More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has NO basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has NO authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do NOT consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, NOR the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To TERMINATE the production of nuclear waste.
- To provide for secure INTERIM storage AT, or AS CLOSE AS POSSIBLE TO, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and ISOLATION from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been NO technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to REMOVE Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials. Protect US - NOT Nuclear companies! Thank you.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials. In addition it seems to all who know about the thorium phase of American energy development that switching as many reactors as possible to thouium salt operatinns would allow the system to eat up all the plutionium and dirty fuel rods without the expense of storage or moving at least part of them from where they are now in storage at the plants where they were used first!
A huge savings in moving and storage expense!
Don't you wish GE had sold japan thorium salt power generators instead of nuc's!

Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

Personally, I had radiation therapy on my tonsils and adenoids in the early 1950's in the hopes of stopping frequent ear infections. It did not stop the ear infections, but it did burn out my thyroid gland. I have been taking thyroid hormone since I was 15 years old.I was lucky, in that many recipients of these treatments developed thyroid cancer. I would NEVER CONSENT to having radioactive waste stored in my community nor in communities near where people are living or growing. Storing nuclear waste near a fault line is also a bad idea.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Storage near fault lines is another bad idea.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative is putting the nuclear cart before the horse. It has no basis in policy or the public interest, and is simply an attempt to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment.

DOE has no existing authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future. I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:
• Terminate the production of nuclear waste.
• Provide for secure interim storage at, or as close as possible to, the site of generation.
• Determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks used for storage at reactor sites (HOSS), only putting the containers on a concrete slab with a fence. The difference would be the added hazards and insecurity of transportation, and the huge amount of nuclear waste stored at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. - To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

I have been living in Chicago all of my life and I am aware that nuclear waste products from plants such as Zion and Braidwood are stored in close proximity to my home and family. I have always found this to be very disturbing and I do not wish to be the situation for anyone else. For that reason I believe that all nuclear power plants need to be phased out as quickly as possible to end the dilemma of storing radioactive materials for tens of thousands of years. Closing these plants would be a rational thing to do and that is why I find the Department of Energy's (DOE) consent-based siting initiative incredible as it has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. - To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

As a parent and grandparent, it concerns me very much that basic protections of American citizens could be brushed aside in favor of more aid and comfort to the moribund and destructive Nuke industry. The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. - To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: HERE IS MY COMMENT OPPOSING THE USDOE'S CONSENT-BASED SITING PROCESS FOR RADIOACTIVE WASTE!!

Dear Energy Secretary Moniz=

I am one of the original, modern environmental/energy/conservation activists ever since around the very first "EARTH DAY Celebration," which was more than 46 years ago. I have a Bachelor of Science (B.S.) Degree in Biology and Environmental Studies from Dana College, Blair, Nebraska. I am a energy-environmental researcher, writer, speaker, and organizer. I am a member of the Chicago-based Nuclear Energy Information Service (NEIS), "Illinois' Nuclear Power Watchdog Group." Continuing on, the U.S. Department of Energy's (DOE) consent-based siting initiative has NO RATIONAL BASIS IN POLICY OR THE PUBLIC INTEREST, and is simply a vehicle to put the shorter-term interests of the nuclear power and radioactive waste industries before the need to protect public health, public safety, and environmental quality. In short, the USDOE is "putting the nuclear cart before the horse!" The USDOE has NO AUTHORITY to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the USDOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the radwaste from commercial nuclear power generation when a repository is in operation.

The USDOE has clearly stated it intends to support the continued production of more radioactive waste into the distant future.

I DO NOT CONSENT TO THIS PROCESS, THE CONTINUED GENERATION OF RADIOACTIVE WASTE, THE SITING OF CONSOLIDATED STORAGE FACILITIES, NOR THE MASS TRANSPORTATION OF RADIOACTICE WASTE TO THEM!!

The top goals for managing radioactive waste MUST BE TO STOP MAKING IT TO BEGIN WITH, AND TO ISOLATE THE RADWASTE THAT WE HAVE FROM THE ENVIRONMENT! The only rational basis for an "integrated management plan" for highly radioactive irradiated nuclear fuel is:

- To terminate the production of ALL radioactive waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its longer-term management and isolation from the biosphere.

Over 100 organizations have endorsed improving the storage and security of radioactive waste at reactor sites through 'Hardened On-Reactor-Site Storage' (HOSS). HOSS would first move high-level radwaste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this radwaste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I OPPOSE THE CONSOLIDATION AND TRANSPORTATION OF HIGH-LEVEL RADIOACTIVE WASTE TO NEWER SITES unless (and until) a viable longer-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a "PARKING LOT DUMP!" The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of radioactive waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the radioactive waste remains in an interim consolidated storage system, radwaste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto longer-term or even permanent high-level radioactive waste site, there would have been NO TECHNICAL QUALIFICATION OR SCIENTIFIC BASIS or choosing the site; the willingness of a community to support the siting of a temporary storage facility would be VIOLATED; and the consent-based process would be MEANINGLESS, if not FRAUDULENT.

The Nuclear Waste Policy Act was RIGHT, requiring the USDOE to have a longer-term management facility licensed and in operation before the agency can take title to and transport civilian radioactive waste. The central problem afflicting radwaste policy in the United States is the selection of Yucca Mountain in Nevada as the sole site to be considered for a high-level radioactive waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting radioactive waste policy on track is to remove Yucca Mountain from the US radwaste program! The second step is to limit the radioactive waste being made. The third step to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible radioactive waste storage methods are developed—and the options and risks for radioactive waste storage are known--can public consent to the siting of radwaste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in radioactive waste management first is DECEPTIVE AND IRRESPONSIBLE!
The U.S. Department of Energy has "gone rogue" in pursuing consent-based siting for consolidated storage first, and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless (and until) Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current USDOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the U.S. Department of Energy FAILED in its effort to implement the NWPA. CONSOLIDATED STORAGE ONLY INCREASES THE RISKS OF RADIOACTIVE WASTE, AND DOES NOTHING TO ADVANCE CREDIBLE SOLUTIONS TO THE LONGER-TERM MANAGEMENT AND ISOLATION OF RADIOACTIVE MATERIALS!!

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,
Over 40 years ago, I visited the Trojan Nuclear Power plant in Oregon as a college student. I asked them about the destination of their nuclear waste and they didn't have a clear answer. I was astounded and still can't believe that Nuclear Power Plants are being still used and constructed without a place for the waste. Stop using this dangerous source of power. We live near the dangerous San Onofre waste storage and there is still no idea what to do with it. It's a ticking time-bomb.

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. - To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be

transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

No consideration of the rights or consent of those along radioactive waste transport routes is being made or requested. Although one of the greatest dangers to the most people, environments and ecosystems is the movement of tens of thousands of tons of nuclear waste on roads, rails and waterways, DOE stated at its Washington DC 'kickoff' meeting that there is complete federal preemption over transport of nuclear waste so that would not be part of the process.

Nuclear Information and Resource Service (NIRS) states, In its campaign, "Stop Mobile Chernobyl — No Fukushima Highways," "An 'interim' storage site would begin the transport of tens of thousands of casks of lethal high-level nuclear waste across the entire United States, potentially affecting 100 million Americans who live within a mile or two of likely transport routes--our nation's roads and railways.
http://www.nirs.org/radwaste/hlwtransport/mobilechernobyl.htm

There is no mechanism for consideration of the rights of future generations that inevitably would be affected.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. - To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only

substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to ISOLATE the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be

transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an Unscientific and Politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance Credible Solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. - To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Nuclear energy is the dirtiest energy with and the most dangerous for the planet. We need to abolish nuclear energy and replace it with clean renewable energies.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.
