Acronyms

Acronym	Definition
CH_4	Methane
CO	Carbon monoxide
CO_2	Carbon dioxide
CO_2e	Carbon dioxide equivalents
EKCAPCD	Eastern Kern County Air Pollution Control District
EMFAC	EMission FACtors model developed by the California Air Resources Board.
GBVAB	Great Basin Valleys Air Basin
gr	grams
Haz	Hazardous Waste Disposal Location
HP	Horse Power
kWh	kilowatt hour
lbs	pounds
LF	Load Factor
M&M	Monitoring and Maintenance
MDAB	Mojave Desert Air Basin
MDAQMD	Mojave Desert Air Quality Management District
MT	Metric Tons
MWh	megowatt hour
N_2O	Nitrogen dioxide
NEPAB	Northeast Plateau Air Basin
Non-Haz	Non-Hazardous Waste Disposal Location
NOP	Notice of Preparation
NOx	Nitrogen oxides
PM_{10}	Particulate matter with a diameter of 10 microns or smaller
$PM_{2.5}$	Particulate matter with a diameter of 2.5 microns or smaller
Rad	Radiological Waste Disposal Location
ROC	Reactive Organic Compounds
RP	Responsible Party
SACVAB	Sacramento Valley Air Basin
SCAB	South Coast Air Basin
SCAQMD	South Coast Air Quality Management District
SCCAB	South Central Coast Air Basin
SJVAB	San Joaquin Valley Air Basin
SJVAPCD	San Joaquin Valley Air Pollution Controld District
SOx	Sulfur oxides
SSAB	Salton Sea Air Basin
Tier 3	EPA Standard for emissions from offroad vehicle engines.
VCAPCD	Ventura County Air Pollution Control District
VMT	Vehicle Miles Traveled
VOC	Volatile Organic Compounds

Offsite Exhaust Emission Factors

Table 1-1: Emission Factors for Commuter Trips

Emission Factors (gr/mile)

	Exhaust								Fugitive	
	ROC/VOC	**NOx**	**CO**	**SO_x**	**PM10**	**PM2.5**	**CO_2**	**CH_4**	**PM10**	**PM2.5**
Commuter Trips (offsite)	0.022	0.084	0.892	0.003	0.002	0.002	301.999	0.012	N/A	N/A
Commuter Trips (onsite)	0.056	0.111	1.356	0.003	0.005	0.004	556.107	0.022		
Emission Factors (lbs/mile)										
Commuter Trips (offsite)	4.80E-05	1.85E-04	0.002	6.68E-06	3.97E-06	3.66E-06	0.666	2.64E-05	7.948E-04	1.951E-04
Commuter Trips (onsite)	1.23E-04	2.46E-04	0.003	6.68E-06	1.08E-05	9.90E-06	1.226	4.86E-05	7.948E-04	1.951E-04

Assumptions
- 453.6 grams per pound

Sources
- Emission facotrs for vehicle exhaust were taken from EMFAC2014 model (v1.07). Aggregated speeds for offsite and 15 mph for onsite. (See "EMFAC2014 Emission Rates for Commuter Vehicles", Section 8 of Appendix D or Appendix E of this DEIR, for full EMFAC modeling details)

- Emission factors for offsite vehicle fugitive dust derived from AP42 - 13.2.1 - Paved Roads

Reintrained Road Dust Emission Factors (Paved Roads):

$E = k(sL)^{0.91} \times W^{1.02}$

$E_{PM10} = k*(0.1)^{0.91}*497^{1.02}$

$= 0.0022 * 0.123 * 2.936$

$= 7.95E\text{-}04$ PM10

$E_{PM2.5} = 0.00054 * 0.123 * 2.936$

$= 1.95E\text{-}04$ PM2.5

k	0.0022	PM10 - particle size multiplier (lbs/VMT)
k	0.00054	PM2.5 - particle size multiplier (lbs/VMT)
sL	0.1	road surace silt loading grams per square meter (g/m^2)
w	2.88	average

- Emission factors for onsite vehicle fugitive dust taken from Table 1-8

Note: For the purposes of this appendix, if a Table is listd as "*Table #-#* " (Table 1-1 for example) it assumes it is from this appendix. If the Table is from another source, the source is listed with the table. For example, " *Table 3.4 of Appendix D of the CalEEMod User Guide*"

Onsite Exhaust Emission Factors

Sources:

- Equipment type taken from Table 3-16 in the PD.
- Quantity of each equipment type was provided by DTSC based on current onsite operations.
- Emission factors for unmitigated onsite construction equipment taken from Table 3.4 of Appendix D of the CalEEMod user guide (BREEZE software, a Division of Trinity Consultants, 2016). 2016 emission factors were used as a conservative estimate for all years as equipment is not anticipated to be changed out unless it breaks. Therefore even though construction could last for 18 years, there is the potential that the same equipment in use at the beginning of the project would be in use at the end of the project.
- Emissions for water truck and Haul trucks taken from EMFAC 2014 for Ventura County for Heavy Heavy Duty Trucks at 15 mph. (See "EMFAC2014 Emission Rates for Haul Trucks", Section 8 of Appendix D of this EIR, for full EMFAC modeling details)
- Emission factors for onsite worker transport trips are from EMFAC2014 for Ventura County for LDA vehicles traveling 15 mph. (See (See "EMFAC2014 Emission Rates for Commuter Vehicles", Section 8 of Appendix D of this EIR, for full EMFAC modeling details)
- Horsepower and load factors taken as the average for each equipment type from Table 3.3 of Appendix D of the CalEEMod User's Guide (BREEZE software, a Division of Trinity Consultants, 2016).
- Tier 4 final Emissions are taken from Table 3.5 of Appendix D of the CalEEMod User Guide (BREEZE software, a Division of Trinity Consultants, 2016). Tier 4 is an EPA standard for emissions of offroad vehicle engines.

Santa Susana Field Laboratory
Initial Clean-up - Unmitigated

Onsite Exhaust Emissions

Table 1-5: Emissions Per Offroad Vehicle Type per 8 Hour Work Day

	ROC/VOC	NOx	CO	SO_x	PM10	PM2.5	CO_2	CH_4
				(lbs/day) per Excavation Site				
Rubber Tired Dozers	0.209	4.043	4.531	0.009	0.153	0.153	887.739	0.268

Water Truck	0.149	3.793	0.922	0.003	0.016	0.015	620.212	31.011

Equations

- Daily emssions = (Emission Factor X Horse power X Load Factor X Quantity X Hours per day) / 453.6
  - 453.6 grams per pound
  - Emission Factor, Horse Power, and Load Factor from Table 1-3.
  - 8 Hour work day (8 hour of equipment usage)
  - Quantity is assumed to be 1 for the purposes of daily emissions in Table 1-5.
- Daily emissions (Water truck) = (Emission Factor X Miles) / 453.6
  - Assumes water trucks at 90 miles per day for onsite operations (15 mph for 6 hrs per day)
- Impact Chisels are electric and therefore do not have quantifiable onsite emissions.

*Totals may not add exactly due to rounding.

Santa Susana Field Laboratory
Initial Clean-up - Unmitigated

Initial Clean Up Equipment Assumptions

Table 1-6: Initial Clean-up Equipment Assumptions

Equipment List	Area IV	O_2 Plant	DOE Demo	Boeing TTF	DOE RMHF/ HWMF
Rubber Tired Dozers	1.5	1.5	0	1	2
Concrete/Industrial Saws	0	0	0.1	0	0
Tractors/Loaders/Backhoes	2.5	2.5	3	1.5	3
Graders	0.75	0.75	0	0.75	1.5
Excavators	1.00	1.00	2.00	1	2
Scrapers	0	0	0	0	0
cranes	0	0	0.25	0	0
impact chisels	0	0	0.5	0	0
grapplers	0	0	0	0	0
Forklifts	1	1	0	1	2
Water Truck	1	1	1	1	2
Haul Trucks (3 years)	76	9	3	3	5
Workers	10	10	23	8	20

* All Boeing activities removed from Initial Clean-up Activities

Table 1-7: Scaling for daily truck trips

	Years	Total Trucks	Haul Trucks	% of Total	Scale to 96 trucks per day	
Area IV	3	34247	44	0.795998	76	69% of the trips are hazardous, the remainder are radiological.
O2 Plant	3	3695	5	0.085882	9	80% of the trips are hazardous the remainder are non-hazardous.
DOE - Demo	2	788	2	0.027473	3	
Boeing - Demo	1	752	0	0	0	No longer part of Initial Clean-up. Truck trips zeroed out to maintain 96 trucks per day over the whole site
TTF - Boeing	0.5	26	2	0.036259	3	
Post Closure - DOE	30	0	0	0	0	
Post Closure - NASA	30	0	0	0	0	
Totals	30	0	55		96	

Sources:
- Equipment type, number of workers, and total haul trucks taken from Table 3-16 in the PD.
- Quantity of each equipment type was provided by DTSC based on current onsite operations.

Equations
- Haul trucks for each program were scaled from the average daily truck trips to a maximum of 96 daily trips for the whole site.
  Air Quality Thresholds are based on daily emissions, therefore 96 haul trucks were used as that is the maximum number of trucks that will access the site per day.
- Average daily trips for the initial projects is equal to 53. Scaled to have a minimum of one truck per day for each phase. (See Table 1-7).
  Haul trucks per day for the initial clean-up were determined by dividing the total number of trucks by the number of years of the activity then by 260 days per year.

Santa Susana Field Laboratory
Initial Clean-up - Unmitigated

Onsite Fugitive Dust Emission Factors

Table 1-8 Emission Factors For Fugitive Dust

	PM10	PM2.5	Units
Scraper/Grader	1.543	0.167	lbs/VMT
Dozer/Excavator	0.753	0.414	lbs/hr
Truck Loading	1.11E-04	1.68E-05	lbs/ton
Mechanical Demolition	1.11E-04	1.68E-05	lbs/ton
Debris Loading	0.020	0.003	lbs/ton
Unpaved Road Haul	0.876	0.088	lbs/VMT
Paved Road - Haul	0.007	0.002	lbs/VMT
Paved Road Commute	7.9E-04	2.0E-04	lbs/VMT

Fugitive emissions from scrapers/graders:

PM_{10} = $(0.051 \times (S)^{2.0}) \times F_{PM10}$
= $(0.051 \times (7.1)^{2.0}) \times 0.6$
= 1.543 lbs/VMT

$PM_{2.5}$ = $(0.04 \times (S)^{2.5}) \times F_{PM2.5}$
= $(0.04 \times (7.1)^{2.5}) \times 0.031$
= 0.167 lbs/VMT

S = mean vehicle speed (mph) Default = 7.1
F_{PM10} = PM_{10} scaling factor default of 0.6
$F_{PM2.5}$ = $PM_{2.5}$ scaling factor default of 0.031

Fugitive emissions from Dozers and Excavators:

PM_{10} = $((C_{PM15} \times s^{1.5})/M^{1.4}) \times F_{PM10}$
= $((1 \times 6.9^{1.5})/7.9^{1.4}) \times 0.75$
= 0.753 lbs/hr

$PM_{2.5}$ = $((5.7 \times 6.9^{1.2})/7.9^{1.3}) \times 0.105$

C_{PM15} = arbitary coefficient used by AP-42 = 1
s = material silt content = 6.9 %
M = material moisture content = 7.9%
F_{PM10} = PM_{10} scaling factor default of 0.75
$F_{PM2.5}$ = $PM_{2.5}$ scaling factor default of 0.105

Fugitive emissions from truck loading

PM_{10} = $k \times (0.0032) \times ((U/5)^{1.3}/(M/2)^{1.4})$
= $0.35 \times (0.0032) \times ((5.82/5)^{1.3}/(12/2)^{1.4})$
= 1.11E-04 lbs/ton

$PM_{2.5}$ = $k \times (0.0032) \times ((U/5)^{1.3}/(M/2)^{1.4})$
= $0.053 \times (0.0032) \times ((5.82/5)^{1.3}/(12/2)^{1.4})$
= 1.68E-05 lbs/ton

k = particle size (PM10 = 0.35, PM2.5 = 0.053)
U= wind speed (miles - hour) = 5.82
M = Material moisture content = 12%

Fugitive Emissions from Mechanical Demolition

PM_{10} = $k \times (0.0032) \times ((U/5)^{1.3}/(M/2)^{1.4})$
= $0.35 \times (0.0032) \times ((5.82/5)^{1.3}/(12/2)^{1.4})$
= 1.11E-04 lbs/ton

$PM_{2.5}$ = $k \times (0.0032) \times ((U/5)^{1.3}/(M/2)^{1.4})$
= $0.053 \times (0.0032) \times ((5.82/5)^{1.3}/(12/2)^{1.4})$
= 1.68E-05 lbs/ton

k = particle size (PM10 = 0.35, PM2.5 = 0.053)
U= wind speed (miles - hour) = 5.82
M = Material moisture content = 12%

Fugitive Emissions from Debris Loading

PM_{10} = $k \times EF_{L\text{-}TSP}$
= 0.35×0.058
= 0.020 lbs/ton

$PM_{2.5}$ = $k \times EF_{L\text{-}TSP}$
= 0.053×0.058
= 0.003 lbs/ton

k = particle size (PM10 = 0.35, PM2.5 = 0.053)
$EF_{L\text{-}TSP}$ = default value = 0.058 lbs/ton

Santa Susana Field Laboratory
Initial Clean-up - Unmitigated

Onsite Fugitive Emissions

Equations

- Emissons for graders and scrapers = Emission factor x(((Acres / blade width of 12 ft) x 43,560 sqft per acre) / 5,280 ft per mile)
  - Acres are based on table provided on page 8 of CalEEMod Appendix A. (BREEZE software, a Division of Trinity Consultants, 2016).

    scrapers 1 acers/8hr day (conservately uses 1 acre for both because of the type of activities)
  - Emissions include a 63% reduction for required fugitive dust control measures based on VCAPCD regulations and a 69% reduction based on mitigation.
  - Emission factor taken from Table 1-8.
- Emissions for dozers/excavators = # equipment x hours of operation x emission factor
  - Number of dozers and excavators taken from Table 1-6.
  - 8 hours per day
  - Emission factor taken from Table 1-8.
- Emissions for truck loading (soils) = emission factor * tons of material
  - Emission factor taken from Table 1-8.
- Emissions for Excavation truck loading = EF x Tons
  - Tons of soil = tons per truck (Assumed 23) times 2 times the number of trucks (From Table 1-6). Twice the number of trucks is used to account for potential import and unloading of backfill.
- Emissions for Mechanical demolition and debris loading = Emission Factor (lbs/ton) X tons of debris
  - Assumes 23 tons per truck
  - Emission factor taken from Table 1-8.
  - Tons of soil = tons per truck (Assumed 23) times the number of trucks (From Table 1-6).
- Emissions for fugitive dust from unpaved or paved roads = Number of Miles x Number of Trucks x Emission Factor for PM10/PM2.5
  - Equations and constants for unpaved roads taken from EPA's AP-42 13.2.2 Unpaved Roads
  - Equations and constants for Paved roads taken from AP42 - 13.2.1 - Paved Roads
  - Emissions for unpaved roads include a 63% reduction for required fugitive dust control measures based on VCAPCD regulations and a 69% reduction based on mitigation.
  - Assumes 3/4 of haul routes are paved.
  - Emission factor taken from Table 1-8.

Sources
- Trucks per day taken from Table 1-6
- Emission Factors taken from EMFAC2014, maximum emissions from each air district potentially crossed for 55 mph, and weighted average by distance for SCCAB and SCAB for <55MPH.
- Distance assumptions for each waste type provided by DTSC.
- Fugitive road dust taken from USEPA AP42 13.2.2 - Paved Roads

Assumptions
- 453.6 grams per pound
- Weighted average determined by distance and speed for each RP.
- Daily trucks are based on 96 trucks per day.
- Annual truck trips are based on 96 trips per day for 260 days.
- HWMF has 412 trips per year and RMHF has 824 trips per year

Santa Susana Field Laboratory
Initial Clean-up - Unmitigated

Offsite Emissions

Assumptions

- 40 miles per commute trip, either within VCAPCD or SCAQMD.
- Assumes 23 workers per day
- Assumes 2 trips per worker
- Boeing activities have been removed from initial projects.
- [1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

- For maximum emissions by air basin, the maximum distance that could be traveled through each air basin based on the potential disposal sites is used. Disposal sites are determined based on RP and type of disposal (non-hazardous, hazardous, radiological).

Equations

-	Commuter Trips	=	Sum of: emission factor in grams per mile (Table 1-1) divided by 453.6 (grams per pound) times miles total miles per day plus fugitive lbs per mile (Table 1-1) times number of miles for each Air District (SCAQMD, VCAPCD).
-	Haul Truck Trips	=	sum of: emission factor in grams per mile (Table 1-9) times 453.6 (grams per pound) times miles total miles per day for each type of disposal location (Non-hazardous, Hazardous, Radiological) plus the emission factors for fugitive road dust (Table 1-9) times
		=	total miels per day.
-	Total Miles	=	miles per trip times number of trips.
-	tons/year	=	lbs/day multiplied by 260 days divided by 2000 lbs per ton.
-	MT/year	=	lbs/day multiplied by 260 days per year divided by 2004.62 metric tons per pound.

Sources

- Worker Trips and Truck Trips taken from Table 1-6
- Number of Haul Trips per daty taken from Table 1-10
- Miles per waste disposal type taken from Table 1-9

Total Number of Trucks	21,920	82,400	56,750	0
Maximum Annual Trucks (GHG)	7,020	7,020	6,760	0

Sources
- Equipment lists provided by DTSC
- Hauling assumes 96 trucks per day, 32 for each RP.
- Total trucks by soil type taken from Table 3-4 of the Project Description

Assumptions
- Assumes equipment operates 8 hours per day. Water truck is 90 miles per day (15 mph * 6 hr/day)
- Assumes Boeing has 3 excavation sites per day, DOE has 1 excavation site per day, NASA has one excavation site per day
- Equipment usage is the number of equipment operating a full 8 hours. Therefore, 0.75 of an equipmment or 0.5 of a piece of equipment means operation of 6 or 4 hours per day respectively.
- Maximum annual trucks assumes 80 trucks per day for 260 days per year.

Santa Susana Field Laboratory

Sources - Emission Factors used to determine weighted emissions taken from Table 1-9.

Assumptions
- 453.6 grams per pound
- Weighted average is based on distance and speed.
- Max Trucks per day assumes maximum potential milage based on number of trucks per waste type and length of trip, and 32 trips per day per RP
- Max trucks per year assumes 80 trucks per day (27 for DOE and Boeing, 26 for NASA) and is weighted to take into account the total amount of trucks per waste type (Table 1-11)

Santa Susana Field Laboratory
Overall Site Cleanup - Unmitigated

Offsite Emissions

Assumptions

- 40 miles per commute trip, either within VCAPCD or SCAQMD.
- Number of workers per day is taken from Table 1-11. For M&M each RP is assumed to have 3 workers.
- Assumes 2 trips per worker
- Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. Only the maximum for each air district is reported as a worst case scenario. 40 miles per trip was the average trip length assumed for workers.

- For maximum emissions by air basin, the maximum distance that could be traveled through each air basin based on the potential disposal sites is used. Disposal sites are determined based on RP and type of disposal (non-hazardous, hazardous, radiological).
- No haul trucks required for M&M activities.

Equations

-	Commuter Trips	=	Sum of: emission factor in grams per mile (Table 1-1) times 453.6 (grams per pound) times miles total miles per day for each Air District (SCAQMD, VCAPCD).
-	Haul Truck Trips	=	sum of: emission factor in grams per mile (Table 1-9) times 453.6 (grams per pound) times miles total miles per day for each type of disposal location (Non-hazardous, Hazardous, Radiological) plus the emission factors for fugitive
		=	road dust times total miels per day.
-	Total Miles	=	miles per trip times number of trips.
-	tons/year	=	lbs/day multiplied by 260 days divided by 2000 lbs per ton.
-	MT/year	=	lbs/day multiplied by 260 days per year divided by 2004.62 metric tons per pound.

Assumptions

- Boeing has 15 workers and 15 contractors, DOE has 2 workers, and NASA has 6 workers. Existing onsite emissions are based on the operations occurring onsite at the time of the NOP. The NOP was completed before the NASA demolition of existing structures. The personnel onsite consists of one NASA civil servant and four NASA contractors for environmental investigation (NASA, 2016). The analysis assumed 6 workers as a worst case scenario based on the information provided at the time the analysis was conducted.

[1] - Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

- Average 4 mile onsite round trip in addition to the offsite.
- Emissions occur 260 days per year = 52 weeks x 5 days per week.
- Miles provided for offsite trips are one way miles and the analysis assumes two one way trips per employee (one to and one from the site)

Santa Susana Field Laboratory
Existing Conditions

Equations: (For daily and annual pollutant concentrations)

emission factors (lbs/mile) = emission factor in grams per mile (Table 1-1) divided by 453.6 (grams per pound)

Miles = miles per trip times number of trips.

pollutant calculations

lbs/day = emission factor in lbs/mile time number of miles. PM10 and PM2.5 include fugitive emissions from road travel.

tons/year = lbs/day multiplied by 260 days divided by 2000 lbs per ton.

MT/year = lbs/day multiplied by 260 days per year divided by 2004.62 metric tons per pound.

Note: Assumptions and equations are the same for all RPs and therefore are not repeated for each set of cacluations

Initial Clean-up - LST Emissions Summary (Unmitigated)

Table 3-2: LST Initial Clean-up Emissions Summary

LST Emissions Summary
(lbs/day)

	NOx	CO	PM10	PM2.5
Emissions	128	157	75	28
Threshold	131	5045	114	53
Significant?	No	No	**No**	**No**

Threshold Determination (2 acre site)

	NOx	NOx^2	CO	PM10	PM2.5	
500 meters	263	146	7,460	162	84	Source Receptor Area 6
400 meters	237	131	5,045	114	53	
300 meters	212	117	3,837	90	37	
200 meters	187	103	2,629	66	21	Source Receptor Area 6

LST's determined by max for each activity as the activities occur at different locations throughout the site.

Sources: LSTs are determined by summing the onsite emissions as reported in Table 3-1.

Assumptions NOx^2: The screening criteria for NOx were developed based on the 1-hour NO_2 CAAQS of 0.18 ppm. However, since the publication of the SCAQMD's guidance, the USEPA has promulgated a 1-hour NO_2 NAAQS of 0.100 ppm based on a 98th percentile value, which is more stringent than the CAAQS. In order to determine if Project emissions would result in an exceedance of the 1 hour NO_2 NAAQS, an approximated LST was estimated to evaluate the federal 1-hour NO_2 standard, as the SCAQMD significance threshold has not been updated to reflect this standard. Calculated by scaling the NO_2 LST for by the ratio of 1-hour NO_2 standards (federal/state)(i.e., 236 lb/day * (0.10/0.18) = 131 lb/day).

Santa Susana Field Laboratory
Initial Clean-up - Unmitigated

Assumptions - Equipment usage is the number of equipment operating a full 8 hours. Therefore, 0.75 of an equipmment or 0.5 of a piece of equipment means operation of 6 or 4 hours per day respectively.

Initial Clean-up - Unmitigated

Initial Clean Up Emissions

Equations

- Daily emssions (Exhaust) (lbs/day) = sum of daily emissions for each piece of equipment.
- Emissions from each equipment type = Number of pieces of equipment times the emissions per day for that piece of equipment.
  - Emissions per day per equipment type from Table 1-5.
  - Number of Pieces of Equipment per activty from Table 1-6.
- Daily emssions (Fugitive) (lbs/day) - Taken from Table 3-5 and 3-6 for initial clean-up projects.
- Daily emssions (haul trucks) (lbs/day) = [(Emission Factor$_{exhaust}$ X number of trips X Miles) x (Emission Factor$_{idle}$ X number of minutes X number of trucks)] / 453.6
  - Emission Factors from Table 1-4.
  - Number of Trips from Table 1-6
  - **4** miles/ round trip
  - **15** minutes idling per truck (- assumes idling entering the site, at the loading location, and leaving the site)
- Daily emssions (crew (onsite worker transport)) = ((Number of Employees/15) times Emission Factor times 4) / 453.6
  - Number of employees per phase taken from Table 1-6.
  - **15** workers/onsite van
  - Emission Factor taken from Table 1-5
  - **4** miles/ round trip
  - 453.6 grams per pound
- Total Daily Emissions for each criteria pollutant is the sume of the daily exhaust, fugitive, haul truck, and crew emissions.
- Annual emssions (Tons/year) = (Daily Emissions * Number of Days)/2000
  - Daily Emissions from Table 3-3.
  - 2,000.00 lbs/ton
  - 260 days per year
- Annual emssions (MT/year) = (Daily Emissions * Number of Days)/2204.623
  - Daily Emissions from Table 3-3.
  - 2,204.62 lbs per Metric Ton

[1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

[2] PM10 and PM2.5 emissions include fugitive road dust

[1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

[2] PM10 and PM2.5 emissions include fugitive road dust

[1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

[2] PM10 and PM2.5 emissions include fugitive road dust

25 meters	147	81	644	7	4	Source Receptor Area 6
	25.3333333	1207.75	24	15.75		

LST's determined by max for each RP as the activities occur at different locations throughout the site.

Sources: LSTs are determined by summing the onsite emissions as reported in Table 4-1.

Assumptions NOx^2: The screening criteria for NOx were developed based on the 1-hour NO_2 CAAQS of 0.18 ppm. However, since the publication of the SCAQMD's guidance, the USEPA has promulgated a 1-hour NO_2 NAAQS of 0.100 ppm based on a 98th percentile value, which is more stringent than the CAAQS. In order to determine if Project emissions would result in an exceedance of the 1 hour NO_2 NAAQS, an approximated LST was estimated to evaluate the federal 1-hour NO_2 standard, as the SCAQMD significance threshold has not been updated to reflect this standard. Calculated by scaling the NO_2 LST for by the ratio of 1-hour NO_2 standards (federal/state)(i.e., 236 lb/day * (0.10/0.18) = 131 lb/day).

Overall Site Cleanup Emissions

Equations

- Daily emssions (Exhaust) (lbs/day) = sum of daily emissions for each piece of equipment.
- Emissions from each equipment type = Number of pieces of equipment times the emissions per day for that piece of equipment.
  - Emissions per day per equipment type from Table 1-5.
  - Number of Pieces of Equipment per activty from Table 1-11.
- Daily emssions (Fugitive) (lbs/day) - Taken from Tables 4-8 and 4-9.
- Daily emssions (haul trucks) (lbs/day) =
  [(Emission Factorexhaust X number of trips X Miles) x (Emission Factoridle X number of minutes X number of trucks)] / 453.6
  - Emission Factors from Table 1-4.
  - Number of Trips from Table 1-11
  - **4** miles/ round trip
  - **15** minutes idling per truck (- assumes idling entering the site, at the loading location, and leaving the site)
- Daily emssions (crew (onsite worker transport)) (lbs/day) = ((Number of Employees/15) times Emission Factor times 4) / 453.6
  - Number of employees per phase taken from Table 1-11.
  - **15** workers/onsite van
  - Emission Factor taken from Table 1-5
  - **4** miles/ round trip
  - 453.6 grams per pound
- Total Daily Emissions (lbs/day) for each criteria pollutant is the sume of the daily exhaust, fugitive, haul truck, and crew emissions.
- Annual emssions (Tons/year) = (Daily Emissions * Number of Days)/2000
  - Daily Emissions from Table 4-6.
  - 2,000.00 lbs/ton
  - 260 days per year
- Annual emssions (MT/year) = (Daily Emissions * Number of Days)/2204.623
  - Daily Emissions from Table 4-6.
  - 2,204.62 lbs per Metric Ton
  - 260 days per year

Onsite Fugitive Emissions

Equations

- Emissons for graders and scrapers = Emission factor x(((Acres / blade width of 12 ft) x 43,560 sqft per acre) / 5,280 ft per mile)
  - Acres are based on table provided on page 8 of CalEEMod Appendix A. (BREEZE software, a Division of Trinity Consultants, 2016).
    scrapers 1 acers/8hr day (conservately uses 1 acre for both because of the type of activities)
  - Emissions include a 63% reduction for required fugitive dust control measures based on VCAPCD regulations and a 69% reduction based on mitigation.
  - Emission factor taken from Table 1-8.
- Emissions for dozers/excavators = # equipment x hours of operation x emission factor
  - Number of dozers and excavators taken from Table 1-11.
  - 8 hours per day
  - Emission factor taken from Table 1-8.
- Emissions for truck loading (soils) = emission factor * tons of material
  - Emission factor taken from Table 1-8.
- Emissions include a 63% reduction for required fugitive dust control measures.
- Emissions for Excavation truck loading = EF x Tons
  - Tons of soil = tons per truck (Assumed 23) times 2 times the number of trucks (From Table 1-11). Twice the number of trucks is used to account for potential import and unloading of backfill.
- Emissions for Mechanical demolition and debris loading = Emission Factor (lbs/ton) X tons of debris
  - Assumes 23 tons per truck
  - Emission factor taken from Table 1-8.
  - Tons of soil = tons per truck (Assumed 23) times the number of trucks (From Table 1-11).
- Emissions for Pave and Unpaved Roads = Emission Factor (Table 1-8) times number of miles per vehicle times number of vehicles
  - Emissions for unpaved roads include a 63% reduction for required fugitive dust control measures based on VCAPCD regulations and a 69% reduction based on mitigation.
  - Assumes 3/4 of haul routes are paved.

*Totals may not add exactly due to rounding.

[1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

[2] PM10 and PM2.5 emissions include fugitive road dust

[1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

[2] PM10 and PM2.5 emissions include fugitive road dust

[1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

[2] PM10 and PM2.5 emissions include fugitive road dust

Onsite Exhaust Emission Factors

Sources:

- Quantity of each equipment type was provided by DTSC based on current onsite operations.
- Emission factors for unmitigated onsite construction equipment taken from Table 3.4 of Appendix D of the CalEEMod user guide (BREEZE software, a Division of Trinity Consultants, 2016). 2016 emission factors were used as a conservative estimate for all years as equipment is not anticipated to be changed out unless it breaks. Therefore even though construction could last for 18 years, there is the potential that the same equipment in use at the beginning of the project would be in use at the end of the project.
- Emissions for water truck and Haul trucks taken from EMFAC 2014 for Ventura County for Heavy Heavy Duty Trucks at 15 mph.
  (See "EMFAC2014 Emission Rates for Haul Trucks", Section 8 of Appendix D of this EIR, for full EMFAC modeling details)
- Emission factors for onsite worker transport trips are from EMFAC2014 for Ventura County for LDA vehicles traveling 15 mph. (See
  (See "EMFAC2014 Emission Rates for Commuter Vehicles", Section 8 of Appendix D of this EIR, for full EMFAC modeling details)
- Horsepower and load factors taken as the average for each equipment type from Table 3.3 of Appendix D of the CalEEMod User's Guide (BREEZE software, a Division of Trinity Consultants, 2016).
- Tier 4 final Emissions are taken from Table 3.5 of Appendix D of the CalEEMod User Guide (BREEZE software, a Division of Trinity Consultants, 2016). Tier 4 is an EPA standard for emissions of offroad vehicle engines.

Equations

- Daily emssions = (Emission Factor X Horse power X Load Factor X Quantity X Hours per day) / 453.6
  - 453.6 grams per pound
  - Emission Factor, Horse Power, and Load Factor from Table 1-3.
  - 8 Hour work day (8 hour of equipment usage)
  - Quantity is assumed to be 1 for the purposes of daily emissions in Table 1-5.
- Daily emissions (Water truck) = (Emission Factor X Miles) / 453.6
  - Assumes water trucks at 90 miles per day for onsite operations (15 mph for 6 hrs per day)
- Impact Chisels are electric and therefore do not have quantifiable onsite emissions.

*Totals may not add exactly due to rounding.

Sources
- Trucks per day taken from Table 1-6
- Emission Factors taken from EMFAC2014, maximum emissions from each air district potentially crossed for 55 mph, and weighted average by distance for SCCAB and SCAB for <55MPH.
- Distance assumptions for each waste type provided by DTSC.
- Fugitive road dust taken from USEPA AP42 13.2.2 - Paved Roads

Assumptions
- 453.6 grams per pound
- Weighted average determined by distance and speed for each RP.
- Daily trucks are based on 96 trucks per day.
- Annual truck trips are based on 96 trips per day for 260 days.
- HWMF has 412 trips per year and RMHF has 824 trips per year

Santa Susana Field Laboratory
Initial Clean-up - Mitigated

Offsite Emissions

Assumptions

- 40 miles per commute trip, either within VCAPCD or SCAQMD.
- Assumes 23 workers per day
- Assumes 2 trips per worker
- Boeing activities have been removed from initial projects.
- [1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

- For maximum emissions by air basin, the maximum distance that could be traveled through each air basin based on the potential disposal sites is used. Disposal sites are determined based on RP and type of disposal (non-hazardous, hazardous, radiological).

Equations

-	Commuter Trips	=	Sum of: emission factor in grams per mile (Table 1-1) divided by 453.6 (grams per pound) times miles total miles per day plus fugitive lbs per mile (Table 1-1) times number of miles for each Air District (SCAQMD, VCAPCD).
-	Haul Truck Trips	=	sum of: emission factor in grams per mile (Table 1-9) times 453.6 (grams per pound) times miles total miles per day for each type of disposal location (Non-hazardous, Hazardous, Radiological) plus the emission factors for fugitive road dust (Table 1-9) times
		=	total miels per day.
-	Total Miles	=	miles per trip times number of trips.
-	tons/year	=	lbs/day multiplied by 260 days divided by 2000 lbs per ton.
-	MT/year	=	lbs/day multiplied by 260 days per year divided by 2004.62 metric tons per pound.

Sources

- Worker Trips and Truck Trips taken from Table 1-6
- Number of Haul Trips per daty taken from Table 1-10
- Miles per waste disposal type taken from Table 1-9

Sources - Emission Factors used to determine weighted emissions taken from Table 1-9.

Assumptions
- 453.6 grams per pound
- Weighted average is based on distance and speed.
- Max Trucks per day assumes maximum potential milage based on number of trucks per waste type and length of trip, and 32 trips per day per RP
- Max trucks per year assumes 80 trucks per day (27 for DOE and Boeing, 26 for NASA) and is weighted to take into account the total amount of trucks per waste type (Table 1-11)

Santa Susana Field Laboratory
Overall Site Cleanup - Mitigated

Offsite Emissions

Assumptions

- 40 miles per commute trip, either within VCAPCD or SCAQMD.
- Number of workers per day is taken from Table 1-11. For M&M each RP is assumed to have 3 workers.
- Assumes 2 trips per worker
- Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. Only the maximum for each air district is reported as a worst case scenario. 40 miles per trip was the average trip length assumed for workers.

- For maximum emissions by air basin, the maximum distance that could be traveled through each air basin based on the potential disposal sites is used. Disposal sites are determined based on RP and type of disposal (non-hazardous, hazardous, radiological).
- No haul trucks required for M&M activities.

Equations

-	Commuter Trips	=	Sum of: emission factor in grams per mile (Table 1-1) times 453.6 (grams per pound) times miles total miles per day for each Air District (SCAQMD, VCAPCD).
-	Haul Truck Trips	=	sum of: emission factor in grams per mile (Table 1-9) times 453.6 (grams per pound) times miles total miles per day for each type of disposal location (Non-hazardous, Hazardous, Radiological) plus the emission factors for fugitive
		=	road dust times total miels per day.
-	Total Miles	=	miles per trip times number of trips.
-	tons/year	=	lbs/day multiplied by 260 days divided by 2000 lbs per ton.
-	MT/year	=	lbs/day multiplied by 260 days per year divided by 2004.62 metric tons per pound.

Sources

Santa Susana Field Laboratory
Initial Clean-up - Mitigated

Onsite Fugitive Dust Emission Factors

Table 5-7: Mitigated Emission Factors For Fugitive Dust

	PM10	PM2.5	Units
Scraper/Grader	1.436	0.155	lbs/VMT
Dozer/Excavator	0.701	0.385	lbs/hr
Truck Loading	1.11E-04	1.68E-05	lbs/ton
Mechanical Demolition	1.03E-04	1.56E-05	lbs/ton
Debris Loading	0.020	0.003	lbs/ton
Unpaved Road Haul	0.734	0.073	lbs/VMT
Paved Road Haul	0.007	0.002	lbs/VMT
Paved Road Commute	7.9E-04	2.0E-04	lbs/VMT

Fugitive emissions from scrapers/graders:

PM_{10} = $(0.051 \times (S)^{2.0}) \times F_{PM10}$
= $(0.051 \times (7.1)^{2.0}) \times 0.6$
= 1.543 lbs/VMT

$PM_{2.5}$ = $(0.04 \times (S)^{2.5}) \times F_{PM2.5}$
= $(0.04 \times (7.1)^{2.5}) \times 0.031$
= 0.167 lbs/VMT

S = mean vehicle speed (mph) Default = 7.1
F_{PM10} = PM_{10} scaling factor default of 0.6
$F_{PM2.5}$ = $PM_{2.5}$ scaling factor default of 0.031

Fugitive emissions from Dozers and Excavators:

PM_{10} = $((C_{PM15} \times s^{1.5})/M^{1.4}) \times F_{PM10}$
= $((1 \times 6.9^{1.5})/7.9^{1.4}) \times 0.75$
= 0.753 lbs/hr

$PM_{2.5}$ = $((C_{TSP} \times s^{1.2})/M^{1.3}) \times F_{PM2.5}$
= $((5.7 \times 6.9^{1.2})/7.9^{1.3}) \times 0.105$

C_{PM15} = arbitary coefficient used by AP-42 = 1
s = material silt content = 6.9 %
M = material moisture content = 7.9%
F_{PM10} = PM_{10} scaling factor default of 0.75
C_{TSP} = arbitary coefficient used by AP-42 = 5.7
$F_{PM2.5}$ = $PM_{2.5}$ scaling factor default of 0.105

Fugitive emissions from truck loading

PM_{10} = $k \times (0.0032) \times ((U/5)^{1.3}/(M/2)^{1.4})$
= $0.35 \times (0.0032) \times ((5.82/5)^{1.3}/(12/2)^{1.4})$
= 1.11E-04 lbs/ton

$PM_{2.5}$ = $k \times (0.0032) \times ((U/5)^{1.3}/(M/2)^{1.4})$
= $0.053 \times (0.0032) \times ((5.82/5)^{1.3}/(12/2)^{1.4})$
= 1.68E-05 lbs/ton

k = particle size (PM10 = 0.35, PM2.5 = 0.053)
U= wind speed (miles - hour) = 5.82
M = Material moisture content = 12%

Fugitive Emissions from Mechanical Demolition

PM_{10} = $k \times (0.0032) \times ((U/5)^{1.3}/(M/2)^{1.4})$
= $0.35 \times (0.0032) \times ((5.82/5)^{1.3}/(12/2)^{1.4})$
= 1.11E-04 lbs/ton

k = particle size (PM10 = 0.35, PM2.5 = 0.053)
U= wind speed (miles - hour) = 5.82
M = Material moisture content = 12%

Santa Susana Field Laboratory
Initial Clean-up - Mitigated

Onsite Fugitive Emissions

$PM_{2.5}$ = k x (0.0032) x $((U/5)^{1.3}/(M/2)^{1.4})$

= 0.053 x (0.0032) x $((5.82/5)^{1.3}/(12/2)^{1.4})$

= 1.68E-05 lbs/ton

Fugitive Emissions from Debris Loading

PM_{10} = k x $EF_{L\text{-}TSP}$
= 0.35 x 0.058
= 0.020 lbs/ton

k = particle size (PM10 = 0.35, PM2.5 = 0.053)
$EF_{L\text{-}TSP}$ = default value = 0.058 lbs/ton

$PM_{2.5}$ = k x $EF_{L\text{-}TSP}$
= 0.053 x 0.058
= 0.003 lbs/ton

Equations

- Emissons for graders and scrapers = Emission factor x(((Acres / blade width of 12 ft) x 43,560 sqft per acre) / 5,280 ft per mile)
  - Acres are based on table provided on page 8 of CalEEMod Appendix A. (BREEZE software, a Division of Trinity Consultants, 2016).
    scrapers 1 acers/8hr day (conservately uses 1 acre for both because of the type of activities)
  - Emissions include a 69% reduction for required fugitive dust control measures.
  - Emission factor taken from Table 1-8.
- Emissions for dozers/excavators = # equipment x hours of operation x emission factor
  - Number of dozers and excavators taken from Table 1-6.
  - 8 hours per day
  - Emission factor taken from Table 1-8.
- Emissions for truck loading (soils) = emission factor * tons of material
  - Emission factor taken from Table 1-8.
- Emissions include a 63% reduction for required fugitive dust control measures.
- Emissions for Excavation truck loading = EF x Tons
  - Tons of soil = tons per truck (Assumed 23) times 2 times the number of trucks (From Table 1-6). Twice the number of trucks is used to account for
  - Emission factor taken from Table 1-8.
  - Tons of soil = tons per truck (Assumed 23) times the number of trucks (From Table 1-6).
- Emissions for fugitive dust from unpaved roads = Number of Miles x Number of Trucks x Emission Factor for PM10/PM2.5
  - Equations and constants taken from EPA's AP-42 13.2.2 Unpaved Roads
  - Emissions include a 69% reduction for required fugitive dust control measures.
  - Emission factor taken from Table 1-8.

Santa Susana Field Laboratory
Initial Clean-up - LST Emissions Summary (Mitigated)

Table 6-2: LST Initial Clean-up Emissions Summary

LST Emissions Summary
(lbs/day)

	NOx	CO	PM10	PM2.5
Emissions	27	158	63	22
Threshold	131	5045	114	53
Significant?	No	No	**No**	**No**

Threshold Determination (2 acre site)

	NOx	NOx^2	CO	PM10	PM2.5	
500 meters	263	146	7,460	162	84	Source Receptor Area 6
400 meters	237	131	5,045	114	53	
300 meters	212	117	3,837	90	37	
200 meters	187	103	2,629	66	21	Source Receptor Area 6

LST's determined by max for each activity as the activities occur at different locations throughout the site.

Sources: LSTs are determined by summing the onsite emissions as reported in Table 3-1.

Assumptions NOx^2: The screening criteria for NOx were developed based on the 1-hour NO_2 CAAQS of 0.18 ppm. However, since the publication of the SCAQMD's guidance, the USEPA has promulgated a 1-hour NO_2 NAAQS of 0.100 ppm based on a 98th percentile value, which is more stringent than the CAAQS. In order to determine if Project emissions would result in an exceedance of the 1 hour NO_2 NAAQS, an approximated LST was estimated to evaluate the federal 1-hour NO_2 standard, as the SCAQMD significance threshold has not been updated to reflect this standard. Calculated by scaling the NO_2 LST for by the ratio of 1-hour NO_2 standards (federal/state)(i.e., 236 lb/day * (0.10/0.18) = 131 lb/day).

Initial Clean-up - Mitigated

Initial Clean Up Emissions

Equations

- Daily emssions (Exhaust) (lbs/day) = sum of daily emissions for each piece of equipment.
- Emissions from each equipment type = Number of pieces of equipment times the emissions per day for that piece of equipment.
  - Emissions per day per equipment type from Table 1-5.
  - Number of Pieces of Equipment per activty from Table 1-6.
- Daily emssions (Fugitive) (lbs/day) - Taken from Table 3-5 and 3-6 for initial clean-up projects.
- Daily emssions (haul trucks) (lbs/day) = [(Emission Factor$_{exhaust}$ X number of trips X Miles) x (Emission Factor$_{idle}$ X number of minutes X number of trucks)] / 453.6
  - Emission Factors from Table 1-4.
  - Number of Trips from Table 1-6
  - **4** miles/ round trip
  - **15** minutes idling per truck (- assumes idling entering the site, at the loading location, and leaving the site)
- Daily emssions (crew (onsite worker transport)) = ((Number of Employees/15) times Emission Factor times 4) / 453.6
  - Number of employees per phase taken from Table 1-6.
  - **15** workers/onsite van
  - Emission Factor taken from Table 1-5
  - **4** miles/ round trip
  - 453.6 grams per pound
- Total Daily Emissions for each criteria pollutant is the sume of the daily exhaust, fugitive, haul truck, and crew emissions.
- Annual emssions (Tons/year) = (Daily Emissions * Number of Days)/2000
  - Daily Emissions from Table 3-3.
  - 2,000.00 lbs/ton
  - 260 days per year
- Annual emssions (MT/year) = (Daily Emissions * Number of Days)/2204.623
  - Daily Emissions from Table 3-3.
  - 2,204.62 lbs per Metric Ton

[1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

[2] PM10 and PM2.5 emissions include fugitive road dust

[1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

[2] PM10 and PM2.5 emissions include fugitive road dust

[1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

[2] PM10 and PM2.5 emissions include fugitive road dust

	25.3333333	1207.75	24	15.75		

LST's determined by max for each RP as the activities occur at different locations throughout the site.

Sources: LSTs are determined by summing the onsite emissions as reported in Table 7-1.

Assumptions NOx^2: The screening criteria for NOx were developed based on the 1-hour NO_2 CAAQS of 0.18 ppm. However, since the publication of the SCAQMD's guidance, the USEPA has promulgated a 1-hour NO_2 NAAQS of 0.100 ppm based on a 98th percentile value, which is more stringent than the CAAQS. In order to determine if Project emissions would result in an exceedance of the 1 hour NO_2 NAAQS, an approximated LST was estimated to evaluate the federal 1-hour NO_2 standard, as the SCAQMD significance threshold has not been updated to reflect this standard. Calculated by scaling the NO_2 LST for by the ratio of 1-hour NO_2 standards (federal/state)(i.e., 236 lb/day * (0.10/0.18) = 131 lb/day).

Overall Site Cleanup Emissions

Equations

- Daily emssions (Exhaust) (lbs/day) = sum of daily emissions for each piece of equipment.
- Emissions from each equipment type = Number of pieces of equipment times the emissions per day for that piece of equipment.
  - Emissions per day per equipment type from Table 1-5.
  - Number of Pieces of Equipment per activty from Table 1-11.
- Daily emssions (Fugitive) (lbs/day) - Taken from Tables 7-8 and 7-9.
- Daily emssions (haul trucks) (lbs/day) =
  [(Emission Factorexhaust X number of trips X Miles) x (Emission Factoridle X number of minutes X number of trucks)] / 453.6
  - Emission Factors from Table 1-4.
  - Number of Trips from Table 1-11
  - **4** miles/ round trip
  - **15** minutes idling per truck (- assumes idling entering the site, at the loading location, and leaving the site)
- Daily emssions (crew (onsite worker transport)) (lbs/day) = ((Number of Employees/15) times Emission Factor times 4) / 453.6
  - Number of employees per phase taken from Table 1-11.
  - **15** workers/onsite van
  - Emission Factor taken from Table 1-5
  - **4** miles/ round trip
  - 453.6 grams per pound
- Total Daily Emissions (lbs/day) for each criteria pollutant is the sume of the daily exhaust, fugitive, haul truck, and crew emissions.
- Annual emssions (Tons/year) = (Daily Emissions * Number of Days)/2000
  - Daily Emissions from Table 7-6.
  - 2,000.00 lbs/ton
  - 260 days per year
- Annual emssions (MT/year) = (Daily Emissions * Number of Days)/2204.623
  - Daily Emissions from Table 7-6.
  - 2,204.62 lbs per Metric Ton
  - 260 days per year

[1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

[2] PM10 and PM2.5 emissions include fugitive road dust

[1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

[2] PM10 and PM2.5 emissions include fugitive road dust

*Totals may not add exactly due to rounding.

[1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

[2] PM10 and PM2.5 emissions include fugitive road dust

memorandum

date March 24, 2016

to California Environmental Protection Agency, Department of Toxic Substance Control (DTSC)

from Heidi Rous, Environmental Science Associates (ESA)

subject Santa Susana Field Laboratories Project EIR
Feasibility of Alternative-Fueled Cleanup Equipment and Trucks

Introduction and Project Background

Environmental Science Associates (ESA) is providing this Technical Memorandum in support of the California Environmental Quality Act (CEQA) document development for consideration by the California Environmental Protection Agency, Department of Toxic Substances Control (DTSC) in assessing the remedial action to be undertaken at the approximately 2,850-acre Santa Susana Field Laboratories (SSFL) site and adjacent offsite areas (the project site). Roughly 541 acres at the project site have been targeted for some level of remedial action. The project site is located in the southeastern-most part of Ventura County and adjacent to Los Angeles County, approximately 29 miles northwest of downtown Los Angeles and approximately one mile south of the City of Simi Valley.

This memorandum discusses the feasibility of alternative-fueled cleanup equipment and trucks for the removal of impacted material from the SSFL site and adjacent offsite areas. The remedial technologies considered to address the multiple affected media, the variety of contaminants present, and the unique and various conditions at the site includes: excavation and offsite disposal; soil vapor extraction; biological treatment; capping and onsite management; phytoremediation (the use of plants to remediate chemicals of concern in contaminated media); and physical remediation methods (soil washing/partitioning; soil solidification/stabilization; thermal desorption).

The DTSC's proposed remedy for the project site would generate a daily maximum number of 96 round trips (resulting in 192 total trips) for trucks visiting the site for export and import of materials for all Responsible Parties (RPs) combined. This maximum would represent all types of truck trips, including: equipment deliveries; excavation spoils; building demolition debris; and delivery of backfill soil. For planning purposes, it is assumed that the actual number of trucks would range between approximately 48 round trips and a maximum of 96 round trips. This predicted variability is based on factors such as funding, the complexity of various projects stages (i.e., building removal, excavation, backfilling, confirmation sampling, etc.), coordination between multiple RPs, determination of final soil excavation volumes, and project initiation and ability to ramp up overall production given the nature of the SSFL project as a whole. Reclamation would consist of limited backfilling, grading, and revegetation as necessary.

Equipment Exhaust

Implementation of the project Cleanup Plan has the potential to generate short-term emissions of criteria pollutants, toxic air contaminants (TAC), and greenhouse gases (GHGs) through the operation of diesel-fueled heavy-duty equipment, vehicle trips generated from workers and visitors traveling to and from the project site, haul trucks importing and exporting material, and vehicles bringing supplies and equipment. Mobile source emissions, primarily oxides of nitrogen (NO_X), particulate matter (PM), and carbon dioxide (CO_2) would result from the use of this on- and off-road equipment. The project site is located in the South Central Coast Air Basin (SCCAB) and adjacent to the South Coast Air Basin (SoCAB), which are designated as state and federal non-attainment area for ozone and a state non-attainment area for PM10. The SoCAB is also designated as a state and federal non-attainment area for PM2.5. A non-attainment designation means that the area does not meet the health-based ambient air quality standards for these pollutants. Emissions of NO_X are a precursor to the formation of ground-level ozone, which occurs due to complex photo-chemical reactions of these pollutants in the atmosphere in the presence of sunlight. Additionally, the use of diesel fuel would generate diesel particulate matter (DPM) exhaust, which is classified as a TAC, and a carcinogen by the State of California.

To estimate the emissions associated with the heavy-duty diesel-fueled equipment required for the project cleanup activities, the types and number of equipment, and hours of operation per day must be determined based on the maximum daily throughput or rate of cleanup. Emission factors are based on U.S. Environmental Protection Agency (USEPA) off-road emissions standards applicable to the equipment assumed to be used during the project cleanup activities. USEPA emissions standards are classified as Tiers 1-4, with a higher tiered engine (Tier 4) applying to newer engine model years, resulting in lower emissions (cleaner). The DTSC is committed to using the higher tiered engines (Tier 4) to reduce diesel exhaust emissions.

On-road vehicles, such as personal automobiles, delivery trucks, and haul trucks, are calculated based on vehicle miles traveled (VMT), average speed, and engine model year. Although the project is located in the Ventura County portion of the SCCAB, which is under the jurisdiction of the Ventura County Air Pollution Control District (VCAPCD) for air quality planning, and directly adjacent to the SoCAB, which is under the jurisdiction of the South Coast Air Quality Management District (SCAQMD) for air quality planning, haul trucks exporting soil may travel (i.e., VMT) to a receiver landfill located outside of the SCCAB. The selection of the receiver site (landfill) would depend on the characterization of the impacted soil. Export haul truck trip lengths (i.e., VMT per one-way trip) from the project site to receiver sites would be up to approximately 18 miles in the SCCAB, approximately 12 to 125 miles within the SoCAB, up to approximately 300 miles within in the San Joaquin Valley Air Basin (SJVAB), up to approximately 140 miles within the Salton Sea Air Basin (SSAB), up to approximately 200 miles in the Mojave Desert Air Basin (MDAB), up to approximately 160 miles in the Great Basin Valleys Air Basin (GBVAB), up to approximately 230 miles in the Sacramento Valley Air Basin (SACVAB), and up to approximately 66 miles in the Northeast Plateau Air Basin (NEPAB). The VMT anticipated from implementation of the remedy at the project site is expected to result in non-negligible emissions in these air basins.

In 2008, CARB approved the Truck and Bus regulation to reduce PM and NO_X emissions from existing diesel vehicles operating in California, which was amended in December 2010 to apply to nearly all diesel fueled trucks and busses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds. For the largest trucks in the fleet, i.e. a GVWR greater than 26,000 pounds, there are two options to comply with the requirements. For option one, the fleet owner retrofits or replaces engines, starting with the oldest engine model year, to meet the 2010

engine standards, or better. This option would be phased over 8 years, starting in 2015 and would be fully implemented by 2023. Therefore, all trucks operating in the State subject to this option would meet or exceed the 2010 engine emission standards for NO_X and PM by 2023. Method two required fleet owners, starting in 2012, to retrofit a portion of their fleet with DPM filters (DPFs) to achieve at least 85 percent removal efficiency, such that by January 1, 2016 their entire fleet is equipped with DPFs. However, DPFs do not lower NO_X emissions; thus, fleet owners choosing the second option must still comply with the 2010 engine emission standards for their trucks and busses by 2020.

Emission Control Strategies

The project would implement a number of mitigation measures to reduce fugitive dust, and equipment and truck exhaust emissions. To account for control measures when preparing an emissions inventory, the VCAPCD *Ventura County Air Quality Assessment Guidelines*, SCAQMD CEQA *Air Quality Handbook* and *Air Quality Analysis Handbook* and CARB regulations provide control efficiency percentages, which are supported by peer reviewed scientific studies. The control efficiency percentages apply to fugitive dust or engine exhaust emissions sources in order to reduce emissions. Based on the control measures discussed below, such control measures (and results) for equipment exhaust included in the analysis are, as follows:

- Use of USEPA Tier 4 emissions compliant equipment for cleanup activities (cleaner engines, i.e., lower DPM and NO_X emissions up to 95 and 90 percent, respectively).
- Use of newer model year trucks for export (cleaner engines, i.e., lower DPM and NO_X emissions up to 90 and 80 percent, respectively, compared to pre-2010 models).
- Limit idling of all equipment and trucks to five minutes per instance (which reduces DPM and NO_X emissions, although difficult to reliably quantify).

Although implementation of these control measures would reduce emissions, project-related air pollutant emissions are predicted to exceed applicable thresholds. Specifically, regional emissions of NO_X would likely exceed the VCAPCD and SCAQMD's daily significance thresholds. Emissions of TACs, specifically DPM, could also exceed the health risk significance threshold of 10 in one million. As is required by CEQA, DTSC must consider all feasible mitigation measures to reduce significant impacts, and has requested ESA to investigate the feasibility of additional emission reducing technologies including alternative-fueled engines.

The following discussion considers the feasibility of alternative-fueled equipment and trucks, as mitigation to further reduce project emissions of NO_X and other pollutants, including the feasibility of: :

1. Biodiesel Fuel;
2. Compressed Natural Gas (CNG) and Liquefied Natural Gas (LNG); and
3. Electric Engines (plug-in or hybrid).

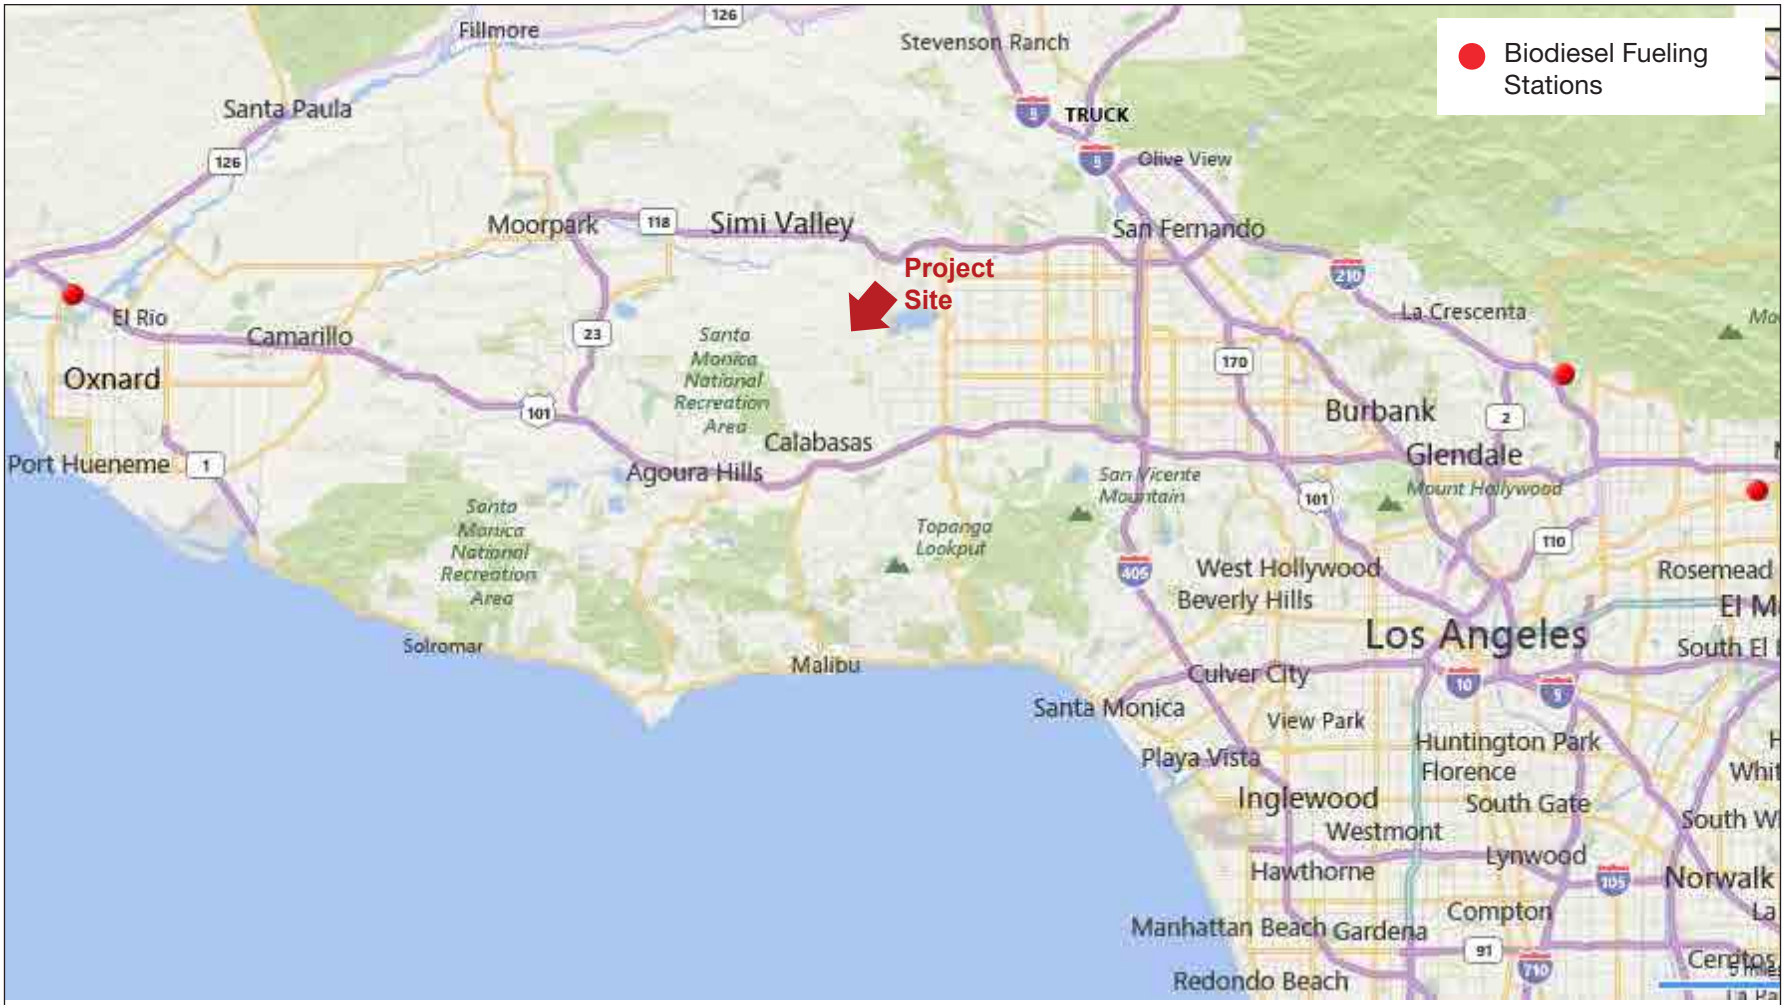
1. Biodiesel Fuel

Biodiesel Basics

Biodiesel is a cleaner burning diesel replacement fuel, produced from a renewable diverse mix of resources including agricultural oils, recycled cooking oil, and animal fats. Meeting strict technical fuel quality and engine performance specifications (American Society of Testing & Materials (ASTM) D6751), biodiesel can be used in existing diesel engines without modification, and is covered by all major engine manufacturers' warranties, most

often in blends of 5 percent up to 20 percent (known as B20) biodiesel. Biodiesel is produced in nearly every state in the country. Biodiesel is the only alternative fuel to have fully completed the health effects testing requirements of the 1990 Amendments to the federal Clean Air Act. Health testing was performed based on inhalation of biodiesel exhaust at different concentrations. Results of the testing concluded that biodiesel exhaust concentrations expected to be observed on the field would not pose a threat to human health (Sharp, 1998)

Biodiesel that meets ASTM D6751 and is legally registered with the USEPA, is a legal motor fuel for sale and distribution (Biodiesel.org 2016). The use of biodiesel in a conventional diesel engine, not equipped with new diesel after treatment, results in substantial reduction of unburned hydrocarbons, carbon monoxide (CO), and PM compared to emissions from diesel fuel. In addition, the exhaust emissions of sulfur oxides and sulfates (major components of acid rain) from biodiesel are essentially eliminated compared to higher sulfur diesel (Biodiesel.org 2016).



Of the major exhaust pollutants, both unburned hydrocarbons and NO_X are ozone (or smog) forming precursors. The use of biodiesel in a conventional diesel engine results in substantial reduction of unburned hydrocarbons, CO, and PM. However, emissions of NO_X are either slightly reduced or slightly increased depending on the duty cycle of the engine and testing methods used. Biodiesel further enhances the advantages of diesel by reducing vehicle emissions. B20, a 20 percent blend of biodiesel and conventional diesel, reduces emissions of hydrocarbons by 20 percent and CO and PM emissions by 12 percent. Based on engine testing, using the most stringent emissions testing protocols required by USEPA for certification of fuels or fuel additives in the U.S., the overall ozone forming potential of the hydrocarbon emissions from biodiesel was nearly 50 percent less than that measured for diesel fuel. New Technology Diesel Engines (NTDE) (i.e. those with PM traps and selective catalytic reduction, SCR, technology required for on-road applications in the US after 2010) reduce emissions of both PM and NO_X with B20 by over 90 percent compared to a conventional diesel engine based on model year 2004 emissions standards. This makes NTDEs as clean as or cleaner than either gasoline or natural gas fueled engines (Biodiesel.org 2016).

Biodiesel Availability

Biodiesel is available nationwide, and can be purchased directly from biodiesel producers and marketers, petroleum distributors, or at a few public retailers throughout the nation (Biodiesel.org 2016). Biodiesel fuel is available at fueling stations within 25 miles of the SSFL site, as shown in **Figure 1**, *Biodiesel Fueling Stations near Santa Susana Field Laboratories Site*, below.

Biodiesel Usage

Biodiesel usage is growing rapidly in every market segment where conventional diesel fuel is used. Some of the leading types of consumers of biodiesel fuels include state and municipal governments, school districts, U.S. Department of Defense, agriculture, cruise ships, mining, commercial trucking and truck stop operators. Many cities and states have started to require that their trucks and buses use biodiesel fuels. Notable examples of municipal users in California include the cities of San Francisco, San Jose, and Santa Monica. Some states such as Washington, Louisiana and Minnesota now also mandate that a certain percentage of all diesel fuel sold must be biodiesel.

SOURCE: http://biodiesel.org/using-biodiesel/finding-biodiesel/retail-locations/retail-map

Figure 1
Biodiesel Fueling Stations near Santa Susana Field Laboratories

Use of biodiesel is diverse, with a variety of users (e.g., municipalities, agencies, and utilities) and equipment and vehicle fleets, such as the following examples (Berkeleybioddiesel.org 2016):

- New common rail engines use biodiesel fuel, B5 or B20, depending on manufacturer.
- Automobile manufacturer acceptance and vehicular usage of biodiesel fuel began when Chrysler released the Jeep Liberty CRD diesels into the American market with B5, which was an indication of at least partial acceptance of biodiesel fuel usage in the automotive industry.
- The City of Halifax, Nova Scotia updated its bus system to allow the fleet of city buses to run completely on a fish-oil based biodiesel fuel.
- The McDonalds Corporation in United Kingdom produced biodiesel from the waste oil of its restaurants and use as biodiesel fuel to run its vehicle fleet. The British Train Operating Company, Virgin Trains was transformed to run on B20. The Royal Train runs onB100.
- The Disneyland Theme Park operates its park trains on B98 biodiesel blends.
- Caterpillar Corporation uses of blends up to B20 in its off-road Tier 4 938K wheel loader. Caterpillar has approved the use of B20 biodiesel across its range of compact and mid-range engines.
- Komatsu Corporation announced that an acceptable biodiesel fuel blend of up to B20 can be used for all Komatsu engines.
- The Volvo Corporation warranty statement for Volvo Trucks' D11, D13, and D16 engines that the use of biodiesel up to a maximum of B20 in and of itself, will not affect the manufacturer's mechanical warranty as to engine and emissions system related components, provided the bio fuel used in the blend conforms to ASTM standards.
- The John Deere Corporation announced that all John Deere engines can use biodiesel blends. B5 blends are preferred, but concentrations up to B20 can be used providing the biodiesel used in the fuel blend meets the ASTM standards.

Applications of biodiesel fuel can also be seen as a heating fuel in domestic and commercial boilers, using a blend of heating oil and standardized biofuel, known as "bio heat" (Berkeleybioddiesel.org 2016).

As of 2015, the annual U.S. production of biodiesel was 1,263 million gallons (U.S. Energy Information Administration (EIA 2016), and 32 million gallons in California (California Biodiesel Alliance 2016).

U.S. Environmental Protection Agency Policy on Biofuels:

The USEPA has set a target of 18.8 billion (bn) gallons blended into the U.S.' fuel supply in 2017, up 4 percent from the 18.1 bn gallons set for this year, which includes 14.8 bn for conventional biofuels, mainly ethanol, up from 14.5 bn for this year. This figure is still far below the 24 bn gallon target in the Renewable Fuel Standard set in 2007 by Congress, which was aimed at cutting US oil imports and increasing renewable fuel use. In addition:

- Total renewable fuel volumes would grow by nearly 700 million gallons between 2016 and 2017.
- Biomass-based biodiesel, which must achieve at least 50 percent lifecycle emissions reductions, would grow by 100 million gallons between 2017 and 2018.
- Cellulosic biofuel, which requires 60 percent lifecycle carbon emissions reductions, would grow by 82 million gallons, or 35 percent, between 2016 and 2017.

Biodiesel Benefits and Drawbacks

The use of biodiesel has benefits and drawbacks. According to a USEPA study, the use of B20 can reduce emissions of hydrocarbons by 20 percent, CO by 11 percent, and PM by 10 percent; however it can increase NO_X emissions by 2 percent. The use of biodiesel does not contribute substantial amounts of GHGs to the global climate change problem since they only emit back to the environment the CO_2 that their source plants absorbed from the atmosphere as part of the natural carbon cycle. A benefit of biodiesel is that it can be used in existing diesel engines with no physical changes needed.

Many producers have been unable to produce biodiesel that meets ASTM 6751 quality due primarily to their inability to remove all impurities and water during the washing and refining processes. The USEPA found that the use of B20 can reduce fuel efficiency by 1 to 2 percent. B100, and other diesel/biodiesel blends, are more expensive to consumers than standard diesel fuel, as a result of the rapidly rising feedstock prices and production problems of producers.

2. Compressed Natural Gas (CNG) and Liquefied Natural Gas (LNG)

CNG/LNG Basics

CNG and LNG are two forms of natural gas currently used in vehicles. CNG is produced by compressing natural gas to less than 1 percent of its volume at standard atmospheric pressure. To provide adequate driving range, CNG is stored onboard a vehicle in a compressed gaseous state within cylinders at a pressure of 3,000 to 3,600 pounds per square inch. CNG is used in light-, medium-, and heavy-duty applications. A CNG-powered vehicle gets about the same fuel economy as a conventional gasoline vehicle on a gallon of gasoline equivalent (GGE) basis. GGE is the typical way CNG is sold at public fueling stations. One GGE equals about 5.66 pounds of CNG.

LNG is natural gas that has been converted to liquid form for easier storage and transport. LNG is produced by purifying natural gas and super-cooling it to approximately -260 °F to turn it into a liquid. During the process known as liquefaction, natural gas is cooled below its boiling point, removing most of the compounds found in the fuel. The remaining natural gas is primarily methane with small amounts of other hydrocarbons. LNG must be kept at cold temperatures and stored in double-walled, vacuum-insulated pressure vessels. Because of LNG's relatively high production cost as well as the need to store it in expensive cryogenic tanks, the fuel's widespread use in commercial applications has been limited. One GGE equals about 1.5 gallons of LNG (U.S. Department of Energy, 2016).

There are three types of natural gas vehicles (NGVs):

- **Dedicated:** designed to run only on natural gas.
- **Bi-fuel**: have two separate fueling systems that enable them to run on either natural gas or gasoline.
- **Dual-fuel**: traditionally limited to heavy-duty applications have fuel systems that run on natural gas, and use diesel fuel for ignition assistance.

Light-duty vehicles are typically equipped with dedicated or bi-fuel systems, while heavy-duty vehicles use dedicated or dual-fuel systems. On the vehicle, natural gas is stored in tanks as CNG. Dedicated NGVs only have

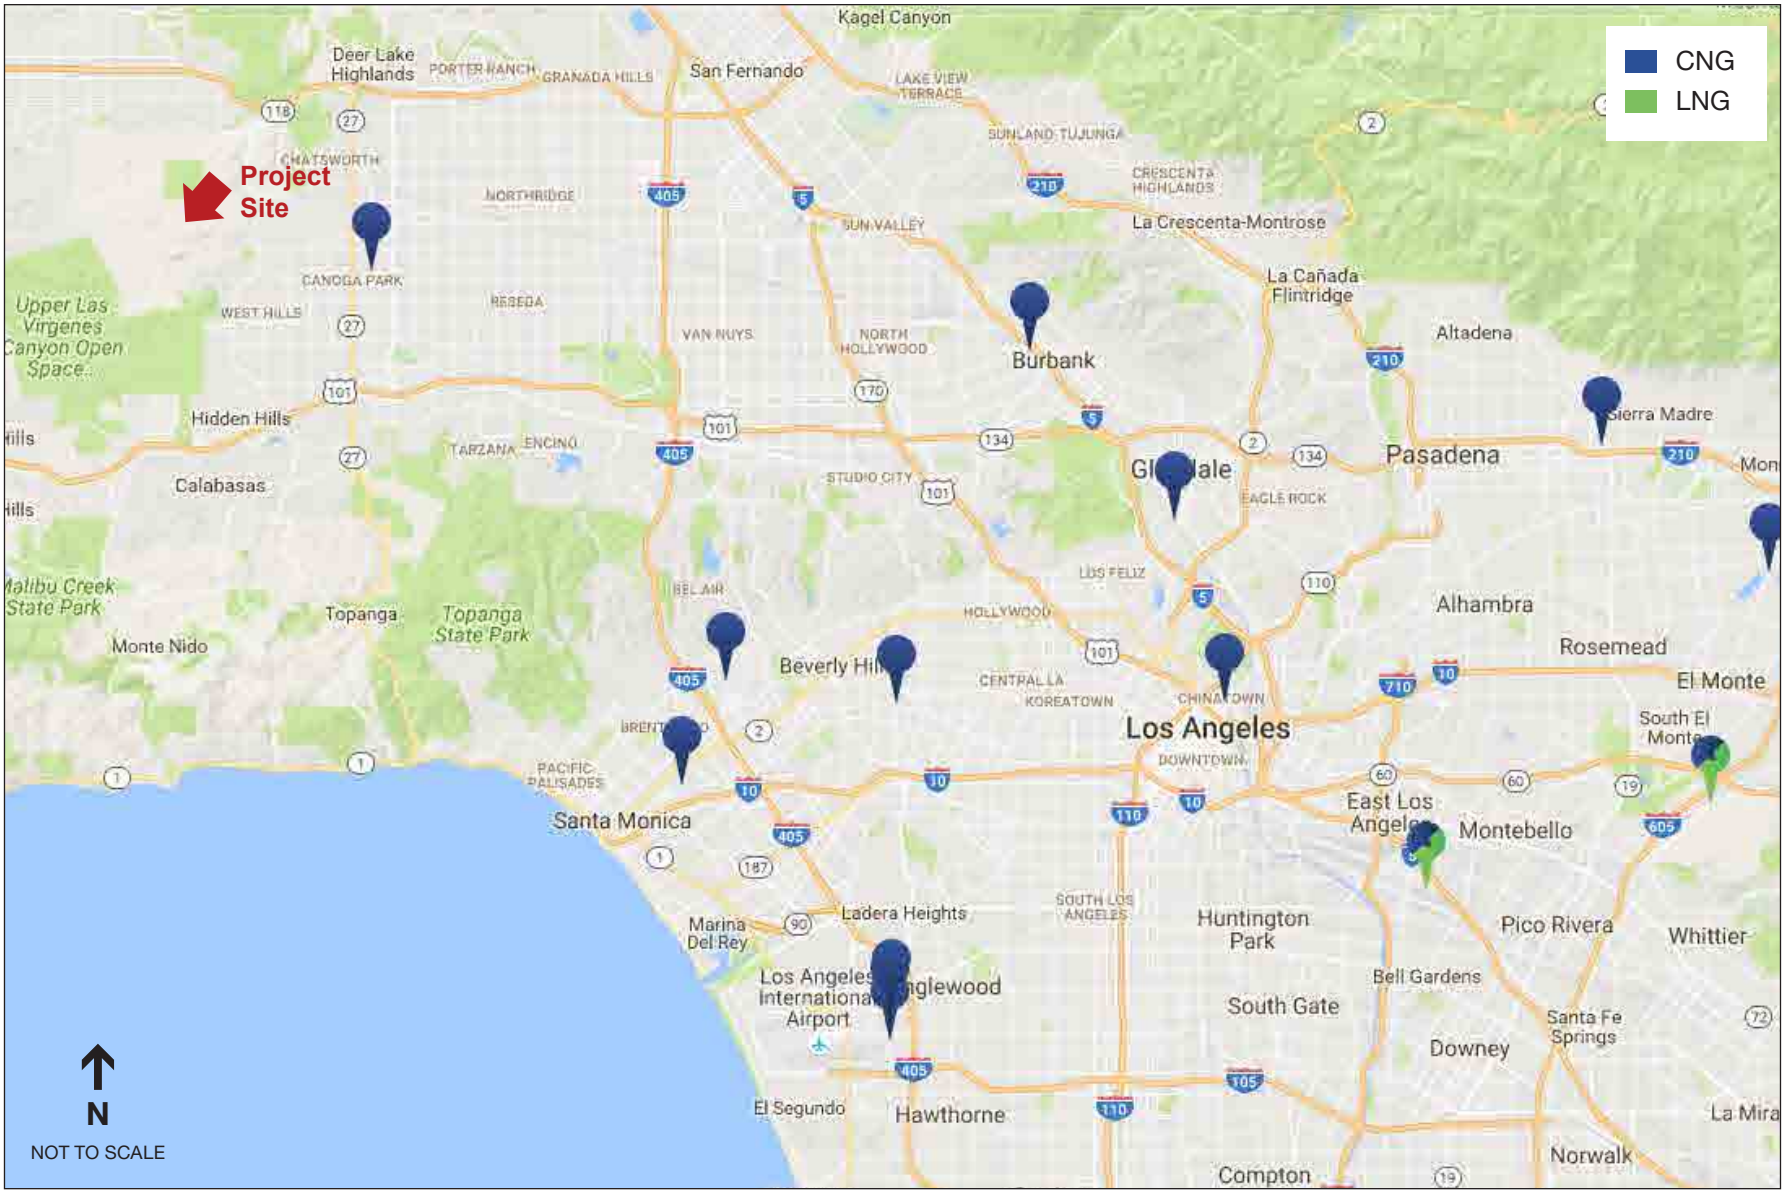
one fuel tank, and are not as heavy as bi-fuel NGVs and can offer more cargo capacity. The driving range of NGVs is generally less than that of comparable conventional vehicles because of the lower energy density of natural gas. Extra storage tanks can increase range, but the additional weight may displace cargo capacity.

LNG, a more expensive option, is used in some heavy-duty vehicles. The form of natural gas used is typically chosen based on the range an application needs. Because it is a liquid, the energy density of LNG is greater than CNG, so more fuel can be stored onboard the vehicle. As a result, LNG is more suitable than CNG for trucks that require longer ranges because liquid is more dense than gas, and, therefore, more energy can be stored by volume in a given tank. LNG is typically used in medium- and heavy-duty vehicles, such as Class 7 and 8 trucks requiring a greater range.

CNG/LNG Availability

Natural gas powers approximately 150,000 vehicles in the United States and approximately 15.2 million vehicles worldwide. Both CNG and LNG are domestically produced, relatively low priced, and commercially available. Considered alternative fuels under the Energy Policy Act of 1992, CNG and LNG are sold in units of GGEs or diesel gallon equivalents (DGEs) based on the energy content of a gallon of gasoline or diesel fuel. CNG/LNG fueling stations are available within 2 miles of the SSFL site, as shown in **Figure 2**, *CNG/LNG Fueling Stations near Santa Susana Field Laboratories Site,* below.

CNG/LNG Usage



CNG and LNG usage has been supported by various companies in the past for off-road construction trucks and on-road heavy duty trucks, such as the following:

- With regard to off-road construction trucks, Caterpillar is expected to produce three large CNG powered mining trucks: the Cat 793, 795 and 797, which will be available by 2017. These trucks would be used mainly for hauling mining ore, debris, and soil.
- For on-road trucks, Volvo offers two CNG-powered on-road heavy duty day cabs (Model VNL and VNM) equipped with a factory-installed Cummins ISL G engine (available 2013). The larger, more robust VNL model features a 12-liter Cummins- Westport ISX12 G gas engine. As of November 2016, Volvo VNL models are commercially available with the ISX12 natural gas engine.
- Terex introduced its first natural-gas-fueled mixer truck -- the front-discharge FD5000 “Great Lakes” --with a new 12-liter Cummins ISX12G engine available in ratings up to 400 hp and 1450 ft. lb. of torque, in 2014.
- Freightliner Trucks showcased its first 114SD concrete mixer with CNG technology at the 2013 World of Concrete in Las Vegas. In addition, there are other Freightliner trucks that run off of natural gas.

These engines discussed above are also incorporated into a number of mass transit uses. CNG/LNG is used in a variety of heavy-duty sources, such as school buses, transit buses, capacity trucks, tractors, and freightliners.

CNG/LNG Benefits and Drawbacks

Natural gas vehicles are good choices for centrally fueled fleets. CNG tank technology and safety are improving, and in many cases CNG can provide operators with adequate range (less than 250 miles/day) for their operations. For vehicles needing to travel long distances (greater than 250 miles/day), LNG is a better choice. The advantages of natural gas as a transportation fuel include its domestic availability, widespread distribution infrastructure, low cost, and inherently clean-burning qualities.

SOURCE: http://www.cnglngstations.com/

Figure 2

CNG/LNG Fueling Stations near Santa Susana Field Laboratories

The horsepower, acceleration, and cruise speed of NGVs are comparable to those of equivalent conventional vehicles. However, torque levels are slightly lower compared to diesel fueled engines. The Cummins ISL G natural gas engine has a diesel counterpart, the ISL 9 engine. The ISL G (natural gas) provides torque levels of up to 1,000 lb-ft, while the ISL 9 (diesel) provides torque levels of up to 1,300 lb-ft. Although the ISL G and ISL 9 engines are rated for 80,000 lb line haul applications, the deficiency in torque result in trucks travelling slower to the receiver destination. As torque is required for hauling heavy loads upgrade, use of natural gas engines may not be feasible for hauling heavy loads.

Compared with conventional diesel and gasoline vehicles, NGVs can produce some emissions benefits. When used as a vehicle fuel, natural gas can offer life cycle GHG emissions benefits over conventional fuels, depending on vehicle type, drive cycle, and engine calibration. In addition, using natural gas may reduce some types of tailpipe emissions from fuel combustion in a vehicle's engine. The emissions of primary concern include the regulated emissions of hydrocarbons, NO_X, CO, as well as CO_2. Due to increasingly stringent emissions regulations, the gap has narrowed between tailpipe emissions benefits from NGVs and conventional vehicles with modern emissions controls. USEPA is requiring all fuels and vehicle types to meet increasingly lower, near zero, thresholds for tailpipe emissions of air pollutants. Still, NGVs continue to provide emissions benefits, especially when replacing older conventional vehicles or when considering life cycle emissions (ADFC 2016).

There are many heavy-duty NVGs —as well as a number of light-duty NGVs—available from original equipment manufacturers. Qualified system retrofitters can also economically, safely, and reliably convert many vehicles for natural gas operation.

However, unlike biodiesel, which is a fuel which can be used interchangeably with conventional diesel with no physical alteration of the engine needed, powering heavy duty equipment with CNG or LNG requires a major engine retrofit or for new equipment to be purchased with a CNG/LNG compatible engine to be installed by the original engine manufacturer (OEM). Thus, the use of CNG or LNG can prove to be costly.

3. Electric Engines (EVs, Plug-In, or Hybrid)

Electric Engine Basics

Electricity can be produced from a variety of energy sources, including oil, coal, nuclear energy, hydropower, natural gas, wind energy, solar energy, and stored hydrogen. Plug-in electric vehicles are capable of drawing electricity from electrical power sources (generally the electricity grid) and storing electricity in batteries. Though not yet widely available, fuel cell vehicles use hydrogen to generate electricity onboard the vehicle. Electric vehicles discussed here include all-electric vehicles (EV), plug-in hybrid electric vehicles (PHEV), and hybrid electric vehicles (HEV).

Plug-in All-Electric Vehicles (EV)

All-electric vehicles (EVs) use a battery to store the electrical energy from a plug-in source that powers the electric motor (there is no internal combustion motor). EVs are sometimes referred to as battery electric vehicles (BEVs). EV batteries are charged by plugging the vehicle into an electric power source. Although most U.S. electricity production contributes to air pollution, the USEPA categorizes all-electric vehicles as zero-emission vehicles because they produce no direct exhaust or emissions. Because EVs use no fuel, widespread use of these vehicles could dramatically reduce petroleum consumption.

Currently available EVs have a shorter driving range per charge than most conventional vehicles have per tank of gas. EV manufacturers typically target a range of 100 miles on a fully charged EV. According to the U.S. Department of Transportation, Federal Highway Administration, 100 miles is sufficient for more than 90 percent of all household vehicle trips in the United States. For longer trips, it is necessary to recharge the vehicle or swap the battery.

The efficiency and driving range of EVs varies substantially based on driving conditions and driving habits. Extreme outside temperatures tend to reduce range, because more energy must be used to heat or cool the cabin. High driving speeds reduce range because of the energy required to overcome increased drag. Compared with gradual acceleration, rapid acceleration reduces range. Hauling heavy loads or driving up significant inclines also reduces range.

Plug-in Hybrid Electric Vehicles (PHEV)

Plug-in hybrid electric vehicles (PHEVs) are powered by both an electric motor using electricity stored in batteries, or an internal combustion engine or other propulsion source, using a fuel such as gasoline or diesel. Using electricity from the grid to run the vehicle some or all of the time reduces operating costs and petroleum consumption, relative to conventional vehicles. PHEVs might also produce lower levels of emissions, depending on the electricity source.

PHEVs generally have larger battery packs than non-plug-in hybrid electric vehicles (discussed below). This makes it possible to drive moderate distances using just electricity (about 10 to 40-plus miles in current models), commonly referred to as the "all-electric range" of the vehicle.

During urban driving, most of a PHEV's power comes from stored electricity, if the battery is charged. For example, a light-duty PHEV driver might drive to and from work on all-electric power, plug in the vehicle to charge it at night, and be ready for another all-electric commute the next day. The internal combustion engine powers the vehicle when the battery is mostly depleted, during rapid acceleration, or when intensive heating or air conditioning is required. Some heavy-duty PHEVs work the opposite way, with the internal combustion engine used for driving to and from a job site and electricity used to power the vehicle's equipment or control the cab's climate while at the job site. The PHEV fuel consumption depends on the distance driven between battery charges. For example, if the PHEV is never plugged in to charge, the fuel economy will be about the same as a similarly sized non-plug-in hybrid electric vehicle. If the PHEV is driven a shorter distance than its all-electric range, and plugged in to charge between trips, it may be possible to use only electric power.

PHEV batteries can be charged by an outside electric power source, by the internal combustion engine, or through regenerative braking. During braking, the electric motor acts as a generator, using the energy to charge the battery (U.S. Department of Energy, 2016)

Hybrid Electric Vehicles (HEVs)

Like PHEVs, hybrid electric vehicles (HEVs) are powered by an internal combustion engine or other propulsion source that can be run on conventional or alternative fuel, and an electric motor that uses energy stored in a battery (however, not recharged from a plug-in source). The extra power provided by the electric motor allows for a smaller combustion engine. Additionally, the battery can power auxiliary loads like sound systems and headlights, and reduce engine idling when stopped. Together, HEVs combine the benefits of high fuel economy and low emissions with the power and range of conventional vehicles.

A HEV cannot plug into off-board sources of electricity to charge the battery. Instead, the HEV uses regenerative braking and the internal combustion engine to charge the battery. The HEV captures energy normally lost during braking by using the electric motor as a generator, and storing the captured energy in the battery. The energy from the battery provides extra power during acceleration.

Charging Stations

Charging equipment for plug-in electric vehicles (PHEVs or EVs) is classified by the rate at which the batteries are charged. Charging times vary based on how depleted the battery is, how much energy it holds, the type of battery, and the type of EV. The charging time can range from 15 minutes to 20 hours or more, depending on these factors.

Many plug-in electric vehicle owners may do the majority of their charging at home (or at fleet facilities, in the case of fleets). Some employers offer access to charging at the workplace. In many states, plug-in electric vehicle drivers also have access to public charging stations at libraries, shopping centers, hospitals, and businesses. The charging infrastructure is rapidly expanding, providing drivers with the convenience, range, and confidence to meet more of their transportation needs with plug-in vehicles. PHEVs have added flexibility, because they can also refuel with gasoline or diesel (or possibly other fuels in the future) when necessary (U.S. Department of Energy, 2016).

Electric Engines and Charging Station Availability

A number of light-, medium-, and heavy-duty HEVs, PHEVs, and EVs are available from a variety of automakers. Heavy-duty vehicles can also be converted to PHEVs. Nevertheless, as shown in **Table 1**, various types of heavy-duty HEVs have limited commercial availability.

TABLE 1
SUMMARY OF HEAVY-DUTY EV TECHNOLOGY READINESS

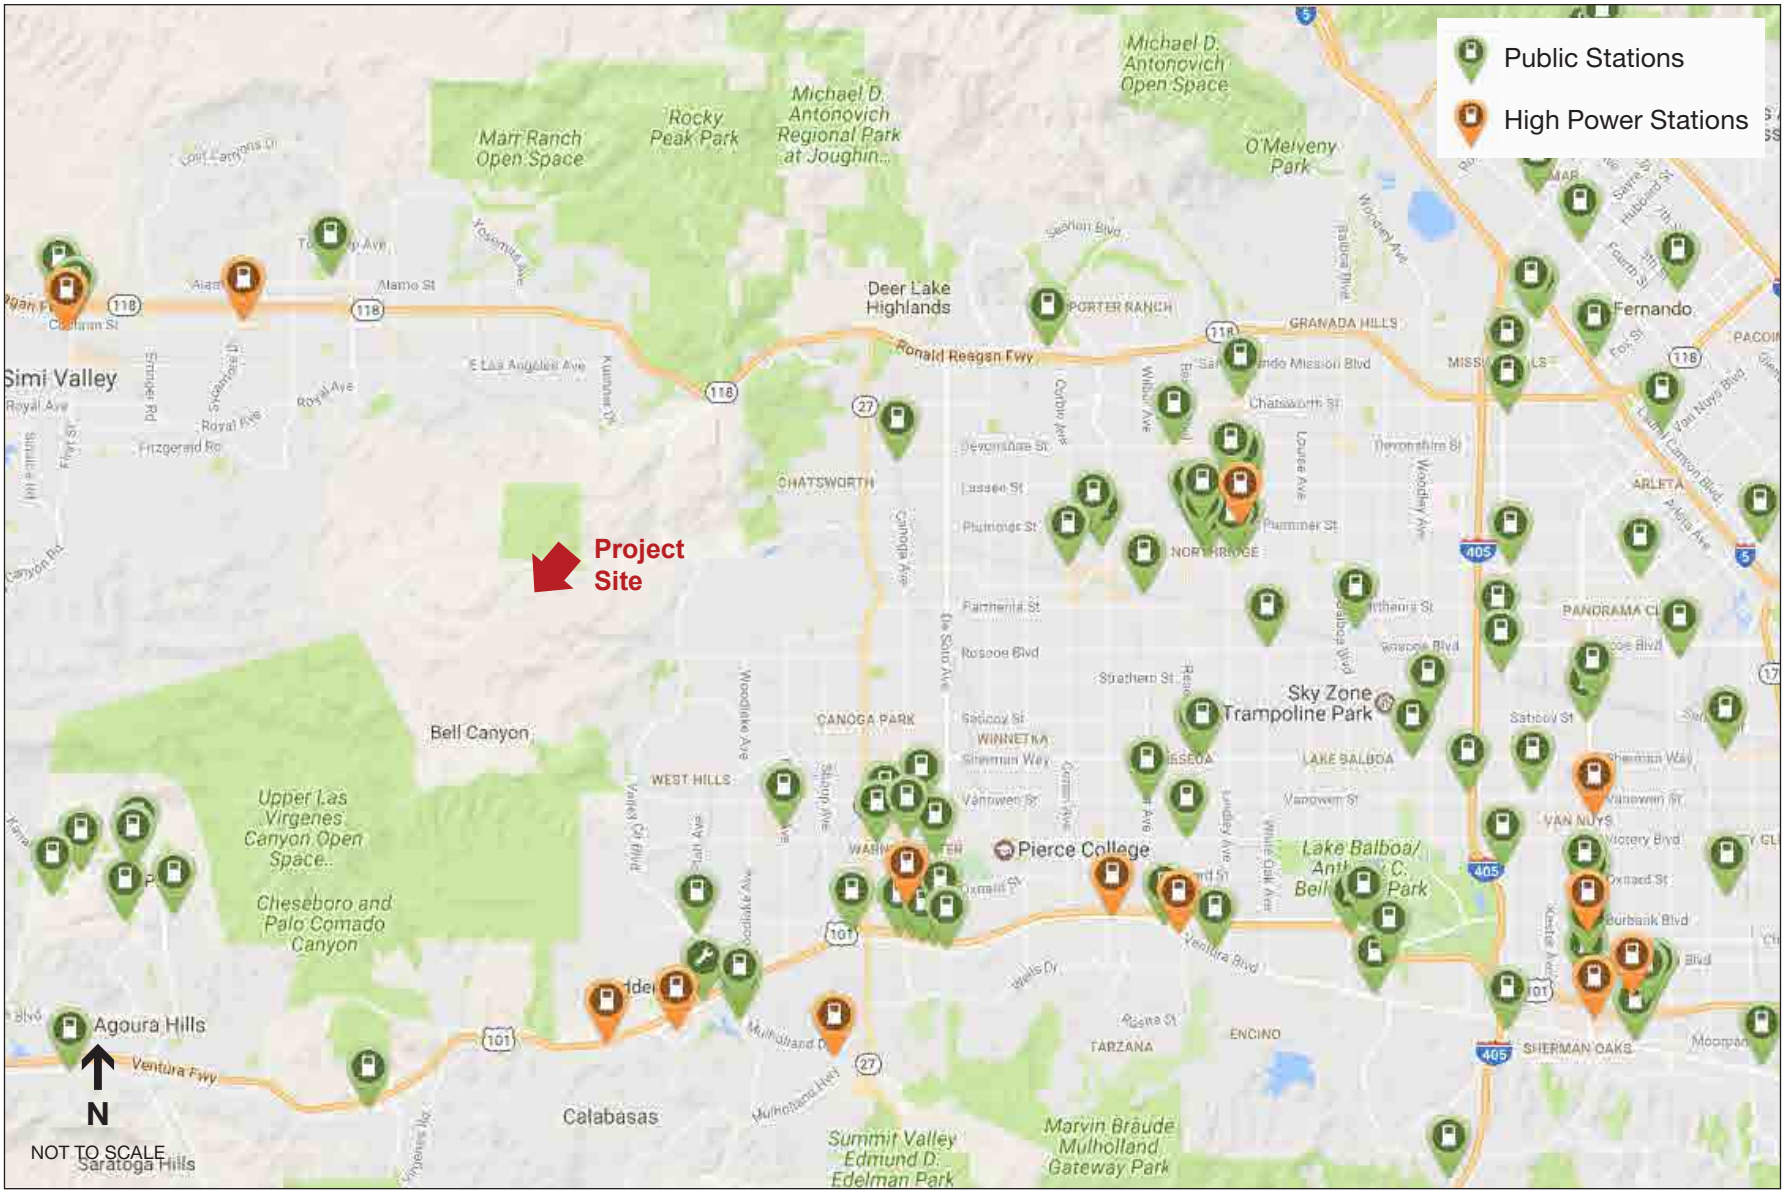
Vehicle	Technology Readiness	Number in Service	Notes
Transit Bus	Commercially Available	Approximately 40 in California, and > 2,500 worldwide	3 models commercially available in U.S.
School Bus	Limited Commercial Availability	4 in California	3 new buses ordered in SCAQMD 6 repowers underway with V2G
Medium-Duty (8,501 to 14,000 lbs.)	Limited Commercial Availability	300+	Focused on delivery service
Heavy-Duty (> 14,000 lbs.)	Demonstration Phase	2 Drayage 1 Refuse	13 Class-8 Trucks under construction

Source: CARB, 2015

Public charging stations are not as ubiquitous as gas stations, but charging equipment manufacturers, automakers, utilities, Clean Cities coalitions, municipalities, and government agencies are establishing a rapidly expanding network of charging infrastructure. Plug-in electric vehicles can be recharged at stations available within close distance of the SSFL site, as shown in **Figure 3**, *Electric Vehicle Charging Stations near Santa Susana Field Laboratories Site*, below. The cost of charging stations is variable depending upon the type of charging station (DC fast charging) and location (curbside or garage). Component cost of charging stations vary based on

hardware, electrical materials and labor, other materials and labor, transformer, mobilization, and permitting. Depending on these factors, a charging station for the project is estimated at approximately $5,300 to $13,150 for a curbside station, and $29,650 to $91,200 for a DC fast charging station (Greenbiz.com 2016).

Electric Engines Usage



The need to reduce diesel exhaust emissions has led to the development of electric engines in construction equipment and vehicles. The new technology trend for heavy equipment is the merger of diesel engines with electric drive trains. Diesel-electric and hybrid drive systems provide slightly smaller engines operating at a lower rpm, which results in fuel savings. **Table 2** summarizes examples of heavy duty EV/Hybrid vehicles.

TABLE 2
EXAMPLES OF HEAVY-DUTY HYBRID ELECTRIC VEHICLES

Vehicle	Type	Purpose
Autocar E3 Hybrid	Hybrid Electric	Refuse
Peterbilt Motors 320 HLA	Hybrid - Hydraulic	Refuse

Source: U.S. Department of Energy, Alternative Fuel Data Center, 2016

At the request of partner agencies, the Los Angeles County Metropolitan Transportation Authority (Metro) has taken the lead in forming a Countywide Zero-Emission Trucks Collaborative to promote development and deployment of zero-emission trucks in Los Angeles County. The Collaborative will include ports of Long Beach and Los Angeles, Caltrans, Southern California Association of Governments (SCAG), and SCAQMD. The Collaborative is currently developing pilot projects as well as demonstration projects for zero-emission trucks. Advancing zero-emission truck technology and implementation will help achieve the air quality objectives of Metro's Long Range Transportation Plan, goods movement program, and the agency's over-arching goal of creating a more sustainable transportation system. The collective efforts will be critical to meeting the stringent, federal health-based air standards proposed by the USEPA. The SDAQMD believes that should the new standards be adopted by USEPA, then a significant percentage of vehicles will need to achieve zero or near-zero-emissions by 2023. However, to date, the focus has been on dedicated zero-emission electric truck technology along the I-710. As part of the I-710 Corridor Project EIR/EIS, Metro has explored the feasibility of zero-emission trucks, including an Alternative with a 17-mile zero-emission, dedicated freight corridor in response to community air quality concerns. Metro has been investigating vehicle technologies that could meet the zero-emission requirement of the corridor. However, there are a series of challenges to overcome and critical stages in the development process to be completed before commercialization of zero-emission trucks will be realized. Establishing a coalition focused on technology advancement and implementation will help align Metro's policies and leverage its investments with those of partner agencies to realize our common vision for zero-emission trucks, clean air, and sustainable communities (Metro 2016).

Electric Engines Benefits and Drawbacks

Overall, electric equipment results in lower PM and NO_X emissions when compared to conventional diesel engines. However, electric equipment can cost 20 to 40 percent more than its internal combustion counterpart. Electric equipment has a downtime for recharging. The batteries typically provide enough power for one standard eight-hour shift or approximately 6 hours of constant use. After that, 8 to 16 hours are required to recharge batteries, followed by 8 hours for batteries to cool before using. Faster charging batteries can restore batteries from 20 to 100 percent in 60 to 90 minutes, though more expensive than a standard battery. In addition, battery charging stations and battery transporters are required. Although PHEVs are generally more expensive than similar conventional and hybrid vehicles, some cost can be recovered through fuel savings, a federal tax credit, or state incentives. Plug-in EVs and PHEVs use electricity from the grid to run some or all of the time reducing operating costs and petroleum consumption, relative to conventional vehicles and PHEVs. PHEVs may produce lower levels of emissions, depending on the electricity source. PHEVs generally have larger battery packs than HEVs, which makes it possible to drive moderate distances using just electricity (approximately 10 to 40-plus miles in current models). The PHEV fuel consumption depends on the distance driven between battery charges. PHEV batteries can be charged by an outside electric power source, by the internal combustion engine, or through regenerative braking. HEVs combine the benefits of high fuel economy and low emissions with the power and range of conventional vehicles, without requiring a plug-in to charge the batteries.

Conclusion

The three alternative strategies for reducing air pollutant emissions, above and beyond those reductions to be achieved with implementation of the mitigation measures listed above, were analyzed for availability, feasibility (i.e. ability to meet the project needs), and efficiency. As shown in this memorandum, while alternative fuels and associated alternative-fueled equipment are available, such fuels and equipment are not feasible for implementation in this project. The use of biodiesel would not decrease, and may in fact slightly increase NOx, the pollutant for which project emissions exceed the regional threshold for the SCCAB and SoCAB. Emissions of NO_X contribute to the formation of ground-level ozone and the SCCAB and SoCAB are designated as non-attainment for the federal and state ozone standards. Therefore, biodiesel would not be feasible for this project. Natural gas (CNG/LNG) is available in sufficient quantities, but the equipment available is currently limited to a few manufacturers or still in the prototype stage. Therefore, there is insufficient availability of natural gas (CNG/LNG)-fueled trucks available for the hauling of materials from the SSFL site to appropriate receiver facilities and would not be feasible for this project. In addition, electric engines were considered; however, due to the daily relocation of equipment throughout the SSFL site and the need for trucks to travel long distances away from the SSFL site, lack of charging stations in proximity to daily cleanup locations, and downtime for recharging, electric equipment was determined to be not feasible for this project.

Fact Sheet for Applying CalEEMod to Localized Significance Thresholds

This fact sheet describes how construction mitigation measures from the new CalEEMod Land Use Model may be applied to the SCAQMD Localized Significance Threshold (LST) Methodology. The LST Methodology uses lookup tables based on site acreage to determine the significance of emissions for CEQA purposes. However, CalEEMod does not allow the user to mitigate construction emissions by directly modifying acreage disturbed.

CalEEMod calculates construction emissions (off-road exhaust and fugitive dust) based on the number of equipment hours and the maximum daily soil disturbance activity possible for each piece of equipment. In order to compare CalEEMod reported emissions against the LST lookup tables, the CEQA document should contain in its project design features or its mitigation measures the following parameters:

1) The off-road equipment list (including type of equipment, horsepower, and hours of operation) assumed for the day of construction activity with maximum emissions
2) The maximum number of acres disturbed on the peak day using the equipment list from above and the following table from the CalEEMod appendix

Equipment Type	Acres/8hr-day
Crawler Tractors	0.5
Graders	0.5
Rubber Tired Dozers	0.5
Scrapers	1

3) Any emission control devices added onto off-road equipment
4) Specific dust suppression techniques used on the day of construction activity with maximum emissions

Example 1

A 15-acre development proposes to use one grader, one scraper, and one tractor for eight hours each during Site Preparation activities (the peak day in this case). As the maximum daily disturbed acreage for this equipment is 2 acres (0.5+1+0.5=2), the project proponent should compare CalEEMod reported emissions against the 2-acre LST lookup tables.

Example 2

A 1-acre development proposes to use 2 dozers and 2 tractors for eight hours per day each during Grading activities. The total acreage disturbed is 2 acres per day occurring on a 1-acre site (meaning the site is graded twice in one day). In this case, the CalEEMod reported emissions should be compared against the 1-acre LST lookup tables.

Assumptions
- 453.6 grams per pound

Sources
- Emission facotrs for vehicle exhaust were taken from EMFAC2014 model (v1.07). Aggregated speeds for offsite and 15 mph for onsite. (See "EMFAC2014 Emission Rates for Commuter Vehicles", Section 8 of Appendix D or Appendix E of this DEIR, for full EMFAC modeling details)

- Emission factors for offsite vehicle fugitive dust derived from AP42 - 13.2.1 - Paved Roads

Reintrained Road Dust Emission Factors (Paved Roads):

$$E = k(sL)^{0.91} \times W^{1.02}$$

$$E_{PM10} = k*(0.1)^{0.91}*497^{1.02}$$
$$= 0.0022 * 0.123 * 2.936$$
$$= 7.95E\text{-}04 \text{ PM10}$$

$$E_{PM2.5} = 0.00054 * 0.123 * 2.936$$
$$= 1.95E\text{-}04 \text{ PM2.5}$$

k	0.0022	PM10 - particle size multiplier (lbs/VMT)
k	0.00054	PM2.5 - particle size multiplier (lbs/VMT)
sL	0.1	road surace silt loading grams per square meter (g/m^2)
w	2.88	average

- Emission factors for onsite vehicle fugitive dust taken from Table 1-8

Note: For the purposes of this appendix, if a Table is listd as "*Table #-#* " (Table 1-1 for example) it assumes it is from this appendix. If the Table is from another source, the source is listed with the table. For example, " *Table 3.4 of Appendix D of the CalEEMod User Guide*"

Onsite Exhaust Emission Factors

Sources:

- Equipment type taken from Table 3-16 in the PD.
- Quantity of each equipment type was provided by DTSC based on current onsite operations.
- Emission factors for unmitigated onsite construction equipment taken from Table 3.4 of Appendix D of the CalEEMod user guide (BREEZE software, a Division of Trinity Consultants, 2016). 2016 emission factors were used as a conservative estimate for all years as equipment is not anticipated to be changed out unless it breaks. Therefore even though construction could last for 18 years, there is the potential that the same equipment in use at the beginning of the project would be in use at the end of the project.
- Emissions for water truck and Haul trucks taken from EMFAC 2014 for Ventura County for Heavy Heavy Duty Trucks at 15 mph. (See "EMFAC2014 Emission Rates for Haul Trucks", Section 8 of Appendix D of this EIR, for full EMFAC modeling details)
- Emission factors for onsite worker transport trips are from EMFAC2014 for Ventura County for LDA vehicles traveling 15 mph. (See (See "EMFAC2014 Emission Rates for Commuter Vehicles", Section 8 of Appendix D of this EIR, for full EMFAC modeling details)
- Horsepower and load factors taken as the average for each equipment type from Table 3.3 of Appendix D of the CalEEMod User's Guide (BREEZE software, a Division of Trinity Consultants, 2016).
- Tier 4 final Emissions are taken from Table 3.5 of Appendix D of the CalEEMod User Guide (BREEZE software, a Division of Trinity Consultants, 2016). Tier 4 is an EPA standard for emissions of offroad vehicle engines.

Equations

- Daily emssions = (Emission Factor X Horse power X Load Factor X Quantity X Hours per day) / 453.6
  - 453.6 grams per pound
  - Emission Factor, Horse Power, and Load Factor from Table 1-3.
  - 8 Hour work day (8 hour of equipment usage)
  - Quantity is assumed to be 1 for the purposes of daily emissions in Table 1-5.
- Daily emissions (Water truck) = (Emission Factor X Miles) / 453.6
  - Assumes water trucks at 90 miles per day for onsite operations (15 mph for 6 hrs per day)
- Impact Chisels are electric and therefore do not have quantifiable onsite emissions.

*Totals may not add exactly due to rounding.

Santa Susana Field Laboratory
Initial Clean-up - Unmitigated

Initial Clean Up Equipment Assumptions

Table 1-6: Initial Clean-up Equipment Assumptions

Equipment List	Area IV	O_2 Plant	DOE Demo	Boeing TTF	DOE RMHF/ HWMF
Rubber Tired Dozers	1.5	1.5	0	1	2
Concrete/Industrial Saws	0	0	0.1	0	0
Tractors/Loaders/Backhoes	2.5	2.5	3	1.5	3
Graders	0.75	0.75	0	0.75	1.5
Excavators	1.00	1.00	2.00	1	2
Scrapers	0	0	0	0	0

Forklifts	1	1	0	1	2
Water Truck	1	1	1	1	2
Haul Trucks (3 years)	76	9	3	3	5
Workers	10	10	23	8	20

* All Boeing activities removed from Initial Clean-up Activities

Table 1-7: Scaling for daily truck trips

	Years	Total Trucks	Haul Trucks	% of Total	Scale to 96 trucks per day	
Area IV	3	34247	44	0.795998	76	69% of the trips are hazardous, the remainder are radiological.
O2 Plant	3	3695	5	0.085882	9	80% of the trips are hazardous the remainder are non-hazardous.
DOE - Demo	2	788	2	0.027473	3	
Boeing - Demo	1	752	0	0	0	No longer part of Initial Clean-up. Truck trips zeroed out to maintain 96 trucks per day over the whole site
TTF - Boeing	0.5	26	2	0.036259	3	
Post Closure - DOE	30	0	0	0	0	
Post Closure - NASA	30	0	0	0	0	
Totals	30	0	55		96	

Sources:
- Equipment type, number of workers, and total haul trucks taken from Table 3-16 in the PD.
- Quantity of each equipment type was provided by DTSC based on current onsite operations.

Equations
- Haul trucks for each program were scaled from the average daily truck trips to a maximum of 96 daily trips for the whole site.
  Air Quality Thresholds are based on daily emissions, therefore 96 haul trucks were used as that is the maximum number of trucks that will access the site per day.
- Average daily trips for the initial projects is equal to 53. Scaled to have a minimum of one truck per day for each phase. (See Table 1-7).
  Haul trucks per day for the initial clean-up were determined by dividing the total number of trucks by the number of years of the activity then by 260 days per year.

Santa Susana Field Laboratory
Initial Clean-up - Unmitigated

Onsite Fugitive Dust Emission Factors

Table 1-8 Emission Factors For Fugitive Dust

	PM10	PM2.5	Units
Scraper/Grader	1.543	0.167	lbs/VMT
Dozer/Excavator	0.753	0.414	lbs/hr
Truck Loading	1.11E-04	1.68E-05	lbs/ton
Mechanical Demolition	1.11E-04	1.68E-05	lbs/ton
Debris Loading	0.020	0.003	lbs/ton
Unpaved Road Haul	0.876	0.088	lbs/VMT
Paved Road - Haul	0.007	0.002	lbs/VMT
Paved Road Commute	7.9E-04	2.0E-04	lbs/VMT

Fugitive emissions from scrapers/graders:

PM_{10} = $(0.051 \times (S)^{2.0}) \times F_{PM10}$
= $(0.051 \times (7.1)^{2.0}) \times 0.6$
= 1.543 lbs/VMT

$PM_{2.5}$ = $(0.04 \times (S)^{2.5}) \times F_{PM2.5}$
= $(0.04 \times (7.1)^{2.5}) \times 0.031$
= 0.167 lbs/VMT

S = mean vehicle speed (mph) Default = 7.1
F_{PM10} = PM_{10} scaling factor default of 0.6
$F_{PM2.5}$ = $PM_{2.5}$ scaling factor default of 0.031

Fugitive emissions from Dozers and Excavators:

PM_{10} = $((C_{PM15} \times s^{1.5})/M^{1.4}) \times F_{PM10}$
= $((1 \times 6.9^{1.5})/7.9^{1.4}) \times 0.75$
= 0.753 lbs/hr
= $((5.7 \times 6.9^{1.2})/7.9^{1.3}) \times 0.105$

C_{PM15} = arbitary coefficient used by AP-42 = 1
s = material silt content = 6.9 %
M = material moisture content = 7.9%
F_{PM10} = PM_{10} scaling factor default of 0.75
$F_{PM2.5}$ = $PM_{2.5}$ scaling factor default of 0.105

Fugitive emissions from truck loading

PM_{10} = $k \times (0.0032) \times ((U/5)^{1.3}/(M/2)^{1.4})$
= $0.35 \times (0.0032) \times ((5.82/5)^{1.3}/(12/2)^{1.4})$
= 1.11E-04 lbs/ton

$PM_{2.5}$ = $k \times (0.0032) \times ((U/5)^{1.3}/(M/2)^{1.4})$
= $0.053 \times (0.0032) \times ((5.82/5)^{1.3}/(12/2)^{1.4})$
= 1.68E-05 lbs/ton

k = particle size (PM10 = 0.35, PM2.5 = 0.053)
U= wind speed (miles - hour) = 5.82
M = Material moisture content = 12%

Fugitive Emissions from Mechanical Demolition

PM_{10} = $k \times (0.0032) \times ((U/5)^{1.3}/(M/2)^{1.4})$
= $0.35 \times (0.0032) \times ((5.82/5)^{1.3}/(12/2)^{1.4})$
= 1.11E-04 lbs/ton

$PM_{2.5}$ = $k \times (0.0032) \times ((U/5)^{1.3}/(M/2)^{1.4})$
= $0.053 \times (0.0032) \times ((5.82/5)^{1.3}/(12/2)^{1.4})$
= 1.68E-05 lbs/ton

k = particle size (PM10 = 0.35, PM2.5 = 0.053)
U= wind speed (miles - hour) = 5.82
M = Material moisture content = 12%

Fugitive Emissions from Debris Loading

PM_{10} = $k \times EF_{L\text{-}TSP}$
= 0.35×0.058
= 0.020 lbs/ton

$PM_{2.5}$ = $k \times EF_{L\text{-}TSP}$
= 0.053×0.058
= 0.003 lbs/ton

k = particle size (PM10 = 0.35, PM2.5 = 0.053)
$EF_{L\text{-}TSP}$ = default value = 0.058 lbs/ton

Santa Susana Field Laboratory
Initial Clean-up - Unmitigated

Onsite Fugitive Emissions

Equations

- Emissons for graders and scrapers = Emission factor x(((Acres / blade width of 12 ft) x 43,560 sqft per acre) / 5,280 ft per mile)
  - Acres are based on table provided on page 8 of CalEEMod Appendix A. (BREEZE software, a Division of Trinity Consultants, 2016).

    scrapers 1 acers/8hr day (conservately uses 1 acre for both because of the type of activities)
  - Emissions include a 63% reduction for required fugitive dust control measures based on VCAPCD regulations and a 69% reduction based on mitigation.
  - Emission factor taken from Table 1-8.
- Emissions for dozers/excavators = # equipment x hours of operation x emission factor
  - Number of dozers and excavators taken from Table 1-6.
  - 8 hours per day
  - Emission factor taken from Table 1-8.
- Emissions for truck loading (soils) = emission factor * tons of material
  - Emission factor taken from Table 1-8.
- Emissions for Excavation truck loading = EF x Tons
  - Tons of soil = tons per truck (Assumed 23) times 2 times the number of trucks (From Table 1-6). Twice the number of trucks is used to account for potential import and unloading of backfill.
- Emissions for Mechanical demolition and debris loading = Emission Factor (lbs/ton) X tons of debris
  - Assumes 23 tons per truck
  - Emission factor taken from Table 1-8.
  - Tons of soil = tons per truck (Assumed 23) times the number of trucks (From Table 1-6).
- Emissions for fugitive dust from unpaved or paved roads = Number of Miles x Number of Trucks x Emission Factor for PM10/PM2.5
  - Equations and constants for unpaved roads taken from EPA's AP-42 13.2.2 Unpaved Roads
  - Equations and constants for Paved roads taken from AP42 - 13.2.1 - Paved Roads
  - Emissions for unpaved roads include a 63% reduction for required fugitive dust control measures based on VCAPCD regulations and a 69% reduction based on mitigation.
  - Assumes 3/4 of haul routes are paved.
  - Emission factor taken from Table 1-8.

Sources
- Trucks per day taken from Table 1-6
- Emission Factors taken from EMFAC2014, maximum emissions from each air district potentially crossed for 55 mph, and weighted average by distance for SCCAB and SCAB for <55MPH.
- Distance assumptions for each waste type provided by DTSC.
- Fugitive road dust taken from USEPA AP42 13.2.2 - Paved Roads

Assumptions
- 453.6 grams per pound
- Weighted average determined by distance and speed for each RP.
- Daily trucks are based on 96 trucks per day.
- Annual truck trips are based on 96 trips per day for 260 days.
- HWMF has 412 trips per year and RMHF has 824 trips per year

Santa Susana Field Laboratory
Initial Clean-up - Unmitigated

Offsite Emissions

Assumptions

- 40 miles per commute trip, either within VCAPCD or SCAQMD.
- Assumes 23 workers per day
- Assumes 2 trips per worker
- Boeing activities have been removed from initial projects.
- [1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

- For maximum emissions by air basin, the maximum distance that could be traveled through each air basin based on the potential disposal sites is used. Disposal sites are determined based on RP and type of disposal (non-hazardous, hazardous, radiological).

Equations

-	Commuter Trips	=	Sum of: emission factor in grams per mile (Table 1-1) divided by 453.6 (grams per pound) times miles total miles per day plus fugitive lbs per mile (Table 1-1) times number of miles for each Air District (SCAQMD, VCAPCD).
-	Haul Truck Trips	=	sum of: emission factor in grams per mile (Table 1-9) times 453.6 (grams per pound) times miles total miles per day for each type of disposal location (Non-hazardous, Hazardous, Radiological) plus the emission factors for fugitive road dust (Table 1-9) times
		=	total miels per day.
-	Total Miles	=	miles per trip times number of trips.
-	tons/year	=	lbs/day multiplied by 260 days divided by 2000 lbs per ton.
-	MT/year	=	lbs/day multiplied by 260 days per year divided by 2004.62 metric tons per pound.

Sources

- Worker Trips and Truck Trips taken from Table 1-6
- Number of Haul Trips per daty taken from Table 1-10
- Miles per waste disposal type taken from Table 1-9

Total Number of Trucks	21,920	82,400	56,750	0
Maximum Annual Trucks (GHG)	7,020	7,020	6,760	0

Sources
- Equipment lists provided by DTSC
- Hauling assumes 96 trucks per day, 32 for each RP.
- Total trucks by soil type taken from Table 3-4 of the Project Description

Assumptions
- Assumes equipment operates 8 hours per day. Water truck is 90 miles per day (15 mph * 6 hr/day)
- Assumes Boeing has 3 excavation sites per day, DOE has 1 excavation site per day, NASA has one excavation site per day
- Equipment usage is the number of equipment operating a full 8 hours. Therefore, 0.75 of an equipmment or 0.5 of a piece of equipment means operation of 6 or 4 hours per day respectively.
- Maximum annual trucks assumes 80 trucks per day for 260 days per year.

Santa Susana Field Laboratory
Overall Site Cleanup - Unmitigated

Sources - Emission Factors used to determine weighted emissions taken from Table 1-9.

Assumptions
- 453.6 grams per pound
- Weighted average is based on distance and speed.
- Max Trucks per day assumes maximum potential milage based on number of trucks per waste type and length of trip, and 32 trips per day per RP
- Max trucks per year assumes 80 trucks per day (27 for DOE and Boeing, 26 for NASA) and is weighted to take into account the total amount of trucks per waste type (Table 1-11)

Santa Susana Field Laboratory
Overall Site Cleanup - Unmitigated

Offsite Emissions

Assumptions

- 40 miles per commute trip, either within VCAPCD or SCAQMD.
- Number of workers per day is taken from Table 1-11. For M&M each RP is assumed to have 3 workers.
- Assumes 2 trips per worker
- Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. Only the maximum for each air district is reported as a worst case scenario. 40 miles per trip was the average trip length assumed for workers.

- For maximum emissions by air basin, the maximum distance that could be traveled through each air basin based on the potential disposal sites is used. Disposal sites are determined based on RP and type of disposal (non-hazardous, hazardous, radiological).
- No haul trucks required for M&M activities.

Equations

-	Commuter Trips	=	Sum of: emission factor in grams per mile (Table 1-1) times 453.6 (grams per pound) times miles total miles per day for each Air District (SCAQMD, VCAPCD).
-	Haul Truck Trips	=	sum of: emission factor in grams per mile (Table 1-9) times 453.6 (grams per pound) times miles total miles per day for each type of disposal location (Non-hazardous, Hazardous, Radiological) plus the emission factors for fugitive
		=	road dust times total miels per day.
-	Total Miles	=	miles per trip times number of trips.
-	tons/year	=	lbs/day multiplied by 260 days divided by 2000 lbs per ton.
-	MT/year	=	lbs/day multiplied by 260 days per year divided by 2004.62 metric tons per pound.

Assumptions

- Boeing has 15 workers and 15 contractors, DOE has 2 workers, and NASA has 6 workers. Existing onsite emissions are based on the operations occurring onsite at the time of the NOP. The NOP was completed before the NASA demolition of existing structures. The personnel onsite consists of one NASA civil servant and four NASA contractors for environmental investigation (NASA, 2016). The analysis assumed 6 workers as a worst case scenario based on the information provided at the time the analysis was conducted.
- [1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.
- Average 4 mile onsite round trip in addition to the offsite.
- Emissions occur 260 days per year = 52 weeks x 5 days per week.
- Miles provided for offsite trips are one way miles and the analysis assumes two one way trips per employee (one to and one from the site)

Santa Susana Field Laboratory
Existing Conditions

Equations: (For daily and annual pollutant concentrations)

emission factors (lbs/mile) = emission factor in grams per mile (Table 1-1) divided by 453.6 (grams per pound)

Miles = miles per trip times number of trips.

pollutant calculations

lbs/day = emission factor in lbs/mile time number of miles. PM10 and PM2.5 include fugitive emissions from road travel.

tons/year = lbs/day multiplied by 260 days divided by 2000 lbs per ton.

MT/year = lbs/day multiplied by 260 days per year divided by 2004.62 metric tons per pound.

Note: Assumptions and equations are the same for all RPs and therefore are not repeated for each set of cacluations

				994,913	Total Lbs/MWh CO_2e
				451	Total MT CO_2e

Sources: Intensity Factors: Taken from the CalEEMod model version 2016.3.1 for SCE.
kWh per month: Taken from the Energy Section of the EIR.

Equations: (For Electrical consumptions)

kWh per year = kWh per month multiplied by 12 months per year.

MWh per year = kWh per year divided by 1,000 kilowatts per megawatt.

lbs/MWhr (per pollutant) = MWh per year multiplied by the pollutant specific carbon intensity factor.

lbs/MWhr (CO_2e) = lbs/MWh multiplied by the global warming potential for each pollutant (CO = 1; CH_4 = 25; N_2O = 298).

MT CO_2e = Total lbs/MWh CO_2e divided by 2004.62 metric tons per pound.

Santa Susana Field Laboratory
Unmitigated - Onsite Initial Clean-up - Emissions
Initial Clean Up Emissions

Equations

- Daily emssions (Exhaust) (lbs/day) = sum of daily emissions for each piece of equipment.
- Emissions from each equipment type = Number of pieces of equipment times the emissions per day for that piece of equipment.
  - Emissions per day per equipment type from Table 1-5.
  - Number of Pieces of Equipment per activty from Table 1-6.
- Daily emssions (crew (onsite worker transport)) = ((Number of Employees/15) times Emission Factor times 4) / 453.6
  - Number of employees per phase taken from Table 3-1.
  - **15** workers/onsite van
  - Emission Factor taken from Table 1-5
  - **4** miles/ round trip
  - 453.6 grams per pound
  - **2** trips/day
- Total Daily Emissions for each GHG is the sume of the daily exhaust, haul truck, and crew emissions.
- Annual emssions (MT/year) = (Daily Emissions * Number of Days)/2204.623 - Exhaust and Crew
  - Daily Emissions from Table 3-3.
  - 2,204.62 lbs per Metric Ton
  - 260 days per year
- Annual emssions (haul trucks) (MT/year)
  = (Emission Factorexhaust X number of trips X Miles) + (Emission Factoridle * Number of trucks * Minutes) /1,000,000
  - Emission Factors from Table 1-4.
  - Number of Trips from Table 1-6
  - **4** miles/ round trip
  - **15** minutes idling per truck (- assumes idling entering the site, at the loading location, and leaving the site)
  - 1,000,000 g/MT

[1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

Equations

- Daily emssions (Exhaust) (lbs/day) = sum of daily emissions for each piece of equipment.
- Emissions from each equipment type = Number of pieces of equipment times the emissions per day for that piece of equipment.
  - Emissions per day per equipment type from Table 1-5.
  - Number of Pieces of Equipment per activty from Table 1-11.
- Daily emssions (crew (onsite worker transport)) (lbs/day) = ((Number of Employees/15) times Emission Factor times 4) / 453.6
  - Number of employees per phase taken from Table 1-11.
  - **15** workers/onsite van
  - Emission Factor taken from Table 1-5
  - **4** miles/ round trip
  - 453.6 grams per pound
- Total Daily Emissions (lbs/day) for each criteria pollutant is the sum of the daily exhaust, haul truck, and crew emissions.
- Annual emssions (MT/year) = (Daily Emissions * Number of Days)/2204.623 - For Exhaust and Crew emissions
  - Daily Emissions from Table 4-6.
  - 2,204.62 lbs per Metric Ton
  - 260 days per year
- Annual emssions (haul trucks) (MT/year)
  = (Emission Factorexhaust X number of trips X Miles) + (Emission Factoridle * Number of trucks * Minutes) /1,000,000
  - 20,800 trucks per year per year for the site (See Table 1-11).
  - **15** minutes idling per truck (- assumes idling entering the site, at the loading location, and leaving the site)
  - 1,000,000.00 g/metric ton
  - 260 days per year
  - Emission Factors from Table 1-4.
  - **4** miles/ round trip

[1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

SCAQMD	39.58	144	5,700	3,795	0.15	447.517	0.018	447.535
total[1]	40	144	5,760	3,835	0.15	452.266	0.018	452.284

*Totals may not add exactly due to rounding.

[1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

Onsite Exhaust Emission Factors

Sources:

- Quantity of each equipment type was provided by DTSC based on current onsite operations.
- Emission factors for unmitigated onsite construction equipment taken from Table 3.4 of Appendix D of the CalEEMod user guide (BREEZE software, a Division of Trinity Consultants, 2016). 2016 emission factors were used as a conservative estimate for all years as equipment is not anticipated to be changed out unless it breaks. Therefore even though construction could last for 18 years, there is the potential that the same equipment in use at the beginning of the project would be in use at the end of the project.
- Emissions for water truck and Haul trucks taken from EMFAC 2014 for Ventura County for Heavy Heavy Duty Trucks at 15 mph.
  (See "EMFAC2014 Emission Rates for Haul Trucks", Section 8 of Appendix D of this EIR, for full EMFAC modeling details)
- Emission factors for onsite worker transport trips are from EMFAC2014 for Ventura County for LDA vehicles traveling 15 mph. (See
  (See "EMFAC2014 Emission Rates for Commuter Vehicles", Section 8 of Appendix D of this EIR, for full EMFAC modeling details)
- Horsepower and load factors taken as the average for each equipment type from Table 3.3 of Appendix D of the CalEEMod User's Guide (BREEZE software, a Division of Trinity Consultants, 2016).
- Tier 4 final Emissions are taken from Table 3.5 of Appendix D of the CalEEMod User Guide (BREEZE software, a Division of Trinity Consultants, 2016). Tier 4 is an EPA standard for emissions of offroad vehicle engines.

Equations

- Daily emssions = (Emission Factor X Horse power X Load Factor X Quantity X Hours per day) / 453.6
  - 453.6 grams per pound
  - Emission Factor, Horse Power, and Load Factor from Table 1-3.
  - 8 Hour work day (8 hour of equipment usage)
  - Quantity is assumed to be 1 for the purposes of daily emissions in Table 1-5.
- Daily emissions (Water truck) = (Emission Factor X Miles) / 453.6
  - Assumes water trucks at 90 miles per day for onsite operations (15 mph for 6 hrs per day)
- Impact Chisels are electric and therefore do not have quantifiable onsite emissions.

*Totals may not add exactly due to rounding.

Sources
- Trucks per day taken from Table 1-6
- Emission Factors taken from EMFAC2014, maximum emissions from each air district potentially crossed for 55 mph, and weighted average by distance for SCCAB and SCAB for <55MPH.
- Distance assumptions for each waste type provided by DTSC.
- Fugitive road dust taken from USEPA AP42 13.2.2 - Paved Roads

Assumptions
- 453.6 grams per pound
- Weighted average determined by distance and speed for each RP.
- Daily trucks are based on 96 trucks per day.
- Annual truck trips are based on 96 trips per day for 260 days.
- HWMF has 412 trips per year and RMHF has 824 trips per year

Santa Susana Field Laboratory
Initial Clean-up - Mitigated

Offsite Emissions

Assumptions

- 40 miles per commute trip, either within VCAPCD or SCAQMD.
- Assumes 23 workers per day
- Assumes 2 trips per worker
- Boeing activities have been removed from initial projects.
- [1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

- For maximum emissions by air basin, the maximum distance that could be traveled through each air basin based on the potential disposal sites is used. Disposal sites are determined based on RP and type of disposal (non-hazardous, hazardous, radiological).

Equations

-	Commuter Trips	=	Sum of: emission factor in grams per mile (Table 1-1) divided by 453.6 (grams per pound) times miles total miles per day plus fugitive lbs per mile (Table 1-1) times number of miles for each Air District (SCAQMD, VCAPCD).
-	Haul Truck Trips	=	sum of: emission factor in grams per mile (Table 1-9) times 453.6 (grams per pound) times miles total miles per day for each type of disposal location (Non-hazardous, Hazardous, Radiological) plus the emission factors for fugitive road dust (Table 1-9) times
		=	total miels per day.
-	Total Miles	=	miles per trip times number of trips.
-	tons/year	=	lbs/day multiplied by 260 days divided by 2000 lbs per ton.
-	MT/year	=	lbs/day multiplied by 260 days per year divided by 2004.62 metric tons per pound.

Sources

- Worker Trips and Truck Trips taken from Table 1-6

Sources - Emission Factors used to determine weighted emissions taken from Table 1-9.

Assumptions
- 453.6 grams per pound
- Weighted average is based on distance and speed.
- Max Trucks per day assumes maximum potential milage based on number of trucks per waste type and length of trip, and 32 trips per day per RP
- Max trucks per year assumes 80 trucks per day (27 for DOE and Boeing, 26 for NASA) and is weighted to take into account the total amount of trucks per waste type (Table 1-11)

Santa Susana Field Laboratory
Overall Site Cleanup - Mitigated

Offsite Emissions

Assumptions

- 40 miles per commute trip, either within VCAPCD or SCAQMD.
- Number of workers per day is taken from Table 1-11. For M&M each RP is assumed to have 3 workers.
- Assumes 2 trips per worker
- Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. Only the maximum for each air district is reported as a worst case scenario. 40 miles per trip was the average trip length assumed for workers.

- For maximum emissions by air basin, the maximum distance that could be traveled through each air basin based on the potential disposal sites is used. Disposal sites are determined based on RP and type of disposal (non-hazardous, hazardous, radiological).
- No haul trucks required for M&M activities.

Equations

-	Commuter Trips	=	Sum of: emission factor in grams per mile (Table 1-1) times 453.6 (grams per pound) times miles total miles per day for each Air District (SCAQMD, VCAPCD).
-	Haul Truck Trips	=	sum of: emission factor in grams per mile (Table 1-9) times 453.6 (grams per pound) times miles total miles per day for each type of disposal location (Non-hazardous, Hazardous, Radiological) plus the emission factors for fugitive
		=	road dust times total miels per day.
-	Total Miles	=	miles per trip times number of trips.
-	tons/year	=	lbs/day multiplied by 260 days divided by 2000 lbs per ton.
-	MT/year	=	lbs/day multiplied by 260 days per year divided by 2004.62 metric tons per pound.

Sources

- Worker Trips and Truck Trips taken from Table 1-11
- Miles for haul truck trips taken from Table 1-9
- Number of haul truck trips taken from Table 1-12

Santa Susana Field Laboratory
Mitigated - Onsite Initial Clean-up - Emissions
Initial Clean Up Emissions

Equations

- Daily emssions (Exhaust) (lbs/day) = sum of daily emissions for each piece of equipment.
- Emissions from each equipment type = Number of pieces of equipment times the emissions per day for that piece of equipment.
  - Emissions per day per equipment type from Table 1-5.
  - Number of Pieces of Equipment per activty from Table 1-6.
- Daily emssions (crew (onsite worker transport)) = ((Number of Employees/15) times Emission Factor times 4) / 453.6
  - Number of employees per phase taken from Table 3-1.
  - **15** workers/onsite van
  - Emission Factor taken from Table 1-5
  - **4** miles/ round trip
  - 453.6 grams per pound
  - **2** trips/day
- Total Daily Emissions for each GHG is the sume of the daily exhaust, haul truck, and crew emissions.
- Annual emssions (MT/year) = (Daily Emissions * Number of Days)/2204.623 - Exhaust and Crew
  - Daily Emissions from Table 3-3.
  - 2,204.62 lbs per Metric Ton
  - 260 days per year
- Annual emssions (haul trucks) (MT/year)
  = (Emission Factorexhaust X number of trips X Miles) + (Emission Factoridle * Number of trucks * Minutes) /1,000,000
  - Emission Factors from Table 1-4.
  - Number of Trips from Table 1-6
  - **4** miles/ round trip
  - **15** minutes idling per truck (- assumes idling entering the site, at the loading location, and leaving the site)
  - 1,000,000 g/MT

[1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

Equations

- Daily emssions (Exhaust) (lbs/day) = sum of daily emissions for each piece of equipment.
- Emissions from each equipment type = Number of pieces of equipment times the emissions per day for that piece of equipment.
  - Emissions per day per equipment type from Table 1-5.
  - Number of Pieces of Equipment per activty from Table 1-11.
- Daily emssions (crew (onsite worker transport)) (lbs/day) = ((Number of Employees/15) times Emission Factor times 4) / 453.6
  - Number of employees per phase taken from Table 1-11.
  - **15** workers/onsite van
  - Emission Factor taken from Table 1-5
  - **4** miles/ round trip
  - 453.6 grams per pound
- Total Daily Emissions (lbs/day) for each criteria pollutant is the sum of the daily exhaust, haul truck, and crew emissions.
- Annual emssions (MT/year) = (Daily Emissions * Number of Days)/2204.623 - For Exhaust and Crew emissions
  - Daily Emissions from Table 4-6.
  - 2,204.62 lbs per Metric Ton
  - 260 days per year
- Annual emssions (haul trucks) (MT/year)
  = (Emission Factorexhaust X number of trips X Miles) + (Emission Factoridle * Number of trucks * Minutes) /1,000,000
  - 20,800 trucks per year per year for the site (See Table 1-11).
  - **15** minutes idling per truck (- assumes idling entering the site, at the loading location, and leaving the site)
  - 1,000,000.00 g/metric ton
  - 260 days per year
  - Emission Factors from Table 1-4.
  - **4** miles/ round trip

[1] Because it is unknown how many workers come from the SCAQMD jurisdiction and how many would come from the VCAPCD jurisdiction, assumptions on travel to the site based on potential maximum distance within each jurisdiction based on site location. 40 miles per trip was the average trip length assumed for workers. The table takes the potential routes to the site into account and proveds two scenarios, the maximum within the VCAPCD and the maximum within the SCAQMD. Only the maximum for each air district is reported as a worst case scenario.

F.3 Soil Vapor Extraction Emissions

Santa Susana Field Laboratory

Emissions Summary

No.	Matrix	Depth Interval	Ty	EcoRAClass	Preferred Analyte Name	Units	Detects	Samples	or SQL	CTE EPC
1	Soil vapor	0 - 6 ft bgs	O	VOC	1,1,1-Trichloroethane	mg/m3	1	31	0.120	0.120
2	Soil vapor	0 - 6 ft bgs	O	VOC	1,1,2-Trichloro-1,2,2-trifluoroethane	mg/m3	2	31	0.330	0.314
3	Soil vapor	0 - 6 ft bgs	O	VOC	Benzene	mg/m3	1	31	0.038	0.038
4	Soil vapor	0 - 6 ft bgs	O	VOC	Ethylbenzene	mg/m3	3	31	0.530	0.133
5	Soil vapor	0 - 6 ft bgs	O	VOC	Tetrachloroethene	mg/m3	1	30	0.120	0.120
6	Soil vapor	0 - 6 ft bgs	O	VOC	Toluene	mg/m3	4	30	0.480	0.124
7	Soil vapor	0 - 6 ft bgs	O	VOC	Trichloroethene	mg/m3	1	31	0.100	0.100
8	Soil vapor	0 - 6 ft bgs	O	VOC	m,p-Xylenes	mg/m3	3	31	1.400	0.418
9	Soil vapor	0 - 6 ft bgs	O	VOC	o-Xylene	mg/m3	1	31	0.250	0.231
10	Soil vapor	0 - 6 ft bgs	O	VOC	1,1,2-Trichloroethane	mg/m3	0	31	1.000	0.224
11	Modeled Vapor	0 - 6 ft bgs	O	VOC	1,2,4-Trichlorobenzene	mg/m3	3	76	0.254	1.689
12	Modeled Vapor	0 - 6 ft bgs	O	VOC	1,2,4-Trimethylbenzene	mg/m3	1	69	0.002	0.000
13	Modeled Vapor	0 - 6 ft bgs	O	VOC	1,2-Dichlorobenzene	mg/m3	1	81	0.000	0.002
14	Modeled Vapor	0 - 6 ft bgs	O	VOC	1,2-Dichloropropane	mg/m3	1	69	0.390	0.858
15	Modeled Vapor	0 - 6 ft bgs	O	VOC	1,3-Dichlorobenzene	mg/m3	1	81	0.000	0.010
16	Modeled Vapor	0 - 6 ft bgs	O	VOC	1,4-Dichlorobenzene	mg/m3	1	81	0.000	0.002
17	Modeled Vapor	0 - 6 ft bgs	O	VOC	2-Butanone (MEK)	mg/m3	5	69	0.009	0.002
18	Modeled Vapor	0 - 6 ft bgs	O	VOC	4-Methyl-2-pentanone (MIBK)	mg/m3	1	64	0.000	0.000
19	Modeled Vapor	0 - 6 ft bgs	O	VOC	Acetone	mg/m3	9	70	3.800	0.100
20	Modeled Vapor	0 - 6 ft bgs	O	VOC	Chloromethane	mg/m3	1	69	0.036	0.065
21	Modeled Vapor	0 - 6 ft bgs	O	VOC	Isopropylbenzene	mg/m3	1	64	0.003	0.003

Preferred Analyte Name	RME EPC	CTE EPC Basis	RME EPC Basis	Comments	CAS No.	In HARP?
1,1,1-Trichloroethane	0.120	RME CTE**	Maximum Result	Detected	71556	Yes
1,1,2-Trichloro-1,2,2-trifluoroethane	0.314	RME CTE**	95% KM (t) UCL	Detected	76131	Yes
