

Non-rare earth magnetic materials

Michael A. McGuire

Oak Ridge National Laboratory

5/14/2013

PM045

Overview

Timeline

- Project start date – Oct. 2009
- Project end date – Sept. 2015
- Percent complete – 57 %

Budget

- Total project funding (FY09-12)
\$1314K
- Funding received in FY12
\$360K
- Funding for FY13
\$234K (est.)

Targets / Barriers

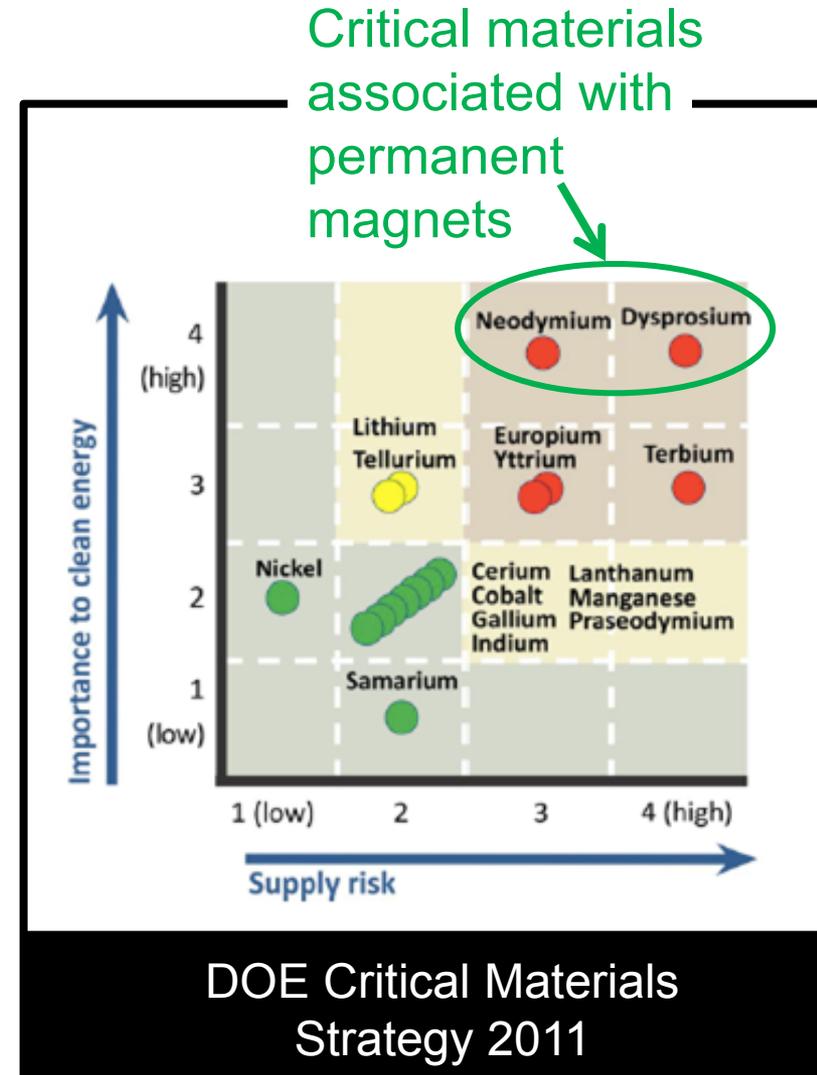

- Relevant Targets
 - lowering the cost of electrical propulsion systems toward
 - 2015 (2020) target of 12 (8) \$/kW
- Relevant Barriers
 - **Limited domestic supply:** rare-earth elements.
 - **Cost:** high-performance permanent magnet materials.

Collaborations

- ORNL: *computation, processing*
- Univ. Tenn.: *characterization*
- Georgia Tech Research Institute: *characterization*

Relevance: the problem

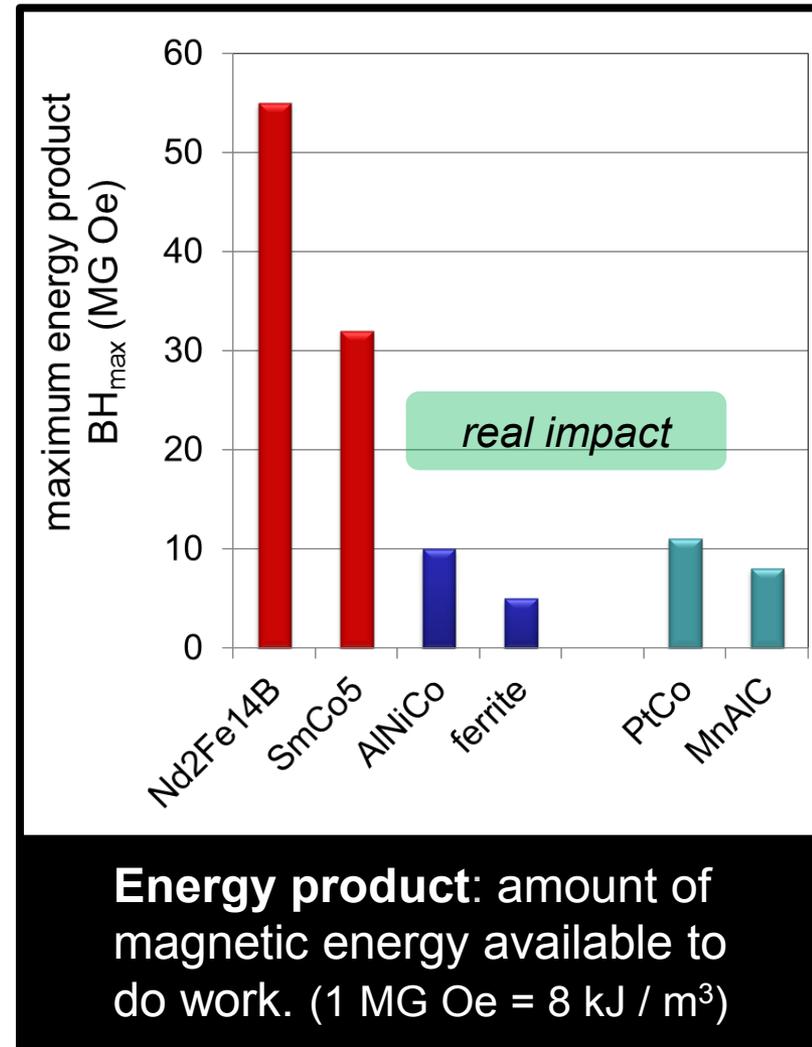

- **Permanent magnet (PM) motors** are key for state-of-the-art electric motors for propulsion.
- Magnets account for:
 - 40% of current motor materials cost.
 - 30% of current motor cost.
 - **60% of 2020 target motor cost.**
- **Reducing magnet cost** is critical to meeting targets with internal PM motors.
- Available high-performance magnets contain **rare-earth elements**, which are expensive and subject to supply chain disruptions.

Relevance: project objectives

The overall goal of this project is to identify alternative hard ferromagnetic materials which do not contain rare-earth elements and are relevant to PM motor technology.

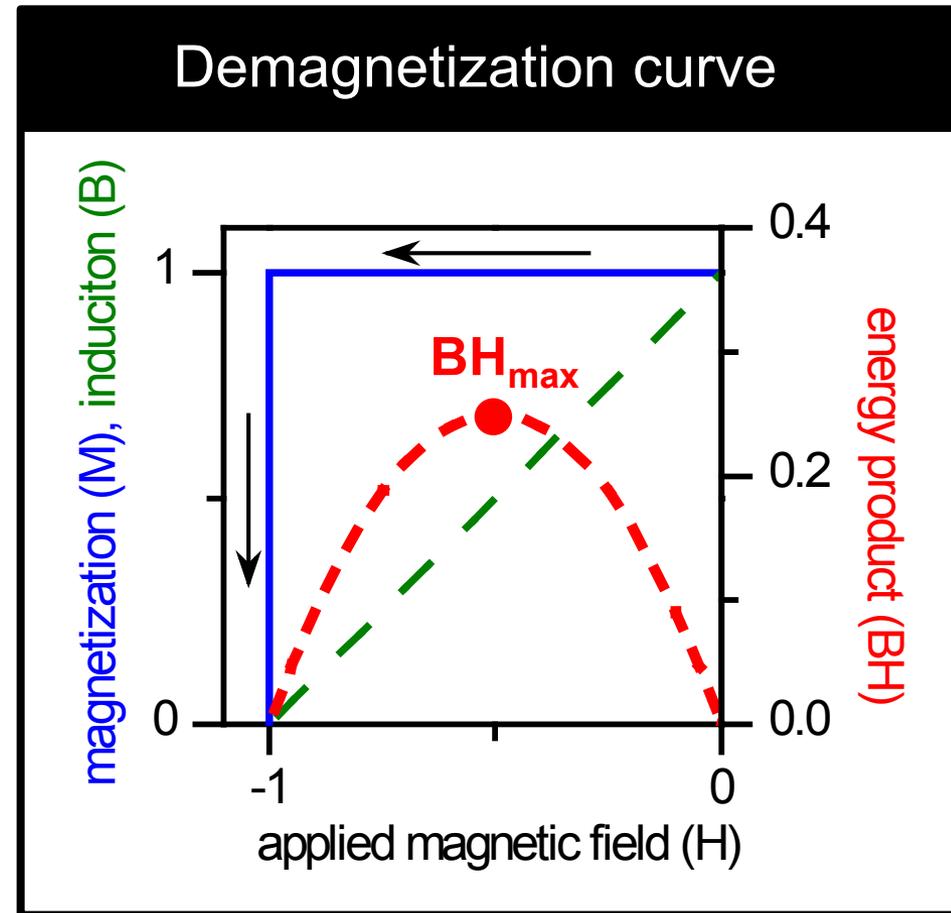

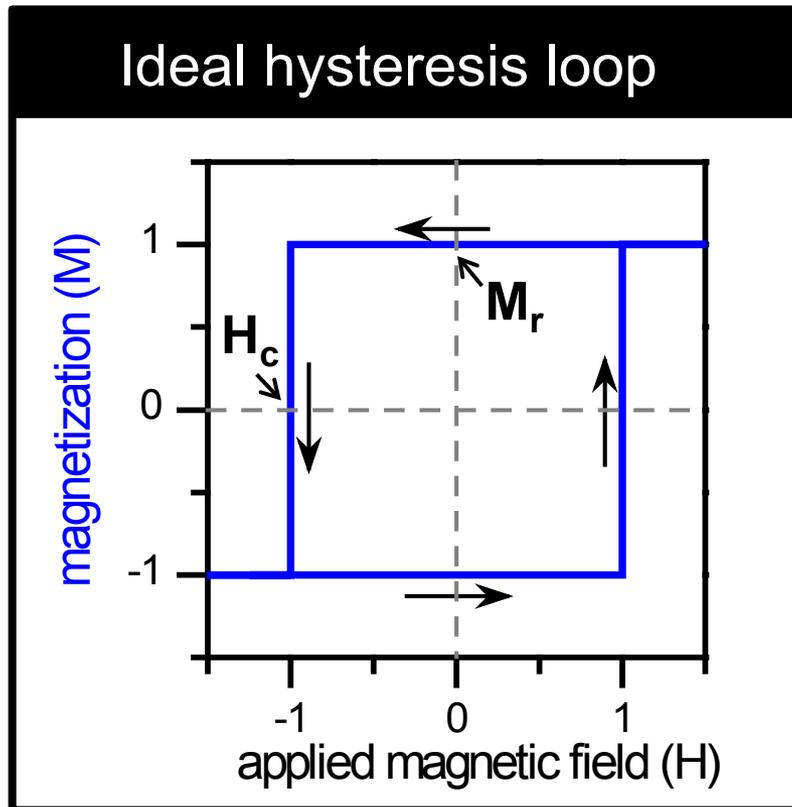

- **Objectives** of this project:
 - Identify new materials in chemical systems which contain elements with the most promise for good PM properties.
 - Examine known materials worth further study.
 - Understand the usefulness of heavy transition metals for magnetic anisotropy.
- **Relevance** to VT program:
 - The availability of alternative PM materials, especially those without rare-earth elements, may enable progress toward cost targets for motors.

Approach: magnetic performance

Parameters characterizing magnetic performance:

- Remanent magnetization (M_r)
- Coercive field (H_c)
- Energy product (BH)
- Curie temperature (T_C)

Approach: methodology

This project addresses the **technical barrier of cost and availability of rare-earth elements** by focusing on **rare-earth free chemical systems**.

Uniqueness: Utilize **heavy transition metals** instead of rare-earth elements to provide anisotropy. **Focus on new PM materials.**

Target non-cubic crystal structures rich in **3d transition metals** (strong magnetism), with **heavier transition metals** (strong spin-orbit coupling), as well as **light “interstitials” elements** (complex/new materials).

Approach: milestones

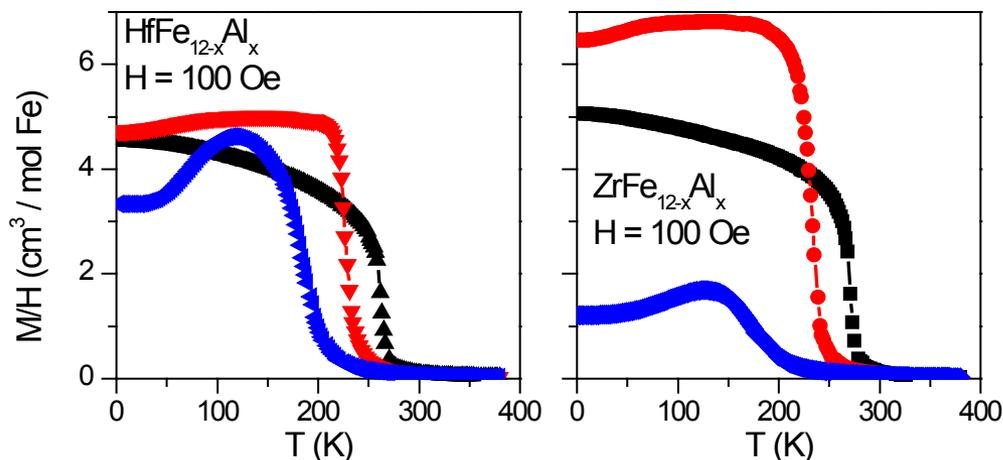

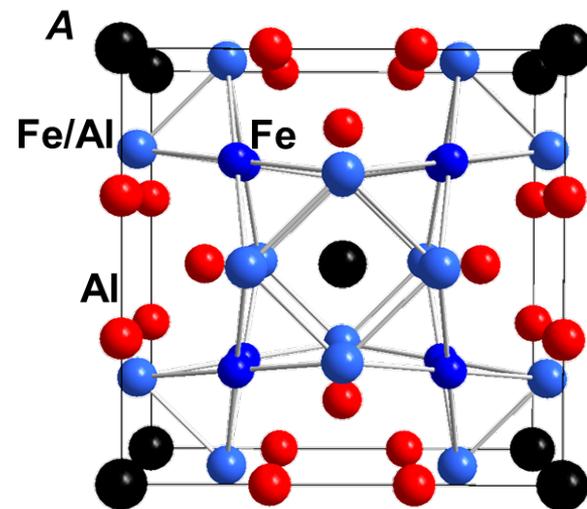

Month/Year	Milestone
September 2012	Milestone: Determine usefulness of metal flux synthesis technique for producing crystals of new ternary phosphides with high transition metal concentrations. Complete: Small crystals or many complex phases produced. Continue with technique.
September 2012	Milestone: Develop capabilities to produce sub-nitrides using flowing ammonia gas, and examine effects of mild nitriding conditions on magnetic intermetallic compounds. Complete: Poor reactivity of metals with nitrogen and poor thermal stability of products prevented significant progress. This route toward new magnets was determined to be inappropriate for this project.
September 2013	Milestone: Identify new ferromagnetic phosphides using metal-flux crystal growth and conventional synthesis methods, and assess their potential for PM applications. Progress: Exploratory crystal growth experiments ongoing.
September 2013	Milestone: Apply high magnetic field processing capabilities available at ORNL to stabilize ferromagnetic phases in rare-earth-free chemical systems. Progress: Initial experiments have demonstrated stability enhancement induced by high magnetic fields.

Progress

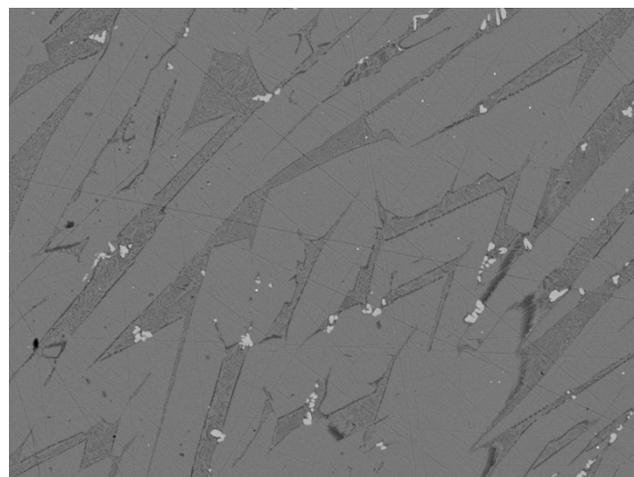

- **New ferromagnets: $\text{ZrFe}_{12-x}\text{Al}_x$ and $\text{HfFe}_{12-x}\text{Al}_x$**
FY11-12
- **Stabilizing $L1_0$ magnetic phases: $\text{FePd}_{1-x}\text{Ni}_x$**
FY13
- **Promising new permanent magnet system: $\text{Hf}_2\text{Co}_{11}\text{B}$**
FY10-13

Progress: $A\text{Fe}_{12-x}\text{Al}_x$ ($A = \text{Zr}, \text{Hf}$)

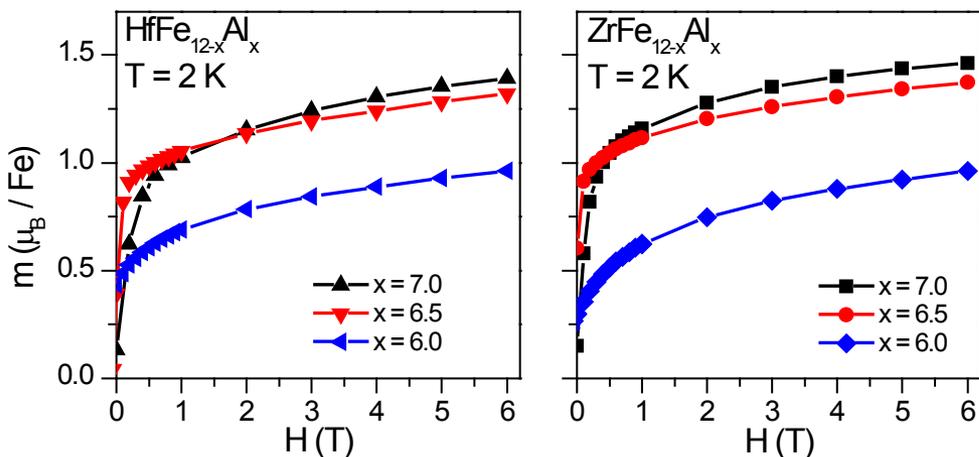

- Discovered new Fe-Al based ferromagnets
- Synthesized materials with varying Al contents
- Characterized crystallographic, magnetic, and microstructural properties

Scanning electron micrograph of HfFe_6Al_6

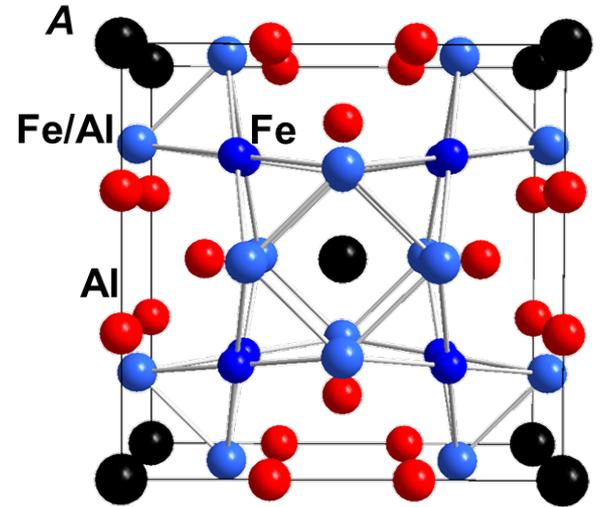

TM3000_0100 2011/08/18 11:35 H D7.6 x500 200 μm

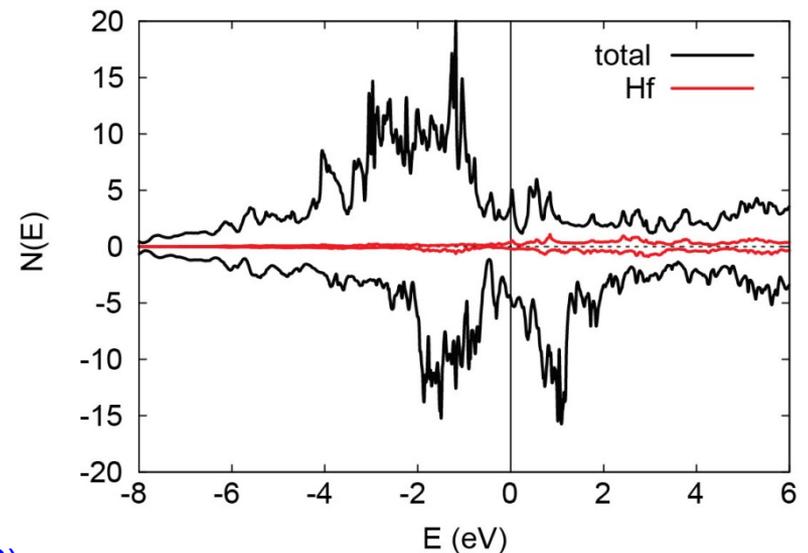

Progress: $A\text{Fe}_{12-x}\text{Al}_x$ ($A = \text{Zr}, \text{Hf}$)

- Discovered new Fe-Al based ferromagnets
- Synthesized materials with varying Al contents
- Characterized crystallographic, magnetic, and microstructural properties
- Understood experimental data using results of first principles calculations
 - Remanent magnetization may be due to magnetic moments on Zr/Hf.
 - Antiferromagnetic interactions among certain Fe sites suppresses ferromagnetism at high Fe contents

composition	T_C (K)	M_S (μ_B / Fe)	M_r (μ_B / Fe)
ZrFe_5Al_7	271	1.46	0.15
$\text{ZrFe}_{5.5}\text{Al}_{6.5}$	233	1.37	0.6
ZrFe_6Al_6	170-190	0.96	0.3
HfFe_5Al_7	263	1.39	0.13
$\text{HfFe}_{5.5}\text{Al}_{6.5}$	230	1.32	0.39
HfFe_6Al_6	180-195	0.96	0.44

- Reported findings: [J. Appl. Phys. 111, 093918 \(2012\)](#).

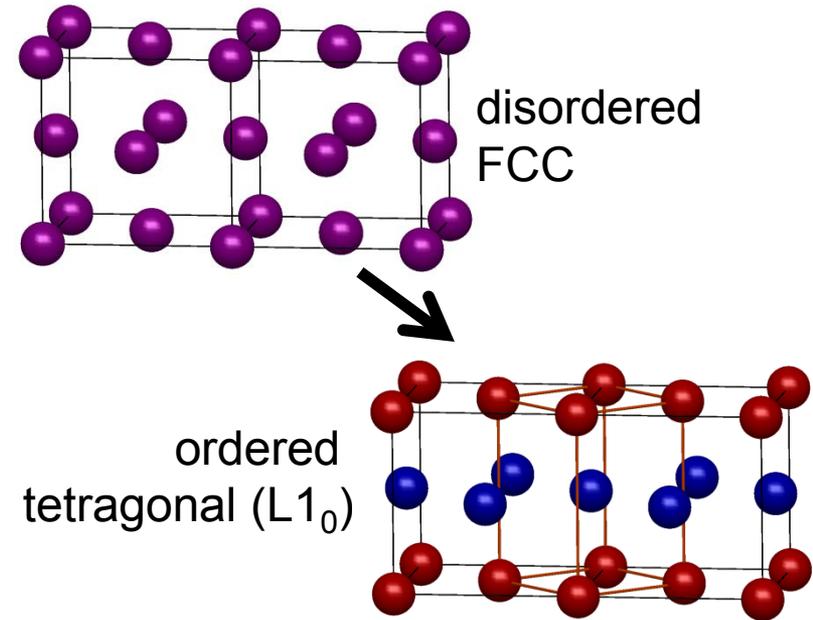

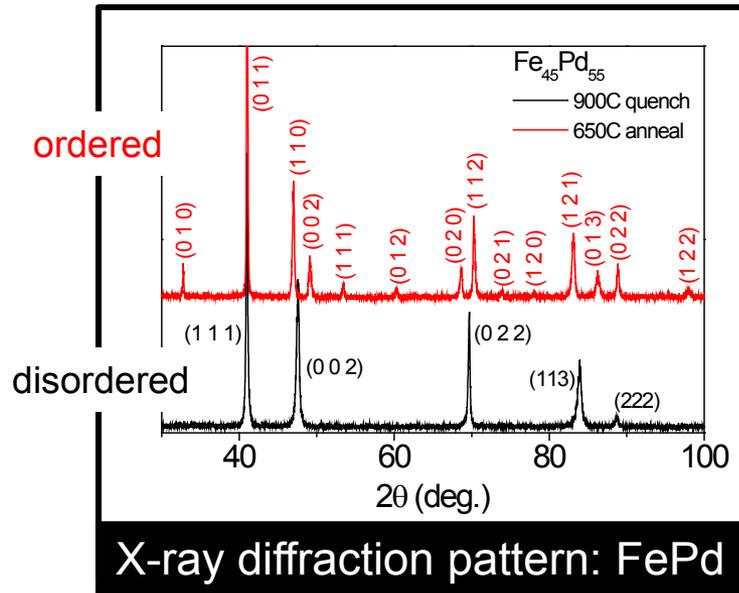

Progress

- New ferromagnets: $\text{ZrFe}_{12-x}\text{Al}_x$ and $\text{HfFe}_{12-x}\text{Al}_x$
FY11-12
- **Stabilizing $L1_0$ magnetic phases: $\text{FePd}_{1-x}\text{Ni}_x$**
FY13
- Promising new permanent magnet system: $\text{Hf}_2\text{Co}_{11}\text{B}$
FY10-13

Progress: stabilizing $L1_0$ compounds

Background information

- Class of strongly anisotropic ferromagnets
- Binary transition metal compounds with order-disorder phase transitions.

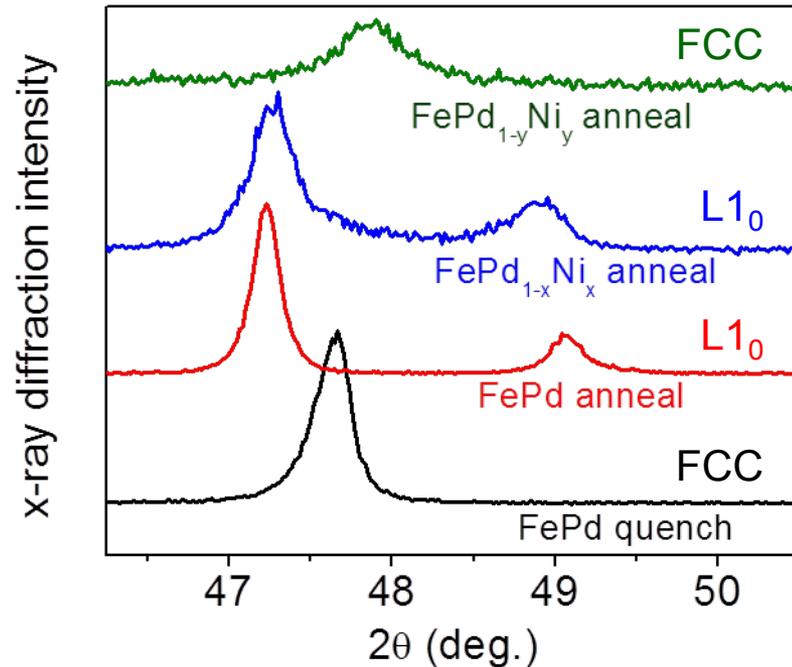

Suction cast $FePd_{1-x}Ni_x$ alloys for thermo-magnetic processing

- Examples: MnAl, CoPt, CoPd, FePd, FePt
 - $L1_0$ FeNi is particularly attractive, but *only found in meteorites*
- Investigate $FePd_{1-x}Ni_x$ alloys, use high magnetic field processing to stabilize $L1_0$ phase.

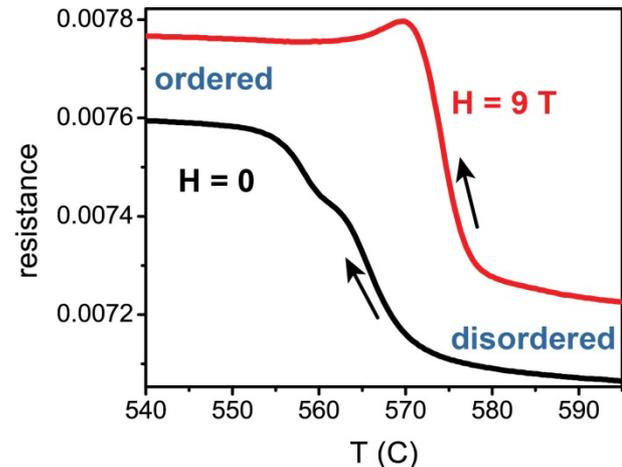

Progress: stabilizing $L1_0$ compounds

- Produced $L1_0$ $\text{FePd}_{1-x}\text{Ni}_x$ for low Ni concentrations.

- Cast alloys for **thermomagnetic processing**
- Performed preliminary processing experiments
- Observed magnetic-field-induced increase in stability of the $L1_0$ phase.**

Thermo-magnetic processing:
 $L1_0$ phase stabilized by field

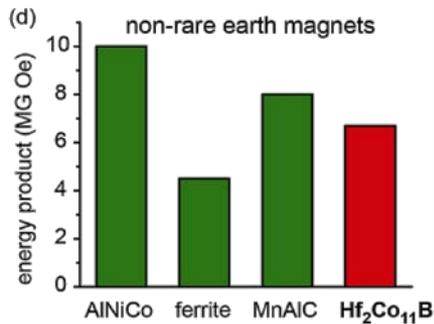

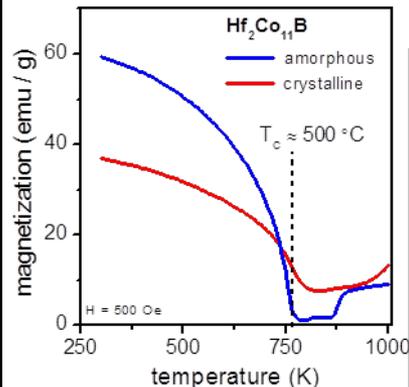

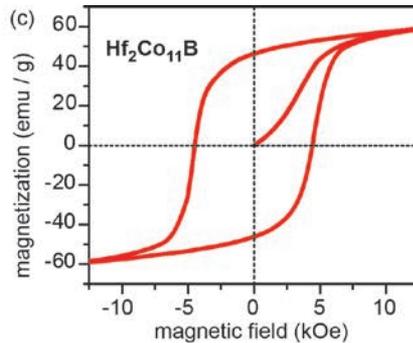

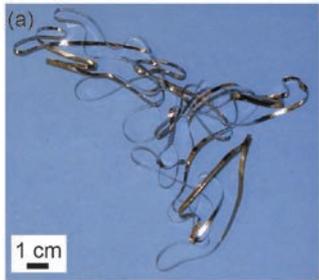

Magnetic field causes order-disorder transition to occur at higher temperature.

Progress

- New ferromagnets: $\text{ZrFe}_{12-x}\text{Al}_x$ and $\text{HfFe}_{12-x}\text{Al}_x$
FY11-12
- Stabilizing $L1_0$ magnetic phases: $\text{FePd}_{1-x}\text{Ni}_x$
FY13
- **Promising new permanent magnet system: $\text{Hf}_2\text{Co}_{11}\text{B}$**
FY10-13

Progress: $\text{Hf}_2\text{Co}_{11}\text{B}$

$\text{Hf}_2\text{Co}_{11}\text{B}$: melt-spun ribbons and magnetic properties

Continuing study of Hf-Co-B alloys.

- Progress in FY2012-2013
 - **Demonstrated $\text{BH}_{\text{max}} = 6.7 \text{ MGOe}$**
 - Correlated microstructure and magnetism
 - **Filed Provisional Patent Application**

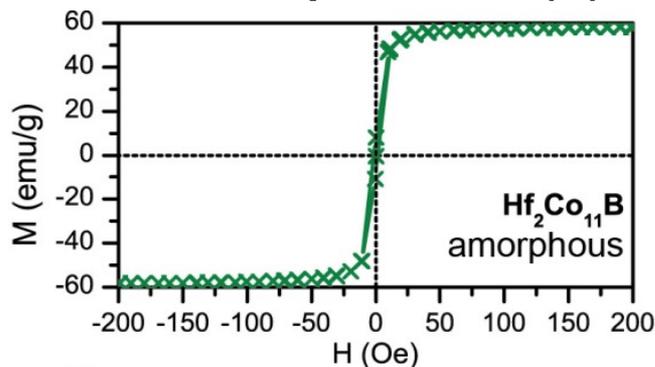

Key findings:

- Energy product competitive with well-established, long-studied non-rare earth magnet materials.
- Energy product near half that obtained in optimized NdFeB melt-spun ribbons.
- Curie temperature $\sim 150^\circ\text{C}$ higher than NdFeB.
- Cost can be reduced by partial Hf \rightarrow Zr, impact on performance currently under study.

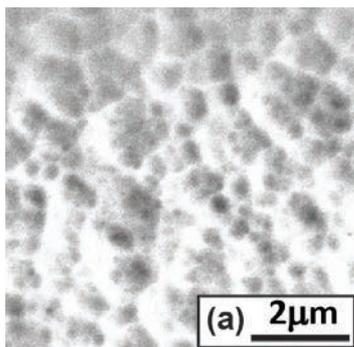

Progress: $\text{Hf}_2\text{Co}_{11}\text{B}$

Magnetism and microstructure

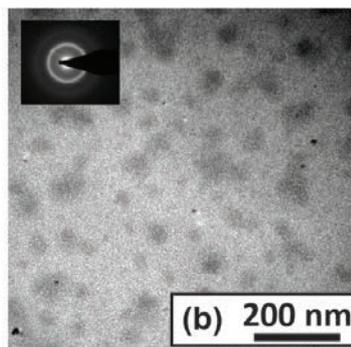

Room temperature $M(H)$

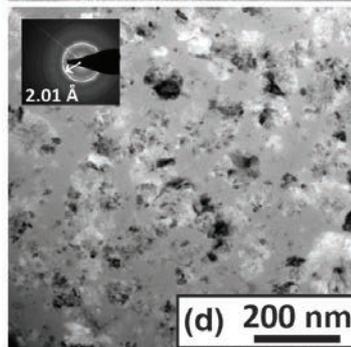

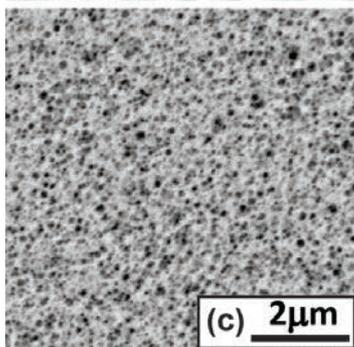

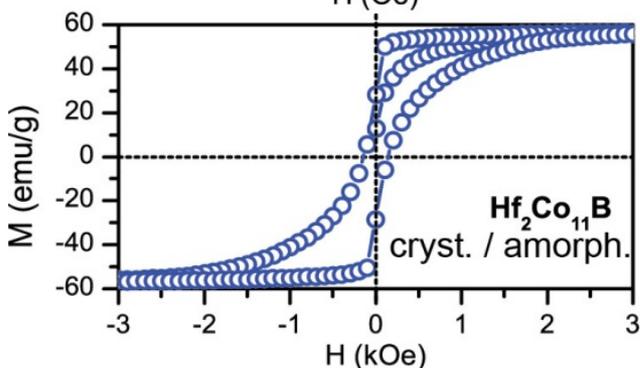

SEM backscatter

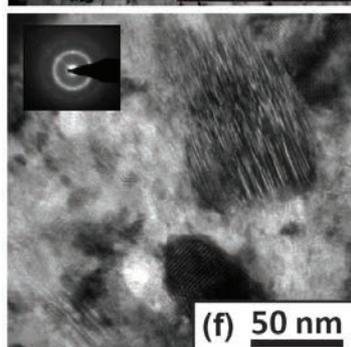

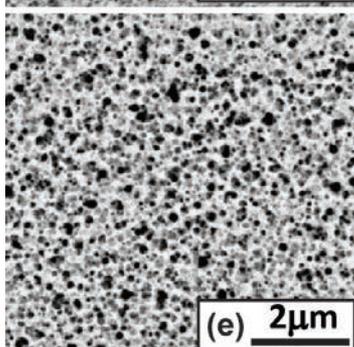

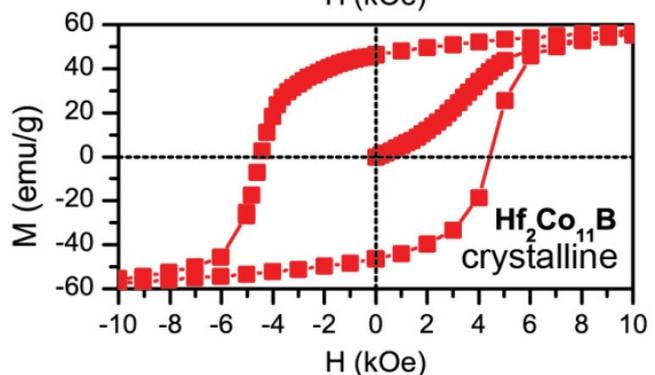

TEM bright field

Amorphous material is a very soft ferromagnet

Partially crystallized material show mixed hard/soft magnetism.

Further crystallization produces **hard ferromagnetism**.

Complex structure 16

Collaborations

- **David Singh**, Materials Theory, Oak Ridge National Lab
 - First principle calculations
- **Orlando Rios**, Materials Processing, Oak Ridge National Lab
 - Magnetic field processing and microstructure analysis
- **Nirmal Ghimire and David Mandrus**, University of Tennessee
 - Sample synthesis and characterization
- **Michael Koehler**, University of Tennessee
 - High temperature magnetic measurements
- **John Schultz**, Georgia Tech Research Institute
 - High frequency magnetic measurements

Proposed Future Work: FY13-14

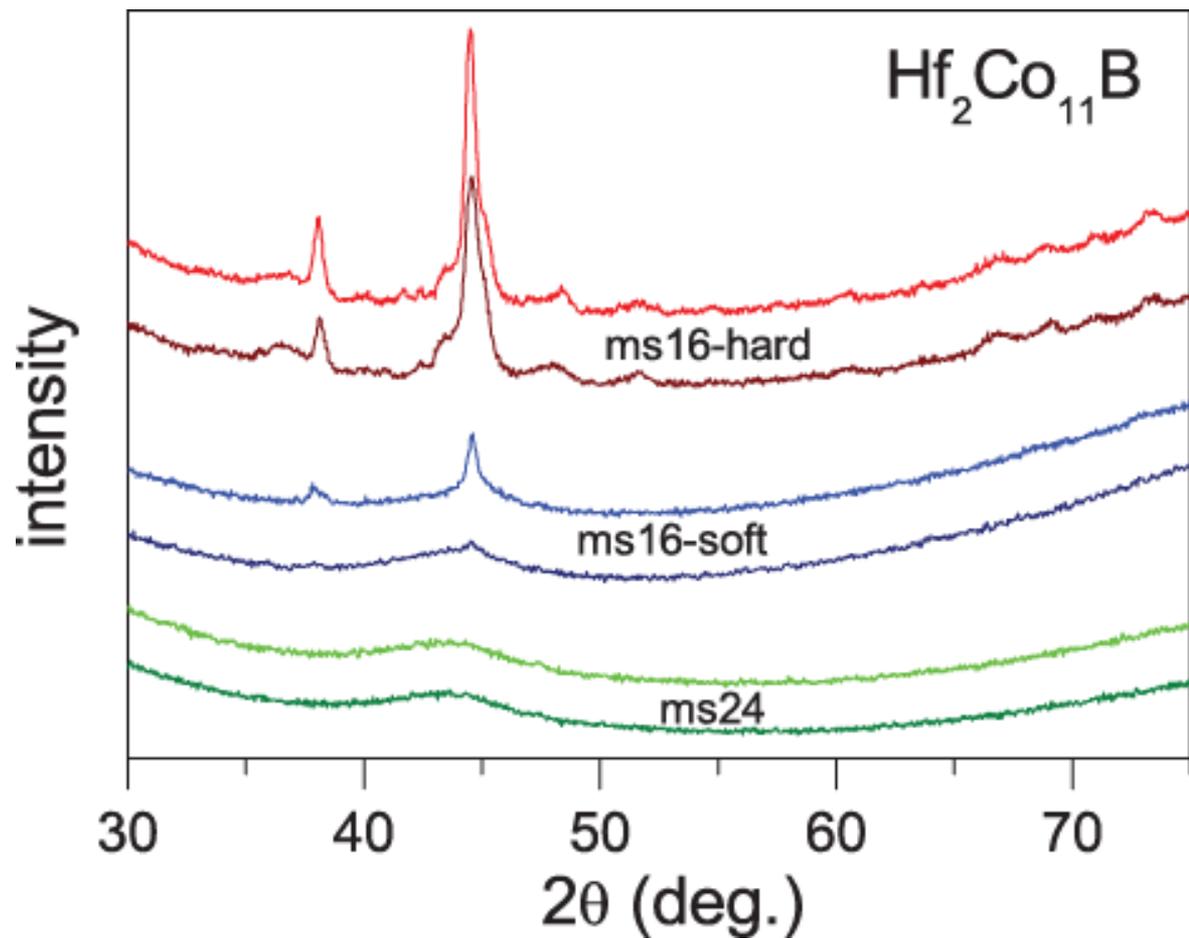

- **Hf₂Co₁₁B**
 - Continue optimizing processing conditions, melt-spinning, crystallization.
 - Chemical modifications for cost and performance (Zr substitution for Hf, Fe for Co, optimal B content → Hf_{2-x}Zr_xCo_{11-y}Fe_yB_z).
- **L1₀ phases**
 - Synthesize FePd_{1-x}Ni_x alloys for x = 0.1, 0.2...0.9, 1.0.
 - Characterize magnetic properties: magnetization, curie temperatures.
 - Explore thermomagnetic processing to stabilize the L1₀ structure.
- **New transition metal rich phosphides**
 - Continue exploratory syntheses in ternary Cr/Mn/Fe/Co-rich phosphide systems.
 - Tune crystal growth conditions (solvent compositions) to favor products with high concentrations of metals.
 - Complement with arc-melting when appropriate (e.g. Fe-phosphides).

Summary

- **Relevance:** Discovery and development of alternative permanent magnet materials addresses the cost and limited domestic supply of rare-earth elements, which are barriers to meeting **motor cost targets**.
- **Approach:** Focus on **new materials discovery and characterization supported by computation**, to identify and understand new candidate materials. Combine **heavy and light transition metals**.
- **Accomplishments and Progress:**
 - Discovered and characterized **new rare-earth free Fe-based ferromagnets $AFe_{12-x}Al_x$** , and **understood performance limits** using first principles calculations.
 - Processed **$FePd_{1-x}Ni_x$ alloys in high magnetic fields** and showed **increased stability** of the anisotropic magnetic phase and **improved kinetics** for phase transformation.
 - Demonstrated **Hf-Co-B alloys to be competitive rare-earth free permanent magnet materials** with high Curie temperature (500 °C), energy products near **7 MGOe**, and expectations of further improvement.
- **Collaborations:** Materials theory, processing, and microstructure studies at ORNL, synthesis and characterization at Univ. Tenn., characterization at GTRI.
- **Proposed Future Work:** Improving $Hf_2Co_{11}B$ -based alloys by chemical modification, exploration of Cr/Mn/Fe/Co-rich phosphides for new ferromagnets.
