The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future. This is very short sighted both for public health and for the environment. Nuclear power is more expensive than truly positive alternatives of wind and solar with a need to use tremendous amounts of water which is very scarce in many parts of the country.
We need to stop producing nuclear weapons also which we have signed treaties to reduce rather than make more.
NO! NO! NO! to nuclear in any form. The waste we now have should stay as close to where it was produced but as far from people as possible.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. - To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. - To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed — and the options and risks for nuclear waste storage are known - can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment.

In short, DOE is putting the nuclear cart before the horse.

DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

Firstly; I suspect that you don't even know that the U.S. Patent office granted a patent to a small California company who solved the last remaining scientific problem keeping fusion power from practical application... containment of the reaction. DOE solved the ignition issue in 1979 at ANL. See: fusionpowercorporation.com for the answer... RFADHIF!!!

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. - To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

Two of the most technically advanced countries in the world -- France and Germany -- are phasing out their nuclear plants. There must be a reason. Why are we even considering subsidizing ours? Have we forgotten Fukushima so soon?

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,
I am writing to oppose the transport of nuclear material on our highways and through communities in the USA. An accident would be catastrophic and would expose innocent people to genetic mutations and reproductive dangers.

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Comment in opposition to DOE's proposed consent-based siting of nuclear waste

Dear Secretary Moniz,

The Department of Energy's (DOE) proposal for 'consent-based' interim siting of nuclear waste, in consolidated non-generation sites, serves in essence just to put short-term interests of the nuclear power and radioactive waste industries before the need to protect the public's tax funds, health, safety, and environment. In effect the proposal would commit DOE to a dangerous policy of supporting the continued production of more nuclear waste into the distant future.

I oppose and do not consent to unending generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

A rational "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel must above all END the further waste production; and for existing waste must (a) provide for secure interim storage as close as possible to the site of generation and (b) determine and use
scientifically viable, environmentally responsible, and socially just methods for long-term isolation of the waste from the biosphere.

Scores of concerned organizations have endorsed improving interim storage and security of nuclear waste via Hardened On-Reactor-Site Storage (HOSS). HOSS would provide interim storage of maximum feasible safety and security by moving (sufficiently cooled) waste out of fuel pools to on-site robust, hardened dry-cask storage. This approach both reduces risk of catastrophic fuel pool fires and best protects us from needless extra dangers of moving and transporting the waste - actions which increase likelihood of or vulnerability to natural disasters, industrial accidents, and military or terrorist attacks.

I oppose the consolidation and transportation of waste to new interim sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, but their use would add the hazards and insecurity of transportation. If a consolidated storage site truly is temporary, then each container will have to move at least twice - i.e. both to the site and from it - compounding transportation hazards. Indeed, with use of an interim consolidated 'consent-based' storage system, waste may need to be transported multiple times, as community consent periods expire.

The Nuclear Waste Policy Act (NWPA) correctly required DOE to have a long-term management facility licensed and in operation before the agency takes title to and transports civilian nuclear waste.

A rational policy for USA nuclear waste has long been foiled by the unscientific fiat pre-selection of Yucca Mountain as the sole site for a nuclear waste repository - before the site's suitability was carefully studied! As its first step a rational waste policy must end such fiat pre-selection of Yucca Mountain or of any other site.

A needed second step is to curtail the waste being generated, and a third step is to energize scientific research to

identify feasible technologies and locations for long-term (million-year) isolation of the radioactive materials in nuclear waste from the environment so that storage at reactor sites can actually be “interim”.

Only after scientifically viable and environmentally responsible nuclear waste storage methods are identified can meaningful public consent be given to the siting of nuclear waste facilities.

The current DOE administration must stop scapegoating NWPA for prohibiting consolidated storage independent of an operating repository. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

To: Consent Based Siting
Subject: DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,
I'm writing to voice my serious concerns about the Department of Energy's (DOE) consent-based siting initiative. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act correctly requires the DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste.

DOE has clearly stated it intends to support the continued production of nuclear waste into the future. As a mother of two, I find this concerning and unacceptable. Consent-based siting must only be predicated on the idea that dangerous, radioactive waste and the nuclear energy that produces it must be phased out in favor of renewables and efficiency, so that we can focus on safely storing a known quantity of hazardous material for perpetuity. Mass transportation of nuclear waste poses grave risks, and should not be done on an ongoing basis.

The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- terminate the production of nuclear waste.
- provide for secure interim storage at, or as close as possible to, the site of generation.
- determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

The best option for storing nuclear waste already generated is to keep it at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site, there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible. To pursue consent before there can be public confidence in nuclear waste management first is irresponsible.

Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of

nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

With respect to storing nuclear waste, there is only one option for DOE, to store the waste on site at the nuclear plants themselves. If DOE wishes to continue supporting the most dangerous fuel on the planet, then the utilities have to take on the liability for their waste, not us.

With regard to storing nuclear waste in the Carolinas, Georgia and Florida, there is no safe way to store it, ever. The Floridan Aquifer stretches from the Appalachian Mountains through Florida and the Bahamas, and dye tests have shown that some of it even reaches islands in the Caribbean. One leak could destroy the safety of drinking water for millions of people, and wipe out the economies of over one-third of the US.

That's what your support of the nuclear energy utilities actually means. And, that's really, really stupid.

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

I do not give you my consent to transport nuclear waste through my community or to my community. I do not agree with continuing the use of nuclear power because there is no safe disposal.

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them. "

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

This is yet one more "stick it to The People
plans" of the DOE's. Chernobyl was 30 yrs ago and IT IS STILL HOT!!!! because there is no "shelf life" for radioactive waste...a fact you are well aware of. So, what to do with all the Hot Waste? Give it to The People. You want to put it in household products like pots and pans and pet dishes as well as Zippers! ? And now you want to dump the contaminated, poisonous, and DANGEROUS junk in our communities including in what passes for livable spaces our Gov't forced the First Nations People onto and called "reservations?" You are INSANE to think We, the People, are going to simply say OK and quietly accept this HOT Radioactive Waste in our communities or in any so-called Product.

You and the AEC should have thought this all the way through before deciding that Nuclear Breeder and Reactor plants was a good idea. Nuclear anything makes Radioactive Waste and before anything was made, the FIRST problem to have contended with was what WERE you going to do with the Contaminated and Radioactive Waste! There is NO SAFE LEVEL of Radiation. There is NO CURE for Radiation POISONING! 500-1,000 yrs of "shelf life" is a GUESSTIMATE! Everyone involved needed to start with the end product and work backward from there, but that would be too logical so that now, you've got a big problem: What to do with all the HOT WASTE!

Tell ya' what! If this is such a good thing and such a good idea, PUT THE HOT STUFF IN YOUR COMMUNITY! Put your actions and ideas where YOU live. If you cannot conceive of having your streets paved with this or burying it under schools and/or playgrounds which your children and grandchildren attend and/or play in....if YOU would say: NO WAY!....then you have your answer without asking anyone else - a fact you have already considered and rejected.

There should be no Nuclear ANYTHING for the simple reason that it creates its own waste product which is HOT and FILTHY DIRTY with RADIOACTIVE POISON for 500 yrs and Upwards.

RADIOACTIVE WASTE IS A POISON, A CONTAMINANT THAT WILL HORRIBLY AND PAINFULLY KILL ANY LIVING THING ANYWHERE NEAR IT. Don't even think of putting HOT waste in our areas - or in ANY areas. You have too much of a bad thing? Tough! You should have considered every angle of that before you allowed Nuclear Reactors to be built.

You might consider working with NASA and find a way to send this junk to the deepest, darkest, and furthest Black Hole where NOTHING can get out once in. That'll work - but don't even think of bringing it here.

The Department of Energy’s (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need

to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. - To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest. The DOE has no credible policy for safely storing the huge wastes already on hand, whether at/near the sites of its creation or in consolidated storage facilities.

Therefore, I do not consent to the process proposed, nor the creation of more wastes.

Howard Wilshire

If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I DO NOT consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

To: Consent Based Siting
Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. - To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

Subject: Comment OPPOSING DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has ABSOLUTELY NO basis in policy or certainly the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. THIS IS COMPLETELY AND TOTALLY UNACCEPTABLE!!! In short, DOE is putting the nuclear cart WAY before the horse. DOE has NO (AS IN NONE) authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation. Nuclear waste is a huge and gruesome mess that no one truly knows what to do with! There is NO safe way to deal with it either!!

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future. WHY??? LET'S DO THE WORLD A FAVOR AND STOP PRODUCING NUCLEAR WASTE NOW!!!!!!!!!!

I do NOT consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, NOR the mass transportation of nuclear waste to them. AGAIN, IT'S TOTALLY UNACCEPTABLE!!!!!!!!!!!!!!!!!!

The top goal for managing nuclear waste must be to STOP MAKING IT and to completely isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act!!!!!!!!!!!!!

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP!!!!! WHAT??? This IS INSANITY!!!!!The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are unacceptable security risks. If the site is temporary as

intended, then, by definition, each container will move at least twice, compounding transportation hazards even further!!! This just isn't wise AT ALL!!!

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent. This truly is not a good plan at all!!!

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation BEFORE the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste. Not good!!

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is very, very deceptive and totally irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has NO statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must STOP scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does NOTHING to advance credible solutions to the long-term management and isolation of radioactive materials. Please go back to the drawing board and try again.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP.
