Subject: Notification of Planned 230kV Outage at Potomac River
Generating Station

To Whom It May Concern:

One of the two new 230kV transmission lines - [REDACTED] into Potomac River substation is scheduled to be energized on Thursday May 31, 2007. This circuit will not carry load for the first (2) days after being energized for test purposes. On Saturday June 2, 2007 load will be applied to the circuit from the Potomac River substation.

The next planned outage on [REDACTED] high voltage circuit between Palmers Corner Substation and the Potomac River Generating Station is scheduled for Sunday, June 3, 2007 and will begin at 4:00 AM with a scheduled return date of Saturday, June 9, 2007 at 2:00 PM.

This planned transmission outage is contingent on the availability of Mirant generation. PJM will be responsible for ensuring that sufficient on line generation resources are scheduled daily to maintain reliable operations of the Potomac River area.

This outage is necessary to continue the 230kV reliability upgrades into the Potomac River area.
