Probe ID/Soil ID: GSV-DG-S09
Site: SA 6
Drilling Contractor: EST
Borehole TD: 21' BGS.
Project: Phase 3 DOE Data Gap Sampling 2014
Logged by: Andrew Rayne
Driller: Martin Kilhullen
Borehole Diameter: 2.25"
Job #: 10503982.3050105/10503982.3060105
Reviewed by:
Rig Type/Method: Geoprobe 5400 / DP
Probe Completion Date/Time: 6/9/14 0915

Vapor Implant Specs
Material: Stainless Steel
Length: 6"
Diameter: 3/8"

Tubing Specs
Material: Teflon
Diameter: 1/4"
Color: Clear

Sand Pack Specs
Grain Size: #3
Manufacturer: Cemex

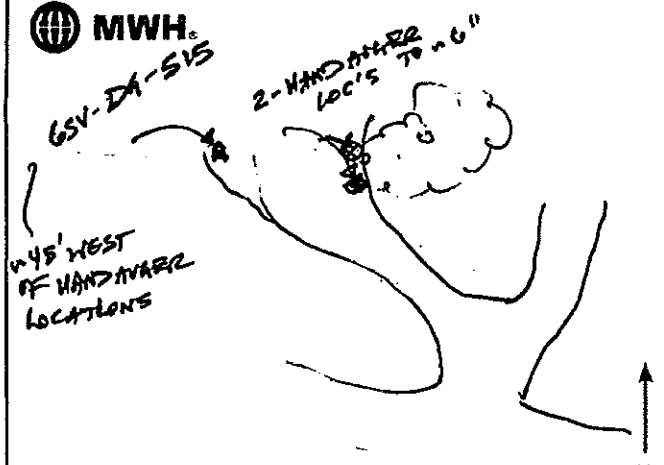

Dry Bentonite
Type: #8
Manufacturer: CETCO

Hydrated Bentonite
Type: #8
Manufacturer: CETCO

Notes:
1. Probes not to scale.
2. Borings are approximately 2 inches in diameter using a Macrocore or Dual Tube sampler and can hold up to 5 soil vapor probes. If additional depths will require sampling at the same location, a second boring may need to be drilled.

Job #: 10503982
Site: SA SD
Logged by: V. Vathanasin
Reviewed by:
Drilling Contractor: EST
Driller: Morgan Hughes
Rig Type/Method: Geoprobe 5400/DP
Borehole TD: 12.0
Borehole Diameter: 2.25"
Probe Completion Date/Time: 1420/6-3-14

Vapor Implant Specs
Material: Stainless Steel
Length: 6"
Diameter: 3/8"

Tubing Specs
Material: Teflon
Diameter: 1/4"
Color: Clear

Sand Pack Specs
Grain Size: #3
Manufacturer: Cemex

Dry Bentonite
Type: #8
Manufacturer: Cetco

Hydrated Bentonite
Type: #8
Manufacturer: Cetco

Notes:

1. Probes not to scale.
2. Borings are approximately 2 inches in diameter using a Macrocore or Dual Tube sampler and can hold up to 5 soil vapor probes. If additional depths will require sampling at the same location, a second boring may need to be drilled.

Asphalt Metal Plastic

Concrete Wood Glass

Igneous/Metamorphic Gravel (N/A)

Other _____

Is Staining Present Yes (No)

Color 10YR 4/4 dark yellowish brown

Odor

1. **Odor Strength (circle one)**

(None) Slight Strong

2. **Odor Description (circle one)**

Organic Petroleum Chemical

(N/A) Other _____

Moisture Condition (circle one)

(Dry) Moist Wet

PG Signature [signature] **PG Registration #** 7735

Additional Comments Sample includes rinsate + DUP 9 encores, 1 802 jar 12 μRem, 52 cpm, 0.0 ppm

TD = 4.9' bgs

SSFL Phase 3 – Field Sample Data Sheet

SSFL Phase 3 – Field Data Sample Sheet (Sample Descriptions)

Soil Classification (circle one)

MAJOR DIVISION			GROUP SYMBOL	LETTER SYMBOL	GROUP NAME
COARSE GRAINED SOILS CONTAINS MORE THAN 50% FINES	GRAVEL AND GRAVELLY SOILS MORE THAN 50% OF COARSE FRACTION RETAINED ON NO. 4 SIEVE	GRAVEL WITH < 5% FINES		GW	Well-graded GRAVEL
				GP	Poorly graded GRAVEL
		GRAVEL WITH BETWEEN 5% AND 15% FINES		GW-GM	Well-graded GRAVEL with silt
				GW-GC	Well-graded GRAVEL with clay
				GP-GM	Poorly graded GRAVEL with silt
				GP-GC	Poorly graded GRAVEL with clay
		GRAVEL WITH ≥ 15% FINES		GM	Silty GRAVEL
				GC	Clayey GRAVEL
	SAND AND SANDY SOILS MORE THAN 50% OF COARSE FRACTION PASSING ON NO. 4 SIEVE	SAND WITH < 5% FINES		SW	Well-graded SAND
				SP	Poorly graded SAND
		SAND WITH BETWEEN 5% AND 15% FINES		SW-SM	Well-graded SAND with silt
				SW-SC	Well-graded SAND with clay
				SP-SM	Poorly graded SAND with silt
				SP-SC	Poorly graded SAND with clay
		SAND WITH ≥ 15% FINES		(SM)	Silty SAND
				SC	Clayey SAND
FINE GRAINED SOILS CONTAINS MORE THAN 50% FINES	SILT AND CLAY	LIQUID LIMIT LESS THAN 50		ML	Inorganic SILT with low plasticity
				CL	Lean inorganic CLAY with low plasticity
				OL	Organic SILT with low plasticity
		LIQUID LIMIT GREATER THAN 50		MH	Elastic inorganic SILT with moderate to high plasticity
				CH	Fat inorganic CLAY with moderate to high plasticity
				CH	Organic SILT or CLAY with moderate to high plasticity
HIGHLY ORGANIC SOILS				PT	PEAT soils with high organic contents

Fill Material

1. **Is Fill Material Present** Yes (No)

2. **Percentage Fill (%)** 0

3. **Fill Description (circle all that apply)**

Asphalt Metal Plastic

Concrete Wood Glass

Igneous/Metamorphic Gravel (N/A)

Other _____

Is Staining Present Yes (No)

Color 10YR 4/4 dark yellowish brown

Odor

1. **Odor Strength (circle one)**

1.0 INTRODUCTION

This technical memorandum (TM) has been prepared to present the trench investigation observations and soil sampling procedures completed during the Phase 3 Chemical Data Gap Investigation within Area IV of the Santa Susana Field Laboratory (SSFL). Trenching and soil sampling activities were conducted in accordance with the Master Field Sampling Plan (MFSP) for Chemical Data Gap Investigation, Phase 3 Soil Chemical Sampling at Area IV, Santa Susana Field Laboratory (Phase 3 Work Plan) (CDM Smith [CDM], 2012). Soil samples collected from trenches addressed data gaps proposed in the Final Phase 3 Data Gap Analysis Technical Memoranda for Subarea 5A (MWH, 2012c), Subarea 5B (MWH, 2012b), Subarea 5C (MWH, 2012a), Subarea 5D (MWH, 2013c), Subarea 3/6 (MWH, 2012d), Subarea 7 (MWH, 2013a), and Subarea 8 (MWH, 2013b). This TM was prepared for the Department of Energy (DOE) and is in compliance with the Administrative Order of Consent (AOC) for Remedial Action (AOC; Docket No. HSA-CO 10/11 - 037).

The purpose of this TM is to describe the completed field investigation associated with the trench soil sampling within Area IV of the SSFL. Soil samples were provided to CDM for coordination of laboratory analysis and data management. Therefore, chemical soil sampling results are not included as part of this TM.

1.1 TRENCH INVESTIGATION OBJECTIVES

The objective of the trench investigation conducted within Area IV of the SSFL was to obtain chemical soil data identified in the Phase 3 data gap analysis that will be used to evaluate whether the nature and extent of contamination at potential source areas within DOE sites are sufficiently characterized for remediation per the AOC. The trench locations were selected based on a targeted approach that focused on known or suspected subsurface features identified during previous geophysical surveys, aerial photo analysis, debris surveys and historical document review. Soil sampling locations were selected based on data gap recommendations and visual observations during field activities.

1.2 REPORT ORGANIZATION

This information presented in this TM is organized as follows:

- **Section 1.0 – Introduction.**

  This section presents the purpose and objective of this technical memorandum.

- **Section 2.0 –Trench Investigation.**

  This section describes the details of field preparation, implementation activities, observations, debris removal and deviations from the field sampling plan.

- **Section 3.0 – References.**
  The section provides the references cited in this site report.

2.0 TRENCH INVESTIGATION

Trenching activities and sampling within Area IV was performed by MWH between May 19th and June 4th of 2014. Locations, sample depths, and rationale for proposed trenches are provided in the Final Phase 3 Data Gap Analysis Technical Memoranda for Subarea 5A (MWH, 2012c), Subarea 5B (MWH, 2012b), Subarea 5C (MWH, 2012a), Subarea 5D (MWH, 2013c), Subarea 3/6 (MWH, 2012d), Subarea 7 (MWH, 2013a), and Subarea 8 (MWH, 2013b). Trench locations implemented as part of the field effort are shown on Figure 1-1.

2.1 PREPARATION ACTIVITIES

Prior to the trenching investigation, a series of preparation activities were completed including an underground utility survey, geophysical survey, biological survey, screening for surficial archaeological surficial artifacts, surficial radiological screening, vegetation clearance, and trench locating using a global position system (GPS) device and staking.

All proposed trench locations were staked using a GPS device in the field. Trench locations were adjusted in the field to target features identified in the sampling plan. Underground Service Alert (USA) was notified to mark subsurface utilities within a 50 foot buffer around the proposed trench. In addition, geophysical clearance of subsurface utilities in the general vicinity of each trench was completed on April 29, 2014 and May 5, 2014, by Underground Location Services (ULS) Service Corporation, a geophysical company subcontracted by MWH. A geophysical survey was also completed by Spectrum Geophysical to identify known and potentially unknown subsurface structures and readily identifiable subsurface utilities in Subarea 5D. Final trench locations were modified based on field observations, USA, and geophysical clearances.

A senior biologist with Leidos performed the initial oak tree and biological survey at each trench location. Trench locations were either adjusted or the trenching activities were rescheduled if sensitive or protected species were affected. The biologist returned to the site on a weekly basis until the trenching activities were completed. Trench locations and access areas that needed vegetation clearance were inspected by the biologist and every effort was made to remove evasive plants and protect native plants within these areas.

An archaeologist with Leidos conducted screening of surficial soil prior to and during trenching for Native American artifacts. No trenches were proposed in previously known Native American sensitive areas.

Before any subsurface work was performed a project specific hazard analysis was completed. This assessment determined that personal dust monitors would be worn by the MWH Field geologist and the subcontractor providing the dust control measures. Trenching activities would stop if dust measurements exceeded 0.1 milligrams per cubic meter (mg/m^3). All other subcontractors or observers would be up wind and out of the exclusion zone of the trenching activities. Dust measurements throughout trenching activities did not exceed 0.1 mg/m^3. Level D personal protective equipment (PPE) was selected for this work with a Level C upgrade to a half face respirator w/ organic vapor/ High-efficiency particulate air (HEPA) cartridges if dust levels exceeded 0.1 mg/m^3.

A certified health physicist from CDM was onsite to oversee radiation survey activities, confirm background levels and provide field direction to the onsite radiological screening technician. The onsite radiological technician used a field screening instrument to screen the surface of all trench locations prior to soil disturbance. All radiological screening activates were conducted according to Standard Operating Procedures (SOP) 7 of the Phase 3 Work Plan (CDM, 2012).

2.2 TRENCH ACTIVITIES

Nineteen trenches were advanced using a Deere 310 SJ backhoe. The trench locations are shown on Figure 1-1. A total of 53 primary soil samples were collected from the trench locations. Table 2-1 presents the sampling summary including sample identification (ID), sample depth, analytical suite, and rationale.

Trenching was conducted under the supervision of a competent person and a state of California professional geologist. Subsurface trenching activities were observed by an archaeologist from Leidos and a Native American from the Native America Monitoring Group (NAMG) for any Native American artifacts that could have been unearthed during trenching activities. Trench spoils were stockpiled at a minimum of 3 feet from the edge of the excavation and no personnel entered the trenches. Trenching was advanced until targeted features were exhumed or until bedrock was encountered. A water sprayer attached to a 500 gallon water buffalo with potable water was used throughout trenching activities for dust suppression.

Radiological screening was performed on the soil within the backhoe bucket according to SOP 7 of the Phase 3 Work Plan (CDM, 2012). During the collection of soil samples a Bicron MicroR Detector was used to monitor for potential gamma radiation by a CDM health and safety of field worker. A Ludlum 2360 Radiation Monitor was used to screen each soil sample to identify potential radiological activity. Any debris recovered or removed from the trench was also

screened for radiation. Readings were recorded in the field logbook and on the CDM field data sample sheet.

Volatile organic compound (VOC) vapor measurements were collected according to SOP 6 of the Phase 3 Work Plan (CDM, 2012). A photoionization detector (PID) was used to measure VOC vapors from subsurface soil. Measurements were collected for every soil sample, stained soil, stock piles and ambient conditions downwind of trenching activities. PID concentrations will be recorded on the field logbooks and trench logs.

Once radiological and VOC screening was preformed, soil samples were collected at targeted features or at 5 foot intervals until bedrock. Samples collected from back hoe trenches were collected according to SOP 5 of the Phase 3 Work Plan (CDM, 2012) and are further described below. A trench log was prepared detailing descriptions of soil, bedrock and targeted features along the trench wall in accordance with the Unified Soil Classification System (USCS) (American Standard for Testing and Materials [ASTM], 2009) and following the procedures outlined in SOP 9 of the Phase 3 Work Plan (CDM, 2012). Trench logs are included in Appendix A. GPS coordinates and photos were collected at each trench location, soil sample and feature within the trench. Photos of each trench are provided in Appendix B. Following sample collection and geologic logging, trenches were backfilled with trench spoils and compacted using the weight of the backhoe.

After backfilling activities, the backhoe bucket was decontaminated between each trench location. A decontamination area was built using plastic sheeting with bermed sides that was large enough to fully contain the bucket to be cleaned. The decontamination area was located in the Area IV waste accumulation yard south of Building 4038. The backhoe bucket and arm was screened for radioactivity. The backhoe bucket was sprayed with a hand sprayer with potable water, washed with bushes, water and Liquinox to remove any soil, and sprayed with American Society of Testing and Materials (ASTM) Type II water on a final rinse. The backhoe was then removed from the decontamination pool and allowed to air dry before moving on to the next trench location. All decontamination wastewater was placed in 55-gallon liquid waste drums. All plastic sheeting and PPE was stored in separate solid waste containers. All investigation derived waste (IDW) containers were properly labeled and stored at the Area IV waste accumulation yard for proper disposal according to SOP 20 of the Phase 3 Work Plan (CDM, 2012).

2.3 TRENCH SOIL SAMPLE COLLECTION

Soil samples for chemical analysis were collected from the trenches using the backhoe bucket that was firmly planted on the ground per SOP 5 of the Phase 3 Work Plan (CDM, 2012). Soil samples were either collected at the targeted feature or adjusted based on observations, field instrument readings, or unexpected features. If the targeted feature was not encountered then samples were collected at 0.5 feet below ground surface (bgs) and every five feet until bedrock.

2.3.1 Sample Collection Methods

Soil samples were collected directly from the bucket of the backhoe and placed into a clean sample container according to SOP 2 and 5 of the Phase 3 Work Plan (CDM, 2012). Soil collected for VOCs, 1-4-dioxane, and total petroleum hydrocarbons (TPH) - gasoline range organics (GRO) were collected directly from the bottom of the sample jars using EnCore® samplers. All other samples were collected in appropriate sample containers.

2.3.2 Field Quality Control Procedures

Soil duplicates were collected in separate containers, but from the same location of the original parent samples. Field duplicates were collected at a frequency of one per twenty primary soil samples. An equipment rinsate blank was collected from the backhoe bucket and submitted for analysis on a weekly basis throughout trench sampling activities. One trip blank was submitted in each cooler that contained soil samples to be analyzed for VOCs, 1,4-dioxane, and/or TPH-GRO. One source blank was prepared and submitted for each lot number of ASTM Type II water used during the sampling event. All field QC samples were collected in accordance to the QAPP in the Phase 3 Work Plan (CDM, 2012). Laboratory QC data will be provided with the analytical results in a separate TM (to be prepared by CDM at a future date).

2.3.3 Sample Handling

All containers were labeled immediately after collection and samples identifications (IDs) were applied per CDM sample container labeling procedures outlined in the Phase 3 Work Plan. The exteriors of sample containers were wiped clean with a paper towel to remove residual soil from the exterior of the containers prior to labeling. Each labeled container was placed in a zip-top plastic bag, sealed, and placed in a cooler containing ice. Soil samples were maintained at a temperature of 4 degrees Celsius (°C) with an acceptable range between 2 and 6 °C. Sample collection documentation was tracked on a CDM field data sample sheet and chain-of-custody (COC) according to SOP 10 of the Phase 2 Work Plan (CDM, 2012). Soil samples and sample documentation was handed over to the CDM field staff for final packaging and shipping to the chemical laboratory.

2.3.4 Chemical Analysis

Samples are to be analyzed according to the Final Phase 3 Data Gap Analysis Technical Memoranda using the following EPA Methods:

- VOCs and 1,4-dioxane by EPA Method 8260B and 8260B SIM;
- Metals by EPA Methods 6010B/6020/7471A/7199;
- Biphenyls by EPA Method 8270C;
- Terphenyls by EPA Method 8015B;
- Glycols by EPA Method 8015B;
- Morpholine by EPA Method 8260 TIC;
- Polyaromatic hydrocarbons (PAHs) by EPA Method 8270 SIM;
- Polychlorinated biphenyl (PCBs) and PCTs by EPA Method 8082;
- Pesticides by EPA Method 8081;
- Herbicides by EPA Method 8151A;
- Dioxins/furans by EPA Method 1613B;
- Perchlorate by EPA Method 314.0 with confirmation by EPA Method 6850;
- TPH by EPA Method 8015B;
- Energetics by EPA Method 8330A;
- pH by EPA Method 9045C; and
- Soil Moisture by ASTM D2216/EPA Method 160.3.

2.4 FINDINGS

During trenching activities MWH personal observed anticipated features targeted for investigation and sampling and unexpected subsurface features, which were documented and sampled if warranted. A summary of observations recorded during trenching including descriptions of targeted features and unanticipated subsurface features is presented in Table 2-2.

2.5 DEBRIS REMOVAL

If debris was observed in the trench or removed during trenching activities, it was screened for radiation and VOCs. All debris was segregated and placed on plastic for disposal according to SOP 20 of the Phase 3 Work Plan (CDM, 2012). GPS coordinates and photo documentation was collected and a description summary was recorded on the trench log for each piece of debris. Debris removal logs are included in Appendix C.

2.6 DEVIATIONS FROM THE TRENCH FIELD SAMPLING PLAN

Deviations from proposed trenching sample rationale in the field sampling plan were documented and are summarized in Table 2-3. Trench locations were adjusted in the field for a variety reasons including geophysical survey results (e.g., trench moved to target a geophysical anomaly identified adjacent to proposed trench location), features observed at the ground surface (e.g., clay pipe indicating potential leach field location), trenching proposed in a biologically sensitive area, and topographic features (e.g., adjusted to target low spot where water could pond or collect). Similarly, sample depths were adjusted when necessary based on field observations including fill, subsurface features (e.g., pipelines, debris), and depth to bedrock.

During sampling activities, three trench locations in Subarea 5A (i.e., 5ASV_DG-615, -616, and -617) were identified within an active bird nesting area and could not be excavated. DOE communicated the decision to defer trenching to the remedial planning phase along with rationale for each location in a letter to DTSC dated July 31, 2014 (DOE, 2014). If VOC data at these locations is deemed necessary during the remedial planning phase, trenches will be excavated.

5C_DG-646	Trench	Southern Screening Area	SL-646-SA5C-TR-0.5	Primary	Fill	0.5	6/4/2014	X	X	X	X	X	X	X	X	X	X		X			X	X	X	X	The geophysical survey performed as part of the Phase 3 activities to investigate the new potential fill area identified ("Loose Earth Fill") in historical drawings found two magnetometer anomalies and potential fill at thicknesses up to 12 feet. Excavate four trenches to evaluate vertical and lateral extent of potential fill and and one of the magnetometer anomalies (5C_DG-653). Collect surface samples at each location to characterize area for potential aerial deposition from burning activities at the B100 Trench; analyze for PAHs, metals, and dioxins.**Collect one sample from each trench at 5' bgs. Collect additional samples targeting fill, native below fill, debris, staining, and/or elevated PID readings based on field observations. If no impacts are observed, collect the deepest sample in soil just above bedrock (~10' bgs).** Analyze all samples for the standard investigation suite (PAHs, PCBs/PCTs, metals, and TPH) and for documented chemicals used in historical Area IV operations (dioxins, Cr(VI), biphenyls, terphenyls, glycols, perchlorate, and energetics).

PHASE 3 TRENCH FEATURE SUMMARY
SANTA SUSANA FIELD LABORATORY
VENTURA COUNTY, CALIFORNIA

Location ID	Date of trench	Samples collected	Targeted Subsurface Feature(s)	Were geophysical anomaly whiskers present?	Was targeted feature in SAP encountered?	Were unexpected features encountered?
5A-DG-587	5/22/2014	SL-587-SA5A-TR-0.5 SL-587-SA5A-TR-5.5 SL-887-SA5A-TR-5.5 (Duplicate)	1) Linear magnetometer anomaly 2) medium toned mounded material 3) Fill of unknown origin	Yes, white whiskers along trend of linear magnetometer anomaly.	1) Yes: A 6-inch pipe was encountered ~5 ft. bgs that is likely the linear magnetometer anomaly. 2) No: Medium toned mounded material not observed (area was flat). 3) Yes: Fill was encountered.	1) An asphalt swale was also encountered ~2 ft. bgs that was not on the same trend as the pipe. 2) Plastic and asphalt debris at 1 foot bgs.
5A-DG-636	5/23/2014	SL-636-SA5A-TR-0.5 SL-636-SA5A-TR-3.5 SL-636-SA5A-TR-5.5	1) Linear terrain conductivity anomaly	Yes, white whiskers along trend of linear terrain conductivity anomaly.	1) Yes: An 8- to 12-inch section of red concrete topped with copper braided cable (grounding wire from existing transformer) was encountered ~2 ft. bgs that is likely the linear terrain conductivity anomaly.	1) Asphalt debris at 1 foot bgs.
5A-DG-730	5/22/2014	SL-730-SA5A-TR-0.5 SL-730-SA5A-TR-6.0	1) 3 point magnetometer anomalies 2) Interpreted drain remnant	Yes, targeted line of whiskers	1) Yes: Various metal debris observed at surface likely the point magnetometer anomalies. 2) No: Drain remnant not encountered.	No
5B-DG-529	5/28/2014	SL-529-SA5B-TR-0.5 SL-529-SA5B-TR-2.0 SL-529-SA5B-TR-3.0 SL-529-SA5B-TR-6.0	1) Fill material 2) Potential leach field	Yes, targeted whiskers and clay pipe at the surface.	1) Yes: Fill was encountered. 2) No: Evidence of former leach field not encountered.	- Clay pipe and other debris at the surface. - Encountered 1-inch metal pipe and 6-inch wrapped water line - Mixed debris (concrete, asphalt, a copper wire, etc.) throughout fill (0.5 - 11 ft. bgs [total depth]) - Red concrete and plastic between 2.0 and 4.0 ft. bgs. - Stained/discolored soil throughout fill (0.5 - 11 ft. bgs [total depth])
5B-DG-693	5/27/2014	SL-636-SA5A-TR-0.5 SL-636-SA5A-TR-3.5 SL-636-SA5A-TR-5.0	1) Leach line 2) Linear terrain conductivity anomaly 3) Northern terminus of above ground fuel line	Yes, whiskers were targeted and low spot with clay pipe debris	1) Yes: Leach lines not encountered, but gravel fill encountered 3 ft. bgs likely associated with former leach line. 2) Yes: 1-inch metal pipe encountered 3 ft. bgs likely the linear terrain conductivity anomaly. 3) No: Evidence that former above ground fuel line went below ground not observed.	- Clay pipe and other debris at the surface. - Encountered 8 ft. long metal utility pole anchor (3/4" dia.) and 8 ft. long metal utility pole anchor (1" dia.) 4 ft. bgs.
5B-DG-699	5/28/2014	SL-699-SA5B-TR-0.5 SL-699-SA5B-TR-3.0 SL-699-SA5B-TR-8.0	1) Linear terrain conductivity anomaly	Yes, white whiskers along trend of linear terrain conductivity anomaly.	1) Yes: 1-inch metal pipe encountered 2 ft. bgs likely the linear terrain conductivity anomaly (appeared same pipe as encountered in 5B_DG-693)	No
5B-DG-707	5/27/2014	SL-707-SA5B-TR-0.5 SL-707-SA5B-TR-3.0	--	--	--	No

Table 2-2
PHASE 3 TRENCH FEATURE SUMMARY
SANTA SUSANA FIELD LABORATORY
VENTURA COUNTY, CALIFORNIA

Location ID	Date of trench	Samples collected	Targeted Subsurface Feature(s)	Were geophysical anomaly whiskers present?	Was targeted feature in SAP encountered?	Were unexpected features encountered?
5C-DG-503	5/29/2014	SL-503-SA5C-TR-0.5 SL-503-SA5C-TR-5.0 SL-503-SA5C-TR-7.5	1) Fill material	N/A	1) Yes: Hummocky conditions on surface and fill observed to 5 ft. bgs.	No
5C-DG-605	5/29/2014	SL-605-SA5C-TR-0.5 SL-605-SA5C-TR-5.0 SL-605-SA5C-TR-10.0	1) Mounded material.	N/A	1) Yes: Mounding on surface observed and fill with mixed debris (concrete, gravel, and metal debris) was encountered to 11 ft. bgs.	No
5C-DG-646	6/4/2014	SL-646-SA5C-TR-0.5 SL-646-SA5C-TR-5.0	1) New potential fill area identified ("Loose Earth Fill") in historical drawings	N/A	1) Yes: Fill with particle size debris encountered to 8 ft. bgs (thin layer of native and then bedrock).	No
5C-DG-651	5/30/2014	SL-651-SA5C-TR-0.5 SL-651-SA5C-TR-5.0MS SL-951-SA5C-TR-5.0 (split) SL-651-SA5C-TR-10.0 SL-651-SA5C-TR-15.0	1) New potential fill area identified ("Loose Earth Fill") in historical drawings	Yes, whisker present along northern edge of excavation.	1) Yes: Fill with mixed debris (wire, rebar, paint can lid, brick/cinder block) observed to bedrock (15 ft. bgs) with more debris below 5 ft. bgs.	No
5C-DG-653	6/2/2014	SL-653-SA5C-TR-0.5 SL-653-SA5C-TR-5.0 SL-653-SA5C-TR-10.0 SL-653-SA5C-TR-15.0	1) New potential fill area identified ("Loose Earth Fill") in historical drawings 2) Magnetometer anomaly.	Yes, whisker present along northern edge of excavation.	1) Yes: Fill comprised primarily of disturbed soil and SS bedrock chunks with some debris (asphalt, concrete, potential ACM, brick) encountered to 13 feet bgs (thin layer of native and then bedrock). 2) Possibly: Metal debris encountered may be anomaly.	No
5C-DG-655	6/4/2014	SL-655-SA5C-TR-0.5 SL-655-SA5C-TR-5.0	1) New potential fill area identified ("Loose Earth Fill") in historical drawings	N/A	1) Yes: Fill encountered to 8 ft. bgs (thing layer of native and then bedrock). Trenching in progress, Blasting wire observed	No
6-DG-569	5/20/2014	SL-569-SA6-TR-0.5 SL-569-SA6-TR-2.5	1) Linear terrain conductivity anomaly 2) Fill material	Yes, white whiskers along trend of linear terrain conductivity anomaly.	1) Yes: Clay pipe and asphalt chunks at surface likely linear terrain conductivity anomaly. 2) Yes: Fill encountered to 2 ft. bgs.	No
6-DG-570	5/20/2014	SL-570-SA6-TR-0.5 SL-570-SA6-TR-2.0 SL-570-SA6-TR-6.0	1) Linear magnetometer anomaly 2) Fill material	Yes, whiskers were present and targeted	1) Yes: Pipe encountered at 0.5 ft. bgs. 2) Yes: Fill encountered to 1 ft. bgs.	No
6-DG-686	5/21/2014	SL-686-SA6-TR-0.5 SL-686-SA6-TR-5.0 SL-686-SA6-TR-11.0	1) Ground penetrating radar area. 2) Historic dirt road.	Yes, whiskers were present and targeted but could have been magnetometer and not GPR whiskers.	1) No: No fill or evidence of disturbed soil encountered. Note: anomaly could not be targeted because located in drip line of oak tree. 2) No: Historic dirt road not observed.	- Weathered bedrock with roots encountered from 6 to 12 ft. bgs.
8-DG-534	5/19/2014	SL-534-SA8-TR-0.5 SL-534-SA8-TR-5.0	--	--	--	No

Table 2-2
PHASE 3 TRENCH FEATURE SUMMARY
SANTA SUSANA FIELD LABORATORY
VENTURA COUNTY, CALIFORNIA

Location ID	Date of trench	Samples collected	Targeted Subsurface Feature(s)	Were geophysical anomaly whiskers present?	Was targeted feature in SAP encountered?	Were unexpected features encountered?
8-DG-548	5/19/2014	SL-548-SA8-TR-0.5 SL-548-SA8-TR-5.0MS SL-848-SA8-TR-5.0 (duplicate) SL-548-SA8-TR-10.0	1) Topographic Low 2) Terrain Conductivity Anomaly.	N/A	1) Yes: topographic low spot found and targeted. 2) Yes: Localized metal debris with glass shards at surface and fill with burnt wood fragments encountered to 1.5 ft. bgs.	No
8-DG-611	5/20/2014	SL-611-SA8-TR-0.5 SL-611-SA8-TR-5.0 SL-611-SA8-TR-10.5	1) Debris area identified during 2008 debris survey.	N/A	1) Yes: Mound at surface targeted and fill limited to 1 ft bgs.	No

Notes
bgs - below ground surface
dia. - Diameter
ft - feet
N/A - not spplicable

Table 2-3
TRENCH FIELD INVESTIGATION PLAN DEVIATIONS
SANTA SUSANA FIELD LABORATORY
VENTURA COUNTY, CALIFORNIA

Location ID	Completion Date	Samples collected	Sample Rationale	Sample deviations	Trench Location Deviation
5A-DG-587	5/22/2014	SL-587-SA5A-TR-0.5 SL-587-SA5A-TR-5.5 SL-887-SA5A-TR-5.5 (Duplicate)	Location targets AST with unknown contents (Unknown-AT-L9-3) and linear magnetometer anomaly; positioned within medium toned mounded material identified in EPA TM and fill of unknown origin observed in borings within B4023. Bedrock is anticipated ~10 feet bgs. Collect deepest sample targeting soil just above bedrock. Conduct adjacent test pit for linear magnetometer anomaly and adjust 5-foot sample to target feature (or sample pit as appropriate).	Shallow sample was collected at 0.5 feet above a buried asphalt swale and deep sample was collected at 5.5 feet immediately beneath a 6-inch pipe.	N/A
5A-DG-730	5/22/2014	SL-730-SA5A-TR-0.5 SL-730-SA5A-TR-6.0	Location targets three point magnetometer anomalies and inline with interpreted drain remnant. Bedrock anticipated <10 feet bgs. Collect deepest sample targeting soil just above bedrock. Conduct adjacent test pit for three point magnetometer anomalies and interpreted drain remnant and adjust 5-foot sample to target feature (or sample pit as appropriate).	N/A	Moved 6 feet to south of proposed location to target geophysical anomaly (whiskers) marked in the field.
5B-DG-529	5/28/2014	SL-529-SA5B-TR-0.5 SL-529-SA5B-TR-2.0 SL-529-SA5B-TR-3.0 SL-529-SA5B-TR-6.0	Targets AST with unknown contents; also targets southern portion of fill and potential leach field location. Excavate exploratory trench perpendicular to leach field orientation to investigate leach field location (inspect for signs of fill, gravel, leach lines, etc.). Analyze for corrosion inhibitors due to cooling tower operations in area. Analyze at depth due to potential fill, potential leach field impacts, and soil movement/fill. 15 foot sample targets native soil just above bedrock; analyze for full suite plus VOCs (SM) to evaluate potential migration pathway to groundwater.	2-foot sample was collected under potential 1-inch natural gas line; 3-foot sample located under a water line; and 11-foot sample targeted fill.	East west trending along anomaly (whisker) and clay pipe debris at surface.
5B-DG-707	5/27/2014	SL-707-SA5B-TR-0.5 SL-707-SA5B-TR-3.0	Step out for TPH detections to the south and dioxins/pesticides to the north; also targets fuel pipeline from T-735. Collect samples at 5' intervals to bedrock with deepest sample just above bedrock; analyze all depths.	N/A	Moved 11.0 feet. northwest to target location of former fuel pipeline elbow location. Targeted trench with concrete observed at ground surface which could have been concrete footing for the former fuel pipeline
5C-DG-605	5/29/2014	SL-605-SA5C-TR-0.5 SL-605-SA5C-TR-5.0 SL-605-SA5C-TR-10.0	Representative sample targeting mounded material observed in EPA aerial photo review. Analytical suites selected since detected in other portions of the area. Excavate exploratory trench and collect samples based on field observation. Conditions should be observed in the trench and sample depths should target fill and native soil immediately beneath it.	N/A	Moved 50.0 feet. west to target mound.
5C-DG-646	6/4/2014	SL-646-SA5C-TR-0.5 SL-646-SA5C-TR-5.0	The geophysical survey performed as part of the Phase 3 activities to investigate the new potential fill area identified ("Loose Earth Fill") in historical drawings found two magnetometer anomalies and potential fill at thicknesses up to 12 feet. Excavate four trenches to evaluate vertical and lateral extent of potential fill and and one of the magnetometer anomalies (5C_DG-653). Collect surface samples at each location to characterize area for potential aerial deposition from burning activities at the B100 Trench; analyze for PAHs, metals, and dioxins. Collect one sample from each trench at 5' bgs. Collect additional samples targeting fill, native below fill, debris, staining, and/or elevated PID readings based on field observations. If no impacts are observed, collect the deepest sample in soil just above bedrock (~10' bgs). Analyze all samples for the standard investigation suite (PAHs, PCBs/PCTs, metals, and TPH) and for documented chemicals used in historical Area IV operations (dioxins, Cr(VI), biphenyls, terphenyls, glycols, perchlorate, and energetics).	N/A	Moved to target west portion of the disturbed soil.

Excavate four trenches to evaluate vertical and lateral extent of potential fill and and one of the magnetometer anomalies (5C_DG-653). Collect surface samples at each location to characterize area for potential aerial deposition from burning activities at the B100 Trench; analyze for PAHs, metals, and dioxins. Collect one sample from each trench at 5' bgs. Collect additional samples targeting fill, native below fill, debris, staining, and/or elevated PID readings based on field observations. If no impacts are observed, collect the deepest sample in soil just above bedrock (~10' bgs). Analyze all samples for the standard investigation suite (PAHs, PCBs/PCTs, metals, and TPH) and for documented chemicals used in historical Area IV operations (dioxins, Cr(VI), biphenyls, terphenyls, glycols, perchlorate, and energetics).	Samples collected at 0.5. 5.0, 10 and 15. 10 and 15 foot sample collected in interval of debris (pipe, rebar, piece of I-beam, and piece of a paint can lid).	Moved 12.0 ft. southwest to target lateral extent of disturbed soil.
5C-DG-653	6/2/2014	SL-653-SA5C-TR-0.5 SL-653-SA5C-TR-5.0 SL-653-SA5C-TR-10.0 SL-653-SA5C-TR-15.0		Samples collected at 0.5. 5.0, 10 and 15. 15 foot sample collected near possible ACM	Moved to target disturbed soil in the northern edge and geophysical anomaly.
5C-DG-655	6/4/2014	SL-655-SA5C-TR-0.5 SL-655-SA5C-TR-5.0		Samples collected at 0.5 in fill and 5.0 feet in native above bedrock. TD= 8.0	Moved to target eastern portion of disturbed soil.
6-DG-686	5/21/2014	SL-686-SA6-TR-0.5 SL-686-SA6-TR-5.0 SL-686-SA6-TR-11.0	Location characterizes area west of ESG storage yard identified in 1988 Radiological Survey Report and targets surface water flow pathway at end of historical dirt road; also addresses potential aerial dispersion/deposition to the northwest of incinerator at Building 4040. Conduct exploratory test pit to investigate ground penetrating radar anomaly area; if fill with debris is present, collect and analyze sample within fill and just above bedrock. Bedrock anticipated <2'.	N/A	Moved 20 feet WNW out of drip line of oak tree.
8-DG-548	5/19/2014	SL-548-SA8-TR-0.5 SL-548-SA8-TR-5.0MS SL-848-SA8-TR-5.0 (duplicate) SL-548-SA8-TR-10.0	Conduct exploratory trench to investigate topographic low spot adjacent to the debris area identified during 2008 debris survey. Also targets terrain conductivity anomaly. Fill anticipated based on previous sampling in the area and historical aerial photographs. Excavate until top of native soils encountered. Bedrock anticipated >10 feet bgs. Collect and analyze samples at 5-foot intervals to bedrock beginning at 5 feet bgs. Collect deepest sample targeting soil just above bedrock.	N/A	Moved 2 feet to east to target metal debris at surface and low spot.
8-DG-611	5/20/2014	SL-611-SA8-TR-0.5 SL-611-SA8-TR-5.0 SL-611-SA8-TR-10.5	Characterizes hillslope southeast of the ESADA and targets debris area identified during the 2008 debris survey. Conduct exploratory test pit to investigate debris area. If fill, staining, debris, or other impacts are observed, collect sample targeting top of native soil. Bedrock anticipated <10 feet bgs. If deep soils encountered, sample and place on hold pending shallow results.	Sample collected at 0.5, 5.0 and 10.5. Sample at 0.5 feet targeted fill; samples at 5.0 and 10.5 was collected in native soil.	Adjusted to target soil mound near road.

Acronyms
AST - Aboveground storage tank
bgs - below ground surface
Cr IV - Hexavalent Chromium
EPA = Environmental Protection Agency
dia. - Diameter
ESADA = Empire State Atomic Development Authority
ESG - Energy Systems Group
ft - feet
N/A - not spplicable
PAH = polyaromatic hydrocarbons
PCB = polychlorinated biphenyls
PCT = polychlorinated terphenyls
SM - Soil matrix
TPH = total petroleum hydrocarbons
WNW - West Northwest

SCALE:

Surface area covered with mustard, Palmer's goldenbush, some road base, Flat topography

TD = 8.0' bgs

* Backfilled with trench cuttings at 14:22

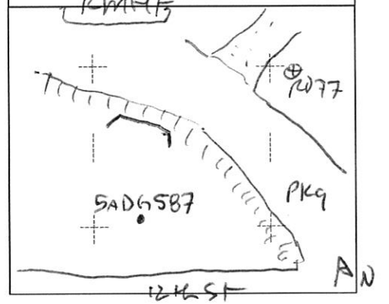

Samples taken
- SL-587-SASA-TR-0.5 @ 12:14
- SL-587-SASA-TR-5.5 MS @ 13:03
- SL-887-SASA-TR-5.5 @ 13:08

- 0.0-1.0 Silty Sand (SM), brown (10YR 4/3), medium dense, dry. Predominant fine sand (70), silt/clay (25%), and few medium sand (5%). Asphalt present in chunks and there is a section of plastic + mixed debris including asphalt, some clasts of sandstone. No stain, no odor. Fill material
- 1.0-5.5 Silty sand (SM), dark brown (7.5YR 3/3) transitioning to dark yellowish brown (10YR 4/4) ~3.5' bgs. Predominant fine sand (65%) some silt/clay (35%), and trace medium sand. In eastern portion of trench there is a remnant asphalt swale ~5' wide with asphalt debris filling in concave portion. No stain, no odor. Fill material.
- 5.5-7.5 silt/fine sand - clay (ML-CL), dark brown (10YR 3/3). stiff, moist, Predominant silt/clay (60%), fine sand (40%). medium plastic, low toughness and rapid dilatancy. No stain, no odor. Fill
- 7.5-8.0 Decomposed bedrock (WS), Sandstone, Grey (10YR 5/1) with brownish yellow staining (10YR 6/6), extremely weak (R0), very soft (H7). moldable, massive
- 8.0 Highly weathered bedrock (WX), Sandstone, like yellowish brown (10YR 6/4), stratified, weak (R2). moderately hard (H4) to moderately soft (H5).

All trench logs were prepared by a California Professional geologist.

LENGTH (FEET)

ENTER TRENCH DIRECTION
SCALE:

TD = 8.0' bgs
Backfilled w/ trench cuttings @ 09:12

Samples taken:
- SL-636-SASA-TR-0.5 @ 07:46
- SL-636-SASA-TR-3.5 @ 08:47
- SL-636-SASA-TR-7.5 @ 08:41

0-2.5 Silty sand with gravel (sm), yellowish brown (10YR 5/4) dense, dry. Predominantly fine sand (50%), some silt (30%), little gravel (15%) and few medium sand (5%). Gravels consist of sandstone clasts up to 2", some occasional road base rock, asphalt chunks and small brick material. At 18" there is an ~18" x 12" section of concrete ~N/S running topped w/ ½" copper braided cable (from existing transformer powering B 7042). No stain, odor. Fill material.

2.5-6.0 Silty sand (sm), dark yellowish brown (10YR 4/6), dense, dry. Predominantly fine sand (75%), little silt/clay (20%), and few medium sand (5%). Some brick material, sandstone fragments. No stain, no odor. Fill material. moist likely.

6.0-8.0 Silty sand (sm), dark yellowish brown (10YR 4/4), medium dense, dry. Predominant fine sand (65%), some silt/clay (35%), and trace medium sand. No stain, no odor. Native soil.
Highly weathered bedrock (WR). Sandstone, olive brown (2.5Y 4/4), fine-coarse grained, very weak (R1), soft (H6), with relict bedding, oxidized along planes.

LENGTH (FEET)

① SILTY SAND (SM), DRY, VERY DARK GRAYISH BROWN (10YR 3/2), LOOSE, FINE TO MEDIUM, SUBANGULAR TO SUBROUNDED, 60% FINE SAND, 20% FINES (SILT/CLAY), 15% MED. SAND, LOOSE, 10% GRAVEL & MIXED DEBRIS; ASPHALT, CONCRETE, RED CONCRETE, PLASTIC, GRAVEL; FILL ROOTS.

② SILTY SAND (SM) MOIST, VERY DARK GRAYISH BROWN (10YR 3/2) TO (10YR 6/6) BROWNISH YELLOW, 50% FINE SAND 10% MEDIUM SAND, AND COARSE SAND, SUBANGULAR TO SUBROUNDED, 20% FINES (SILT/CLAY), 20% DEBRIS → MIXED DEBRIS OF CONCRETE, ASPHALT, COPPER WIRE, 1-INCH METAL LINE, 6-INCH WRAPPED WATER LINE, RED CONCRETE & PLASTIC; FILL, LOOSE; STAINED/DISCOLORED SOIL.

③ WEATHERED SANDSTONE (SS) FINE TO MEDIUM SAND, ANGULAR TO SUB-ROUNDED, MODERATELY SOFT, FRIABLE, LIGHT YELLOWISH BROWN (10YR 6/4)

NOTES

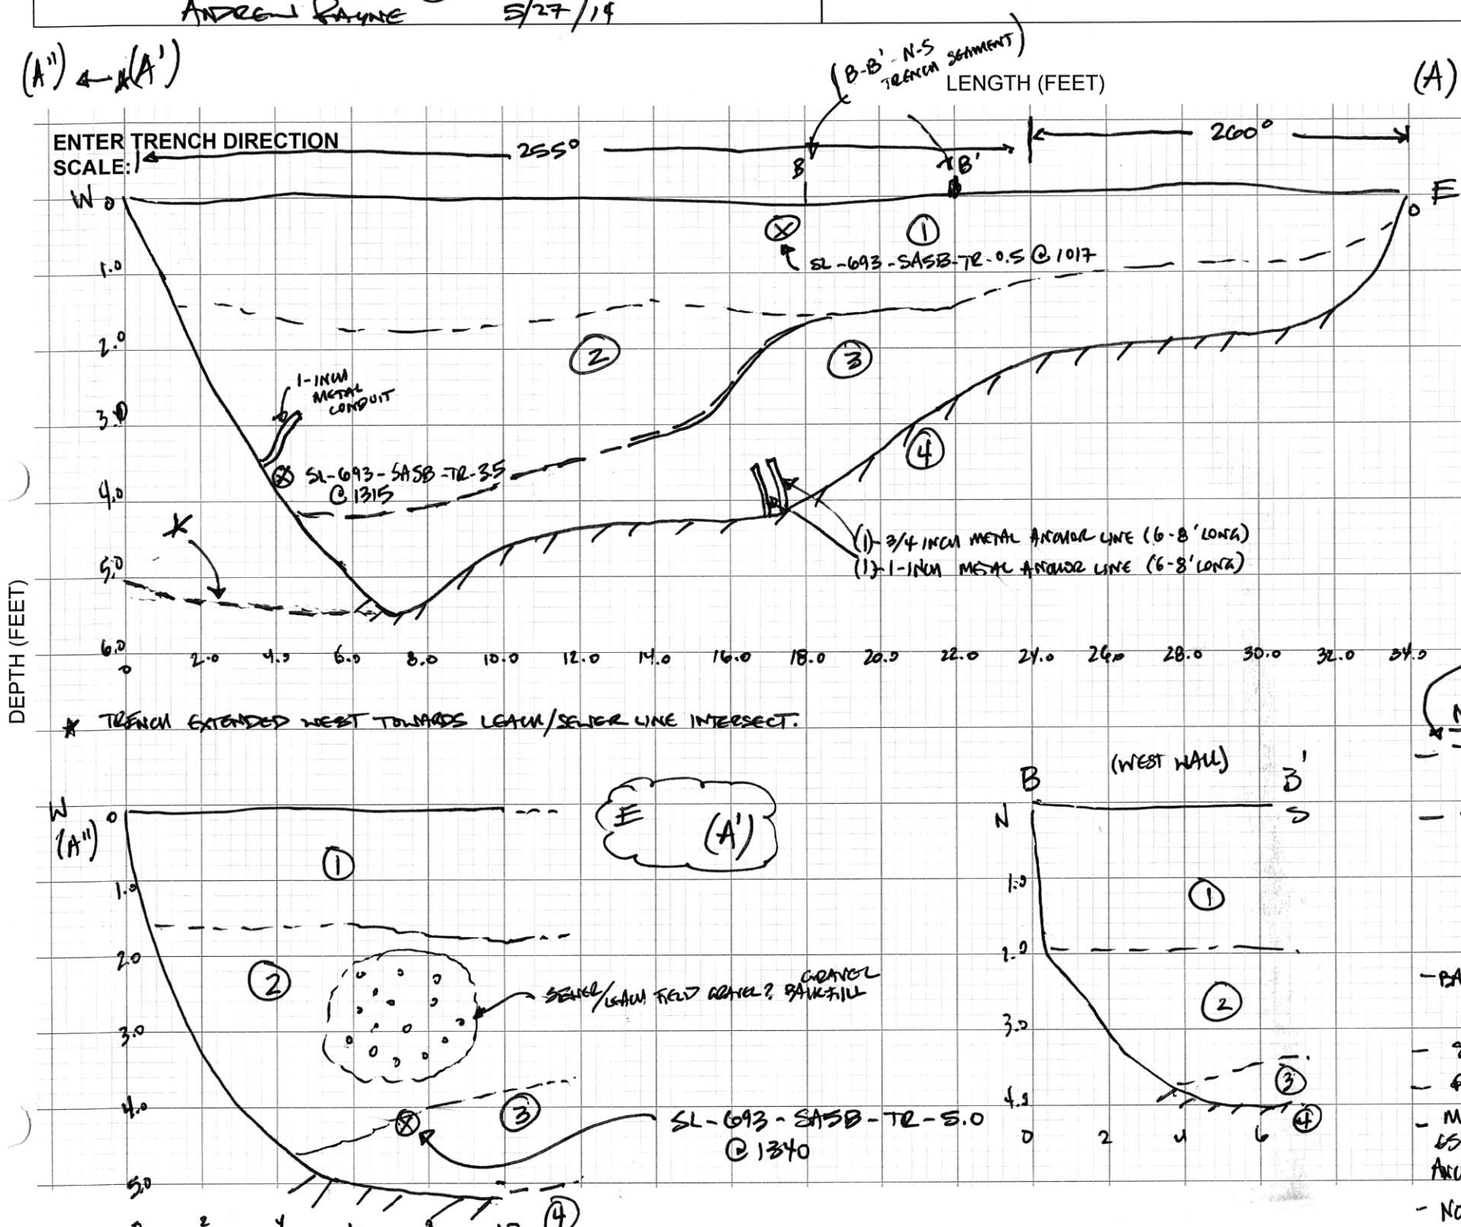

- SURFACE PROXIMAL TO TRENCH WAS SCATTERED W/ MIXED DEBRIS INCLUDING: CONCRETE, ASPHALT, PLASTIC, GRAVEL, RED CONCRETE AND CLAY PIECES.
- TD OF TRENCH = 11.75' BGS; STAINING WAS OBSERVED IN SOIL BELOW 0.5' BGS; STAINING FROM 0.5' TO DEPTH TO BEDROCK.
- PID READINGS WERE PREDOMINANTLY BETWEEN 0 AND 1.0 PPM; HOWEVER, 1.0 PPM MAY BE NOISE;
- BACKFILL TRENCH @ 1530
- SAMPLES COLLECTED
  - SL-529-SASB-TR-0.5 @ 1305 (12 NREM, 111 CPM)
  - SL-529-SASB-TR-2.0 @ 1405 (18 NREM, 120 CPM)
  - SL-529-SASB-TR-3.0 @ 1415 (16 NREM, 124 CPM)
  - SL-529-SASB-TR-11.0 @ 1430 (12 NREM, 70 CPM)
- A 1-INCH METAL PIPE AND 6-INCH WRAPPED WATER LINE ENCOUNTERED; SAMPLES COLLECTED BENEATH LINES.
- FILL MATERIAL ENCOUNTERED THROUGHOUT TRENCH; COPPER WIRE ALSO ENCOUNTERED; NO OBVIOUS EVIDENCE OF LEACH FIELD GRAVELS OR PIPING ENCOUNTERED.

EXPLANATION

- SOIL TYPE CONTACT (SHARP)

Geologist or Hydrogeologist/Date: MM ELLIS 20 MAY 2014		Checked by/Date		Wall of Trench Shown (Circle One) N S E W NE NW SE SW	

LENGTH (FEET)

ENTER TRENCH DIRECTION
SCALE:

Surface covered with some base gravel, asphalt chunks, some clay (pipe) pieces, sandstone cobbles.

0.0-0.5 Silty sand (SM). Brown (10YR 4/3). Dense, dry. Predominant fine sand (45%), some silt+clay (30%), little medium sand (15%), few gravels (10%). Gravels consist of road base and native bedrock clasts. No stain. No odor. Fill material.

0.5-1.9 Silty sand (SM). Brown (10YR 4/3). Dense, dry. Same characteristics of 0.0-0.5 interval except gravels are reduced. Predominant fine sand (50%), some silt+clay (30%), little medium sand (15%), few gravel (~5%). No stain, no odor. Fill material.

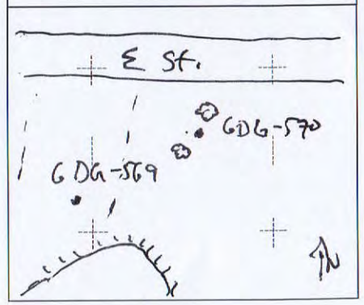

1.9-2.8 ~~Silty sand (SM)~~, Dark yellowish brown (10YR 4/4) → poorly graded sand (SP). Dense, dry. Predominant fine sand (85%), few silt clay (10%) and few medium sand (5%). No stain, no odor. Native soil.

2.8 TD on Bedrock, sandstone, (lite yellowish brown (2.5Y 6/4). moderately weathered (W3), weak (R2), moderately soft (H5) fine to medium grained, sub angular to subrounded grains.

Samples Taken
10:58 0.5' SL-569-SA6-TR-0.5
11:15 2.5' SL-569-SA6-TR-2.5

- Backfill trench with trench cuttings at 13:52.
- Samples taken from backhoe bucket

SCALE:

0.0 – 1.5 Clayey sand (SC), dark yellowish brown (10YR 4/4), dense and hard, dry. Predominant silt/clay (45%), some fine sand (40%), little medium sand (15%). No stain, no odor. Several burnt wood fragments and woody material. Native soil.

1.5 – 7.0 Silt, very fine sand (ML), brown (7.5 Y 4/4), dense, hard, dry. Predominant silt/clay (55%), some fine sand (35%) and few medium sand (10%) No stain, no odor. Native soil.

7.0 – 12.5 Silt, very fine sand (ML), Brown (7.5 Y 4/3). Dense, hard, dry. Predominant silt (60%), some fine sand (35%) and little medium sand (5%) No stain no odor. In native soil; however gradational contact at ~10.5' bgs includes soil w/ similar characteristics w/ color change to strong brown (7.5 Y 4/6). Upper portion has white streaks of material ($CaCO_3$). Effervesces. Very firm soil also pervasive with fracture fill of carbonate. May be in decomposed/ residual soil. Sample at 10.0'.

12.5 – Decomposed, highly fractured bedrock (WS) Sandstone, dark yellowish brown (10YR 4/6), fragments with very pale brown (10YR 7/4) fracture fill. Extremely weak (R0), very soft (H7). Effervesces violently.

APPENDIX C

DEBRIS REMOVAL LOG

Debris Removal Log
Debris Number: 4006-029
Santa Susana Field Laboratory, Ventura County, California

Inspector: **Andrew Payne**
Date: May 27, 2014

Condition of Soil Beneath Debris:

• Condition of Soil: **Not impacted.**

• PID Headspace Reading: **0.0 ppm**

• Sample Collected: **Yes**

• Sample ID: **SL-693-SA5B-TR-3.5**

• Analyses: **Metals (including Hg), PAHs (SIM), Dioxins, PCB/PCT, pH, Pesticides, TPH-GRO, TPH-EFH**

• Comments: **Debris 4006-029 was a 1-inch subsurface metal pipe found in the western portion of PDU (4006 leach field) during Area IV Data Gap Soil Vapor and Trench Sampling (Trench ID 5B_DG-693) down to 3.5 ft bgs. Radiological information of soil adjacent to debris was 10 µREM, 76 CPM (counts per minute). No staining or odors observed during removal; soil appears to be native/alluvium material. No leach lines were encountered. GPS coordinates: 267083.785 Northing 1785172.911 Easting.**

1.0 INTRODUCTION

This technical memorandum (TM) has been prepared to summarize activities associated with collection of soil vapor samples in Area IV of the Santa Susana Field Laboratory (SSFL) in accordance with Addendum 12 to the Master Field Sampling Plan (MFSP) for Chemical Data Gap Investigation, Phase 3 Soil Vapor Implementation for Area IV, Santa Susana Field Laboratory (Soil Vapor Implementation Plan) (MWH Americas, Inc. [MWH], 2014a) and the SSFL Standard Operating Procedure (SOP) 20 to Work Plan for Chemical Data Gap Investigation, Phase 3 Soil Chemical Sampling at Area IV (MFSP SOP 20) (MWH, 2014b). These documents describe the sample rationale and procedures for soil vapor sampling and supplement the Work Plan for Chemical Data Gap Investigation, Phase 3 Soil Chemical Sampling at Area IV, Santa Susana Field Laboratory (Phase 3 Work Plan) (CDM Smith [CDM], 2012). This TM was prepared for the United States Department of Energy (DOE) and is in compliance with the Administrative Order of Consent (AOC) for Remedial Action (AOC; Docket No. HSA-CO 10/11 - 037).

The purpose of this TM is to describe the completed field activities and present soil vapor analytical results and data quality associated with the sampling efforts performed under the Phase 3 Soil Vapor Implementation Plan. This TM does not include soil matrix analytical results for samples collected from the soil vapor investigation locations, or an evaluation/ interpretation of the soil and soil vapor analytical data. Analytical data from soil matrix samples will be presented in a separate TM prepared by CDM. The data evaluation and interpretation process will be a collective review process of all media and will be presented at a future date in a Final Data Summary Report.

1.1 SOIL VAPOR SAMPLING OBJECTIVES

The objective of the soil vapor sampling conducted within Area IV of the SSFL was to obtain volatile organic compound (VOC) data that will be used to evaluate whether the nature and extent of contamination at potential source areas are characterized sufficiently for remediation per the AOC. The sample locations were selected based on a targeted (or “biased”) approach that focused on known or suspected chemical use areas (such as tanks, buildings, and reactors). Soil vapor sampling was also performed in areas of groundwater VOC impacts where surface release sources could not be identified.

1.2 REPORT ORGANIZATION

The information in this TM is presented in sections organized as follows:

- **Section 1.0 – Introduction**

  This section presents the purpose and objective of this technical memorandum.

- **Section 2.0 –Field Sampling and Analytical Methods**

  This section describes field sampling procedures and laboratory analytical methods associated with the soil vapor sampling.

- **Section 3.0 –Sampling Results**

  This section summarizes analytical results for soil vapor samples.

- **Section 4.0 – Data Usability Assessment**

  This section summarizes the assessment of analytical results quality for soil vapor samples.

- **Section 5.0 – References**
  This section lists the references cited in this report.

2.0 FIELD SAMPLING AND ANALYTICAL METHODS

Field activities at the 153 planned soil vapor sample locations within Area IV were performed by MWH between May and June 2014. Specific rationale for targeting each soil vapor sample location and depth is provided in the California Environmental Protection Agency Department of Toxic Substances Control (DTSC) -approved Soil Vapor Implementation Plan (MWH, 2014a). The soil vapor sample locations are shown on Figure 2-1. A total of 177 primary soil vapor samples were collected from probes installed at 106 locations. A total of 66 primary soil matrix samples were collected from 56 locations and analyzed for VOCs when soil vapor samples could not be collected due to shallow bedrock or refusal (less than 5.5 feet [ft] below ground surface [bgs]), or there was anticipated or measured high vacuum conditions from the soil vapor probe based on lithology. Neither soil vapor or soil matrix were collected at 11 locations, including 6 locations that were inaccessible due to active bird nesting and 5 locations where soil was less than 3 feet thick (see Section 2.5 for additional information). Table 2-1 provides a summary of collected soil vapor and quality control (QC) samples.

2.1 SOIL VAPOR PROBE INSTALLATION

Before soil probe installation, a lithologic boring log was prepared detailing descriptions of soil removed from the boring via continuous coring or hand auger in accordance with the Unified Soil Classification System (USCS) (American Standard for Testing and Materials [ASTM], 2009) and following the procedures outlined in SOP 9 of the Phase 3 Work Plan (CDM, 2012). Borings were logged to bedrock or refusal and geologic interpretation of soils were used to determine the final soil vapor probe construction. Single and multiple depth soil vapor probe construction detail forms were completed to document compliance with, deviation from, or additional details associated with the installation of the vapor probes. Soil boring logs and soil vapor probe construction details are included in Appendix A. All field work logging was performed and supervised by a California Professional Geologist.

The selection of depth intervals for soil vapor probe installation and sampling involved site-specific decisions and took into consideration the thickness of the unconsolidated alluvium and the depth to the weathered bedrock. Sample depths were adjusted as needed to target the coarsest-grained material, photoionization detector (PID) headspace detections, and to avoid fine-grained materials.

Temporary soil vapor probes were installed using hand auger and direct-push methods according to procedures outlined in SOP 20 of the Phase 3 Work Plan (MWH, 2014b). However, due to the potential for bridging and clogging of hydrated bentonite in the annular space associated with using a tremie pipe, the method used for filling the annular space with hydrated bentonite was by 6-inch lifts (see Section 2.5 for additional information). Each lift was hydrated at a rate of one ounce of water for every inch of bentonite seal within the borehole. The drilling and soil vapor probe installation activities were performed by Environmental Support Technologies (EST) of Irvine, California.

Global positioning system (GPS) coordinates and photos were collected at each completed soil vapor sample location.

2.2 SOIL VAPOR SAMPLE COLLECTION

Soil vapor samples were collected in accordance with procedures outlined in SOP 20 of the Phase 3 Work Plan (MWH, 2014b). Before sample collection, a minimum 48-hour equilibrium time passed to allow subsurface conditions to equilibrate and vapor concentrations to stabilize after probe installation. Soil vapor probes were purged to remove stagnant or ambient air from the sampling system and samples collected were representative of subsurface conditions. A helium leak test was performed at every active vapor monitoring point each time a soil vapor sample was collected. Due to schedule constraints and limited resources, two methods of sample collection were employed during field work. Samples were either collected in glass bulbs and analyzed on site by a mobile laboratory or collected in summa canisters for analysis by an offsite stationary laboratory. Samples collected in glass bulbs were analyzed by United States Environmental Protection Agency (EPA) Method 8260B and samples collected in summa canisters were analyzed by EPA Method TO-15. All active soil vapor samples were collected during dry weather to limit soil moisture variability.

Soil vapor sample containers were labeled with unique sample identification (ID) following CDM's nomenclature as defined in the Phase 3 Work Plan (CDM, 2012). Container IDs previously assigned to reusable sample containers by the laboratory (such as Bulb IDs for glass bulbs) were recorded on soil vapor sampling form. Once the soil vapor sample was collected and disconnected from the probe, the sample container was immediately labeled with the sample ID information and collection date. Documentation of soil vapor sampling was recorded on the soil vapor sampling form and this information was used to generate the COC.

Glass bulb soil vapor samples were immediately submitted under proper COC to the onsite mobile laboratory for analysis. The mobile laboratory added surrogates to soil vapor samples collected in glass bulbs within 15 minutes of collection. Glass bulb soil vapor samples were wrapped in aluminum foil and stored out of direct sunlight to prevent the degradation of light-sensitive compounds.

Summa soil vapor samples were shipped under proper COC to an offsite stationary laboratory for analysis. The offsite stationary laboratory added surrogates to soil vapor samples collected in summa canisters before analysis. The shipment of summa soil vapor samples to offsite stationary laboratories was performed following the procedures outlined in SOP 11 of the Phase 3 Work Plan (CDM, 2012).

EST collected the soil vapor samples using glass bulbs and analyzed the samples in a mobile laboratory for VOCs using EPA Method 8260B. EST also collected the soil vapor samples using summa canisters for analysis at an offsite stationary laboratory using EPA Method TO-15. Eurofins Lancaster Laboratories Environmental (Lancaster), located in Lancaster, Pennsylvania; Eurofins Calscience Environmental Laboratory (Calscience), located in Garden Grove, California; and TestAmerica Laboratories, Inc (TestAmerica), located in Arvada, Colorado analyzed samples for VOCs using EPA Method TO-15. All laboratories that performed analysis for the soil vapor study are National Environmental Laboratory Accreditation Program (NELAP)-accredited environmental testing laboratories.

2.3 FIELD QUALITY CONTROL ACTIVITIES

A leak test using helium was performed at every active vapor probe location each time a soil vapor sample was collected. Helium was used because it has not been identified as a potential contaminant in Area IV at the SSFL and allows for leak detection in real-time so that corrective action can be taken before sampling. If a helium reading of greater than 5 percent or 50,000 parts per million by volume (ppmv) was measured, then the probe leak check failed and corrective action was required. All leaks identified during this soil vapor study were found in the sample train and were immediately corrected. No replacement vapor probes were installed as a result of ambient air break through.

Each glass bulb container was observed for condensation before and after soil vapor sampling. No condensation was noted in any glass bulbs used for sampling. The vacuum on each summa canister was checked on the vacuum gauge to confirm the proper flow rate of 100 to

200 milliliters per minute (mL/min) was maintained while sampling. One summa canister was discarded due to the lack of vacuum.

A sample flow rate of 100 to 200 mL/min must be achieved when sampling soil vapor probes. When high vacuum was measured at a sample probe (greater than 100 inches of water), then a sample was not collected from that probe. In general, if a soil matrix sample had not been collected during probe installation in anticipation of high vacuum conditions based on lithology, a new probe was installed and attempted to be sampled and a soil matrix sample was collected and analyzed for VOCs (see Section 2.5 see Section 2.5 for additional information).

2.3.1 Duplicates and Split Samples

At least one field duplicate sample and one split sample were collected per day for the mobile laboratory and one per 20 samples for the primary offsite stationary laboratory. Duplicate and split samples were collected at the same time as the primary sample, in separate sample containers at the same location and depth as the primary sample. The analysis of the duplicate sample was performed by the same laboratory that performs the primary sample analysis and the analysis of the split sample was performed by an offsite stationary laboratory different than the primary laboratory.

2.3.2 Field Blank Samples

One field blank was collected daily for each primary laboratory to assess the possibility of contamination from ambient air.

2.3.3 Sample Container Decontamination

Sample containers, both summa and glass bulb, were certified as clean by the supplier or verified to be clean by laboratory analysis. Glass bulb sample containers were decontaminated after each use by the mobile laboratory. To verify the glass bulb decontamination procedures, the mobile laboratory used one glass bulb as an equipment blank daily.

2.4 ACTIVE SOIL VAPOR ANALTICAL LABORATORY METHODS

Soil vapor sample analyses were performed by an onsite mobile laboratory and an offsite stationary laboratory. All laboratories used to analyze the active vapor samples are certified by the State of California for the method of analysis.

2.4.1 Target Analytes, Analytical Methods and Method Detection Limits

Target analytes and the method reporting limits (MRLs) for EPA Method 8260B and EPA TO-15 are included in SOP 20 of the Phase 3 Work Plan (MWH, 2014b). For onsite soil vapor sample analysis, the required MRLs were achieved using an onsite mobile laboratory equipped with a gas chromatography/mass chromatography (GC/MS) instrument and a purge and trap apparatus modified to accept a 100 cubic centimeter (cc) sample aliquot.

2.4.2 Analytical Laboratory Quality Control Procedures

Instrument setup and calibration for the onsite mobile laboratory and offsite stationary laboratory resulted in the complete resolution of targeted compounds provided in Table 4-1 of SOP 20. For the mobile laboratory, the initial calibration was performed upon arrival at the site and whenever:

- The mobile laboratory changed location;
- The GC column was changed; and
- The daily mid-point calibration check did not meet requirements.

For offsite stationary laboratories, daily calibration checks were performed prior to each instrument analyzing the first sample and whenever:

- The GC column was changed; and
- The daily mid-point calibration check did not meet requirements.

At a minimum, at least five different concentration levels were used for the initial calibration. The relative standard deviation (%RSD) for the target compound average response factor limits are listed in Table 4-1 of the SOP 20. Each initial calibration was verified by an initial calibration verification or laboratory control sample (LCS). The onsite mobile laboratory also performed an additional MRL level initial calibration verification (ICV)/LCS daily, prior to the analysis of any samples.

Each day that samples were analyzed by the onsite mobile or offsite stationary laboratory, the calibration was checked. The daily calibration check standard contained the target compounds at concentrations at or near the mid-point of the calibration. The percent difference (%D) for each response factor limits are summarized in Table 4-1 of SOP 20.

2.4.3 Data Review Processes

As data were reported by laboratories, a data review process was implemented to ensure appropriate feedback and correction of errors. These steps included:

- As samples were submitted to the laboratory, the COC would be checked against the laboratory acknowledgement of sample receipt form. Any sample log-in errors were identified and corrected at that time.
- A sample tracking spreadsheet was updated to track the samples collected, sample dates, lab receipts, laboratory sample delivery group (SDG) numbers, field QC sample information, sample location coordinates, and laboratory deliverables required including reports, electronic data deliverable, raw data, and the status of validation.
- When the laboratory report was received by e-mail, a preliminary review of the data was performed for accuracy.
- A check of the requested analysis on the COC against the reported data in the laboratory report was performed.
- A complete review of the laboratory case narratives was conducted.

2.5 DEVIATIONS FROM THE SOIL VAPOR IMPLEMENTATION PLAN

Deviations during field work and sample collection from the proposed sample rationale in the Soil Vapor Implementation Plan and SOPs in the Phase 3 Work Plan are discussed in the sections below. Deviations did not impact achieving the data quality objectives (DQOs) of this sampling event.

2.5.1 Soil Vapor

Soil vapor investigation locations were adjusted as necessary based on field conditions (e.g., infrastructure, sensitive animal and plant species, or archaeological artifacts). The modified locations did not impact achieving the DQOs of this sampling event. During probe installation, the preferred method for filling the annular space with hydrated bentonite was by addition of 6-inch lifts to avoid bridging and clogging of hydrated bentonite in the annular space associated with using a tremie pipe. Each lift was hydrated at a rate of one ounce of water for every inch of bentonite seal within the borehole. The method of hydrating the bentonite using six inch lifts is a standard practice at the SSFL and was discussed as an alternate approach in the procedures outlined in SOP 20. Therefore, this method of soil vapor probe construction was not a deviation, but is discussed in this section to clarify what was implemented.

As stated in Section 2.3, a sample flow rate of 100 to 200 mL/min must be achieved when sampling soil vapor probes. When high vacuum was measured at a sample probe (greater than

100 inches of water), a sample was not collected. Six soil vapor probes measured high vacuum, including 5BSV_DG-562 (10.5 to 11.5 ft bgs), 5BSV_DG-563 (4.5 to 5.5 ft bgs), 5CSV_DG-549 (7.0 to 8.0 ft bgs), 5CSV_DG-561 (11.5 to 12.5 ft bgs), 5DSV_DG-556 (10.0 to 11.0 ft bgs), and 6SV_DG-509 (20.0 to 21.0 ft bgs). A new probe was subsequently installed and successfully sampled at 5BSV_DG-549 and 5CSV_DG-562. A new probe was installed at 5BSV_DG-561 but high vacuum was still measured; therefore, a soil sample was collected and analyzed for VOCs. New probes were not installed at 5BSV_DG-563, 5DSV_DG-556, and 6SV_DG-509 either due to shallow soils, because a soil sample had been collected and analyzed for VOCs, or it was determined that data from nearby soil vapor probes provide sufficient data for remedial planning.

Prior to and during sampling, biological, archaeological, and Native American cultural monitors inspected proposed sampling locations for signs of sensitive species and archaeological artifacts. If sensitive species or artifacts were observed, the sampling area was protected and sampling postponed until the sensitive species was no longer present, or in the case of plant species and cultural artifacts, deferred indefinitely. During sampling activities, six soil vapor sampling locations in Subarea 5A (i.e., 5ASV_DG-549, -573, -589, -590, -602, -606) were identified within an active bird nesting area and could not be sampled. DOE communicated the decision to defer sampling to the remedial planning phase along with rationale for each location in a letter to DTSC dated July 31, 2014 (DOE, 2014c). If VOC data at these locations is deemed necessary during the remedial planning phase, samples will be collected.

There were no deviations from the analytical suites proposed in the Soil Vapor Implementation Plan.

2.5.2 **Soil Sampling**

- As discussed in the DTSC Soil Gas Advisory (DTSC, et all, 2012) and SOP 20, soil samples are to be collected in lieu of soil vapor samples and analyzed using EPA Method 8260B when soils were less than 5.5 ft bgs. In general, soil samples being analyzed for VOC are only collected if soils are at least 3 feet thick, except in cases where asphalt or concrete are present above the soil. However, to be consistent with CDM's soil sampling procedures, soil samples were collected for VOC analysis as shallow as 1.5 feet bgs, even when asphalt or concrete were not present above the soil. Soil samples were not collected from 4 locations due to thin soils and no asphalt or concrete present, including 5ASV_DG-623, 5BSV_DG-527, 5BSV_DG-582, and 5BSV_DG-597).

3.0 SAMPLING RESULTS

3.1 SOIL VAPOR SAMPLING RESULTS

Sampling activities were completed in accordance with the Phase 3 Work Plan (CDM, 2012) and the SOP 20 of the Phase 3 Work Plan (MWH, 2014b). A total of 177 primary soil vapor samples, 19 soil vapor field duplicate samples, 19 soil vapor split samples, 16 field/equipment blanks, and 23 ambient air blanks were collected from 106 locations. Table 2-1 provides a summary of the primary, duplicate, and split samples collected including sample name, sample types (e.g., primary, split), sample depth, matrix, and analysis. Table 3-1 is a summary of soil vapor data by analyte and includes the detection frequency, the minimum and maximum detected concentrations, the range of (method detection limit) MDL and MRLs, and the object name and depth of the maximum detected concentration. Appendix B is a complete set of all validated primary, duplicate, and split sample data organized by sample location in tabular format. The laboratory analytical reports for data collected during the soil vapor implementation are included as Appendix C.

3.2 SOIL SAMPLING RESULTS

Soil sample were collected for VOC analysis when soil vapor samples could not be collected due to shallow bedrock or refusal (less than 5.5 ft bgs), or there was anticipated or measured high vacuum conditions from the soil vapor probe based on lithology. A total of 66 primary soil samples, 2 soil duplicate samples, and 1 soil split samples were collected from 56 locations. Soil matrix sample analytical results will be presented by CDM in a separate technical memorandum.

4.0 DATA VALIDATION AND USABILITY ASSESSMENT

The purpose of the data usability assessment provided in Appendix D and discussed here is to: 1) summarize the data validation performed on the data sets, and 2) determine whether the sample results meet the DQOs outlined in the Phase 3 Work Plan (CDM, 2012).

4.1 DATA VALIDATION

The laboratories provided data reporting packages to MWH and an independent validation firm, MECx. A MECx chemist performed a Level V data validation of 100% of the data in accordance with the EPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (USEPA, 2008) and individual method requirements and guidelines from the SSFL Quality Assurance Project Plan (QAPP) (MECx, 2013). This encompassed an evaluation of sample collection procedures, holding times, instrument calibration summary information (to assess system performance), blanks (to assess contamination), sample duplicates (to assess precision), laboratory control samples (to assess accuracy), and matrix spike and surrogate spike recoveries (to assess accuracy and matrix effects). Upon completion of the data review process MECx provided a comprehensive data validation report for each data package and a Data Usability Assessment Report (DUAR) summarizing the review process and results in terms of precision, accuracy, representativeness, completeness, comparability, and sensitivity. The data validation reports and DUAR are included in Appendix D.

4.2 DATA QUALITY ASSESSMENT

Analytical data generated during the Phase 3 Soil Vapor Sampling in Area IV were validated according to the QAPP. No data were flagged as rejected, and all results are usable as qualified. A summary of data qualified as a result of the verification process is presented in Table 4-1. MWH reviewed the data validation reports and the DUAR, and assessed the qualified data against the DQOs for the project. MWH concluded that all DQOs specified in Final Phase 3 Work Plan were achieved.

8SV_DG-545	SVL-545-SA8-SV-6.75-7.25	Primary Sample	--	7.25	6/19/2014 10:37	Soil Vapor	VOCs	Yes	In Place

Total Number of Primary Soil Vapor Samples	Total QC Samples[1]	Total Validated Samples
177	38	215

Acronyms:
"--" - not applicable
ft bgs - feet below ground surface
QC - quality control
VOCs - volatile organic compounds by Environmental Protection Agency Method 8260B or TO-15

Notes:
1. QC samples include co-located duplicates and laboratory split samples.

Table 3-1

Acronyms:
CAS - chemical abstract service
µg/L - micrograms per litter
ft bgs - feet below ground surface

Notes:
Samples were analyized for volatile organic compounds (VOCs) by Environmental Protection Agency Method 8260B or TO-15
Soil samples collected for VOCs are not summarized in this report.

TABLE 4-1
PHASE 3 SOIL VAPOR
SUMMARY OF QUALIFIED DATA
SANTA SUSANA FIELD LABORATORY
VENTURA COUNTY, CALIFORNIA
(Page 10 of 10)

Object Name	Sample Name	Parent Sample Name	Lab Sample Name	Collection Date	Matrix Type	Sample Type	Result Type	Analysis Method	Analyte	CAS Number	Result Value (µg/L)	Validator Qualifier Code	Validator Qualifier Description	Lab Name	Validation Level	Validation Notes	Validation Report Identifier

Acronyms
µg/L - micrograms per liter
CAS - chemical abstract service
EST - Environmental Support Technologies
RL - reporting limit

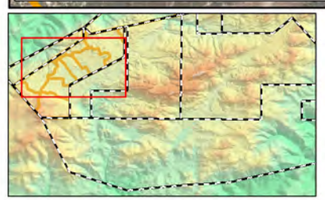

Validation Notes:
B - Presumed contamination as indicated by the preparation (method) blank results.
C - Calibration percent standard deviation or percent difference was non-compliant.
F - Presumed contamination as indicated by the field blank or equipment rinse blank results.
*III - Laboratory control spike/laboratory control spike duplicate relative percent difference exceeded the control limit.
L - Laboratory blank spike/blank spike duplicate percent recovery was not within control limits.

Validation Qualifiers:
J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
UJ - The analyte was not deemed above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Drilling Contractor: EST
Driller: MATT MCMULLEN
Rig Type/Method: Geoprobe 5400
Borehole TD: 30.0' bgs
Borehole Diameter: 2.25"
Probe Completion Date/Time: 05 JUN 14 11:30

Vapor Implant Specs
Material: stainless steel
Length: 6"
Diameter: 3/8"

Tubing Specs
Material: teflon
Diameter: 1/4"
Color: clear

Sand Pack Specs
Grain Size: #3 sand
Manufacturer: Cemex

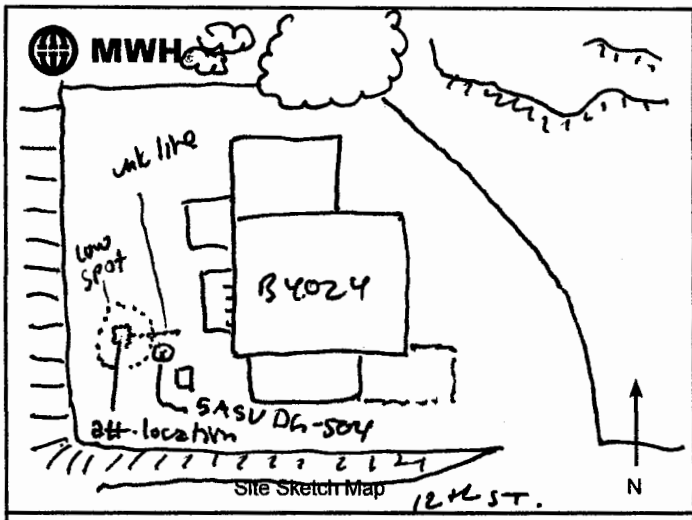

Dry Bentonite
Type: #8 crumbles
Manufacturer: Cetco

Hydrated Bentonite
Type: #8 crumbles
Manufacturer: Cetco

Notes:
1. Probes not to scale.
2. Borings are approximately 2 inches in diameter using a Macrocore or Dual Tube sampler and can hold up to 5 soil vapor probes. If additional depths will require sampling at the same location, a second boring may need to be drilled.
