- Notes:
- All concentrations shown in mg/kg.
- 
- Not applicable or chemical is not a COC for this endpoint  
Not evaluated because exposure pathway is incomplete
- bgs
- Below ground surface
- C
- Cancer effect
- COC
- Chemical of concern
- DF
- Detection frequency
- EPC
- Exposure point concentration
- HI
- Hazard index
- HXCDF
- Hexachlorodibenzofuran
- IND
- Industrial (industrial exposure scenario)
- mg/kg
- Milligram per kilogram
- MI
- Maritime/Industrial (industrial exposure scenario)
- NC
- Noncancer effect
- OS
- Open space (recreational exposure scenario)
- PAH
- Polynuclear aromatic hydrocarbon
- Pest
- Pesticide
- PCB
- Polychlorinated biphenyl
- PECDD
- Pentachlorodibenzo-p-dioxin
- PECDF
- Pentachlorodibenzofuran
- RD
- Research and development (residential exposure scenario)
- RME
- Reasonable maximum exposure
- SVOC
- Semivolatile organic compound
- VOC
- Volatile organic compound

TABLE 5-5: TOTAL RISK - RISK CHARACTERIZATION ANALYSIS FOR SURFACE SOIL (0 TO 2 FEET BGS) BY PLANNED REUSE (CONTINUED)

Revised Remedial Investigation Report for Parcel E, Hunters Point Shipyard, San Francisco, California

Notes: All concentrations shown in milligrams per kilogram (mg/kg).

- <1
- Less than 1
- 
- Not applicable or chemical is not a COC for this endpoint
- %
- Percent
- bgs
- Below ground surface
- C
- Cancer effect
- COC
- Chemical of concern
- EPC
- Exposure point concentration
- HHRA
- Human health risk assessment
- HI
- Hazard index
- HPAL
- Hunters Point ambient level
- IND
- Industrial (industrial exposure scenario)
- MI
- Maritime industrial (industrial exposure scenario)
- MU
- Mixed use (residential exposure scenario)
- NC
- Noncancer effect
- PAH
- Polynuclear aromatic hydrocarbon
- Pest/PCB
- Pesticide/polychlorinated biphenyl
- RD
- Redevelopment block
- RME
- Reasonable maximum exposure
- SVOC
- Semivolatile organic compound
- VOC
- Volatile organic compound

TABLE 5-7: TOTAL RISK - RISK CHARACTERIZATION ANALYSIS FOR SUBSURFACE SOIL (0 TO 10 FEET BGS), CONSTRUCTION WORKER SCENARIO

|----|---------------------------------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

or severe. Any HQ greater than 1.0 is generally interpreted as indicating some risk in a SLERA. In a BERA, however, more realistic assessment is appropriate. Because the low TRVs, which represent a lowest observable adverse effect level, were used to derive the PSCs, an HQ greater than 1.0 does not indicate immediate unacceptable risk.

In summary, no significant unacceptable risk to ecological receptors was indicated at Parcel E. The maximum HQs based on PSCs derived using the low TRV were 2.16 (for kestrels exposed to PCBs in soil) and 2.67 for the house mouse (exposed to lead in soil). Because the house mouse is not considered to warrant protection as a species, and no other small mammals were trapped at the site, this level of risk is acceptable. The low HQ for the kestrel does not indicate population-level risk of a magnitude that warrants remediation.

### 5.3 RESULTS OF THE PARCEL E SHORELINE HUMAN HEALTH RISK ASSESSMENT AND SCREENING-LEVEL ECOLOGICAL RISK ASSESSMENT

This section summarizes the potential human health and ecological risks from exposure to chemicals present in sediments along the shoreline at Parcel E and identifies COCs for human health and environmental receptors. Potential risk from exposure to chemicals present in sediment was evaluated for the entire shoreline area at HPS, including the shoreline area associated with Parcel E. The risk assessments for sediment are being conducted as part of the Parcel F (offshore area) RI/FS activities and are drawn from for use in this Revised Parcel E RI Report.

A complete description of the methods used in performing the HHRA are provided in the Final Hunters Point Shipyard Parcel F Validation Study ([Battelle, BBL, and Neptune & Company 2005](#)), and [Attachment 1](#) of this Revised RI Report contains tables from the Parcel F Validation Study summarizing the HHRA results. [Appendix G](#) presents the detailed results of the SLERA, which was performed as part of the Parcels E and E-2 Shoreline Characterization Technical Memorandum.

#### 5.3.1 Risk to Human Health Along the Parcel E Shoreline

This section presents the results of the human health evaluation of the Parcel E shoreline sediments. The HHRA was performed according to standard EPA risk assessment guidance ([EPA 1989, 1992](#)).

Current and reasonably anticipated future human exposure to COPCs associated with the shoreline along Parcel E was estimated. It was assumed that the primary exposure pathway would be through the consumption of shellfish, and that individuals harvesting shellfish would be directly exposed to sediments via direct contact and incidental ingestion. For the purposes of the human health risk assessment, the entire shoreline was considered as one exposure unit.

Risks to humans were calculated using sediment data from the Parcel E and E-2 shoreline at HPS. EPCs were developed to model exposures under both a reasonable maximum exposure (RME) and a central tendency exposure (CTE) scenarios. The RME relies on conservative exposure factors to estimate the RMEs anticipated for a site, whereas the CTE describes a more typical or average exposure to an individual. The EPCs for direct contact for both the RME and CTE were defined as the 95 percentile upper confidence limit of the surface sediments collected along the Parcels E and E-2 shoreline.

Using the EPCs for each media (sediment and shellfish tissue) and the parameters described above, doses associated with each scenario were calculated using the standard risk equations presented below.

### Sediment Exposures

$$Dose(mg / kg - day) = \frac{(C_{sed} \times IR_{sed} \times FI \times EF \times ED) + (C_{sed} \times SA \times AF \times DAF \times FI \times EF \times ED)}{BW \times AT} \quad (5-1)$$

### Consumption of Shellfish

$$Dose(mg / kg - day) = \frac{C_{tissue} \times IR_{tissue} \times EF \times ED \times FI}{BW \times AT} \quad (5-2)$$

where:

|      |   |                                                                                       |
|------|---|---------------------------------------------------------------------------------------|
| Dose | = | Rate of chemical intake across the body (milligrams per kilogram per day [mg/kg-day]) |
| C    | = | Chemical concentration in contaminated media or EPC (mg/kg)                           |
| IR   | = | Contact or ingestion rate (milligrams per day)                                        |
| EF   | = | Exposure frequency (days/year)                                                        |
| ED   | = | Exposure duration (years)                                                             |
| FI   | = | Fraction ingestion (unitless)                                                         |
| SA   | = | Skin surface area exposed (square centimeters per day)                                |
| AF   | = | Skin adherence factor (milligrams per square centimeter)                              |
| DAF  | = | Dermal absorption factor (unitless)                                                   |
| BW   | = | Body weight (kilogram)                                                                |
| AT   | = | Averaging time (days)                                                                 |

[Attachment 1](#) (see Table 1) summarizes the specific exposure factors used to derive the dose calculated for each exposure scenario. With the exception of the shellfish ingestion rate, the exposure parameters used were the same as those used to estimate risk for the Parcel F sediments in the Parcel F Validation Study ([Battelle, BBL, and Neptune & Company 2005](#)).

The doses derived in this manner for each scenario were then summed to estimate a lifetime average daily dose and average daily dose for each constituent by sampling area based on the adult and child RME and CTE exposure scenarios, respectively.

A summary of the individual risk and hazard values calculated for all chemicals evaluated within each exposure scenario is presented in [Attachment 1](#) (see Tables 2 and 3). Total cumulative risks and the risk drivers for each scenario are summarized in [Attachment 1](#) (see Tables 4 and 5). Cancer risks derived in this assessment can be compared with EPA's risk management range (that is, 1E-06 to 1E-04) for health protectiveness at Superfund sites. Based on this range, EPA typically considers 1E-06 as the "point of departure" for taking action at Superfund sites ([EPA 1989](#)).

Risks associated with direct contact to sediment were relatively low. For the RME scenario, PCBs were the only chemical with a risk greater than 1E-06. For the CTE scenario, all risks were below 1E-06 and hazards were below 1. For the shellfish ingestion pathway, the primary risk drivers associated with Parcels E and E-2 shoreline sediments were arsenic, chromium, total PCBs, and dioxins. Risks for these chemicals exceeded 1E-06 for both RME and CTE scenarios. Risks for arsenic and dioxins were similar to those for reference areas, but risks for chromium and total PCBs associated with site sediments were higher than those for reference areas ([Battelle, BBL, and Neptune & Company 2005](#)). For noncancer risks, total PCBs were the primary contributor.

Based on this evaluation, chromium and total PCBs appear to be the primary COCs for the evaluation of human health along the Parcel E shoreline.

### **5.3.2 Risk to Ecological Receptors Along the Parcel E Shoreline**

The Navy conducted a SLERA to determine if chemicals detected along the shoreline pose an ecological risk to those receptors exposed to the narrow intertidal zone of Parcels E and E-2 (see [Appendix G](#)). For the purposes of the SLERA, the habitat along the entire shoreline was considered as one exposure unit. In addition, the shoreline was not divided into Parcels E and E-2 because it would reduce sample sizes below what is practicable for assessing risk.

Sediment samples were analyzed for metals, VOCs, SVOCs, pesticides, PCBs, TPH, dioxins and furans, and organotins. All chemicals detected in sediment samples from the shoreline were screened to identify COPECs. A toxicity-based approach was used to identify site-related chemicals that may pose risks to sensitive ecological receptors, including benthic invertebrates, birds, and mammals.

Notes:

- a COCs identified for this exposure scenario are based on the planned reuse for Parcel E.  
b The construction worker exposure scenario is not associated with a specific planned reuse for Parcel E.

Table 5-16 shows the risk results from exposure to groundwater in the B-aquifer. The risk results shown in Table 5-16 are limited to those exposure areas for which the cancer risk exceeded 1E-06 or the noncancer HI exceeded 1.0. Risk results for groundwater in the B-aquifer, which was evaluated for residential exposure from domestic use, are based on each exposure area evaluated, regardless of planned reuse. The following chemicals were identified as COCs in groundwater in the B-aquifer based on planned reuse.

| Exposure Scenario | Chemicals of Concern in B-Aquifer Groundwater |                              |
|-------------------|-----------------------------------------------|------------------------------|
| Residential       | 1,4-DCB<br>Arsenic<br>Manganese<br>Thallium   | PCE<br>TCE<br>Vinyl Chloride |

## 5.2 BASELINE ECOLOGICAL RISK ASSESSMENT

This section summarizes the results of the BERA of ecological receptors exposed to soil in the open space at Parcel E. The complete BERA is provided in Appendix J of this Revised RI Report. ERAs are intended to fulfill the following three basic tasks under CERCLA:

1. Document whether actual or potential ecological risks exist at a site
2. Identify chemicals at a site that pose an unacceptable ecological risk
3. Generate data to be used to evaluate cleanup options, if necessary

All three of these tasks have been accomplished in part by previously completed investigations at Parcel E. Appendix J summarizes work completed to date and provides a refinement of the conclusions reached in the 1997 ERA (Tetra Tech, LFR, and U&A 1997), the Draft Final Validation Study Report (Tetra Tech and LFR 2000a), and the PSC Technical Memorandum (Tetra Tech and LFR 2000b). Soil samples collected since the 2000 Parcel E Validation Study were evaluated using methods consistent with the previous investigations.

### 5.2.1 Overview of the Ecological Risk Assessment Process at Parcel E

The EPA separates the ERA process into the following eight steps ([EPA 1997](#)):

- Step 1: Screening-level problem formulation and evaluation of ecological effects
- Step 2: Screening-level preliminary exposure estimate and risk calculation
- Step 3: Baseline risk assessment problem formulation
- Step 4: Study design and data quality objectives
- Step 5: Field verification of sampling design
- Step 6: Site investigation and analysis of exposure and effects
- Step 7: Risk characterization
- Step 8: Risk management

This BERA was initiated before the current 8-step framework guidance by EPA was released; however, the essential elements of the current guidance are represented. Elements of the screening-level ecological risk assessment (SLERA) and problem formulation (Steps 1, 2, and 3) are summarized in [Sections 5.2.2](#) (Ecological Setting), [5.2.3](#) (Data Evaluated), and [5.2.4](#) (Conceptual Site Model and Risk Questions). The results of the Step 3a risk refinement are described in [Section 5.2.5](#) (Chemicals of Potential Ecological Concern). Steps 4, 5, and 6, which were completed in 2000, are summarized in [Section 5.2.6](#) (Update of the Validation Study and Calculation of Additional Protective Soil Concentrations). [Section 5.2.7](#) summarizes the results of the evaluation of risk to birds and mammals based on the RI data set, and [Section 5.2.8](#) presents the results of the risk characterization. [Section 5.2.9](#) presents the conclusions of the BERA. Step 8, risk management, will occur in cooperation with the regulatory agencies at a later date.

### 5.2.2 Ecological Setting

Parcel E is characterized by patches of ruderal vegetation, industrial areas, and landscaped areas, as described in [Section 3.7](#) of the Revised RI Report. This BERA addresses only areas that are unpaved and not occupied by buildings. The unpaved open space evaluated in this BERA includes terrestrial areas designated as Redevelopment Blocks EOS-1, EOS-2, and EOS-3 on [Figure 5-11](#).

The terrestrial area of Parcel E is a relatively simple habitat dominated by a variety of weedy and ornamental plant species. Plants, the primary producers in these ecosystems, provide leafy vegetation, seeds, and fruits for the primary consumers. The most common observed primary consumer was an omnivorous mammal, the house mouse, and a typical herbivorous insect at the

site is the grasshopper. Granivores, such as mourning doves (*Zenaida macroura*), house finches (*Carpodacus mexicanus*), and sparrows, feed on plant seeds. Terrestrial invertebrates, such as insects and earthworms, are consumed by a variety of birds, including the mockingbird (*Mimus polyglottos*), meadowlark (*Sturnella neglecta*), loggerhead shrike (*Lanius ludovicianus*), and American kestrel. Top predators include the red-tailed hawk (*Buteo jamaicensis*) and red fox (*Vulpes vulpes*).

### 5.2.3 Data Evaluated

All chemicals detected in soil samples from open space areas (Redevelopment Blocks EOS-1, EOS-2, and EOS-3) in Parcel E were screened to identify chemicals of potential ecological concern (COPEC). Inorganic and organic chemicals were screened against toxicity benchmarks for selected receptors, as recommended by EPA (1997). Due to poor habitat quality, plants and terrestrial invertebrates were eliminated as receptors of concern during previous phases of this investigation (PRC 1994a, 1996a, 1996b; Tetra Tech, LFR, and U&A 1997; Tetra Tech and LFR 2000a, 2000b). This risk assessment focused on terrestrial birds and mammals as ecological receptors of concern.

The open space designated as Redevelopment Blocks EOS-1, EOS-2, and EOS-3 was considered a single exposure unit in this BERA. Most of the area is unpaved; however, limited paved areas were included for geographic continuity. This land is planned for future recreational use as open space.

The site-specific data set used in this BERA included laboratory analysis of surface soil samples for metals, VOCs, SVOCs, pesticides, PCBs, TPH, and dioxins and furans. Soil samples collected from 0 to 3 feet bgs were evaluated as a single exposure unit.

All samples collected from 0 to 3 feet bgs from areas that are now within the boundary of Parcel E open space are included, regardless of when they were collected. Samples collected from the Parcel E shoreline, which represents the area below the high tide line, were excluded. Samples from areas that are now considered Parcel E-2 also were excluded. Any samples from areas that were excavated prior to December 2004 as part of a removal action also were removed from the data set. The combined data set used in this BERA included nearly 300 surface soil samples (collected between 0 and 3 feet bgs), although the sample size varied by type of analysis (see Appendix J, Table J-1).

### 5.2.4 Conceptual Site Model and Risk Questions

During previous investigations, plants and terrestrial invertebrates were evaluated as assessment endpoints. The poor quality and fragmentation of the habitat was acknowledged by the regulatory agencies during review of previous reports on Parcel E (see Appendix A of the Draft Final Validation Study [Tetra Tech and LFR 2000a]), and it was agreed that this BERA would consider risk to birds and mammals only.

The CSM for this BERA contains few complete exposure pathways, thus it is relatively straightforward (see [Figure 5-12](#)). Carnivorous terrestrial birds and omnivorous small mammals were assumed to be exposed to chemicals in surface soil and food items at Parcel E, based on surveys performed during previous phases of the RI ([Tetra Tech and LFR 2000a, 2000b](#)). Neither ingestion of surface water, dermal exposure, nor inhalation was considered significant at Parcel E.

The risk question at Parcel E is equally straight forward: *Do chemicals in soil or food items at Parcel E pose a risk to the continued health and well-being of populations of carnivorous birds or omnivorous small mammals that forage there?* Components of this overall question included the evaluation of effects on survival, growth, and reproduction of key species. The metrics used to answer the risk question were detected concentrations of COPECs in soil and PSCs.

The open space in Parcel E provides foraging habitat for a variety of birds and mammals with broad habitat requirements and a high tolerance for human disturbance. Results of previous investigations of Parcel E indicated the house mouse is a fairly common permanent resident and the red-tailed hawk and American kestrel are frequent visitors ([Tetra Tech and LFR 2000a](#)). Therefore, these three species were selected as representative or surrogate species for this BERA. Carnivorous birds, represented by the kestrel and the red-tailed hawk, spend only a portion of their time foraging at Parcel E, which provides low-quality habitat for these wide-ranging species. Small mammals, in contrast, were assumed to forage exclusively at Parcel E.

The specific assessment endpoints are sufficient rates of survival, growth, and reproduction to sustain populations of species representing the trophic guilds listed below.

- Carnivorous bird (represented by the American kestrel)
- Raptors (represented by the red-tailed hawk)
- Omnivorous mammals (represented by the house mouse)

### **5.2.5 Chemicals of Potential Ecological Concern**

The inorganic chemicals for which both the toxicity screening value and the HPAL were exceeded, as well as inorganic chemicals for which no screening values were available, were evaluated further in this BERA (see [Appendix J, Table J-4](#)). The following chemicals were retained as COPECs in the ERA for birds and mammals:

- |            |              |
|------------|--------------|
| • Antimony | • Lead       |
| • Arsenic  | • Molybdenum |
| • Barium   | • Nickel     |
| • Chromium | • Zinc       |
| • Copper   |              |

Organic chemicals were largely eliminated as COPECs during the 1997 ERA and Parcel E Validation Study ([Tetra Tech, LFR, and U&A 1997](#); [Tetra Tech and LFR 2000a, 2000b](#)). In this BERA, organic chemicals were considered COPECs if the EPC exceeded the EPCs reported in the 1997 RI Report by at least 10 percent. Concentrations of chemicals for which the current EPCs were within 10 percent of the previously evaluated EPCs were considered unchanged since the 1997 RI, so no update was required. As a result, the following organic COPECs were reevaluated in this BERA (see [Appendix J, Table J-4](#)):

- Toluene
- TCE
- Xylene
- PCBs (as total Aroclors)
- Total DDTs

### **5.2.6 Update of the Validation Study and Calculation of Additional Protective Soil Concentrations**

This section expands on the formulation presented in the Parcel E Validation Study ([Tetra Tech and LFR 2000a](#)) and incorporates comments received from the regulatory agencies and natural resource trustees on the Validation Study. The purpose of the Parcel E Validation Study was to refine the Phase 1 ERA for birds and mammals by using site-specific bioaccumulation factors in the food chain model.

Subsequent to the findings of the Validation Study that birds and mammals may be at risk from several metals in soil at Parcel E, the Navy and the regulatory agencies agreed to calculate site-specific PSCs that represent metals concentration in soil that, if met, would reduce the risk to acceptable levels. In 2000, PSCs were calculated for cadmium, copper (for birds only), lead, nickel, selenium, and zinc using the results for collocated soil and tissue samples collected from Parcel E during the Validation Study ([Tetra Tech and LFR 2000b](#)).

Since the PSCs were derived, additional soil samples were collected, removal actions were completed, and the boundaries of Parcel E were changed (see [Appendix A](#) of this Revised RI Report). The conclusions of the 1997 ERA and the Validation Study are considered valid for the area that was evaluated at that time, and the PSCs that were derived are applicable to all of Parcel E. As a result, it is not necessary to reevaluate the conclusions of the 1997 ERA or the Validation Study. However, the Navy was concerned that chemicals eliminated as COPECs during the Validation Study may be elevated above risk-based concentrations in the new data set due to the spatial heterogeneity of soil concentrations. To address this issue, the new data set was evaluated for consistency with the previous data set to identify any additional chemicals that should be included in the ERA.

Based on the comparison of pre-2000 data with all data, PSCs were calculated for the following chemicals: molybdenum, toluene, TCE, xylene, total DDTs, and total Aroclors. New PSCs were calculated for copper (for mammals only), molybdenum, toluene, TCE, xylene, total DDTs, and total Aroclors because none were provided in the PSC Technical Memorandum ([Tetra Tech and](#)

[LFR 2000b](#)). PSCs for lead in mammals were recalculated because new mammalian toxicity reference values (TRV) for lead became available after the original PSCs were developed. Risk estimates for mammals based on both the previous TRV (adjusted for bioavailability) and the new TRV (not adjusted for bioavailability) are provided in [Appendix J, Section J5.4](#).

### **5.2.7 Evaluation of Risk to Birds and Mammals**

Of the inorganic chemicals carried forward from the Phase 1 ERA and the Validation Study, or added during this update only copper and lead were shown to pose unacceptable risk to birds or mammals under the site-specific conditions at Parcel E assessed in this ERA. EPCs for cadmium and selenium at Parcel E were less than HPALs; EPCs for nickel and zinc exceeded HPALS but were less than the PSCs for birds and mammals. [Table 5-17](#) lists the EPCs and hazard quotients (HQ) calculated for each of the representative receptors for selected chemicals.

The identification of risk posed by lead is problematical because the result depends on which TRV and bioavailability assumption is used. The original TRV was coupled with an estimate that lead in soil at Parcel E is 10 percent as bioavailable as lead acetate was in the laboratory study from which the low TRV was derived. As a result, HQs less than 1.0 were calculated for both birds and mammals. The revised TRV required by the regulatory agencies, with an assumption of 100 percent bioavailability, resulted in an HQ of 2.67 for the house mouse (adult) and 1.19 for the kestrel.

The only organic chemicals that were retained as COPECs were PCBs (total Aroclors and total DDTs). Both total Aroclors and total DDTs were eliminated as COPECs during the Phase 1 ERA and Validation Study. However, the EPCs for total Aroclors and total DDTs in the RI soil data set were substantially greater than the concentrations reported in earlier reports, so these chemicals were reevaluated in the ERA. The HQs for total Aroclors ranged from 1.29 to 2.16. The HQs for DDTs were all less than 1.0.

Results of the risk evaluation indicated carnivorous birds (such as the American kestrel) and small omnivorous mammals (such as the house mouse) may be at risk from ingested doses of copper, lead, and PCBs at Parcel E. Both lead and copper occur at concentrations well above the HPALs, and both of these metals are known to cause adverse effects to vertebrates when ingested. However, the magnitude of the HQ (all less than 2.7) and the low quality of the habitat at Parcel E suggests that risk is not immediate or severe. Because the low TRVs, which represent a lowest observable adverse effect level, were used to derive the PSCs, an HQ greater than 1.0 does not indicate immediate unacceptable risk. Nevertheless, any HQ greater than 1.0 is generally interpreted as indicating some risk.

### **5.2.8 Risk Characterization**

The open area in Parcel E is best characterized as marginal, ruderal habitat of limited ecological significance. This description is corroborated by the California Department of Fish and Game's comments on the Parcel E Validation Study, which stated, "The onshore habitat at Parcel E is of

moderate quality and isolated from good wildlife habitat. Consequently, this site is not considered a high priority for terrestrial receptors by DFG” (Tetra Tech and LFR 2000a; Appendix E). The Navy agrees with this general evaluation of Parcel E. The principal concern at Parcel E is that chemicals in soil will be transported to the more ecologically sensitive and valuable offshore area (Parcel F). The migration of chemicals to the Bay is being concurrently addressed under a separate investigation, the results of which are presented in Appendix G of this Revised RI Report.

The only resident small mammal documented at Parcel E is the house mouse, which is not normally considered to warrant government protection. A 200-trap night effort yielded several house mice but no deer mice, the native small mammal that was the original focus of the Phase 1 ERA. The house mouse was shown to be at risk from ingested doses of copper, lead, and PCBs, with HQs ranging from 1.29 (PCBs) to 2.67 (lead). These values do not indicate significant, immediate risk to mammals.

The house mouse is of interest primarily as a potential conduit of chemicals to the red-tailed hawk. Dose estimates for the red-tailed hawk, based on a diet of house mouse, were below risk-based concentrations for all chemicals. High-quality habitat with intact vegetation and limited human disturbance is available to the red-tailed hawk in the nearby hills, west of HPS. Although individual red-tailed hawks have been observed at Parcel E, the parcel does not represent a significant foraging ground for the population. No risk to the hawk was suggested by any of the data collected at Parcel E.

The American kestrel is widely distributed in open habitats throughout the entire state of California and throughout the United States. It is of interest in the risk assessment because it consumes a variety of large insect and small vertebrate prey, which may contain chemicals accumulated from soil at Parcel E. The kestrel may be at risk from lead (HQ = 1.19) and PCBs (HQ = 2.16) ingested in soil and food items. Although any HQ greater than 1.0 is interpreted as indicating potential risk, the values calculated for the kestrel do not raise significant concerns about the overall health of kestrel populations in the area.

### **5.2.9 Summary and Conclusions of the Ecological Risk Assessment**

The open space of Parcel E that was investigated in this ERA is slated for future use as a recreational area for the human population of the greater Bay area. The land immediately adjacent to the open space is designated industrial, maritime/industrial, or mixed use. The most likely use of the adjacent area is as a business park. The physical disturbances that typically occur in such an urban park setting are expected to limit the attractiveness of the open space to all but the most tolerant wildlife species, such as the house mouse and kestrel.

Results of the risk evaluation indicated carnivorous birds (such as the American kestrel) and small omnivorous mammals (such as the house mouse) may be at risk from ingested doses of copper, lead, and PCBs at Parcel E. Lead occurs at concentrations well above the HPALs, and is known to cause adverse effects to vertebrates when ingested. However, the magnitude of the HQ (all less than 2.7) and the low quality of the habitat at Parcel E suggests that risk is not immediate

or severe. Any HQ greater than 1.0 is generally interpreted as indicating some risk in a SLERA. In a BERA, however, more realistic assessment is appropriate. Because the low TRVs, which represent a lowest observable adverse effect level, were used to derive the PSCs, an HQ greater than 1.0 does not indicate immediate unacceptable risk.

In summary, no significant unacceptable risk to ecological receptors was indicated at Parcel E. The maximum HQs based on PSCs derived using the low TRV were 2.16 (for kestrels exposed to PCBs in soil) and 2.67 for the house mouse (exposed to lead in soil). Because the house mouse is not considered to warrant protection as a species, and no other small mammals were trapped at the site, this level of risk is acceptable. The low HQ for the kestrel does not indicate population-level risk of a magnitude that warrants remediation.

### **5.3 RESULTS OF THE PARCEL E SHORELINE HUMAN HEALTH RISK ASSESSMENT AND SCREENING-LEVEL ECOLOGICAL RISK ASSESSMENT**

This section summarizes the potential human health and ecological risks from exposure to chemicals present in sediments along the shoreline at Parcel E and identifies COCs for human health and environmental receptors. Potential risk from exposure to chemicals present in sediment was evaluated for the entire shoreline area at HPS, including the shoreline area associated with Parcel E. The risk assessments for sediment are being conducted as part of the Parcel F (offshore area) RI/FS activities and are drawn from for use in this Revised Parcel E RI Report.

A complete description of the methods used in performing the HHRA are provided in the Final Hunters Point Shipyard Parcel F Validation Study ([Battelle, BBL, and Neptune & Company 2005](#)), and [Attachment 1](#) of this Revised RI Report contains tables from the Parcel F Validation Study summarizing the HHRA results. [Appendix G](#) presents the detailed results of the SLERA, which was performed as part of the Parcels E and E-2 Shoreline Characterization Technical Memorandum.

#### **5.3.1 Risk to Human Health Along the Parcel E Shoreline**

This section presents the results of the human health evaluation of the Parcel E shoreline sediments. The HHRA was performed according to standard EPA risk assessment guidance ([EPA 1989, 1992](#)).

Current and reasonably anticipated future human exposure to COPCs associated with the shoreline along Parcel E was estimated. It was assumed that the primary exposure pathway would be through the consumption of shellfish, and that individuals harvesting shellfish would be directly exposed to sediments via direct contact and incidental ingestion. For the purposes of the human health risk assessment, the entire shoreline was considered as one exposure unit.

**TABLE 5-17: RISK TO BIRDS AND MAMMALS AT PARCEL E**

Revised Remedial Investigation Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| Analyte             | EPC<br>(mg/kg) | House Mouse    |          |                |          | American Kestrel |      | Red-tailed Hawk |        |

The doses derived in this manner for each scenario were then summed to estimate a lifetime average daily dose and average daily dose for each constituent by sampling area based on the adult and child RME and CTE exposure scenarios, respectively.

A summary of the individual risk and hazard values calculated for all chemicals evaluated within each exposure scenario is presented in [Attachment 1](#) (see Tables 2 and 3). Total cumulative risks and the risk drivers for each scenario are summarized in [Attachment 1](#) (see Tables 4 and 5). Cancer risks derived in this assessment can be compared with EPA's risk management range (that is, 1E-06 to 1E-04) for health protectiveness at Superfund sites. Based on this range, EPA typically considers 1E-06 as the "point of departure" for taking action at Superfund sites ([EPA 1989](#)).

Risks associated with direct contact to sediment were relatively low. For the RME scenario, PCBs were the only chemical with a risk greater than 1E-06. For the CTE scenario, all risks were below 1E-06 and hazards were below 1. For the shellfish ingestion pathway, the primary risk drivers associated with Parcels E and E-2 shoreline sediments were arsenic, chromium, total PCBs, and dioxins. Risks for these chemicals exceeded 1E-06 for both RME and CTE scenarios. Risks for arsenic and dioxins were similar to those for reference areas, but risks for chromium and total PCBs associated with site sediments were higher than those for reference areas ([Battelle, BBL, and Neptune & Company 2005](#)). For noncancer risks, total PCBs were the primary contributor.

Based on this evaluation, chromium and total PCBs appear to be the primary COCs for the evaluation of human health along the Parcel E shoreline.

### 5.3.2 Risk to Ecological Receptors Along the Parcel E Shoreline

The Navy conducted a SLERA to determine if chemicals detected along the shoreline pose an ecological risk to those receptors exposed to the narrow intertidal zone of Parcels E and E-2 (see [Appendix G](#)). For the purposes of the SLERA, the habitat along the entire shoreline was considered as one exposure unit. In addition, the shoreline was not divided into Parcels E and E-2 because it would reduce sample sizes below what is practicable for assessing risk.

Sediment samples were analyzed for metals, VOCs, SVOCs, pesticides, PCBs, TPH, dioxins and furans, and organotins. All chemicals detected in sediment samples from the shoreline were screened to identify COPECs. A toxicity-based approach was used to identify site-related chemicals that may pose risks to sensitive ecological receptors, including benthic invertebrates, birds, and mammals.

This section summarizes the characterization of risk posed to benthic invertebrates, birds, and mammals from surface and subsurface sediments. Concentrations of chemicals in sediment were compared with effects ranges to assess potential risk to benthic invertebrates. Food-chain models were used to assess the exposure of birds and mammals to ingested chemicals. Ingested doses were estimated for three birds (willet, surf scoter, and red tailed-hawk) and one mammal (house mouse). Details of the values used in the dose equation and the assumptions of the exposure assessment are provided in [Appendix G](#), Shoreline Technical Memorandum.

### ***Risk to Benthic Invertebrates***

The characterization of risk posed to benthic invertebrates from surface and subsurface sediment is summarized below.

**Surface Sediment:** All detected inorganic and organic chemicals in sediment were evaluated in the toxicological screen by evaluating the HQ (ratio of exposure point concentrations in surface sediment to effects range-median [ER-M] values). Chemicals with HQs greater than 1.0 were considered COPECs for benthic invertebrates. [Table G-6](#) in [Appendix G](#), Shoreline Technical Memorandum, presents the HQs.

HQs ranged from 1.30 for zinc to 3.19 for nickel for benthic invertebrates. No ER-M value is available for molybdenum, so it was considered a COPEC by default. The HQ for cadmium was less than 1.0; therefore, it was eliminated as a COPEC for benthic invertebrates.

Exposure concentrations for 4,4'-dichlorodiphenyldichloroethane (DDD), 4,4'-dichlorodiphenyldichloroethene (DDE), 4,4'-DDT, total DDTs, and PCBs exceeded their respective ER-M values; therefore, they were retained as primary COPECs for benthic invertebrates. HQs for these COPECs ranged from 1.19 (DDE) to 356.67 (total PCBs) (see [Table G-6](#) in [Appendix G](#), Shoreline Technical Memorandum).

**Subsurface Sediment:** Risk to benthic invertebrates from subsurface sediment was evaluated exactly as described above for surface sediment. Chemicals with HQs greater than 1.0 were considered COPECs for benthic invertebrates. [Table G-7](#) in [Appendix G](#), Shoreline Technical Memorandum) presents HQs based on the ratio of exposure point concentrations in subsurface sediment to ER-M values. HQs ranged from 1.12 for antimony to 65.46 for copper.

Exposure concentrations for 4,4'-DDD, 4,4'-DDE, 4,4'-DDT, total DDTs, dieldrin, endrin, and PCBs exceeded their respective ER-M values; therefore, they were retained as primary COPECs for benthic invertebrates. HQs for these COPECs ranged from 2.9 (DDD) to 1,500 (total PCBs).

In summary, copper, lead, zinc, and PCBs were measured at concentrations that pose a potential risk to benthic invertebrates in surface and subsurface sediment from the Parcels E and E-2 shoreline. For all of these metals, exposure point concentrations are higher in the subsurface samples. Several HQs for pesticides in sediment indicated potential risk, especially DDT and dieldrin in the subsurface samples.

### **Risk to Birds**

Based on life history and foraging habits, daily doses were estimated for the surf scoter, willet, and red-tailed hawk feeding along the Parcels E and E-2 shoreline. Site-specific daily dose estimates were compared with high and low TRVs to evaluate the potential adverse biological effects on each receptor (see [Table 4](#) in [Appendix G](#)). Based on this comparison, the risk to representative receptors was characterized; this comparison was performed in a manner consistent with EPA's HQ methodology ([EPA 1998](#)), as presented below.

$$HQ = \frac{Dose}{TRV} = \frac{(mg / kg - day)}{(mg / kg - day)} \quad (5-3)$$

where:

|      |   |                                                                         |
|------|---|-------------------------------------------------------------------------|
| HQ   | = | Hazard quotient (unitless)                                              |
| Dose | = | Chemical-, receptor-, and site-specific daily dose estimate (mg/kg-day) |
| TRV  | = | Chemical- and receptor-specific toxicity reference value (mg/kg-day)    |

A receptor is considered to exhibit potential significant risk if the HQ is greater than 1 using the high TRV. In contrast, a receptor is considered to exhibit only a potential risk if the HQ is greater than 1 using the low TRV.

Significant risk to birds was indicated only for the willet exposed to total PCBs. Results of the food-chain modeling indicated no significant risk to either the surf scoter or the red-tailed hawk. Other chemicals for which potential risk to birds is suggested include cadmium, copper, lead, mercury, PCBs, total DDTs, and dieldrin.

### **Risk to Mammals**

Risk to mammals was evaluated in the same way as risk to birds described above. Based on life history and foraging habits, daily dose estimates were calculated for the omnivorous house mouse feeding along the Parcels E and E-2 shoreline. HQs were calculated using the high and low TRVs. Doses for aluminum, antimony, molybdenum, and PCBs indicated significant risk to the mouse from both surface and subsurface sediment. Doses based on surface samples also exceeded the high TRV for cadmium and vanadium. Subsurface doses exceeded the high TRV for copper and zinc (see [Table 5](#) of [Appendix G](#)). A complete set of HQs is provided in [Table G-18](#) of [Appendix G](#).

The greatest significant risk (high TRV HQ) was indicated for PCBs ingested by the house mouse. A complete discussion of the chemicals posing risk and the chemicals that pose no significant risk to the house mouse is presented in [Appendix G](#).

Based on the results of the SLERA, risk to invertebrates, birds, and mammals along the shoreline should be evaluated further in an FS to determine the appropriate remedial alternative for the intertidal sediments along the entire Parcels E and E-2 shoreline.

| 29 | Risks to aquatic wildlife | Section 2.5.2 | Final Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California. ERRG. August 2012. Section 2.5.2.3, page 2-45; Table 2-14. |
|----|---------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 2.5.2.3. Risk Evaluation of Groundwater

A risk evaluation of aquatic wildlife exposed to potentially contaminated groundwater at Parcel E is provided in [Appendix A](#). The assessment consists of the following general steps:

- Aquatic evaluation criteria were selected based on surface water quality criteria (Basin Plan Table 3-3; California Toxics Rule; National Recommended Water Quality Criteria; and National Ambient Water Quality Criteria). All of these standards apply to surface water; none of them applies to groundwater. Therefore, these potential ARARs for surface water would be applied to the surface water at the interface of the A-aquifer groundwater, but would not be used to set cleanup standards for in-situ A-aquifer groundwater at Parcel E.
- The Navy developed trigger levels for various inland locations to ensure surface water quality criteria are not exceeded if groundwater at Parcel E discharges to the bay. The trigger levels are intended to serve as conservative comparison values for groundwater to indicate when additional evaluation may be necessary. The development of the trigger levels was initially performed in the Parcel D FS, and has also been applied at HPS Parcels B and C. The development of the trigger levels is discussed in Attachment A1 to [Appendix A](#).
- Chemical concentrations in groundwater were screened against the assigned aquatic evaluation criteria, mainly comprising saltwater aquatic criteria, to identify COPECs for surface water quality.
- Site-specific data for select COPECs were then evaluated against trigger levels, where appropriate, to confirm if the COPECs posed a potential risk to aquatic receptors requiring remedial option analysis.

Based on concentrations exceeding trigger levels (as adjusted based on HGALs), the following chemicals (or groups of chemicals) pose a potential threat to aquatic wildlife through exposure to surface water impacted by contaminated groundwater at Parcel E:

- Metals: arsenic, copper, lead, nickel, and zinc;
- PCBs and pesticides: Aroclor-1254, Aroclor-1260, 4,4'-dichlorodiphenyldichloroethene (DDE), and alpha-chlordane; and
- Total TPH: sum of detected concentrations of all TPH ranges (gasoline-range, diesel-range, and motor-oil range).

[Figure 2-9](#) shows the locations where groundwater concentrations exceeded their respective trigger levels. As discussed in [Appendix A](#), chemical concentrations at the IR-05 metals plume and the IR-12 nickel plume do not exceed their respective trigger levels; as a result, these plumes do not require further evaluation in this FS Report. As discussed in [Section 2.3.3.1](#), chemical concentrations at the IR-02 Southeast metals plume have attenuated following the Metal Debris Reef removal action; as a result, this plume also does not require further evaluation in the FS Report. [Table 2-14](#) summarizes the specific COPECs at the locations identified on [Figure 2-9](#).

**Table 2-14. Groundwater COECs for Aquatic Wildlife**

## Section A1. Introduction

This appendix summarizes an aquatic evaluation performed to determine whether chemicals in Parcel E groundwater could affect aquatic organisms in San Francisco Bay. The evaluation consists of two parts:

1. A screening evaluation that is a direct comparison of groundwater data against aquatic evaluation criteria. The screening evaluation is used primarily as a tool in identifying chemicals of potential ecological concern (COPECs) in A-aquifer groundwater that may pose a risk to aquatic organisms in San Francisco Bay.
2. A trigger-level evaluation to determine if chemical concentrations at the groundwater and bay interface pose risk to the aquatic environment. The trigger-level evaluation is a quantitative method used to calculate attenuation of chemicals as they migrate in A-aquifer groundwater, prior to discharging to San Francisco Bay. This trigger-level evaluation method was developed by the Department of the Navy for Hunters Point Shipyard (HPS), and has been used in other parcel evaluations (Parcels C and D) with regulatory agency concurrence.

Although no direct exposure pathway exists from B-aquifer or bedrock water-bearing zone (WBZ) groundwater to aquatic organisms in San Francisco Bay, groundwater data for the B-aquifer and bedrock WBZ were also evaluated to determine which chemicals detected at elevated concentrations at Parcel E could potentially migrate to the bay. This conservative measure was used to address the uncertainty of the lithologic conditions adjacent to and beyond the Parcel E and F boundaries. The available data show that the Bay Mud aquitard is continuous adjacent to and beyond the Parcel E boundary beneath the bay. The aquitard separates the permeable B-aquifer zones and the fractured bedrock WBZ from the surface waters of the bay offshore of Parcel E. Bay Mud deposits range from 5 to 76 feet thick under most of Parcel E; the aquitard is thickest in the southern portion of the parcel, along the shoreline.

The evaluations in this appendix consider both applicable or relevant and appropriate requirement (ARAR)-based surface water quality criteria and non-ARAR-based criteria for screening data at Parcel E. These criteria were considered to provide a comprehensive analysis based on agreements with the regulatory agencies and to maintain consistency with previous aquatic evaluations conducted at HPS (Parcels C and D). However, chemicals of ecological concern (COECs) are identified based on ARARs, as well as on the screening evaluation. Selection of screening criteria and development and evaluation of trigger levels are discussed in detail in [Sections A2.3 and A2.5](#).

This evaluation supplements the “Nature and Extent of Chemicals in Groundwater” screening evaluation presented in the Parcel E Remedial Investigation (RI) Report ([Barajas & Associates, Inc., 2008](#)), which evaluated migration of chemicals off site, in the direction of San Francisco Bay.

This report is organized as follows:

- [Section A1](#): Introduction
- [Section A2](#): Aquatic Evaluation Methodology
- [Section A3](#): Aquatic Evaluation Results
- [Section A4](#): Conclusions and Recommendations
- [Section A5](#): References

Figures and tables are provided following [Section A5](#). Attachments providing supplementary information are presented at the end of this appendix and include:

- [Attachment A1](#). Groundwater Modeling and Calculation of Attenuation Factors (Appendix G of the Final Revised Parcel D Feasibility Study Report; [SulTech, 2007](#))
- [Attachment A2](#). Groundwater Data Summary
- [Attachment A3](#). Aquatic Evaluation Maps

## Section A2. Aquatic Evaluation Methodology

---

A thorough analysis of existing groundwater data was conducted to provide the most conservative evaluation of the potential for chemicals in Parcel E groundwater to migrate to San Francisco Bay at concentrations that could affect surface waters. Existing data include data collected during past investigations (i.e., the RI, the groundwater data gaps investigations (GDGI) and during ongoing basewide groundwater monitoring program [BGMP]). The data evaluation included A- and B-aquifers and bedrock WBZ data.

All compiled data were initially screened against aquatic evaluation criteria, mainly comprising saltwater aquatic evaluation criteria. Chemicals detected in groundwater at concentrations exceeding the aquatic evaluation criteria were defined as COPECs. Data for COPECs exhibiting persistent and definable source areas were screened against trigger levels as a secondary evaluation (see [Section A2.5](#) and [Attachment A1](#)) to determine if they should be considered a COEC. The following subsections describe the steps involved in the aquatic evaluation.

### A2.1. COMPILATION OF GROUNDWATER DATA

All groundwater monitoring data collected at Parcel E from 1990 to October 2009 (when the data set was “locked” for the purposes of performing this aquatic evaluation) were compiled and tabulated by the following analytical groups:

- Anions
- Metals
- Volatile organic compounds (VOCs)
- Semivolatile organic compounds (SVOCs)
- Organochlorine pesticides
- Polychlorinated biphenyls (PCBs)
- Petroleum hydrocarbons

Data from wells located in Parcel E-2, along the western boundary of Parcel E, were also compiled for this evaluation because the regional groundwater flow direction in this area is to the southeast (from Parcel E-2 to Parcel E). Therefore, chemicals in groundwater may be migrating across this boundary and

warrant evaluation. [Attachment A2](#) contains the tables that list comprehensive analytical results for samples collected between 1990 and October 2009.

## **A2.2. IDENTIFICATION OF CHEMICAL DETECTIONS IN GROUNDWATER**

All monitoring well data were evaluated to identify all chemical concentrations exceeding reporting limits at Parcel E. Quantitative data, such as the number, location, range of reporting limits, and magnitude and frequency of detections, are presented in the tables in [Attachment A2](#). It should be noted that the laboratory reporting limits for current, routinely used analytical methods are greater than the aquatic evaluation criteria for the following chemicals (or analytical groups):

- Cyanide
- Sulfide
- Organochlorine pesticides
- PCBs

As a result, screening criteria established in the BGMP Sampling and Analysis Plan (Tetra Tech EM Inc. [\[TtEMI\], 2004b](#)) were set at the project-required quantitation limits. Consistent with this approach, all chemicals that were detected at concentrations greater than the laboratory reporting limits and exceeding the aquatic evaluation criteria were included in this aquatic evaluation. As a conservative measure, chemicals that were identified and quantified at concentrations below the laboratory reporting limit, but greater than the aquatic evaluation criterion, were also presented for informational purposes.

## **A2.3. SELECTION OF AQUATIC EVALUATION CRITERIA**

Aquatic evaluation criteria (also identified as surface water criteria) have been identified for other studies conducted at HPS; specifically, the Parcel D Feasibility Study (FS) ([SulTech, 2007](#)), Parcel C FS ([SulTech, 2008](#)), and Parcel E RI ([Barajas & Associates, Inc., 2008](#)). [Table A-1](#) summarizes the aquatic evaluation criteria considered in this evaluation.

The criteria were primarily based on promulgated and recommended values for protection of saltwater aquatic life, derived from the following sources:

1. San Francisco Bay Basin (Region 2) Water Quality Control Plan (Basin Plan) (San Francisco Bay Regional Water Quality Control Board [\[SFRWQCB\], 2007](#))
2. California Toxics Rule (CTR) Priority Toxic Pollutants for the State of California (U.S. Environmental Protection Agency [\[EPA\], 2000](#))

3. National Ambient Water Quality Criteria (NAWQC) ([Central Valley Regional Water Quality Control Board, 2007](#))
4. National Recommended Water Quality Criteria (NRWQC) ([EPA, 2006](#))

These criteria were developed to protect the environment, including aquatic organisms, from the negative effects of chemicals in surface water. The beneficial uses of groundwater do not include maintenance of freshwater or marine organisms because these organisms do not live in groundwater. Because no water quality criteria exist for groundwater and surface water quality criteria were deemed inappropriate for comparison with groundwater, the Navy developed alternative water quality criteria to evaluate the potential for chemicals in HPS groundwater to contaminate San Francisco Bay.

The Navy's evaluation of ARARs for water quality concluded that the state standards promulgated in Table 3-3 of the Basin Plan ([SFRWQCB, 2007](#)) and the federal standards promulgated in the CTR ([EPA, 2000](#)) are potential ARARs for the A-aquifer at Parcel E to be met at the interface of groundwater and San Francisco Bay. The Navy has further concluded that the guidelines for NAWQC and NRWQC are not ARARs for A-aquifer groundwater and the bay because other standards are better suited to Parcel E, including state standards in Table 3-3 of the Basin Plan and the federal standards developed for the state of California codified in the CTR. (Refer to [Appendix B, Section B2.2.4](#) for a detailed discussion of ARARs for surface water.) All of these standards apply to surface water; none of them applies to groundwater. Therefore, these potential ARARs for surface water would be applied to surface water at the interface of A-aquifer groundwater and the bay, but would not be used to set cleanup standards for in-situ A-aquifer groundwater at Parcel E.

For the B-aquifer, the Navy identified federal and state maximum contaminant levels as potential ARARs. (Refer to [Appendix B, Section B2.2.3](#) for a detailed discussion of groundwater ARARs.) These ARARs also would be protective of the discharge of B-aquifer groundwater to permeable zones underlying San Francisco Bay. Surface water criteria are not identified as potential ARARs for the interface of B-aquifer groundwater and the bay.

The most conservative (lowest) surface water criterion for each chemical was used in this evaluation, except for metals in A-aquifer groundwater. For metals in A-aquifer groundwater, the appropriate Hunters Point groundwater ambient level (HGAL) ([PRC Environmental Management, Inc., 1996](#)) was selected as the aquatic evaluation criterion, unless a surface water criterion exceeding the HGAL existed. In such a case, the most conservative (lowest) saltwater aquatic evaluation criterion above the HGAL was used as the aquatic evaluation criterion. [Table A-2](#) summarizes the HGALs for the A-aquifer. HGALs are not applicable to the B-aquifer based on its potential beneficial uses (see Appendix F of the RI Report [[Barajas & Associates, Inc., 2008](#)] for the results of the A-aquifer and B-aquifer beneficial use evaluations).

Petroleum hydrocarbons are not classified as a hazardous substance under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), Title 42 United States Code Section 9601[14]), thus they are excluded from consideration under the CERCLA process unless commingled with hazardous substances regulated under CERCLA. A screening evaluation was conducted to identify areas where petroleum hydrocarbons are commingled with other inorganic and organic chemicals that are regulated under CERCLA. The aquatic evaluation criterion used for petroleum hydrocarbons in this evaluation is based on the HPS-specific methodology established under the petroleum program ([Shaw Environmental, Inc., 2007](#)). This methodology sums all total petroleum hydrocarbon (TPH) categories (diesel-range, gasoline-range, and motor-oil range) and compares the sum against a total TPH criterion, which ranges from 1,400 to 20,000 micrograms per liter ( $\mu\text{g/L}$ ), depending on the distance from the shoreline.

#### A2.4. DATA SCREENING EVALUATION

The purpose of the data screening evaluation is to identify chemicals in groundwater that could migrate to San Francisco Bay at concentrations exceeding aquatic evaluation criteria. Such chemicals are considered COPECs and should be evaluated further.

The data evaluation focused on A-aquifer wells located within the tidal influence zone (TIZ) ([Figure A-1](#)), which is consistent with past requests from [SFRWQCB \(2006\)](#). The TIZ was defined as the area where the maximum tidal fluctuation exceeds 0.10 foot in the A-aquifer based on data collected during the Phase III GDGI ([TtEMI, 2004a](#)). It should be noted that the TIZ, which is defined by groundwater level (pressure) responses to tidal fluctuations in San Francisco Bay, is not the same as the tidal mixing zone (TMZ), where bay water flows in and out during a tidal cycle so that A-aquifer groundwater physically mixes with bay water. Past studies have shown that the TIZ extends farther inland than the TMZ ([TtEMI, 2004a](#)); therefore, the data evaluation presented herein is adequately conservative to assess potential exposure to aquatic organisms in the bay. For completeness, the evaluation also compares concentrations in A-aquifer wells located inland of the TIZ and B-aquifer wells against the corresponding aquatic evaluation criterion.

This evaluation was refined by evaluating the magnitude of the chemical concentrations relative to aquatic evaluation criteria. [Figures A3-1 through A3-30](#) (in [Attachment A3](#)) present data from both the A- and B-aquifers for each chemical—or, in the case of PCBs and petroleum hydrocarbons, summed chemical—that has at least one detected concentration exceeding the corresponding aquatic evaluation criterion. For wells with data that exceeded aquatic evaluation criteria, a data table is included on the figure to display the magnitude and temporal distribution of those exceedances.

The aquatic evaluation was performed for the following analytical groups: anions, metals, VOCs, SVOCs, pesticides, PCBs, and petroleum hydrocarbons. If potential contamination was identified in groundwater, the figures were further used to determine if the potential contamination:

- is short-lived or persistent over time (for example, whether or not the concentrations that exceeded aquatic evaluation criteria were detected during the last four sampling rounds);
- is variable, increasing, or decreasing over time;
- is present over a contiguous area or occurs in scattered or single unrelated locations; or
- significantly exceeds the aquatic evaluation criteria (that is, greater than 10 times the criteria).

Data were evaluated based on the factors listed above and using a weight-of-evidence approach to identify COPECs that warrant further assessment in the trigger-level evaluation.

## **A2.5. TRIGGER-LEVEL EVALUATION**

The trigger-level evaluation identifies COECs that should be addressed by the FS. The nearest surface water body to Parcel E, where CTR is applicable, is San Francisco Bay. Elevated concentrations of chemicals in groundwater at Parcel E could affect surface water quality as contaminated groundwater migrates and discharges to the bay.

To address the potential effects of groundwater contamination on the bay, the Navy developed trigger levels for various inland locations to ensure surface water quality criteria are not exceeded where groundwater at Parcel E discharges to the bay. The trigger levels are intended to serve as conservative comparison values for groundwater to indicate when additional evaluation may be necessary. The development of trigger levels was initially performed for Parcel D evaluations (Parcel D FS; [SulTech, 2007](#)). The trigger-level evaluation methodology has also been applied at Parcel C (Parcel C FS; [SulTech, 2008](#)). The development of the trigger levels is discussed in [Attachment A1](#) (Appendix G from the Parcel D FS; [SulTech, 2007](#)).

Site-specific data for select COPECs were evaluated against trigger levels, where appropriate, to determine which are COECs and thus need to be addressed in the FS and remedial design. The trigger-level evaluation, including the theoretical assumptions behind the evaluation and the evaluation methodology, are described in the following subsections.

### **A2.5.1. Trigger-Level Evaluation Theory**

At HPS, attenuation of chemical and metal concentrations occurs in groundwater as it migrates through three different zones: (1) the area of groundwater transport to the TMZ, (2) the TMZ, and (3) the bay discharge zone.

As chemicals migrate from an inland source area through soil and groundwater, they are subjected to physical, chemical, and biological processes that tend to reduce their concentrations. These processes include sorption of chemicals to soil particles, volatilization, hydrodynamic dispersion and molecular diffusion, and chemical and biological transformations. The magnitudes by which chemical

concentrations are reduced depend on a number of physical, chemical, and biological factors, including groundwater flow gradients, which may vary across Parcel E. For example, as groundwater moves through the TIZ and approaches the TMZ, the tidal influence would be expected to decrease the groundwater flow gradient, and consequently increase the residence time during which chemical concentrations would be reduced through physical, chemical, and biological processes. For simplicity and conservatism, this trigger-level evaluation does not account for potential reductions in groundwater flow gradients within the TIZ and further study would be needed to evaluate its potential effect. Such studies are not needed to support the Parcel E FS, but may be considered during the remedial design.

Additional reduction in chemical concentrations takes place in the TMZ near the shoreline. The TMZ is where bay waters move inland through the aquifer, mixing with groundwater. The net discharge of groundwater may not be changed by tidal influence, but rising tides introduce bay water into the aquifer so that concentrations of chemicals in groundwater that discharge during low tide are reduced by mixing of bay water and groundwater in the aquifer in this zone.

Finally, as groundwater discharges to the bay, concentrations of chemicals are further reduced due to dilution with bay water.

The processes described above needed to be accounted for to compare groundwater concentrations originating from inland source areas with aquatic evaluation criteria protective of bay organisms. To make this comparison, the Navy developed HPS-specific trigger levels. The development of trigger levels takes an extremely conservative approach because it does not account for attenuation in the TMZ or attenuation from discharge to the bay. Hydrodynamic dispersion in the inland contaminant transport zone was the only mechanism used to establish the attenuation factors (AFs), which were used to calculate the trigger levels. Therefore, the trigger levels likely overestimate the potential effects from chemicals and metals migrating in groundwater to San Francisco Bay.

For the purposes of this evaluation, and to maintain consistency with past HPS trigger-level evaluations (Parcels D and C), the AFs for the TMZ and for the bay discharge zone were assumed to be 1 (no attenuation). These assumptions provide a highly conservative approach that conforms to agreements made with regulatory agencies.

As part of the development of the Revised Parcel D FS Report ([SulTech, 2007](#)), the Navy developed a modeling approach to provide conservative estimates of the maximum concentrations in groundwater expected at the point of discharge (San Francisco Bay). The analytical solute transport model BIOSCREEN ([EPA, 1997](#)) was used to predict these maximum discharge concentrations and to then calculate AFs. The summary of the modeling evaluation from the Revised Parcel D FS is included as [Attachment A1](#).

The modeling confirmed that the amount of attenuation caused by hydrodynamic dispersion during groundwater transport can be significant at HPS, and that the greater the travel distance to the ecological receptor, the greater the AF. Results of the groundwater modeling effort were nomographs ([Attachment A1, Figure G-1](#)) that assign specific AFs for any chemical or metal found in HPS groundwater based on plume width and distance to the aquatic organisms in San Francisco Bay. The nomograph information presented in [Attachment A1](#) was used to assign AFs and calculate trigger levels for this evaluation.

### A2.5.2. Trigger-Level Evaluation Methodology

Trigger-level evaluations were only performed for chemicals that have exhibited inland sources of elevated concentrations with the potential to migrate to San Francisco Bay from Parcel E. The approach for assigning AFs and trigger levels and evaluating COPEC against trigger levels for Parcel E is presented below.

1. Wells identified in the screening evaluation as having persistent chemical or metal concentrations exceeding aquatic evaluation criteria were assigned AFs. Chemical data from wells located within the TIZ were not evaluated because the nomographs specify AFs of 1 for small distances from the shoreline, which produces an evaluation corresponding to the initial screening against aquatic evaluation criteria.
2. Source area width for each chemical and metal was estimated using the following methodology:
  - a. If contamination is persistent and limited to a single well, the plume width was assumed to be 40 feet (the narrowest plume width represented by the nomographs). Also, the centerline of the plume was assumed to be perpendicular to the shoreline and passing through the center of the well.
  - b. If contamination is persistent in multiple wells adjacent to each other, and the source area is believed to exceed a width of 360 feet, the plume width was assumed to be 360 feet. This distance corresponds to the widest plume width represented by the nomographs. Also, the center of the plume was assumed to be perpendicular to the shoreline and passing through the well with the highest and most persistent detected concentrations.
  - c. If contamination is present in multiple wells adjacent to each other, but is limited to a source area width of less than 360 feet, then the plume width is assumed to be the distance between the wells at the edges of the contamination, plus an additional 20 feet on either side. Also, the center of the plume was assumed to be perpendicular to the shoreline and passing through the well with the highest and most persistent detected concentrations.
3. The chemical migration distance was measured as the distance from the center of plume to the TMZ, which was conservatively assumed to be located 50 feet inland from the shoreline. As stated above, an AF of 1 was assumed for the area between the TMZ boundary and the bay shoreline; therefore, that distance was not included in the measurement of the transport zone, where attenuation is assumed to occur.

4. Using the nomograph curve for the chosen source area width, the AF was selected by finding the intercept of the migration distance along the curve and reading off the associated AF along the y (vertical) axis.
5. Once the AF was determined, it was rounded down to the nearest whole number to produce a conservative usable AF.
6. The trigger level for each defined chemical or metal source area was then calculated by multiplying the AF by the applicable aquatic evaluation criterion.
7. Groundwater data in the identified source area were then rescreened against the associated trigger level, and results were evaluated to determine if the source area could potentially pose negative effects to surface water quality and aquatic organisms.

The approach for assigning AF described above is consistent with the approach used to evaluate other parcels at HPS. The trigger-level evaluation is considered overly conservative because trigger levels only account for hydrodynamic dispersion in groundwater transport and ignore attenuation in the TMZ or attenuation from discharge to the surface water body. For this reason, trigger levels are only intended to serve as comparison values for groundwater to chemicals and metals in groundwater that may pose a risk to aquatic organisms. During future remedial design efforts for Parcel E, the Navy may choose to perform more quantitative analyses and modeling to refine the identification of COECs and specify risk-based remediation goals for groundwater affecting surface water.

GROUNDWATER EVALUATION  
FOR AQUATIC LIFE AT PARCEL E**

Feasibility Study Report for Parcel E

- Prevent exposure of humans to VOCs in soil gas at concentrations that would pose unacceptable risk via indoor air inhalation of vapors. The Navy has developed soil gas action levels (SGALs) to guide future vapor mitigation or remediation (ChaduxTt, 2010). A focused soil gas survey is currently being implemented to identify locations where concentrations of COCs in soil gas may exceed SGALs and to evaluate the extent of the VOC area requiring institutional controls (ARIC).

Exposure to VOCs in indoor air through the vapor intrusion pathway under the residential exposure scenario presents a potential unacceptable risk in some areas of Parcel E (Barajas & Associates, Inc., 2008b). Vapor intrusion is not applicable in open space areas (outdoors) because it applies only to indoor air where any discharged vapors cannot rapidly dissipate; open space areas are not likely to have buildings that are continuously occupied. VOCs in soil gas typically result from VOCs present in both soil and groundwater. The volatile COCs identified in the table above are present in soil at concentrations that may affect soil gas. Section 3.1.3 identifies additional volatile COCs in groundwater that may affect soil gas. The identified volatile COCs (in both soil and groundwater) will be further evaluated during the soil gas survey.

#### 3.1.1.2. Soil RAOs for the Protection of the Environment

The BERA concluded that risk to wildlife is not considered significant and does not warrant response actions based only on ecological concerns; therefore, no ecological RAO for soil is proposed. However, ecological benchmarks (Table 3-1) will be considered during any response action undertaken to address risk identified in the HHRA.

#### 3.1.1.3. Preliminary Remediation Goals for Soil

PRGs for soil were developed for COCs identified during the incremental risk evaluation. The PRGs, which will be finalized in the ROD, were developed based on the following approach:

- Soil RBCs for each exposure scenario were calculated based on a target cancer risk level of 1E-06 and target noncancer HI of 1, consistent with the exposure pathways and assumptions used in the HHRA to assess risks (Barajas & Associates, Inc., 2008b).
- PRGs for COCs in soil were selected based on a comparison of the RBC for each COC, the laboratory practical quantitation limit (PQL) based on standard EPA analytical methods, and the HPAL (metals only). For metals, the RBC was compared with the HPAL and, if the HPAL exceeded the RBC, the HPAL was selected. For organic chemicals, the RBC was selected, unless it was below the laboratory PQL. In that case, the laboratory PQL would be selected.
- Table 3-1 lists the PRGs for each COC in soil. The PRGs for use in implementation of the soil remedial action are developed and presented in Section 4, Development of Remedial Alternatives.

**Table 3-1. Preliminary Remediation Goals for COCs in Soil**

Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| Exposure Scenario | COC                        | Redevelopment Block         | Risk-Based Concentration (mg/kg) <sup>a</sup> | HPAL (mg/kg) | Laboratory PQL (mg/kg) | PRG (mg/kg) |

## Notes:

a = Unless otherwise noted, risk-based concentration is from HHRA (Appendix I of Revised RI Report for Parcel E [Barajas and Associates, 2008b]). Although the land use presented in the HHRA does not match the 2010 Redevelopment Plan, the above list of COCs was verified by conducting queries of the risk-based concentrations against the Parcel E soil data. Prior to conducting the data query, a comprehensive list of risk-based concentrations was developed for all COCs detected in one or more soil samples using the toxicity factors, exposure parameters, and chemical data used in the HHRA.

b = The TPH PRG is based on the HPS petroleum source criterion (Shaw, 2007)

c = BERA concluded that risk to wildlife does not warrant response actions based only on ecological concerns; however, ecological benchmarks will be considered during response actions to address risk identified in the HHRA

d = Risk-based concentration is from BERA (Appendix J of Revised RI Report for Parcel E [Barajas and Associates, 2008b])

BERA = baseline ecological risk assessment

BHC = benzene hexachloride

COC = chemical of concern

DDD = dichlorodiphenyldichloroethane

DDE = dichlorodiphenyldichloroethene

HHRA = human health risk assessment

HPAL = Hunters Point ambient level

HXCDF = hexachlorodibenzofuran

IR = Installation Restoration

mg/kg = milligrams per kilogram

PECDD = pentachlorodibenzodioxin

PECDF = pentachlorodibenzofuran

PQL = practical quantitation limit

PRG = preliminary remediation goal

RI = Remedial Investigation

TPH = total petroleum hydrocarbons

## J5.0 EVALUATION OF RISK TO BIRDS AND MAMMALS

This section expands on the formulation presented in the Parcel E Validation Study ([Tetra Tech and LFR 2000a](#)) and incorporates comments received from the regulatory agencies and natural resource trustees on the Validation Study. The purpose of the Parcel E Validation Study was to refine the Phase 1 ERA for birds and mammals by using site-specific BAFs in the food chain model.

Available data for evaluating risk to representative birds and mammals included measured concentrations of COPECs in soils and PSCs derived for Parcel E. [Section J5.1](#) presents the derivation of the original set of PSCs following the Validation Study. [Section J5.2](#) describes the selection of additional chemicals for the derivation of PSCs. [Section J5.3](#) discusses special considerations for lead. [Sections J5.4 and J5.5](#) present the risk assessment for birds and mammals, respectively. The summary of risk to birds and mammals is in [Section J5.6](#). Toxicological profiles are presented in [Section J5.7](#).

The Validation Study concluded that cadmium, copper, lead, nickel, selenium, and zinc posed potential risk to birds or mammals at Parcel E. These COPECs were evaluated in the ERA presented in this appendix. In addition, some chemicals that were eliminated as COPECs during the Validation Study but were measured at higher concentrations in the current data set at Parcel E were reevaluated in this ERA, as described in [Section J5.2](#).

### J5.1 CALCULATION OF PROTECTIVE SOIL CONCENTRATIONS

Subsequent to the findings in the Validation Study that birds and mammals may be at risk from several metals in soil at Parcel E, the Navy and the regulatory agencies agreed to calculate site-specific PSCs that would reduce the risk to acceptable levels. In 2000, PSCs were calculated for cadmium, copper (for birds only), lead, nickel, selenium, and zinc using the results for collocated soil and tissue samples collected from Parcel E during the Validation Study.

Since the PSCs were derived, additional soil samples were collected, removal actions were completed, and the boundaries of Parcel E were changed (see [Appendix A](#) of the Revised RI Report for details). The conclusions of the 1997 ERA and the Validation Study are considered valid for the area that was evaluated at that time, and the PSCs that were derived are applicable to all of Parcel E. It is not necessary to reevaluate the conclusions of the 1997 ERA or the Validation Study. However, the Navy was concerned that chemicals that had been eliminated as COPECs during the Validation Study may be elevated above risk-based concentrations in the new data set due to the spatial heterogeneity of soil concentrations. To address this issue, the new data set was evaluated for consistency with the previous data set to identify any additional chemicals that should be included in the BERA.

Surface soil (less than 3 feet bgs) concentrations previously used in calculating PSCs, referred to as “pre-2000 data,” were compared with surface soil concentrations representative of current soil in Parcel E, referred to as “all” data. The all data set excludes data from the following areas: (1) the shoreline of Parcel E that was evaluated in the Shoreline Technical Memorandum (see [Appendix G](#)), (2) areas that are now in Parcel E-2, and (3) samples that were subject to removal action prior to December 2004. The all data set includes soil samples collected both before and after the Validation Study from terrestrial areas that are within the current boundaries of Parcel E.

## **J5.2                   SELECTION OF ADDITIONAL CHEMICALS FOR CALCULATION OF PROTECTIVE SOIL CONCENTRATIONS**

The new soil data did not change any of the original PSCs, which were based on the collocated soil and tissue samples collected during the Parcel E Validation Study.

In the 1997 Parcel E RI Report, UCL<sub>95S</sub> (pre-2000 data) were provided for separate IR sites ([Tetra Tech, LFR, and U&A 1997](#)). The pre-2000 UCL<sub>95S</sub> (maximum and minimum concentrations were not provided) were averaged and then compared with the all data UCL<sub>95S</sub>. Chemicals with at least a 5 percent frequency of detection for the all data set were retained for comparison with the pre-2000 data. If the UCL<sub>95</sub> in the all data set was greater than the UCL<sub>95</sub> in the pre-2000 data set, the chemical was considered elevated with respect to previous sampling and retained for further evaluation using PSCs (see [Table J-5](#)).

Based on the comparison of pre-2000 data with all data, PSCs were calculated for the following chemicals: molybdenum, toluene, trichloroethene (TCE), xylene, DDTs, and total Aroclors. New PSCs were calculated for copper (for mammals only), molybdenum, toluene, TCE, xylene, DDTs, and total Aroclors because none were provided in the PSC Technical Memorandum ([Tetra Tech and LFR 2000b](#)). PSCs for lead in mammals were recalculated because new mammalian TRVs for lead became available after the original PSCs were developed. Risk estimates for mammals based on both the previous TRV (adjusted for bioavailability) and the new TRV (not adjusted for bioavailability) are provided in [Section J5.4](#).

PSC were calculated in accordance with methods established in the PSC Technical Memorandum ([Tetra Tech and LFR 2000b](#)). Navy and BTAG TRVs were used whenever they were available ([Navy 1998](#)). TRVs for molybdenum, toluene (mammals only), TCE (mammals only), and xylene (mammals only) were from papers cited in [Sample, Opresko, and Suter \(1996\)](#). A complete list of PSCs used in this ERA is provided in [Table J-6](#).

## **J5.3                   SPECIAL CONSIDERATION FOR LEAD**

In the PSC Technical Memorandum ([Tetra Tech and LFR 2000b](#)), back-calculated soil concentrations that reflected a lead HQ of 1.0 for the house mouse (adult and juvenile) and the kestrel were lower than the HPAL. In fact, the PSC for lead for the most sensitive receptor, the adult house mouse, was 0.54 mg/kg, which is one order of magnitude below the HPAL of 8.9

mg/kg. Acknowledging the unrealistically low and unachievable PSC for lead, the Navy evaluated a PSC based on the high TRV for lead, which represents an effect level. The back-calculated soil concentration for the house mouse based on the high TRV was five orders of magnitude higher than the back-calculated soil concentration based on the low TRV. The model also predicted that a lead concentration in soil of 0 would result in an adult house mouse upper HQ of 130.77 (see Figure 6a in [Tetra Tech and LFR 2000b](#)). This result is clearly aberrant, indicating that at least one of the values used in the model was incorrect.

In the PSC Technical Memorandum ([Tetra Tech and LFR 2000b](#)), the lead soil concentration back-calculated from the kestrel upper HQ was 8.8 mg/kg, which was roughly equivalent, although less than, the lead HPAL (8.9 mg/kg). Thus, neither the PSC for the house mouse nor the kestrel would be possible to achieve at Parcel E.

Doses calculated for birds and mammals were compared directly with low TRVs in the Parcel E Validation Study and the PSC Technical Memorandum without accounting for bioavailability and relevance of TRVs to site-specific conditions at Parcel E. The low TRV for lead was derived from a study that fed a very soluble form of lead (lead acetate) to rats in drinking water ([Krasovskii, Vasukovich, and Chariev 1979](#)). Use of this study required that several extremely conservative assumptions be incorporated into the back-calculation model, as discussed below.

- The form of lead ingested by birds and mammals at Parcel E is lead acetate, a very soluble and bioavailable form of lead.
- Birds and mammals ingest lead at Parcel E as lead acetate in drinking water (lead acetate is very soluble in water).
- Site-specific soil and chemical conditions at Parcel E affecting the bioavailability of lead in soil are the same as controlled laboratory conditions used to generate the low TRV.

Based on the historical use of Parcel E, however, it is unlikely that lead in Parcel E soil is in a soluble organic form. Instead, the lead found at Parcel E is likely bound within metal fragments and strongly adsorbed to organic matter, soil hydroxides, and clays because of the near-neutral pH conditions at Parcel E ([World Health Organization 1977](#); [Agency for Toxic Substances Disease Registry 1991](#); also see Tables 3a through 3l in the PSC Technical Memorandum, [Tetra Tech and LFR 2000b](#)). Further evidence of the low bioavailability of lead at Parcel E comes from the field tissue samples collected for the Parcel E Validation Study. Lead was not detected at all in plants growing in soil with very high lead concentrations at some locations. For example, at sampling location IR02SS303, lead was detected in soils at 2,153 mg/kg; however, no lead was detected in plant tissue samples (seed, stem, and leaf) collected from the same location. The actual bioavailability of lead at Parcel E is unknown and represents a source of uncertainty in the BERA.

During a 6-month period following review of the PSC Technical Memorandum (March through August 1999), the regulatory agencies worked with the Navy to develop a more appropriate approach to assessing risk from lead to birds and mammals at Parcel E. The regulatory agencies agreed that the best approach would be to reassess exposure parameters used in the back-calculation by incorporating information on the bioavailability of the form of lead known to be present at Parcel E, relative to the bioavailability of the form of lead used in the laboratory studies to derive TRVs. Therefore, additional information on bioavailability of lead to receptors from soils at Parcel E was evaluated because (1) mouse and kestrel PSCs calculated using low TRVs were less than the HPAL, (2) an extremely wide range (five orders of magnitude) existed between PSCs calculated using high and low TRVs, and (3) the chemical characteristics of lead in soil at Parcel E differed substantially from laboratory conditions upon which low TRVs for lead were derived.

Conflicting guidance has been issued since the agreement to evaluate bioavailability of lead at Parcel E. In November 2002, the Region 9 BTAG issued a revised low TRV for mammals exposed to lead (<http://www.dtsc.ca.gov/AssessingRisk>). The revised TRV of 1.0 mg/kg-day is based on a study of chronic low-level toxicity in the rat exposed to lead (Fowler and others 1980). DTSC requires that the new TRVs be substituted for the previous TRV. To satisfy that requirement, the Navy calculated PSCs for small mammals using the revised TRV, with no adjustment for bioavailability. Both the bioavailability-adjusted PSCs using the previous TRV and the unadjusted PSCs using the revised TRV are used in the evaluation of risk to mammals at Parcel E (see Section J5.5). The lead TRV for birds was not adjusted.

#### **J5.4 EVALUATION OF RISK TO BIRDS**

Inorganic chemicals for which the EPC exceeded the HPAL were compared with PSCs for the kestrel and the red-tailed hawk. An HQ greater than 1.0 was interpreted as indicating risk to birds that ingest soil and prey at Parcel E. HQs were calculated for copper, lead, molybdenum, nickel, and zinc. The HQ for lead was 1.19 when the PSC for the kestrel was used as the benchmark. As a result, lead was considered a chemical of ecological concern (COEC). Concentrations of copper, molybdenum, nickel, and zinc were lower than the PSCs for the kestrel, resulting in HQs less than 1.0. As a result, these chemicals were eliminated as COECs for birds. No HQs were greater than 1.0 for the red-tailed hawk.

The Validation Study concluded that no organic compounds posed a risk to birds or mammals at Parcel E (Tetra Tech and LFR 2000a). The comparison of “pre-2000” and “all” data sets revealed that five organic compounds were present in the current data set at concentrations higher than previously measured. Three of these compounds were VOCs (toluene, TCE, and xylene), the fourth compound was total Aroclors, a measure of PCB concentrations. DDT was also elevated (see Table J-5). Because of low toxicity and bioaccumulation potential and high mobility, VOCs were eliminated as COPECs in the 1997 ERA and Validation Study. Toxicity data were unavailable to support calculation of PSCs for birds exposed to VOCs. However, exposure of birds to VOCs in soil is not expected to result in significant risk because (1) VOCs volatilize so readily and (2) neither the kestrel nor the red-tailed hawk spends significant time on the ground. Because no burrowing birds were found to occur in the areas where VOCs were detected in soil, additional evaluation of the VOCs is not warranted. The HQ for total Aroclors,

contamination at Parcel E during these investigations, including former disposal areas in IR-02, the Former Oily Waste Ponds in IR-03, and a TCE spill at Building 406 (Figure 3 on page 4).

The chemicals found in soil and groundwater at Parcel E include metals (such as lead and zinc), VOCs (such as TCE), *semivolatile organic compounds (SVOCs)*, pesticides, *polychlorinated biphenyls (PCBs)*, and petroleum-related compounds (also referred to as total petroleum hydrocarbons [TPH]). In addition, *radioactive chemicals* were found in soil at several locations in Parcel E, but radioactive chemicals were not found in groundwater at levels that could impact people or wildlife in the Bay.

Most of the chemical contamination in soil at Parcel E is present at relatively shallow depths (less than 10 feet below the ground surface). However, deeper soil and groundwater contamination (10 to 20 feet below the ground surface) is found in isolated areas, most notably at the Former Oily Waste Ponds and the TCE plume at Building 406. In addition, the contaminated oil at the Former Oily Waste Ponds and the TCE source at Building 406 may be considered *principal threat wastes* that could require removal or treatment.

is present at relatively shallow depths (less than 10 feet below the ground surface). The chemical contamination in groundwater at Parcel UC-3 is limited to a relatively small area in the eastern portion of Crisp Road.

The Navy identified soil *hot spots* at multiple locations in Parcels E and UC-3, but these contaminant sources are not considered principal threat wastes because the chemicals (primarily metals, SVOCs, and PCBs) do not migrate readily in the environment. The Navy is currently collecting additional data at soil hot spots throughout Parcels E and UC-3 in order to better understand the extent of contamination at these areas. In addition, the Navy is monitoring groundwater plumes at Parcels E and UC-3 to help plan the future cleanup.

## SUMMARY OF SITE RISKS

**"Risk"** is the likelihood or probability that a hazardous chemical, when released to the environment, will cause effects (such as cancer or other illnesses) on exposed humans or wildlife. Chemicals that are spilled onto the ground or released through underground pipes can contaminate soil, air, and groundwater. Figure 5 below shows the most common ways, such as breathing of contaminants from soil, that people may be exposed to contamination (referred to as the *exposure pathway*).

Figure 5. Conceptual Site Model.

## Section 3. Remedial Action Objectives, Applicable or Relevant and Appropriate Requirements, General Response Actions, and Process Options

This section (1) presents the site-specific RAOs, including PRGs, for soil, shoreline sediment, and groundwater at Parcel E based on the COCs and COECs identified in the Revised RI Report and in [Appendix A](#) of this FS Report (see Section 3.1); (2) identifies potential ARARs (see [Section 3.2](#)); and (3) presents a range of GRAs and associated process options that will satisfy the RAOs for soil, shoreline sediment, and groundwater (see [Section 3.3](#)). The GRAs and process options retained through the screening process are used in later sections as the basis for developing remedial alternatives. A separate set of GRAs and process options were developed for NAPL at IR-03, the location of the former oil reclamation ponds. The prevalence of NAPL in the area of IR-03 and the associated site-specific contamination issues in soil and groundwater are addressed in the NAPL evaluation sections.

### 3.1. REMEDIAL ACTION OBJECTIVES

RAOs are medium-specific goals for protecting human health and the environment. Each RAO specifies (1) the COCs (or COECs), (2) the exposure route and receptors, and (3) an acceptable chemical concentration for each medium of concern (such as soil and groundwater). RAOs include both an exposure pathway and a chemical concentration in a given medium because protectiveness may be achieved in two ways: (1) by limiting or eliminating the exposure pathway or (2) by reducing chemical concentrations.

The RAO evaluation for this FS Report is based on (1) the results of the risk assessments presented in the Revised RI Report ([Barajas & Associates, Inc., 2008b](#)), with appropriate adjustments based on the amended redevelopment plan ([SFRA, 2010c](#)), and (2) the risk evaluation conducted to assess potential effects from groundwater discharge to San Francisco Bay ([Appendix A](#) of this FS Report). The NCP details the expectations for remedy selection in Title 40 CFR (40 CFR) § 300.430 (a)(1)(iii). The DoD integrates the NCP expectations with the objectives of the BRAC program for expediting transfer of DoD property for reuse and development. The NCP processes and criteria were used to develop RAOs for Parcel E.

An important component of developing RAOs is the determination of future land use. According to EPA's land use directive ([EPA, 1995](#)), RAOs "should reflect the reasonably anticipated future land use or

uses...,” thereby allowing for the development of “alternatives that would achieve cleanup levels associated with the reasonably anticipated future land use...” of the site. The EPA land use directive states that “in cases where future land use is relatively certain, the remedial action objective generally should reflect this land use...” and “...need not include alternative land use scenarios...” (EPA, 1995). RAOs developed for Parcel E are based on the city’s planned reuse for each redevelopment block, which is considered the reasonable anticipated end use of the property. In accordance with the EPA land use directive (EPA, 1995), this FS Report develops remedial alternatives based on the planned reuse only.

Figure 1-2 shows the redevelopment blocks within Parcel E. The RAOs for each environmental medium of concern are presented in the following sections.

### 3.1.1. RAOs for Soil and Soil Gas

The Revised RI Report evaluated risk from human exposure to soil (residential, industrial, and recreational) associated with each redevelopment block and its planned reuse (Barajas & Associates, Inc., 2008b). Based on the amended redevelopment plan (SFRA, 2010c), the reuses relevant to the Parcel E redevelopment blocks are mixed use and open space, as shown on Figure 1-2. The two exposure scenarios applicable to these planned reuses are residential and recreational, as shown in the table below. The COCs for each exposure scenario are also provided in the table and discussed later in this section.

| Exposure Scenario | Redevelopment Block                   | Planned Reuse | COCs <sup>a</sup>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Notes:**  
All concentrations are in microgram per cubic meter.

a Reporting limits were adjusted by a factor of 1.6 to account for dilution from pressurization of a 6-liter Summa canister

b The analytical methods listed are a few among several possible methods for soil gas analysis; final analytical methods will be identified in the sampling and analysis plan.

c The preliminary SGAL is based on the lowest concentration between the cancer- and noncancer-based soil gas RBC. If the soil gas RBC is less than the laboratory RL, then the laboratory RL is used as the SGAL.

| e | From "Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California" (CTR) (EPA 2000) and "Water Quality Control Plan, San Francisco Bay Basin Region" (RWQCB 2007a). The most appropriate criteria were used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| f | Criterion made more suitably protective by means of standard convention of lowering acute values by 80 percent and instantaneous values by 90 percent to make them more appropriate for use under chronic exposure scenarios.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| g | An acute criterion (EPA identified as Criteria Maximum Concentration [CMC]) is an estimate of the highest concentration of a material in surface water to which an aquatic community can be exposed briefly without resulting in an unacceptable effect. The chronic concentration (EPA identified as Criterion Continuous Concentration [CCC]) is an estimate of the highest concentration of a material in surface water to which an aquatic community can be exposed indefinitely without resulting in an unacceptable effect. The CMC and CCC are just two of the six parts of an aquatic life criterion; the other four parts are the acute averaging period, chronic averaging period, acute frequency of allowed exceedence, and chronic frequency of allowed exceedence. Because 304(a) aquatic life criteria are national guidance, they are intended to be protective of the vast majority of the aquatic communities in the United States. |

| The following lettered footnotes are derived from EPA "National Recommended Water Quality Criteria" (EPA 2006), Table 1 - Priority Toxic Pollutants (unless otherwise noted): |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| A                                                                                                                                                                             | This recommended water quality criterion was derived from data for arsenic (III), but is applied here to total arsenic, which might imply that arsenic (III) and arsenic (V) are equally toxic to aquatic life and that their toxicities are additive. In the arsenic criteria document (EPA 440/5-84-033, January 1985), Species Mean Acute Values are given for both arsenic (III) and arsenic (V) for five species and the ratios of the SMAVs for each species range from 0.6 to 1.7. Chronic values are available for both arsenic (III) and arsenic (V) for one species; for the fathead minnow, the chronic value for arsenic (V) is 0.29 times the chronic value for arsenic (III). No data are known to be available concerning whether the toxicities of the forms of arsenic to aquatic organisms are additive.                                                                                                                                                                                                                                                                                                                                                                                                       |
| B                                                                                                                                                                             | This criterion has been revised to reflect The Environmental Protection Agency's q1* or RID (Reference Dose), as contained in the Integrated Risk Information System (IRIS) as of May 17, 2002. The fish tissue bioconcentration factor (BCF) from the 1980 Am                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| C                                                                                                                                                                             | This criterion is based on carcinogenicity of 10 <sup>-6</sup> risk. Alternate risk levels may be obtained by moving the decimal point (e.g., for a risk level of 10 <sup>-5</sup> , move the decimal point in the recommended criterion one place to the right).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| D                                                                                                                                                                             | Freshwater and saltwater criteria for metals are expressed in terms of the dissolved metal in the water column. The recommended water quality criteria value was calculated by using the previous 304(a) aquatic life criteria expressed in terms of total recoverable metal, and multiplying it by a conversion factor (CF). The term "Conversion Factor" (CF) represents the recommended conversion factor for converting a metal criterion expressed as the total recoverable fraction in the water column to a criterion expressed as the dissolved fraction in the water column. (Conversion Factors for saltwater CCCs are not currently available. Conversion factors derived for saltwater CMCs have been used for both saltwater CMCs and CCCs). See "Office of Water Policy and Technical Guidance on Interpretation and Implementation of Aquatic Life Metals Criteria.@ October 1, 1993, by Martha G. Prothro, Acting Assistant Administrator for Water, available from the Water Resource center, USEPA, 401 M St., SW, mail code RC4100, Washington, DC 20460; and 40CFR131.36(b)(1). Conversion Factors applied in the table can be found in Appendix A to the Preamble- Conversion Factors for Dissolved Metals. |
| F                                                                                                                                                                             | Freshwater aquatic life values for pentachlorophenol are expressed as a function of pH, and are calculated as follows: CMC = exp(1.005(pH)-4.869); CCC = exp(1.005(pH)-5.134). Values displayed in table correspond to a pH of 7.8.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| G                                                                                                                                                                             | This Criterion is based on 304(a) aquatic life criterion issued in 1980, and was issued in one of the following documents: Aldrin/Dieldrin (EPA 440/5-80- 019), Chlordane (EPA 440/5-80-027), DDT (EPA 440/5-80-038), Endosulfan (EPA 440/5-80-046), Endrin (EPA 440/5-80-047), Heptachlor (EPA 440/5-80-052), Hexachlorocyclohexane (EPA 440/5-80-054), Silver (EPA 440/5-80-071). The Minimum Data Requirements and derivation procedures were different in the 1980 Guidelines than in the 1985 Guidelines. For example, a CMC derived using the 1980 Guidelines was derived to be used as an instantaneous maximum. If assessment is to be done using an averaging period, the values given should be divided by 2 to obtain a value that is more comparable to a CMC derived using the 1985 Guidelines.                                                                                                                                                                                                                                                                                                                                                                                                                     |

| V                                                                                                                                                                             | This value was derived from data for heptachlor, and the criteria document provides insufficient data to estimate the relative toxicities of heptachlor and heptachlor epoxide.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Y                                                                                                                                                                             | This value was derived from data for endosulfan and is most appropriately applied to the sum of alpha-endosulfan and beta-endosulfan.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| aa                                                                                                                                                                            | This criterion is based on a 304(a) aquatic life criterion issued in 1980 or 1986, and was issued in one of the following documents: Aldrin/Dieldrin (EPA 440/5-80-019), Chlordane (EPA 440/5-80-027), DDT (EPA 440/5-80-038), Endrin (EPA 440/5-80-047), Heptachlor (EPA 440/5-80-052), Polychlorinated biphenyls (EPA 440/5-80-068), Toxaphene (EPA 440/5-86-006). This CCC is currently based on the Final Residue Value (FRV) procedure. Since the publication of the Great Lakes Aquatic Life Criteria Guidelines in 1995 (60FR15393-15399, March 23, 1995), the Agency no longer uses the Final Residue Value procedure for deriving CCCs for new or revised 304(a) aquatic life criteria. Therefore, the Agency anticipates that future revisions of this CCC will not be based on the FRV procedure.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| bb                                                                                                                                                                            | This water quality criterion is based on a 304(a) aquatic life criterion that was derived using the 1985 Guidelines (Guidelines for Deriving Numerical National Water Quality Criteria for the Protection of Aquatic Organisms and Their Uses, PB85-227049, January 1985) and was issued in one of the following criteria documents: Arsenic (EPA 440/5-84-033), Cadmium (EPA-822-R-01-001), Chromium (EPA 440/5-84-029), Copper (EPA 440/5-84-031), Cyanide (EPA 440/5- 84-028), Lead (EPA 440/5-84-027), Nickel (EPA 440/5-86-004), Pentachlorophenol (EPA 440/5-86-009), Toxaphene, (EPA 440/5-86-006), Zinc (EPA 440/5-87- 003).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| cc                                                                                                                                                                            | When the concentration of dissolved organic carbon is elevated, copper is substantially less toxic, and use of Water-Effect Ratios might be appropriate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| dd                                                                                                                                                                            | The selenium criteria document (EPA 440/5-87-006, September 1987) provides that if selenium is as toxic to saltwater fishes in the field as it is to freshwater fishes in the field, the status of the fish community should be monitored whenever the concentration of selenium exceeds 5.0 Fg/L in salt water because the saltwater CCC does not take into account uptake via the food chain.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| ee                                                                                                                                                                            | This recommended water quality criterion was derived on page 43 of the mercury criteria document (EPA 440/5-84-026, January 1985). The saltwater CCC of 0.025 ug/L given on page 23 of the criteria document is based on the Final Residue Value procedure in the 1985 Guidelines. Since the publication of the Great Lakes Aquatic Life Criteria Guidelines in 1995 (60FR15393-15399, March 23, 1995), the Agency no longer uses the Final Residue Value procedure for deriving CCCs for new or revised 304(a) aquatic life criteria.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ff                                                                                                                                                                            | This recommended water quality criterion was derived in <i>Ambient Water Quality Criteria Saltwater Copper Addendum</i> (draft, April 14, 1995) and was promulgated in the Interim final National Toxics Rule (60 FR 22228-222237, May 4, 1995).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| gg                                                                                                                                                                            | EPA is actively working on this criterion, and so this recommended water quality criterion may change substantially in the near future.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| hh                                                                                                                                                                            | This recommended water quality criterion was derived from data for inorganic mercury (II), but is applied here to total mercury. If a substantial portion of the mercury in the water column is methylmercury, this criterion will probably be under protective. In addition, even though inorganic mercury is converted to methylmercury and methylmercury bioaccumulates to a great extent, this criterion does not account for uptake via the food chain because sufficient data were not available when the criterion was derived.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ii                                                                                                                                                                            | This criterion applies to DDT and its metabolites (that is, the total concentration of DDT and its metabolites should not exceed this value.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

(Originally footnote c in CTR)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ll                                                                                                                                                                            | This criterion is based on 304(a) aquatic life criterion issued in 1980, and was issued in one of the following documents: Aldrin/Dieldrin (EPA 440/5–80–019), Chlordane (EPA 440/5–80–027), DDT (EPA 440/5–80–038), Endosulfan (EPA 440/5–80–046), Endrin (EPA 440/5–80–047), Heptachlor (440/5–80–052), Hexachlorocyclohexane (EPA 440/5–80–054), Silver (EPA 440/5–80–071). The Minimum Data Requirements and derivation procedures were different in the 1980 Guidelines than in the 1985 Guidelines. For example, a "CMC" derived using the 1980 Guidelines was derived to be used as an instantaneous maximum. If assessment is to be done using an averaging period, the values given should be divided by 2 to obtain a value that is more comparable to a CMC derived using the 1985 Guidelines (originally footnote g in the CTR).                                                                                                                                                                                                                                                                                                                                                                                     |
| mm                                                                                                                                                                            | Criteria for these metals are expressed as a function of the water-effect ratio (WER) (originally footnote i in the CTR).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| nn                                                                                                                                                                            | No criterion for protection of human health from consumption of aquatic organisms (excluding water) was presented in the 1980 criteria document or in the 1986 Quality Criteria for Water. Nevertheless, sufficient information was presented in the 1980 document to allow a calculation of a criterion, even though the results of such a calculation were not shown in the document (originally footnote j in the CTR).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| oo                                                                                                                                                                            | These freshwater and saltwater criteria for metals are expressed in terms of the dissolved fraction of the metal in the water column. Criterion values were calculated by using EPA's Clean Water Act 304(a) guidance values (described in the total recoverable fraction) and then applying the conversion factors in § 131.36(b)(1) and (2) (originally footnote m in the CTR).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| pp                                                                                                                                                                            | These criteria were promulgated for specific waters in California in the National Toxics Rule ("NTR"), at § 131.36. The specific waters to which the NTR criteria apply include: Waters of the State defined as bays or estuaries and waters of the State defined as inland, i.e., all surface waters of the State not ocean waters. These waters specifically include the San Francisco Bay upstream to and including Suisun Bay and the Sacramento-San Joaquin Delta. This section does not apply instead of the NTR for this criterion (originally footnote o in the CTR).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| qq                                                                                                                                                                            | These criteria were promulgated for specific waters in California in the NTR. The specific waters to which the NTR criteria apply included: Waters of the State defined as bays or estuaries including the San Francisco Bay upstream to and including Suisun                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| rr                                                                                                                                                                            | PCBs are a class of chemicals that include Aroclors 1242,1254,1221,1232,1248,1260, and 1016. The aquatic life criteria apply to the sum of this set of seven Aroclors (originally footnote u in the CTR).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| ss                                                                                                                                                                            | This criterion has been recalculated pursuant of all congener or isomer or homolog or Aroclor analyses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| 115                                                                                                                                                                                                        | Criterion most appropriately applied to the sum of alpha-endosulfan and beta-endosulfan.                                                                                                                                                                                                                                                                |
| 116                                                                                                                                                                                                        | Applies separately to Aroclors 1242, 1254, 1221, 1232, 1248, 1260, and 1016; based on carcinogenicity at 1-in-a-million risk level.                                                                                                                                                                                                                     |
| 136                                                                                                                                                                                                        | Draft Chronic Criterion: The concentration of selenium in whole-body fish tissue should not exceed 7.91 ug/g dw (dry weight). In addition, if whole-body fish tissue concentrations exceed 5.85 ug/g dw during summer or fall, fish tissue should be monitored during the winter to determine whether the selenium concentration exceeds 7.91 ug/g dw.  |
| 137                                                                                                                                                                                                        | Expressed as free cyanide (as CN).                                                                                                                                                                                                                                                                                                                      |
| 140                                                                                                                                                                                                        | Criterion derived from data for inorganic mercury (II), but is applied to total mercury. It will probably be underprotective if a substantial portion of mercury in the water column is methylmercury. Derivation of criterion did not consider exposure through the diet, which is probably important for aquatic life occupying upper trophic levels. |

**Table A-3. Groundwater COECs for Aquatic Wildlife** *(continued)*  
Feasibility Study Report for Parcel E, Hunters Point Shipyard

Notes:

- (a) References for the aquatic evaluation criteria are included in Tables A-1 and A-2.
- (b) Attenuation factor assigned based on nomographs developed specifically for HPS groundwater (see Attachment A-1).
- (c) Value shown has been HGAL-adjusted and is applicable to the A-aquifer.
- (d) Well IR02MWB-3 has been destroyed; new well IR02MW375A is located in approximately the same area.
- (e) Range of values shown; total TPH aquatic criteria assigned as a function of distance from shoreline; the source of these criteria is the "Final New Preliminary Screening Criteria and Petroleum Program Strategy, Hunters Point Shipyard, San Francisco, California" (Shaw Environmental, Inc., 2007)

### 3.3. ANALYSIS OF GENERAL RESPONSE ACTIONS AND PROCESS OPTIONS

GRAs are categories of actions that are made up of technologies. Multiple process options may be available for each technology. These GRAs are responses or remedies that would meet the RAOs to protect human health and the environment from known contamination at Parcel E. Process options are specific technologies used to carry out a GRA.

Section 3.3.1 describes the development of GRAs for Parcel E soil, shoreline sediment, groundwater, and NAPL. NAPL is evaluated separately to address the unique nature and extent of the NAPL (see [Section 3.1.4](#)). [Section 3.3.2](#) presents the results of the analysis of the proposed GRAs and associated process options.

#### 3.3.1. Development of GRAs

GRAs were developed based on professional engineering judgment and experience with response actions proven successful for the COCs at Parcel E and elsewhere at HPS. Because the RAOs were developed based on the planned future land use, the GRAs were also developed based on the planned future land use of each redevelopment block. [Table 3-6](#) presents the GRAs and the process options for soil and shoreline sediment. [Table 3-7](#) presents the GRAs and process options for groundwater. A separate analysis is presented for NAPL to address IR-03, the site of the former oil reclamation ponds. [Table 3-8](#) presents the GRAs and process options for NAPL.

The following GRAs were identified to ensure that the RAOs for all media are achieved.

##### *Soil and Shoreline Sediment*

- No action – Required GRA for CERCLA evaluation
- Institutional controls – Includes land use and access restrictions implemented through legal and administrative mechanisms (such as restrictive covenants and deed restrictions) to mitigate potential unacceptable exposure to chemicals in soil and shoreline sediment
- Engineering controls – Includes fencing, barriers, and signs to restrict access and potential unacceptable exposure to contaminated soil and shoreline sediment
- Monitoring – Includes soil gas monitoring to evaluate the potential for vapor intrusion
- Removal – Includes excavation and off-site disposal of contaminated soil and shoreline sediment
- Treatment – Includes in-situ and ex-situ treatment of soil or shoreline sediment to reduce the toxicity, mobility, and volume of chemicals
- Containment – Includes covering (1) contaminated soil to prevent direct exposure of humans through dermal contact, inhalation, or ingestion; and (2) contaminated shoreline sediment to prevent direct contact with humans or wildlife

**Groundwater**

- No action – Required GRA for CERCLA evaluation
- Institutional controls – Includes land use and access restrictions implemented through legal and administrative mechanisms (such as restrictive covenants and deed restrictions) to mitigate potential unacceptable exposure to chemicals in soil gas or groundwater
- Engineering controls – Includes vapor barriers, sub-slab depressurization, and epoxy coatings to mitigate potential unacceptable vapor intrusion risk from VOCs in soil gas or groundwater
- Monitoring – Includes groundwater monitoring to assess changes in the concentrations of chemicals in groundwater
- Treatment – Includes in-situ and on-site ex-situ treatment of contaminated groundwater
- Removal – Includes pumping to remove contaminated groundwater and off-site treatment or disposal
- Containment – Includes installing (1) vertical barriers to control groundwater flow and limit migration of contaminated groundwater and (2) barriers or covers to prevent vapor intrusion or limit infiltration

**NAPL (IR-03)**

- No action – Required GRA for CERCLA evaluation
- Institutional controls – Includes land use and access restrictions implemented through legal and administrative mechanisms (such as restrictive covenants and deed restrictions) to mitigate potential unacceptable exposure to contaminated media at IR-03
- Engineering controls – Includes fencing, barriers, and signs to restrict access and potential unacceptable exposure to contaminated media at IR-03
- Monitoring – Includes groundwater monitoring to assess the adequacy of remediation
- Removal – Includes pumping or excavation to remove NAPL and associated contaminated soil and groundwater for off-site treatment or disposal
- Treatment – Includes in-situ and on-site ex-situ treatment of NAPL and associated contaminated soil and groundwater
- Containment – Includes (1) installing vertical barriers to control NAPL and limit migration of contaminated groundwater and (2) covering contaminated soil to limit infiltration and prevent direct exposure of humans through the dermal contact, inhalation, and ingestion exposure pathways

**3.3.2. Analysis of GRAs and Process Options**

Technologies and process options for each of the GRAs selected for this FS Report underwent an initial screening. The goal of screening process options is to provide a “toolbox” of available technologies that can be applied as needed in the selected remedial alternative presented in the ROD to best achieve the

RAOs. The language in the ROD needs to be flexible enough to allow application of appropriate technologies based on results of treatability studies and other design-related studies for various sites across Parcel E.

During the initial screening, a range of technology types and process options were evaluated in terms of technical implementability, site conditions, waste characteristics, chemical properties, and the ability to meet NCP requirements and RAOs. [Tables 3-6, 3-7, and 3-8](#) summarize the initial screening results for soil and shoreline sediment, groundwater, and NAPL, respectively. Those GRAs and process options that were carried forward from the initial screening were then analyzed with respect to effectiveness, implementability, and cost. [Section 3.3.2.1](#) presents the analysis for the applicable process options for soil and shoreline sediment, and [Section 3.3.2.2](#) presents the analysis for the applicable process options for groundwater. [Section 3.3.2.3](#) presents the analysis of the applicable process options for NAPL and associated soil and groundwater. [Tables 3-9, 3-10, and 3-11](#) summarize the results of the detailed analysis for soil and shoreline sediment, groundwater, and NAPL, respectively.

#### **3.3.2.1. Screening and Detailed Analysis of GRAs and Process Options for Soil and Shoreline Sediment**

Potentially applicable GRAs identified for soil and shoreline sediment at Parcel E consist of (1) no action, (2) institutional controls, (3) engineering controls, (4) monitoring, (5) removal, (6) treatment, and (7) containment. [Table 3-6](#) presents the initial screening of technologies and process options for these GRAs. This table includes the various technology types, process options, and results of the screening analysis for each GRA for soil and shoreline sediment. The rationale for those options eliminated from further evaluation is presented in [Table 3-6](#); these eliminated technologies and process options are not discussed further.

All seven GRAs were retained for further evaluation, including no action. Removal process options were considered effective and implementable for many COCs, but were not considered implementable for the ubiquitous metals that are present in fill at Parcel E at concentrations greater than PRGs. Containment process options, supplemented with institutional controls, were considered effective and implementable for the ubiquitous metals at Parcel E. Most of the technologies and process options for treatment were eliminated during the initial screening for soil and shoreline sediment at Parcel E; only SVE was retained for evaluation. Treatment is not cost effective or as implementable as removal and containment process options.

Those technologies and process options retained during the initial screening were evaluated for effectiveness, implementability, and cost, in accordance with the NCP (specifically 40 CFR § 300.430 [e][7]) and EPA RI/FS guidance ([EPA, 1988](#); Section 4.2.5). [Table 3-9](#) summarizes the results of the detailed analysis. The analysis of GRAs and process options focuses primarily on soil because site-specific conditions at Parcel E (including the volume of contaminated soil and the range of chemical

**Table 3-6. Screening of GRAs and Process Options for Soil and Shoreline Sediment at Parcel E**  
Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| Institutional Controls  | Legal Mechanisms          | Covenants to Restrict Use of Property and Deed Restrictions                | Restricts use of parcel through environmental restrictive covenants that will run with the land; allows only designated land use in accordance with the proposed redevelopment plan (EPA, 2000a); includes criteria during and after future development to ensure mitigated exposure conditions are maintained, such as covers, barriers, or other engineering controls (Navy and DTSC, 2000). | Retained<br>Easily implemented and effective; usually required to restrict activity based on land use.                                             |
|                         | Administrative Mechanisms | Land Use Plans and Soil and Groundwater Management Procedures and Policies | Manage and prevent exposure to humans during future site activities.                                                                                                                                                                                                                                                                                                                           | Eliminated<br>Covenants to Restrict Use of Property and Deed Restrictions are sufficient to enforce land use and activity restrictions.            |
| Engineering Controls    | Physical Barriers         | Fencing, Barriers, and Signs                                               | Restrict land use where there is exposure to potentially contaminated soil using fencing, barriers, and posting signs (EPA, 2000a).                                                                                                                                                                                                                                                            | Retained<br>Easily implemented and effective; usually required to restrict activity based on land use. Not applicable for use in open space areas. |
| Monitoring              | Soil Gas Monitoring       | Periodic Soil Gas Monitoring                                               | Collect and analyze soil gas samples periodically to evaluate the potential for vapor intrusion.                                                                                                                                                                                                                                                                                               | Retained<br>Easily implemented; required to evaluate effectiveness of other process options; low cost.                                             |

**Table 3-6. Screening of GRAs and Process Options for Soil and Shoreline Sediment at Parcel E** *(continued)*  
Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| General Response Action | Remedial Technology Type                   | Process Option                                                                                                | Description                                                                                                                                                                                                                                                                            | Comments                                                                                                                                                                                                                                                |
|-------------------------|--------------------------------------------|---------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Removal <sup>1</sup>    | Excavation and Off-Site Treatment/Disposal | Conventional Excavation and Disposal at Licensed Treatment/Disposal Facility (e.g., RCRA, non-RCRA, and LLRW) | Excavate soil containing chemicals using conventional mechanical equipment; limit to depths of less than 10 feet bgs. Transport and dispose of soils at a permitted treatment and disposal facility.                                                                                   | Retained for some COCs<br>Effective for non-ubiquitous metals and PAHs; easily and quickly implemented; permanent remedy; and moderate cost.<br>Eliminated for ubiquitous metals<br>Not implementable or cost-effective for entire redevelopment blocks |
| Treatment <sup>1</sup>  | Physical/Chemical Treatment                | Soil Vapor Extraction (with or without thermally enhanced recovery)                                           | Extract VOCs from unsaturated zone with vacuum pumps; extraction performance can be enhanced with active volatilization of VOCs in groundwater (EPA, 1997b). May be used with thermal enhancement (e.g., six-phase heating or steam injection) to enhance volatilization of chemicals. | Retained for some COCs<br>Effective in treating VOCs; effectiveness enhanced when implemented with active volatilization                                                                                                                                |
|                         |                                            | Mechano-Chemical Destruction                                                                                  | Treat chemicals with a proprietary reagent in a high-intensity ball mill; includes pretreatment (drying/sieving) and solidification/stabilization of treated soil. Offgas treatment required.                                                                                          | Eliminated<br>High risks to workers associated with on-site treatment, high cost, stringent regulatory requirements.                                                                                                                                    |
|                         |                                            | Thermal Treatment: Thermal Desorption or Incineration                                                         | Volatilize chemicals in soil. Thermal desorption raises temperature to levels just below oxidation (destruction) temperatures. Incineration raises temperature to combustion temperatures (FRTR, 2005).                                                                                | Eliminated<br>Effective for organic chemicals; however, not effective for metals. Can volatilize metals, creating additional environmental concerns from potential air emissions. High cost, stringent regulatory requirements                          |

**Table 3-6. Screening of GRAs and Process Options for Soil and Shoreline Sediment at Parcel E (continued)**  
Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| General Response Action | Remedial Technology Type             | Process Option               | Description                                                                                                                                                                                                                                                                | Comments                                                                                                                                                               |
|-------------------------|--------------------------------------|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Treatment (cont.)       | Physical/ Chemical Treatment (cont.) | Soil Washing                 | Remove chemicals in soil using an aqueous-based wash solution. Usually combined with mechanical screening methods to remove debris.                                                                                                                                        | Eliminated<br>Limited effectiveness with hydrophobic compounds such as PCBs and PAHs; high O&M cost.                                                                   |
|                         |                                      | Solidification/Stabilization | Reduce chemical mobility through physical or chemical reaction with stabilizing agents (EPA, 1998b).                                                                                                                                                                       | Eliminated<br>Limited effectiveness for treatment of PAHs.                                                                                                             |
|                         |                                      | Solvated Electron Process    | Treat soil by first mixing with liquid ammonia to form a soil/ammonia slurry, adding elemental calcium or sodium to the slurry; then separate ammonia from soil as a liquid until most of the ammonia is removed; and finally as a vapor by warming the soil (FRTR, 2005). | Eliminated<br>Not applicable for metals; highly exothermic reaction with health and safety concerns; not cost-effective for small volumes of PAHs.                     |
|                         |                                      | Chemical Oxidation           | Convert inorganic chemicals to nonhazardous compounds using an oxidizing agent (EPA 1998a). Typical oxidants include hydrogen peroxide, potassium permanganate, and sodium persulfate                                                                                      | Eliminated<br>Low effectiveness for treatment of low-level VOCs in soils; high cost. Also, difficult to effectively deliver to nonaqueous phase (e.g., soil and NAPL). |
|                         | Biological Treatment                 | Phytoremediation             | Use plants to remediate contamination in soil. Phytoremediation can be used for various chemicals, including metals, solvents, PAHs, pesticides, petroleum hydrocarbons, and explosives.                                                                                   | Eliminated<br>Low implementability and high cost per unit area                                                                                                         |

**Table 3-6. Screening of GRAs and Process Options for Soil and Shoreline Sediment at Parcel E (continued)**  
Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| General Response Action  | Remedial Technology Type     | Process Option              | Description                                                                                                                                                                                                                                                              | Comments                                                                                                                                                                                       |
|--------------------------|------------------------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Treatment (cont.)        | Biological Treatment (cont.) | Bioremediation              | Reduce chemicals in soil by metabolizing organic chemicals with biological amendments (FRTR, 2005)                                                                                                                                                                       | Eliminated<br>Not effective for metals; not efficient for small volumes of soils containing low-level PAHs.                                                                                    |
| Containment <sup>1</sup> | Covers                       | Soil Covers                 | Place soil cover over contaminated soil; prevents direct contact with contaminated soil.                                                                                                                                                                                 | Retained for areas that are not paved or do not require paving to achieve planned land uses.<br>Effective for metals and PAHs; easily and quickly implemented; moderate cost per unit area.    |
|                          |                              | Asphalt or Concrete Covers  | Place an asphalt or concrete cover over contaminated soil; prevents direct contact with contaminated soil.                                                                                                                                                               | Retained for areas that are paved or require paving to achieve planned land uses.<br>Effective for metals and PAHs; moderate cost per unit area.                                               |
|                          |                              | Engineered Alternative Caps | Place a soil cover with a geomembrane liner that is made of an impermeable, synthetic material; prevents direct contact with contaminated soil and minimizes migration of contamination. Can also include engineered soil caps using clay instead of synthetic material. | Retained for areas with elevated concentrations of mobile chemicals that are not paved or do not require paving to achieve planned land uses.<br>Effective; easy to moderate implementability. |
|                          |                              | Maintained Landscaping      | Maintain a vegetative cover over soil over contaminated areas to eliminate the direct exposure pathway.                                                                                                                                                                  | Eliminated<br>Not considered applicable to bare soil areas at Parcel E with organic chemical concentrations exceeding RBCs.<br>Would not be an effective method for eliminating exposure.      |

**Table 3-6. Screening of GRAs and Process Options for Soil and Shoreline Sediment at Parcel E (continued)**  
Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| General Response Action             | Remedial Technology Type                          | Process Option                     | Description                                                                                                                                                                 | Comments                                                                                                                                             |
|-------------------------------------|---------------------------------------------------|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Containment <sup>1</sup><br>(cont.) | Shoreline Armoring <sup>2</sup>                   | Protective Revetments <sup>2</sup> | Install an erosion control structure consisting of riprap, large armor units, gabions, articulating concrete mats, or engineered concrete structures along the shoreline.   | Retained for detailed evaluation. Rock revetment successfully implemented along HPS shoreline in the past.                                           |
|                                     |                                                   | Seawalls <sup>2</sup>              | Install a massive concrete structure with its weight providing its stability. Prevents inland flooding from major storm events accompanied by large, powerful waves.        | Eliminated<br>High implementation cost. However, maintenance of existing seawalls may be incorporated as part of a shoreline protection alternative. |
|                                     |                                                   | Bulkheads <sup>2</sup>             | Install vertical retaining walls to hold or prevent soil from sliding seaward. Reduces land erosion and loss to the sea; does not mitigate coastal flooding or wave damage. | Eliminated<br>Would not fully contain shoreline sediment from potential wave-induced erosion and would not satisfy RAOs.                             |
|                                     | Shoreline Stabilization (Structural) <sup>2</sup> | Breakwaters <sup>2</sup>           | Install rock structure offshore or adjacent to headlands with crest above MHHW. Protects shore from large, powerful waves from major storm events.                          | Eliminated<br>Would not fully contain shoreline sediment from potential wave-induced erosion and would not satisfy RAOs.                             |
|                                     |                                                   | Groins <sup>2</sup>                | Install narrow rock or timber structure(s) perpendicular to shoreline. Reduces erosion associated with longshore currents.                                                  | Eliminated<br>Would not fully contain shoreline sediment from potential wave-induced erosion and would not satisfy RAOs.                             |

| General Response Action             | Remedial Technology Type                                     | Process Option                                                                        | Description                                                                                                                                                                                                                           | Comments                                                                                                                                                                                    |
|-------------------------------------|--------------------------------------------------------------|---------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Containment <sup>1</sup><br>(cont.) | Shoreline Stabilization (Structural) <sup>2</sup><br>(cont.) | Nearshore Sills <sup>2</sup>                                                          | Install narrow rock structure(s) parallel to shoreline with crest at or below MHHW. Rock may be substituted with natural material (such as oyster shells) and be combined with vegetation to reduce erosion from wave action.         | Eliminated as stand-alone option <sup>3</sup><br>Would not fully contain shoreline sediment from potential wave-induced erosion and would not satisfy RAOs.                                 |
|                                     |                                                              | Offshore Reefs <sup>2</sup>                                                           | Install rock structure offshore with crest at or below MHHW. Rock may be substituted with natural material (such as oyster shells) and be combined with vegetation to reduce erosion from wave action.                                | Eliminated as stand-alone option <sup>3</sup><br>Would not fully contain shoreline sediment from potential wave-induced erosion and would not satisfy RAOs.                                 |
|                                     | Shoreline Stabilization (Nonstructural) <sup>2</sup>         | Aquatic Vegetation (submerged or intertidal) <sup>2</sup>                             | Plant aquatic vegetation either offshore or within intertidal zone. Reduces erosion from wave action.                                                                                                                                 | Eliminated as stand-alone option <sup>3</sup><br>Would not fully contain shoreline sediment from potential wave-induced erosion and would not satisfy RAOs.                                 |
|                                     |                                                              | Sand Fill (or other clean, imported soil type meeting design objectives) <sup>2</sup> | Place soil to prevent direct exposure to contaminated shoreline sediment. May be combined with aquatic vegetation offshore and within intertidal zone to reduce erosion from wave action.                                             | Eliminated as stand-alone option <sup>3</sup><br>Would not fully contain shoreline sediment from potential wave-induced erosion and would not satisfy RAOs.                                 |
|                                     |                                                              | Natural Shoreline Materials with Offshore Reef <sup>2</sup>                           | Place soil to prevent direct exposure to contaminated shoreline sediment. Install rock structure offshore <sup>4</sup> , with crest at or below MHHW to reduce wave energy, and plant aquatic vegetation to reduce erosion potential. | Retained for detailed evaluation. Assumes that offshore reef and aquatic vegetation could be developed in a manner that adequately controls erosion potential in intertidal shoreline zone. |

**Table 3-6. Screening of GRAs and Process Options for Soil and Shoreline Sediment at Parcel E** *(continued)*  
Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| General Response Action                      | Remedial Technology Type                      | Process Option                                                      | Description                                                                                                                                                           | Comments                                                                                                                                                                                                                 |
|----------------------------------------------|-----------------------------------------------|---------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Containment <sup>1</sup><br>( <i>cont.</i> ) | Shoreline Stabilization (Hybrid) <sup>2</sup> | Natural Shoreline Materials with Underlying Rock Armor <sup>2</sup> | Place soil to prevent direct exposure to contaminated shoreline sediment. Install rock armoring layer under soil if wave action causes erosion of soil.               | Retained for detailed evaluation. Stabilization options successfully implemented following removal action at Metal Debris Reef in 2007.                                                                                  |
|                                              | Shoreline Nourishment <sup>2</sup>            | Berms or Dunes <sup>2</sup>                                         | Place additional sand (in a berm or dune) at higher tidal elevations to protect onshore property and provide stabilizing soil source following storm-related erosion. | Eliminated<br>Would not fully contain shoreline sediment from potential wave-induced erosion and would not satisfy RAOs. Difficult to implement at narrow Parcel E shoreline (substantial excavation would be required). |
|                                              |                                               | Feeder Beach <sup>2</sup>                                           | Construct a wider beach to protect onshore property and provide stabilizing soil source following storm-related erosion.                                              | Eliminated<br>Would not fully contain shoreline sediment from potential wave-induced erosion and would not satisfy RAOs. Difficult to implement at narrow Parcel E shoreline (substantial excavation would be required). |

**Table 3-6. Screening of GRAs and Process Options for Soil and Shoreline Sediment at Parcel E (continued)**  
Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

Notes: Shaded process options are eliminated for further evaluation as a remedial alternative. Eliminated technologies are not presented in text.

1. GRA applies to soil only.
2. Shoreline protection technologies and process options are evaluated in Appendix D.
3. Eliminated as stand-alone stabilization option but may be incorporated with hybrid stabilization option.
4. Offshore reef consisting of rocks is identified as a representative structural element for this hybrid stabilization option; however, alternative structural elements may be proposed that meet the design objectives and provide equal (or superior) performance relative to effectiveness, implementability, and cost. Alternative structural elements may use natural materials (such as oyster shells) or may involve placing the structure closer to the shore (such as a nearshore sill). See Table 3-9 for a more detailed evaluation of this option.

bgs = below ground surface

DTSC = Department of Toxic Substances Control

EPA = U.S. Environmental Protection Agency

FRTR = Federal Remediation Technologies Roundtable

GRAs = general response actions

HPS = Hunters Point Shipyard

IR = Installation Restoration

LLRW = low-level radioactive waste

MHHW = mean higher high water

NAPL = non-aqueous-phase liquid

Navy = Department of the Navy

NCP = National Oil and Hazardous Substances Pollution Contingency Plan

O&M = operation and maintenance

PAHs = polycyclic aromatic hydrocarbons

PCBs = polychlorinated biphenyls

RAOs = remedial action objectives

RBCs = risk-based concentrations

RCRA = Resource Conservation and Recovery Act

VOCs = volatile organic compounds

Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| General Response Action | Remedial Technology Type     | Process Option                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                | Comments                                                                                                                                                                                                                            |
|-------------------------|------------------------------|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Treatment<br>(cont.)    | In-Situ Physical Treatment   | Air Sparging with SVE                | Inject air into the bottom of a saturated zone to strip VOCs from groundwater. Extract VOCs from the unsaturated zone with SVE.                                                                                                                                                                                                                                                                                                            | Retained<br>Easily implemented in conjunction with SVE; improves effectiveness of SVE at reducing VOC mass in groundwater.                                                                                                          |
|                         |                              | Pneumatic/ Hydraulic Fracturing      | Inject air and water under pressure into soil to enhance permeability by developing cracks in low-permeability and consolidated sediments to increase removal efficiency. Used as part of injection processes (e.g., in-situ bioremediation, ZVI).                                                                                                                                                                                         | Retained<br>Effective at enhancing distribution of reagents; demonstrated to be implementable in treatment studies at HPS; low cost.                                                                                                |
|                         | In-Situ Biological Treatment | Anaerobic and Aerobic Bioremediation | Introduce amendments to groundwater in areas where chlorinated solvents are present to enhance biodegradation of chlorinated VOCs. Amendments include electron donors, electron receptors, nutrients, and microorganisms, if necessary. Requires monitoring to assess program (FRTR, 2005).                                                                                                                                                | Retained<br>Effective for VOCs at moderate to low concentrations; easily implemented; moderate cost; no O&M costs; requires monitoring, but treatment should reduce long-term monitoring effort.                                    |
|                         |                              | Phytoremediation                     | Allow plants to uptake water (including dissolved chemicals in water) and release it to the atmosphere through transpiration. Plant uptake is used to remove, transfer, stabilize, and destroy inorganic and organic chemicals in groundwater; requires monitoring to assess remedial progress. Note that phytoremediation may also be used to provide hydraulic control by uptake of contaminated groundwater (known as phytohydraulics). | Eliminated<br>Effective for organic COCs and COECs at low concentrations; may not be implementable with planned reuse; moderate implementation cost; moderate to low O&M cost; requires monitoring; lengthy treatment period likely |

Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| General Response Action | Remedial Technology Type                | Process Option                    | Description                                                                                                                                                                                                           | Comments                                                                                                                                                                                                                                                                                           |
|-------------------------|-----------------------------------------|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Treatment<br>(cont.)    | In-Situ Biological Treatment<br>(cont.) | Biosparging                       | Add oxygen and nutrients to the injected air stream to enhance air sparging; enhances growth of naturally occurring microbes and accelerates bioremediation.                                                          | Eliminated<br>Low effectiveness (unlikely to meet RAOs within a reasonable time frame). Other more effective oxidation processes are available.                                                                                                                                                    |
|                         | In-Situ Chemical Groundwater Treatment  | Chemical Reduction: ZVI Injection | Inject ZVI into an aquifer to encourage enhanced reductive dechlorination of chlorinated VOCs.                                                                                                                        | Retained<br>Highly effective for VOCs; most efficient at high concentrations; implementable as a fast-reacting remedy; moderate to high success in pilot tests at HPS; high implementation costs with low O&M costs; requires monitoring, but treatment should reduce long-term monitoring effort. |
|                         |                                         | In-Situ Chemical Oxidation        | Inject chemical oxidants into the vadose zone and groundwater to oxidize site chemicals, leaving water and carbon dioxide. Typical oxidants include hydrogen peroxide, potassium permanganate, and sodium persulfate. | Eliminated<br>Not effective for low-level VOC contamination in groundwater; challenges posed by heterogeneous fill (preferential flowpaths), and availability of other relevant and effective technologies                                                                                         |

Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| General Response Action     | Remedial Technology Type                                 | Process Option              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Comments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------|----------------------------------------------------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Treatment<br><i>(cont.)</i> | In-Situ Chemical Groundwater Treatment<br><i>(cont.)</i> | Electrokinetic Separation   | Induce acidic (low pH) conditions through electronic current, creating an acid front at the anode and a base front (high pH) at the cathode. Acidic conditions mobilize metals for transport and collection at the cathode. Requires monitoring to assess remedial progress (Ground-Water Remediation Technology Analysis Center, 1997).                                                                                                                                                          | Eliminated<br>Highly effective for metals but less effective for VOCs; requires subsequent disposal of collected COCs and COECs that may need additional treatment prior to disposal; reactions may form undesirable byproducts; high implementation and O&M cost.                                                                                                                                                                                                                               |
|                             |                                                          | Ozone Sparging with SVE     | Inject ozone into the aquifer to mobilize and react with VOCs into unsaturated vadose zone soil and create a highly oxygenized environment; oxygenized groundwater chemically degrades VOCs (EPA, 1998b).                                                                                                                                                                                                                                                                                         | Eliminated<br>Possibility that ozone may follow preferential pathways or accumulate under or in buildings.                                                                                                                                                                                                                                                                                                                                                                                       |
|                             |                                                          | Permeable Reactive Barriers | Install passive or reactive treatment walls across the flow path of a contaminant plume, allowing the plume groundwater to passively move through walls while prohibiting movement of chemicals by using agents such as zero-valent metals, chelators (ligands selected for their specificity for a metal), sorbents, microbes, or others. The chemicals will either degrade or be retained in a concentrated form by the barrier material; requires monitoring to assess remedial effectiveness. | Eliminated<br>High level of effort to implement; only treats water that moves through the wall, not the source area; may have slow results based on groundwater gradients at HPS; ineffective where preferential pathways exist; implementation may conflict with planned reuse; limited field data concerning the longevity of wall reactivity or loss or permeability through precipitation (EPA, 2000b); would not reduce the vapor intrusion pathway risk; high implementation and O&M cost. |

| Removal                 | Extract and Dispose             | Pump and Treat                                                              | Remove groundwater from the subsurface for ex-situ treatment. Treatment of extracted groundwater would be required or discharge to the POTW.                                                                                                                                                                                                                                                                                                                                                                               | Eliminated<br>Not effective for low-level contamination in groundwater; challenges posed by heterogeneous fill (preferential flow paths), and availability of other relevant and effective technologies. |
|                         |                                 | Surfactant Enhanced In-Situ Flushing                                        | Inject surfactants or cosolvents into the source area to enhance groundwater pump-and-treat process and solubilize DNAPL. Accomplish dissolved-phase capture through a series of extraction wells.                                                                                                                                                                                                                                                                                                                         | Eliminated<br>Difficult to implement; risk of mobilizing NAPL beyond site boundary.                                                                                                                      |
| Containment             | Physical and Hydraulic Barriers | Slurry or Sheet-Pile Wall (with groundwater extraction wells, if necessary) | Install slurry or sheet-pile walls below ground to contain, capture, or redirect groundwater flow. Can be used to decrease the groundwater flow gradient and consequently increase the residence time during which chemical concentrations would be reduced through physical, chemical, and biological processes. Where needed, groundwater extraction wells might be used behind a wall to further mitigate migration (e.g., at a landfill where landfill leachate poses an unacceptable risk to downgradient receptors). | Retained<br>Effective in containing chemicals in groundwater; implemented successfully at HPS in the past, low to moderate cost.                                                                         |

**Table 3-7. Screening of GRAs and Process Options for Groundwater (continued)**  
Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

Notes: Shaded process options are eliminated for further evaluation as a remedial alternative.

COCs = chemicals of concern

COECs = chemicals of ecological concern

DNAPL = dense nonaqueous-phase liquid

EPA = U.S. Environmental Protection Agency

FRTR = Federal Remediation Technologies Roundtable

FS = Feasibility Study

GRAs = general response actions

HPS = Hunters Point Shipyard

IR = Installation Restoration

NAPL = nonaqueous-phase liquid

NCP = National Oil and Hazardous Substances Pollution Contingency Plan

O&M = operation and maintenance

POTW = publicly owned treatment works

RAOs = remediation action objectives

SVE = soil vapor extraction

TtEMI = Tetra Tech EM Inc.

VOCs = volatile organic compounds

ZVI = zero-valent iron

| <b>NAPL PROCESS OPTIONS (continued)</b> |                             |                                                                                                                                      |                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                    |
| Removal (cont.)                         | Physical Extraction (cont.) | Thermally Enhanced Extraction by Hot Water Circulation, Electrical Resistive Heating, Thermal Conductive Heating, or Steam Injection | Use hot water circulation, electrical resistive heating, thermal conductive heating, or steam injection to decrease viscosity in NAPL, mobilizing it for extraction. May need to be implemented in conjunction with containment action (to retain heat within treatment zone and prevent off-site migration of NAPL). | Retained<br>Significantly improves effectiveness in recovering viscous NAPL source areas using standard extraction techniques. Extraction not feasible without enhancement; moderate capital cost; moderate to high operational cost due to power consumption. Capital cost can be partially offset if equipment is used for thermal treatment upon completion of NAPL extraction. |
|                                         |                             | Treatment and Off-Site Disposal of Extracted NAPL/ Groundwater                                                                       | Treat extracted NAPL, groundwater, and vapor prior to disposal. Depending on the POTW facility pretreatment requirements and other potential regulatory issues, extracted groundwater can be conveyed and discharged to a POTW facility.                                                                              | Retained for further evaluation as a component of remedial alternatives. High effectiveness and implementability.                                                                                                                                                                                                                                                                  |
|                                         |                             | Excavation                                                                                                                           | Remove contaminated material with heavy equipment. Excavated soil can be stockpiled on site for treatment or transported to a permitted off-site treatment and disposal facility.                                                                                                                                     | Retained for consideration of ex-situ treatment or off-site disposal scenarios.                                                                                                                                                                                                                                                                                                    |
|                                         |                             | Off-Site Disposal of Excavated NAPL/ Soil                                                                                            | Collect and transport soil to an appropriate treatment, storage, or disposal facility. Disposal of soil would involve constructing on-site staging area from which soil would be transferred to trucks and transported to an off-site facility.                                                                       | Retained<br>Highly effective; off-site disposal could be used for (1) disposal of small volumes of process residuals or (2) sitewide cleanup of soil from IR-03.                                                                                                                                                                                                                   |

**Table 3-8. Screening of GRAs and Process Options for NAPL at IR-03 (continued)**  
Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| General Response Action                 | Remedial Technology          | Process Option                           | Description                                                                                                                                                                                                      | Conclusion                                                                                                                                                                                                         |
|-----------------------------------------|------------------------------|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>NAPL PROCESS OPTIONS (continued)</b> |                              |                                          |                                                                                                                                                                                                                  |                                                                                                                                                                                                                    |
| Containment                             | Covering and Capping         | Soil Cover or Engineered Alternative Cap | Isolate contaminated soil and buried debris from potential humans or wildlife at the site using a soil cover or engineered alternative cap.                                                                      | Retained<br>Easily implemented; a low-permeability geosynthetic clay cap was installed over the surface of IR-03 in 1997; effective in eliminating exposure; low to moderate cost.                                 |
|                                         | Hydraulic Barriers           | Slurry or Sheet-Pile Wall                | Install slurry or sheet-pile walls below the ground to contain, capture, or redirect groundwater flow in the vicinity of IR-03.                                                                                  | Retained<br>Effective in containing NAPL and groundwater contaminants. Easy to moderate implementability; may be difficult to implement close to shoreline because large debris is present; moderate to high cost. |
| In-Situ Treatment                       | Solidification/Stabilization | In-Situ Mixing                           | Mix one or more reagents directly into contaminated soil/NAPL with mechanical equipment. Reagents may include stabilizing agents (such as cement or bentonite) and reactive agents (such as a chemical oxidant). | Retained<br>Effective in stabilizing NAPL if homogeneous mixing is achieved; may be difficult to implement close to shoreline because large debris is present. Moderate to high capital cost; low O&M cost.        |
|                                         |                              | Ex-Situ Mixing                           | Excavate contaminated soil and NAPL, transport to on-site location, and spread in layers. Mix a binding reagent into soil/NAPL with mechanical equipment and transport/place stabilized material in excavation.  | Retained<br>Effective in stabilizing NAPL with homogeneous mixing process; implementation may be limited by available on-site area. High capital cost; low O&M cost.                                               |

|-------------------------------------------------------------|----------------------|---------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>NAPL PROCESS OPTIONS (continued)</b>                     |                      |                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                        |
| In-Situ Treatment                                           | Biological Treatment | Anaerobic and Aerobic Bioremediation                                                              | Introduce amendments to subsurface to enhance biodegradation of NAPL. Amendments include electron donors/receptors, nutrients, and microorganisms.                                                                                                                                                                                                                  | Eliminated as stand-alone option for NAPL treatment, but may be considered to address associated groundwater contamination.                                                                                            |
|                                                             | Chemical Treatment   | In-Situ Chemical Oxidation                                                                        | Inject chemical oxidants into subsurface to oxidize NAPL. Typical oxidants include hydrogen peroxide, potassium permanganate, and sodium persulfate.                                                                                                                                                                                                                | Thick, viscous nature of NAPL would limit effectiveness of in-situ biodegradation and chemical oxidation.                                                                                                              |
| <b>ADDITIONAL OPTIONS TO ADDRESS ASSOCIATED GROUNDWATER</b> |                      |                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                        |
| In-Situ Treatment                                           | Thermal Treatment    | Thermal Treatment by Electrical Resistive Heating, Thermal Conductive Heating, or Steam Injection | Use electrical resistive heating, thermal conductive heating, or steam injection to vaporize VOCs and SVOCs in groundwater. The vaporized chemicals are subsequently captured using vacuum extraction (e.g., SVE). May need to be implemented in conjunction with containment action (to retain heat within treatment zone and prevent off-site migration of NAPL). | Retained<br>Easily implemented as a follow-up step to thermally-enhanced extraction; effective at treating organic compounds in groundwater, short treatment duration; high operational cost due to power consumption. |
|                                                             | Biological Treatment | Anaerobic and Aerobic Bioremediation                                                              | Introduce amendments to groundwater to enhance biodegradation of organic chemicals. Amendments include electron donors, electron receptors, nutrients, and microorganisms, if necessary. Requires monitoring to assess program.                                                                                                                                     | Retained<br>Effective at moderate to low concentrations; easily implemented at moderate cost; no O&M cost; requires monitoring, but treatment should reduce long-term monitoring effort.                               |
|                                                             | Passive              | Monitored Natural Attenuation                                                                     | Allow chemicals to attenuate naturally via biodegradation, dispersion, dilution, or adsorption. Requires monitoring to assess reduction rates.                                                                                                                                                                                                                      | Retained<br>Periodic monitoring is easily implemented; low cost.                                                                                                                                                       |

| <b>ADDITIONAL OPTIONS TO ADDRESS ASSOCIATED GROUNDWATER (continued)</b> |                     |                            |                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                       |
| In-Situ Treatment                                                       | Chemical Treatment  | Treatment Barrier          | Integrate reactive components into a hydraulic barrier to mediate contaminant destruction using "funnel and gate" approach.                                                                                 | Eliminated<br>Low effectiveness and high cost due to long treatment period.                                                                                                                                                                                                                           |
|                                                                         |                     | In-Situ Chemical Oxidation | Inject chemical oxidants into vadose zone and groundwater to oxidize site chemicals to water and carbon dioxide. Typical oxidants include hydrogen peroxide, potassium permanganate, and sodium persulfate. | Eliminated<br>Low effectiveness due to difficulty achieving contact of injected agent with low-level, widespread residual contamination. Pilot tests using chemical oxidation with permanganate at Parcel C were found to be difficult to implement because of unanticipated preferential flow paths. |

Notes: Shaded process options are eliminated for further evaluation as a remedial alternative.

COCs = chemicals of concern

COECs = chemicals of ecological concern

DPE = dual-phase extraction

IR = Installation Restoration

NAPL = nonaqueous-phase liquid

NCP = National Oil and Hazardous Substances Pollution Contingency Plan

O&M = operation and maintenance

POTW = publicly owned treatment works

SVE = soil vapor extraction

VOCs = volatile organic compounds

**Table 3-9. Detailed Evaluation of GRAs and Process Options for Soil and Shoreline Sediment**  
Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| General Response Action | Remedial Technology Type                    | Process Option                                                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                    | Effectiveness                                                                                                                                                                                                                                                                | Implementability                                                                                                                                                                                                                                                   | Cost                                                                                                | Comments                                                                                                                                           |

| Institutional Controls  | Legal Mechanisms                            | Covenants to Restrict Use of Property and Deed Restrictions                                                | Restricts use of parcel through environmental restrictive covenants that will run with the land; allows only designated land use in accordance with the proposed redevelopment plan (EPA, 2000a); includes criteria during and after future development to ensure mitigated exposure conditions are maintained, such as covers, barriers, or other engineering controls (Navy and DTSC, 2000). | Ineffective in reducing contamination. Effective at limiting or preventing exposure of humans to contamination, especially when used in combination with other options. Does not prevent exposure of wildlife.                                                               | Easily implemented. Requires legal documents and authority to enforce restrictions.                                                                                                                                                                                | Low                                                                                                 | Retained<br>Easily implemented and effective, usually required to restrict activity based on land use.                                             |
| Engineering Controls    | Physical Barriers                           | Fencing, Barriers, and Signs                                                                               | Restrict land use where there is exposure to potentially contaminated soil using fencing, barriers, and posting signs.                                                                                                                                                                                                                                                                         | Effectively prevents exposure of humans to contamination, especially when used in combination with other options. Does not reduce volume or toxicity of contamination (EPA, 2000a). Conflicts with land use of open space areas.                                             | Easily implemented. Requires legal documents and authority to enforce restrictions.                                                                                                                                                                                | Low                                                                                                 | Retained<br>Easily implemented and effective; usually required to restrict activity based on land use. Not applicable for use in open space areas. |
| Monitoring              | Soil Gas Monitoring                         | Periodic Soil Gas Monitoring                                                                               | Collect and analyze soil gas samples periodically to evaluate the potential for vapor intrusion.                                                                                                                                                                                                                                                                                               | Does not achieve RAOs; does not reduce the toxicity or volume of contamination. However, it would be effective as a means of monitoring effectiveness of groundwater remediation actions.                                                                                    | Easily implemented.                                                                                                                                                                                                                                                | Moderate                                                                                            | Retained<br>Easily implemented; required to evaluate effectiveness of other process options; moderate cost.                                        |
| Removal <sup>1</sup>    | Excavation and Off-Site Treatment/ Disposal | Conventional Excavation and Disposal at Licensed Treatment/ Disposal Facility (e.g., RCRA, non-RCRA, LLRW) | Excavate soil containing chemicals using conventional mechanical equipment; limit to depths of less than 10 feet bgs. Transport and dispose of soils at a permitted treatment and disposal facility.                                                                                                                                                                                           | Effectively removes contamination and prevents long-term exposure to contamination. May expose workers and environment to chemicals during implementation. Uses conventional construction methods and is a proven technology. Does not reduce total amount of contamination. | Easily implemented. Requires appropriate permits and waste characterization.<br><br>Groundwater inflow control for excavations below the water table, radiological screening, and required large volumes of clean backfill material could reduce implementability. | Moderate to high, depending on characterization and off-site disposal of large volumes of material. | Retained for some COCs<br>Effective for non-ubiquitous metals and PAHs; easily implemented, permanent remedy; and moderate to high cost.           |
| Treatment <sup>1</sup>  | Physical/ Chemical Treatment                | Soil Vapor Extraction (with or without thermally enhanced recovery)                                        | Extract VOCs from unsaturated zone with vacuum pumps; extraction performance can be enhanced with active volatilization of VOCs in groundwater (EPA, 1997b). May be used with thermal enhancement (e.g., six-phase heating or steam injection) to enhance volatilization of chemicals.                                                                                                         | Effective in reducing the toxicity, mobility, and volume of contaminated material. EPA presumptive remedy for VOCs in unsaturated zone. Pilot tests at Building 406 indicated SVE is effective for reducing mass of VOCs in soil.                                            | Moderately implementable. Off-gas treatment likely required by regulatory agencies for soil vapor. Must meet local and state requirements for off-gas release and related factors.                                                                                 | Moderate                                                                                            | Retained for some COCs<br>Effective in treating VOCs; effectiveness enhanced when implemented with active volatilization                           |

**Table 3-9. Detailed Evaluation of GRAs and Process Options for Soil and Shoreline Sediment** *(continued)*  
Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| General Response Action  | Remedial Technology Type | Process Option              | Description                                                                                                                                                                                                                                                              | Effectiveness                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Implementability                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Cost     | Comments                                                                                                                                                                                             |
|--------------------------|--------------------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Containment <sup>1</sup> | Covers                   | Soil Covers                 | Place soil cover over contaminated soil; prevents direct contact with contaminated soil.                                                                                                                                                                                 | Effectively prevents direct exposure of humans to contamination.<br><br>It is possible this remedy could begin to fail over time, but monitoring, regular maintenance, and other safeguards would minimize this potential risk and thereby improve effectiveness.<br><br>Institutional controls would be needed with each containment option to protect the remedy                                                                                                                                                                                                                 | Easily implemented. Planned land use prohibits the placement of a soil cover over the entire site; could be used in conjunction with asphalt covers.                                                                                                                                                                                                                                                                                                              | Moderate | Retained for areas that are not paved or do not require paving to achieve planned land uses.<br><br>Effective for metals and PAHs; easily and quickly implemented; moderate cost per area.           |
|                          |                          | Asphalt or Concrete Covers  | Place an asphalt or concrete cover over contaminated soil; prevents direct contact with contaminated soil.                                                                                                                                                               | Effectively prevents direct exposure of humans to contamination.<br><br>It is possible this remedy could weather and crack over time, but monitoring, regular maintenance, and other safeguards would minimize this potential risk and thereby improve effectiveness.<br><br>Institutional controls would be needed with each containment option to protect the remedy                                                                                                                                                                                                             | Easily implemented. Planned land use prohibits the placement of an asphalt cover over the entire site; could be used in conjunction with soil covers.                                                                                                                                                                                                                                                                                                             | Moderate | Retained for areas that are paved or require paving to achieve planned land uses<br><br>Effective for metals and PAHs; moderate cost per area.                                                       |
|                          |                          | Engineered Alternative Caps | Place a soil cover with a geomembrane liner that is made of an impermeable, synthetic material; prevents direct contact with contaminated soil and minimizes migration of contamination. Can also include engineered soil caps using clay instead of synthetic material. | Effectively prevents direct exposure of humans to contamination.<br><br>An engineered alternative cap would incorporate a low-permeability layer that would minimize water infiltration to the contaminated zone. It is possible this remedy could begin to fail over time, but monitoring, regular maintenance, and other safeguards would minimize this potential risk and thereby improve effectiveness.<br><br>A clay cap swells and fills any voids or holes when saturated.<br><br>Institutional controls would be needed with each containment option to protect the remedy | Technology required to implement engineered alternative caps are readily available and implementable.<br><br>An engineered alternative cap would be characterized by low to moderate degree of implementability because of the need to promote adequate surface drainage by excavating certain amounts of soil and debris at the site or placing sub-cap fill material in other areas, and the likelihood that the liner would need to be replaced in the future. | Moderate | Retained for areas with elevated concentrations of mobile chemicals that are not paved or do not require paving to achieve planned land uses.<br><br>Effective; easy to moderate implementability. . |

Table 3-9. Detailed Evaluation of GRAs and Process Options for Soil and Shoreline Sediment (continued)  
Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| General Response Action  | Remedial Technology Type                      | Process Option                                                      | Description                                                                                                                                                                                                                           | Effectiveness                                                                                                                                                                                                                                                        | Implementability                                                                                                                                                           | Cost     | Comments                                                                                                                                                                                                                                                                                               |
|--------------------------|-----------------------------------------------|---------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Containment <sup>1</sup> | Shoreline Armoring <sup>2</sup>               | Rock Revetment <sup>2</sup>                                         | Install an erosion control structure consisting of riprap, large armor units, gabions, articulating concrete mats, or engineered concrete structures along the shoreline.                                                             | Provides a robust containment structure to control shoreline erosion<br>Short-term effects could be managed through proper construction techniques<br>Inhibits pedestrian access and limits shoreline recreation<br>Not visually appealing                           | Readily implementable<br>Would comply with ARARs<br>Minor long-term O&M                                                                                                    | Moderate | Viable protection option for steep and narrow shoreline areas. Successfully implemented at similar shoreline area at HPS Parcel B (IR Site 07). Revetment design may be adjusted to incorporate localized, low-profile areas where soil and vegetation could be placed (for aesthetic considerations). |
|                          | Shoreline Stabilization (Hybrid) <sup>2</sup> | Natural Shoreline Materials with Offshore Reef <sup>2</sup>         | Place soil to prevent direct exposure to contaminated shoreline sediment. Install rock structure offshore <sup>3</sup> , with crest at or below MHHW to reduce wave energy, and plant aquatic vegetation to reduce erosion potential. | Uncertain effectiveness in reducing the offshore wave energy and controlling erosion<br>Construction of offshore reef would impact existing aquatic habitat<br>Limits access for shoreline recreation<br>Provides habitat for aquatic wildlife<br>Visually appealing | Construction of offshore reef requires specialized labor and equipment<br>Construction of offshore reef may not comply with ARARs<br>Potentially significant long-term O&M | High     | Not a viable protection option because of (1) uncertain effectiveness in controlling erosion potential in intertidal shoreline zone, and (2) significant implementation issues related to constructing the offshore reef.                                                                              |
|                          |                                               | Natural Shoreline Materials with Underlying Rock Armor <sup>2</sup> | Place soil to prevent direct exposure to contaminated shoreline sediment. Install rock armoring layer under soil if wave action causes erosion of soil.                                                                               | Provides a robust protective structure to prevent unacceptable shoreline erosion<br>Short-term effects could be managed through proper construction techniques<br>Does not inhibit pedestrian access or limit shoreline recreation<br>Visually appealing             | Readily implementable<br>Would comply with ARARs<br>Potentially significant long-term O&M                                                                                  | High     | Viable protection option for gradually sloped and wide shoreline areas. Stabilization option successfully implemented following removal action at Metal Debris Reef in 2007.                                                                                                                           |

Notes: Only processes and technologies retained for further consideration are included in this table.

1. GRA applies to soil only.

2. Shoreline protection technologies and process options are evaluated in Appendix D.

3. Offshore reef consisting of rocks is identified as a representative structural element for this hybrid stabilization option; however, alternative structural elements may be proposed that meet the design objectives and provide equal (or superior) performance relative to effectiveness, implementability, and cost. Alternative structural elements may use natural materials (such as oyster shells) or may involve placing the structure closer to the shore (such as a near-shore sill). This option was determined to not be a viable protection option for reasons unrelated to the material type and offshore location of the reef.

ARARs = applicable or relevant and appropriate requirements  
bgs = below ground surface  
DTSC = Department of Toxic Substances Control  
EPA = U.S. Environmental Protection Agency  
GRAs = general response actions  
HPS = Hunters Point Shipyard

LLRW = low-level radioactive waste  
MHHW = mean higher high water  
Navy = Department of the Navy  
NCP = National Oil and Hazardous Substances Pollution Contingency Plan  
O&M = operation and maintenance  
PAHs = polycyclic aromatic hydrocarbons

RAOs = remedial action objectives  
RCRA = Resource Conservation and Recovery Act  
SVE = soil vapor extraction  
VOCs = volatile organic compounds

| No Action               | Not Applicable           | Not Applicable                                              | No Action                                                                                                                                                                                                                                                                                                                                                                                                                                                | Does not achieve RAOs.                                                                                                                                                                                                   | Not acceptable to local government or public.                                                                                                                                                                                                                                                         | None                      | Retained<br>Required by NCP.                                                                           |
| Institutional Controls  | Legal Mechanisms         | Covenants to Restrict Use of Property and Deed Restrictions | Restricts use of parcel through environmental restrictive covenants that will run with the land; allows only designated land use in accordance with the proposed redevelopment plan (EPA, 2000a); includes criteria during and after future development to restrict extraction of groundwater, installation of new groundwater wells, and restrict subsurface intrusive activities that might result in or aid the movement of contaminated groundwater. | Ineffective in reducing contamination. Effective at limiting or preventing exposure of humans to contamination, especially when used in combination with other options. Does not prevent exposure of marine organisms.   | Easily implemented. Requires legal documents and authority to enforce restrictions.                                                                                                                                                                                                                   | Low                       | Retained<br>Easily implemented and effective; usually required to restrict activity based on land use. |
| Engineering Controls    | Physical Barriers        | Security Features and Signs                                 | Prohibits activities that could spread groundwater contamination by requiring locked well caps and secured utility access covers, and identifying and securing any additional conduit where humans or wildlife could potentially be exposed to groundwater. Requires posted signs and locked doors to prohibit occupancy of buildings or other enclosures where unacceptable risk exists from the vapor intrusion pathway.                               | Effective at preventing exposure of humans to contamination, especially when used in combination with other options. Does not prevent exposure of marine organisms; does not reduce toxicity or volume of contamination. | Easily implemented. Maintenance and implementation of engineering controls during future land use are controlled through land use restrictions (below).                                                                                                                                               | Low                       | Retained<br>Easily implemented and effective; prevents exposure to COCs and COECs.                     |
|                         | Vapor Barrier            | Sub-Slab Depressurization                                   | Install blowers and vapor collection points below a building to maintain a negative pressure gradient and prevent vapor intrusion.                                                                                                                                                                                                                                                                                                                       | Effective at preventing vapor intrusion when properly installed and operated with new construction.                                                                                                                      | Easily implementable as part of new construction.<br><br>However, for existing construction, extensive investigation into conditions under the building would be necessary to ensure the systems are covering the entire foundation and to evaluate utility conduits and other preferential pathways. | Low for new construction. | Retained for new construction<br><br>Effective and low-cost method to minimize vapor intrusion only.   |

**Table 3-10. Detailed Evaluation of GRAs and Process Options for Groundwater** *(continued)*  
Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| General Response Action | Remedial Technology Type     | Process Option                       | Description                                                                                                                                                                                                                                                                                 | Effectiveness                                                                                                                                                                                                                                                                                                                                                                       | Implementability                                                                                                                                                                                                                     | Cost                                                                                                                                                                                                                          | Comments                                                                                                                                                                                          |
|-------------------------|------------------------------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Monitoring              | Groundwater Monitoring       | Periodic Groundwater Monitoring      | Collect and analyze groundwater samples periodically to monitor aquifer hydraulics and chemistry and variations in groundwater contamination. Chemicals are identified for detection monitoring and evaluation monitoring programs.                                                         | Does not achieve RAOs; does not reduce the toxicity or volume of contamination. However, it would be effective as a means of monitoring effectiveness of groundwater remediation actions.                                                                                                                                                                                           | Easily implemented.                                                                                                                                                                                                                  | Moderate                                                                                                                                                                                                                      | Retained<br>Easily implemented; required to evaluate effectiveness of other process options; moderate cost.                                                                                       |
| Treatment               | Passive                      | Monitored Natural Attenuation        | Allow chemicals to naturally attenuate via biodegradation, dispersion, dilution, or adsorption. Requires monitoring to assess recovery rates and success.                                                                                                                                   | Effective as a polishing step following in-situ treatment at source areas. Not likely to be effective without remediation at source areas. Would reduce toxicity and volume of chemicals over time.                                                                                                                                                                                 | Readily implementable; however, this option usually requires modeling and evaluation of chemical degradation rates and pathways, identifying plume behavior, and predicting chemical concentrations at downgradient receptor points. | Low capital cost. O&M costs could be high depending on frequency and duration of monitoring period.                                                                                                                           | Retained for use as a component of remedial alternatives<br>Periodic monitoring can be readily implemented; low capital cost.                                                                     |
|                         | In-Situ Physical Treatment   | Air Sparging with SVE                | Inject air into the bottom of a saturated zone to strip VOCs from groundwater. Extract VOCs from the unsaturated zone with SVE.                                                                                                                                                             | Would require pilot testing to verify effectiveness. Stratification of fill material could be an issue. Vapors must be extracted and treated. May cause aerobic subsurface conditions that could limit the natural degradation of chemicals. Generally more applicable to the lighter gasoline constituents, because they readily transfer from the dissolved to the gaseous phase. | Easily implementable. An extended timeframe could be required to meet RAOs. Would require implementation of associated vapor extraction and treatment system.                                                                        | Moderate capital cost. Moderate O&M cost assuming effectiveness in a reasonable timeframe (i.e., approximately 5 years).                                                                                                      | Retained<br>Easily implemented in conjunction with SVE; improves effectiveness of SVE at reducing VOC mass in groundwater.                                                                        |
|                         |                              | Pneumatic/Hydraulic Fracturing       | Inject air and water under pressure into soil to enhance permeability by developing cracks in low-permeability and consolidated sediments to increase removal efficiency. Used as part of injection processes (e.g., in situ bioremediation, ZVI).                                          | Fracturing of the subsurface to increase permeability, enhances the distribution of treatment solutions.                                                                                                                                                                                                                                                                            | Implementability demonstrated by treatability studies at Parcel C.                                                                                                                                                                   | Low. Injection equipment required by retained technologies.                                                                                                                                                                   | Retained<br>Effective at enhancing distribution of reagents; low cost.                                                                                                                            |
|                         | In-Situ Biological Treatment | Anaerobic and Aerobic Bioremediation | Introduce amendments to groundwater in areas where chlorinated solvents are present to enhance biodegradation of chlorinated VOCs. Amendments include electron donors, electron receptors, nutrients, and microorganisms, if necessary. Requires monitoring to assess program (FRTR, 2005). | Effective for reduction of volume, mobility, and toxicity of some fuel hydrocarbons and VOCs. Not effective for extremely high concentrations.                                                                                                                                                                                                                                      | Easily implemented.                                                                                                                                                                                                                  | Moderate capital cost. Extensive contamination at Parcel E drive costs a little higher, than they would be at a site with a less complex contaminant distribution. Low O&M cost. No removal or handling of groundwater costs. | Retained<br>Effective for VOCs at moderate to low concentrations; easily implemented; moderate cost; low O&M costs; requires monitoring, but treatment should reduce long-term monitoring effort. |

Table 3-10. Detailed Evaluation of GRAs and Process Options for Groundwater (continued)  
Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| General Response Action  | Remedial Technology Type               | Process Option                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Effectiveness                                                                                                                                                                                                                                                                                                                      | Implementability                                                                                                                                                                                                                          | Cost                                           | Comments                                                                                                                                                                                                                                                                                           |

| Treatment<br>(continued) | In-Situ Chemical Groundwater Treatment | Chemical Reduction: ZVI Injection                                           | Inject ZVI into an aquifer to encourage enhanced reductive dechlorination of chlorinated VOCs.                                                                                                                                                                                                                                                                                                                                                                                                                             | Effective for reduction of volume, mobility, and toxicity of VOCs. Proven technology. Treatability study of ZVI injection at Parcel C resulted in mass reduction of about 99.2 percent of chlorinated VOCs within the treatment zone. Effective, if reducing agent is delivered successfully in tight soil.                        | Easily implementable.                                                                                                                                                                                                                     | Moderate to high capital cost. Low O&M cost, . | Retained<br>Highly effective for VOCs; most efficient at high concentrations; implementable as a fast-reacting remedy; moderate to high success in pilot tests at HPS; high implementation costs with low O&M costs; requires monitoring, but treatment should reduce long-term monitoring effort. |
| Containment              | Physical and Hydraulic Barriers        | Slurry or Sheet-Pile Wall (with groundwater extraction wells, if necessary) | Install slurry or sheet-pile walls below ground to contain, capture, or redirect groundwater flow. Can be used to decrease the groundwater flow gradient and consequently increase the residence time during which chemical concentrations would be reduced through physical, chemical, and biological processes. Where needed, groundwater extraction wells might be used behind a wall to further mitigate migration (e.g., at a landfill where landfill leachate poses an unacceptable risk to downgradient receptors). | Vertical barriers can effectively control migration of contaminated groundwater. The effectiveness of steel sheet-pile walls may be affected by corrosion; these effects can be mitigated through installation and use of a cathodic protection system. Vertical barriers do not reduce exposure from the vapor intrusion pathway. | Installing a new slurry or sheet-pile wall in Parcel E would be challenging to implement due to subsurface conditions; however, pre-design investigations to identify subsurface obstructions in advance would increase implementability. | Moderate to high.                              | Retained<br>Effective in containing chemicals in groundwater; implemented successfully at HPS in the past, moderate to high cost.                                                                                                                                                                  |

Notes: Only processes and technologies retained for further consideration are included in this table.

| NAPL PROCESS OPTIONS    |                        |                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                              |                                                                                                                                                         |                                                                                                                                                                                                     |                                                                                                                                                                              |
| No action               | None                   | None                                                        | No further response actions.                                                                                                                                                                                                                                                                                                                                                                                                                             | Ineffective in reducing contamination. Would not prevent public access or exposure to site contaminants.                                                                                                                                                                     | No action required.                                                                                                                                     | No direct costs.                                                                                                                                                                                    | Retained<br>No action as required by NCP.                                                                                                                                    |
| Institutional Controls  | Legal Mechanisms       | Covenants to Restrict Use of Property and Deed Restrictions | Restricts use of parcel through environmental restrictive covenants that will run with the land; allows only designated land use in accordance with the proposed redevelopment plan (EPA, 2000a); includes criteria during and after future development to restrict extraction of groundwater, installation of new groundwater wells, and restrict subsurface intrusive activities that might result in or aid the movement of contaminated groundwater. | Ineffective in reducing contamination. Effective at limiting or preventing exposure of humans to contamination, especially when used in combination with other options. Does not prevent exposure of aquatic wildlife.                                                       | Easily implemented. Requires legal documents and authority to enforce restrictions.                                                                     | Low                                                                                                                                                                                                 | Retained<br>Easily implemented and effective; usually required to restrict activity based on land use.                                                                       |
| Engineering Controls    | Physical Barriers      | Security Features and Signs                                 | Prohibits activities that could spread groundwater contamination by requiring locked well caps and secured utility access covers, and identifying and securing any additional conduit where potential humans and wildlife could be exposed to groundwater and NAPL.                                                                                                                                                                                      | Effective at preventing exposure of humans to contamination, especially when used in combination with other options. Does not prevent exposure of marine organisms; does not reduce toxicity or volume of contamination.                                                     | Easily implemented. Maintenance and implementation of engineering controls during future land use are controlled through land use restrictions (below). | Low                                                                                                                                                                                                 | Retained<br>Easily implemented and effective; prevents exposure to COCs and COECs; low cost.                                                                                 |
| Monitoring              | Groundwater Monitoring | Periodic Groundwater Monitoring                             | Collect and analyze groundwater samples periodically to monitor variations in aquifer chemistry and hydraulics and changes in groundwater contamination.                                                                                                                                                                                                                                                                                                 | As a stand-alone technology, groundwater sampling and analysis would not be effective at reducing the mass, volume, or toxicity of groundwater contamination. However, it is an effective means of monitoring the effectiveness of groundwater remediation actions.          | Readily implementable as demonstrated by previous and current monitoring programs.                                                                      | Low capital cost. Moderate annual O&M cost.                                                                                                                                                         | Retained<br>Easily implemented; effective for all COCs; low cost.                                                                                                            |
| Removal                 | Physical Extraction    | Liquid-Phase Pumping                                        | Recover NAPL to the maximum extent practicable through either traditional pumping techniques.                                                                                                                                                                                                                                                                                                                                                            | Prior efforts to remove NAPL through pumping were largely unsuccessful due to the high viscosity of the NAPL material. Combining this approach with thermal treatment may increase the effectiveness of this technology but could create vapors not captured by the pumping. | Extraction by traditional pumping is implementable, but may result in large volumes of groundwater requiring treatment.                                 | Moderate capital and O&M costs. The need to treat excessive amounts of groundwater could result in high O&M costs. Combining this approach with thermal treatment significantly increases the cost. | Eliminated<br>Potentially effective only when combined with thermal treatment, but liquid-phase pumping would not effectively capture vapors created during heating process. |

**Table 3-11. Detailed Evaluation of GRAs and Process Options for NAPL at IR-03** *(continued)*  
Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| General Response Action                        | Remedial Technology                | Process Option                                                                                                                     | Description                                                                                                                                                                                                                              | Effectiveness                                                                                                                                                                                                                                                                                                           | Implementability                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Cost                                                                                                                                                                                                                                                                                                                                                                                                                                                | Conclusion                                                                                                                                                                                                                                                                                                              |

| <b>NAPL PROCESS OPTIONS</b> <i>(continued)</i> |                                    |                                                                                                                                    |                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                         |
| Removal <i>(cont.)</i>                         | Physical Extraction <i>(cont.)</i> | Dual-Phase Extraction                                                                                                              | Use vacuum pumps to remove various combinations of contaminated groundwater, separate phase petroleum product, and hydrocarbon vapor from the subsurface. Extracted liquids and vapor are collected and treated.                         | DPE can be effective in removing NAPL from the subsurface, and can also stimulate biodegradation of petroleum constituents in the unsaturated zone by increasing the supply of oxygen. Combining this approach with thermal treatment may increase the effectiveness of this technology.                                | Extraction by DPE is implementable, but may result in large volumes of groundwater and vapor requiring treatment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Moderate capital and O&M costs. The need to treat excessive amounts of groundwater and vapor could result in high O&M costs. Combining this approach with thermal treatment significantly increases the cost.                                                                                                                                                                                                                                       | Retained<br>Potentially effective when combined with thermal treatment.                                                                                                                                                                                                                                                 |
|                                                |                                    | Thermally Enhanced Extraction by Hot Water Injection, Electrical Resistive Heating, Thermal Conductive Heating, or Steam Injection | Use hot water injection, electrical resistive heating, thermal conductive heating, or steam injection to decrease viscosity of NAPL, potentially increasing its mobility for removal (via extraction).                                   | Thermally enhanced extraction is a proven technology used in the treatment of NAPL. The site-specific conditions at IR-03 (most notably the thick viscous product) may limit the effectiveness of this technology. Bench-scale or pilot-scale studies would be needed to better understand its potential effectiveness. | Implementation would be moderately difficult because of specialized equipment and significant power demand required for these options. Bench-scale or pilot-scale studies would be needed to better understand the implementability of these technologies.                                                                                                                                                                                                                                                                                                                                                                                               | High. These technologies are generally considered to be capital- and energy-intensive.                                                                                                                                                                                                                                                                                                                                                              | Retained<br>May improve effectiveness in recovering viscous NAPL source areas using standard extraction techniques. Bench-scale or pilot-scale studies would be needed to better understand its effectiveness and implementability. Moderate capital cost; moderate to high operational cost due to energy consumption. |
|                                                |                                    | Treatment and Off-Site Disposal of Extracted NAPL/ Groundwater                                                                     | Treat extracted NAPL, groundwater, and vapor prior to disposal. Depending on the POTW facility pretreatment requirements and other potential regulatory issues, extracted groundwater can be conveyed and discharged to a POTW facility. | Filtration, precipitation, and adsorption could effectively remove some of the groundwater chemicals present at IR-03. Discharge to a POTW facility is an effective means of disposing untreated groundwater. A permit fee would likely be required from the local POTW facility for discharge of the extracted water.  | These treatment technologies are commonly used in groundwater treatment and would be readily implementable.<br><br>Filtration and precipitation would create a sludge material containing the chemicals, which would need to be disposed of in an off-site disposal facility. Adsorption would also generate spent activated carbon media, which would need to be either regenerated or disposed.<br><br>Discharge to a POTW facility would be feasible if concentrations in the waste stream from extracted groundwater are below RCRA criteria, and if a connection to a POTW facility that is capable of treating COCs at IR-03 is identified nearby. | These ex-situ technologies would have relatively high annual O&M costs. In addition, groundwater extraction for hydraulic containment could be required for a long duration, making this option less cost-effective compared with other options.<br><br>Conveyance structures would need to be constructed and administrative requirements would need to be met for a discharge to a POTW facility. Capital and O&M costs would be low to moderate. | Retained<br>High effectiveness and implementability.                                                                                                                                                                                                                                                                    |

**Table 3-11. Detailed Evaluation of GRAs and Process Options for NAPL at IR-03** *(continued)*  
Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| General Response Action                        | Remedial Technology                   | Process Option                            | Description                                                                                                                                                                                                                                     | Effectiveness                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Implementability                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Cost                                                                                                                                                                                                                                                                | Conclusion                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------|---------------------------------------|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>NAPL PROCESS OPTIONS</b> <i>(continued)</i> |                                       |                                           |                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                    |
| Removal<br><i>(cont.)</i>                      | Physical Extraction<br><i>(cont.)</i> | Excavation                                | Remove contaminated material with heavy equipment. Excavated soil could be stockpiled on site for treatment, or transported to a permitted off-site treatment and disposal facility.                                                            | Excavation would be applicable to the complete range of chemical groups, with no particular target group. However, excavation must be performed in conjunction with either off-site disposal or ex-situ treatment to prevent exposure to humans and wildlife.                                                                                                                                                                                                                                          | Implementability would be limited by (1) the generation of fugitive emissions during operations and (2) depth and composition of the media requiring excavation. Excavations below the water table would be less implementable than shallower excavations due to the added complexities of dewatering and water treatment.                                                                                                                                                                                                                                                                                                                                                                                                                | Excavation costs would include equipment and labor. Additional costs could include on-site storage facilities and soil characterization. Overall capital costs would be high.                                                                                       | Retained<br>Effective if used in combination with ex-situ treatment or off-site disposal options.                                                                                                                                                                                                                                                                                  |
|                                                |                                       | Off-Site Disposal of Excavated NAPL/ Soil | Collect and transport soil to an appropriate treatment, storage, or disposal facility. Disposal of soil would involve constructing on-site staging area from which soil would be transferred to trucks and transported to an off-site facility. | Off-site disposal would be applicable to the complete range of chemical groups, with no particular target group. The effectiveness would be moderate, as excavation will be performed in conjunction with off-site disposal, where the effectiveness of the facility to prevent exposure to humans and wildlife cannot be directly controlled or monitored.                                                                                                                                            | Excavation and off-site disposal are commonly used in soil treatment and would be readily implementable for small to moderate volumes. Soil saturated with either water or NAPL would require processing (phase separation or stabilization) prior to off-site disposal. May be difficult to implement for large treatment volumes because of limited on-site area available for material staging and characterization.                                                                                                                                                                                                                                                                                                                   | Costs for off-site disposal could range from moderate to very high, depending on the volume of soil required for disposal and its chemical characteristics.                                                                                                         | Retained<br>Highly effective; off-site disposal could be used for disposal of small volumes of process residuals or areas with extensive NAPL. May not be practical for large treatment volumes because of implementation challenges (limited on-site area for staging) and high capital cost; these constraints may be less significant if ex-situ treatment volume is minimized. |
| Treatment                                      | Solidification/Stabilization          | In-Situ Mixing                            | Mix one or more reagents directly into the contaminated soil/NAPL with mechanical equipment. Reagents include stabilizing agents (such as cement or bentonite), and reactive agents (such as chemical oxidants).                                | Effectiveness relies on homogenous mixing of reagents with the contaminated soil and NAPL; homogeneous mixing may be difficult to achieve in shoreline areas containing large debris. Bench-scale or pilot-scale studies would be required to identify the appropriate reagent(s) to solidify and stabilize the contaminated soil and NAPL. If designed and implemented appropriately, technology would be capable of preventing migration of NAPL to San Francisco Bay (in accordance with the RAOs). | Mechanical equipment for in-situ mixing is readily available. Mixing process would require controls (including capture, treatment, and disposal) for air and liquid residuals; these controls may be moderately difficult to implement given the range of organic, inorganic, and radiological contaminants at the site. Mixing process may be difficult to implement in shoreline areas containing large debris. Administrative implementability may be challenging if technology is not implemented in combination with other technologies that seek to remove the NAPL source to the extent practicable (consistent with Water Board guidance for closure of low-risk fuel sites in the San Francisco Bay Region [Water Board, 1996]). | Capital costs for in-situ mixing would be moderate to high, depending on the treatment volume. O&M costs would be low because minimal long-term management of groundwater would be needed for the stabilized waste (which would have a low hydraulic conductivity). | Retained<br>Capable of reliably achieving RAOs with readily available equipment. Bench-scale or pilot-scale studies would be needed to identify the appropriate reagent(s). Moderate to high capital cost; low O&M costs.                                                                                                                                                          |

**Table 3-11. Detailed Evaluation of GRAs and Process Options for NAPL at IR-03** *(continued)*  
Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| General Response Action                        | Remedial Technology                         | Process Option                           | Description                                                                                                                                                                                                                                                                           | Effectiveness                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Implementability                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Cost                                                                                                                                                                                                                                                                                                                                                                                                                 | Conclusion                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>NAPL PROCESS OPTIONS</b> <i>(continued)</i> |                                             |                                          |                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                |
| Treatment <i>(cont.)</i>                       | Solidification/Stabilization <i>(cont.)</i> | Ex-Situ Mixing                           | Excavate contaminated soil and NAPL, transport to on-site location, and spread in layers. Mix a binding reagent into the soil/NAPL with mechanical equipment and transport/place stabilized material in excavation.                                                                   | Ex-situ mixing would be effective because homogenous mixing could be controlled and monitored. Bench-scale or pilot-scale studies would be required to identify the appropriate reagent(s) to solidify and stabilize the contaminated soil and NAPL. If designed and implemented appropriately, technology would be capable of preventing migration of NAPL to San Francisco Bay (in accordance with the RAOs).                                                                                                                                                          | Mechanical equipment for excavation and ex-situ mixing is readily available. Mixing process would require controls for liquid residuals; these controls may be moderately difficult to implement given the range of organic, inorganic, and radiological contaminants at the site. Air emissions would require monitoring but could not be effectively captured and treated. May be difficult to implement for large treatment volumes because of limited on-site area available for material processing. Administrative implementability may be challenging if technology is not implemented in combination with other technologies that seek to remove the NAPL source to the extent practicable. | Capital costs for ex-situ solidification and stabilization would be high because of the labor intensive process of excavation, transportation, mixing, and backfilling. High costs could be moderated if ex-situ treatment volume is minimized. O&M costs would be low because minimal long-term management of groundwater would be needed for the stabilized waste (which would have a low hydraulic conductivity). | Retained<br>Capable of reliably achieving RAOs with readily available equipment. Bench-scale or pilot-scale studies would be needed to identify the appropriate reagent(s). May not be practical for large treatment volumes because of implementation challenges (limited on-site area for mixing) and high capital cost; these constraints may be less significant if ex-situ treatment volume is minimized. |
| Containment                                    | Covering and Capping                        | Soil Cover or Engineered Alternative Cap | Isolate contaminated soil and buried debris from potential humans or wildlife at the site using a soil cover or engineered alternative cap. An engineered alternative cap would incorporate a low-permeability layer that would minimize water infiltration to the contaminated zone. | Cover/cap of suitable thickness would be effective to prevent direct exposure to underlying contaminated soil or debris. Monitoring, regular maintenance, and institutional controls would be performed to ensure its effectiveness.                                                                                                                                                                                                                                                                                                                                     | Technology required to implement soil covers and engineered alternative caps are readily available and easily implementable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Low to moderate capital and O&M costs                                                                                                                                                                                                                                                                                                                                                                                | Retained<br>Easily implemented; a low-permeability geosynthetic clay cap was installed over the surface of IR-03 in 1997; effective in eliminating exposure; low to moderate cost.                                                                                                                                                                                                                             |
|                                                | Hydraulic Barriers                          | Slurry or Sheet-Pile Wall                | Install slurry or sheet-pile walls below the ground to contain, capture, or redirect groundwater flow in the vicinity of IR-03.                                                                                                                                                       | Vertical barriers can effectively control migration of NAPL and associated contaminated groundwater. Hydraulic gradient between the wall would need to be monitored and managed to remain within acceptable limits; water management could include extraction and treatment, or installation of an upgradient flow diversion structure. A sheet-pile wall was installed (in 1998) along the southern edge of the former oil reclamation ponds; the existing wall does not have cathodic protection, and would not be an effective component of a future remedial action. | Installing a new slurry or sheet-pile wall at this site would be challenging to implement due to the subsurface conditions at IR-03 and short distance from the shoreline; however, pre-design investigations to identify subsurface obstructions in advance could improve implementation.                                                                                                                                                                                                                                                                                                                                                                                                          | Moderate to High                                                                                                                                                                                                                                                                                                                                                                                                     | Retained<br>Effective in containing NAPL and groundwater contaminants. May be difficult to implement close to shoreline and may require pre-design investigations; moderate to high cost.                                                                                                                                                                                                                      |

Table 3-11. Detailed Evaluation of GRAs and Process Options for NAPL at IR-03 (continued)  
Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| General Response Action                                        | Remedial Technology  | Process Option                                                                                    | Description                                                                                                                                                                                                                                                                                 | Effectiveness                                                                                                                                                                                                                                                                                                                                                                                               | Implementability                                                                                                                                                                                                                                                                                                                                                            | Cost                                                                                                                                                                                                                                                                 | Conclusion                                                                                                                                                                                                                                                                          |

| ADDITIONAL OPTIONS TO ADDRESS GROUNDWATER ASSOCIATED WITH NAPL |                      |                                                                                                   |                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                     |
| In-Situ Treatment                                              | Thermal Treatment    | Thermal Treatment by Electrical Resistive Heating, Thermal Conductive Heating, or Steam Injection | Use electrical resistive heating, thermal conductive heating, or steam injection to vaporize VOCs and SVOCs in groundwater. The vaporized chemicals are subsequently captured using vacuum extraction (e.g., SVE).                                                                          | Potentially effective but site-specific treatability studies would be necessary to determine the viability of ERH, TCH, and steam injection to cost-effectively achieve the necessary temperatures to vaporize VOCs and SVOCs in groundwater (following NAPL removal). Heat loss through high groundwater flow velocities would need to be controlled through some form of containment (slurry wall, etc.). | Implementation would be moderately difficult because of specialized equipment and significant power demand required for these options. Bench-scale or pilot-scale studies would be needed to better understand the implementability of these technologies. Implementation challenges also include the effective capture and treatment of potentially high volumes of vapor. | High. These technologies are generally considered to be capital- and energy-intensive. Additional capital cost of heating to temperatures capable of volatilizing chemicals would be moderate if implemented in conjunction with thermally-enhanced NAPL extraction. | Retained<br>Potentially effective at treating organic compounds in groundwater. Bench-scale or pilot-scale studies would be needed to better understand its effectiveness and implementability. Moderate capital cost; moderate to high operational cost due to energy consumption. |
|                                                                | Biological Treatment | Anaerobic and Aerobic Bioremediation                                                              | Introduce amendments to groundwater in areas where chlorinated solvents are present to enhance biodegradation of chlorinated VOCs. Amendments include electron donors, electron receptors, nutrients, and microorganisms, if necessary. Requires monitoring to assess program (FRTR, 2005). | Potentially effective for treating residual fuel hydrocarbons and VOCs following NAPL source removal/treatment.                                                                                                                                                                                                                                                                                             | Easily implemented.                                                                                                                                                                                                                                                                                                                                                         | Moderate capital cost. Low O&M cost.                                                                                                                                                                                                                                 | Retained<br>Potentially effective for treating residual fuel hydrocarbons and VOCs following NAPL source removal/treatment; easily implemented at moderate cost..                                                                                                                   |
|                                                                | Passive              | Monitored Natural Attenuation                                                                     | Allow chemicals to naturally attenuate via biodegradation, dispersion, dilution, or adsorption. Requires monitoring to assess recovery rates and success.                                                                                                                                   | Effective as a polishing step following in-situ treatment at high concentration areas. Not likely to be effective without remediation of high concentration areas.                                                                                                                                                                                                                                          | Readily implementable; option would require evaluation of chemical degradation rates and pathways.                                                                                                                                                                                                                                                                          | Low capital cost. Low O&M costs.                                                                                                                                                                                                                                     | Retained<br>Effective as a polishing step; readily implementable and low cost.                                                                                                                                                                                                      |

General Assumptions:  
Work will be performed in Level D PPE  
Values from the "Means 2005 Environmental Remediation - Unit Price" and "Means 2005 Environmental Remediation - Assemblies" were multiplied by a factor of = 113% to account for an inflation rate of 3.1 percent per annum.

|-------------------------------------------------|----------|-------|-------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Sample pipe casing for asbestos                 | 805      | each  | \$ 14.00    | \$ 11,264           | Quote fom Asbestos TEM Laboratories, Berkeley, CA (March 2009); assume three samples per access point                                   |
| Access point asbestos abatement                 |          |       |             |                     | Assume that all steam lines at access points is covered with ACM                                                                        |
| Cover surfaces with 6 mil polyethylene sheeting | 26,820   | SF    | \$ 0.29     | \$ 7,778            | Means 2005 Environmental Remediation - Unit Price. Pg 8-4. 25 01 0210; assume 100 SF of surface area to be covered at each access point |
| Remove pipe insulation with glove bag           | 1,341    | LF    | \$ 25.26    | \$ 33,877           | Means 2005 Environmental Remediation - Unit Price. Pg 8-7. 25 01 0419; assume 5 LF of pipe exposed at each access point                 |
| HEPA vacuum cleaner, 55 gal                     | 1        | each  | \$ 3,713.81 | \$ 3,714            | Means 2005 Environmental Remediation - Unit Price. Pg 8-2. 25 01 0118; assume 5 LF of pipe exposed at each access point                 |
| Sample interior of steam lines                  | 805      | each  | \$ 539.00   | \$ 433,677          | See "LAB COST" Worksheet for detail; assume three samples per access point                                                              |
| Close lines in place with grout                 | 16,809   | CF    | \$ 12.44    | \$ 209,138          | Means 2009 Heavy Construction. Pg 81. 04 05 16.30 2000; assume that 90% of the lines meet in place closure requirements                 |
| Remove failed lines                             | 5,364    | LF    | \$ 11.14    | \$ 59,765           | Means 2009 Heavy Construction. Pg 24. 02 41 13.33 2900; assume that 10% of the lines will be removed                                    |
| Collect and bag removed lines                   | 24,138   | CF    | \$ 4.11     | \$ 99,266           | Means 2005 Environmental Remediation - Unit Price. Pg 8-8. 25 01 0502; assume 1 CY of material for every 6 LF of pipe removed           |
| Dispose of pipe covered with ACM                | 894      | CY    | \$ 166.70   | \$ 149,031          | Means 2005 Environmental Remediation - Unit Price. Pg 8-8. 25 01 0506 and Pg 8-9. 25 01 0507 (average)                                  |
| Transport pipe to disposal site                 | 715      | miles | \$ 6.98     | \$ 4,989            | Means 2009 Heavy Construction. Pg 38. 02 81 20.10 1260 and 1270 (average); assume a 20-mile roundtrip to disposal facility              |
| Dispose of oily water in vacuum truck           | 44       | hour  | \$ 242.03   | \$ 10,649           | Means 2009 Heavy Construction. Pg 39. 02 81 20.10 3120; Assume each load take 4 hours total, 5,000-gallon truck                         |
| <b>TOTAL</b>                                    |          |       |             | <b>\$ 1,023,148</b> |                                                                                                                                         |

## Notes:

ACM = asbestos-containing material

Values from the "Means 2005 Environmental Remediation - Unit Price" and "Means 2005 Environmental Remediation - Assemblies" were multiplied by an inflation factor (see "BACKUP" Worksheet)

Assume costs for Level C are included in Health &amp; Safety line item in "BACKUP" Worksheet

Assume that no excess soil will be excavated and that rad screening will not be performed

Assume that all steam lines are an average of 8" in diameter

Estimated quantities based on steam line removal closeout reports for Parcel C and Parcel D.

## Steam Line Info:

Number of access points 268 each

Assume 1 access point every 200 feet

Length of steam lines 53,640 LF

| <b>TOTAL</b>                                                             |          |        |              | \$ 315,678 |                                                                                                                                         |

**Notes:**

Values from the "Means 2005 Environmental Remediation - Unit Price" and "Means 2005 Environmental Remediation - Assemblies" were multiplied by an inflation factor (see "BACKUP" Worksheet)

Assume costs for Level C are included in Health &amp; Safety line item in "BACKUP" Worksheet

Estimated quantities based on steam line removal closeout reports for Parcel C and Parcel D.

**Fuel Line Volumes and Areas:**

|                                                             |       |                    |  |                                                    |
|-------------------------------------------------------------|-------|--------------------|--|----------------------------------------------------|
| Length of fuel lines                                        | 2,827 | LF                 |  |                                                    |
| Area requiring excavation and backfill                      | 8,481 | SF                 |  | Assumed 3-foot-wide trench                         |
| Volume requiring excavation and backfill + 20% fluff factor | 754   | CY                 |  | Assumed 2-foot-deep trench + 20% soil fluff factor |
| Excavated material tonnage                                  | 1,131 | TN                 |  | Assumed unit weight of 1.5 TN/CY                   |
| Total number of 50'x50' grid surfaces estimated             |       | 3 surface grids    |  | See Backup Worksheet "RAD SCREENING"               |
| Total number of estimated equivalent grids                  |       | 6 equivalent grids |  | See Backup Worksheet "RAD SCREENING"               |

**Table E-12. Soil Alternatives - Shoreline Protection Cost Detail**

Feasibility Study Report for Parcel E, Hunters Point Shipyard, San Francisco, California

| Description                                                           | Quantity  | Unit |       |    | Unit Price  | Cost         | Remarks                                                                                                                                            |
|-----------------------------------------------------------------------|-----------|------|-------|----|-------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Excavate shoreline area to 2.5 feet bgs (excavator) in wet conditions | 40,560    | bcy  | 1,000 | 41 | \$ 3.65     | \$ 147,890   | Means 2010 Heavy Construction: 31 23 16.42 0250, plus 50% for work in water (Means 2009 Heavy Construction: 31 23 16.42 4250)                      |
| Load excavated material (track loader) in wet conditions              | 40,560    | bcy  | 1,190 | 35 | \$ 2.58     | \$ 104,815   | Means 2010 Heavy Construction: 31 23 23.15 6070 (w/o material), plus 50% for work in water (Means 2009 Heavy Construction: 31 23 16.42 4250)       |
| Haul soil to secondary screening area (22 cy off-road hauler)         | 52,728    | lcy  | 1,190 | 45 | \$ 3.58     | \$ 188,524   | Means 2010 Heavy Construction: 31 23 23.20 5060                                                                                                    |
| Debris handling to facilitate radiological screening (track loader)   | 4,056     | bcy  | 75    | 55 | \$ 8.61     | \$ 34,938    | Means 2010 Heavy Construction: 31 23 23.15 6070 (assumes debris is 10% of excavation volume, unit rate adjusted to reflect slower production rate) |
| Radiological screening                                                | 1,095,120 | sf   |       |    | \$ 0.30     | \$ 328,536   | Consistent with cost estimate from Parcel E Radiological Addendum (Appendix D)                                                                     |
| Soil analysis for disposal (4-point composite sample - 1 per 500 bcy) | 82        | each |       |    | \$ 1,042.00 | \$ 85,444    | Consistent with cost estimate from Parcel E Radiological Addendum (Appendix D); includes additional costs for radiological analyses                |
| Load material for disposal (track loader)                             | 40,560    | bcy  | 1,190 | 35 | \$ 1.72     | \$ 69,877    | Means 2010 Heavy Construction: 31 23 23.15 6070 (w/o material)                                                                                     |
| Transport and disposal of excavated material                          |           |      |       |    |             |              |                                                                                                                                                    |
