

# Geospatial Technologies from the Ground Up: The State Perspective

Department of Energy  
Geospatial Technology Summit

August 16, 2011

Jon Gottsegen  
President, National States Geographic Information Council  
State GIS Coordinator/Enterprise GIS Services Mgr, State of  
Colorado Office of Information Technology

# What is NSGIC? ([www.nsgic.org](http://www.nsgic.org))

- Small 501 (c) 6 nonprofit organization (~579 members)
- Formed in 1991
- We Promote
  - Effective and efficient government through the prudent adoption of geospatial technologies
  - Statewide GIS coordination efforts
- We serve as the voice of States for geospatial issues
- Actively engaged with many Federal organizations
  - Especially focused on the FGDC and the National Spatial Data Infrastructure
- Each State has a single vote on advocacy and business issues
- We Educate and Advocate

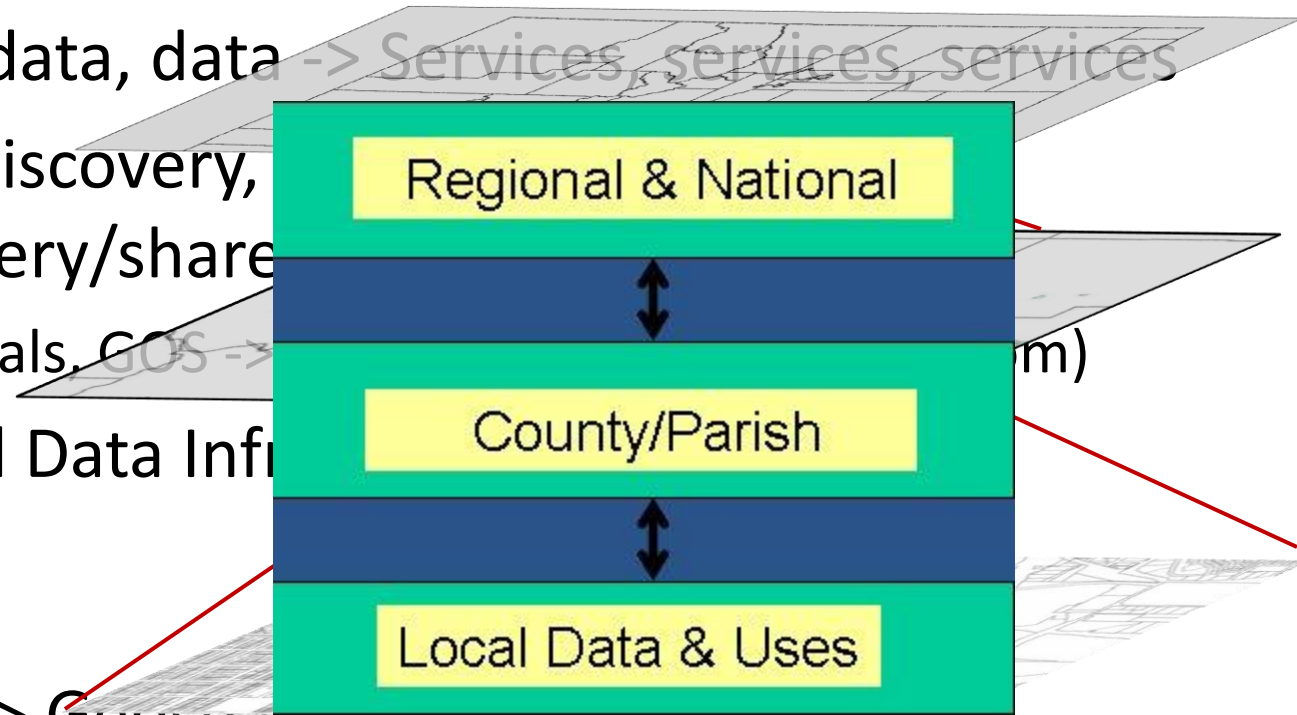

# Geospatial Collaboration

  - Portals, GOS -> Service “brokers” (ArcGIS.com)

The image displays two web interfaces. On the left is the **geodata.gov** portal, which includes a search bar and a sidebar with categories like 'Special Interest' (e.g., Fire, Mosquito, Geographic Names) and 'Data Categories' (e.g., Administrative, Boundaries, Elevation). On the right is the **ArcGIS** community page, titled 'Featured Maps and Apps from the ArcGIS Community'. It features a navigation bar with 'GALLERY', 'MAP', 'GROUPS', and 'MY CONTENT', along with a search box. Below the navigation, there are tabs for 'Maps', 'Web Apps', and 'Mobile Apps'. A grid of six featured maps is shown, including 'Recent Earthquakes near Japan', 'Supermarket Access Map', 'Palm Springs Places To Go', 'Gulf Oil Spill Over Time', 'Recent Population Change in USA', and 'Soil Survey Map of USA'. To the right of the grid, there is a search prompt and a list of filters: 'Highest Rated', 'Most Recent', and 'Most Viewed'. Below the filters, there are links for 'What is a map?' and 'Create your Web map and save it online.'

WELCOME TO THE

### Mapping Response to BP Oil Spill in the Gulf of Mexico

During the 2010 oil spill in the Gulf of Mexico, the Environmental Response Management Application (ERMA) offered near-real time information about the response effort. Developed by NOAA with the EPA, U.S. Coast Guard, and the Department of State, the site provided a "one-stop-shop" for spill response information.

**COMMON DATA**

Core geospatial data will be a key building block of the platform offering. Data sets are selected by the Managing Partner because they meet inclusion criteria outlined in the A-16 Supplemental Guidance and are used by two or more agencies/partners to meet their business needs.

**COMMON SERVICES**

Common geospatial services will provide users with consistent capabilities for performing necessary geospatial functions.

Examples of common services include geocoding, basemap services, requirements development and tracking tools, system computing cycles and file transfer protocol (FTP) services, acquisition services, data production services and training.

**COMMON APPLICATIONS**

Key tools or capabilities that enable users to perform geospatial visualization or analysis, including software, online applications and geo-processing required by two or more agencies/partners/customers.

This category of applications include a broad spectrum of analytical support generated to facilitate the government's delivery of services to citizens.

**fgdc**

**DATA.gov**

The FGDC is an interagency committee that promotes the coordinated development, use, sharing, and dissemination of geospatial data on a national basis.

Data.gov increases the ability of the public to easily find, download, and use datasets generated and held by the Federal Government.

Appendix B

**Stewardship Plan**  
**Community Anchor Institutions**

Section I: Introduction

This plan outlines stewardship procedures and expectations for a data set of Community Anchor Institutions (CAIs). These institution locations are critical for a variety of uses in the state and are of interest to local, state and federal entities as well as private citizens and academia. The work has been motivated by federal grants for mapping broadband service, but will benefit multiple applications. Some of the stewardship planning and testing has been funded by the USGS as well for maintenance of "structures" data, in USGS language, for homeland security.

**I.1: What are CAIs?**

The National Telecommunications and Information Administration defines CAIs to include health care, public safety, education and higher education facilities, as well as government buildings. The last group of facilities is open ended and should be refined. Consequently, the CAI work group is defining CAIs as the following types of features to start:

- > Health care facilities
- > Police stations
- > Fire stations
- > Emergency medical services locations
- > Public schools
- > Private schools
- > Universities, colleges and community colleges
- > Correctional institutions
- > County courthouses
- > City halls
- > Emergency operations centers
- > Public safety answering points
- > Regional and local dispatch centers

Other facility types may be added in the future as this data is developed and stewardship proceeds.

**I.2: Why Collect CAI Data**

CAI information is used for a variety of activities. These activities include:

**Section V: Governance Process and Structure**.....

**V.1: Stewardship Process** .....

V.1.1: Needs Assessment.....

V.1.2: Establishing and Maintaining a Team.....

V.1.3: Data Compilation/Maintenance.....

V.1.4: Distribution.....

V.1.5: Data Governance and Standards Process.....

## 6" products meet local, state and Federal needs

NSGIC is working with the National Program of Federal Geographic Information System that produces state products that are available to the public through its...

Survey (USGS). Under this program, Alaska will receive statewide 1-meter imagery once every five years. This program will also produce 1-foot resolution imagery once every three years for 50% of the land mass in all states except Alaska. It will offer the option for the states to buy-up any or all of the remaining...

- All imagery will reside in the public domain, remain available on Internet, and use a consistent approach to address security concerns.

Highly detailed 3" imagery (below) is a buy-up option

...ing a return on investment that is achieved through the application of uniform standards.

... Funding Methods  
... Development of FGDC Metadata that is discoverable

**THE NATIONAL**

**REPORT**

**National Land Parcel Data: A Vision for the Future**

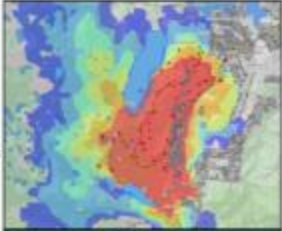

**IN BRIEF**

**ACADEMIES**

Land parcel data—information on the boundaries, ownership, value, zoning, and other aspects of property—provides critical information to support emergency response, business activities, and the daily operation of local government. There are many benefits to having complete and consistent digital coverage of land parcel data across the nation, but parcel data are not nationally integrated in the United States. This National Research Council report recommends actions needed to establish a nationally integrated land parcel data system.

The availability of land parcel data—information on the rights, interests, ownership, and value of land—affects our lives in countless ways. For example, when major wildland fires sweep through an area, the U.S. Forest Service can locate the fires using satellite imagery and use sophisticated models to predict where they will spread. But if it is land parcel data that lets them answer key questions about what is in the fire's path: Are there houses or other buildings in the way, and who owns them? Who should be alerted to the impending danger? Are there areas with a high density of buildings where the Forest Service should be focusing their efforts? Digital land parcel data can inform all of these questions. By combining fire spread predictions and land parcel data, fire fighters can get the information they need to save property and lives.

Following such natural disasters as hurricanes or tornadoes, parcel data are needed to know whose property was affected, whose property is also key to the daily operations of local government. Without knowing who owns what land, local governments could not do its assessments, plan locations for new roads and

Land parcel data help firefighters know what lies in a fire's path. This map combines fire spread predictions (red indicates immediate fire danger) with parcel data (black dots indicate buildings) to help determine where firefighting efforts should be focused. SOURCE: USDA Forest Service, courtesy Kevin Hyde, METI.

# Advocacy

## 2011 Advocacy Agenda

approved September 16, 2010

### Address Data for Public Safety & Economic Health

Addresses are the most commonly used and well known locators of people, places and events, but no consistent national address file is publicly available. To better understand problems like the foreclosure crisis and access to health care, comprehensive lists of addresses must be available and converted to digital points on map that facilitate thorough analyses and the development of appropriate mitigation strategies. Sharing and managing address data helps to support many of the business requirements of all levels of government, including enabling emergency responders to be

more effective. To advance development of a consistent national address file, NSGIC will continue to advocate for the following actions:

- Public release of the 2010 address points collected by the Census Bureau at a cost of \$444 million. These addresses are currently protected as confidential information.
- Education of its membership about overlaps with other address sources (e.g. U.S. Post Office & National Telecommunications Information Administration Broadband Mapping).

- Development of effective state-wide address programs. Address data can be funded by state 911 funds or by federal grants for broadband mapping.
- Exposure of new technologies for address collection such as crowd sourcing (e.g. OpenAddress).

This issue overlaps the "For the Nation" initiatives and public domain data sharing. From an economic standpoint, building a national address file is completely feasible and could return well over \$1 billion in value to the national economy.

### For the Nation Data Programs to Share Costs & Sustain Jobs

Our Nation needs comprehensive programs to coordinate the acquisition of accurate geospatial data to meet the business needs of government (all levels). Instituting such programs will increase the availability of products to underserved areas, reduce duplication of effort, result in cost avoidance and take advantage of large-area contracting mechanisms that significantly reduce the costs for everyone. The resulting data will "fuel" high technology jobs in the private sector and benefit the general public that should have free access to these products.

Nationwide data programs meet government business requirements, serve as a public resource, enable efficient and effective government and spur

development of business applications that improve and stimulate the economy. They also provide a unified digital map of America for future generations to maintain.

National geospatial data programs should serve as the common base map component of all government GIS efforts. The base map layers should be stewarded by individual authorities and maintained by all levels of government on a routine cycle to support government business needs.

NSGIC has outlined a systematic process for obtaining high quality geospatial data *For the Nation* in its data lifecycle proposal. Data layers such as Imagery, Transportation, Address Points and Parcels have received significant attention over past five years with

visible progress when measured against NSGIC's lifecycle model.

There are no technical issues to prevent these initiatives, nor are there any concerns about the capacity of the industry to create the required products. We simply need to find effective ways to encourage government agencies to work together on coordinated mapping programs and to identify appropriate funding models.

Foremost among these initiatives are *Imagery for the Nation* and *Transportation for the Nation*. We are encouraged by the success of these initiatives to date, and NSGIC will continue to promote them, monitor their progress against the lifecycle model and communicate their progress to the geospatial community.

The National States Geographic Information Council (NSGIC) is a nonpartisan 501 (c) 6 organization committed to efficient and effective government through the prudent adoption of geospatial technologies. Established in 1991, NSGIC voting members include senior state geographic information officers, coordinators, managers, and Councils.

State Government Geospatial Maturity Assessment

1. NSGIC State Government Geospatial Maturity Assessment

Welcome to the NSGIC Geospatial Maturity Assessment (GMA) that was developed for state governments. It is an objective baseline assessment methodology for routinely monitoring and validating the performance of a state's geospatial business capabilities. By using the GMA, decision makers (e.g., Chief Information Officer (CIOs), Geographic Information Officer (GIOs), Governor, Legislators, etc.) will have an understanding of the extent and value of geospatial assets and capabilities in your state and how they compare to other states.

# Successful Collaborative Activities

- Broadband
- NAIP
- EPA Exchange Network
- Digital Coast
- HSIP
- NGAC

# Broadband Grant

## Model for Successful Fed-State Collaboration

- National Telecommunications and Information Administration manages grant program
- Every state received funds
- Service area data from broadband providers
  - Nondisclosure agreements
- Various formats -> census block geography
  - Census block based data delivered to NTIA
- National broadband map

# From the Beginning

- NTIA grant program officers worked with states to help structure grants in most efficient way
- Programs had to deliver specific products while providing benefits to states
- Open to building state capacity

# Evolutionary Process

- Collaborative process
- NTIA and FCC looked to states' experience refine goals, specs, etc
  - Solicited input
  - Feasibility check
  - Ensures business needs are be met
- Open, regular communications to and from states
- NSGIC working group

# Successful Interaction

- 0 to nationwide data set in 1 year!
- Lessons and Keys to Success:
  - Funding
  - Clear goals
  - Good, open communication and collaboration
  - Simple model to start, with continuing evolution
  - Clear, direct business case
- Model for other information types like addresses
- States can do good things when given adequate funding, guidance and a collaborative environment

# Conclusions

- Collaboration is only way we'll build national data sets and services
- Create once, use many times
- Collaboration is a decision more than a technology
- Support for geospatial developments increasingly from the question-askers (e.g., DoE, HUD) rather than the data developers (USGS)
- Question: How do your activities support or impede coordinated approach?
