3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

BRIAN PELTIER

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Amanda Percy

Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Jim B Perry

Consent-Based Siting

From: Toddy Perryman [mailto:tperryman@bitterroot.com]
Sent: Friday, July 29, 2016 11:25 AM
To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Grant Peterson

Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Thomas Peterson

Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

James Phelps

To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Barbara Phinney

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Buck Pilkenton

Consent-Based Siting

From: Hal Pillinger [mailto:hp.pillfam@verizon.net]
Sent: Sunday, July 31, 2016 11:25 AM
To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

John Piotter

Consent-Based Siting

From: Wayne Pipke [mailto:pipman77-news@yahoo.com]
Sent: Thursday, July 28, 2016 4:29 PM
To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Roger Podewell

To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law

tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Mary Pollock

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Jenica Popa

Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Larry Porter

Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

I suggest that Washington D. C., our nation's capital, be considered for the nuclear waste site. The decisions to support nuclear power was initiated there, Washington D. C. is not within a state or county, so decision making can proceed quickly

Thank you for your consideration.

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Christine Powell

All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Robert Price

Consent-Based Siting

From: Fiona Priskich [mailto:fionapriskich@hotmail.com]
Sent: Friday, July 29, 2016 2:36 AM
To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. 1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Wyn Protzen

Consent-Based Siting

From: Linda Proudfit [mailto:lproudfit@comcast.net]
Sent: Sunday, July 31, 2016 6:18 PM
To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Rene Pugh

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

York Quillen

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Richard Rabin

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Tom Ragouzis

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Jessica Rathbun

Consent-Based Siting

From: robert Raven [mailto:robraven60@gmail.com]
Sent: Thursday, July 28, 2016 7:30 PM
To: Consent Based Siting
Subject: Opposing DOE's Consent-Based Siting Process for Nuclear Waste!

Dear Secretary Moniz,

Do Not Allow Nuclear Wastes on Our Roads!
It's an accident waiting to happen! Crash?
A Nuclear Spill would kill commute! Fire?
Evacuate the area for many months, years?
Protect Our Children and Grandchildren!

The Department of Energy's (DOE) consent-based siting initiative has no basis in policy or the public interest, and is simply a vehicle to put the short-term interests of the nuclear power and radioactive waste industries before the need to protect public health and safety and the environment. In short, DOE is putting the nuclear cart before the horse. DOE has no authority to pursue such a siting process for consolidated storage of commercial nuclear waste. The Nuclear Waste Policy Act (NWPA) and the DOE's Standard Contract with nuclear power generators explicitly state that the federal government may take title to and possession of the waste from commercial nuclear power generation when a repository is in operation.

DOE has clearly stated it intends to support the continued production of more nuclear waste into the distant future.

I do not consent to this process, the continued generation of nuclear waste, the siting of consolidated storage facilities, nor the mass transportation of nuclear waste to them.

The top goal for managing nuclear waste must be to STOP MAKING IT and to isolate the waste we have from the environment. The only rational basis for an "integrated management plan" for highly radioactive spent (irradiated) nuclear fuel is to:

- To terminate the production of nuclear waste.
- To provide for secure interim storage at, or as close as possible to, the site of generation.
- To determine scientifically viable, environmentally responsible, and socially just and equitable methods for its long-term management and isolation from the biosphere.

More than 100 organizations have endorsed improving the storage and security of nuclear waste at reactor sites through Hardened On-Reactor-Site Storage (HOSS). HOSS would first move waste (when sufficiently cooled) out of fuel pools to robust, hardened dry-cask storage, reducing the hazard of catastrophic fuel pool fires and better protecting the waste from natural disasters, industrial accidents, and military or terrorist attacks. HOSS would improve the safety and security of this waste for interim storage at, or as near as possible to, the reactor sites where it is generated.
I oppose the consolidation and transportation of waste to new sites unless and until a viable long-term management facility is in operation, per the Nuclear Waste Policy Act.

The consolidated storage facilities under consideration would use precisely the same technology and dry-casks

currently available for storage at reactor sites, with containers on a concrete slab with a fence, a PARKING LOT DUMP. The only substantive changes would be the added hazards and insecurity of transportation, and the unprecedented amount of nuclear waste to be stored in this configuration at one or more centralized additional sites, both of which are security risks. If the site is temporary as intended, then, by definition, each container will move at least twice, compounding transportation hazards.

Depending on how long the waste remains in an interim consolidated storage system, waste may need to be transported multiple times, as community consent periods expire and require siting of new consolidated storage facilties. Conversely, if the site devolves to a de facto long-term or even permanent waste site there would have been no technical qualification or scientific basis for choosing the site; the willingness of a community to support the siting of a temporary storage facility would be violated; and the consent-based process would be meaningless, if not fraudulent.

The Nuclear Waste Policy Act was right, requiring DOE to have a long-term management facility licensed and in operation before the agency can take title to and transport civilian nuclear waste. The central problem afflicting nuclear waste policy in the United States is the selection of Yucca Mountain as the sole site to be considered for a nuclear waste repository. Yucca Mountain was chosen by Congress through an unscientific and politicized process of elimination, excluding all other sites before Yucca Mountain was studied to determine whether the site could isolate the radioactivity in this waste.

The first step to getting nuclear waste policy on track is to remove Yucca Mountain from the US nuclear waste program. The second step is to limit the waste being made and third to make energetic progress on scientific research to identify feasible technologies and locations for isolating the radioactive materials in nuclear waste from the environment for a million years, so that storage at reactor sites will actually be “interim” on the scale of human generations. Only once scientifically viable and environmentally responsible nuclear waste storage methods are developed—and the options and risks for nuclear waste storage are known--can public consent to the siting of nuclear waste facilities be possible, much less play a meaningful role in the process. To pursue consent before there can be public confidence in nuclear waste management first is deceptive and irresponsible.

The Department of Energy has gone rogue in pursuing consent-based siting for consolidated storage first and suggesting that the public’s input has any value when the agency has no statutory authority to pursue such a program. Unless and until Yucca Mountain is removed from consideration under the Nuclear Waste Policy Act, there will be no progress on a legal site. The current DOE administration must stop scapegoating the NWPA for prohibiting consolidated storage independent of an operating repository, instead of offering candor in admitting that the Department of Energy failed in its effort to implement NWPA. Consolidated storage only increases the risks of nuclear waste, and does nothing to advance credible solutions to the long-term management and isolation of radioactive materials.

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Laura Ray

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Robert Reese

Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Shirley Reis

Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Justin Resnick

Consent-Based Siting

From: Charles Retherford [mailto:retherford@beasleylaw.com]
Sent: Friday, July 29, 2016 10:40 AM
To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Joanne Rhea

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Janet Riordan

Subject: Consent-based siting public comment

I am not in favor of nuclear energy and its power plants. Some may consider it "clean", but you certainly can't consider its residue as such. It is incredibly dangerous, remaining radioactive for centuries. There really is no safe place to store this ever-increasing waste. But it will continue to be generated, so with that in mind, I somewhat support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And finally the opportunity will be provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

Subject: Consent-based siting public comment

First and foremost, I don't believe anyplace should vote or decide to consent to storing nuclear waste. In fact, that is the prime reason I am against nuclear power plants, other than the immense dangers posed should a natural or man-made disaster occur. Nuclear waste will remain "hot" for thousands of years. It is simply too dangerous to store in man-made facilities. But, if you must, than I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Philip Ritter

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

William Roberson

Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Katherine Robertson

Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Marcia Robinson

Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Iris Rochkind

Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Lenora Roedner

Consent-Based Siting

From: Richard Roelofs [mailto:richard10@myfairpoint.net]
Sent: Thursday, July 28, 2016 8:26 PM
To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Subject: Consent-based siting public comment/ I do not want it near my home and family DO you want it near Yours????

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

MARY ROJESKI

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

monika romero

Consent-Based Siting

From: Denise Romesburg [mailto:mysa_nal@yahoo.com]
Sent: Thursday, July 28, 2016 9:05 PM
To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Jerry Rosen

Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

David Rosmer

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Jerome Roth

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Tom Rowe

Consent-Based Siting

From: Allen Royer [mailto:algroyer@yahoo.com]
Sent: Friday, July 29, 2016 1:47 AM
To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

Subject: Consent-based siting public comment

I'm a retired engineer living with my family of four in the Rochester NY area.

Finding/engineering a solution to our nuclear waste problem here in the U.S., more than anything, IMNSHO, is all about trust. While science, technology, and economics are certainly involved, none are the primary stumbling block that has lead to our dismal failures in this area.

Our nuclear industries and associated government agencies, right from the get go, showed a level of arrogance seldom displayed within democracies. This was. ultimately, highly counterproductive, expensive, and ultimately dangerous. It remains so to this day.

Without trust, neither business, government, nor society can flourish.

Below is is a message from Public Citizen. I support the sentiments express, hope you do too, and believe the principles enumerated are critical to our eventually finding a safe, equitable, and workable solution.

--Mike Rudnick, PhD

- - - - -

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A

broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Gayle Ruedi

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

This measure is critical for the long-term well-being of our society and the world. Please take this seriously. Thank you for your consideration.

Sincerely,
John A. Rush,
Hamilton, MT

Consent-Based Siting

From: Claire Russell [mailto:jessamyn_russell@yahoo.com]
Sent: Sunday, July 31, 2016 2:13 PM
To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

William Ryerson

All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Rob Sackett

Consent-Based Siting

From: Bernie Saftner [mailto:bmsaftner@yahoo.com]
Sent: Thursday, July 28, 2016 4:14 PM
To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

kathleen salvas

Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Brenda Sanders

Consent-Based Siting

From: Nina Sandhu [mailto:nsandhu91@yahoo.com]
Sent: Friday, July 29, 2016 2:14 AM
To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Alice Sather

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Carol Savary

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Kevin Schader

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

Consent-Based Siting

From: Peter Scharf [mailto:scharfpm7@gmail.com]
Sent: Thursday, July 28, 2016 10:22 PM
To: Consent Based Siting
Subject: Consent-based siting public comment

The most important issue in siting nuclear waste is to evaluate the costs of storing and protecting nuclear waste for the duration of its radioactive life (approx. 100,000 years). These costs should be borne by the nuclear industry and be included in the price of energy produced by nuclear fuel. This is the only fair way to allow free market forces to favor renewable non-toxic fuels.

After consideration of the costs, I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Sylvia Schleimer

Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process.
