Remu

Overview

Timeline

Remu

Start: December 17, 2009 End: December 16, 2013 Status: Approx. 64% complete

Barriers and Risks

- Market Acceptance Timing
- •Manufacturing Expansion
- Production Component Supply
- Application Integration

Budget

Total: \$120,400,000 DOE Share: \$60,200,000 Contractor Share: \$60,200,000

Partners (subawardee)

Objectives

•Accelerate the adoption and use of electric drive vehicles in the market by developing a standardized platform of lower cost, higher performance hybrid electric motors and controls

•Invest in the expansion or refurbishment of U.S. based manufacturing facilities, as well as new product tooling and engineering, production and test equipment, and product commercialization

Technical Feasibility:

•The new motor and inverter products proposed in the project are based on an extension of existing product and process technology.

•Remy has been producing rotating electrical products for over 100 years and hybrid electric drive motors since 2003.

•Phoenix has been producing electronic controls for over 20 years.

Ability to Complete Facility:

•Manufacturing processes, including site expansions and supply chain management, are well-established at both Remy and Phoenix International.

•Phase I of the project began with the refurbishment of existing facilities to support initial production capacity.

•Phase II of the project includes the addition of capacity in a second existing facility to support high volume production.

Ability to Deliver Commercial Ready Product:

•For this project, many of the target customers are Remy's existing customers in both the automotive and heavy duty market where Remy has the leading share of rotating electrical products in North America.

•These customers have been very enthusiastic regarding Remy's new approach to reduce costs through creating a family of standardized electric drive motors, and have launched new product development efforts with Remy.

Ability to Estimate Costs:

•Remy's facilities planning group continues to provide direction for the manufacturing site costs based on several previous plant relocations in the United States.

•Phoenix International has very current costs for site expansion and equipment having commissioned a new power electronics facility in January of 2009.

•New product designs are extensions of existing products.

•Material prices are reviewed by global purchasing and supplier quality teams at both companies.

Ability to Recycle:

•Remy is the largest U.S. remanufacturer of starter and alternator products, recycling and refurbishing 4 to 5 million units per year in its two U.S. facilities in Virginia and Oklahoma.

•Planning for such recycling of hybrid motors is already underway in joint meetings between Remy, its customers, and its suppliers.

•Remy has standard workflow procedures in all of its manufacturing operations which define and control the segregation and recycling of various scrap raw materials used in its process, including byproduct materials and nonconforming products.

•Phoenix International's recycling plan is to leverage Remy's existing capability in the product recycling area.

•If re-manufacturing is called for, the inverter parts could be returned to Phoenix facilities for rebuild or Phoenix could supply the required subcomponents back to Remy to facilitate the remanufacturing.

•In cases where scrapping of the inverter is called for; the housing and bus bar metals are recyclable.

Remy

Environmental Impact:

•Existing facilities are being utilized for all phases of the project so that no new construction will be required.

•Phase 1 production does not require any new environmental permits.

Phase 1 Manufacturing Facility

Key Milestones for 2012	
Validation Test Capacity Fully Installed	COMPLETE
Phase 1 Production Facility Complete	COMPLETE
Ready For Start Of Production	COMPLETE
Production Stage Hardware Available	COMPLETE
Inverter Production Release	COMPLETE

This project has helped to fund <u>204 direct jobs</u> at Remy and our sub-awardees.

Another 979 jobs are estimated to have been funded at our suppliers and vendors.

Production Intent Design Motor Samples:

Multiple configurations of the HVH410 and HVH250 motors have been produced.

Configurations include:

- •Oil Cooling
- •Water Cooling
- •3 motor lengths
- •Multiple Winding Patterns
- •Customer Specific Assemblies

Production Validation:

Motors have been tested to meet standardized performance and durability targets.
Validation to customer specific specifications has also been complete.

Motor Test Stands

Remy

Technical Accomplishments and Progress (HVH410)

OOOOO Note: The torque and power ratings are based on typical operating conditions as noted on the performance graphs. There are several variables that 00 may change the motor performance, including coolant flow rate, operating temperature, inverter settings and parameters, etc. For actual performance, the motor must be evaluated in its final system and application. All specifications are subject to change.

•PD550

Production released

PD300

PD550 Dual

Phoenix International:

•Remy has collaborated with Phoenix International as a subawardee to this grant.

•The inverters will be developed and put in production by Phoenix International at a location in Fargo, ND.

•The inverter sizes required will match the motor sizes needed in the marketplace.

•The motors and inverters are typically matched to various customer requirements such as peak power of the motor and available voltage of the DC source.

•Inverter development will follow the same typical steps as the motor development with the delivery of prototypes and production devices availability at the same time.

•This will provide the customer with a matched set of motor and inverter drive systems.

2013:

•Expand motor production capacity to a Phase 2 facility based on market demand

2013 Focus:

Customer production launches. Implementation of Phase 2.

•Accelerating the adoption and use of electric drive vehicles in the market.

•Developing a standardized platform of lower cost, higher performance hybrid electric motors and controls.

•Building on the proven success of existing product and other technologies.

Remy

0000000

•Matching product features and production capacity to real market requirements.

•Delivering technical accomplishments on time.
