I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of

nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. - To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

I have read and also support all of the above pre-written comments. We need an abrupt change in previous policy towards nuclear power and need to abandon the idea that continuation of nuclear power generation is a necessary bridge to renewable resources. We must shift to renewable resources (non fossil and non nuclear) immediately together with efficiency standards and load reduction. The discomfort and disruption that such an abrupt change would cause is the price of survival. For the sake of my children and grandchildren (who cannot yet speak for themselves) , I would accept nothing less.

The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. - To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

I do not consent to future nuclear waste production, nor do I agree to a future for the nuclear energy in this country. Nuclear waste is simply too dangerous to produce, to transport and to store for the very very long term. We need to consider our children's children's children and all the creatures we share the earth with. I do not agree that a nuclear waste producing world is safe for people or animals, and I think events have born out the logic of this position.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. - To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Thank you, Secretary Moniz:

I am thankful for your service to our country through your work at DOE. America relies on civil servants, such as yourself, to protect our country and to make sure our government functions well for all of us. I respect your role and ask you to fairly consider my comments about the DOE consent-based siting initiative.

This consent-based siting initiative by DOE has no basis in policy or the public interest. It is biased in favor of the radioactive waste industries. DOE lacks regulatory authority on this particular siting process for consolidated storage of commercial nuclear waste.

I object to this consent-based siting initiative. I object to the mass transportation of nuclear waste to siting depositories.

I desire better-thought-out solutions to America's need to manage and isolate radioactive materials.

Sincerely yours,

Diane J. Peterson

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

There is one - and only one by definition - BEST WAY to deal with nuclear waste, and that is to STOP CREATING NUCLEAR WASTE.

The nuclear power industry must first be held accountable - financially and technologically - for the safe, long-term storage of already existing nuclear waste. It must pay for the research and development of the proper storage of these cancer-causing wastes.

We were once told by the industry that nuclear power would be so cheap to produce, that it would not have to be metered. That turned out to be totally false.

The nuclear power profit-makers have so far passed along to the taxpayers much of their costs by deliberately failing to create the essential storage for nuclear waste. They are not entitled to continue to suck at the public teat for their private profit.

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Why you idiots ever let nuclear power proliferate is beyond me. Nuclear power should be eliminated as an energy source within 4 years. The tragedy is the waste. Japan's failure of leadership should not be our curse. The U.S. waste should be buried in the state with the most members working for the Department of Energy. West Virginia? Mississippi?

The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them. I personally believe that nuclear power is simply too dangerous. Yes, it may be clean power but there are a lot of things that go wrong and we have see that occur with very serious consequences.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

Look, my family did professional research on nuclear waste many decades ago. YOU promote nuclear waste and escalation, at today's level of scientific understanding, only at the peril of the entire world. "Knock it off!" - pardon me, but your resistance is urgent! I know how lawyers line the committee rooms and buck out the ones who know something!
The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Siting public comment

First, Stop Making More Nuclear Waste ASAP!
Close Nuclear Power and DOD Reactors! Clean Up!
Protect the People from Nuclear Accidents, Terrorism!
Ban Transportation of Nuclear Wastes on Roads, Rail, Ship!
Nuclear Wastes should be Secured On Site in solid Bunkers!
Plutonium and Uranium should be Degraded to Low Levels!
Encourage Solar and Wind Power for US Gov and Nation!

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of

citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

robert Raven

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

I do not consent to have nuclear waste in my community.  I have personally seen victims of Fukishima.  The toll of nuclear waste is vast and irrevokable.  It poisons all within it's purview.  After many years of creating nuclear energy throughout the world, there is still no safe way to dispose of the waste.  Storing the spent casks in the ocean destroys ocean life.  Piling them on trucks to be driven through multiple communities where they can be subject to any type of traffic accident is nothing short of a nightmare waiting to happen.  You must think of the long-term consequences before developing a plan.  The citizenry is counting on you.

I DO NOT WANT IT IN MY COMMUNITY!  I have children and hope to have grandchildren someday.  Do not destroy my community and everything in it.  We do not need nuclear energy.  We need to invest in solar and wind power, which are much safer.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

Nuclear power has no place in our growing population. It puts us all in jeopardy and there will be no escape from the horrors of radiation exposure. You can talk about "escape routes" but they will simply become huge traffic jams and people will be stuck sitting in their cars as their skin melts away.

There are many ways to provide clean renewable energy sources and we should be concentrating on implementing them.

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment.

DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do NOT CONSENT to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at  sites which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to let the nuclear power and radioactive waste industries off the hook for responsibly taking care of this very dangerous high level radioactive waste which is dangerous for many thousands of years.

The U.S. government has to protect public health and safety and the environment. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste.

I DO NOT CONSENT to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment.

The highly radioactive nuclear waste must have secure interim storage at, or as close as possible to, the site of generation, in hardened on-reactor-site storage (HOSS)in stainless steel casks of a thickness comparable to those used in Japan and Europe, NOT the ridiculously thin gauage of only 3/4 inch which have reportedly been known to leak. The stainless steel casks need also to be put into concrete casks which can be air-cooled for further protection.

The transporting of the highly radioactive waste across state lines on public highways or railways to new sites, thus exposing thousands of people to possible accidents, is to me unthinkably dangerous and unnecessary.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be "interim" on the scale of human

generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public's input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site.

The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

To me, your "consent-based" scheme is simply a way to absolve the nuclear industry from its responsibility to take care of the waste at the nuclear plant sites and if implemented would greatly increase the danger to the public both when the waste is transported and where these so-called "interim" storage places would be located. No one in their right mind would want this waste anywhere near their community, so "consent-based" is to me merely a fancy term for coercion.

I strongly object to "consent-based" storage of nuclear waste in interim storage places.

Our children and future generations must be protected from such irresponsible schemes. It is bad enough that they are stuck with such a Faustian bargain which they had no say about. Do not make the situation worse in this way, but instead the US government must put great effort and funding into researching how to deal with the waste where it presently is in HOSS storage as the decades go by, AND must make sure of the integrity of the storage materials and workmanship of the HOSS storage as it is used at the source of its generation. Please do imagine how this could affect your own children.

With great concern,

Nancy Rice

To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

I worry about nuclear threats of foolish war planners. I worry about cheap and corrupt governments who go to war for ill thought out reasons (arrogance). All these warrior nations and in spite of the NATO, SEATO and other like membered defense bodies somebody will push the button one of these days. But: I worry more about the daily contribution of nuclear materials into our neighborhood environments. In the longer run the sloppy handling of nuclear power generation will do is ill more than the hair triggered proud new nations in this world. What are we doing to deal with these conditions?

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.

I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage

facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

Subject: Comment Opposing DOE's Consent-Based Siting Process for Nuclear Waste

Dear Secretary Moniz,

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.
