5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Nuclear waste storage sites should include the private residences of those elected and appointed bastards who take bribes from the industry, and who claim that the industry is safe.

Thank you for your consideration.

Sincerely,

Mark Schmerling

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Bobbie chneider Schneider

To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

The vast quantities of nuclear waste are not going anywhere -- forever. So we ultimately do have to develop workable processes and find a place or places to store it -- forever. Given the essentially eternal nature of this storage responsibility, it only makes sense to get the consent of the localities most likely to be affected by inadequate storage methods or the as-yet-unknown behavior of concentrated radioactive waste over long periods of time.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. 3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Chris Scholl

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Mary Schroff

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

June Schumacher

Consent-Based Siting

From: Kathleen Schumacher Schumacher [mailto:kathleen.schumacher@gmail.com]

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Marge Schwartz

Consent-Based Siting

From: Michele Schwartz [mailto:mgschwar@ptd.net]
Sent: Thursday, July 28, 2016 11:10 PM
To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Patricia Scofield

A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

SARAH SCOTT

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Yvonne Segal

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Dan A Senour

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

susan shaberman

People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Irving Shapiro

Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

James Shea

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Bret Sher

Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

JOYCE SHIFFRIN

Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Cheryl Shushan

To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Michael Sileno

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Marvin Silvey

Consent-Based Siting

From: Jarrod Simmons [mailto:simmonsjarrod11@gmail.com]
Sent: Friday, July 29, 2016 7:31 AM
To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Jim Simonis

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

We had no ability to question the untold amount of nuclear waste sitting on the Delaware river at the Salem site of PSEG.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Linda Skonberg

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. Consent-Based Siting

From: Jeffry Smallwood [mailto:jeffs53@hotmail.com]

To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Jeffry Smallwood

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Denise Smith

To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Kathy Smith

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

William Snavely

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Yin So

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Sean Solowiej

Consent-Based Siting

From: Jean Sommer [mailto:jeansommer123@gmail.com]
Sent: Thursday, July 28, 2016 7:18 PM
To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an adaptive, staged and consent-based approach to nuclear waste disposal. I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will position the federal government to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process.The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process.=People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, negotiated with full public disclosure;
not used as coercion.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities.

8) Flexible - Consent can be withdrawn.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation.

To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Pamela Spacek

Consent-Based Siting

From: Philip Spadaro [mailto:phspadaro@verizon.net]
Sent: Thursday, July 28, 2016 7:26 PM
To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Subject: Consent-based siting public comment

As someone who has spent my entire adult life concerning myself with nuclear power and its consequent waste, I appreciate the opportunity to add my strongest urging for you to adopt the 10 Criteria for Community Consent.

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Georgeanne Spates

Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Michael Spina

Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Delores Stachura

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Cara Stanley

Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Valerie W Stasik

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Ann Steele

Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Marc Stein

Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Chandra Stephens

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Ronald Stetson

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Steve Stillwagon

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Joe Stoner

Consent-Based Siting

From: Eric Stordahl [mailto:wuffybruno@yahoo.com]
Sent: Friday, July 29, 2016 1:09 AM
To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Gail Strong

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Tony Suh

To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Amanda Summers

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Lindsay Suter

To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Robert Dale Sweeney

All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

c t

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Amanda Tarlton

All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Gregg Taylor

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Taylor Teegarden

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment This is a welcomed opportunity thank you

I really feel that this is an important issue.I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. I am really appreciative of the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

Mary E & Paul Teshima

Consent-Based Siting

From: Lawrence Tetenbaum [mailto:emtlarry@aol.com]
Sent: Thursday, July 28, 2016 9:11 PM
To: Consent Based Siting
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information. Information must be accessible and offered through a variety of platforms. The full range of cost and risks associated with the project must be disclosed and verified, as well as alternatives being considered. Achieving informed consent is not an end, but an ongoing exercise that responds to new information and findings as well as new generations.

2) Inclusive - Consent should be granted by those most impacted, including states, tribes and communities. A broad range of state, tribal and local stakeholders should be included in the decision-making process, and efforts must be made to increase the number of community members who recognize themselves and their communities as stakeholders in the siting process. People and entities that would financially benefit from the siting process should be clearly disclosed.

3) Collaborative - Consent can't be achieved through a top-down process. Activities related to outreach, engagement and education must be planned in coordination with appropriate stakeholders. Any agreements or decision-making must result from mutual input and understanding, and must be responsive to the concerns of citizens.

4) Just - Consent should not be bought. Financial compensation and other incentives must be reasonable, not used as coercion, and negotiated with full public disclosure.

5) Transparent - Consent must be pursued through an open process. Consent can be achieved and maintained through trust. Open access to information includes disclosure of funding and any conflicts of interest with the sources of information. All meetings, hearings and communications must be open to the public and on record.

6) Legitimate - A consent-based siting process must not just be the policy of the Department of Energy, but the law of the land.

7) Balanced- Consent will require sharing of power among federal executive and legislative branches, and state and local governments and communities. Negotiating and decision-making power must be shared among affected federal, state and local entities, including those in the transportation sector. States also should be granted some authority over regulation of the facility.

8) Flexible - Consent can be withdrawn. The consent-based siting process must provide ample opportunity and defined moments to correct course or completely withdrawal from the siting process.

9) Contractual - States, tribes and communities must have clear recourse if the terms of consent are breached.

10) Tailored – The consent process must be responsive to each situation. While these common elements should be applied to any consent-based process, any approach must be tailored to the specific, unique needs of the particular state, tribe and communities where a waste dump is being considered.

Thank you for your consideration.

Sincerely,

maureen thomas-murphy

To: Consent Based Siting <consentbasedsiting@hq.doe.gov>
Subject: Consent-based siting public comment

I support the Blue Ribbon Commission on America's Nuclear Future's recommendation to implement an explicitly adaptive, staged and consent-based approach to nuclear waste disposal. And I welcome the opportunity provided by the U.S. Department of Energy to submit comments on the agency's nascent effort to design a consent-based siting process.

Achieving consent-based siting, if done right, could lay the foundation for a fair and just process for siting a nuclear waste management facility that will well position the federal government – after decades of failure – to meet its nuclear waste management commitments and begin to restore the loss of trust and confidence in its ability to find a viable and permanent solution to our waste crisis.

I support and urge the DOE to apply the following 10 Criteria for Community Consent:

1) Informed - Communities must know what they are consenting to at each stage of the process. Early and often public engagement activities should offer the public, community leaders, experts and agency representatives frequent opportunities to exchange information.
