

## Technical Memorandum

### Co-Located Chemical Sampling Results at Historical Site Assessment Subarea 7 in Area IV

### Santa Susana Field Laboratory Ventura County, California

*Prepared for:*

Department of Energy  
Energy Technology and Engineering Center  
P.O. Box 10300  
Canoga Park, California 91309

*Prepared by:*

**CDM** Federal Programs Corporation (CDM Smith)

*Prepared under:*

US Department of Energy  
EM Consolidated Business Center  
Contract DE-AM09-05SR22404  
CDM Task Order DE-AT30-08CC60021/ET17

July 2012

## Introduction

This Technical Memorandum (TM) presents the results of chemical analyses of surface and subsurface soil, and soil from intermittent drainages collected under the *Master Work Plan/Field Sampling and Analysis Plan, Co-Located Chemical Sampling at Area IV, Santa Susana Field Laboratory, Ventura County, California* (CDM Federal Programs Corporation [CDM] 2011a) (WP/FSAP) and *Addendum No. 6 to Master Work Plan/Field Sampling and Analysis Plan, Co-Located Chemical Sampling at Area IV Santa Susana Field Laboratory* (WP/FSAP Addendum), *Ventura County, California, EPA Subareas 3, 5D South, 7 and 8 South Soil Sampling* (CDM 2011b).

This TM addresses sampling within U.S. Environmental Protection Agency (EPA) Historical Site Assessment (HSA) Subarea 7 of Area IV at Santa Susana Field Laboratory (SSFL) and provides a description of the sampling activities, the analytical results, and a discussion of the analytical data review findings. The TM does not provide an interpretation of the results. The data provided in this TM are intended to be combined with data collected under the prior Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) efforts within the Area IV soil chemical database. A data gap analysis will be performed to assess the adequacy of Area IV data as a whole in defining the nature and extent of chemicals in soil for purposes of remedy determination.

### 1.1 Co-Located Soil Chemical Sampling Objectives

The radiological characterization study being performed by EPA includes collection of surface and subsurface soil, as well as drainage soil samples throughout Area IV of SSFL and the Northern Buffer Zone for analysis of radionuclides. The California Department of Toxic Substances Control (DTSC) and Department of Energy (DOE) agreed in the *Administrative Order on Consent for Remedial Action (AOC*, Docket Number HSA-CO 10/11-037) (DTSC 2010) that soil/sediment samples collected by EPA also be analyzed for chemical analytes. EPA's contractor, HydroGeoLogic, Inc. (HGL) was responsible for the collection of the EPA-proposed soil samples. DTSC and DOE agreed that the chemical analyses of the soil samples provided by EPA would be done by DOE's contractor, CDM. CDM was responsible for the management, shipment, and laboratory analyses of the samples collected for chemical analyses.

The AOC was signed by DTSC and DOE on December 6, 2010. The AOC is a legally binding order that requires and describes the characterization of Area IV and Northern Buffer Zone soils/sediments and further defines DOE's obligations in relation to radiologic and chemical cleanup of soils within these areas. It also stipulates that during Phase 1 of the chemical investigation activities, DOE is to analyze soil samples for chemical constituents at locations where EPA collects a sample for radiological analysis.

### 1.2 Basis for HSA Subarea 7 Soil Sampling

HGL's *Field Sampling Plan for Soil Sampling, Area IV Radiological Study, Santa Susana Field Laboratory, Ventura County, California* (HGL 2010) includes a description of the project objectives, the scope of work, laboratory analytical suites, sample collection and other standard field operation methods for EPA's radiological characterization study.

*Subarea 7 FSP Addendum, Santa Susana Field Laboratory Site, Area IV Radiological Study* (HGL 2011) was prepared by HGL to support the radiological soil sampling field implementation program specific to Subarea 7. This addendum provides the technical justification for location of the drainage, surface, and subsurface soil samples in Subarea 7. CDM obtained collocated soil samples for chemical analysis at each location where HGL collected soil samples for radionuclides analyses.

## 1.3 Geology

Subarea 7 is within the Chatsworth Formation that consists of fine to coarse grained sandstone interbedded with siltstone. The overlying native soils encountered consist of mostly sand and silts with minimal clay. The observed contact with bedrock occurs between 0.8 foot to 20 feet below ground surface (bgs). Non-native materials (gravel and asphalt) were observed in only trace quantities within this subarea.

Additional information regarding the geology in Area IV can be found in Volume I of *Group 7 – Northern Portion of Area IV RCRA Facility Investigation Report Santa Susana Field Laboratory, Ventura County, California* (MWH 2009).

## 1.4 Technical Memorandum Organization

This TM includes the following sections:

- **Section 1 - Introduction** – Summarizes the basis and objectives of the co-located soil sampling in Subarea 7
- **Section 2 - Field Sampling and Analytical Methods** – Provides details regarding field sampling procedures and laboratory analytical methods
- **Section 3 - Soil Sample Analytical Results** – Provides a summary of detected analytical results for each chemical; the appendices provide the overall results
- **Section 4 - Data Usability Assessment** – Discusses the results of the data review and validation processes
- **Section 5 - References**

## Section 2

# Field Sampling and Analytical Methods

Soil samples were collected from surface and drainage locations in Subarea 7 from September 13 through September 23, 2011. Subsurface sampling was performed from October 7 through November 4, 2011. The sample locations in the western portion of Subarea 7 are shown on Figure 2-1 and the locations in the eastern portion of Subarea 7 are shown on Figure 2-2.

Table 2-1 provides the rationale for sampling at each location, sample number, and date of collection for the soil samples; location description; description of any fill materials encountered; reasons for not sampling some of the locations proposed by EPA, and the required analyses.

All soil sampling equipment (described in Sections 2.1 and 2.2) that came into contact with sample materials was decontaminated prior to sample collection in accordance with the WP/FSAP.

## 2.1 Surface and Drainage Sampling

Surface soil and drainage samples in Subarea 7 were collected from the ground surface to 6 inches bgs. The surface of the sample area was prepared by HGL sampling personnel by removing leaves, grass, and any other surface debris. Surface samples to be analyzed for semivolatile organic compounds (SVOCs), polycyclic aromatic hydrocarbons (PAHs), and polychlorinated biphenyls (PCBs)/polychlorinated triphenyls (PCTs) were collected first using a slide hammer equipped with a 2-inch diameter and 6-inch long stainless steel sample liner. The sampler was pounded into the soil until its top was flush with the ground surface and then removed from the soil. The sample sleeve was removed from the sampler and both ends capped with a Teflon® liner and a plastic cap.

The soil sample for the remaining analytes was collected from a circular hole, approximately 12 inches in diameter to a depth of 6 inches bgs, using a stainless steel trowel and transferred to a stainless steel bowl and homogenized. Debris, wood, or other materials larger than 0.25 inch were removed prior to homogenization. After homogenization, the sample was placed into one or more 16-ounce glass jars. Adhesive sample labels, completed with all sampling information, were affixed to both the sample sleeves and jars. All sleeves and jars were placed into plastic baggies, and placed in a cooler with double bagged ice.

All surface and drainage samples were to be analyzed for the primary sample analytes (i.e., SVOCs, PAHs, metals [including mercury], hexavalent chromium, pH, fluoride, PCBs/PCTs, dioxins, and perchlorate) and pesticides and herbicides in Subarea 7. Selected surface and drainage samples in Subarea 7 were also to be analyzed for all of the secondary analytes (i.e., total petroleum hydrocarbons - extractable fuel hydrocarbons [TPH-EFH], TPH-gasoline range organics [TPH-GRO], nitrates, formaldehyde, n-Nitrosodimethylamine [NDMA], energetics, cyanide, terphenyls, glycols, and alcohols) or a subset of them as shown in Table 2-1.

**Notes & Abbreviations:**  
EPA Location ID is highlighted in yellow for subsurface locations that were sampled using a hand auger  
Surface samples at SL-11 and SL-101 were sampled for Primary analytes only. These locations should also have been sampled for GATTC.  
Subsurface sample at SL-37 should have been sampled only for Primary and GATT but was also sampled for cyanide.  
Surface sample at SL-99 was sampled for Primary analytes and GATT, but should have also been sampled for cyanide.  
Primary analyses include: SVOCs, Metals, Chromium VI, Fluoride, Perchlorate, PCBs/PCTs, Dioxins/Furans, pH, in all samples and pesticides/herbicides in surface/drainage samples only.  
Secondary analyses include: Alcohols, terphenyls, glycols, TPH-extractable fuel hydrocarbons, Formaldehyde, n-Nitrosodimethylamine, Energetics, Nitrate, Cyanide  
bgs = below ground surface  
dioxane = 1,4-dioxane  
ft = feet  
GATT = glycols, alcohols, terphenyls and TPH-extractable fuel hydrocarbons  
GATTC = glycols, alcohols, terphenyls, TPH-extractable fuel hydrocarbons, and cyanide  
GPR = ground penetrating radar  
GRAY = gamma ray anomaly  
GRO = gasoline range organics  
NA = not applicable  
NDMA = n-Nitrosodimethylamine  
PCB/PCTs = polychlorinated biphenyls/polychlorinated triphenyls  
PGRAY = potential gamma ray anomaly  
RMHF = Radioactive Material Handling Facility  
SVOCs = semivolatile organic compounds  
SRE = Sodium Reactor Experiment  
TPH = total petroleum hydrocarbons  
VOCs = volatile organic compounds

## 2.2 Subsurface Sampling

Most of the subsurface soil sampling was performed by a California-licensed direct push technology (DPT) subcontractor under HGL oversight. The majority of the DPT borings in Subarea 7 were advanced to a targeted depth of between approximately 5 and 10 feet bgs. Table 2-1 provides the actual depths achieved at each location.

Soil cores were collected using the Geoprobe® dual-tube sampling method, which consisted of a 2-inch outer steel drive casing and an inner 1-3/4-inch diameter acetate soil sampling sleeve. After the acetate liner was retracted from the core barrel, it was opened lengthwise with a cutting tool. The core was screened for radioactivity using Micro R (for gamma radiation) and Pancake (for alpha and beta radiation) probes, followed by screening with a photoionization detector (PID). Based on the instrument readings and/or visual evidence of possible contamination, the sample depths were determined. If no elevated radiation or PID readings were indicated, samples were collected from the acetate sleeve by the CDM sampler at the default depths of 4 to 5 feet bgs and 9 to 10 feet bgs.

Soil for VOCs, 1,4-dioxane, and TPH-GRO analyses was collected from the acetate sleeve using EnCore® samplers. Subsurface soil for SVOC, PAH, and PCB/PCT analyses was removed from the acetate sleeve in a manner causing minimal soil disturbance and placed into 16-ounce glass jars. Soil for all other analyses was also placed into 16-ounce glass jars. Adhesive sample labels were completed with all sampling information and affixed to each sample jar, and then placed into plastic baggies. The EnCore® samplers were placed in one of the bags in which they were received, and the sample label affixed to the outside of the bag. All jars and EnCore® samplers were placed in a cooler with double bagged ice.

Several subsurface locations were not accessible by the Geoprobe® rig, therefore, these borings were advanced using a hand auger. Each location was augered to the target depth of 5 feet bgs, where possible, and each foot of augered soil was retrieved to the surface, placed in plastic bags and screened using the Micro R, Pancake, and PID. All borings in Subarea 7 were sampled by CDM for chemical analyses at approximately 4 to 5 feet bgs, or in some cases at a shallower depth (see Table 2-1), using a slide hammer with stainless steel sleeves. The EnCore® samplers were filled from one end of the sleeve and the sleeve was capped and submitted for the SVOC, PAH, and PCB/PCT analyses. Jars were then filled with sample material collected using the hand auger for the remaining analyses. This process was repeated at those locations where a deeper sample (i.e., target depth of 9 to 10 feet bgs) could also be collected. Because sampling using a hand auger was not addressed in the WP/FSAP or in the FSAP Addendum for Subarea 7, this sampling method constitutes a variance from the FSAP (see Section 2.8). However, sample collection from hand augered holes was revised effective August 2, 2011 and approved by DTSC, such that when conditions permitted, a 6-inch sleeve was collected using a slide hammer for the SVOC, PAH, and PCB/PCT analyses, and any EnCore® samples were collected from the bottom of the sleeve.

After all samples were collected from each boring and hand augered hole, the soil cuttings were used to backfill the hole and the hole was topped off with a bentonite chip seal. At locations in asphalt, asphalt patch material was applied on top of the bentonite.

## 2.3 Sample Handling

All soil samples collected by HGL for chemical analyses were relinquished by the field sampler to CDM's Field Team Leader (FTL). The FTL ensured that the sample labels were completed legibly and

accurately. Any discrepancies were discussed with the field samplers and corrections to the sample labels were made as needed. All sample labels were covered with clear tape, the sleeves and jars placed back into their plastic baggie, and refrigerated.

All sampling information was recorded onto one or more chain-of-custody (CoC) forms. Each sampler reviewed the CoC and any discrepancies were corrected by the FTL. Each completed CoC was signed by the sampler and the FTL as the individual responsible for release of the samples to the courier. All samples were packed into coolers in accordance with Section 6.4 of the *Master Work Plan/Field Sampling and Analysis Plan, Co-Located Chemical Sampling at Area IV, Santa Susana Field Laboratory, Ventura County, California* (CDM 2011a).

## 2.4 Field Quality Control Procedures

Quality control (QC) samples collected in the field included field duplicates, matrix spike (MS)/matrix spike duplicate (MSD) samples, equipment rinsate blanks, and field blanks. Trip blanks filled with laboratory analyte-free water were sent to the site from the laboratory and were submitted unopened with any samples to be analyzed for VOCs/1,4-dioxane, and/or TPH-GRO.

### 2.4.1 Field Duplicates and MS/MSD Samples

Both the field duplicates and MS/MSD samples were to be collected at a frequency of one per 20 parent soil samples collected. The field duplicate and MS/MSD samples were collected from the same location. The duplicate samples were submitted to the laboratory as separate (and blind) from the parent samples. The MS/MSD samples are additional volume of the parent samples collected in triple volume for the DPT subsurface samples; a double volume of soil was sufficient for the surface and hand-augered MS/MSD samples.

For Subarea 7, five surface MS/MSD/duplicate samples were collected from Subarea 7 and analyzed for the primary analytes and pesticides/herbicides. One of these samples was also analyzed for all the secondary analytes, and three others were analyzed for TPH-GRO, TPH-EFH, terphenyls, glycols, alcohols, and cyanide. For the subsurface samples, six MS/MSD/duplicate samples were collected and analyzed for the primary analytes. Two of these samples were also analyzed for all secondary analytes, two other samples were analyzed for TPH-GRO, TPH-EFH, terphenyls, glycols, alcohols, NDMA, nitrates, and formaldehyde, and one sample was analyzed for TPH-GRO, TPH-EFH, terphenyls, glycols, alcohols, and cyanide.

### 2.4.2 Equipment Rinsate Blank Samples

As stated in the Master WP/FSAP, equipment rinsate blanks were to be prepared and submitted for chemical analysis at a minimum frequency of one per 20 parent soil samples collected for each sampling technique and whenever there were changes in the sample collection procedures, sampling decontamination procedures, or sampling equipment. As sampling was being conducted in Subarea 5D North during the week of June 20, 2011, the frequency of collection of equipment blanks was changed (to align with frequency of collection of equipment blanks performed under the RFI program) to weekly for both surface/drainage and subsurface samples regardless of the number of soil samples collected.

Other subareas were concurrently sampled during the Subarea 7 sampling period. Therefore, since equipment blanks were labeled with specific subareas in the sample identification numbers, they were in some instances also related to samples collected from other subareas. Equipment blanks that are associated with Subarea 7 soil samples are listed below.

| Equipment Blank Number | Equipment Blank Date | Equipment Blank Analyses                                  | Soil Sample Type |
|------------------------|----------------------|-----------------------------------------------------------|------------------|
| EB-SA7-SS-091411       | 9/14/11              | Primary, secondary, pesticide/herbicides                  | Surface          |
| EB-SA7-SB-091511       | 9/15/11              | Primary, secondary, VOCs & dioxane                        | Subsurface       |
| EB-SA7-SS-092111       | 9/21/11              | Primary, secondary, pesticide/herbicides                  | Surface          |
| EB-SA7-SB-092211       | 9/22/11              | Primary, secondary, VOCs & dioxane                        | Subsurface       |
| EB-SA7-SB-092711       | 9/27/11              | Primary, secondary, VOCs & dioxane                        | Subsurface       |
| EB-SA6-SB-100511       | 10/5/11              | Primary, secondary, VOCs & dioxane                        | Subsurface       |
| EB-SA6-SB-100611       | 10/6/11              | Primary, secondary, VOCs & dioxane, pesticides/herbicides | Subsurface       |
| EB-SA3-SB-101211       | 10/12/11             | Primary, secondary                                        | Subsurface       |
| EB-SA7-SB-101311       | 10/13/11             | Primary, secondary                                        | Subsurface       |
| EB-SA5DS-SB-101811     | 10/18/11             | Primary, secondary, VOCs & dioxane                        | Subsurface       |
| EB-SA7-SB-101911       | 10/19/11             | Primary, secondary, VOCs & dioxane                        | Subsurface       |
| EB-SA7-SB-102611       | 10/26/11             | Primary                                                   | Subsurface       |
| EB-SA7-SB-102711       | 10/27/11             | Secondary                                                 | Subsurface       |
| EB-SA7-SB-110311       | 11/3/11              | Primary, secondary                                        | Subsurface       |

During the Subarea 7 sampling period, several equipment blanks (consisting of HGL's American Society for Testing and Materials [ASTM] Type II water) were also collected for NDMA only. Collection of equipment blanks for NDMA analysis began after review of equipment blank data indicated that NDMA was being detected in equipment blanks collected in association with soil samples from other subareas of Area IV. The field team was instructed by the project manager to begin collecting equipment blanks using HGL's ASTM Type II water and submitting soil (i.e., baked sand prepared by Lancaster Laboratories, Inc. [LLI]) and water trip blanks in an effort to determine a possible source of the NDMA other than onsite. Results of all NDMA equipment and trip blank analyses will be discussed in a separate report.

### 2.4.3 Field Blank Samples

Field blanks were to be collected once for each lot number of ASTM Type II water that HGL used for decontamination. Two field blanks were collected during sampling in Subarea 7: one field blank was collected of the bottled drinking water and one of the ASTM Type II water used by HGL for decontamination of the sampling equipment. The drinking water field blank was analyzed by LLI for all primary and secondary analytes, pesticides and herbicides, and VOCs/1,4-dioxane. The ASTM Type II water field blank was analyzed by EMAX Laboratories, Inc. [EMAX] located in Torrance, CA for the primary analytes, VOCs/1,4-dioxane and TPH-GRO, TPH-EFH, nitrates, energetics, cyanide, glycols, and alcohols.

### 2.4.4 Decontamination of Sampling Equipment

All drilling equipment was cleaned by HGL and their DPT subcontractor before and after completing each boring. This included the sampling device and drill rods. The external surfaces of the equipment were washed with potable water and Alconox, or equivalent laboratory-grade detergent. Equipment was scrubbed until all visible dirt, grime, grease, oil, loose paint, rust flakes, etc., was removed. The equipment was then rinsed with potable water.

Hand sampling equipment used to collect the surface and drainage samples, including shovels, hand trowels, and mixing bowls, were decontaminated as follows:

- Washed with a solution of potable water and Liquinox, or equivalent laboratory-grade detergent
- Rinsed thoroughly with potable water
- Given a final rinse with ASTM Type II water

If the sampling device was not used immediately after being decontaminated, it was wrapped in oil-free aluminum foil, or placed in a closed plastic, stainless steel, glass, or Teflon® container.

## 2.5 Analytical Laboratory Methods and Procedures

### 2.5.1 Analytical Methods

The analytical methods for the co-located chemical soil samples were divided into two suites of analyses. The primary suite performed on all samples includes:

- Metals using EPA Methods 6010B/6020, 7471A (mercury), and 7199 (chromium VI)
- Soil pH using EPA Method 9045M
- Fluoride using EPA Method 300.0
- SVOCs using EPA Method 8270C and PAHs using Method 8270C selective ion monitoring (SIM)
- PCBs and PCTs using EPA Method 8082
- Dioxins and furans using EPA Method 1613B
- Perchlorate using EPA Method 314.0 (and EPA Method 6850 for verification of non-detects at a rate of 10 percent of the samples submitted)

Surface soil samples only were also to be analyzed for:

- Pesticides using EPA Method 8081A
- Herbicides using EPA Method 8151A

Locations selected for sampling for the secondary suite of analyses were based on several factors including locations with a process history of the specific chemical usage, sample sites with elevated instrument readings, soil fill, waste, or visually contaminated materials. The secondary list of analyses includes:

- Nitrates using EPA Method 300.0
- Formaldehyde using EPA Method 8315A
- TPH-GRO/TPH-EFH/glycols using EPA Method 8015M
- NDMA using EPA Method 1625C
- Energetics using EPA Method 8330A
- Cyanide using EPA Method 9012B

- Alcohols and terphenyls using EPA Method 8015B

Through July 22, 2011, all shallow (i.e., target depth of 4 to 5 feet bgs) subsurface soil samples and any deeper subsurface soil samples at locations where both the primary and secondary suites were to be sampled, were also analyzed for:

- EPA Method 8260B for VOCs and
- EPA Method 8260B SIM for 1,4-dioxane

These analyses were also to be performed on samples collected from deeper target depths at locations that were originally proposed for primary analyses only but exhibited elevated instrument readings, soil fill, waste, or visually contaminated materials.

After July 22, 2011, shallow subsurface soil samples were to be analyzed for VOCs and 1,4-dioxane only at locations that where:

- Field instruments indicated the presence of VOCs above background
- Staining or exhibiting organic odors were detected
- A feature such as a sump or tank was known or suspected to have contained VOCs
- RFI data indicate the potential for VOCs to be at the subsurface soil/bedrock interface
- RFI data indicate potential for VOCs to be harbored in clay soil

### 2.5.2 Analytical Method Modifications

The analytical laboratory used for the Subarea 7 co-located soil sampling effort was LLI of Lancaster, Pennsylvania. LLI was selected by competitive procurement based on their proposed method detection limits (MDLs). Selection of LLI as the co-located soil analytical laboratory was discussed with the community on October 10, 2010. A second laboratory (EMAX) was subcontracted and samples collected in Subarea 7 were shipped to EMAX on November 1, 2, and 3 and December 1, 2011. EMAX performed all analyses with the exception of samples collected for dioxin/furans, formaldehyde and terphenyls. Although the methods performed by EMAX are not identical to the methods performed by LLI in some cases, the methods are equivalent.

The analytical methods identified for the co-located soil sampling were selected to be consistent with the methods used for the RFI. These analytical methods are presented in the *Quality Assurance Project Plan, Santa Susana Field Laboratory RCRA Facility Investigation, Surficial Media Operable Unit* (MECx 2009) (RFI Quality Assurance Project Plan [QAPP]) and are listed in Table 2-2.

For Subarea 7 sampling, CDM also evaluated the RFI QAPP detection limits relative to risk-based soil criteria. There were several instances where risk-based soil values were lower than the RFI QAPP limits. To determine whether the analytical MDL could be lowered, method modifications were discussed with DTSC and LLI chemists at the time of implementation. The ability of the laboratory to achieve project reporting limits (RLs) and QC criteria using these method modifications remains under evaluation by the project chemists. Table 2-2 also identifies methods that have been modified in an effort to lower respective MDLs and RLs.

**Table 2-2 Analytical Methods and Method Modifications for Soil**

| Parameter Group                     | Analytical Method    | Method Modified? |
|-------------------------------------|----------------------|------------------|
| Volatile Organic Compounds          | EPA 8260B            | No               |
| 1,4-Dioxane                         | EPA 8260B SIM        | No               |
| <b>Primary Analytes</b>             |                      |                  |
| Select SVOCs                        | EPA 8270C SIM        | No               |
| SVOCs                               | EPA 8270C            | No               |
| Metals (including Mercury)          | EPA 6010B/6020/7471A | No               |
| Chromium VI                         | EPA 7199             | No               |
| Fluoride                            | EPA 300.0            | No               |
| Perchlorate <sup>1</sup>            | EPA 6850             | No               |
| Perchlorate                         | EPA 314.0            | No               |
| PCBs/PCTs                           | EPA 8082             | Yes              |
| Pesticides                          | EPA 8081A            | Yes              |
| Herbicides                          | EPA 8151A            | Yes              |
| Dioxins/Furans                      | EPA 1613B            | No               |
| <b>Secondary Analytes</b>           |                      |                  |
| Alcohols                            | EPA 8015B            | Yes              |
| Terphenyls                          | EPA 8015B            | Yes              |
| Glycols                             | EPA 8015M            | Yes              |
| TPH (GRO and EFH)                   | EPA 8015M            | Yes              |
| Formaldehyde                        | EPA 8315A            | Yes              |
| n-Nitrosodimethylamine <sup>2</sup> | EPA 1625C            | No               |
| Energetics                          | EPA 8330A            | Yes              |
| Nitrate                             | EPA 300.0            | No               |
| Cyanide                             | EPA 9012B            | No               |
| pH                                  | EPA 9045M            | No               |

<sup>1</sup> Perchlorate by Method EPA 6850 was analyzed on 10 percent of samples analyzed by Method EPA 314.0

<sup>2</sup> n-Nitrosodimethylamine was analyzed by both Methods 8270C and 8270C SIM in addition to 1625C

The method modifications primarily involved increasing the prescribed sample volume (soil mass extracted) and concentrating the resulting extract to a smaller final volume, as follows:

- Method 8082 (PCBs and PCTs) – 60 grams of sample prepared and concentrated 5 fold to a final volume of 2 milliliters (mL)
- Method 8081A (Pesticides) – 60 grams of sample prepared and taken to a final volume of 4 mL (due to extract cleanup techniques)
- Method 8151A (Herbicides) – 60 grams of sample prepared and taken to a final volume of 2 mL
- Method 8330A (Energetics) – 5 grams of sample prepared in 10 mL of solvent
- Method 8315A (Formaldehyde) – 20 grams of sample used to prepare the leachate
- Method 8015M (TPH-EFH) – 60 grams of sample prepared and taken to a final volume of 1 mL
- Method 8015B (Alcohols) – 10 grams of sample prepared and taken to a final volume of 5 mL
- Method 8015M (Glycols) – 10 grams of sample prepared and taken to a final volume of 5 mL
- Method 8015B (Terphenyls) – 60 grams of sample prepared and extract concentrated to a final volume of 5 mL instead of 10 mL

For samples analyzed for glycols, an additional method modification was used. The standard method prescribes water extraction of the soils followed by concentration and then analysis by direct injection of the extract. The extraction procedure was altered by using acetone as the extraction solvent followed by concentration and then direct injection into the gas chromatograph. This modification was developed as a response to observed continuing calibration exceedances that could not be corrected using the standard procedure. These exceedances were due to the analytical column experiencing rapid degradation as a result of injecting water.

## 2.6 Data Review Processes

Analytical data produced by LLI were subject to multiple review steps to coincide with the start of distinct tasks. These steps were performed in a timely manner to ensure appropriate feedback and correction of errors. These steps included:

- Cross-reference check of sample CoC documents against the laboratory acknowledgement of sample receipt form. The laboratory acknowledgement of sample receipt was typically transmitted to the data manager via e-mail two to three days after sample receipt and login and includes a summary of the requested analyses to be performed per sample. Sample log-in errors were identified and corrected at this step.
- Tracking of sample collection, receipt, and laboratory sample delivery group (SDG) numbers on a sample tracking spreadsheet. This spreadsheet also includes field QC sample information, sample location coordinates, and required laboratory deliverables including reports, electronic data deliverables, raw data, and the status of validation.

Upon receipt of the laboratory report (delivered via e-mail), a preliminary review of the data was performed. This review consisted of:

- Reconciliation of the reported analyses against the analyses that were requested on the CoCs.
- Review of the laboratory case narratives. The case narrative identifies and explains quality issues encountered during the analysis of the samples. Quality issues may include (but are not limited to) missed holding times, poor spike recoveries in matrix or batch-specific QC samples, instrument calibration exceedances, and blank contamination. The laboratory consults with the project chemists on these issues and receives instruction on how to proceed before reporting the sample results.
- Review of the laboratory-specific QC data. These data are provided by the laboratory in summary form. Any unanticipated deviations from the project or method-specific criteria are reconciled with the laboratory at this stage.

## 2.7 Increased Field and Laboratory Quality Control Measures

Further evaluation of additional quality control items such as the frequency of equipment blank collection (Section 2.4.2) and evaluation of low level RLs were identified and implemented during the field sampling and laboratory analytical program. In addition, a second analytical laboratory (EMAX) was contracted to provide analytical services at the SSFL site. These additional measures of quality control were developed in order to address and monitor these items throughout the sampling program.

As discussed above, collection of additional equipment blanks consisting of HGL's ASTM Type II water was initiated when review of equipment blank data indicated that NDMA was being detected in equipment blanks collected from other subareas (e.g., Subarea 5C) of Area IV. During sampling in Subarea 7, several equipment blanks consisting of HGL's ASTM Type II water were collected for NDMA only.

CDM further evaluated the modified RLs at the request of DTSC chemists to verify that LLI was achieving the lower RL. LLI was requested in September 2011 to analyze additional soil QC samples spiked near the RL to verify their RLs and to evaluate precision and accuracy of the results. The QC samples consisted of MS and laboratory control samples (LCS) that were spiked at the MRL. The LCS consists of an aliquot of blank matrix (sand) to which known quantities of the method analyte and all preservation compounds are added. The LCS is prepared and analyzed in a similar manner as the sample. Evaluation of these additional QC sample results is on-going.

## 2.8 Deviations from the WP/FSAP

During the field sampling and analytical programs, modifications from the procedures detailed in the WP/FSAP (CDM 2011a) were required. These deviations and associated resolutions were discussed with the FTL, the project manager, and in some cases with the DTSC representative prior to implementation. These deviations are described below.

### 2.8.1 Field Sampling

A total of 185 locations in Subarea 7 (Table 2-1) were to be sampled at one or more depths. No subsurface samples were collected at 65 locations as noted in Table 2-1 due to shallow refusal at less than 2.5 feet bgs. Samples were not collected at SL-40 due to archeological concerns.

Subsurface sampling using a hand auger was not originally planned in the Master WP/FSAP or the FSAP Addendum for Subarea 7. Twenty-nine locations in Subarea 7 were hand augered as noted in Table 2-1. All hand augered locations were sampled using a slide hammer for collection of soil submitted for SVOC, PAH, and PCB/PCT analyses and all required Encore® samplers for VOCs/1,4-dioxane or TPH-GRO analyses were collected from one end of the sleeves.

Review of the data is ongoing to ascertain whether VOC and SVOC results should be qualified based on changes to the planned sampling procedure. The results of this review will be reported in a future revision of this document.

The surface samples at SL-11 and SL-101 were to be sampled for the primary analytes and for glycols, alcohols, terphenyls, TPH, and cyanide. However, these locations were sampled for the primary analytes only. The subsurface sample at SL-37 and the surface sample at SL-99 should have been sampled for the primary analytes and glycols, alcohols, terphenyls, and TPH, but both locations were also sampled for cyanide.

### 2.8.2 Analytical

As noted in Section 2.5.2, some analytical methods have been modified for this project. All modifications were discussed with DTSC representatives prior to their implementation. Review of the analytical methods and sample results indicates that the objectives for the project were addressed for all non-modified analyses. All modified analyses are undergoing further studies evaluating the effect of the modifications on precision and accuracy. The RL-LCS and RL-MS QC samples analyzed by LLI are a prime part of these studies. An independent study evaluating the precision and accuracy of the

modified herbicide method has been completed. Review of these herbicide results indicate that the method modifications did not achieve precision and accuracy goals at this lower reporting limit for some of the analytes. Data are currently under further review and it is likely that reporting limits may be elevated for some analytes.

## Section 3

### Area IV Subareas 7 Soil Sampling Results

Because this TM only provides a presentation of the analytical results, data in this section are presented in a summary fashion. Table 3-1 provides a summary of the Subarea 7 surface and drainage soil data. The table details the chemicals analyzed, their associated frequency of detection, the minimum and maximum detected concentrations, the range of observed detection limits and RLs, and the sample location where the maximum concentration of each analyte was detected. Table 3-2 provides the same information for Subarea 7 subsurface soil data. This table also indicates depths at which maximum concentrations were observed. For the subsurface soil data, samples were sent to both EMAX and LLI laboratories. A column has been added to the tables to indicate which laboratory the maximum concentration came from. Table 3-3 provides a summary of the Subarea 7 combined surface and subsurface datasets.

When screening criteria are developed to assess the presence/absence of contamination (i.e., above/below the applicable criteria) the Subarea 7 data will be combined with RFI data to better define the nature and extent of surface soil contamination throughout Subarea 7.

Appendix A provides tables for all validated data by analytical method and sample location. Data validation qualifier codes and their definitions are presented in these tables. Appendix B provides the summary analytical data reports as received from LLI. Appendix C presents the data usability and assessment report (DUAR), which details specific qualifications of sample results along with all validation reports. Appendix D is the master database of all sample results including the data validation "flags" (qualifiers).

B - Method blank contamination  
L - Laboratory control sample recoveries outside of criteria  
Q - Matrix spike recoveries outside of criteria  
E - Laboratory control sample and or matrix spike relative percent differences outside of criteria  
I - Internal standards outside of criteria  
A - Serial dilution results outside of criteria  
F - Field blank contamination  
Z - Analytes reported below the reporting limits and above the method detection limit

## Section 4

# Data Usability Assessment

The purposes of the DUAR provided in Appendix C and summarized here are to: (1) describe the data validation processes performed on the data sets and (2) determine whether the sample results meet the data quality objectives (DQOs) outlined in the *Master Work Plan/Field Sampling and Analysis Plan Co-Located Chemical Sampling at Area IV, Santa Susana Field Laboratory, Ventura County, California* (CDM 2011a).

### 4.1 Usability Summary

For the Subarea 7 data usability assessment, 58 data sets, or SDGs were reviewed. A SDG consists of 20 or fewer samples grouped together by analytical method for analyses depending on the time and date the samples were received by the laboratory. The analyses performed are discussed in Sections 2.5.1 and 2.5.2.

Samples were collected and analyzed in accordance with the WP/FSAP (CDM 2011a), and WP/FSAP Addendum for Subarea 7 with the exception of deviations during the field investigation as stated in Section 2.8.

The data generated for the Subarea 7 samples, together with the added data validation qualifiers are usable as reported, with the exception of three antimony results, three diethylene glycol results, three EFH (C12-C14) results, two EFH (C15-C20) results, four EFH (C18-C11), 34 pesticide results, 88 herbicide results, 27 SVOC results, 2 SVOC SIM results, and one cyanide result (0.38 percent of all analytes) that were rejected for Subarea 7 data. These rejected data do not impact project objectives and goals. Specific details are provided in the validation reports in Appendix C and Section 4.7.

### 4.2 Data Validation Procedures

Data were validated by the independent data validation firm Laboratory Data Consultants, Inc. All data validation was conducted in accordance with *EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review* (EPA 2004), *EPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review* (EPA 2008), and *EPA Contract Laboratory Program National Functional Guidelines for Chlorinated Dioxin/Furan Data Review* (EPA 2005).

The data validation strategy was to validate 10 percent of the data according to EPA Level IV protocols (all QC parameters and raw data) and the remaining 90 percent according to EPA Level III protocols (all QC parameters except calibrations and raw data).

Table 4-1 shows all SDGs that include Subarea 7 soil samples and those SDGs that were validated as Level III or Level IV. Some SDGs contain samples from other subareas, but all samples in an SDG were validated together. An index of samples associated with each SDG is presented at the beginning of Appendix C.

**Table 4-1 Sample Delivery Groups and Validation Levels for Subarea 7**

| Sample Delivery Group | Level of Validation Performed | CDM Review |
|-----------------------|-------------------------------|------------|
| <b>8 North</b>        |                               |            |

| DX150                 | Level III                     |            |

**Table 4-1 Sample Delivery Groups and Validation Levels for Subarea 7**

| Sample Delivery Group | Level of Validation Performed | CDM Review |
|-----------------------|-------------------------------|------------|
| DX151                 | Level III                     |            |
| DX152                 | Level III                     |            |
| DX153                 | Level III                     |            |
| DX154                 | Level III                     |            |
| 11K007                | Level IV                      | Yes        |

**Note:** Some SDGs contain samples from other subareas, but all samples in an SDG were validated together.

In order to evaluate the quality of the laboratory and the validation firm, CDM chemists reviewed 10 percent of the Subarea 7 soil sample SDGs. The purpose of the review was to identify any QC issues with the laboratory not identified by the validation firm or any discrepancies in validation procedures by the validation firm. No additional qualifiers were applied to the data based on CDM's review. The results of this review are provided in Section 4.8.

### 4.3 Quality Assurance Objectives

Quality assurance (QA) objectives for measurement data are expressed in terms of precision, accuracy, representativeness, comparability, completeness, and sensitivity (PARCCS). The QA objectives provide a mechanism for evaluating and measuring data quality.

A review of the collected data is necessary to determine if DQOs established in the WP/FSAP (CDM 2011a) have been met. The following data measurement tasks were evaluated:

- Specification and adherence to analytical method and reporting detection limit requirements
- Identification of the appropriate laboratory analytical QC requirements and verification of whether these QC requirements were met
- Verification that measurement performance criteria (representativeness and completeness) for the data were met
- Verification that field procedures were followed, deviations were documented, and determination of impact on data quality as a result of these deviations

The data validation review determines if the collected data are of sufficient quality (except for the rejected results) to support their intended use.

### 4.4 Summary of Field and Laboratory QA Activities

CDM completed sampling activities in Subarea 7 in accordance with the approved WP/FSAP (CDM 2011a) and Addendum to the WP/FSAP (CDM 2011b). A total of 257 samples were collected and analyzed from 116 drainage and surface locations and 102 soil boring locations. Table 2-1 provides a summary of the samples collected and the laboratory analyses requested.

### 4.5 Field Quality QA/QC

The field QC samples were collected at a frequency of 1 per 20 samples (5 percent) for MS/MSDs and field duplicates. MS/MSD and field duplicate samples were collected by CDM at 11 sample locations in Subarea 7 and analyzed by LLI and EMAX. MS/MSD and field duplicate samples met the frequency requirements detailed in the WP/FSAP (CDM 2011a).

As discussed in Section 2.4.2, nine equipment rinsate blank samples were collected weekly during the time samples were collected in Subarea 7. Two field blank samples were collected during sampling in Subarea 7. Results for the equipment rinsate blank and field blank samples labeled in association with Subarea 7 are presented in Appendix C and a summary of the detected results is presented in Tables 4-2 and 4-3.

**Table 4-2 Equipment Blanks for Subarea 7 Samples – Detected Results Only**

Thirty-five trip blank samples were shipped with the Subarea 7 soil samples. The results for these samples are presented in Appendix C and a summary of the detected results is presented in Table 4-4. Data qualifications based on blank detections and impacts to the data due to contaminants detected in the blanks are discussed in Section 4.7.3 and in the Appendix C validation reports.

Temperature blanks were to be included with each shipment of samples. Based on validation results, all temperature blanks for Subarea 7 met criteria. Field QA/QC objectives were attained through the use of appropriate sampling techniques and collection of the required number and frequency of QC samples.

## 4.6 Laboratory Quality QA/QC

Analytical QA/QC was assessed by laboratory QC checks, method blanks, sample custody tracking, sample preservation, adherence to holding times, LCSs, MSs, calibration recoveries, surrogates, tuning criteria, second column confirmations, internal standards, serial dilutions, laboratory duplicates, and interference check standards. The majority of the laboratory QC sample criteria met project requirements as indicated in the data validation reports in Appendix C with the appropriate qualifiers applied. Three antimony results, three diethylene glycol results, three EFH (C12-C14) results, three EFH (C15-C20) results, four EFH (C18-C11) results, 34 pesticide results, 88 herbicide results, 27 SVOC

results, 2 SVOC SIM results, and one cyanide result (0.38 percent of all analytes) were rejected for Subarea 7 as discussed in Section 4.7 and in Appendix C.

## 4.7 Data Quality Indicators

This section summarizes the validation performed. Individual SDG validation reports with specific sample detail are provided in Appendix C.

Achievement of the DQOs was determined in part by the use of data quality indicators (DQIs) described in the DUAR in Appendix C. These DQIs for measurement data are expressed in terms of PARCCS. The DQIs provide a mechanism for ongoing control to evaluate and measure data quality throughout the project. These criteria are defined in the sections below.

### 4.7.1 Precision

Precision is the measurement of the ability to obtain the same value on re-analysis of a sample through the entire analytical process. The closer the measurement results, the greater the precision. Precision has nothing to do with accuracy or true values of the sample. Instead, it is focused on random errors inherent in the analysis that stem from the measurement process and are compounded by the non-homogeneous nature of some samples. Precision is measured by analyzing two portions of the sample (sample and duplicate) and then comparing the results. This comparison can be expressed in terms of relative percent difference (RPD). RPD is calculated as the absolute difference between the two measurements divided by the average of the two measurements.

$$RPD = \frac{[(A-B)/A+B]}{2} \times 100$$

The problem with this formula is that it depends on the average of the two measurements and the magnitude of the calculated RPD is intimately linked to the magnitude of the results. When sample results are close to the RL, the RPD is greater but does not necessarily indicate that the precision is out of control limits, just that the sample concentrations are low.

RPD as a measure of precision works very well in those cases where the same level of analyte is present in all samples; however, it does not work well as a quantitative tool when varying levels are present. Analysis of sample duplicates is valuable as a quantitative measure of precision but is not useful as a quantitative measure in environmental sample analyses. Another option that is used for evaluating the differences between sample results that are close to the RL is calculating the absolute difference between the results. In this situation, the difference between the sample results is compared to the RL (2 times the RL for soils) and if the difference is greater, the sample results are qualified as estimated "J."

Because of these problems, precision is normally calculated on spike samples, either on MS and MSD or on a LCS and laboratory control sample duplicate (LCSD). In this case, a known concentration of analyte has been created in each sample and long and short term evaluations of RPD can be made that are applicable to the reality of the measurement. The drawback is that the precision measurement is only applicable to the particular spike level used.

For the Subarea 7 soil data set, precision was evaluated by reviewing RPD results for MS/MSDs, LCS/LCSDs, laboratory duplicates, and field duplicates.

Laboratory RPD control limits are presented in the WP/FSAP (CDM 2011a) or are laboratory specific. For laboratory duplicates, if one or both of the sample results were less than 2 times the RL, a control limit of the absolute difference value equal to the RL was used for comparison.

The field duplicate RPD criterion is 50 percent. Field duplicates for this project were validated as follows: If one result is non-detect and the other result is above the RL, the RPD result is reported at 200 percent and the field duplicate sample and parent sample results are qualified as estimated "J" for a detect value or "UJ" for a non-detect value. If the field duplicate RPD is above the 50 percent criterion (and both sample results are above the RL) the field duplicate and parent sample results for that analyte are qualified as estimated "J."

Qualifiers were applied to applicable sample analyte results during the validation process based on laboratory and field duplicate precision results. Details of the validation and the number of analytes qualified are provided in the DUAR and laboratory validation reports in Appendix C.

The following Subarea 7 individual analyte results were qualified as estimated "J/UJ" based on precision criteria:

- Some of the fluoride/nitrate, metals and PCBs/PCTs analyte results due to laboratory precision criteria
- Some of the dioxins, alcohols and terphenyls, TPH and glycols, PCB/PCTs and herbicide analyte results as RPD results between the two columns were outside of criteria

The following individual analyte results were rejected "R" based on precision criteria:

- Three antimony results based on MSs

Some dioxin results, various metal results, hexavalent chromium results, mercury results, alcohol and terphenyls, TPH and glycol results, pesticides, PCB/PCT results, herbicide results, SVOC results, SVOC SIM results and cyanide results for Subarea 7 samples were qualified as estimated "J/UJ" based on field duplicate precision criteria. No results were rejected based on field duplicate precision criteria. All field duplicate RPD results are presented in Appendix C.

There is no discernable pattern or reason for the laboratory and field duplicate sample RPD exceedances identified. No field sampling issues were identified that would cause the RPD results that were outside of criteria. These exceedances are reasonable for this type of sampling activity. Sample results that have been qualified as estimated "J/UJ" due to precision criteria are usable for project decisions with a degree of caution.

#### 4.7.2 Accuracy

Accuracy is a concept from quantitative analysis that attempts to address the question of how close the analytical result is to the true value of the analyte in the sample. Accuracy is determined through a spike procedure, where a known amount of the target analyte is added to a portion of the sample then the sample and the spiked sample are analyzed. The quantitative measure of accuracy is percent recovery (%R) calculated as follows:

$$\text{Percent Recovery} = \frac{(\text{Total Analyte Found} - \text{Analyte Originally Present})}{\text{Analyte Added}} \times 100$$

Each measurement performed on a sample is subject to random and systematic error. Accuracy is related to the systematic error. Attempts to assess systematic error are always complicated by the inherent random error of the measurement.

Analytical accuracy for the entire data collection activity is difficult to assess because several sources of error exist. Errors can be introduced by any of the following:

- Sampling procedure
- Field contamination
- Sample preservation and handling
- Sample matrix
- Sample preparation
- Analytical techniques

Accuracy is maintained to the extent possible by adhering to the EPA method and approved field and analytical standard operating procedures.

The following QC samples are used to assess laboratory accuracy:

Matrix Spikes: MSs are samples with a known amount of a target analyte added to them. Analysis of the sample that has been spiked and comparison with the results from the unspiked sample (background) gives information about the ability of the test procedure to generate a correct result from the sample.

Reporting Limit Matrix Spikes: RL-MSs are samples to which a known amount of a target analyte has been added to the sample at the reporting limit concentration. Analysis of the sample that has been spiked and comparison with the results from the unspiked sample (background) gives information about the ability of the test procedure to generate a correct result from the sample. The RL-MS is designed to verify the laboratory methods ability to accurately quantitate the spiked compound at the RL in the site matrix. The RL-MS is an extra QC sample used for the modified methods identified in Table 2-2.

Post Digestion Spikes: Post digestion spikes are performed after the sample has been prepared and are ready for analysis. These are also termed "analytical spikes." The technique is used in conjunction with a MS to provide data that can separate interferences produced as part of the sample preparation from interferences that are innate qualities of the sample.

Laboratory Control Samples: LCSs consist of a portion of analyte-free water or solid phase sample that is spiked with target analytes at a known concentration.

Reporting Limit Laboratory Control Samples: RL-LCSs consist of a portion of analyte-free water or solid phase sample that is spiked at the reporting limit with target analytes at a known concentration. The RL-LCS is designed to verify the laboratory methods ability to accurately quantitate the spiked compound at the RL. The RL-LCS is an extra QC sample used for the modified methods identified in Table 2-2.

Surrogates: Surrogate recovery is a QC measure limited to use in organics analysis. Surrogates are compounds added to every sample at the beginning of the sample preparation to monitor the success of the sample preparation and analytical procedures on an individual sample

basis. Individual compounds used as surrogates are selected based on their ability to mimic the behavior of specific target analytes held to be particularly sensitive to the sample preparation manipulations.

Interference Check Samples: Interference check sample analysis is a QC measure unique to metals analysis using inductively coupled plasma atomic emission spectrometry. This QC sample verifies the analytical instrument's ability to overcome interferences typical of those found in samples.

Calibrations: Method requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable quantitative data for metals. Initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of the analytical run. Continuing calibrations demonstrate that the initial calibration is still valid by checking the performance of the instrument on a continuing basis.

Internal Standards: Internal standards measure the gas chromatograph/mass spectrometer sensitivity and response stability during each analysis.

Serial Dilution: Serial dilutions are performed on at least one sample from every batch of analyses for metals to determine if physical or chemical interferences exist in the analyte determinations.

For the Subarea 7 soil data sets, accuracy was evaluated by reviewing the %R values of initial and continuing calibration (percent difference or percent drift [%D] for organic analyses), internal standards, surrogate spikes (organic analyses only), MS/MSD, LCS/LCSD, inductively coupled plasma (ICP) interference standards, serial dilution results, and reviewing method blanks, calibration blanks, equipment rinsate blanks, and trip blank results. These QC results assist in identifying the type and magnitude of effects that may have contributed to system error introduced from field and/or laboratory procedures.

Qualifiers were applied to applicable sample results during the validation process based on laboratory accuracy results. Details of the validation and the number of analytes qualified are discussed in detail in the DUAR and laboratory validation reports in Appendix C. No qualifiers were applied to applicable sample results based on the accuracy results of the RL-LCS and RL-MS samples. These QC samples are intended to evaluate the effects of the method modifications on the RLs program-wide. A statistically robust population of RL-LCS and RL-MS samples has not yet been achieved. When enough data has been collected, decisions regarding the accuracy and precision of these RLs will be addressed by all parties including possible changes to the RLs.

The following Subarea 7 individual analyte results were qualified as estimated "J/UJ" based on accuracy criteria:

- Some of the dioxin results, fluoride/nitrate results, metals, TPH and glycols, pesticide results, PCB/PCTs, herbicides, SVOC results, SVOC SIM results, and cyanide results due to MSs
- Some of the pesticides, PCB/PCT results, herbicide results and SVOC results due to LCSs
- Some of the NDMA results, alcohol and terphenyl results, TPH and glycols, pesticides and PCB/PCT results due to surrogates

- Some of the alcohol and terphenyl results, pesticides, PCB/PCT results, VOC results and energetic results due to calibrations
- Some of the metal analyte results due to serial dilutions

The following individual analyte results were rejected "R" based on accuracy criteria:

- Three antimony results based on MSs (these results were previously rejected due to precision criteria as well)
- Three diethylene glycol results, three EFH (C12-C14) results, two EFH (C15-C20) results and four EFH (C8-C11) results based on MSs and surrogates
- Thirty-four pesticide results based on MSs and surrogates
- Eighty-eight herbicide results based on LCSs and MSs
- Twenty-seven SVOC results based on MSs and LCSs
- Two SVOC SIM results (Di-n-octylphthalate and benzo(k) fluoranthene) based on internal standards and MSs
- One cyanide result based on MS

Sample preservation, handling, and holding times are additional measures of accuracy of the data. Holding times are defined as the amount of time that elapses between collection of the sample in the field to the start of the analysis. Preservation is defined as techniques used to maintain the target analytes at concentrations representative of the source sampled. Published holding times are viewed as valid as long as the associated preservation and container requirements have been met. All holding times, sample preservation and handling criteria were met except for ten TPH and glycol results. These are discussed in detail in the DUAR and laboratory validation reports in Appendix C.

Sample results that have been qualified as estimated "J/UJ" due to accuracy criteria are usable for project decisions. Results that have been rejected are not usable.

#### 4.7.3 Blank Contamination

Blanks are used to determine the level of laboratory and field contamination introduced into the samples, independent of the level of target analytes found in the sample source. Sources of sample contamination can include the containers and equipment used to collect the sample, preservatives added to the sample, other samples in transport coolers and laboratory sample storage refrigerators, standards and solutions used to calibrate instruments, glassware and reagents used to process samples, airborne contamination in the laboratory preparation area and the analytical instrument sample introduction equipment. Each analyte group has its own particular suite of common laboratory contaminants. Active measures must be performed to continually measure the ambient contamination level and steps taken to discover the source of the contamination to eliminate or minimize the levels. Random spot contamination can also occur from analytes that are not common laboratory problems but that can arise as a problem for a specific project or over a short period of time. Sample equipment decontamination practices are discussed in Section 2.4.4. Field blanks, equipment blanks, trip blanks and laboratory method blanks are analyzed to identify possible sources of contamination. The DUAR and laboratory validation reports in Appendix C discuss the results that were qualified based on field and laboratory blank contamination.

In summary, for Subarea 7 samples, some dioxins, metals, mercury, TPH and glycols, VOCs, and SVOC SIM results were qualified as non-detect due to laboratory blank contamination criteria. Some results for metals, hexavalent chromium, mercury and VOC analytes were also qualified based on field blank contamination. The percentage of results qualified as non-detect based on laboratory blank contamination was less than 5 percent, as discussed in Appendix C, for all analyses except the following: 28 percent of the dioxins; and 23 percent of the mercury results. These results were qualified as non-detect "U" due to laboratory blank contamination.

For the dioxins, estimated detection limits (EDLs) are calculated for each sample. The EDLs for this analysis are very low, reported in nanograms per kilogram (ng/kg) or parts per trillion, resulting in numerous results qualified as estimated "J" values because they are below the RL. Many of these estimated values have been subsequently qualified as non-detect "U" because the compound was detected in related laboratory blanks. The laboratory blank results correlate to the sample EDLs and low level detections of dioxin analytes are somewhat inevitable because of the nature and universal extent of the compounds. The dioxin levels found in the blanks are well below site-related action levels. Therefore, the resulting qualification of associated sample results as not detected or "U" qualified data do not falsely diminish identification of site-related contaminants.

The other reported analytes that had blank qualifications greater than 5 percent do not indicate a laboratory blank contamination problem as the overall sample counts for those analytes were low. For example, there were only 257 mercury samples analyzed and out of those samples 57 mercury results were qualified due to blank contamination.

Tables 4-2 through 4-4 provide a summary of analytes observed in equipment, field, and trip blank samples, respectively. Most of the detected compounds in these blanks were below the RLs but above the MDLs. Compounds detected above the RL in equipment, trip, and field blanks are highlighted yellow in the associated tables. The field blanks had detections of analytes as shown in Table 4-3. ASTM Type II water is not typically certified "clean" to the low RLs established for the low level methods used for the co-located sampling program.

A review of the ASTM Type II field blanks for all Phase 1 sampling showed one detect of heptachlor, three detects of naphthalene, and one detect of RDX above their respective RL. One field blank had detects above the RLs for four metal analytes and one field blank had detects above the RLs for a variety of VOC analytes. ASTM Type II water field blanks will continue to be reviewed to monitor for detected concentrations of analytes throughout the sampling program. The associated sample results were qualified accordingly during the validation process.

A review of all Phase 1 equipment blanks was also performed. In general, a variety of analytes were detected above their respective RLs. The most frequently detected analytes were naphthalene, NDMA and RDX. Naphthalene was detected in 28 percent of the equipment blanks, NDMA in 27 percent of the equipment blanks, and RDX in 26 percent of the equipment blanks. Other analytes were detected in the equipment blanks with methylene chloride being detected in eight percent of the equipment blanks. All other analytes were detected in less than five percent of the equipment blank samples.

Further review of the equipment blanks is being conducted and all Phase 3 equipment blanks collected to-date are being evaluated to determine if these low level detections are consistent indicating a possible deficiency in decontamination procedures and/or source water impacts that need to be addressed and corrected. Associated sample results were qualified accordingly during the validation process regarding field blank contamination. No sample results were rejected due to detected concentrations in any field, trip, equipment or laboratory blanks.

#### 4.7.4 Representativeness, Comparability, and Sensitivity

Representativeness, comparability, and sensitivity are achieved by using EPA-approved sampling procedures and analytical methodologies. By following the procedures described in the WP/FSAP for this sampling event and future sampling events, sample analysis should yield results representative of environmental conditions at the time of sampling. Similarly, reasonable comparability of analytical results for this and future sampling events can be achieved if approved EPA analytical methods and standardized reporting units are employed.

##### 4.7.4.1 Representativeness

Representativeness is a qualitative term that expresses the degree to which the sample data accurately and precisely represent the environmental conditions corresponding to the location and depth interval of sample collection. Requirements and procedures for sample collection are designed to maximize sample representativeness.

Representativeness also can be monitored by reviewing field documentation and/or performing field audits. For this report, a detailed review was performed on the CoC forms, laboratory sample confirmation logs, and data validation packages. Laboratory QA/QC requirements were included in the WP/FSAP (CDM 2011a) and laboratory statements of work (SOWs) to ensure that the laboratory analytical results were representative of true field conditions.

The most significant measure of representativeness is the accuracy of the sampling network and selection of appropriate locations and depths, etc. Field sampling accuracy was attained through adherence to the approved WP/FSAP for sample location and collection and by using approved standard operating procedures for field data collection. Therefore the data should represent, as near as possible, the actual field conditions at the time of sampling.

Representativeness has been achieved by the performed field work and laboratory analyses. The analytical data generated that have not been rejected are viewed to be a representative characterization of the project area.

##### 4.7.4.2 Comparability

Comparability is a qualitative term that expresses the confidence with which a data set can be compared with another. Strict adherence to standard sample collection procedures, analytical detection limits, reporting units and analytical methods assures that data from like samples and sample conditions are comparable. This comparability is independent of laboratory personnel, data reviewers, or sampling personnel. Comparability criteria are met for the project if, based on data review, the sample collection and analytical procedures are determined to have been followed, or defined to show that variations did not affect the values reported.

To ensure comparability of data generated for the site, standard sample collection procedures and DTSC-reviewed analytical methods were utilized by CDM. The sample analyses were performed by LLI and EMAX. Utilizing such procedures and methods enables the current data to be comparable with previous and future data sets generated using similar methods.

##### 4.7.4.3 Sensitivity

Sensitivity is related to the ability to compare analytical results with project-specific levels of interest, such as risk-based screening levels or action levels. Analytical detection limits for the various sample analytes should be below the level of interest to allow an effective comparison.

### *Detection Limits*

The MDL study attempts to answer the question, "What is the lowest level of analyte in a sample that will result in a signal different than zero"? The study is based upon repetitive analysis of an interference-free sample spiked with a known amount of the target analyte. The MDL is a measure of the ability of the test procedure to generate a positive response for the target analyte in the absence of any other interferences from the sample.

The RL is generally defined as the lowest concentration at which an analyte can be detected in a sample and its concentration reported with a reasonable degree of accuracy and precision. For samples that do not pose a particular matrix problem, the RL is typically about three to five times higher than the MDL.

Laboratory results are reported according to rules that provide established certainty of detection and RLs. An analyte result is flagged with a "U" if that analyte was not detected, or qualified with a "J" flag if associated QC results fall outside the appropriate tolerance limits. Also, if an analyte is present at a concentration between the MDL and the RL, the analytical result is flagged with a "J," indicating an estimated quantity. Qualifying the result as an estimated concentration reflects increased uncertainty in the reported value.

RLs for the modified methods identified in Table 2-2 are evaluated through the analysis of RL-LCS and RL-MS samples created by LLI. The evaluation of these QC samples is ongoing throughout all subareas of Area IV and recommendations regarding program-wide sample qualification based on the RL-LCS and RL-MS QC results have not been finalized. Qualification of individual sample results for Subarea 7 was not performed based on the current RL-LCS and RL-MS QC results.

Qualifiers were applied to applicable sample results by the laboratory and identified during the validation process based on sample results being reported as detected below the RL/MDL. Details of the validation and the number of results qualified are discussed in detail in the DUAR and laboratory validation reports in Appendix C.

In summary, for all Subarea 7 samples analyzed, results for some of the analytes were qualified as estimated due to RL criteria for all analytical methods except for VOC SIM results and energetic results. The VOC SIM and energetic results required no qualification based on RL criteria.

In general, for the data validated in this TM, RLs for the sample results were low enough to compare to the RLs stated in the WP/FSAP (CDM 2011a). The RLs for this project are lower than "normal" environmental data analyses for some classes of compounds. Some analytical laboratory methods were modified in order to achieve the lowest practicable RLs in an attempt to comply with the AOC. All modified analyses are undergoing further studies to evaluate the effect of the modifications on precision and accuracy. An independent study evaluating the precision and accuracy of the modified herbicide method has been completed. Review of the herbicide results indicate that the method modifications did not achieve precision and accuracy goals at this lower reporting limit for some of the analytes. Data are currently under further review and it is likely that reporting limits may be elevated for some analytes. These results are still considered usable for project decisions.

## 4.8 Review of Selected Validation Reports

CDM performed a review of the validation reports identified in Table 4-1. This review involved comparing the validation report results against the laboratory data packages as well as the validation

guidance documents. All validation report results were verified against the laboratory data packages and validation guidance documents were followed as required.

## 4.9 Data Completeness

Completeness of the data collection program is defined as the percentage of samples planned for collection as listed in the WP/FSAP (CDM 2011a) versus the actual number of samples collected during the field program (see equation A).

Completeness for acceptable data is defined as the percentage of acceptable data obtained judged to be valid versus the total quantity of data generated (see equation B). Acceptable data include both data that pass all the QC criteria (unqualified data) and data that may not pass all the QC criteria but had appropriate corrective actions taken (qualified but usable data).

$$\text{Equation A.} \quad \% \text{Completeness} = C \times \frac{100}{n}$$

Where:

C = actual number of samples collected  
n = total number of samples planned

$$\text{Equation B.} \quad \% \text{Completeness} = V \times \frac{100}{n'}$$

Where:

V = number of measurements judged valid  
n' = total number of measurements made

The overall completeness goal, as defined in the WP/FSAP (CDM 2011a), for this sampling event is 90 percent for each analytical test for all project data.

A total of 266 Subarea 7 soil samples including field duplicates were collected and analyzed. As discussed in Section 2.8, 185 locations were to be sampled in Subarea 7. Some locations required only a subsurface sample while other locations required both a surface and subsurface sample. The number of subsurface samples to be collected at each location is not pre-determined because the total depth of each boring varies depending on the local geology. Of the locations to be sampled in Subarea 7, subsurface samples were not collected at 65 locations due to shallow refusal at less than 2.5 feet and one location was not sampled due to archeological concerns.

As discussed in Section 2.8, the sampling deviations do not impact completeness objectives for this sampling program. Ninety-nine percent of the sample locations identified in the WP/FSAP Addendum for Subarea 7 were sampled; this meets the completeness goal for the number of locations sampled versus number of locations planned to be sampled.

The completeness goal achieved for acceptable data was 99.6 percent of the number of measurements judged to be valid versus the total number of measurements made for all Subarea 7 samples analyzed. Table 4-6 summarizes all results that were estimated or rejected.

The following Subarea 7 individual analyte results were rejected per analyses:

- Method 6020
  - Three out of 4,378 antimony results (0.068 percent)

- Method 8015M
  - Twelve out of 1,557 individual TPH and glycol results (0.77 percent)
- Method 8081A
  - Thirty-four out of 2,415 individual pesticide results (1.4 percent)
- Method 8151A
  - Eight-eight out of 1,150 individual herbicide results (7.6 percent)
- Method 8270C
  - Twenty-seven out of 13,501 individual SVOC results (0.199 percent)
- Method 8270C SIM
  - Two out of 5,832 individual SVOC SIM results (0.034 percent)
- Method 9012B
  - One out of 133 cyanide results (0.75 percent)

**Table 4-6 Summary of Data Completeness Following Data Validation – Subarea 7**

|                                                                                | Number of Analyte Detections Without Qualifiers | Number of Estimated Results | Number of Rejected Results | Number of Nondetect Results | Number of Estimated Nondetect Results | Total Analytes Detect and Nondetect | Percent of Analyte Results Judged Valid Versus Total Analyte Results Collected |
|--------------------------------------------------------------------------------|-------------------------------------------------|-----------------------------|----------------------------|-----------------------------|---------------------------------------|-------------------------------------|--------------------------------------------------------------------------------|
| Dioxins                                                                        | 666                                             | 2010                        |                            | 1667                        | 26                                    | 4269                                | 100                                                                            |
| NDMA                                                                           |                                                 | 3                           |                            | 78                          |                                       | 81                                  | 100                                                                            |
| Formaldehyde                                                                   |                                                 | 8                           |                            | 73                          |                                       | 81                                  | 100                                                                            |
| Cyanide                                                                        | 2                                               | 3                           | 1                          | 127                         |                                       | 133                                 | 99.25                                                                          |
| Fluoride, Nitrate                                                              | 106                                             | 137                         |                            | 37                          | 62                                    | 342                                 | 100                                                                            |

| <b>Completeness Total for All Subarea 7 Samples Collected and Judged Valid</b> |                                                 |                             |                            |                             |                                       |                                     | <b>99.62</b>                                                                   |

The completeness goals for both the locations sampled and the number of measurements judged to be valid were met.

Sampling deviations from procedures described in the WP/FSAP (CDM 2011a) are discussed in Section 2.8 of this TM. Deviations did not impact DQOs for this sampling event. The data reported and not rejected are suitable for their intended use for characterization of Area IV of SSFL. The DQIs identified in the WP/FSAP (CDM 2011a) met appropriate criteria. The achievement of the completeness goals for the data indicates a sufficient amount of usable data has been generated on which to base project decisions.

As discussed in Section 2.7, the EMAX split samples were also validated. Sample results were qualified based on blank results, field duplicate results, MSs, ICP serial dilution results and reporting limits. Validation qualifiers applied to the EMAX analyzed samples are similar to the qualifiers applied to LLI analyzed samples. A separate memorandum discusses the details of the precision and accuracy of the EMAX sample results compared to the LLI sample results. The results generally indicate acceptable performance by EMAX.

## 4.10 Assessment of Data Usability and Reconciliation with WP/FSAP Goals

Over 99 percent of the data validated for Subarea 7 and reported in this TM are suitable for their intended use for site characterization. Sample results that were rejected are not suitable for project use. The rejected analyte results do not impact achievement of the overall project objectives. The RLs reported generally met the expected limits proposed by the analytical laboratory in their contract agreement with CDM.

Sample results that were qualified as estimated are usable for project decisions. Numerous dioxin results were qualified as estimated and/or non-detect due to the low detection limits. This data is considered usable.

Field duplicate precision also met criteria a majority of the time. RPDs were outside criteria predominantly when the sample results were close to the RL and/or below the project required action limits. Decisions based on results close to the RL should be made with a degree of caution. The achievement of the completeness goals for number of samples collected, and the number of sample results acceptable for use provides sufficient quality data to support project decisions.

## SSFL Main Qualification Definitions and Notes

**NOTE:** In the Appendix A tables, samples that were analyzed by Lancaster Laboratories are identified with the letter "N" in the sample type code and samples analyzed by EMAX are identified with the word "Split" in the sample type code.

- U** – The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J** – The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- R** – The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.
- UJ** – The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

## SSFL Specific Qualification Definitions

## SSFL Main Qualification Definitions and Notes

**NOTE:** In the Appendix A tables, samples that were analyzed by Lancaster Laboratories are identified with the letter "N" in the sample type code and samples analyzed by EMAX are identified with the word "Split" in the sample type code.

- U** – The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J** – The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- R** – The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.
- UJ** – The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
