Section 1
Introduction

This Technical Memorandum (TM) presents the results of chemical analyses of surface and subsurface soil samples collected from Phase 3 soil locations within Subareas 5D and 8 at the Santa Susana Field Laboratory (SSFL) site in Ventura County, California. This work was performed under three planning documents:

- *Master Field Sampling Plan for Chemical Data Gap Investigation, Phase 3 Soil Chemical Sampling at Area IV, Santa Susana Field Laboratory, Ventura County, California* (CDM Federal Programs Corporation [CDM Smith] 2012a) (Master Field Sampling Plan [FSP])
- *Addendum No. 7 to Master Field Sampling Plan for Chemical Data Gap Investigation, Phase 3 Soil Chemical Sampling at Area IV, Santa Susana Field Laboratory, Ventura County, California, Subarea* 8 (CDM Smith 2013a) (Addendum to the Master FSP)
- *Addendum No. 8 to Master Field Sampling Plan for Chemical Data Gap Investigation, Phase 3 Soil Chemical Sampling at Area IV, Santa Susana Field Laboratory, Ventura County, California, Subarea* 5D (CDM Smith 2013b) (Addendum to the Master FSP)

The Master FSP (CDM Smith 2012a) is Appendix A of the *Work Plan for Chemical Data Gap Investigation, Phase 3 Soil Chemical Sampling at Area IV, Santa Susana Field Laboratory, Ventura County, California* (CDM Smith 2012b), which also includes Appendix B, Quality Assurance Project Plan (QAPP), Appendix C, Worker Safety and Health Program, and Appendix D, Standard Operating Procedures (SOPs).

The Addendums No. 7 (CDM Smith 2013a) and No. 8 (CDM Smith 2013b) to the Master FSP (CDM Smith 2012a) includes several sample locations for trenches and test pits in Subareas 5D and 8. All of the trenches and test pits that exist in the various Area IV subareas will be sampled at one time (during subsequent Phase 3 sampling) and the associated analytical results will be reported in a separate TM for the trenching and "go-back" sampling.

This TM also provides a description of the sampling activities and a discussion of the analytical data review findings for Phase 3 sampling in Subareas 5D and 8. The TM does not provide an interpretation of the results. The data provided in this TM are intended to be combined with data collected under the prior Resource Conversation and Recovery Act (RCRA) Facility Investigation and the chemical collocated sampling program (Phase 1 sampling) to support the Soil Remedial Action Implementation Plan for chemicals in soil in Area IV. The co-located sampling program was Phase 1 of the chemical investigation activities under the Administrative Order on Consent (AOC) for Remedial Action [Docket Number HSA-CO 10/11-037] between the U.S. Department of Energy (DOE) and the California Environmental Protection Agency, Department of Toxic Substances Control (DTSC).

1.1 Objective and Basis for Data Gap Investigation Sampling in Subarea 5D and Subarea 8

The specific objective of sampling under the Chemical Data Gap Investigation is to identify the nature and extent (vertical and lateral) of soil contamination within Area IV for cleanup remedy evaluation.

The document *Subarea 8 Data Gap Analysis Technical Memorandum, Santa Susana Field Laboratory, Ventura County, California*, (SA8 Data Gap Analysis TM) was prepared by MWH Americas, Inc. (MWH) and included as an attachment to *Addendum No. 7 to Master Field Sampling Plan for Chemical Data Gap Investigation, Phase 3 Soil Chemical Sampling at Area IV, Santa Susana Field Laboratory, Ventura County, California, Subarea 8* (CDM Smith 2013a).

The document *Subarea 5D Data Gap Analysis Technical Memorandum, Santa Susana Field Laboratory, Ventura County, California*, (SA5D Data Gap Analysis TM) was prepared by MWH and included as an attachment to *Addendum No. 8 to Master Field Sampling Plan for Chemical Data Gap Investigation, Phase 3 Soil Chemical Sampling at Area IV, Santa Susana Field Laboratory, Ventura County, California, Subarea 5D* (CDM Smith 2013b).

The data gap analysis provides the rationale for selection of each sample location and the chemical sampling rationale.

CDM Smith was responsible for all aspects of the field sampling program under Phase 3 of the AOC, including:

- Field staking of the sample locations selected as a result of the data gap investigation using geographic information system (GIS) coordinates
- Collection of all samples in accordance with the procedures and controls specified in the Master FSP (CDM Smith 2012a), including but not limited to: sample collection; sample container preparation; sample handling; and documentation
- Sample management and shipment, laboratory coordination, and chemical analyses of the samples
- Data review and validation

1.2 Geology

Subareas 5D and 8 of Area IV are within the Cretaceous Chatsworth Formation (Fm) and Tertiary Santa Susana Fm brought into contact by the Burro Flats Fault. The Chatsworth Fm underlies approximately 80 percent of Area IV and is composed predominantly of sandstone interbedded with siltstone and shale. The Santa Susana Fm is composed of interbedded micaceous claystone, siltstone and thin sandstone layers, underling approximately 20 percent of Area IV. The tan fine-grained sandstones of the Santa Susana Fm are known for thin shell beds and calcareous concretions. Many were observed in outcrops and in Subareas 5D and 8. The overlying native soils encountered in Subareas 5D and 8 range from predominantly silty sands to sandy silts at shallow depths with increasing clay content to 10 feet below ground surface (bgs). Disturbed areas in Subareas 5D and 8 comprise fill soils of unknown origin and debris such as concrete, asphalt, and wood. The contact with both formations at many soil boring locations occurs between 2 and 10 feet bgs. Additional information regarding the geology in Area IV can be found in Volume I of *Group 5 – Central Portion of Areas III and IV RCRA Facility Investigation Report, Santa Susana Field Laboratory, Ventura County, California* (CH2M Hill 2008).

1.3 Technical Memorandum Organization

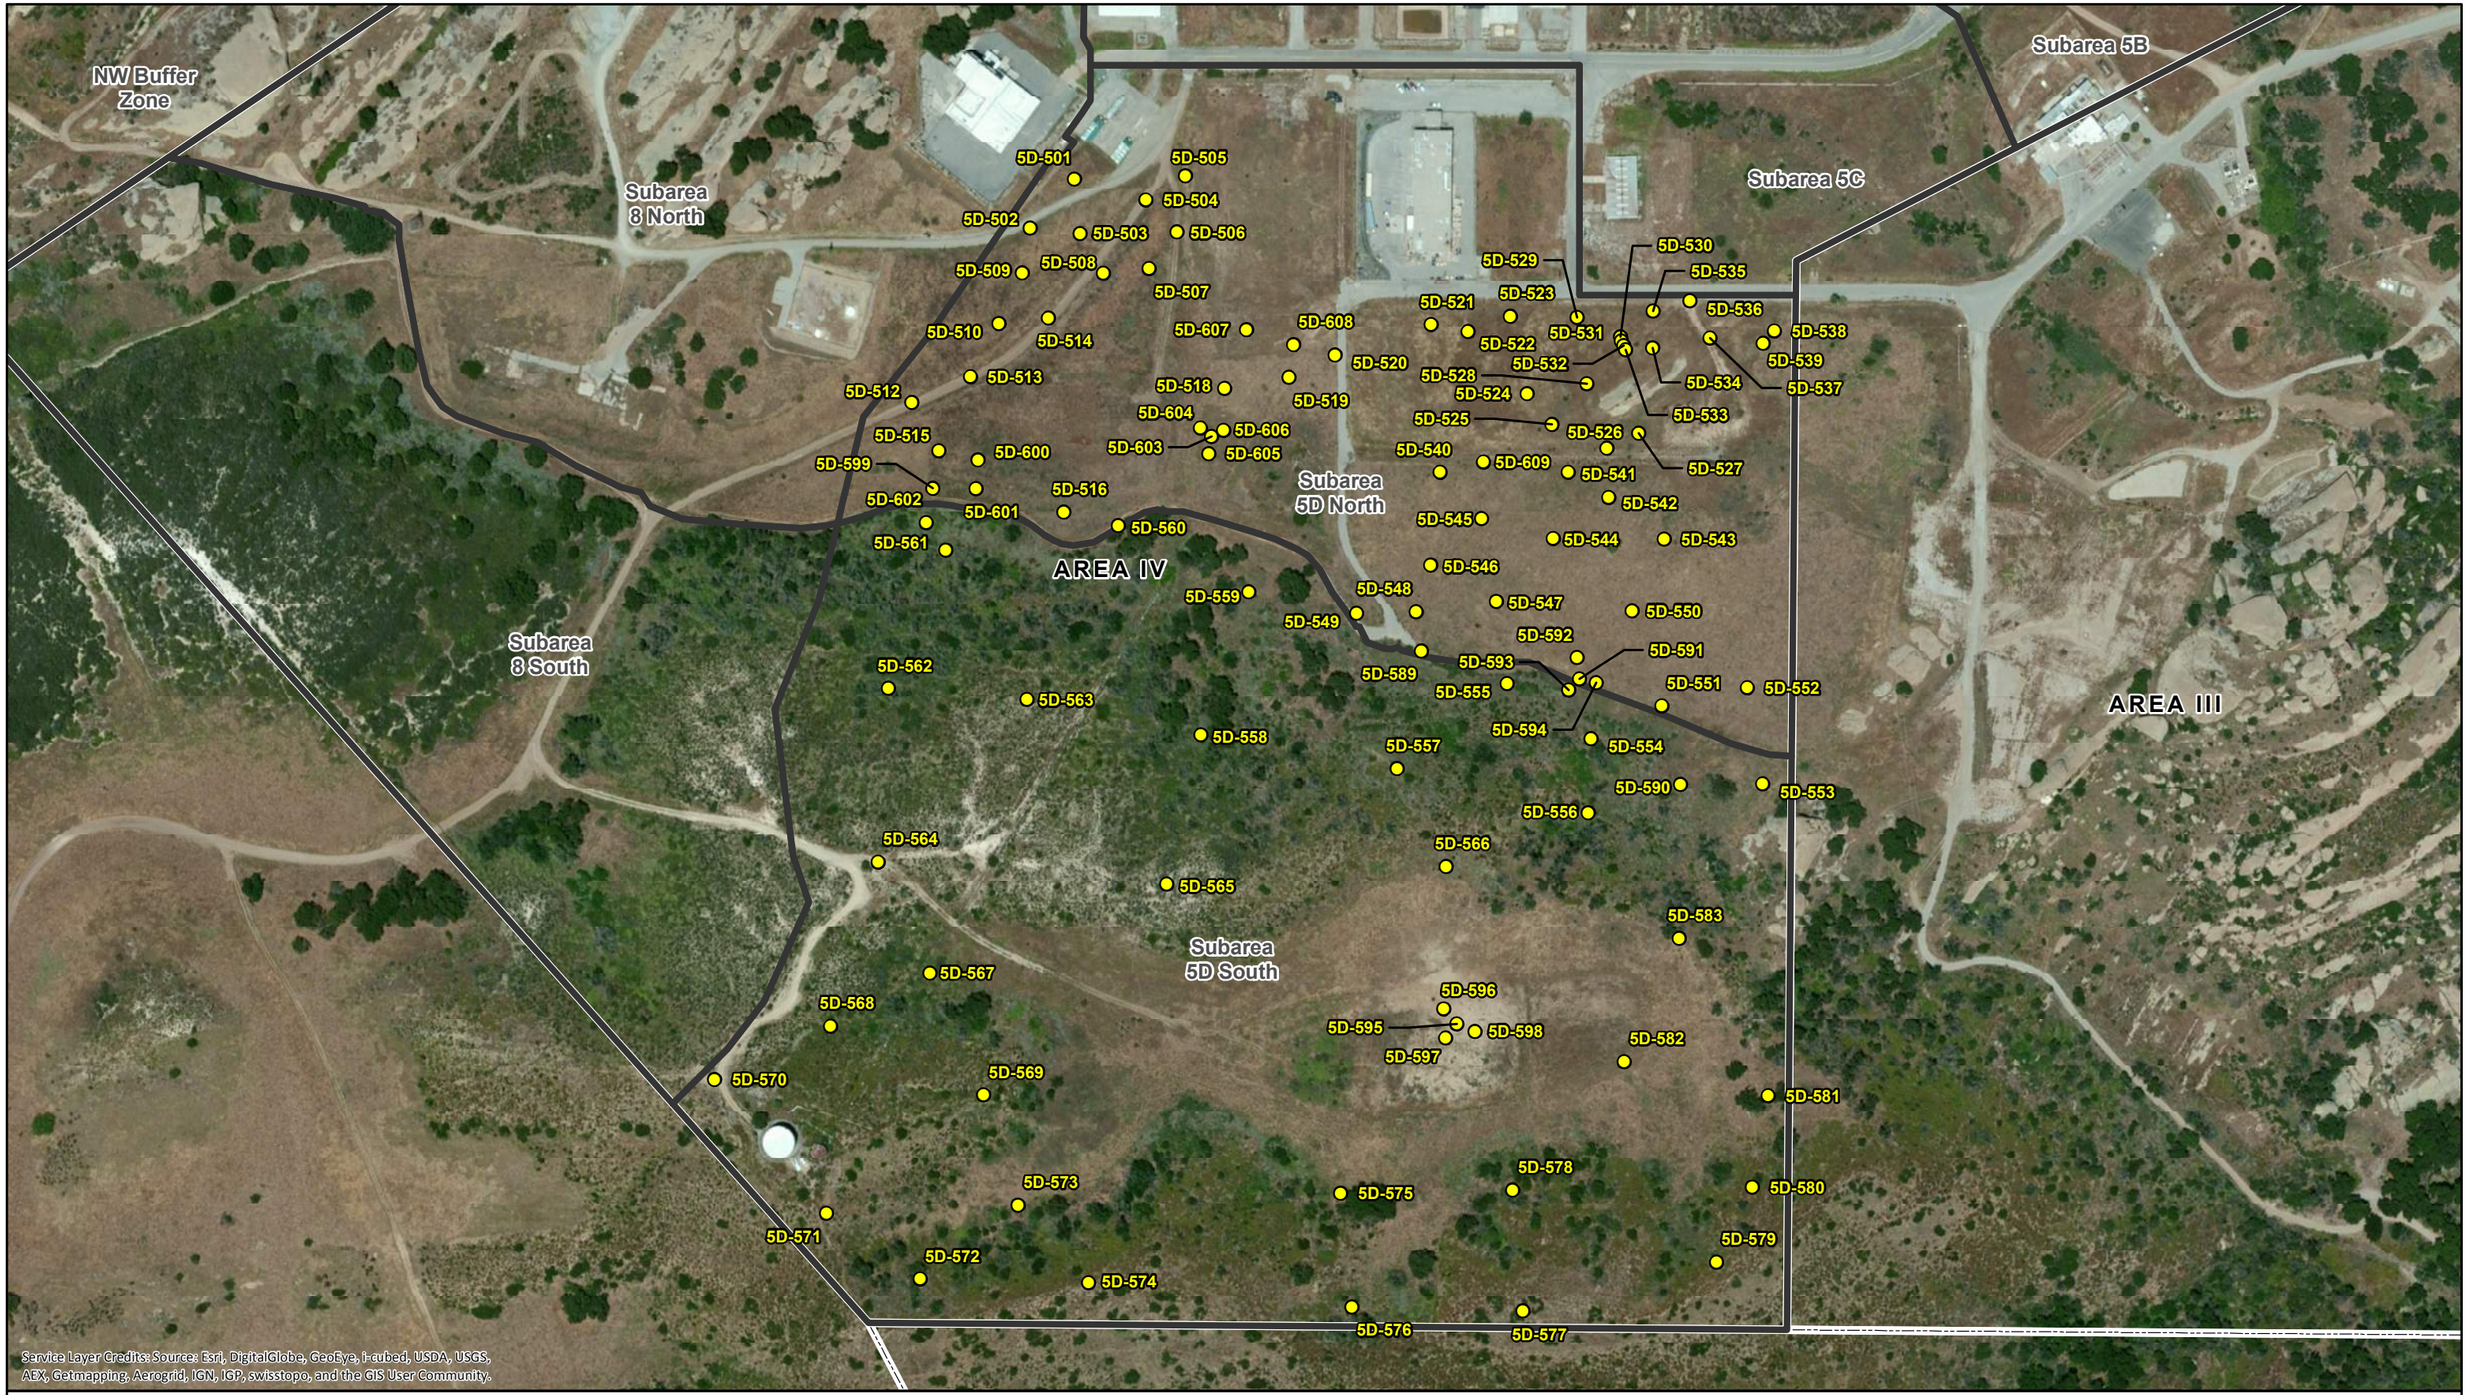
This TM includes the following sections:

- **Section 1 - Introduction** – Summarizes the basis and objectives of Phase 3 soil sampling in Subareas 5D and 8
- **Section 2 - Field Sampling and Analytical Methods** – Provides details regarding field sampling procedures and laboratory analytical methods
- **Section 3 - Soil Sample Analytical Results** – Provides a summary of detected analytical results for each chemical; the appendices provide the overall results
- **Section 4 - Data Usability Assessment** – Discusses the results of the data review and validation processes
- **Section 5 – References** – Identifies the documents used in this report

Section 2
Field Sampling and Analytical Methods

Two hundred and seventy three surface and/or subsurface soil samples were collected from 102 Phase 3 locations in Subarea 5D between August 26 and November 15, 2013. Two hundred and forty one samples were collected from 108 Phase 3 locations in Subarea 8 between July 8 and September 26, 2013. Two mineral grab samples were collected from the hill slope south of Eastern States Atomic Development Agency (ESADA) in Subarea 8 to evaluate a potential source of elevated elemental strontium. Four split samples collected with DTSC are also included in the total sample number for Subarea 8. Sample locations from Subarea 5D are shown on Figure 2-1 and the sample locations in Subarea 8 are shown on Figure 2-2.

Tables 2-1 and 2-2 include the data gap rationale for sampling at each Subarea 5D and 8 location respectively, along with the location identification, location description, rationale/comments, depth of boring, fill description, sample date, sample type, sample number and analyses sampled for. Locations not sampled are highlighted in yellow.



All soil sampling equipment (described in Sections 2.1 and 2.2) that came into contact with sample materials was decontaminated prior to sample collection in accordance with SSFL SOP 12 (Field Equipment Decontamination) of the Master FSP (CDM Smith 2012a). All samples, for both surface and subsurface, were screened for radioactivity using a Micro R Survey Meter (for gamma radiation) and a Pancake Frisker Detector (for alpha and beta radiation), followed by screening with a photoionization detector (PID) as directed in SSFL SOP 7 (Field Measurement of Residual Radiation). For each sample collected, the site geologist also completed a field sample data sheet (FSDS) in accordance with SSFL SOP 8 (Field Data Collection Documents, Content and Control). The completed form was reviewed for correctness in the field by the field sample technician and by the sample coordinator during sample processing. A boring log was created in accordance with SSFL SOP 9 (Lithologic Logging) for each location and reviewed by a state certified Professional Geologist. The FSDS sheets and associated boring logs are presented in Appendix E.

2.1 Surface Sampling

Prior to the collection of the surface soil samples in Subareas 5D and 8, the surface of each sample area was prepared by CDM Smith sampling personnel by removing leaves, grass, and any other surface debris. Surface samples were collected at 31 locations in Subarea 5D and 63 locations in Subarea 8 from the ground surface to 6 inches bgs using a slide hammer equipped with a 2-inch diameter and 6-inch long stainless steel sample liner in accordance with SSFL SOP 2 (Surface Soil Sampling) of the Master FSP (CDM Smith 2012a). The slide hammer sampler was pounded into the soil until the top of the sampler was flush with the ground surface and then removed from the soil. The sample sleeve was removed from the sampler and both ends capped with a Teflon® liner and a plastic cap.

Surface samples were collected at 77 locations in Subarea 5D and 50 locations in Subarea 8 using the direct push technology (DPT) rig in accordance with SSFL SOP 4 (Direct Push Technology (DPT) Sampling) of the Master FSP (CDM Smith 2012a). Stainless steel sleeves measuring 5 ¾ inches by 1 ¾ inches were inserted into the DPT split spoon sampler and pushed to required sample interval. Upon removal from the DPT sampler, each liner was capped on both ends with a Teflon liner and plastic cap.

8_DG-521	West of FSDF	Stepout for TPH at SL-071-SA8N to the southwest and cadmium and mercury at 92-886-1B-1 to the northwest. Location will also assess potential air dispersion impacts related to burning and treatment activities at the former FSDF ponds and is located northwest of FSDF in the prevailing wind direction. Location is one of six locations proposed that will assess this migration pathway, the others include 8_DG-101 and four 'future' samples located west of the Area IV boundary. Two of the future locations are in drainages (8_DG-118 and 8_DG-120) to evaluate the potential for subsequent surface water transport of aerially deposited contaminants. Additional sampling to address this pathway will also be proposed in the Northern Buffer Zone Subarea. Bedrock anticipated <5 feet bgs. Collect surface sample & 5 ft. only and drill to bedrock or refusal. If fill/staining/disturbance/PID hit encountered, sample deeper intervals. Sample fill/native contact and/or default sample depths.	2	None indicated. Soil Samples Designated to be Collected from Subarea 8 - Phase 3

Location ID	Location Description	Rationale / Comments	Boring Total Depth (ft bgs)	Fill Description	Sample Date	Sample Type	Sample Number	Laboratory Analyses
8_DG-544	East of ESADA Former Pistol Range	Delineates northeastern extent of ESADA Pistol Range Clearly Contaminated Area. Also serves as a stepout for dioxins, PAHs, cadmium, and TPH at SL-028-SA8N to the north and targets terrain conductivity fill anomaly and disturbed soil area. Conduct exploratory trench to investigate the terrain conductivity fill anomaly and the extent of disturbed soil. If fill, staining, debris, or other impacts are observed, collect sample targeting top of native soil. Bedrock anticipated ~10 feet bgs. Collect 10-foot sample and place on hold pending shallow results.	NA	NA	NA	Trench- To be sampled at a later date.	NA	NA
8_DG-545	South of Solar Concentrator Facility	Stepout for dioxins, PAHs, and TPH at SL-032-SA8N to the north. Also targets the southern boundary of the soil disturbance area. Conduct exploratory trench to investigate the extent of disturbed soil. If fill, staining, debris, or other impacts are observed, collect sample targeting top of native soil. Bedrock anticipated >10 feet bgs. Collect 10-foot sample and place on hold pending shallow results.	NA	NA	NA	Trench- To be sampled at a later date.	NA	NA
8_DG-546	South of Solar Concentrator Facility	Conduct exploratory trench to investigate debris area identified during 2008 debris survey. Also targets terrain conductivity anomaly. Fill anticipated based on previous sampling in the area and historical aerial photographs. Excavate until top of native soils encountered. Bedrock anticipated >10 feet bgs. No samples proposed since area previously characterized; collect samples if warranted based on field observations.	NA	NA	NA	Trench- To be sampled at a later date.	NA	NA
8_DG-547	Southwest of the Solar Concentrator Facility	Conduct exploratory trench to investigate debris area identified during 2008 debris survey. Also targets geophysical point anomaly. Fill anticipated based on previous sampling in the area and historical aerial photographs. Excavate until top of native soils encountered. Bedrock anticipated >10 feet bgs. No samples proposed since area previously characterized; collect samples if warranted based on field observations.	NA	NA	NA	Trench- To be sampled at a later date.	NA	NA
8_DG-548	West of the Solar Concentrator Facility	Conduct exploratory trench to investigate topographic low spot adjacent to the debris area identified during 2008 debris survey. Also targets terrain conductivity anomaly. Fill anticipated based on previous sampling in the area and historical aerial photographs. Excavate until top of native soils encountered. Bedrock anticipated >10 feet bgs. No samples proposed since area previously characterized; collect samples if warranted based on field observations.	NA	NA	NA	Trench- To be sampled at a later date.	NA	NA
8_DG-549	West of Solar Concetrator Facility	Stepout for dioxins, PAHs, and phthalates at SL-023-SA8N to the south. Also targets area adjacent to historic dirt road. Bedrock anticipated ~10 feet bgs. Collect surface sample & 5 ft. only and drill to bedrock or refusal. If fill/staining/disturbance/PID hit encountered, sample deeper intervals. Sample fill/native contact and/or default sample depths.	16.2	None indicated. Refusal on bedrock.	7/30/2013	Surface	SL-549-SA8-SB-0.0-0.5	Dioxins EPA 1613, Mercury EPA 7471, Metals EPA 6010, Metals EPA 6020, PAH EPA 8270 SIM, PCBs/PCTs EPA 8082, TPH-EFH EPA 8015, pH EPA 9045

8_DG-550	South of B4056 Landfill	Targets the former lined drainage west of the former solar concentrator facility and completes vertical characterization of soils at SL-041-SA8N. Previous samples at this location analyzed at 4-foot and 9-foot depths. The location is adjacent to SL-046-SA8N, where dioxins, TPH, and PAHs were detected above the screening levels in accumulated sediments within the drainage. Bedrock anticipated >10 feet bgs. Collect and analyze samples at 5-foot intervals to bedrock with deepest sample collected just above bedrock to assess potential vertical migration to bedrock. Samples collected at 5-foot and 10-foot depths will be analyze for TPH to complete the analytical suite at SL-041-SA8N.	18	None indicated. 8_DG-577	Northeast of B4009	Conduct exploratory trench to address uncertainty regarding location of a septic tank identified on a facility drawing. Previous geophysical surveys and soil borings did not find evidence of a septic tank in the location identified on the drawing. Also characterizes the operational area northeast of B4009 and the former location of the northern ISI storage trailer. If fill, staining, debris, or other impacts are observed, collect sample targeting top of native soil. Tetralin and biphenyls added to general characterization suite due to potential use in reactor operations. Bedrock anticipated <10 feet bgs. Collect and analyze deepest sample targeting soil just above bedrock since targeting a septic tank to assess potential vertical migration to bedrock.	NA	NA	NA	Trench- To be sampled at a later date. 8_DG-579	Northeast of B4009	Conduct exploratory trench to confirm that UT-4 was removed. UT-4 reportedly removed and the vault filled with concrete. Concrete was encountered during prior attempts to sample the location of UT-4. If a concrete vault encountered, excavate along one side of the vault and collect a sample of native soil at a depth just below the bottom of the vault. Tetralin and biphenyls added to general characterization suite due to potential use in reactor operations. VOCs added due to proximity to potential groundwater impact location. 8_DG-601	Northwestern Portion of Hillslope	Characterizes hillslope west of ESADA. Also targets area adjacent to dirt road. Location will also assess potential air dispersion impacts related to burning and treatment activities at the former FSDF ponds and is located southwest of FSDF in the periodic 'Santa Ana' wind direction. Location is one of six locations proposed that will assess this migration pathway, the others include 8_DG-21 and four 'future' samples located west of the Area IV boundary. Two of the future locations are in drainages (8_DG-118 and 8_DG-120) to evaluate the potential for subsequent surface water transport of aerially deposited contaminants. Additional sampling to address this pathway will also be proposed in the Northern Buffer Zone Subarea. Bedrock anticipated ~10 feet bgs. Collect surface sample & 5 ft. only and drill to bedrock or refusal. If fill/staining/disturbance/PID hit encountered, sample deeper intervals. Sample fill/native contact and/or default sample depths.	20	None indicated. Samples not collected

After the samples were collected and labeled "Top" and "Bottom," adhesive sample labels completed with all sampling information were affixed to all sample sleeves and jars, which were then placed into plastic zip top bags and stored in a cooler with double bagged ice until the samples were relinquished to the project sample coordinator or field team leader (FTL). Each surface sample was to be analyzed for the analytes identified for each sample location as indicated in Table 1 of the Subareas 5D and 8 Data Gap Analysis TMs (CDM Smith 2013a and 2013b).

Two locations in Subarea 8 were collected as grab samples. The locations targeted the mineralized areas on the hill slope south of ESADA to evaluate potential source of elevated strontium detections. Calcium carbonate minerals within the Santa Susana Fm were identified on the hill slope by the FTL and sample locations determined based on best mineral exposure. Several distinct mineral samples were collected and placed in 16 ounce glass jars for analysis. All grab samples were screened for radioactivity using a Micro R Survey Meter (for gamma radiation) and a Pancake Frisker Detector (for alpha and beta radiation), followed by screening with a PID as directed in SSFL SOP 7 (Field Measurement of Residual Radiation). The mineral sample locations in Subarea 8 are shown on Figure 2-2.

Four surface locations in Subarea 8 were collected and homogenized in accordance with the DTSC recommended method. Following homogenization, the soil was split between CDM Smith and the DTSC representative onsite during sample collection. Each set of samples were sent to different laboratories and analyzed for metals by Method Environmental Protection Agency (EPA) 6010, 6020 and 7471. The split sample locations in Subarea 8 are shown on Figure 2-2.

2.2 Subsurface Sampling

Most of the subsurface soil sampling was performed by a California-licensed DPT subcontractor under CDM Smith oversight and in accordance with SSFL SOP 4 (Direct Push Technology [DPT] Sampling) of the Master FSP (CDM Smith 2012a). The majority of the Phase 3 DPT borings in Subareas 5D and 8 were advanced to depths of between approximately 3 and 10 feet bgs. Tables 2-1 and 2-2 provide the actual depths reached at each location. Appendix E also provides the specific boring log for each sample.

Soil cores were collected using the DPT dual-tube sampling method, which consists of a 2-inch outer steel drive casing and an inner 1¾-inch diameter acetate soil sampling sleeve. After the liner was retracted from the core barrel, it was opened lengthwise with a cutting tool. Samples were collected from the acetate sleeve by the CDM Smith sample technician at the depths specified in Table 1 of the Subarea 5D and 8 Data Gap Analysis TM. Samples were also collected from any depths where the PID detected concentrations above background or where there was visual evidence of possible contamination.

Soil for total petroleum hydrocarbons-gasoline range organics (TPH-GRO) and TPH-Extractable Fuel Hydrocarbons (EFH) analyses was collected from the acetate sleeve using EnCore® samplers. Subsurface soil for semivolatile organic compound (SVOC) polycyclic aromatic hydrocarbon (PAH), and polychlorinated biphenyl/polychlorinated triphenyl (PCB/PCT) analyses was removed from the acetate sleeve in a manner causing minimal soil disturbance and placed into glass jars (ranging from four ounces to 16 ounces depending on volume of soil needed for the required analyses). Soil for all non-volatile analyses was also placed into glass jars. Adhesive sample labels were completed with all sampling information and affixed to each sample jar, and then placed into plastic zip top bags. The EnCore® samplers were placed into the bags in which they were received (three samplers per bag),

and the sample label affixed to the outside of the bag. All jars and EnCore® samplers were placed in a cooler with double bagged ice.

Several subsurface locations were not accessible by the DPT rig and borings at these locations were advanced using a hand auger. Each location was augered to the required sample depth and every foot of augered soil was retrieved to the surface, placed in plastic bags and screened using the Micro R, Pancake, and PID. All borings were sampled in accordance with SSFL SOP 3 (Subsurface Soil Sampling with Hand Auger) of the Master FSP (CDM Smith 2012a), using a slide hammer equipped with stainless steel sleeves. Any EnCore® samplers needed were filled from the bottom end of the sleeve, and the sleeve was capped and submitted for the required analyses. This process was repeated at those locations where deeper samples were also to be collected.

After all samples were collected from each boring and hand augered hole, the soil cuttings were used to backfill the hole and the hole was topped off with a bentonite chip seal. At locations in asphalt, asphalt patch was placed on top of the bentonite.

2.3 Sample Handling

All soil samples were relinquished by the field sample technician or geologist to CDM Smith's FTL or sample coordinator. The FTL or sample coordinator reviewed the completed FSDS for each submitted soil sample and ensured that the sample labels were legible and correct and that the sample labels matched the information on the FSDS. Any discrepancies were discussed with the field sample technicians and corrections to the sample labels and/or FSDS were made as needed. All sample labels were covered with clear tape, the sleeves and jars placed back into their plastic zip top bag, and refrigerated.

All sampling information on the FSDS was input into the Scribe electronic database by the sampling coordinator and one or more chain-of-custody (CoC) forms were generated at the end of the day from the database. The FTL reviewed each CoC, corrected any discrepancies, and reprinted the CoC, as needed. All CoCs for the Phase 3 Subarea 5D and 8 sampling activities are presented in Appendix F. Each completed CoC was signed by the field sample technician and the FTL as the individual responsible for release of the samples to the courier. All samples were packed into coolers and shipped in accordance with SSFL SOP 11 (Packaging and Shipping Environmental Samples).

2.4 Field Quality Control Procedures

Quality control (QC) samples collected in the field included field duplicates, matrix spike (MS)/matrix spike duplicate (MSD) samples, equipment rinsate blanks, field blanks and trip blanks.

2.4.1 Field Duplicates and MS/MSD Samples

Both the field duplicates and MS/MSD samples were to be collected at a frequency of one per 20 (five percent) parent soil samples collected. The field duplicate and MS/MSD samples are collected from the same location. The duplicate samples were submitted to the laboratory as separate (and blind) from the parent samples. The MS/MSD samples are additional volume of the parent samples collected in triple volume for the DPT subsurface samples; a double volume of soil was sufficient for the surface and hand-augered MS/MSD samples.

During sampling in Subarea 5D, a total of 16 field duplicates and MS/MSD samples were collected equating to approximately eight percent. In Subarea 8, a total of 13 duplicate and MS/MSD samples

were collected equating to approximately six percent. On an individual method basis, the five percent goal was met or exceeded for all analyses.

2.4.2 Equipment Rinsate Blank Samples

Equipment rinsate blanks were collected weekly for both surface and subsurface samples regardless of the number of soil samples collected. A total of 25 equipment rinsate blank samples were collected and analyzed for all the same analytical parameters as the soil samples.

2.4.3 Field Blank Samples

Field blanks were collected once for each lot number of ASTM International Type II water that was used for decontamination. One field blank was collected during Phase 3 sampling in Subareas 5D and 8. Other field blanks are associated with samples in Subareas 5D and 8 but were collected prior to the sampling conducted in these subareas. The field blank samples were analyzed for all the same analytical parameters as the soil samples.

2.4.4 Trip Blank Samples

Trip blanks filled with laboratory analyte-free water were sent to the site from the laboratory and were submitted unopened with any samples to be analyzed for organic parameters.

2.4.5 Decontamination of Sampling Equipment

All sampling and drilling equipment were decontaminated by the DPT subcontractor and/or CDM Smith staff before and after completing each sample. This included the hand auger equipment, slide hammer equipment, split spoon sampler and drill rods for the DPT, Encore® sampler and other sampling equipment. All sampling equipment was cleaned with the triple rinse method before sampling at the next depth; cleaning was also done between locations. The external surfaces of the equipment were washed with potable water and Alconox, or equivalent laboratory-grade detergent. Equipment was scrubbed until all visible dirt, grime, grease, oil, loose paint, rust flakes, etc., was removed. The equipment was then rinsed with potable water.

Any surface sampling equipment that came into contact with soil including the auger bucket and the slide hammer sampler cup and cap (that holds the stainless steel sleeves in place while sampling) were decontaminated as follows:

- Washed with a solution of potable water and Alconox, or equivalent laboratory-grade detergent
- Rinsed thoroughly with potable water
- Given a final rinse with ASTM International Type II water

If the sampling device was not used immediately after being decontaminated, it was placed in a sealed plastic bag.

2.5 Analytical Laboratory Methods and Procedures

The Subarea 5D and 8 Phase 3 soil samples were subject to analysis using at least one of the following analytical methods:

- Metals using EPA Methods 6010C/6020A, 7471B (mercury), and 7199 (chromium VI)
- Cyanide using EPA Method 9012B

- Fluoride using EPA Method 300
- Sulfite using EPA Method 377.1
- Soil pH using EPA Method 9045M
- SVOCs using EPA Method 8270D
- PAHs using Method 8270D selective ion monitoring (SIM)
- N-Nitrosodimethylamine (NDMA) using EPA Method 8270D and 8270D SIM
- Volatile Organic Compounds (VOCs) using EPA Method 8260B
- Pesticides using EPA Method 8081B
- Herbicides using EPA Method 8151A
- PCBs/PCTs using EPA Method 8082A
- Dioxins/furans using EPA Method 1613B
- Perchlorate using EPA Method 6850
- TPH-EFH using EPA Method 8015M
- TPH-GRO using EPA Method 8015M

Eurofins Lancaster Laboratory in Lancaster, Pennsylvania analyzed all parameters for the Phase 3 Subareas 5D and 8 samples. The laboratory was selected using a competitive procurement process.

2.6 Data Review Processes

Analytical data produced by the laboratory was subject to multiple review steps to coincide with the start of distinct tasks. These steps were performed in a timely manner to ensure appropriate feedback and correction of errors. These steps included:

- Cross-reference checking of sample CoC documents against the laboratory acknowledgement of sample receipt form. The laboratory acknowledgement of sample receipt was typically transmitted to the data manager via e-mail two to three days after sample receipt and login and includes a summary of the requested analyses to be performed per sample. Sample log-in errors were identified and corrected at this step.

- Tracking of sample collection, receipt, and laboratory sample delivery group (SDG) numbers on a sample tracking spreadsheet. This spreadsheet also includes field QC sample information, sample location coordinates, and required laboratory deliverables including reports, electronic data deliverables, raw data, and the status of validation.

- Laboratory consulting with the project chemists on data quality issues that occurred during sample analyses such as missed holding times, poor spike recoveries, etc. These issues are resolved based on technical and professional judgment and project data quality objectives to obtain usable data.

Upon receipt of the laboratory report (delivered via email), a preliminary review of the data was performed. This review consisted of:

- Reconciliation of the reported analyses against the analyses that were requested on the CoCs.

- Review of the laboratory case narratives. The case narrative identifies and explains quality issues encountered during the analysis of the samples. Quality issues may include (but are not limited to) missed holding times, poor spike recoveries in matrix or batch-specific QC samples, instrument calibration exceedances, and blank contamination.
- Review of the laboratory-specific QC data. The QC data are provided by the laboratory in summary form. Any unanticipated deviations from the project or method-specific criteria are reconciled with the laboratory at this stage.

2.7 Deviations from the Master FSP

During the Phase 3 field sampling and analytical programs, modifications from the procedures detailed in the Master FSP (CDM Smith 2012a) and project SOPs were required. These modifications and associated resolutions were discussed with the FTL, the project manager, and in some cases with the DTSC representative prior to implementation. In other instances, deviations implemented in the field were not discussed with the project manager or DTSC prior to their implementation. These deviations are described in the following subsections.

2.7.1 Field Sampling

A total of 104 locations in Subarea 5D (Table 2-1) and 120 locations in Subarea 8 (Table 2-2) were to be sampled at one or more depths. No subsurface samples were collected at one location due to shallow refusal at less than 2.5 feet bgs in Subarea 8. Two locations in Subarea 5D and 11 locations in Subarea 8 were not sampled because they are planned to be completed as trenches and/or test pits. These samples are highlighted in yellow in Tables 2-1 and 2-2.

The SSFL SOP 2 (Surface Soil Sampling) requires soil to be collected in decontaminated stainless steel sleeves during soil sample collection by slide hammer. Due to loose sand soil conditions that prevented soil from remaining within the stainless steel sleeve, three samples were collected using a clean slide hammer and placed directly into glass jars.

2.7.2 Analytical

No analytical deviations were encountered during analyses of samples collected for Phase 3 in Subareas 5D and 8.

Section 3

Area IV Subarea 5D and Subarea 8 Phase 3 Soil Sampling Analytical Results

Because this TM only provides the analytical results, data in this section are presented in a summary fashion. Tables 3-1, 3-2 and 3-3 summarize the Phase 3 Subarea 5D surface, subsurface and combined soil sample data respectively. Tables 3-4, 3-5 and 3-6 summarize the Phase 3 Subarea 8 surface, subsurface and combined soil sample data respectively. The tables detail the chemicals analyzed, their associated chemical abstract service (CAS) number, frequency of detection, minimum and maximum detected concentrations, range of observed detection limits and reporting limits (RLs), and the sample location where the maximum concentration of each analyte was detected. If two locations for the maximum concentration are listed and only one maximum concentration value is provided, this indicates that the concentration was the same at the specified depth at both locations.

Appendix A provides tables for all validated data by analytical method and sample location. Data validation qualifier codes and their definitions are presented in these tables. Appendix B provides the summary analytical data reports as received from Eurofins Lancaster Laboratory. Appendix C presents the data usability and assessment report (DUAR), which details specific qualifications of sample results along with all validation reports. Appendix D is the master database of all sample results including the data validation "flags" (qualifiers). Appendix E provides the FSDS and boring logs and Appendix F provides the CoC records for all of the samples submitted to Eurofins Lancaster Laboratory.

Notes
LL - Eurofins Lancaster Laboratory
ug/kg- microgram per kilogram
mg/kg - milligram per kilogram
ng/kg - nanogram per kilogram
J - Result is an estimated value
H - Holding times exceeded
S - Surrogates outside of criteria
C - Calibration recoveries outside of criteria
R - Calibration relative response factors outside of criteria
B - Method blank contamination
L - Laboratory control sample recoveries outside of criteria
Q - Matrix spike recoveries outside of criteria
E - Laboratory control sample and or matrix spike relative percent differences outside of criteria
I - Internal standards outside of criteria
A - Serial dilution results outside of criteria
F - Field blank contamination
Z - Analytes reported below the reporting limits and above the method detection limit
FD - Field duplicate relative percent difference outside of criteria
*# - Unusual problems found with the quality control data. See validation reports in Appendix C for detail.

LL - Eurofins Lancaster Laboratory
ug/kg- microgram per kilogram
mg/kg - milligram per kilogram
ng/kg - nanogram per kilogram
J - Result is an estimated value
H - Holding times exceeded
S - Surrogates outside of criteria
C - Calibration recoveries outside of criteria
R - Calibration relative response factors outside of criteria
B - Method blank contamination
L - Laboratory control sample recoveries outside of criteria
Q - Matrix spike recoveries outside of criteria
E - Laboratory control sample and or matrix spike relative percent differences outside of criteria
I - Internal standards outside of criteria
A - Serial dilution results outside of criteria
F - Field blank contamination
Z - Analytes reported below the reporting limits and above the method detection limit
FD - Field duplicate relative percent difference outside of criteria
*# - Unusual problems found with the quality control data. See validation reports in Appendix C for detail.

Section 4
Data Usability Assessment

The purpose of the DUAR provided in Appendix C and summarized here is to describe the data validation processes performed on the data sets and determine whether the sample results meet the data quality objectives (DQOs) outlined in the Phase 3 Master FSP (CDM Smith 2012a) and QAPP (CDM Smith 2012b).

4.1 Usability Summary

For the Subarea 5D data usability assessment, 28 data sets, or SDGs were reviewed and 34 SDGs were reviewed for Subarea 8. An SDG consists of 20 or fewer samples grouped together by analytical method for analyses depending on the time and date the samples were received by the laboratory. The analyses performed are discussed in Section 2.5.

Samples were collected and analyzed in accordance with the Master FSP (CDM Smith 2012a), and Addendum to the Master FSP (CDM Smith 2012a) for Subareas 5D and 8 with the exception of the field investigation deviations as stated in Section 2.7.

The validated data for Subarea 5D samples are usable as reported except for the rejected data. Seven herbicide results (dinitrobutyl phenol) were rejected due to laboratory control sample criteria. For all Subarea 5D data, 0.039 percent of the results were rejected. For Subarea 8, ten herbicide results (2,4,5-TP, 2,4,5-T, 2,4-D, 2,4-DB, 2,2-dichloropropionic acid and dinitrobutyl phenol) and four SVOC results (benzidine) were rejected. For all Subarea 8 data, 0.062 percent of the results were rejected.

The validated data for Phase 3 Subareas 5D and 8 samples are usable as reported with the exception of the rejected data. These rejected data and any impact to project objectives and goals are being evaluated in the data gap review process. Specific details are provided in the validation reports in Appendix C and Section 4.7.

4.2 Data Validation Procedures

Data were validated by the independent data validation firm Laboratory Data Consultants, Inc. All data validation was conducted in accordance with *EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review* (EPA 2004), *EPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review* (EPA 2008), and *EPA Contract Laboratory Program National Functional Guidelines for Chlorinated Dioxin/Furan Data Review* (EPA 2005).

The data validation strategy was to validate 10 percent of the data according to EPA Level IV protocols (all QC parameters and raw data) and the remaining 90 percent according to EPA Level III protocols (all QC parameters except calibrations and raw data). The Level IV determination also included reviewing 10 percent of all SDGs for each laboratory and each method. In order to achieve this, the validators chose appropriate samples (samples that were analyzed for all methods) in each SDG. Hence, not all samples in some of the SDGs were Level IV validated but they received a mixture of Level IV and Level III review.

Table 4-1 presents all SDGs that include Subareas 5D and 8 soil samples and the level of review for each SDG. Some SDGs may contain samples from other subareas, but all samples in an SDG were validated together. An index of samples associated with each SDG is presented at the beginning of Appendix C.

Note: Some SDGs may contain samples from other subareas, but all samples in an SDG were validated together.

To evaluate the quality of the laboratory data and the validation process, CDM Smith's chemists reviewed over 10 percent of the Subarea 5D and Subarea 8 soil sample SDGs. The SDGs reviewed are chosen based on methods and level of validation performed by the validation firm. The purpose of the review was to identify any laboratory QC issues not identified by the validation firm or any discrepancies in validation procedures by the validation firm. No additional qualifiers were applied to the data based on CDM Smith's review. The results of this review are provided in Section 4.8.

4.3 Quality Assurance Objectives

Quality assurance (QA) objectives for measurement data are expressed in terms of precision, accuracy, representativeness, comparability, completeness, and sensitivity (PARCCS). The QA objectives provide a mechanism for evaluating and measuring data quality.

A review of the collected data is necessary to determine if DQOs established in the Master FSP (CDM Smith 2012a) have been met. The following data measurement tasks were evaluated:

- Specification and adherence to analytical method and reporting limit requirements
- Identification of the appropriate laboratory analytical QC requirements and verification that QC requirements were met
- Verification that measurement performance criteria (representativeness and completeness) for the data were met
- Verification that field procedures were followed, deviations were documented, and a determination of impact on data quality as a result of these deviations

The data validation review determines if the collected data are of sufficient quality to support their intended use.

4.4 Summary of Field and Laboratory QA Activities

Field quality control samples included field duplicates, MS/MSDs, equipment rinsate blanks, field blanks and trip blank samples. Laboratory QA activities consisted of laboratory QC checks, method blanks, spike samples, calibrations and other method specific QC. The following sections discuss the specific field and laboratory QA activities.

4.5 Field Quality QA/QC

The MS/MSDs and field duplicate QC samples were collected at a frequency of approximately 1 per 20 samples (5 percent). During sampling in Subarea 5D, a total of 16 field duplicate/MS/MSD samples were collected equating to approximately six percent. On an individual method basis, the five percent goal was approximately met or exceeded for all analyses.

In Subarea 8, a total of 13 field QC samples (field duplicate and MS/MSD samples) were collected equating to approximately six percent. On an individual method basis, the five percent goal was met or exceeded for all analyses. Field duplicate and MS/MSD samples met the frequency requirements detailed in the Master FSP (CDM Smith 2012a).

Sections 2.4.2 through 2.4.4 discuss the equipment blanks, field blanks and trip blank samples collected in association with the Phase 3 Subareas 5D and 8 soil samples.

Equipment Rinsate and Field Blanks

The 25 equipment rinsate blank results collected are presented in Appendix C and a summary of the detected results is presented in Table 4-2 for Subarea 5D and Table 4-3 for Subarea 8. Field blank samples were collected from each lot number of ASTM International Type II water used for decontamination. One field blank was collected during sampling in Subarea 5D and Subarea 8. Some of the equipment blanks and field blanks applied to samples in both Subarea 5D and Subarea 8. Two of the field blanks were also collected during prior sampling events but are associated with samples

collected in Subarea 5D and Subarea 8. They are listed in each Subarea specific table below for clarification (listed in both tables if applicable). The detected results are presented below in Table 4-4 (Subarea 5D) and Table 4-5 (Subarea 8) and all results are reported in Appendix C.

Trip Blanks
Fifty-nine trip blank samples were shipped with the Subareas 5D and 8 soil samples. The analytical results for the trip blanks collected in association with the Subareas 5D and 8 soil samples are presented in Appendix C. All trip blank results were nondetect.

Temperature Blanks
Temperature blanks were to be included with each shipment of samples. Based on validation results all temperature blanks submitted with the Subarea 5D and 8 samples met criteria.

Data qualifications based on all blank detections and impacts to the data due to contaminants detected in the blanks are discussed in Section 4.7.3 and in the Appendix C validation reports.

Field QC Summary
Field duplicate and MS/MSD samples met the frequency requirements detailed in the Master FSP (CDM Smith 2012a) for the Phase 3 Subareas 5D and 8 sampling program. On an individual method basis, the five percent goal was met or exceeded for all analyses. Further, field QA/QC objectives were attained through the use of appropriate sampling techniques and collection of the required number and frequency of QC samples.

4.6 Laboratory Quality QA/QC

Analytical QA/QC was assessed by laboratory QC checks, method blanks, sample custody tracking, sample preservation, adherence to holding times, laboratory control samples (LCSs), MSs, calibration recoveries, surrogates, tuning criteria, second column confirmations, internal standards, serial dilutions, laboratory duplicates, and interference check standards. The majority of the laboratory QC sample criteria met project requirements as indicated in the data validation reports in Appendix C with the appropriate qualifiers applied. For Subarea 5D seven herbicide results (dinitrobutyl phenol) were rejected due to laboratory control sample criteria. For Subarea 8, 10 herbicide results (2,4,5-TP, 2,4,5-T, 2,4-D, 2,4-DB, 2,2-dichloropropionic acid and dinitrobutyl phenol) and four SVOC results (benzidine) were rejected. Specific details are provided in the validation reports in Appendix C and Section 4.7.

4.7 Data Quality Indicators

This section summarizes the validation performed. Individual SDG validation reports with specific sample detail are provided in Appendix C.

Achievement of the DQOs was determined in part by the use of data quality indicators (DQIs) described in the DUAR in Appendix C. These DQIs for measurement data are expressed in terms of PARCCS. The DQIs provide a mechanism for ongoing control to evaluate and measure data quality throughout the project. These criteria are defined in the sections below.

4.7.1 Precision

Precision is the measurement of the ability to obtain the same value on re-analysis of a sample through the entire analytical process. The closer the measurement results are, the greater the precision. Precision has nothing to do with accuracy or true values of the sample. Instead, it is focused on random errors inherent in the analysis that stem from the measurement process and are compounded by the non-homogeneous nature of some samples. Precision is measured by analyzing two portions of the sample (sample and duplicate) and then comparing the results. This comparison

can be expressed in terms of relative percent difference (RPD). RPD is calculated as the absolute difference between the two measurements divided by the average of the two measurements.

$$RPD = \frac{[(A-B)/\underline{A+B}]}{2} \times 100$$

The problem with this formula is that it depends on the average of the two measurements and the magnitude of the calculated RPD is intimately linked to the magnitude of the results. When sample results are close to the RL, the RPD is greater but does not necessarily indicate that the precision is out of control limits, just that the sample concentrations are low.

RPD as a measure of precision works very well in those cases where the same level of analyte is present in all samples; however, it does not work well as a quantitative tool when varying levels are present. Analysis of sample duplicates is valuable as a quantitative measure of precision but is not useful as a quantitative measure in environmental sample analyses. Another option that is used for evaluating the differences between sample results that are close to the RL is calculating the absolute difference between the results. In this situation, the difference between the sample results is compared to the RL (two times the RL for soils) and if the difference is greater, the sample results are qualified as estimated "J."

Because of these problems, precision is normally calculated on spike samples, either on a MS and MSD or on a LCS and laboratory control sample duplicate (LCSD). In this case, a known concentration of analyte has been created in each sample and long and short term evaluations of RPD can be made that are applicable to the reality of the measurement. The drawback is that the precision measurement is only applicable to the particular spike level used.

For the Phase 3 Subarea 5D and 8 soil data sets, precision was evaluated by reviewing RPD results for MS/MSDs, LCS/LCSDs, laboratory duplicates, and field duplicates.

Laboratory RPD control limits are presented in the Master FSP (CDM Smith 2012a) or are laboratory specific. For laboratory duplicates, if one or both of the sample results were less than two times the RL, a control limit of the absolute difference value equal to the RL was used for comparison.

The field duplicate RPD criterion is 50 percent. Field duplicates for this project were validated as follows:

If one result is non-detect and the other result is above the RL, the RPD result is reported at 200 percent and the field duplicate sample and parent sample results are qualified as estimated "J" for a detect value or "UJ" for a non-detect value. If the field duplicate RPD is above the 50 percent criterion (and both sample results are above the RL) the field duplicate and parent sample results for that analyte are qualified as estimated "J."

Qualifiers were applied to applicable sample analyte results during the validation process based on laboratory and field duplicate precision results. Details of the validation and the number of analytes qualified are provided in the DUAR and laboratory validation reports in Appendix C.

The following Subarea 5D individual analyte results were qualified as estimated "J/UJ" based on precision criteria:

- Some of the metal analyte results due to laboratory precision criteria

The following Subarea 8 individual analyte results were qualified as estimated "J/UJ" based on precision criteria:

- Some of the metal and hexavalent chromium analyte results due to laboratory precision criteria

Field duplicate precision criteria for Phase 3 Subarea 5D samples required the qualification of some analytes for dioxins, fluoride, metals, hexavalent chromium, mercury, TPH EFH/GRO, pesticides, PCB/PCTs and SVOC SIM results. For Phase 3 Subarea 8 samples, dioxins, metals, perchlorate, hexavalent chromium, mercury, TPH EFH/GRO, pesticides, PCB/PCTs, herbicides, SVOCs and SVOC SIM results were also qualified due to field duplicate precision criteria. No results were rejected based on field duplicate precision criteria. All field duplicate RPD results are presented in Appendix C. In summary, sample results that have been qualified as estimated "J/UJ" due to precision criteria are usable for project decisions with a degree of caution.

There was no discernible pattern or reason for the identified laboratory and field duplicate sample RPD exceedances. No field sampling issues were identified that would cause the RPD results that were outside of criteria. These exceedances are reasonable for this type of sampling activity.

4.7.2 Accuracy

Accuracy is a concept from quantitative analysis that attempts to address the question of how close the analytical result is to the true value of the analyte in the sample. Accuracy is determined through a spike procedure, where a known amount of the target analyte is added to a portion of the sample then the sample and the spiked sample are analyzed. The quantitative measure of accuracy is percent recovery (%R) calculated as follows:

$$\textbf{Percent Recovery} = \frac{(\text{Total Analyte Found} - \text{Analyte Originally Present})}{\text{Analyte Added}} \times 100$$

Each measurement performed on a sample is subject to random and systematic error. Accuracy is related to the systematic error. Attempts to assess systematic error are always complicated by the inherent random error of the measurement.

Analytical accuracy for the entire data collection activity is difficult to assess because several sources of error exist. Errors can be introduced by any of the following:

- Sampling procedure
- Field contamination
- Sample preservation and handling
- Sample matrix
- Sample preparation
- Analytical techniques

Accuracy is maintained to the extent possible by adhering to the EPA method and approved field and analytical standard operating procedures.

The following QC samples are used to assess laboratory accuracy:

Matrix Spikes: MSs are samples with a known amount of a target analyte added to them. Analysis of the sample that has been spiked and comparison with the results from the

unspiked sample (background) gives information about the ability of the test procedure to generate a correct result from the sample.

Post Digestion Spikes: Post digestion spikes are performed after the sample has been prepared and is ready for analysis. These are also termed "analytical spikes." The technique is used in conjunction with an MS to provide data that can separate interferences produced as part of the sample preparation from interferences that are innate qualities of the sample.

Laboratory Control Samples: LCSs consist of a portion of analyte-free water or solid phase sample that is spiked with target analytes at a known concentration.

Surrogates: Surrogate recovery is a QC measure limited to use in organics analysis. Surrogates are compounds added to every sample at the beginning of the sample preparation to monitor the success of the sample preparation and analytical procedures on an individual sample basis. Individual compounds used as surrogates are selected based on their ability to mimic the behavior of specific target analytes held to be particularly sensitive to the sample preparation manipulations.

Interference Check Samples: Interference check sample analysis is a QC measure unique to metals analysis using inductively coupled plasma atomic emission spectrometry. This QC sample verifies the analytical instrument's ability to overcome interferences typical of those found in samples.

Calibrations: Method requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable quantitative data for metals. Initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of the analytical run. Continuing calibrations demonstrate that the initial calibration is still valid by checking the performance of the instrument on a continuing basis.

Internal Standards: Internal standards measure the gas chromatograph/ mass spectrometer sensitivity and response stability during each analysis.

Serial Dilution: Serial dilutions are performed on at least one sample from every batch of analyses for metals to determine if physical or chemical interferences exist in the analyte determinations.

For the Phase 3 Subareas 5D and 8 soil data sets, accuracy was evaluated by reviewing the %R values and relative response factors of initial and continuing calibration (percent difference or percent drift [%D] for organic analyses), internal standards, surrogate spikes (organic analyses only), MS/MSD, LCS/LCSD, inductively coupled plasma (ICP) interferences, and by performing serial dilution checks during metals analyses, in conjunction with method blank, calibration blank, equipment rinsate blank, and trip blank results. These QC results assist in identifying the type and magnitude of effects that may have contributed to system error introduced from field and/or laboratory procedures.

Qualifiers were applied to applicable sample results during the validation process based on laboratory accuracy results. Details of the validation and the number of analytes qualified are discussed in detail in the DUAR and laboratory validation reports in Appendix C.

The following Subarea 5D individual analyte results were qualified as estimated "J/UJ" based on accuracy criteria:

- Some of the dioxins, fluoride, metals, perchlorate, TPH EFH/GRO and SVOC SIM results due to MS recoveries
- Some of the PCB/PCTs and herbicide results due to LCS recoveries
- Some of the metal analyte results due to serial dilutions
- Some of the pesticides, PCB/PCTs, and herbicide results based on calibration criteria
- Some of the TPH EFH/GRO and PCB/PCT results due to surrogates
- Some of the TPH EFH/GRO results based on holding times

The following individual analyte results were rejected "R" based on accuracy criteria:

- Seven herbicide results (dinitrobutyl phenol) based on LCSs

The following Subarea 8 individual analyte results were qualified as estimated "J/UJ" based on accuracy criteria:

- Some of the dioxins, fluoride, sulfite, metals, TPH EFH/GRO, pesticides, herbicides, SVOCs, and SVOC SIM results due to MSs
- Some of the PCB/PCTs, herbicides, SVOCs, and SVOC SIM results due to LCSs
- Some of the pesticides and herbicides results due to surrogates
- Some of the metal analyte results due to serial dilutions
- Some of the PCB/PCTs results due to confirmation column results
- Some of the herbicides, VOCs and SVOCs results based on calibration criteria

The following individual analyte results were rejected "R" based on accuracy criteria:

- Ten herbicide results (2,4,5-TP, 2,4,5-T, 2,4-D, 2,4-DB, 2,2-dichloropropionic acid and dinitrobutyl phenol) based on MSs and LCSs
- Four SVOC results (benzidine) based on MSs

Sample preservation, handling, and holding times are additional measures of accuracy of the data. Holding times are defined as the amount of time that elapses between collection of the sample in the field to the start of the analysis. Preservation is defined as techniques used to maintain the target analytes at concentrations representative of the source sampled. Published holding times are viewed as valid as long as the associated preservation and container requirements have been met. All holding times, sample preservation and handling criteria were met except for those identified above and discussed in detail in the Appendix C DUAR laboratory validation reports.

In summary, sample results that have been qualified as estimated "J/UJ" due to accuracy criteria are usable for project decisions. Results that have been rejected are not usable.

4.7.3 Blank Contamination

Blanks are used to determine the level of laboratory and field contamination introduced into the samples, independent of the level of target analytes found in the sample source. Sources of sample contamination can include the containers and equipment used to collect the sample, preservatives added to the sample, other samples in transport coolers and laboratory sample storage refrigerators, standards and solutions used to calibrate instruments, glassware and reagents used to process samples, airborne contamination in the laboratory preparation area and the analytical instrument sample introduction equipment. Each analyte group has its own particular suite of common laboratory contaminants. Active measures must be performed to continually measure the ambient contamination level and steps taken to discover the source of the contamination to eliminate or minimize the levels. Random spot contamination can also occur from analytes that are not common laboratory problems but that can arise as a problem for a specific project or over a short period of time. Sample equipment decontamination practices are discussed in Section 2.4.5. Field blanks, equipment blanks, trip blanks and laboratory method blanks are analyzed to identify possible sources of contamination. The DUAR and laboratory validation reports in Appendix C discuss the results that were qualified based on field and laboratory blank contamination.

In summary, for Phase 3 Subarea 5D samples, some dioxins, metals and SVOC SIM results were qualified as non-detect due to laboratory blank contamination criteria. For Phase 3 Subarea 8 samples, some dioxins, metals, VOCs and SVOC SIM results were also qualified based on laboratory blank contamination criteria. The percentage of results qualified as non-detect based on laboratory blank contamination was less than 5 percent, as discussed in Appendix C, for all analyses except dioxins for Subarea 5D and Subarea 8 (35 percent and 40 percent respectively). These results were qualified as non-detect "U" due to laboratory blank contamination.

For the dioxins, method detection limits (MDLs) for this analysis are very low, reported in nanogram per kilogram (ng/kg) or parts per trillion, resulting in numerous results qualified as estimated "J." Many of these estimated values have been subsequently qualified as non-detect "U" because the compound was detected in related laboratory blanks. In the laboratory blanks, low level detections of dioxin analytes are somewhat inevitable because of the nature and universal occurrence/presence of the compounds. The dioxin levels found in the blanks are well below site-related action levels. Therefore, the resulting qualification of associated sample results as not detected or "U" does not falsely diminish identification of site-related contaminants.

Tables 4-2 through 4-5 provide a summary of analytes observed in equipment blanks and field blank samples. Trip blank sample results were nondetect; most of the detected compounds in the other blanks were below the RLs but above the MDLs. Compounds detected above the RL are highlighted yellow in the associated tables. The ASTM International Type II water used to generate the equipment and field blanks. The field blanks (source water) had detections of various analytes for dioxins, SVOC SIM, VOCs, metals and SVOCs (above the RL) indicating inherent low level contamination in the source water used.

ASTM International Type II water is not typically certified “clean” to the low RLs established for the low level methods used for Phase 3 Subarea 5D and Subarea 8 sampling. CDM Smith will continue to monitor ASTM International Type II water field blanks for detected concentrations of analytes throughout the sampling program.

A review of the Phase 3 equipment blanks for Subarea 5D and Subarea 8 was also performed. In general, a variety of analytes were detected above their respective RLs. All Phase 3 equipment blanks will continue to be monitored to determine if these low level detections are consistent, thus indicating a possible deficiency in decontamination procedures and/or source water impacts that need to be addressed and corrected.

For Subarea 5D, some metal results and some SVOC SIM results were qualified based on field/equipment blank criteria. For Subarea 8, some metal results, VOC results and some SVOC SIM results were also qualified based on field/equipment blank criteria. To date, chemical detections in equipment blank samples appear to be random occurrences.

4.7.4 Representativeness, Comparability, and Sensitivity

Representativeness, comparability, and sensitivity are achieved by using EPA-approved sampling procedures and analytical methodologies. By following the procedures described in the Master FSP (CDM Smith 2012a) for this sampling event and future sampling events, sample analysis should yield results representative of environmental conditions at the time of sampling. Similarly, reasonable comparability of analytical results for this and future sampling events can be achieved if approved EPA analytical methods and standardized reporting units are employed.

4.7.4.1 Representativeness

Representativeness is a qualitative term that expresses the degree to which the sample data accurately and precisely represent the environmental conditions corresponding to the location and depth interval of sample collection. Requirements and procedures for sample collection are designed to maximize sample representativeness.

Representativeness also can be monitored by reviewing field documentation and/or performing field audits. For this report, a detailed review was performed on the CoC forms, laboratory sample confirmation logs, and data validation packages. Laboratory QA/QC requirements were included in the Master FSP (CDM Smith 2012a) and laboratory statements of work (SOWs) to ensure that the laboratory analytical results were representative of true field conditions.

The most significant measure of representativeness is the accuracy of the sampling network and selection of appropriate locations and depths, etc. Field sampling representativeness was attained through adherence to the approved Master FSP (CDM Smith 2012a) for sample location and collection and by using approved standard operating procedures for field data collection. Therefore the data should represent, as near as possible, the actual field conditions at the time of sampling.

Representativeness has been achieved by the field work and laboratory analyses performed. The analytical data generated that were not rejected are viewed to be a representative characterization of the project area.

4.7.4.2 Comparability

Comparability is a qualitative term that expresses the confidence with which a data set can be compared with another. Strict adherence to standard sample collection procedures, analytical detection limits, reporting units and analytical methods assures that data from like samples and sample conditions are comparable. This comparability is independent of laboratory personnel, data reviewers, or sampling personnel. Comparability criteria are met for the project if, based on data review, the sample collection and analytical procedures are determined to have been followed, or defined to show that variations did not affect the values reported.

To ensure comparability of data generated for the site, standard sample collection procedures and DTSC-reviewed analytical methods were utilized by CDM Smith. The sample analyses were performed by Eurofins Lancaster Laboratory. Utilizing such procedures and methods enables the current data to be comparable with previous and future data sets generated using similar methods.

4.7.4.3 Sensitivity

Sensitivity is related to the ability to generate usable data at reporting levels which facilitate comparisons of analytical results with project-specific levels of interest, such as risk-based screening levels or action levels. Analytical detection limits for the various sample analytes should be below the level of interest to allow an effective comparison.

Detection Limits

The MDL study attempts to answer the question, "What is the lowest level of analyte in a sample that will result in a signal different than zero?" The study is based upon repetitive analysis of an interference-free sample spiked with a known amount of the target analyte. The MDL is a measure of the ability of the test procedure to generate a positive response for the target analyte in the absence of any other interferences from the sample.

The RL is generally defined as the lowest concentration at which an analyte can be detected in a sample and its concentration reported with a reasonable degree of accuracy and precision. For samples that do not pose a particular matrix problem, the RL is typically about three to five times higher than the MDL.

Laboratory results are reported according to rules that provide established certainty of detection and RLs. The result for an analyte is flagged with a "U" if that analyte was not detected, or qualified with a "J" flag if associated QC results fall outside the appropriate control limits. Also, if an analyte is present at a concentration between the MDL and the RL, the analytical result is flagged with a "J," indicating an estimated quantity. Qualifying the result as an estimated concentration reflects increased uncertainty in the reported value.

Qualifiers were applied to applicable sample results by the laboratory and identified during the validation process based on sample results being reported as detected below the RL/MDL. Details of the validation and the number of results qualified are discussed in detail in the DUAR and laboratory validation reports in Appendix C.

In summary, for all methods analyzed for Subarea 5D, results for some of the analytes were qualified as estimated due to the RL criteria for dioxins, fluoride, metals, perchlorate, hexavalent chromium, mercury, TPH EFH/GRO, pesticides, PCB/PCTs, and SVOC SIM. For Subarea 8, results for some of the analytes were qualified as estimated due to RL criteria for dioxins, fluoride, metals, perchlorate, hexavalent chromium, mercury, TPH-EFH/GRO, pesticides, PCB/PCTs, herbicides, SVOCs and SVOC SIM results. For the data validated in this TM, RLs for a majority of the sample results were low enough to compare to the RLs stated in the Master FSP (CDM Smith 2012a). RLs above those stated in the Master FSP (CDM Smith 2012a) will be evaluated on a case by case basis to see if resampling is required.

4.8 Review of Selected Validation Reports

CDM Smith performed a review of the validation reports identified in Table 4-1. This review involved comparing the validation report results against the laboratory data packages as well as the validation

guidance documents. All validation report results were verified against the laboratory data packages and validation guidance documents were followed as required.

4.9 Data Completeness

Completeness of the data collection program is defined as the percentage of samples planned for collection as listed in the Master FSP (CDM Smith 2012a) versus the actual number of samples collected during the field program (see equation A).

Completeness for acceptable data is defined as the percentage of acceptable data obtained that is judged to be valid versus the total quantity of data generated (see equation B). Acceptable data include both data that pass all the QC criteria (unqualified data) and data that may not pass all the QC criteria but had appropriate corrective actions taken (qualified but usable data).

Equation A.

$$\%\text{Completeness} = C \times \frac{100}{n}$$

Where:

C = actual number of samples collected
n = total number of samples planned

Equation B.

$$\%\text{Completeness} = V \times \frac{100}{n'}$$

Where:

V = number of measurements judged valid
n' = total number of measurements made

The overall completeness goal, as defined in the Master FSP (CDM Smith 2012a), for this sampling event is 90 percent for each analytical test for all project data.

A total of 273 soil samples including the field duplicates were collected and analyzed for Subarea 5D and 241 soil samples for Subarea 8. Two mineral grab samples were collected from the hill slope south of ESADA in Subarea 8 to evaluate a potential source of elevated strontium. Four split samples collected with DTSC are also included in the total sample number for Subarea 8. Some locations required only a subsurface sample while other locations required both a surface and a subsurface sample. The number of subsurface samples to be collected at each location was not pre-determined because the total depth of each boring varies depending on the local geology. No subsurface samples were collected at one location due to shallow refusal at less than 2.5 feet bgs in Subarea 8. Two locations in Subarea 5D and 11 locations in Subarea 8 were not sampled because they are planned to be completed as trenches and/or test pits as noted in Section 2.7.1.

The completeness goal for the actual number of samples collected compared to the number of samples planned is considered acceptable as a sample was collected from each location (depending on shallow refusal) and locations for trench samples and near active transformers will be collected during future Phase 3 sampling activities.

The completeness goal achieved for acceptable data was 99.96 percent for Subarea 5D and 99.94 percent for Subarea 8 for the number of measurements judged to be valid versus the total number of measurements made for all samples analyzed. Tables 4-6 and 4-7 summarize all results that were estimated or rejected for Phase 3 Subarea 5D and 8 respectively.

The following Phase 3 Subarea 5D individual analyte results were rejected per analyses:

- Method 8151A
  - Seven out of 390 individual herbicide analyte results (1.79 percent)

The following Phase 3 Subarea 8 individual analyte results were rejected per analyses:

- Method 8151A
  - Ten out of 330 individual herbicide analyte results (3.03 percent)
  - Four out of 1,083 individual SVOC results (0.37 percent)

Completeness Total for Phase 3 Subarea 8 Samples Collected and Judged Valid							**99.94**

The completeness goals for both the locations sampled and the number of measurements judged to be valid were met for both Phase 3 Subarea 5D and Subarea 8.

Sampling deviations from procedures described in the Master FSP (CDM Smith 2012a) are discussed in Section 2.7 of this TM and did not impact DQOs for this sampling event. The data reported, and not rejected, are suitable for their intended use for characterization of Area IV of SSFL. The DQIs identified in the Master FSP (CDM Smith 2012a) met appropriate criteria and the achievement of the completeness goals for the data indicates a sufficient amount of usable data has been generated for project decisions.

4.10 Assessment of Data Usability and Reconciliation with Master FSP Goals

Over 99 percent of the data validated for Subareas 5D and 8, and reported in this TM, are suitable for their intended use for site characterization. Rejected sample results are not suitable for project use. The rejected analyte results do not impact achievement of the overall project objectives. The RLs

reported generally met the expected limits proposed by the analytical laboratories in their subcontract agreements with CDM Smith.

Sample results that were qualified as estimated are usable for project decisions.

Field duplicate precision also met criteria a majority of the time. RPDs were outside criteria predominantly when the sample results were close to the RL and/or below the project required action limits. Decisions based on results close to the RL should be made with a degree of caution. The achievement of the completeness goals for number of samples collected, and the number of sample results acceptable for use provides sufficient quality data to support project decisions.

SSFL Main Qualification Definitions and Notes

NOTE: In the Appendix A tables, samples that were analyzed by Lancaster Laboratories are identified with the letter "N" in the sample type code and samples analyzed by EMAX are identified with the word "Split" in the sample type code.

U – The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

J – The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

R – The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.

UJ – The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Qualifier	Organics	Inorganics
H	Holding times were exceeded.	Holding times were exceeded.
S	Surrogate recovery was outside QC limits.	The sequence or number of standards used for the calibration was incorrect.
C	Calibration %RSD, r, r2 or %D were noncompliant	Correlation coefficient is <0.995.
R	Calibration RRF was <0.05.	%R for calibration is not within control limits
B	Presumed contamination from preparation (method blank)	Presumed contamination from preparation (method) blank or calibration blank
L	Laboratory Control Sample/Laboratory Control Sample Duplicate %R was not within control limits	Laboratory Control Sample/Laboratory Control Sample Duplicate %R or RPD was not within control limits
Q	MS/MSD recovery was poor; RPD	MS/MSD recovery was poor.
E	LCS/LCSD RPD	MS/MSD or Duplicate RPD or difference was high.
I	Internal standard performance was unsatisfactory	ICP ICS results were unsatisfactory.
A	Not applicable.	ICP Serial Dilution %D were not within control limits
M	Instrument Performance Check (BFB or DFTPP) was noncompliant	Not applicable.
T	Presumed contamination from trip blank.	Not applicable.
F	Presumed contamination from FB or ER.	Presumed contamination from FB or ER.
D	The analysis with this flag should not be used because another more technically sound analysis is available.	The analysis with this flag should not be used because another more technically sound analysis is available.
P	Instrument performance for pesticides was poor	Post Digestion Spike recovery was not within control limits
K	EMPC	Not applicable

J-Result is an estimated value
R-Result is rejected if R qualifier is in first position. If R qualifier is after another qualifier, result is not rejected but qualified as estimated during validation

Quality Control Summary

Client Name: CDM Federal Programs Corp. Group Number: 1414412
Reported: 09/11/13 at 07:31 PM

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	**BMQL**	Below Minimum Quantitation Level
N.D.	none detected	**MPN**	Most Probable Number
TNTC	Too Numerous To Count	**CP Units**	cobalt-chloroplatinate units
IU	International Units	**NTU**	nephelometric turbidity units
umhos/cm	micromhos/cm	**ng**	nanogram(s)
C	degrees Celsius	**F**	degrees Fahrenheit
meq	milliequivalents	**lb.**	pound(s)
g	gram(s)	**kg**	kilogram(s)
µg	microgram(s)	**mg**	milligram(s)
mL	milliliter(s)	**L**	liter(s)
m3	cubic meter(s)	**µL**	microliter(s)
		pg/L	picogram/liter

< less than - The number following the sign is the limit of quantitation, the smallest amount of analyte which can be reliably determined using this specific test.

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg), or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Data Qualifiers:

C – result confirmed by reanalysis.

J - estimated value – The result is ≥ the Method Detection Limit (MDL) and < the Limit of Quantitation (LOQ).

U.S. EPA CLP Data Qualifiers:

Organic Qualifiers		Inorganic Qualifiers	
A	TIC is a possible aldol-condensation product	**B**	Value is <CRDL, but ≥IDL
B	Analyte was also detected in the blank	**E**	Estimated due to interference
C	Pesticide result confirmed by GC/MS	**M**	Duplicate injection precision not met
D	Compound quantitated on a diluted sample	**N**	Spike sample not within control limits
E	Concentration exceeds the calibration range of the instrument	**S**	Method of standard additions (MSA) used for calculation
N	Presumptive evidence of a compound (TICs only)	**U**	Compound was not detected
P	Concentration difference between primary and confirmation columns >25%	**W**	Post digestion spike out of control limits
U	Compound was not detected	*****	Duplicate analysis not within control limits
X,Y,Z	Defined in case narrative	**+**	Correlation coefficient for MSA <0.995

Analytical test results meet all requirements of NELAC unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR part 136 Table II as “analyze immediately” are not performed within 15 minutes.

The recovery for a target analyte(s) in the Laboratory Control Spike(s) is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken:
The sample was re-extracted outside the method required holding time and the QC is compliant. All results are reported from the first trial. Similar results were obtained in both trials.

Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.

General Sample Comments

State of California Lab Certification No. 2501

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.

General Sample Comments

State of California Lab Certification No. 2501

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.

General Sample Comments

State of California Lab Certification No. 2501

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Quality Control Summary

Client Name: CDM Federal Programs Corp. Group Number: 1415078
Reported: 09/16/13 at 06:17 PM

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	**BMQL**	Below Minimum Quantitation Level
N.D.	none detected	**MPN**	Most Probable Number
TNTC	Too Numerous To Count	**CP Units**	cobalt-chloroplatinate units
IU	International Units	**NTU**	nephelometric turbidity units
umhos/cm	micromhos/cm	**ng**	nanogram(s)
C	degrees Celsius	**F**	degrees Fahrenheit
meq	milliequivalents	**lb.**	pound(s)
g	gram(s)	**kg**	kilogram(s)
µg	microgram(s)	**mg**	milligram(s)
mL	milliliter(s)	**L**	liter(s)
m3	cubic meter(s)	**µL**	microliter(s)
		pg/L	picogram/liter

< less than - The number following the sign is the limit of quantitation, the smallest amount of analyte which can be reliably determined using this specific test.

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg), or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Data Qualifiers:

C – result confirmed by reanalysis.

J - estimated value – The result is ≥ the Method Detection Limit (MDL) and < the Limit of Quantitation (LOQ).

U.S. EPA CLP Data Qualifiers:

Organic Qualifiers		Inorganic Qualifiers	
A	TIC is a possible aldol-condensation product	**B**	Value is <CRDL, but ≥IDL
B	Analyte was also detected in the blank	**E**	Estimated due to interference
C	Pesticide result confirmed by GC/MS	**M**	Duplicate injection precision not met
D	Compound quantitated on a diluted sample	**N**	Spike sample not within control limits
E	Concentration exceeds the calibration range of the instrument	**S**	Method of standard additions (MSA) used for calculation
N	Presumptive evidence of a compound (TICs only)	**U**	Compound was not detected
P	Concentration difference between primary and confirmation columns >25%	**W**	Post digestion spike out of control limits
U	Compound was not detected	*****	Duplicate analysis not within control limits
X,Y,Z	Defined in case narrative	**+**	Correlation coefficient for MSA <0.995

Analytical test results meet all requirements of NELAC unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. Quality Control Summary

Client Name: CDM Federal Programs Corp. Group Number: 1415400
Reported: 09/13/13 at 03:30 PM

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	**BMQL**	Below Minimum Quantitation Level
N.D.	none detected	**MPN**	Most Probable Number
TNTC	Too Numerous To Count	**CP Units**	cobalt-chloroplatinate units
IU	International Units	**NTU**	nephelometric turbidity units
umhos/cm	micromhos/cm	**ng**	nanogram(s)
C	degrees Celsius	**F**	degrees Fahrenheit
meq	milliequivalents	**lb.**	pound(s)
g	gram(s)	**kg**	kilogram(s)
µg	microgram(s)	**mg**	milligram(s)
mL	milliliter(s)	**L**	liter(s)
m3	cubic meter(s)	**µL**	microliter(s)
		pg/L	picogram/liter

< less than - The number following the sign is the limit of quantitation, the smallest amount of analyte which can be reliably determined using this specific test.

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg), or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Data Qualifiers:

C – result confirmed by reanalysis.

J - estimated value – The result is ≥ the Method Detection Limit (MDL) and < the Limit of Quantitation (LOQ).

U.S. EPA CLP Data Qualifiers:

Organic Qualifiers		Inorganic Qualifiers	
A	TIC is a possible aldol-condensation product	**B**	Value is <CRDL, but ≥IDL
B	Analyte was also detected in the blank	**E**	Estimated due to interference
C	Pesticide result confirmed by GC/MS	**M**	Duplicate injection precision not met
D	Compound quantitated on a diluted sample	**N**	Spike sample not within control limits
E	Concentration exceeds the calibration range of the instrument	**S**	Method of standard additions (MSA) used for calculation
N	Presumptive evidence of a compound (TICs only)	**U**	Compound was not detected
P	Concentration difference between primary and confirmation columns >25%	**W**	Post digestion spike out of control limits
U	Compound was not detected	*****	Duplicate analysis not within control limits
X,Y,Z	Defined in case narrative	**+**	Correlation coefficient for MSA <0.995

Analytical test results meet all requirements of NELAC unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR part 136 Table II as “analyze immediately” are not performed within 15 minutes.

Dioxins/Furans Data Qualifiers:

B Detected in Method Blank
U Undetected
J Estimated concentration between Estimated Detection Limit and Minimum Level
E Exceeds calibration range
C Confirmed quantitation on secondary GC column
Q EMPC - Estimated Maximum Possible Concentration

The recovery for the sample surrogate(s) is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken:
The sample was re-extracted outside the method required holding time and the QC is compliant. All results are reported from the first trial. Similar results were obtained in both trials with the exception of:
naphthalene .74 ug/kg

Quality Control Summary

Client Name: CDM Federal Programs Corp. Group Number: 1415626
Reported: 09/23/13 at 02:13 PM

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	**BMQL**	Below Minimum Quantitation Level
N.D.	none detected	**MPN**	Most Probable Number
TNTC	Too Numerous To Count	**CP Units**	cobalt-chloroplatinate units
IU	International Units	**NTU**	nephelometric turbidity units
umhos/cm	micromhos/cm	**ng**	nanogram(s)
C	degrees Celsius	**F**	degrees Fahrenheit
meq	milliequivalents	**lb.**	pound(s)
g	gram(s)	**kg**	kilogram(s)
µg	microgram(s)	**mg**	milligram(s)
mL	milliliter(s)	**L**	liter(s)
m3	cubic meter(s)	**µL**	microliter(s)
		pg/L	picogram/liter

< less than - The number following the sign is the limit of quantitation, the smallest amount of analyte which can be reliably determined using this specific test.

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg), or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Data Qualifiers:

C – result confirmed by reanalysis.

J - estimated value – The result is ≥ the Method Detection Limit (MDL) and < the Limit of Quantitation (LOQ).

U.S. EPA CLP Data Qualifiers:

Organic Qualifiers		Inorganic Qualifiers	
A	TIC is a possible aldol-condensation product	**B**	Value is <CRDL, but ≥IDL
B	Analyte was also detected in the blank	**E**	Estimated due to interference
C	Pesticide result confirmed by GC/MS	**M**	Duplicate injection precision not met
D	Compound quantitated on a diluted sample	**N**	Spike sample not within control limits
E	Concentration exceeds the calibration range of the instrument	**S**	Method of standard additions (MSA) used for calculation
N	Presumptive evidence of a compound (TICs only)	**U**	Compound was not detected
P	Concentration difference between primary and confirmation columns >25%	**W**	Post digestion spike out of control limits
U	Compound was not detected	*****	Duplicate analysis not within control limits
X,Y,Z	Defined in case narrative	**+**	Correlation coefficient for MSA <0.995

Analytical test results meet all requirements of NELAC unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted.
