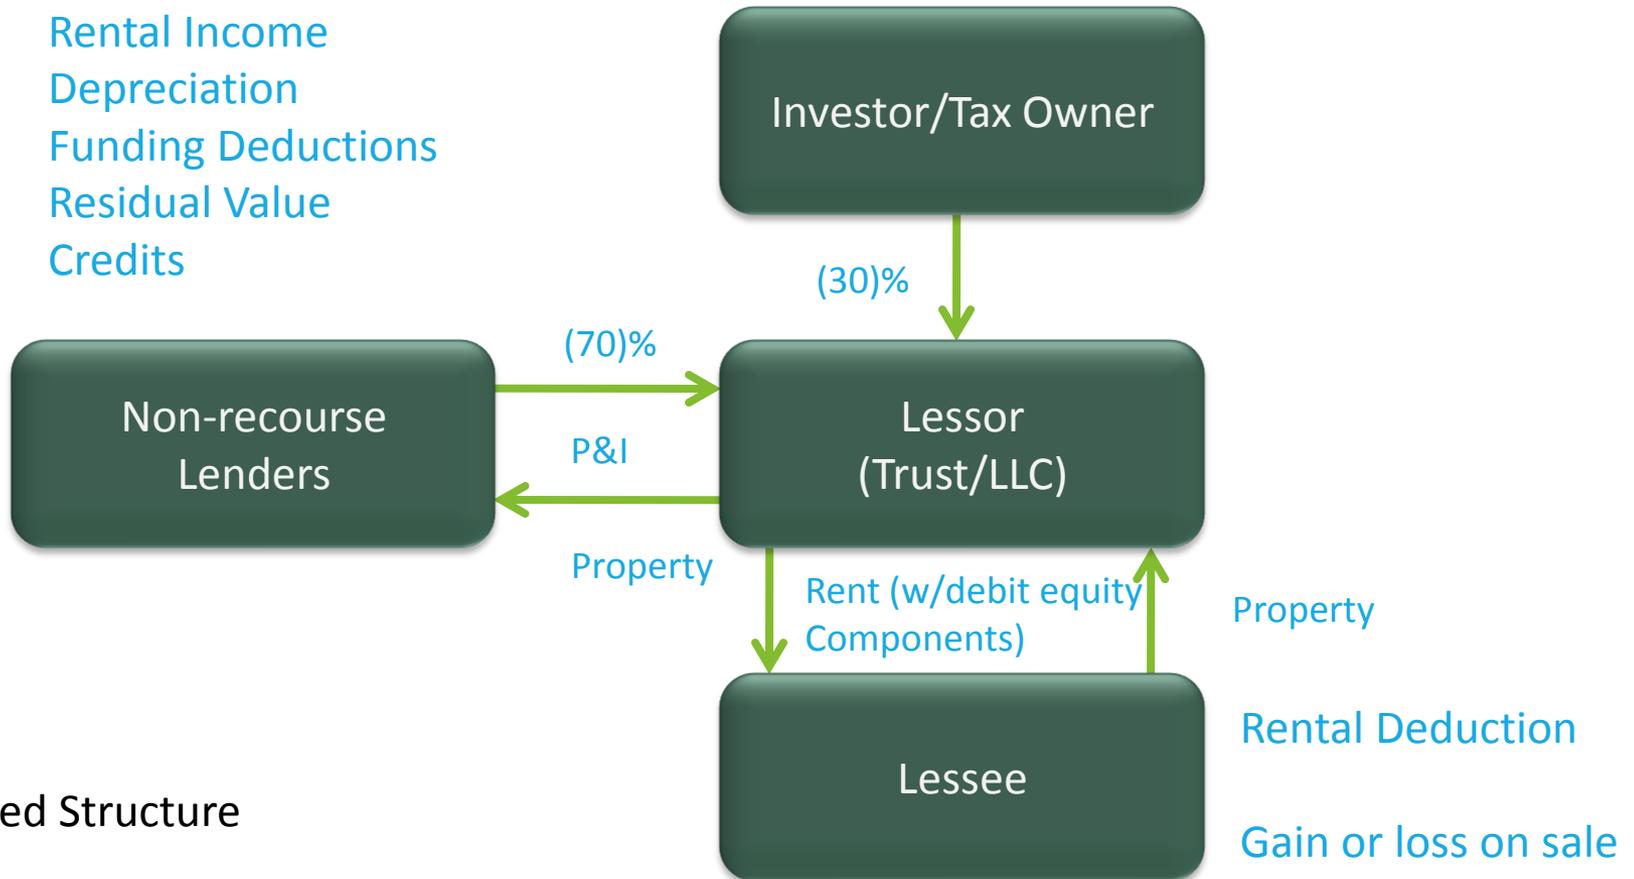

Advanced Structure

- Developer owns project, contributes it to a lessor entity, and leases to tax equity Investor
 - Investor/lessee sells power
 - Pays rent to developer/lessor
 - Lessor elects to pass through tax credit to lessee
- Lessor claims depreciation as owner to shield its income
 - Lessee shares in depreciation through interest in lessor entity
 - Developer deducts rent that may mirror depreciation it would have received as owner
- Tax credit based on market value of project vs. cost
 - Lessor does not have to reduce depreciable basis by half the credit
 - Note: investor must report half the credit as income over five years

Sale Leaseback Structure

Module 303

Advanced Structure

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

Sale Leaseback Structure

- Developer sells project to tax equity investor and then leases it back
 - Sale is the market value of the project
 - Investor receives tax credit and depreciation
- Lease cannot be longer than 80% of expected life and value
- Tax credits only claimed on new equipment
 - Equipment status preserved as new if it's sold and leased back within three months
- Allows developer to indirectly share in tax subsidies through reduced rent for use of equipment

Advanced Structure

U.S. DEPARTMENT OF
ENERGY

Office of
Indian Energy

| | Project Debt | | | Tax Equity | | Lease Equity | DOE |
|---------------------------|---|---|--|--|---------------------|------------------------------------|----------------------------|
| | Bank | Private Bond | Term Loan | Levered | Unlevered | | |
| Investor Universe | Commercial Banks | Private or 144A Offering | Institutional investors w/energy focus | Financial investors and some corps. with tax appetite. | | Lease equity market, institutional | DOE supports 100% or 80% |
| Target Rating | “Investment Grade” no rating needed | BBB-/NAIC 2 | B is doable; BB is preferred | NA (Investment Grade Offtaker) | | NA (Invest. Grade Offtake) | NA |
| Market Capacity | Up to \$1 Billion; up to 1.0XDSCR in Low Case | +\$1.0 Billion | \$750 Million | Sized to target IRR | | Sized to 20-49% of Capital Stack | No Limit |
| Indicative Pricing | L+250-350 2007: 100-150 +fees 1.5-2.0% | 7% Area; T + 5%-6% Fixed | L+250-500; 425 - 450 Libor floor; | 11-13.5; IRR by Flip | 9-10.5% IRR by Flip | 9.0-12.5% after tax yield | T+75-100 bps |
| Tenor | 5-7 years typical, up to 15 | Term of PPA (20-25); Prepayment Penalty | Up to 7 years | Target IRR reached by year 10 with PTC; 6-7 with ITC | | 80% of Useful Life | Up to 30 years |
| Sizing Profile | DSCR Requirements 1.30-1.40X; lockbox; PPA ‘Tail’; EPC with credit support; LIBOR Swaps; Reserves | | 1% amortization with cash sweep | Downside flip dates: +3 years in downside; +6 years in severe downside | | 1.30-1.40 “RSCR” Like Project Debt | Driven by required Ratings |

ENERGY

Office of
Indian Energy

Agenda

- ✓ Background
- ✓ Case Studies
 - ✓ One: Solar Community
 - ✓ Two: Fundamental Commercial
- ✓ Financial Models
- ✓ Case Study Three: Wind Commercial
- ✓ **Summary**

Renewable Energy Project Development Takeaways

- **Who:** Tribal Nations with Natural Resources
- **What:** Develop Renewable Energy projects or go into Renewable Energy business
 - Community: Use the energy/power for tribe
 - Commercial: Sell to power company or others
- **Where:** Indian Country or controlled lands
- **Why:** Value proposition
 - Economic development
 - Risk mitigation
 - Portfolio diversification
 - Jobs
 - Assert sovereignty
- **How:** Informed financial structuring
 - Flip
 - Sale leaseback
 - Inverted lease

Series 300 Summary

- Renewable Energy projects can be an economic development tool for Tribal Nations
- Tribal Nations can participate in Renewable Energy projects for commercial or community benefit
- Renewable Energy projects are financed and structured to transfer risk and allocate capital effectively
 - Flip
 - Simple structure
 - Investor utilizes tax credits in exchange for capital
 - Inverted lease
 - Tax credit based on Fair Market Value
 - Tax credits pass through to Lessee
 - Sale leaseback
 - Lessor purchases project at Fair Market Value
 - Lessor utilizes tax credits and depreciation
