

# ADVANCED VEHICLE TESTING & EVALUATION

**Thomas Garetson**

**PRINCIPAL INVESTIGATOR**

**Intertek Testing Services, North America**

**June 17, 2014**

**VSS029**

# OVERVIEW – NEW AGREEMENT

## TIMELINE

Project Start; Oct. 01, 2011  
Project End; Sep. 30, 2016  
Percent Complete; 15%

## BUDGET

Total Project; \$ 33,088,218  
DOE Share; \$ 26,400,000  
Cost Share; \$ 6,688,218  
Current Auth; \$ 6,351,700

## BARRIERS

Vehicle Availability  
Vehicle Reliability  
Infrastructure Requirements

## PARTNERS

EZ Messenger  
Total Transit  
Idaho National Laboratory  
Argonne National Laboratory  
Peloton Technology  
National Renewable Energy Lab  
SAE  
University of Nebraska - Lincoln

## OBJECTIVES

- ◆ Test and evaluate advanced vehicle technologies intended to reduce the consumption of petroleum
- ◆ Produce lifecycle cost data for vehicles that are utilizing these advanced technologies
- ◆ Provide fleet operations data to the Idaho National Laboratory database in order to disseminate the results of vehicle and infrastructure testing & analysis
- ◆ Provide benchmark data and performance trends for advanced technology vehicles

## MILESTONES

### ◆ Advanced Technology Vehicles on test (2013)

◆ BEV	12
◆ PHEV	18
◆ HEV	16
◆ ICE	8
◆ 3 vehicles completed testing & 28 vehicles started, rest ongoing	

### ◆ Advanced Technology Vehicles to be tested in CY 2014 (difference is those to be started)

◆ BEV	16 (4)
◆ PHEV	22 (4)
◆ HEV	16 (0)
◆ ICE	20(12)

## PROCEDURE/DOCUMENTATION DEVELOPMENT

- ◆ Administrative Procedures for Control of Test Conduct
- ◆ Vehicle Specifications Defining Key Vehicle and Performance Parameters
- ◆ Battery Test Procedures Defining Implementation of Standard Test Requirements
- ◆ Develop Interim Component Durability Test Procedures

## BASELINE TESTING

- ◆ **Baseline Vehicle Performance at outset of testing**
  - ◆ Acceleration
  - ◆ Maximum speed
  - ◆ Braking
  - ◆ Fully electric range (when applicable)
  - ◆ Vehicle coast-down testing to obtain drag coefficients for chassis dynamometer testing
- ◆ **End-of-Test Performance**

## FLEET TESTING

- ◆ Production Vehicles
- ◆ 60,000 to 195,000 Miles (depending upon technology)
- ◆ On-Board Data Logger with Automatic Data Upload
- ◆ Fuel and Maintenance Logs
- ◆ Interim Component Durability Testing

## ACCELERATED TESTING

- ◆ Alternative to Fleet Testing is a Fixed Route Mileage Accumulation

Cycle (mi)	Urban (10 mi)	Highway (10 mi)	Charge (hr)	Reps (N)	Total (mi)	Reps (%)	Miles (%)
10	1	0	4	60	600	37%	11%
20	1	1	8	30	600	19%	11%
40	4	0	12	15	600	9%	11%
40	2	2	12	15	600	9%	11%
40	0	4	12	15	600	9%	11%
60	2	4	12	10	600	6%	11%
80	2	6	12	8	640	5%	12%
100	2	8	12	6	600	4%	11%
200	2	18	12	3	600	2%	11%
<b>Total</b>	<b>2,340</b>	<b>3,100</b>	<b>1,344</b>	<b>162</b>	<b>5,440</b>		
Average	43%	57%	8.3	18			

## TRACTION BATTERY TESTING

- ◆ Hybrid Vehicles
  - ◆  $C_1$  capacity
  - ◆ Hybrid pulse power characterization
- ◆ Plug-In Hybrid Vehicles
  - ◆  $C_3$  capacity
  - ◆ Hybrid pulse power characterization
- ◆ Battery Electric Vehicles
  - ◆  $C_3$  capacity
  - ◆ Electric vehicle power characterization

**VEHICLE TECHNOLOGIES PROGRAM**

**2012 Honda Civic CNG**

**Advanced Vehicle Testing – Baseline Testing Results**

**VEHICLE TECHNOLOGIES PROGRAM**

**PERFORMANCE STATISTICS<sup>1</sup>**

**VEHICLE SPECIFICATIONS**

<u>Vehicle</u>	<u>Engine</u>
VIN: 19XFB5F53CE000672	Model: 1.6 Valve SOHC i-VTEC
Class: Compact	Output: 82 kW @ 6500 rpm
Seabelt Positions: 5	Torque: 144 Nm @ 4300 rpm
Type: Sedan	Configuration: Inline 4-Cylinder
CARB <sup>2</sup> : AT-PZEV	Displacement: 1.8 L
EPA City/Hwy/Combined <sup>3</sup> :	Compression Ratio: 12.7:1
27/38/32 MPGe	Fuel Type: Compressed Natural Gas
<u>Trims</u>	<u>Transmission</u>
Manufacturer: Firestone	Type: Electronically-Controlled Automatic
Model: Affinity	Gears: 5-Speed
Size: P195/65R16	Features: ECO Mode
Pressure F/R: 30/30 psi	
Spare Installed: T135/80D15	
99MM	

**TRACK TESTING<sup>3</sup>**

**Acceleration 0-60 mph<sup>1</sup>**  
Measured Time: 12.9 s  
Performance Goal: ≤13.5 s  
**Maximum Speed**  
At ¼ Mile: 74.0 mph  
At ½ Mile<sup>4</sup>: 104.0 mph  
Performance Goal: ≥90 mph at one-mile mark  
**Banking from 60 mph<sup>5</sup>**  
Measured Time: 3.5 s  
Distance: 133 ft  
**Deceleration from 60-12 mph<sup>6</sup>**  
Measured Time: 96.0 s  
Distance: 3,994 ft

**DYNAMOMETER TESTING<sup>7</sup>**

**Cycle Results<sup>7</sup>**

	72 °F	20 °F	95 °F + 850 W/m²*
UDDS (Cold Start)	29.3 MPGe	24.4 MPGe	25.4 MPGe
UDDS	31.9 MPGe	29.0 MPGe	26.5 MPGe
HWFET	49.5 MPGe	46.4 MPGe	46.3 MPGe
US06	31.2 MPGe	30.7 MPGe	28.7 MPGe
SC03	31.1 MPGe	--	25.9 MPGe

**Fuel Economy at Steady-State Speed, 0% Grade**

10 mph	30.1 MPGe	50 mph	47.1 MPGe
20 mph	39.7 MPGe	60 mph	41.5 MPGe
30 mph	54.3 MPGe	70 mph	38.0 MPGe
40 mph	47.5 MPGe	80 mph	31.8 MPGe

**Duration of Passing Manoeuvre at Grade<sup>8</sup>**

	0% Grade	3% Grade	6% Grade
35-55 mph	5.8 s	7.0 s	9.7 s
55-65 mph	3.5 s	4.4 s	6.5 s
35-70 mph	11.9 s	14.6 s	21.7 s
55-80 mph	10.8 s	15.8 s	29.3 s

Maximum Speed at 25% Grade from Stop: 35.5 mph

**NOTES:**

- Vehicle specifications were supplied by the manufacturer, as stated, or derived from a literature source.
- The vehicle was certified as an Advanced Technology Partial Zero Emission Vehicle by the U.S. Environmental Protection Agency.
- The fuel economy is given in terms of "miles per gallon of gasoline equivalent" (MPGe).
- The fuel tank capacity is given in units of "gallons of gasoline equivalent" (GGE).

**NOTES:**

- Performance numbers based on "Normal" vehicle mode. Performance numbers are averages from multiple tests.
- Vehicle track testing occurs when the vehicle has achieved its "break-in/mileage" of between 4,000 to 6,000 miles, and at the following curb weights/gross vehicle weight ratings (GVWR/GVW) as follows:  
1) 2012 Civic Hybrid 4-door sedan equipped, GVWR: 4,000 lbs; GVW: 3,800 lbs.  
2) 2012 Civic Hybrid 4-door sedan equipped, GVWR: 4,000 lbs; GVW: 3,800 lbs.  
3) 2012 Civic Hybrid 4-door sedan equipped, GVWR: 4,000 lbs; GVW: 3,800 lbs.  
4) 2012 Civic Hybrid 4-door sedan equipped, GVWR: 4,000 lbs; GVW: 3,800 lbs.  
5) 2012 Civic Hybrid 4-door sedan equipped, GVWR: 4,000 lbs; GVW: 3,800 lbs.  
6) 2012 Civic Hybrid 4-door sedan equipped, GVWR: 4,000 lbs; GVW: 3,800 lbs.  
7) 2012 Civic Hybrid 4-door sedan equipped, GVWR: 4,000 lbs; GVW: 3,800 lbs.  
8) 2012 Civic Hybrid 4-door sedan equipped, GVWR: 4,000 lbs; GVW: 3,800 lbs.
- The maximum speed was recorded before the one mile mark.
- The deceleration is measured from the point at which the vehicle begins to move.
- The maximum speed was recorded before the one mile mark.
- Conducted following dry surface.
- Driving in "Drive" on dry surface. Test runs done out after the vehicle reached 12 mph, this ending value is deviation from the normal procedure of starting 10 mph, the threshold below which the vehicle creep speed type shift.
- The vehicle has a higher drag coefficient than most vehicles tested.
- The dynamometer test began on April 19, 2011, with the vehicle odometer reading 4,254 miles. A comprehensive explanation of the dynamometer facility and methodology can be found at [http://www.energy.gov/eere/vehicles/pdfs/4254\\_Chaos\\_Dynamometer\\_Testing\\_Reference\\_Document.pdf](http://www.energy.gov/eere/vehicles/pdfs/4254_Chaos_Dynamometer_Testing_Reference_Document.pdf). The AEC coefficients derive from track conditions tested and analyzed on the dynamometer were A: 22.203 lb./B: 0.4853 kmph, and C: -0.01263 kmph².
- The Cycle-Rankin 1000 provides the fuel economy achieved by the vehicle on five EPA drive cycles at three different ambient temperatures: (1) 72 °F with vehicle climate-control off, (2) 20 °F with vehicle climate-control set to 72°F, and (3) 95 °F with vehicle climate-control set to 72°F. The vehicle is also refueled to 90% (about 100 lbs) of rated tank at 95 °F to simulate driver overnight. The drive cycle test includes a hot start unless otherwise indicated. The first test energy is given in terms of "miles per gallon of gasoline equivalent" (MPGe).
- The passing maneuver indicates the amount of time required for the vehicle to accelerate from the first to the second gear listed, at the specified grade.

This vehicle meets all ENERGY STAR criteria as of the end of this document.  
Values are not included due to the Performance Declassification process.

# Accomplishments

Intertek

Valued Quality. Delivered.

## 2013 FLEET TEST VEHICLES

- ◆ 2 Honda CR-Z HEV
- ◆ 2 Hyundai Sonata HEV
- ◆ 2 Chevrolet Volt PHEV (MY11)
- ◆ 2 Nissan Leaf BEV (MY11)
- ◆ 4 Honda Civic CNG
- ◆ 4 VW Jetta Turbo Diesel
- ◆ 4 Chevrolet Volt PHEV (MY13)
- ◆ 4 Chevrolet Malibu ECO
- ◆ 4 Honda Civic HEV
- ◆ 4 Toyota Prius PHEV
- ◆ 4 Nissan Leaf BEV (MY13)
- ◆ 2 Mitsubishi IMiEV BEV
- ◆ 4 Ford C-Max HEV
- ◆ 4 Ford C-Max Energi (PHEV)
- ◆ 4 VW Jetta HEV

## NATIONAL LABORATORIES

- ◆ Idaho National Laboratory
  - ◆ Procedure development
  - ◆ Data collection & analysis
  - ◆ Reporting
- ◆ Argonne National Laboratory
  - ◆ Vehicle Test Procedure development
  - ◆ Chassis Dynamometer testing
  - ◆ Level 2 AC EV Charging Interoperability tests
- ◆ National Renewable Energy Laboratory
  - ◆ Semi-autonomous vehicle performance evaluation

## INDUSTRY PARTNERS

- ◆ **EZ Messenger**
  - ◆ Document delivery fleet
  - ◆ Mileage accumulation
  - ◆ Route design
- ◆ **Total Transit**
  - ◆ Taxi service
  - ◆ Mileage accumulation

## OTHER PARTNERS

- ◆ Peloton Technologies

- ◆ Semi-autonomous HD vehicle system

- ◆ Society of Automotive Engineers

- ◆ L2 EVSE interoperability

- ◆ University of Nebraska

- ◆ Advanced Agricultural equipment evaluation

## CONTINUOUS IMPROVEMENT

- ◆ Update test procedures
- ◆ Develop new test procedures for new technologies and new vehicle types
- ◆ Develop test procedures for interim component durability testing
- ◆ Continue to automate test reporting
- ◆ Identify & expand test fleet operators
- ◆ Expand scope to include Medium Duty vehicles

## ONGOING TESTING

- ◆ Over 50 vehicle models scheduled for evaluation
- ◆ A dozen fueling infrastructure evaluations

## 2013 SUMMARY

- ◆ Award novation in Q4 to Intertek
- ◆ At year end, over 50 vehicles (15 models) in test fleets employing 5 different technologies and various strategies to reduce petroleum consumption
- ◆ Implemented fleet management software
- ◆ Added fleet operators
- ◆ Auto-populated test reports with ANL & INL
- ◆ Test results posted to AVTA Website

**2013 Chevrolet Volt****Advanced Vehicle Testing – Baseline Testing Results****VEHICLE SPECIFICATIONS<sup>1</sup>****Vehicle**

VIN: 1G1RA6E40DU103929  
Class: Compact  
Seatbelt Positions: 4  
Type<sup>2</sup>: Multi-Mode PHEV (EV, Series, and Power-split)  
CARB<sup>3</sup>: BIN 4  
EPA: 350 Wh/mi (Electricity only); 37 mpg (Hybrid mode, Combined)

**Dimensions**

Drag Coefficient: 0.29  
Wheelbase: 105.7 in  
Track F/R: 61.2 / 62.1 in  
Length/Width: 177.1 in/70.4 in  
Height: 56.6 in  
Ground Clearance: 6.0 in

**Weights**

Design Curb Weight: 3,781 lb  
Delivered Curb Weight: 3,770 lb  
Distribution F/R (%): 61/39  
GVWR: 4,539 lb  
GAWR F/R: 2,512/2,027 lb  
Max. Payload: 758 lb

**Battery**

Manufacturer: LG Chem  
Type: Lithium-ion  
Cathode/Anode Material: LiMn<sub>2</sub>O<sub>4</sub>/Hard Carbon  
Number of Cells: 288  
Cell Config.: 3 parallel, 96 series  
Nominal Cell Voltage: 3.7 V  
Nominal System Voltage: 355.2 V  
Rated Pack Capacity: 45 Ah  
Rated Pack Energy: 16.5 kWh  
Weight of Pack: 435 lb  
Pack Location: Underneath vehicle center  
Cooling: Active – Liquid cooled

**Engine**

Model: DOHC I-4  
Output: 63 kW @ 4800rpm  
Configuration: Inline 4-Cylinder  
Displacement: 1.4 L  
Fuel Tank Capacity: 9.3 gal  
Fuel Type: Premium gasoline

**Motor**

Type: 12-pole permanent magnet AC synchronous  
Max. Power/Torque: 111 kW/370 Nm  
Max. Motor Speed: 9500 rpm  
Cooling: Active – Liquid cooled

**Generator**

Type: 16-pole permanent magnet AC synchronous  
Max. Power/Torque: 55 kW/200 Nm  
Max. Generator Speed: 6000 rpm  
Cooling: Active – Liquid cooled

**Tires**

Manufacturer: Goodyear  
Model: Assurance  
Size: P215/55R17  
Pressure F/R: 35/35 psi  
Spare Installed: N/A - Tire sealant and inflator

## NOTES:

- Vehicle track testing at delivered curb weight plus 332 ± 10 lb (including driver and test equipment), distributed in a manner similar to the original curb loading of the vehicle. Values obtained from drive cycle data without accessories.
- During the 45-mph range test, the maximum battery temperature was 21 °C and the average ambient temperature was 12 °C. During the post-test charge, the beginning and ending battery state of charge (SOC) was 19.9% and 83.5%, respectively, the maximum battery temperature was 24 °C, and the average ambient temperature was 13 °C.
- During the 60-mph range test, the maximum battery temperature was 17 °C and the average ambient temperature was 8 °C. During the post-test charge, the beginning and ending battery state of charge (SOC) was 21.5% and 83.5%, respectively, the maximum battery temperature was 21 °C and the average ambient temperature was 16 °C.
- During the 70-mph range test, the maximum battery temperature was 22 °C and the average ambient temperature was 4 °C. During the post-test charge, the beginning and ending battery state of charge (SOC) was 18.3% and 83.5%, respectively, the maximum battery temperature was 23 °C and the average ambient temperature was 17 °C.
- In addition to the range measured for the 45-mph, 60-mph, and 70-mph tests, drives of approximately 0.7, 0.9, and 1.1 miles, respectively, from test prep area to point at which vehicle test speed is achieved and maintained were required and these distances can be added to the distance traveled during the range test (B) to obtain the total distance traveled. These drives required 0.29, 0.45, and 0.65 kWh to complete, and this energy can be added to the energy consumed during the range test (A) to obtain the total output from the battery. Range is considered reached when vehicle operational mode transitions from charge-depleting to charge-sustaining.
- The AC electricity consumption rate is calculated by dividing the AC energy from the EVSE (C) by the total distance travelled (B).
- The DC electricity consumption rate is calculated by dividing the DC energy from the on-board charger into the battery (D) by the total distance travelled (B).
- Battery Roundtrip Efficiency is calculated by dividing the DC energy out of the battery (A) by the DC energy from the on-board charger into the battery (D).
- On-Board Charger Efficiency is calculated by dividing the DC energy from the on-board charger into the battery (D) by the AC energy from the EVSE (C).
- Overall Vehicle Efficiency is calculated by dividing the DC energy out of the battery (A) by the AC energy from the EVSE (C).

This vehicle meets all PHEV America Minimum Requirements listed at the end of this document.  
Values in red indicate that the Performance Goal was not met.

			82.0	116.8 <sup>6</sup>	153.0 <sup>6</sup>

## NOTES:

1. Values for fuel economy and electricity consumption rate obtained from drive cycle data without accessories and using SAE J1711 methodology. The vehicle is driven on consecutive drive cycles, with fuel economy and electricity consumption rates calculated for each cycle. Where a distance travelled is during a drive cycle, the values have been interpolated.
2. No fuel is used in charge-depleting mode.
3. During the consecutive UDDS cycles, the engine started, i.e., the vehicle transitioned from charge-depleting to charge-sustaining mode, at the 50.7-mile mark, over 6.8 UDDS cycles (the full UDDS cycle is 7.45 miles long). The Performance Goal is to complete two UDDS cycles or 14.90 miles in charge-depleting mode.
4. The consecutive UDDS testing ended at 67.2 miles, after 9 consecutive cycles.
5. During the consecutive HWFET cycles, the engine started, i.e., the vehicle transitioned from charge-depleting to charge-sustaining mode, at the 47.8-mile mark, over 4.7 HWFET cycles (the full HWFET cycle is 10.25 miles long). The Performance Goal is to complete two HWFET cycles or 20.50 miles in charge-depleting mode.
6. The consecutive HWFET testing ended at 82.0 miles, after 8 consecutive cycles.

This vehicle meets all PHEV America Minimum Requirements listed at the end of this document.  
 Values in red indicate that the Performance Goal was not met.

## PHEV Battery Testing Results

2013 Ford CMaxEnergi - VIN 3813

### Vehicle Details And Battery Specifications<sup>1</sup>

#### Vehicle Details

Base Vehicle: 2013 Ford CMaxEnergi	VIN: 1FADP5CUXDL543813
Propulsion System: PHEV	

#### Battery Specifications

Manufacturer: Panasonic	Rated Pack Energy/Capacity: 7.6 kWh / 26 Ah
Type: Lithium-ion	Min/Max Cell Voltage: 3.00/4.20 V
Number of Cells: 84	Pack weight: 272 lb
Nominal Cell/System Voltage: 3.7/310.8 V	Thermal Management: Active - Forced Air

<sup>1</sup> Vehicle details and battery specifications were either supplied by the manufacturer or derived from a literature review

### Battery Laboratory Test Results Summary

Test Number	Vehicle Odometer (Miles)	Date of Test	Measured Average Capacity (Ah)	Measured Average Energy Capacity (kWh)	CD Usable Energy Margin <sup>2</sup> (Wh)	CS Usable Energy Margin <sup>2</sup> (Wh)
Baseline	4,756	3/6/2014	25.6	7.9	416.0	416.0
ICD 1						
ICD 2						
ICD 3						
End-of-Test						

<sup>2</sup> The CD and CS Usable Energy margins are defined as the difference between the battery usable energy values obtained from testing and the corresponding targets as defined in the Battery Test Manual for Plug-In Hybrid Electric Vehicles. A negative margin value indicates performance below the target, however it does not necessarily indicate any deficiency in the performance of the battery as it was designed to operate by the vehicle manufacturer.

## PHEV Battery Test Results Analysis

Battery test results include those from the Static Capacity Test and the Hybrid Pulse Power Characterization (HPPC) Test, based on test procedures from the United States Advanced Battery Consortium Battery Test Manual For Plug-In Hybrid Electric Vehicles at the time of testing. These tests were performed for the US Department of Energy Vehicle Technology Program's Advanced Vehicle Testing Activity which is conducted by the Idaho National Laboratory and Intertek Testing Services, North America.

### Static Capacity Test Results

The static capacity test measures the charge and energy capacities of the battery between maximum and minimum pack voltages when discharged at a constant current calculated to approximate a 10 kW discharge rate.<sup>3</sup> Pack voltage versus capacity discharged during the static capacity test is shown in figure 1. Three iterations of the static capacity test are performed at each interval, and the average results from each interval test are shown in the test results summary table on page 1.

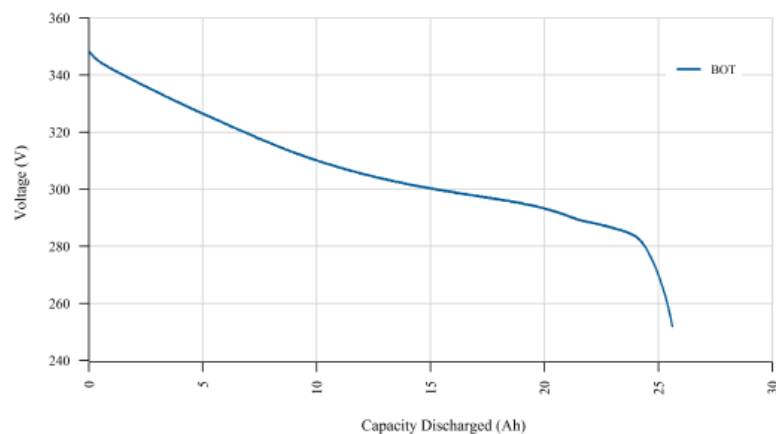

Figure 1. Voltage versus capacity discharged during the static capacity test.

### Hybrid Pulse Power Characterization Test Results

The HPPC test is performed to characterize the discharge and charge pulse power capability of the battery at each 10-percent depth-of-discharge interval. Numerical results derived from the HPPC test results are summarized in the table on the first page, including comparison of the measured results to the United States Advanced Battery Consortium goals for PHEV batteries. The results from these tests are in relation to the targets for a Medium PHEV Battery, having an equivalent electric range of 20 miles.

<sup>3</sup> Discharge rate is determined by taking the average of the maximum and minimum voltage values for a particular pack and dividing that value into 10 kW, per the PHEV manual. For this vehicle, the value is  $10\text{ kW} / 302.4\text{ V} = 33.07\text{ A}$ .

Figures 2 and 3 illustrate the battery charge and discharge calculated pulse resistance, which indicate internal resistance at each 10-percent depth-of-discharge interval.

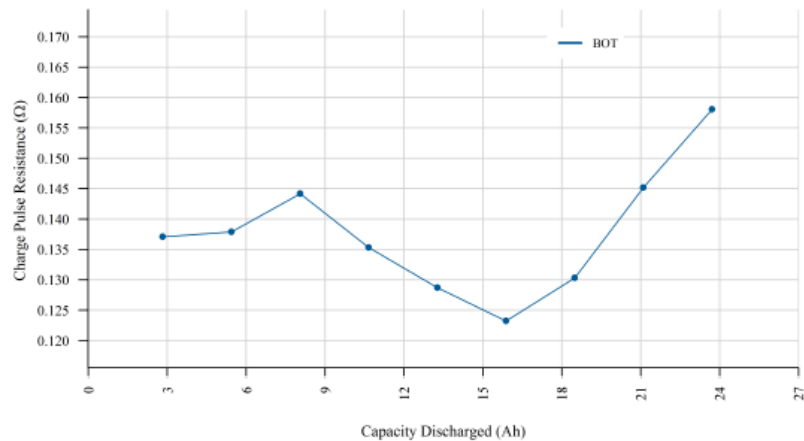

Figure 2. Ten-second charge pulse resistance versus capacity discharged.

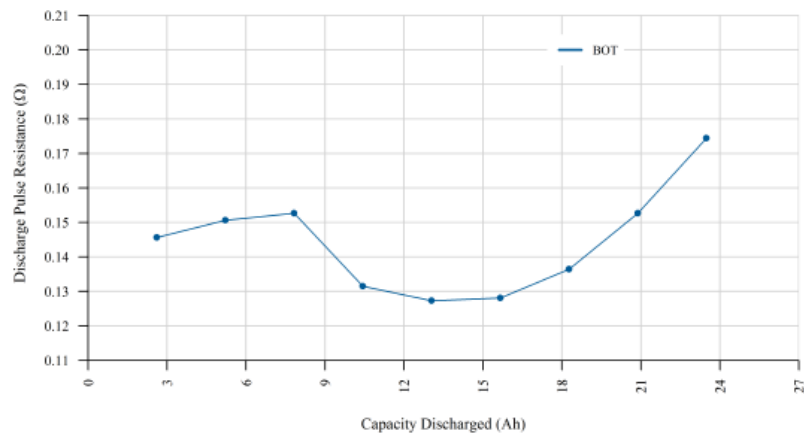

Figure 3. Ten-second discharge pulse resistance versus capacity discharged.

Figure 4 shows the battery's 10-second charge and discharge pulse power capabilities as a function of energy discharged. The Medium PHEV battery target performance goals of 37 kW discharge power and 25 kW charge power are shown as a dashed line. Note that the axes are scaled such that the charge and discharge pulse power goals align.

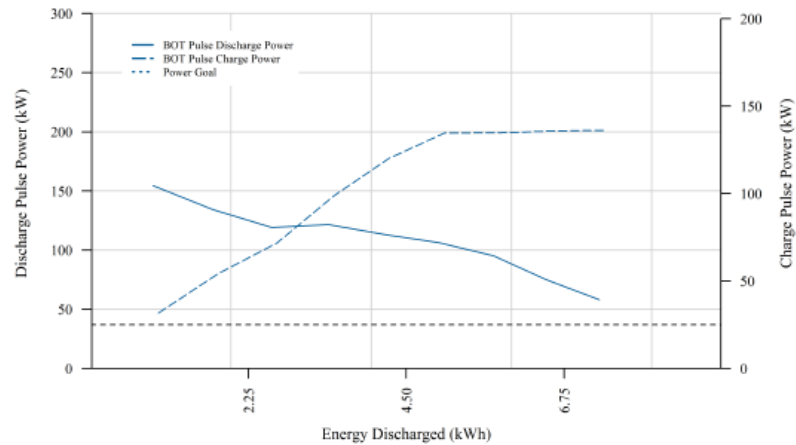

Figure 4. Discharge and charge power capability versus energy discharged.

Figure 5 shows the charge-depleting (CD) and charge-sustaining (CS) usable energy curves as a function of discharge power. The y-axis indicates the usable energy, as calculated using the methods from the PHEV battery test manual, at the power level indicated on the x-axis. The two dotted horizontal lines show the USABC Medium PHEV Battery available energy goals for CS and CD modes of 0.3 kWh and 5.8 kWh, respectively. The dotted vertical line shows the Medium PHEV Battery CS power target of 37 kW. Available Energy is defined as the usable energy, on the y-axis, exactly where the curves cross the discharge power goal. If the entire usable energy line falls to the right of the power goal, the usable energy at each discharge power level exceeds the discharge power target, and vice versa.

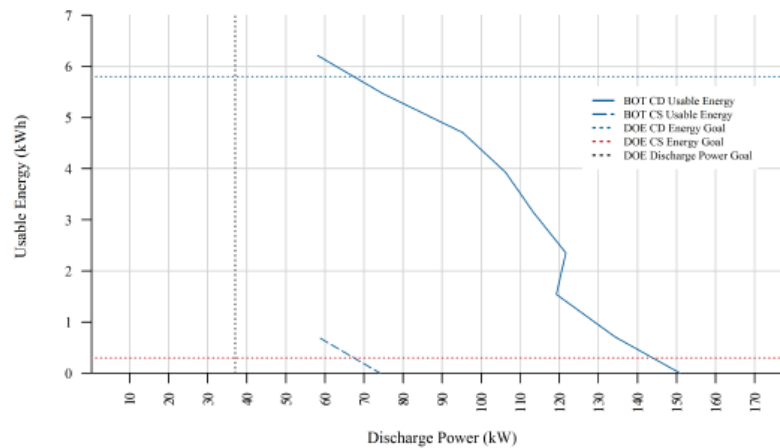

Figure 5. Usable energy versus power.
