# 2.0 INTRODUCTION

Pacific Power proposes to construct, operate and maintain a new 230 kilovolt (kV) transmission line in the south-central portion of Washington from the Vantage Substation near the Wanapum Dam to the Pomona Heights Substation near Selah, Washington (Project). The last transmission line built by Pacific Power to serve the electrical loads in the Yakima Valley was the Pomona-Wanapum 230 kV transmission line which was constructed in the mid-1970s. Pacific Power planning studies have identified the loss of the existing Pomona-Wanapum 230 kV transmission line as the single most critical outage condition on the Mid-Columbia system. The planned line will mitigate the risk and ensure reliable, efficient service. This line will improve the overall reliability, security and operating flexibility of the electrical system that serves the Yakima area. The Project would be designed for one 230 kV three phase (three conductors) circuit and shield wires. H-frame wood pole structures are proposed for most of the line located in open terrain. The H-frame structures would be between 65 and 90 feet tall (and in some cases 100 feet tall), and spaced approximately 750 to 900 feet apart, depending on terrain. The planned in service date for the new transmission line is late 2013.

### 2.1 Project Location

The Survey Area is located in south-central Washington between the Pomona Heights Substation east of Selah, Washington and the Vantage Substation east of the Wanapum Dam on the Columbia River. The U.S. Army Yakima Training Center (YTC) lies directly between the two substations and no access is allowed in the center of YTC because it is used by the Army for live fire training operations. Initial routes passed through the northern extent of the YTC and then south to the Pomona Heights Substation on the west side of Interstate 82. The Surveys conducted in 2010 included these routes (Figure 1). However, YTC authorities expressed concern over these potential routes in a letter dated May 28, 2010. In this letter, YTC authorities stated that any future transmission lines to the west of Interstate 82, on YTC property in the northern portion, or directly along the southern boundary must be buried so as to not interfere with military training operations. Alternative routes were subsequently identified to avoid the majority of YTC and to parallel the southern YTC boundary. All of the current routes travel south from the Vantage Substation through private, state, and BLM lands until south of the YTC boundary, at which point they turn west through mostly private property to the Pomona Heights Substation (Figure 2).

## 2.2 Survey Need

The greater sage-grouse (*Centrocercus urophasianus*) is listed as a Candidate species under the Federal Endangered Species Act and is listed as Threatened by the Washington Department of Fish and Wildlife (WAC 232-12-297). Large expanses of mature sagebrush habitat are a key aspect used by greater sage-grouse throughout the year. Various reports have shown that the presence of transmission lines across these large expanses of mature sagebrush lowers the habitat quality for greater sage-grouse (Graul 1980, Braun 1998, Aldridge and Brigham 2002, Braun et al. 2002, Knock et al. 2003).

The portion of sage-grouse habitat most affected by the presence of transmission lines is the lek. Leks are display grounds used by male sage-grouse to attract females during the breeding season. The same leks are typically used every year and span generations of birds. Researchers have attributed disturbance and abandonment of leks to harassment and predation of greater sage-grouse by common ravens (*Corvus corax*), and various raptors perching on and hunting from overhead utility towers (Graul 1980, Ellis 1987).

A telemetry study conducted in California from 1998 to 2000 found that transmission lines may have effects on sage-grouse lek attendance at distances of over 12 miles. The data also showed that the mean survival of adult greater sage-grouse increased as the distance from a transmission line increased.

However, it was concluded that the data did not indicate that these effects may be limiting to the population for leks more than three miles from the transmission line (Armentrout and Hall 2005).

Through discussions with the U.S. Fish and Wildlife Service (USFWS) and the Washington Department of Fish and Wildlife (WDFW), Pacific Power committed to conduct protocol level aerial surveys for leks throughout a corridor consisting of a three mile buffer on each side of all route alternatives. The three mile buffer was based on the research of Armentrout and Hall (2005) described above. Pacific Power contracted with POWER Engineers, Inc. (POWER) to conduct aerial lek surveys for all potential sage-grouse habitat within three miles of the route alternatives, hereafter referred to as the Survey Area. The 2010 and 2011 Survey Areas are different, due to revisions made to the route alternatives based on scoping comments received from YTC (Figures 1 and 2).

# 3.0 GREATER SAGE-GROUSE

The greater sage-grouse is the largest grouse species in North America with a body length ranging between 55 and 71 centimeters (cm), a wingspan between 83 and 96 cm, and a body weight of 1.3 to 2.7 kilograms (kg). Males are larger and have a distinct white breast, black throat, black belly, and a mottled brown back. When displaying on a lek the tail is raised in a large, distinct fan, the chest is puffed out along with two yellow air sacs just under the neck. Females are smaller than males and are drabber in appearance with mottled brown on the back and chest (Sibley 2003). Females do not display on leks. Instead, they remain in the sagebrush on the periphery of the lek and observe the males.

Greater sage-grouse are closely associated with sagebrush ecosystems of western North America. Sagebrush habitat types have a tremendous amount of natural variation in vegetative composition, habitat fragmentation, topography, substrate, weather, and frequency of fire. Consequently, greater sage-grouse are adapted to a mosaic of sagebrush habitats throughout their range, including relatively tall sagebrush (big sagebrush (*Artemisia tridentata*), three-tip sagebrush (*A. tripartita*), silver sagebrush (*A. cana*)); relatively low sagebrush (low sagebrush (*A. arbuscula*), black sagebrush (*A. nova*)); forb-rich mosaics of low and tall sagebrush; riparian meadows; steppe dominated by native grasses and forbs; scrub-willow (*Salix* spp.); and sagebrush savannas (Hays et al. 1998, Connelly et al. 2003).

Leks are annually used display grounds where males gather to display for females during the mating season. Leks are typically barren areas surrounded by high quality habitat of mature sage brush. Leks are rarely located on slopes greater than 10 percent and typically have very good sight lines which provide two major advantages to grouse: 1) it allows females on the periphery of the lek to view the displaying males; and 2) it allows displaying males to spot potential predators approaching. While displaying on the lek, males also make a loud, deep call, called "booming", which can be heard from over a mile away during favorable conditions. Leks are typically attended in the early morning hours, but males may display well before dawn during a full moon if the sky is clear.

Nests are placed in thick vegetative cover usually dominated by mature sagebrush. Vegetative diverse habitat may be an important aspect of nesting habitat to offer vertical and horizontal concealment (Connelly et al. 1991, Gregg et al. 1994, Sveum et al. 1998). Density of herbaceous cover can be an important indicator of habitat quality for pre-nesting, nesting, and brood rearing hens. Herbaceous cover averaging 18 cm in height and greater has been identified as an important characteristic of sage-grouse nesting and brood rearing habitat (Wakkinen 1990, Gregg et al. 1994). Average distance between a female's nest and the lek where she was first observed was 4.0 kilometers (km) for 23 nests in Colorado (Petersen 1980), 4.6 km for 36 nests in Idaho (Wakkinen et al. 1992), 3.4 km for 94 nests in Idaho (Fischer 1994), 7.8 km for 138 nests in Washington, and 6.2 km for 10 nests in Wyoming (Goebel 1980).

One reason the greater sage-grouse is so dependent on the presence of mature sagebrush is that leaves of various sagebrush species dominate their diet throughout the fall, winter, and early spring (Patterson 1952). Insects such as grasshoppers (*Orthoptera*), beetles (*Coleoptera*), and ants (*Hymenoptera*) are important for juveniles, particularly during the first three weeks of life, and forbs increase in importance as juveniles' age. Adults will occasionally take insects in the late spring and summer, although forbs and sagebrush make up the bulk of the diet during these times (Patterson 1952, Pyle and Crawford 1996).

Predators of greater sage-grouse include golden eagle (*Aquila chrysaetos*), ferruginous hawk (*Buteo regalis*), red-tailed hawk (*B. jamaicensis*), Swainson's hawk (*B. swainsoni*), gyrfalcon (*Falco rusticolus*), northern goshawk (*Accipiter gentilis*), cooper's hawk (*A. cooperi*), coyote (*Canis latrans*), red fox (*Vulpes fulva*), and bobcat (*Felis rufus*). Nest predators include ground squirrel (*Spermophilus spp.*), badger (*Taxidea taxus*), weasel (*Mustella spp.*), coyote, common raven, American crow (*Corvus brachyrhynchos*), and black-billed magpie (*Pica pica*).

Golden eagles will commonly attack male greater sage-grouse during display hours on leks. Ellis (1985) observed lekking greater sage-grouse flushing and ceasing lek activities in the presence of a golden eagle perched 2.0 km away. Ellis (1985) also found that golden eagle predation on greater sage-grouse on leks increased from 26 to 73 percent of the total predation after completion of a transmission line within 200 meters (m).

Greater sage-grouse in the Survey Area are a portion of the Columbia Basin Distinct Population Segment (DPS). The YTC supports one of two Washington populations remaining in the Columbia Basin DPS. The second population is located in Douglas and Grant Counties. Annual surveys for leks and lek counts have been conducted by YTC personnel to monitor trends and assess population status. Ten leks have been active since 1999. As of 2001, the ten year population average on the YTC is 289 birds. Starting in 1989 radio telemetry research and population monitoring has shown that adult use and nesting and brood rearing occurs primarily south of Umtanum ridge in proximity to leks.

# 4.0 METHODOLOGY

POWER conducted a series of three aerial greater sage-grouse lek surveys in 2010 and 2011 along all route alternatives, including a three mile buffer on each side of the route alternatives. The survey protocol used for this project was based on the protocol used by the YTC for aerial greater sage-grouse lek surveys (Appendix A). The YTC greater sage-grouse survey protocol states that aerial greater sage-grouse lek surveys may take place until May 15<sup>th</sup>.

POWER contracted with Central Valley Helicopters of Ellensburg, Washington to perform the surveys. With the exception of one flight, two surveyors were used for each flight. The aircraft was an Enstrom 480 Helicopter, which has large Plexiglas windows in the foot-wells, doors, and windshield to provide maximum visibility during surveys. A Garmin GPSmap 76CSx handheld GPS unit was used in real-time

tracking mode in coordination with a laptop computer running ArcView GIS 3.3 with aerial imagery to aid in navigation of the helicopter. The helicopter contained a Trimble Trim Flight 3 GPS unit which recorded a track log of the survey routes as well as any waypoints marked during the surveys.

Data recorded during each flight included start time, end time, wind speed, wind direction, temperature, cloud cover, and any greater sage-grouse occurrences (Appendix B). Wind speeds were recorded from the Ellensburg or Yakima Airfield weather report, depending on which was closer to the survey area that day.

Surveys did not take place if winds were greater than 15 miles per hour (mph), if visibility was less than five miles, or if it was raining. Areas which were excluded from surveys included highly agricultural areas, and slopes greater than 15 percent. Transects flown over suboptimal habitat, such as areas highly fragmented by agriculture, slopes greater than 15 percent or recently burned areas, were farther apart and flown at higher altitudes and faster speeds as described in Connelly et al. (2003).

### 4.1 2010 Survey

Each survey consisted of three mornings to cover the entire Survey Area. The surveys were performed on the following dates: Survey #1 - April 19<sup>th</sup>, 20<sup>th</sup>, and 22<sup>nd</sup>; Survey #2 - April 26<sup>th</sup>, 27<sup>th</sup>, and 28<sup>th</sup>; Survey #3 - May 12<sup>th</sup> and 13<sup>th</sup>.

Surveys took place from 0.5 hours before sunrise to approximately 1.5 hours after sunrise. Transects were flow at approximately 60 feet above ground level at 40 to 60 miles per hour. Transects were approximately 0.5 mile apart.

Two surveyors were used for each flight, except the Survey #2 flight on Monday April 26. Only one surveyor and the helicopter pilot were available that morning.

The shape and size of the Survey Area caused each survey to be broken up into three mornings of flying. The Survey Area was broken down into the northern section (YTC Training Areas one, two, three, four, and a small area of private agricultural land known as Badger Pocket), the western section (YTC Training Areas 12, 13, 14, 15, 16, and private and BLM administered lands to the west of Interstate 82), and the southern section (YTC Training Areas 7, 8, 9, 10, 11, and privately held lands to the south of the YTC). The eastern section of the Survey Area is highly agricultural and did not provide suitable greater sage-grouse habitat. Therefore, the eastern section was not surveyed for greater sage-grouse leks. Transects were flown in a north-south or east-west orientation, depending upon the area to be surveyed that day.

Surveys were cancelled during Survey #1 on April 21<sup>st</sup> due to rain and made up the following day. Surveys were also cancelled during Survey #3 on May 11<sup>th</sup> due to high winds. These surveys were not made up due to the end of the protocol survey season. Areas excluded from surveys included highly agricultural areas, slopes greater than 15 percent, above 1,100 meters elevation, or below 400 meters feet elevation. The parameters regarding slope and elevation exclusion areas were determined based on results of previous YTC greater sage-grouse surveys. The Survey Area incorporated approximately 479 square miles (306,560 acres).

Radio contact was maintained with Rattlesnake Radio of the YTC every 30 minutes while surveying over airspace controlled by the YTC. Survey areas were planned in advance in consultation with the YTC Range Control to ensure that the training areas scheduled for survey would be safe to access.

### 4.2 2011 Survey

2011 surveys were repeated three times throughout late March and April with at least one week between surveys. The first survey took place over two days on March 29<sup>th</sup> and 30<sup>th</sup>. The second and third surveys were each flown over the course of three days. The second round of surveys took place on April 12<sup>th</sup>, 13<sup>th</sup>, and 14<sup>th</sup>, while the third round of surveys took place on April 27<sup>th</sup>, 28<sup>th</sup>, and 29<sup>th</sup>.

Surveys took place from 0.5 hour before sunrise to approximately 1.5 hours after sunrise. Transects were flow at approximately 60 to 100 feet above ground level at approximately 60 miles per hour. Transects during the first session of surveys were approximately one mile apart; however, after consultation with USFWS, WDFW, and YTC personnel transects were flown at 0.5 mile apart during the second and third sessions of surveys.

The helicopter contained a Trimble Trim Flight 3 GPS unit which recorded a track log of the survey routes as well as any waypoints marked during Survey #1. This track log was used to navigate survey transects for Survey #2 by flying the transects from the Survey #1 and additional transects in between to create more detailed coverage. POWER GIS personnel created transects at exactly 0.5 mile apart for the helicopter to follow during Survey #3 (Figure 2). Two surveyors were used for each flight.

The shape and size of the Survey Area caused each survey to be broken up into multiple mornings of flying. The Survey Area was broken down into the eastern section (YTC Training Areas 3, 4, 5, 6, and 7, and private and BLM lands east of the Columbia River), and the southern section (YTC Training Areas 7, 8, 9, 10, 11, and privately held lands to the south of the YTC). Transects were flown in a north-south or east-west orientation, depending upon the area to be surveyed that day. The eastern section could be covered in one morning of survey, while the southern section was surveyed over the course of two mornings.

The parameters regarding slope and elevation exclusion areas were determined based on results of previous YTC greater sage-grouse surveys.

Survey areas were planned in advance in consultation with the YTC Range Control to ensure that the training areas scheduled for survey would be safe to access.

## 5.0 RESULTS

The most optimal habitat was located along the western and southern portion of the Survey Area. The northern portion lacks suitable sagebrush cover and includes portions of the Manastash Ridge, making the slopes to high for optimal greater sage-grouse habitat. Optimal habitat locations include the gradual slope of the Saddle Mountains to the east of the Columbia River, and a broad flat valley in YTC training area five. However, it should be noted that the sagebrush cover on the southern slope of the Saddle Mountains lacked a grass and forb rich understory due to the number of cattle being grazed on the slope. Less suitable habitat was located along the southern YTC boundary in the eastern portion of the Survey Area where a recent fire had degraded habitat by removing all sagebrush cover, and to the east of the Vantage Substation where agriculture had highly fragmented the remaining sagebrush habitat. Highly developed agricultural areas such as around the towns of Mattawa, Yakima, Moxee, and Selah were not included in the survey. The western portion of the Survey Area. However, the privately held lands were grazed by cattle to the point that little to no herbaceous understory occurred underneath the overhead sagebrush cover. This would degrade the suitability of this area to nesting female greater sage-grouse. The southern portion of

the Survey Area offered the most suitable greater sage-grouse habitat of the Survey Area. Mature sagebrush occurred throughout the southern portion, on and off the YTC, and a lack of grazing created a suitable herbaceous understory. Two historically known leks occur on the YTC in the southern portion of the Survey Area. No historically known leks occur on the private lands south of YTC.

It should be noted that no ground based habitat assessment was performed at this time. All estimations on habitat suitability were performed from the helicopter and are qualitative.

Various greater sage-grouse predators observed throughout the Survey Area included coyote, red-tailed hawk, black-billed magpie, American crow, common raven, and golden eagle.

### 5.1 2010 Survey

#### 5.1.1 Survey #1

No greater sage-grouse individuals or leks were identified during Survey #1 conducted during April 19-22, 2010 (Figure 3).

The northern portion of the Survey Area was surveyed on Monday, April 19<sup>th</sup>. Surveys began at 6:09 AM and concluded at 8:05 AM. Winds were light and variable from the north at approximately one to two mph. The cloud cover was partly cloudy to overcast. Air temperature at the beginning of the survey was 41° Fahrenheit.

The western portion of the Survey Area was surveyed on Tuesday, April 20<sup>th</sup>. Surveys began at 6:00 AM and concluded at 8:04 AM. Winds were a moderate breeze from the north at approximately seven to nine mph. The cloud cover was partly cloudy to overcast. Air temperature at the beginning of the survey was 53° Fahrenheit.

The southern portion of the Survey area was surveyed on Thursday, April 22<sup>nd</sup>. Surveys began at 5:58 AM and concluded at 7:59 AM. Winds were a moderate breeze from the north at approximately seven to nine miles per hour at the beginning of the survey, but increased to over 20 mph as the survey continued. The survey was continued despite the higher than optimal winds due to budgetary and time constraints with the helicopter. The cloud cover was clear. Air temperature at the beginning of the survey was 44° Fahrenheit.

#### 5.1.2 Survey #2

Survey #2 was conducted April 26-28, 2010. Two greater sage-grouse were observed (Figure 4).

The northern portion of the Survey Area was surveyed on Monday, April 26<sup>th</sup>. Surveys began at 5:55 AM and concluded at 7:35 AM. Winds were light to still at zero to two mph. The cloud cover was partly cloudy. Air temperature at the beginning of the survey was 46° Fahrenheit. No greater sage-grouse were observed in the northern portion of the Survey Area at this time.

Only one surveyor and the pilot were available for this survey. However, the northern portion of the Survey Area represents the least suitable greater sage-grouse habitat due to a lack of sagebrush cover and steep slopes formed by the Manastash Ridge. No known historical leks exist in this portion of the Survey Area. Additionally, Central Valley Helicopters pilots regularly participate in game surveys, including greater sage-grouse surveys, and were able to assist in the survey. The less than suitable habitat, absence of known historical leks, and the assistance of the Central Valley Helicopters pilot would negate the effects of only having one surveyor in the helicopter.

Upon completion of the standard survey area for the northern portion of the Survey Area, time still remained in the two hour survey window. At this time, the surveyor flew over a small patch of potential habitat on the eastern side of the Columbia River directly south of the Saddle Mountains. Upon further investigation from the air it was determined that this area did not support suitable greater sage-grouse habitat.

The western portion of the Survey Area was surveyed on Tuesday, April 27<sup>th</sup>. Surveys began at 5:57 AM and concluded at 7:53 AM. Winds were light to still at zero to two mph. The cloud cover was partly cloudy. Air temperature at the beginning of the survey was 48° Fahrenheit. No greater sage-grouse were observed in the western portion of the Survey Area at this time.

The southern portion of the Survey Area was surveyed on Wednesday, April 28<sup>th</sup>. Surveys began at 5:57 AM and concluded at 7:53 AM. Winds were light to still at zero to two mph. The cloud cover was clear. Air temperature at the beginning of the survey was 41° Fahrenheit. Two greater sage-grouse were observed in the YTC Training Area 10 approximately three miles northwest of the Coyote Spring known lek. The birds were flushed from mature sagebrush as the helicopter passed over. The sex of the birds could not be determined. The birds were not displaying when observed. Another unidentified bird was observed in the southeastern portion of the Survey Area south of the YTC Training Area 8. This bird flushed and definitive determination of species could not be made; however it is possible that this bird was a greater sage-grouse. We were unable to relocate the bird from the helicopter.

### 5.1.3 Survey #3

No greater sage-grouse individuals or leks were observed during Survey #3 (Figure 5).

The northern portion of the Survey Area was scheduled to be surveyed on Tuesday, May 11<sup>th</sup>, but was cancelled due to high wind conditions. The survey was not able to be made up due to the survey protocol stating that surveys must conclude by May 15<sup>th</sup> and other scheduling conflicts for Central Valley Helicopters. However, considering that the northern portion of the Survey Area represented the least suitable greater sage-grouse habitat due to a lack of sagebrush cover and steep slopes formed by Manastash Ridge, and the lack of any greater sage-grouse in the northern portion during the first two surveys, it is unlikely that greater sage-grouse inhabit the northern portion of the Survey Area.

The southern portion of the Survey Area was surveyed on Wednesday, May 12<sup>th</sup>. Surveys began at 5:05 AM and concluded at 7:20 AM. Winds were approximately four mph from the northwest. The cloud cover was clear. Air temperature at the beginning of the survey was 48° Fahrenheit.

The western portion of the Survey Area was surveyed on Thursday, May 13<sup>th</sup>. Surveys began at 5:20 AM and concluded at 7:30 AM. Winds were calm. The cloud cover was clear. Air temperature at the beginning of the survey was 47° Fahrenheit.

## 5.2 2011 Survey

### 5.2.1 Survey #1

Transects were flown over potential habitat at approximately one mile apart. Transects for Survey #2 and #3 were flown at closer increments after consultation with USFWS, WDFW, and YTC personnel (Figure 6).

No greater sage-grouse were observed in the Survey Area during Survey #1 (Figure 7).

The eastern portion of the Survey Area was surveyed on Tuesday, March 29<sup>th</sup>. Surveys began at 6:50 AM and concluded at 8:10 AM. Official sunrise on March 29<sup>th</sup> was 6:49 AM. Winds were light and variable from the northeast at approximately three to five mph. The cloud cover was overcast. Air temperature at the beginning of the survey was 48° Fahrenheit.

The southern portion of the Survey Area was surveyed on Wednesday, March 30<sup>th</sup>. Surveys began at 6:30 AM and concluded at 8:20 AM. Official sunrise on March 30<sup>th</sup> was 6:47 AM. Winds were light and variable from the west at approximately six mph. The cloud cover was mostly cloudy. Air temperature at the beginning of the survey was 46° Fahrenheit.

### 5.2.2 Survey #2

No greater sage-grouse individuals or leks were observed during Survey #2 (Figure 8).

Survey #2 began in the southern portion of the Survey Area to meet the training needs of the YTC. Training Areas 7, 8, 9, 10, 11, and privately held lands to the south of the YTC were surveyed on Tuesday April 12<sup>th</sup> beginning at 6:40 AM and ending at 8:00 AM. Official sunrise on April 12<sup>th</sup> was at 6:22 AM. Winds were calm at zero to one mph. Skies were clear with little to no cloud cover. Air temperature at the beginning of the survey was 37° Fahrenheit.

Surveys on the second morning took place on Wednesday April 13<sup>th</sup> from 0615 until 7:50 AM, and focused on creating more extensive survey coverage of the southern portion of the Survey Area. Official sunrise on April 13<sup>th</sup> was at 6:20 AM. Winds were calm at zero to one mph. The cloud cover was overcast. Air temperature at the beginning of the survey was 43° Fahrenheit.

Surveys on the third morning took place on Thursday April 14<sup>th</sup> from 6:10 AM until 8:10 AM, and focused on the eastern portion of the Survey Area near the Vantage Substation, Saddle Mountains, Midway Substation, and Training Areas 3, 4, 5, 6, and 7. Official sunrise on April 13<sup>th</sup> was at 6:18 AM. Winds were light and variable from the east at approximately five mph. The cloud cover was overcast. Air temperature at the beginning of the survey was 34° Fahrenheit.

#### 5.2.3 Survey #3

No greater sage-grouse individuals or leks were observed during Survey #3 (Figure 9).

Survey #3 began in the southern portion of the Survey Area to meet the training needs of the YTC. Training Areas 7, 8, 9, 10, 11, and privately held lands to the south of the YTC were surveyed on Wednesday April 27<sup>th</sup> beginning at 5:20 AM and ending at 7:20 AM. Official sunrise on April 27<sup>th</sup> was at 5:54 AM. Winds were from the northeast at approximately four mph. The cloud cover was overcast. Air temperature at the beginning of the survey was 39° Fahrenheit. Surveys on the second morning took place on Thursday April 28<sup>th</sup> from 5:20 AM until 7:20 AM, and focused on the eastern portion of the Survey Area near the Vantage Substation, Saddle Mountains, Midway Substation, and Training Areas 3, 4, 5, 6, and 7. Winds were from the northeast at approximately six mph. The cloud cover was partly cloudy to clear. Air temperature at the beginning of the survey was 34° Fahrenheit.

Surveys on the third morning took place on Friday April 29<sup>th</sup> from 5:20 AM until 7:20 AM, and focused on the private lands around Highway 24 in the southern portion of the Survey Area and the southeastern portion of the Survey Area. Winds were from the northeast at approximately five mph. Skies were clear with little to no cloud cover. Air temperature at the beginning of the survey was 41° Fahrenheit.

## 6.0 CONCLUSIONS

Based on the results of aerial lek surveys in 2010 and 2011, no previously unknown greater sage-grouse leks occur within three miles of any proposed route alternatives for the Vantage to Pomona Heights Project.

### 6.1 2010 Survey

Greater sage-grouse begin displaying on leks as soon as snow begins to melt and the lek is exposed. Winter 2009 – 2010 was a low snow year for the Yakima region, which would have made the leks available at an earlier date. Accordingly, lekking activities would have ended at an earlier data as well.

Only two greater sage-grouse were observed during the three aerial lek surveys. These two individuals were observed approximately three miles northwest of a known lek and were not attending a lek when observed. The birds were observed at approximately 7:00 AM. At this time of the morning, observations would be expected to occur at a lek site if the lek is still being attended. The observation far away from a known lek, the fact that the individuals were observed late in the protocol survey season, and the low snow year may indicate that birds in this population had concluded lekking activities and were moving to nesting habitat at the time of the aerial lek surveys.

## 6.2 2011 Survey

The three survey efforts in 2011 did not observe any greater sage-grouse individuals or leks, despite numerous survey flights during the optimal lekking period. Informal communication with YTC biologists revealed that they had counted a large number of grouse attending a known lek in between surveys #1 and #2. This confirms that grouse were lekking at the time of the aerial surveys, but no leks were identified in the Survey Area. This is concurrent with the results of the 2010 aerial lek surveys, which also did not identify any greater sage-grouse leks.

### YAKIMA TRAINING CENTER SAGE-GROUSE POPULATION MONITORING PROTOCOL

THIS PAGE INTENTIONALLY LEFT BLANK.

#### SAGE GROUSE POPULATION MONITORING PROTOCOL

#### **INTRODUCTION**

YTC's lek monitoring methods are comprised of two types: (1) Lek Surveys and (2) Lek Counts (WDFW 1995). Lek surveys identify active leks. Lek counts entail censuses of the number of male sage grouse observed on an active lek. Females and unknowns are also recorded during counts and surveys, but only males are used for population estimates; females are much less conspicuous and their attendance is less frequent, making their numbers highly variable in comparison to males. Lek surveys and counts are conducted during the months of February through May.

#### LEK SURVEYS

Lek surveys are a critical component of YTC's sage grouse monitoring program. Lek surveys must be designed to cover an entire area, as opposed to simply visiting known lek sites (Dobkin 1995). Adherence to this requirement reduces the possibility of overlooking active leks. If active leks go undetected, the ability to determine sage grouse population trends is compromised. The number of active leks, as well as the number of males attending leks, is an effective index to lekking species' population trends (Cannon and Knopf 1981). Lek surveys will accomplish two objectives: (1) locate active leks and (2) monitor numbers at leks to determine when to initiate lek counts.

#### **Ground (vehicle) Surveys**

Ground surveys will be designed to equalize effort expended at locating leks. The high cost of aerial surveys limits the number that YTC can afford. Therefore, aerial surveys function as a quick reconnaissance to aid vehicle surveys.

<u>Survey Technique:</u> YTC is divided into four areas for lek surveys (Fig 1). Routes will be established along existing roads within each area. An observer will drive a route and stop roughly every half-mile to search the surrounding area with binoculars while listening for displaying grouse. Speed of travel is not important since most observations must be made from outside of the vehicle. Searching is conducted using binoculars (power: 10X) and spotting scopes (power: 32X). It is important to be sure that no sage grouse are displaying ahead along the survey route. There should be a concerted effort to not disturb birds on a lek.

It is critical that all locations suitable for a lek be searched for sage grouse. Adherence to this requirement is the only means to assure that all areas have received equal effort. To assist in the detection of leks, maps will be created each year noting location of active and inactive leks and areas where sign has been observed.

<u>Lek Characteristics:</u> Sage grouse leks on YTC exist in a variety of vegetation cover types. The Lmumma lek is located on basaltic lithosols interspersed with dense crested wheatgrass and big sagebrush. In contrast, the Knuckles and Coffin Ranch leks are exclusively on basaltic lithosols with a cryptogamic crust and stiff sagebrush. Despite these differences, similarities exist among

YTC leks. Leks are ordinarily elevated above the surrounding landscape, which seems to provide grouse with a 360° view. Leks are usually adjacent to dense vegetation or a draw, providing rapid escape from predators (pers. obs.). Cadwell et al. (1997) reported the following physical characteristics for 16 YTC leks: vegetation communities were dominated by sage/wheatgrass; lek elevation was 578 - 904 m, with an average of 716 m; percentage of slope was 1.3 to 7.6%, with an average of 4.0%; and aspect was variable. Leks typically do not occur in low-lying areas or on crests of main ridges such as Yakima or Umtanum.

<u>Beginning of Survey Season:</u> Surveys will begin the first week of February to document initial lek attendance. It is essential that birds be detected as early in February as possible so military restrictions can be enacted to minimize disturbance. After initial attendance is documented, lek surveys will cease until the third week of February. From 1989 through 1997, sage grouse attendance was low the first two weeks of February at YTC. After the third week of February attendance began to increase. A minimum of one complete ground survey (by vehicle) of 30,000 acres of potential lek areas (stratified by vegetation and slope) on YTC will be completed between 15 February and 15 April of each year. Search areas will be selected and prioritized by the wildlife program manager.

The wildlife program manager will be notified in writing within one working day after grouse are initially detected displaying at a lek. Information included in this document will include the location of the lek and number of birds observed.

All areas targeted for coverage should be surveyed at least once before peak lek attendance. For the years 1989 through 1997, the dates of peak attendance ranged 7 March through 24 April. The goal is to identify all active leks before male lek attendance peaks. Thus, when the peak occurs, field efforts can concentrate on lek counts. This strategy will increase the maximum number of male sage grouse counted at leks.

<u>Survey frequency</u>: Each area will be surveyed a minimum of once during the season. Surveys will be conducted once per week until lek count frequency increases to two per week (*see below*) at which time lek surveys will be terminated. However, if significant amounts of area still need to be surveyed, then additional personnel will be used to finish surveys.

<u>Time of Surveys and Weather Conditions:</u> Surveys will be conducted as close to sunrise as possible (Jenni and Hartzler 1978). This period corresponds to a half-hour before sunrise to 1.5 hours after sunrise. Weather conditions must meet the following criteria: no precipitation; winds  $\leq 15$  mph; and visibility  $\geq 5$  miles.

#### **Aerial Surveys**

Aerial surveys from helicopter will be used to complement ground surveys. Areas identified as inaccessible during ground surveys will be high priority. Impassable roads, such as in the MPRC, or distant areas, such as training areas 1 and 2, limit ground access. Areas selected for aerial surveys will have suitable topographic and vegetation characteristics as described above. The wildlife program manager will be consulted to determine exact survey locations.

During March, one complete aerial survey (to cover a minimum of 50% of YTC) will be conducted where vehicle surveys can not be conducted. Also, surveys will possibly be conducted to follow up on ground observations of grouse. Aerial surveys will be conducted at a maximum of 40 feet above ground level and an approximate ground speed of 40 mph. The helicopter will be flown in a back and forth pattern with an average distance between flight lines of 1/8 mile. A minimum of four observers will be present in the helicopter; all must be capable of identifying sage grouse. Helicopter distance from leks will be sufficient to prevent disruption of sage grouse.

#### Time of Surveys and Weather Conditions

Surveys will be conducted as close to sunrise as possible (Jenni and Hartzler 1978). This period corresponds to a half-hour before sunrise to 1.5 hours after sunrise. Weather conditions must meet the following criteria: no precipitation; winds  $\leq 20$  mph; and visibility  $\geq 10$  miles.

#### LEK COUNTS

Lek counts involve the enumeration of sage grouse at active leks. When a lek is documented during a lek survey it is immediately included in the lek count rotation.

#### **Beginning of Season**

Jenni and Hartzler (1978) suggest conducting counts after the peak in copulatory activity. Generally male lek attendance peaks shortly after copulations peak and males continue to attend for several weeks after. Counts at leks will begin the first or second week of March. The observation of leks during lek surveys will be the most reliable method of determining when to begin counts.

#### **Frequency of Counts**

Lek counts will be conducted once per week until male grouse abundance increases above 10 at two major leks; afterwards two counts per week will be conducted. Counts will continue at two per week until male attendance drops below 10 males at two major leks. Counts will then be conducted once per week. This decrease in male attendance usually occurs by the last week in April. As the end of the season approaches, the rate at which attendance declines will vary between individual leks. Counts will cease at an individual lek when no birds are detected there. Counts will end for the season when no birds are detected at the last remaining active lek.

#### Lek Count Technique

Observation points (OPs) will be selected for all active leks each year. These OPs will maximize visibility of displaying grouse while minimizing disturbance. It is often necessary to use multiple OPs to observe all grouse on a lek. Observers will use as many OPs as necessary to assure that all grouse are visible at a lek. Binoculars (power: 10X) and scopes (power: 32X) will be used to see grouse.

#### **Time of Count and Weather Conditions**

Counts will be conducted as close to sunrise as possible (Jenni and Hartzler 1978). This period corresponds to a half-hour before sunrise to 1.5 hours after sunrise. Weather conditions must meet the following criteria: no precipitation; winds  $\leq 20$  mph; and visibility  $\geq 5$  miles.

#### Length of Counts

Counts will run for 10 minutes at each lek following the detection of birds. If no birds are present upon arrival, a five minute search period will ensue. If birds are detected within the five minute search period then the 10 minute count period begins. If no birds are detected within the first five minutes then the count ceases. This 10 minute count is a guideline to assure equal effort is expended at enumerating birds, and should be the minimum amount of time spent. Observers should use more time if necessary to obtain an accurate count.

#### **Logistics**

Because inter-lek movements by male sage grouse are possible, all leks will be counted on a single day when possible. This step will reduce double counts of males. To reduce timing bias, the order in which leks are visited will be rotated each subsequent survey. However, because time is extremely limited in the morning, only the end leks will be switched as opposed to those in the middle of a lek group. Also, to reduce observer bias, personnel will be rotated among lek groups each subsequent visit.

#### Data to be Collected

- date
   lek name
   arrival and departure time
   cloud cover (%)
   temperature (measured with thermometer in Fahrenheit)
   wind speed (mph measured with wind meter)
   wind direction (degrees measured with compass)
   snow pack on and around lek (%)
   precipitation (snow, rain)
   number of males, females, unknowns and total birds
- 11) comments-presence of predators, troops etc.

#### **APPENDIX A**

A Framework to Assist in Making Sensitive Species Habitat Assessments for BLM-Administered Public Lands in Idaho: Sage-Grouse (*Centrocercus urophasianus*)

# 1.0 INTRODUCTION

Habitat assessment was conducted on approximately 450 acres of accessible federal lands within the Study corridor for the proposed 230 kilovolt (kV) Vantage to Pomona Transmission Line (32.5 miles of Study corridor). This work was conducted to provide information about habitat suitability of the greater sage-grouse (sage-grouse; *Centrocercus urophasianus*) specific to this proposed project. In addition, habitat and plant community information was collected to support sage-grouse habitat documentation and for determining habitat suitability of special status plants (Appendix B-3 Special Status Plant Report).

# 2.0 METHODS

Qualified botanists and natural resource specialists documented habitats and plant communities observed, whether the observed plant community is considered a priority, sage-grouse habitat. Photographs, moisture/disturbance conditions, and incidental sage-grouse observations were made at <sup>1</sup>/<sub>4</sub>-mile intervals on accessible federal lands along the alternative route segments. Habitat observations were largely completed during May 16-25, 2011, but additional observations were made during the June 22-29, 2011 and August 8-10, 2011 surveys. Federal lands that were accessed included Bureau of Reclamation (Reclamation), Bureau of Land Management (BLM), Yakima Training Center (YTC), and U.S. Fish and Wildlife Service (USFWS). The assumed ROW width used for the habitat assessment was 160 feet.

#### Habitat and Plant Community Classification

Plant community is based on the standard of *Steppe Vegetation of Washington* (Daubenmire 1970), per BLM instructions for shrub steppe habitats. In some cases, the observed plant community did not match with this standard, so instead habitat was documented based on the most dominant tree, shrub, grass, and/or forb species (i.e., big sagebrush-cheatgrass). Plant communities were grouped into more generalized habitats (i.e., sagebrush/perennial grassland). Priority status of each plant community is based on a list of 2009 Washington Natural Heritage Program (WANHP) Priority Rare Plant Communities or Wetlands http://www1.dnr.wa.gov/nhp/refdesk/plan/CommunityList.pdf (WANHP 2009). Sources of information for identifying plant species included Vascular Plants of the Pacific Northwest: Vols. I-V (Hitchcock et al. 1969), Flora of the Pacific Northwest (Hitchcock and Cronquist 1973), Field Guide to the Rare Plants of Washington (Camp and Gamon 2011), species-specific literature, and botanists' personal knowledge of the species.

Habitat was estimated through aerial interpretation for federal lands that were not accessible during the surveys and non-federal lands that were not surveyed. Data sources for aerial interpretation included aerial imagery, 2001 YTC vegetation data (YTC 2002), GAP data, and fire history data. Of these, the 2001 YTC vegetation data is the most detailed and has the highest accuracy. The aerial imagery data usually was not sufficiently differentiated to allow for classification more detailed than shrubland; grassland; agriculture; developed, road, or firebreak; basal cliff; rock; irrigation canal; trees; water poplar; intermittent stream or dry gully; riparian; or water body. The 2001 YTC vegetation data and GAP data were also used for showing general habitat in the study corridor.

A list of all habitats and their definitions are provided below:

Agriculture—past or present cultivated land.

Annual grassland—dominated by non-native annual grasses and forbs.

Aspen—dominated by quaking aspen (Populus tremuloides).

Basalt cliff—basalt cliffs.

Bitterbrush—dominated by antelope bitterbrush (Purshia tridentata).

Developed, road, or firebreak—structures, roads, or firebreaks.

Forbs—dominated by forbs, generally buckwheats (Eriogonum spp.).

Grassland—not dominated by shrubs or trees.

Intermittent stream or dry gully—intermittent stream or dry gully.

Irrigation canal—irrigation canals.

Perennial grassland—dominated by native and/or non-native perennial grasses.

**Rabbitbrush/annual grassland**—dominated by rabbitbrush (*Chrysothamnus* spp.) and non-native annual grasses and forbs.

Riparian—dominated by vegetation associated with moving perennial water.

Rock—basalt scree.

**Sagebrush/annual grassland**—dominated by sagebrush (*Artemisia* spp.) and non-native annual grasses and forbs.

**Sagebrush/perennial grassland**—dominated by sagebrush native and/or non-native perennial grasses (although nearly always with native perennial grasses).

Shrubland—dominated by shrubs.

Tree—dominated by trees.

Water body—perennial water.

Watered poplar—dominated by poplars (Populus spp.) planted in an agricultural wind row.

#### Sage-Grouse Habitat Assessment

Sage-grouse habitat assessment was based on *A Framework to Assist in Making Sensitive Species Habitat Assessments for BLM-Administered Public Lands in Idaho: Sage-Grouse (Centrocercus urophasianus)* (BLM 2000; Appendix A of this report). This document is consistent with the *State of Washington Greater Sage-Grouse Recovery Plan* (Stinson et al. 2004). These methods include an ocular assessment of breeding (nesting and early brood-rearing) and winter habitat during the May survey and of late broodrearing habitat during the June and August surveys. Data sheets from BLM (2000, p. 26-31) were used for documenting breeding, late brood-rearing, and winter habitat.

The following data were included on the data sheets and were collected in May, unless otherwise indicated:

- sagebrush canopy cover
- sagebrush height class
- herbaceous perennial forb and grass height
- perennial grass canopy cover
- forb canopy cover
- sagebrush growth form

- forb richness
- sagebrush height and form observations
- proximity of sagebrush cover
- forb availability
- riparian and wet meadow plant community (if applicable, collected in June or August)
- riparian and wet meadow stability (if applicable, collected in June or August)

It was noted if any of the following conditions occur: livestock watering areas or designated livestock trailing stream crossings are within 0.25 mile, riparian areas/wet meadows are located in a deep canyon, and if the slope is >40 percent.

Based on these data, sage-grouse habitat was determined to be suitable, marginal, or unsuitable habitat for breeding, upland and/or riparian/wetland late brood-rearing, and winter habitat. Sagebrush canopy cover was the most heavily weighted factor in assessing breeding and winter sage-grouse habitat. If most of the factors used to assess breeding habitat leaned towards suitable habitat except that sagebrush canopy cover met the lower criteria for marginal habitat, then the overall breeding habitat was classified as marginal. If the same scenario occurred except that sagebrush canopy cover met the higher criteria for marginal habitat was classified as suitable. Using the same scenario again, if the sagebrush canopy cover met the criteria for unsuitable habitat, then the overall breeding habitat was classified as unsuitable. If most of the criteria were marginal or unsuitable and the sagebrush canopy cover was suitable, then the overall breeding habitat was classified as whichever selection had the most factors. This approach was similarly used for assessing the suitability of sage-grouse winter habitat.

## 3.0 RESULTS

Of the 674 acres of federal lands within the 160 foot wide right-of-way (ROW), 450 acres were accessible and surveyed. The remaining 224 acres of federal lands that were not surveyed were inaccessible due to restricted access on the YTC, access issues crossing private lands, dangerously steep terrain, and excessively long distances to hike from car to the ROW corridor. As described in Methods, habitat for inaccessible federal lands was estimated using aerial interpretation of available sources.

Federal lands within the route segment were dominated by sagebrush/perennial grasslands, perennial grasslands, and annual grasslands. Other common habitats included forbs (buckwheats), rabbitbrush/annual grasslands, and sagebrush/annual grasslands. Less common habitats included intermittent stream/dry gully, riparian, aspen, and bitterbrush.

Land area of each habitat along the ROW corridor is provided in Table 1. The overall vegetation of the Project area is shown on the Vegetation and Fire History Map in Appendix A and the more detailed habitat that was documented or estimated along the route segments. Table 2 and Figure 1 shows the suitability of sage-grouse breeding (Figure 2), late brood-rearing, and (Figure 3) winter habitat quality on surveyed federal lands along the ROW corridor centerline. A list of all plant communities observed on federal lands in the ROW corridor is provided in Table 3.

Detailed results on habitats, plant communities, and sagebrush habitat suitability are provided by route segment below.

#### Route 1a

#### Vegetation

Route 1a includes one 4.5 acre parcel of land that is managed by Reclamation and the remainder is nonfederal lands (39.4 acres). The Reclamation parcel was completely accessible for field surveys. Dominant habitats mapped within the Reclamation parcel include 3.7 acres of sagebrush/perennial grassland and 0.8 acres of developed, road, or firebreak (Table 1). There is no record of a fire on the Route 1a Reclamation lands. No riparian habitats were observed on the Reclamation parcel.

The entire list of plant communities that were documented on the Reclamation parcel are listed below. Dominant plant communities are indicated by an asterisk(\*). Priority of plant communities are indicated in parentheses, and are based on the WANHP 2011 Natural Heritage Plan.

#### Annual grasslands

Non-native annual grassland

#### Perennial grasslands

Bluebunch wheatgrass-Sandberg bluegrass, Lithosol (Priority 2) Needle and thread-Sandberg bluegrass (Priority 1) Basin wildrye-Saltgrass (Priority 1)

#### Sagebrush/perennial grass areas

Big sagebrush-Bluebunch wheatgrass (Priority 3)\*

Based on aerial imagery, non-federal lands are dominated by shrublands (16.0 acres); developed, road, or firebreak (12.0 acres); grasslands (5.8 acres); and smaller amounts of sagebrush/perennial grasslands, agriculture, trees, intermittent stream or dry gully, and irrigation canals (Table 1). GAP data indicates that the habitats of Route 1a are generally characterized as agriculture and annual grasslands.

#### **Sage-Grouse Habitat Assessment**

Field observations documented a recently dug east-west trench, its location along a busy road and near residences and a canal, and having an old garbage dump in the northern section. Despite these disturbances, there was high quality, intact big sagebrush (*Artemisia tridentata*) with native perennial bunchgrasses and diverse forb layer. The entire Reclamation parcel totaling 0.3 mile of centerline was classified as suitable breeding, upland late brood-rearing, and winter habitat for sage-grouse (Table 2).

A photograph of the dominant habitat in the Reclamation parcel is provided below.

Photograph 1 - Route 1a - Sagebrush/perennial grass area (Big sagebrush-Bluebunch wheatgrass)

#### Route 1b

#### Vegetation

Route 1b includes one 242.2 acre parcel of land that is managed by the YTC and the remainder is on non-federal lands (1.9 acres). Accessible YTC lands comprised 138.5 acres and the remaining 103.7 acres were closed to access.

Dominant habitats mapped within the surveyed portion of the YTC parcel include 46.0 acres of sagebrush/perennial grassland; 37.1 acres of perennial grassland; 24.7 acres of annual grassland, 18.3 acres of developed, road, or firebreak; 9.2 acres of rabbitbrush/annual grassland; 2.5 acres of intermittent stream or dry gully; and 0.7 acre of aspen (Table 1). Fire history records indicate there have been two fires on YTC land, including one small fire from the late 1990s and a larger fire that bisected the ROW corridor area in 2007. The aspen and intermittent stream or dry gully habitats represent the only riparian habitats observed on the YTC parcel.

The entire list of plant communities that were documented on the YTC parcel are listed below. Dominant plant communities are indicated by an asterisk(\*). Priority of plant communities are indicated in parentheses, and are based on the WANHP 2011 Natural Heritage Plan.

#### Annual grasslands

Non-native annual grassland\*

#### Aspen

Quaking aspen-Chokecherry (Priority)

#### Forb

Thyme buckwheat-Sandberg bluegrass (Priority 3)

#### Intermittent stream/Dry gully

Greasewood / Saltgrass (Priority 2)

#### Perennial grasslands

Crested wheatgrass\* Bluebunch wheatgrass-Sandberg bluegrass, Lithosol (Priority 2)\* Idaho fescue-Parsnipflower buckwheat Needle and thread-Sandberg bluegrass (Priority 1)

#### Rabbitbrush/annual grass areas

Rubber rabbitbrush-Cheatgrass\*

#### Sagebrush/annual grass areas

Big sagebrush-Cheatgrass

#### Sagebrush/perennial grass areas

Big sagebrush-Bluebunch wheatgrass (Priority 3)\* Big sagebrush-Idaho fescue (Priority 3) Big sagebrush-Sandberg bluegrass (Priority 3)\* Stiff sagebrush-Bluebunch wheatgrass\* Stiff sagebrush-Sandberg bluegrass (Priority 3)\*

Based on aerial imagery along the ROW corridor, federal lands that were inaccessible are dominated by shrublands (69.7 acres); grasslands (15.6 acres); developed, road, or firebreak (12.3 acres); and smaller amounts of sagebrush/perennial grasslands and intermittent stream or dry gully (Table 1). Based on aerial imagery along the ROW corridor, the small amount of non-federal lands are dominated by sagebrush/perennial grasslands; shrublands; intermittent stream or dry gully; and developed, road, or firebreak (Table 1).

The 2001, YTC vegetation map indicates that the habitats of the YTC portion of Route 1b study are generally characterized as sagebrush/perennial grasslands and perennial grasslands, with smaller amounts of forb, riparian, and disturbed. GAP data indicates that the habitats of the non-YTC portion of Route 1b are generally characterized as annual grassland and agriculture.

#### **Sage-Grouse Habitat Assessment**

Field observations documented two firebreaks within most of the ROW corridor. The older firebreak is adjacent to a YTC boundary fence line and is dominated by cheatgrass (*Bromus tectorum*) and Russian thistle (*Salsola kali*). The newer firebreak was recently cleared and is still bare ground. Despite these disturbances, the adjacent habitat was predominantly high quality big sagebrush and stiff sagebrush (*Artemisia rigida*) with abundant native perennial bunchgrasses, low non-native species cover, and a diverse and abundant native forb layer.

Of the 7.0 miles of centerline (ca 138.5 acres) that were surveyed, sage-grouse breeding habitat included 3.5 miles suitable, 0.3 mile marginal, and 3.3 miles unsuitable (Table 2). Upland late brood-rearing habitat included 4.5 miles suitable, 2.3 miles marginal, and 0.3 mile unsuitable habitat. There were 0.3 mile of marginal riparian late brood-rearing habitat in an intermittent stream, but it was in the same area as documented suitable upland late brood-rearing habitat. There was also another 0.3 mile of suitable riparian late brood-rearing habitat in aspen along an intermittent stream. Winter habitat included 3.2 miles suitable, 0.5 mile marginal, and 3.3 miles unsuitable habitat. A great-horned owl (*Bubo virginianus*) was observed nesting in the aspen on May 19, 2011, representing potential predator issues. On the same day, there was an incidental sage-grouse observation 1/8 mile north of the ROW corridor, just 0.5 mile west of the aspen stand.

Photographs of most dominant habitats in the YTC parcel are provided below.

Photograph 2 - Route 1b - Annual grasslands (Non-native annual grassland)

Photograph 5 - Route 1b - Rabbitbrush/annual grass areas (Rubber rabbitbrush-Cheatgrass)

Photograph 6 -Route 1b - Sagebrush/perennial grass area (Big sagebrush-Bluebunch wheatgrass)

Photograph 7 - Route 1b - Sagebrush/perennial grass area (Big sagebrush-Sandberg bluegrass)

Photograph 8 - Route 1b - Sagebrush/perennial grass area (Stiff sagebrush-Sandberg bluegrass)

#### Route 1c

#### Vegetation

Route 1c includes several small YTC parcels that comprise 1.7 acres, nearly all which were accessible and surveyed (except for 0.02 acre that was in a restricted area). The remainder is non-federal lands (249.6 acres).

Dominant habitats mapped within the surveyed portion of the YTC parcels include 1.2 acres of developed, road, or firebreak; and 0.5 acre of annual grassland (Table 1). Fire history records indicate there have been no fires on YTC land or the remainder of this route segment.

The entire list of plant communities that were documented on the YTC parcels are listed below. Dominant plant communities are indicated by an asterisk(\*). None were priorities based on the WANHP 2011 Natural Heritage Plan.

#### Annual grasslands

Non-native annual grassland\*

#### Perennial grasslands

#### Crested wheatgrass\*

Based on aerial imagery along the ROW corridor, the small amount of federal lands that were inaccessible are dominated by shrublands (0.02 acre) (Table 1). Based on aerial imagery along the ROW corridor, the non-federal lands are dominated by shrubland; sagebrush/perennial grassland; annual grassland; grassland; perennial grassland; developed, road, or firebreak; and smaller amounts of agriculture; intermittent stream or dry gully; and rabbitbrush/annual grassland (Table 1).

The 2001, YTC vegetation map indicates that the habitats of the YTC portion of the Route 1c segment are generally characterized as sagebrush/perennial grasslands and perennial grasslands, with smaller amounts of forb, riparian, and disturbed. GAP data indicates that the habitats of the non-YTC portion of the Link 1C study corridor are generally characterized as annual grassland and agriculture.

#### **Sage-Grouse Habitat Assessment**

Field observations documented that the habitat was highly disturbed and poor quality, and adjacent to agricultural land, roads and residences. The YTC parcels totaling 0.6 mile of the route centerline was classified as unsuitable for breeding, riparian late brood-rearing, and winter habitat for sage-grouse. Due to the presence of forbs and proximity to agricultural lands, nearly all of the route centerline was classified as marginal upland late brood-rearing habitat for sage-grouse.

Photographs of the dominant habitat along Route 1c are provided below.

Photograph 9 - Route 1c - Perennial grasslands (Crested wheatgrass)

Photograph 10 - Route 1c - Annual grassland (Non-native annual grassland)

#### Route 2a

#### Vegetation

Route 2a has no federal lands and the non-federal lands comprised 19.3 acres. Fire history records indicate there have been no fires along Route 2a.

Based on aerial imagery, the non-federal lands are dominated by shrubland and grassland, with smaller amounts of sagebrush/perennial grassland (Table 1).

The 2001 YTC vegetation map indicates that the habitats of Route 2a are generally characterized as sagebrush/perennial grasslands and perennial grasslands, with smaller amounts of riparian habitat. GAP data indicates that the habitats of Route 2a are generally characterized as annual grassland and agriculture.

#### Sage-Grouse Habitat Assessment

Sage-grouse habitat assessment was non-applicable for Route 2a.

#### Route 2b

#### Vegetation

Route 2b includes one 44.6 acre parcel of land that is managed by the BLM that was accessible. There was an additional 7.6 acres of BLM land that was not accessible, due to issues with private lands and distance from roads. Most of Route 2b is on non-federal lands (266.9 acres).

Dominant habitats mapped within the surveyed portion of the accessible BLM land include 25.4 acres of sagebrush/perennial grassland; 13.0 acres of developed, road, or firebreak; and smaller amounts of annual grassland, agriculture, and intermittent stream or dry gully (Table 1). Fire history records indicate there have been two large fires on BLM land, including one from the late 1980s and a larger fire in 2009. There were no riparian habitats observed on the BLM land.

The entire list of plant communities that were documented on the BLM parcel are listed below. Dominant plant communities are indicated by an asterisk (\*). Priority of plant communities are indicated in parentheses, and are based on the WANHP 2011 Natural Heritage Plan.

#### Annual grasslands

Non-native annual grassland\*

#### Forb

Arrowleaf buckwheat-Sandberg bluegrass (Priority 3) Rock buckwheat-Sandberg bluegrass (Priority 3) Strict buckwheat-Sandberg bluegrass

#### Perennial grasslands

Crested wheatgrass Bluebunch wheatgrass-Sandberg bluegrass, Lithosol (Priority 2)\*

#### Sagebrush/perennial grass areas

Big sagebrush-Bluebunch wheatgrass (Priority 3)\* Big sagebrush-Sandberg bluegrass (Priority 3)\* Stiff sagebrush-Sandberg bluegrass (Priority 3)\*

Based on aerial imagery, federal lands (BLM) that were inaccessible are dominated by shrublands (4.9 acres); grasslands (2.6 acres); and intermittent stream or dry gully (0.1 acre) (Table 1). Based on aerial imagery, the non-federal lands are dominated by sagebrush/perennial grasslands; shrublands; grasslands; agriculture; developed, road, or firebreak; perennial grassland; and with smaller amounts of annual grassland; intermittent stream or dry gully; and rock (Table 1).

The 2001 YTC vegetation map indicates that the habitats along Route 2b are generally characterized as sagebrush/perennial grassland and perennial grassland. GAP data indicates that the habitats of Route 2b are generally characterized as sagebrush/perennial grassland, agriculture, and annual grassland.

#### Sage-Grouse Habitat Assessment

Field observations documented a firebreak within federal lands and habitat adjacent to agriculture. The adjacent habitat is predominantly high quality big sagebrush and stiff sagebrush with abundant native perennial bunchgrasses, low non-native species cover, and a diverse and abundant native forb layer. Some places had lower habitat quality and were dominated by cheatgrass and/or crested wheatgrass (*Agropyron cristatum*).

Of the 7.9 miles of the route centerline (ca 44.6 acres) that were surveyed, sage-grouse breeding habitat included 5.5 miles suitable, 0.5 mile marginal, and 1.9 miles unsuitable (Table 2). Upland late brood-rearing habitat included 6.8 miles suitable, 1.2 miles marginal, and 0.0 miles unsuitable habitat. There was no riparian late brood-rearing habitat. Winter habitat included 6.0 miles suitable, 0.5 mile marginal, and 1.4 miles unsuitable habitat.

Photographs of most dominant habitats on the BLM and YTC lands are provided below.

Photograph 11 - Route 2b - Perennial grassland (Crested wheatgrass)

Photograph 12 - Route 2b - Sagebrush/perennial grass areas (Stiff sagebrush-Sandberg bluegrass)

Photograph 13- Route 2b - Sagebrush/perennial grass areas (Big sagebrush-Bluebunch wheatgrass)

Photograph 14 - Route 2b - Annual grassland (Non-native annual grassland)

#### Route 2c

#### Vegetation

Route 2c includes one small BLM parcel that comprises 0.2 acre, which was inaccessible due to issues with private lands and distance from roads. The remainder is on non-federal lands (351.5 acres).

Fire history records indicate there have been no fires on BLM land or the Route 2c.

Based on aerial imagery, the small amount of federal lands that were inaccessible are dominated by annual grasslands (0.1 acre) and grasslands (0.1 acre) (Table 1). Based on aerial imagery, the non-federal lands are dominated by grassland (152.9 acres); shrubland (95.2 acres); agriculture (66.4 acres); developed, road, or firebreak (17.2 acres); annual grassland (10.5 acres); and smaller amounts of intermittent stream or dry gully, sagebrush/annual grassland, rock, and irrigation canal (Table 1).

GAP data indicates that the habitats of Route 2c are generally characterized as agriculture, sagebrush/perennial grassland, and annual grassland.

#### **Sage-Grouse Habitat Assessment**

Sage-grouse habitat assessment was non-applicable for Route 2c.

#### Route 2d

#### Vegetation

Route 2d includes 19.7 acres that is managed by the BLM that was accessible. There were no other federal lands that were inaccessible. Most of Route 2d was on non-federal lands (117.3 acres).

Dominant habitats mapped within BLM lands include annual grassland (8.2 acres), perennial grassland (6.0 acres), sagebrush/perennial grassland (5.1 acres); and intermittent stream or dry gully (0.4 acre) (Table 1). Fire history records indicate the entire Route 2d area was burned in the 2009 Dry Creek Complex Fire. There were no riparian habitats.

The entire list of plant communities that were documented on the BLM lands are listed below. Dominant plant communities are indicated by an asterisk(\*). Priority of plant communities are indicated in parentheses, and are based on the WANHP 2011 Natural Heritage Plan.

#### Annual grasslands

Non-native annual grassland\*

#### Perennial grasslands

Bluebunch wheatgrass-Sandberg bluegrass, Lithosol (Priority 2)\* Needle and thread-Sandberg bluegrass (Priority 1)

#### Sagebrush/perennial grass areas

Big sagebrush-Sandberg bluegrass (Priority 3) Stiff sagebrush-Sandberg bluegrass (Priority 3)\*
Based on aerial imagery, the non-federal lands are dominated by grasslands, but there are also smaller amounts of annual grassland; intermittent dry stream or gully; shrubland; perennial grassland; sagebrush/perennial grassland; developed, road, or fire break; basalt cliff; and rock (Table 1).

The 2001, YTC vegetation map indicates that the habitats of Route 2d are generally characterized as sagebrush/perennial grassland and perennial grassland. GAP data indicates that the habitats of Route 2d are generally characterized as sagebrush/perennial grassland with a small amount of annual grassland, although this would have likely substantially changed since the 2009 fire.

#### Sage-Grouse Habitat Assessment

Field observations documented that most of the BLM land had burned recently. Most habitat has been converted to non-native annual grassland habitat, although there were some areas with patches of sagebrush and diverse forbs.

Of the 1.0 mile of centerline (ca 19.7 acres) that were surveyed, sage-grouse breeding habitat included 0.3 mile suitable, 0.0 miles marginal, and 0.8 mile unsuitable (Table 2). Upland late brood-rearing habitat included 0.5 mile suitable, 0.5 mile marginal, and 0.0 miles unsuitable habitat. There was no riparian late brood-rearing habitat. Winter habitat included 0.3 mile suitable, 0.0 miles marginal, and 0.8 mile unsuitable habitat. There was no riparian late brood-rearing habitat. There was one incidental observation of a pair of sage-grouse that flushed from a small patch of big sagebrush in an area that had high forb diversity native bunchgrass cover.

Photographs of most dominant habitats in the BLM parcel are provided below.

Photograph 15 - Route 2d - Perennial grassland (Bluebunch wheatgrass-Sandberg bluegrass)

Photograph 16 - Route 2d - Annual grassland (Non-native annual grassland)

Photograph 17- Route 2d - Sagebrush/perennial grass areas (Stiff sagebrush-Sandberg bluegrass)

#### Route 3a

#### Vegetation

Route 3a had no federal lands and the non-federal lands comprised 3.2 acres. Fire history records indicate there have been no fires along Route 3a.

Based on aerial imagery, the non-federal lands are sagebrush/perennial grassland; and developed, road, or firebreak (Table 1).

GAP data indicates that the Route 3a is generally characterized as sagebrush/perennial grassland.

#### **Sage-Grouse Habitat Assessment**

Sage-grouse habitat assessment was non-applicable for Route 3a.

#### Route 3b

#### Vegetation

Route 3b includes 61.1 acres of federal lands that were accessible and 110.4 acres that were inaccessible. The federal lands are managed by the BLM, Reclamation, and YTC. All of the Reclamation lands were accessible and all of the BLM lands were accessible, except for parts that were in water or on cliffs. Most of the YTC lands were inaccessible because of access issues across private lands, except for some parts that were accessible from the road. Most of Route 3b is on non-federal lands (250.6 acres).

Dominant habitats mapped within federal lands were predominantly sagebrush/perennial grassland (35.9 acres), with smaller amounts of annual grassland; sagebrush/annual grassland; watered poplar; rabbitbrush/annual grassland; developed, road, or firebreak; perennial grassland; water body; basalt cliff; and riparian (Table 1). Fire history records indicate a large portion of Route 3b was burned in the late-1990s, 2004, and is the 2009 Dry Creek Complex Fire. There were no riparian habitats observed on the accessible federal lands.

The entire list of plant communities that were documented on the federal lands are listed below. Dominant plant communities are indicated by an asterisk(\*). Priority of plant communities are indicated in parentheses, and are based on the WANHP 2011 Natural Heritage Plan.

#### Forb

Shrubby buckwheat

#### Perennial grasslands

Basin Wildrye-Saltgrass (Priority 1)\* Needle and thread-Sandberg bluegrass (Priority 1)

#### Rabbitbrush/annual grass areas

Rubber rabbitbrush-Cheatgrass\*

Sagebrush/annual grass areas

Big sagebrush-Cheatgrass

#### Sagebrush/perennial grass areas

Big sagebrush-Bluebunch wheatgrass (Priority 3)\* Big sagebrush-Needle and thread (Priority 1) Big sagebrush-Sandberg bluegrass (Priority 3)\* Big sagebrush-Western wheatgrass Stiff sagebrush-Sandberg bluegrass (Priority 3)\*

Based on aerial imagery, the federal lands that were inaccessible are dominated by grasslands (60.4 acres); developed, road, or firebreak (24.6 acres); basalt cliff (12.6 acres); and riparian habitat (9.8 acres); with smaller amounts of intermittent stream or dry gully, rock, watered poplar, and water body (Table 1). Based on aerial imagery, the non-federal lands are dominated by grasslands; developed, road, or firebreak; sagebrush/perennial grassland; water body; watered poplar; riparian; and smaller amounts of rabbitbrush/annual grassland, annual grassland, basalt cliff, agriculture, shrubland, sagebrush/annual grassland, intermittent stream or dry gully, and trees (Table 1).

The 2001, YTC vegetation map indicates that the habitats of the YTC portion of the Route 3b are generally characterized as sagebrush/perennial grassland and perennial grassland, along with smaller amounts of riparian, forb, and disturbed habitats. GAP data of Route 3b are generally characterized as sagebrush/perennial grassland, water, annual grassland, agriculture, and disturbed.

#### **Sage-Grouse Habitat Assessment**

Field observations documented that the federal lands were characterized as a mixture of high quality sagebrush with a diverse forb layer, sagebrush adjacent to agriculture and the watered poplar wind row, basalt cliffs, and seasonally moist alkaline swale habitat resulting from basalt cliff runoff.

Of the 4.1 miles of the route centerline (ca 61.1 acres) that were surveyed, sage-grouse breeding habitat included 1.5 miles suitable, 2.4 miles marginal, and 0.2 mile unsuitable (Table 2). Upland late brood-rearing habitat included 1.7 miles suitable, 1.3 miles marginal, and 1.2 miles unsuitable habitat. There were 0.3 mile of unsuitable riparian late brood-rearing habitat on Reclamation lands. Winter habitat included 2.8 miles suitable, 1.4 miles marginal, and 0.0 miles unsuitable habitat. There were two incidental observations of sage-grouse on YTC lands on May 25, 2011. One observation was of a female sage-grouse in big sagebrush habitat between Huntzinger Road and the watered poplar wind row. The other observation was auditory and also on Reclamation lands, when they were heard near the base of the basalt cliffs. The poplar wind row could also provide raptor perch sites and is adjacent to agricultural fields.

Photographs of most dominant habitats are provided below.

Photograph 18 - Route 3b - Sagebrush/perennial grass areas (Stiff sagebrush-Sandberg bluegrass)

Photograph 22 - Route 3b - Rabbitbrush/annual grass areas (Rubber rabbitbrush-Cheatgrass)

Photograph 23 - Route 3b - Perennial grasslands (Basin wildrye-Saltgrass)

#### Route 3c

#### Vegetation

Route 3c includes 179.8 acres of federal lands that were accessible and 1.2 acres that were inaccessible. The federal lands are managed by the Reclamation, BLM, and USFWS. All of the BLM lands were accessible. Nearly all of the Reclamation lands were accessible, except for one small parcel blocked by a locked gate and private property signs. There were two USFWS parcels, one which was accessible and the other which was only accessed during August surveys for Ute ladies'-tresses (*Spiranthes diluvialis*), due to the large hiking distance required for access. Most of the ROW corridor in Link 3C was on non-federal lands (308.7 acres).

Dominant habitats mapped within federal lands were predominantly sagebrush/perennial grassland (101.9 acres), rabbitbrush/annual grassland (32.4 acres), annual grassland (20.7 acres), and developed, road, or firebreak (10.2 acres), with smaller amounts of agriculture, irrigation canal, riparian, sagebrush/annual grassland, perennial grassland, water, and intermittent stream or dry gully (Table 1). Fire history records indicate a small portion of Route 3c may have been burned in the 2009 Dry Creek Complex Fire. Route 3c has more riparian habitats than any other route, although there were still very few riparian habitats. These riparian habitats were typically dominated by non-native species, included noxious weeds.

The entire list of plant communities that were documented on the federal lands are listed below. Dominant plant communities are indicated by an asterisk(\*). Priority of plant communities are indicated in parentheses, and are based on the WANHP 2011 Natural Heritage Plan.

#### Annual grasslands

Non-native annual grassland\*

#### Bitterbrush

#### Sagebrush/perennial grass areas

Big sagebrush-Bluebunch wheatgrass (Priority 3)\* Big sagebrush-Needle and thread (Priority 1)\* Big sagebrush-Sandberg bluegrass (Priority 3)\* Stiff sagebrush (Priority) Stiff sagebrush-Sandberg bluegrass (Priority 3)\*

Based on aerial imagery, the federal lands that were inaccessible are dominated by shrub lands (1.2 acres) (Table 1). Based on aerial imagery, non-federal lands are dominated by agriculture; developed, road, or firebreak; grassland; shrubland; sagebrush/perennial grassland; sagebrush/annual grassland; and annual grassland; with smaller amounts of water body, rabbitbrush/annual grassland, irrigation canal, riparian habitat, rock, basalt cliff, intermittent stream or dry gully, and perennial grassland (Table 1).

GAP data indicates that the habitats Route 3c are generally characterized as agriculture, sagebrush/perennial grassland, annual grassland, sagebrush/annual grassland, riparian, and water.

#### **Sage-Grouse Habitat Assessment**

Field observations documented that the federal lands were characterized as a mixture of high quality sagebrush, agriculture including vineyards and orchards, weedy and disturbed habitats, cattle feedlots, garbage dumps, irrigation canals and highways, steep rocky slopes, and a few riparian habitats.

Of the 11.6 miles of the route centerline (ca 179.8 acres) that were surveyed, sage-grouse breeding habitat included 4.5 miles suitable, 2.3 miles marginal, and 4.8 miles unsuitable (Table 2). Upland late brood-rearing habitat included 5.0 miles suitable, 3.1 miles marginal, and 3.5 miles unsuitable habitat. There were 0.3 mile of marginal and 0.3 mile of unsuitable riparian late brood-rearing habitat on Reclamation lands. Winter habitat included 4.2 miles suitable, 2.1 miles marginal, and 5.3 miles unsuitable habitat.

There were four incidental observations of sage-grouse on or near Route 3c. One observation was on May 16, 2011 and of two female sage-grouse crossing O Road (south and west of Road 29 SW) into an alfalfa field one mile west of a Reclamation parcel that was surveyed. One observation was on May 17, 2011 and of two sage-grouse <1/8 mile west of BLM lands. One observation was of a sage-grouse on the edge of an agricultural field adjacent to Reclamation lands on June 22, 2011. One observation was of two female sage-grouse along a agricultural canal on August 10, 2011. A red-tail hawk (*Buteo jamaicensis*) nest was also observed on a transmission line tower on BLM lands.

Photographs of most dominant habitats on the federal lands surveyed are provided below.

## 4.0 SUMMARY

Route 2b, 3c, and 1b (in order) had the highest amount of suitable sage-grouse habitat on federal lands that were surveyed. However, Route 1b and 3b had a substantial amount of federal lands that were not surveyed because they were inaccessible. Route 1b appears to have additional suitable sage-grouse habitat on federal lands, based on the amount of shrublands estimated using aerial interpretation. Route 3b likely did not have a substantial amount of suitable sage-grouse habitat because it was predominantly grassland habitat, due to large fires in 2004 and the late-1990s.

This information should be used to compare the potential effects of the proposed project to sage-grouse and other special status species habitat on federal lands. This data can also be used to inform seasonal restrictions and other mitigation measures for minimizing potential effects to sage-grouse and its habitat.

The following summarizes sage-grouse habitat suitability on federal lands by route segment:

**Route 1a**—Suitable breeding, late brood-rearing, and winter sage-grouse habitat for 0.3 mile of 0.3 mile of centerline of federal lands surveyed. There were no federal lands that were not surveyed.

**Route 1b**—Suitable breeding, late brood-rearing, and winter sage-grouse habitat for 3.2 to 4.5 miles of 7.0 miles of centerline of federal lands surveyed. Marginal sage-grouse habitat occurred for 0.3 to 2.3 miles of centerline of federal lands surveyed. There were 5.5 miles of centerline of federal lands that were not surveyed that are predominantly classified as shrublands and potentially represent additional suitable sage-grouse habitat. There was one incidental sage-grouse observation.

**Route 1c**—Suitable breeding, late brood-rearing, and winter sage-grouse habitat for 0.0 miles of 0.6 mile of centerline of federal lands surveyed. Marginal sage-grouse habitat occurred for 0.0 to 0.5 miles of centerline of federal lands surveyed. There were no federal lands that were not surveyed.

**Route 2a**—Suitable and marginal breeding, late brood-rearing, and winter sage-grouse habitat for 0.0 miles of 0.0 miles of centerline of federal lands surveyed. There were no federal lands that were not surveyed.

**Route 2b**—Suitable breeding, late brood-rearing, and winter sage-grouse habitat for 5.5 to 6.8 miles of 7.9 miles of centerline of federal lands surveyed. Marginal sage-grouse habitat occurred for 0.5 to 1.2 miles of centerline of federal lands surveyed. There were 1.3 miles of centerline of federal lands that were not surveyed that are predominantly classified as shrublands and potentially represent additional suitable sage-grouse habitat.

**Route 2c**—Suitable and marginal breeding, late brood-rearing, and winter sage-grouse habitat for 0.0 miles of 0.0 miles of centerline of federal lands surveyed. There were no federal lands that were not surveyed.

**Route 2d**—Suitable breeding, late brood-rearing, and winter sage-grouse habitat for 0.3 to 0.5 miles of 1.0 miles of centerline of federal lands surveyed. Marginal sage-grouse habitat occurred for 0.0 to 0.5 miles of centerline of federal lands surveyed. There were no federal lands that were not surveyed. There was one incidental sage-grouse observation.

**Route 3a**—Suitable and marginal breeding, late brood-rearing, and winter sage-grouse habitat for 0.0 miles of 0.0 miles of centerline of federal lands surveyed. There were no federal lands that were not surveyed.

**Route 3b**—Suitable breeding, late brood-rearing, and winter sage-grouse habitat for 1.5 to 2.8 miles of 4.1 miles of centerline of federal lands surveyed. Marginal sage-grouse habitat occurred for 1.3 to 2.4 miles of centerline of federal lands surveyed. There were 9.6 miles of centerline of federal lands that were not surveyed that are predominantly classified as grasslands and potentially represent less suitable sage-grouse habitat, although there was also the highest amount of riparian habitat across all the routes; as well as basalt cliff habitat, which is important for other special status species. There were two incidental sage-grouse observations.

**Route 3c**—Suitable breeding, late brood-rearing, and winter sage-grouse habitat for 4.2 to 5.0 miles of 11.6 miles of centerline of federal lands surveyed. Marginal sage-grouse habitat occurred for 2.1 to 3.1 miles of centerline of federal lands surveyed. There were 0.1 miles of centerline of federal lands that were not surveyed that are predominantly classified as shrublands and potentially represent additional suitable sage-grouse habitat. There were four incidental sage-grouse observations.

### I. Introduction

### A. Purpose and Need

Sage grouse (*Centrocercus urophasianus*) are North America's largest grouse and found only in habitats dominated by sagebrush (*Artemisia* spp.), particularly big sagebrush (*Artemisia tridentata spp.*). Historical habitat losses and alterations have significantly reduced the range of this species and populations have declined in remaining habitats (Braun 1998, Schroeder et al. 1999). Habitat losses in Idaho have been so severe in recent years as a result of wildfires and subsequent annual grass invasions that conservation efforts are underway to: (1) protect, maintain and enhance existing suitable habitat, (2) improve degraded habitats and (3) restore habitats, where most feasible. They are an Idaho Bureau of Land Management (BLM) sensitive species.

The rate of sagebrush habitat loss has been so great that if conservation measures are not implemented immediately there is a high likelihood that sage grouse and other sagebrush obligate species will warrant listing under the Endangered Species Act within the next 10 years. Recovery or maintenance of sage grouse habitats and populations will be contingent on implementation of land management practices that contribute to, rather than detract from, sage grouse habitat quality and quantity. To complement these efforts we need to have an objective, scientifically-based sage grouse habitat assessment process that can be used for a variety of purposes.

Much of the remaining and restorable sage grouse habitats in Idaho are located on public lands administered by the BLM. This framework is designed to facilitate and standardize sage grouse habitat assessments for BLM lands in a manner that complements management direction in the Interior Columbia Basin Ecosystem Management Project (ICBEMP), fire management planning, sagebrush steppe restoration planning and field evaluations for attainment of land use plan objectives and Idaho Standards for Rangeland Health (USDI 1997) assessments. This framework describes the habitat assessment process Idaho BLM will use to:

- 5. Identify remaining sage grouse habitat areas and priority habitat restoration areas.
- 2. Evaluate and document existing sage grouse habitat suitability and habitat restoration needs.
- 3. Assist in evaluating land uses on public lands that may affect sage grouse habitat conditions or habitat restoration efforts.
- 4. Assist in evaluating attainment of pertinent land use plan objectives and Standard 8 of Idaho 's Standards for Rangeland Health for sage grouse.

This framework is designed acknowledging the immediacy of needed actions. Some of what is outlined in this framework is incomplete and as such it must be considered a dynamic document that will change as we acquire new information. It will remain a draft document through the FY 2000 field season to allow for field testing and review. It is designed to accommodate the realities of current Idaho BLM workforce and budgetary constraints. It is more qualitative than quantitative, although the ability to be more quantitative is provided. It is designed to be applied to a wide range of environmental conditions. This means it must be flexible and can be modified or refined for local conditions; a certain degree of professional judgement will be required in its application.

This habitat assessment framework does not address potential land uses that may directly affect the birds or their behavior and use of areas (e.g., transmission line mortalities, structures near leks or wintering areas that may provide perch sites for raptors). Additional instructions will be developed and provided to the Field Offices at a later date for these types of land uses and related potential effects.

#### B. Applicability of the Framework for Other Sagebrush Obligates

There are several other animal species that are dependent on the presence of sagebrush for survival. Our information concerning these other species and their habitat needs is generally poor, except for a few exceptions. We do know that populations of many sagebrush obligates are declining Paige and Ritter 1999, Wisdom et al. 1999) and several have been identified as BLM sensitive species.

Sage grouse require large areas of sagebrush to survive and we have considerable knowledge of their habitat requirements in comparison with other sagebrush obligates. *As such, we will use this species as an umbrella species (Noss 1990) and assume that habitat needs for other sagebrush obligate species are also being benefitted as a result of protection, improvement and restoration of sage grouse habitat.* In some cases other sagebrush obligates will have habitat needs in addition to what is outlined in this framework for sage grouse. Biologists with the U.S. Geological Survey and Partners in Flight will be assisting us in evaluating the applicability of this framework and the sage grouse habitat indicators to other sagebrush obligate bird species. Where needed, biologists are encouraged to address the unique, additional habitat needs of other sagebrush obligates on a case-by-case basis.

#### C. Guidelines for Management of Sage Grouse Populations and Habitats

In 1977 guidelines for sage grouse habitat management were published (Braun et al. 1977). Since then considerably more information has accrued concerning sage grouse population status and habitat needs, and concern has grown over population trends and future of the species (Braun 1998). As a result, new guidelines are being published (Connelly et al. *in press*) in cooperation with the Western Association of Fish and Wildlife Agencies. *Habitat definitions and quality criteria used for this framework document are primarily derived from these guidelines and the reader is encouraged to read them to better understand the rationale for certain habitat indicators. We provide a brief review of those portions of the guidelines pertinent to this assessment framework.* 

#### 1. Breeding Habitat

Breeding habitat includes leks, nesting and early brood-rearing areas. Suitable nesting and early broodrearing habitats are dominated by sagebrush with a healthy herbaceous understory. Connelly et al. (*in press*) recommend that breeding habitats (exclusive of leks) are managed to support 15-25% canopy cover of sagebrush, perennial herbaceous cover averaging at least 18 cm (7 inches) in height with at least 15% grass canopy cover, 10% forb canopy cover and a diversity of forbs.

#### 2. Late Brood-rearing Habitat

From late June to early November sage grouse will use a variety of moist and mesic habitats where succulent forbs are found. These habitats include riparian areas, wet meadows, lakebeds, farmlands, uplands including sagebrush and recently burned areas. Avoiding land uses that reduce soil moisture, increase erosion, cause invasion of exotic plants, and reduce abundance and diversity of forbs is recommended.

#### 3. Winter Habitat

During the winter months sage grouse feed almost exclusively on sagebrush. Sagebrush stands with canopy covers of 10-30% (inclusive of big and low species of sagebrush) and winter cover heights of at least 25 cm (10 inches) above the snow is needed. Topographic relief and a diversity of sagebrush heights in an area are important.

# II. Regulatory Mechanisms and Management Direction - BLM Land Use Plans, Regulations, Policies and MOU's

The adequacy of existing regulatory mechanisms is one of the five factors that the Fish and Wildlife Service reviews during a species status review for possible listing as threatened or endangered. For BLM-administered public lands federal laws and associated regulations and policies define these regulatory mechanisms. The Federal Land Policy and Management Act (FLPMA) of 1976 is the primary federal law that governs most land uses on BLM-administered lands although other federal laws also provide management direction. Memorandums of Understanding (MOU 's) are not binding, decisionmaking documents but do provide general management direction and emphasis.

It is very important that BLM s existing regulatory mechanisms sufficiently address the habitat needs of sensitive species like sage grouse in decision-making processes to ensure that BLM management is not contributing to the need to list the species. This framework establishes a habitat assessment process to help accomplish this for sage grouse.

Idaho BLM habitat goals for sage grouse, consistent with LUPs and BLM policies and regulations, will be to: (1) protect, maintain and enhance existing suitable habitats, (2) improve degraded sagebrush habitats to suitable conditions, where feasible, and (3) restore habitats to suitable conditions, where most feasible and important for long-term recovery.

#### A. Existing Land Use Plans

Land use plans (LUP 's) in Idaho can be either Resource Management Plans or Management Framework Plans depending on the Resource Area. These plans were developed with public participation and meet the requirements of the FLPMA. These plans establish the management direction for resource uses of public lands administered by the BLM and are, in most cases, the primary decision-making documents (43 CFR 4100).

Most Resource Areas within the range of sage grouse in Idaho have LUP objectives either specific to sage grouse habitat management or general objectives dealing with managing special status species. *This framework document will be used to assess attainment of these objectives as they pertain to sage grouse.* In the cases where LUP's do not have either sage grouse or general special status species objectives, other authorities (e.g., grazing regulations) will be used until LUP maintenance, amendment or revision incorporates such objectives. We are assuming that many of the general habitat needs for other sagebrush obligate bird species are similar to those of sage grouse and therefore addressed in this assessment framework. However, there will be areas or circumstances that will warrant species-specific assessment.

#### B. Interior Columbia Basin Ecosystem Management Project (ICBEMP)

The draft Supplemental Environmental Impact Statement for ICBEMP is currently out for review. If approved, the Record of Decision will amend all BLM Land Use Plans in Idaho. This project provides a long-term integrated strategy that will provide consistent direction at the regional and subregional levels to assist federal land managers in making land use decisions at a local level within the context of broader ecological considerations. This framework document is consistent with and uses the analysis step-down process outlined for ICBEMP.

# C. Idaho Standards for Rangeland Health and Guidelines for Livestock Management

In 1995 new grazing regulations were finalized (60 FR, February 22, 1995) that included Subpart 4180 addressing the "Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration." Within the scope of these regulations, 43CFR 418.2(d), includes specific direction to the BLM State Directors to develop standards that among other things would address:

"(4) Habitat for endangered, threatened, proposed, candidate, or special status species; and; (5) Habitat quality for native plant and animal populations and communities..." (43 CFR 4180.2 (d)...)

In addition, 43CFR 4180.2(e) requires development of guidelines to address:

"(9) Restoring, maintaining or enhancing habitats of Federal Proposed, Federal Candidate, and other special status species to promote their conservation;"

In August, 1997 the Secretary of Interior approved Idaho 's S&G' s. Standard 8 of Idaho 's S&G 's addresses special status species management:

"Habitats are suitable to maintain viable populations of threatened and endangered, sensitive, and other special status species."

Since 1997 S&G assessments and determinations have been conducted in Idaho for areas of BLMadministered lands. Unlike other Standards, specific assessment procedures have not been developed for Standard 8, largely due to the diverse array of sensitive species in the state and the difficulties in developing applicable assessment protocols. This framework outlines the habitat assessment procedure for sage grouse, a BLM sensitive species, and will be used by all BLM Field Offices for Standard 8 assessments.

### D. BLM National Policy on Special Status Species Management

BLM national policy directs State Directors to afford State-designated sensitive species the same level of protection as provided for federal candidate species (BLM 6840 Manual). Specifically the policy direction states:

"BLM shall carry out management, consistent with the principles of multiple use, for the conservation of candidate [and sensitive] species and their habitats and shall ensure that actions authorized, funded, or carried out do not contribute to the need to list any of these species as threatened/endangered. Specifically, BLM shall:

1. Determine the distribution, abundance, reasons for the current status, and habitat needs for candidate [and sensitive] species occurring on land administered by BLM, and evaluate the significance of lands administered by BLM or actions in maintaining those species.

2. For those species where lands administered by BLM or actions have a significant affect on their status, manage the habitat to conserve the species by:

a. Including candidate [and sensitive] species as priority species in land use plans.

b. Developing and implementing rangewide and/or site-specific management plans for candidate [and sensitive] species that include specific habitat and population management objectives designed for recovery, as well as the management strategies necessary to meet those objectives.

c. Ensuring that BLM activities affecting the habitat of candidate [and sensitive] species are carried out in an manner that is consistent with the objectives for those species.

d. Monitoring populations and habitats of candidate [and sensitive] species to determine whether management objectives are being met....."

#### E. Idaho Sage Grouse Management Plan and MOU

Conservation planning for sage grouse began in earnest with development of the Idaho Sage Grouse Management Plan (IDFG 1997). In 1998 Idaho BLM signed a Memorandum of Understanding (MOU) to support the plan. Management objectives for public lands pertinent to habitat assessment include (IDFG 1997:12):

"1. Manage nesting and early brood habitat to provide 15-25% big sagebrush canopy cover and about 7 inches or more of grass and forb understory during the May nesting period.

2. Manage for late summer brood habitat that includes a good variety of succulent vegetation adjacent to sagebrush escape and loafing cover.

3. Manage for winter habitat that has sagebrush exposed under all possible snow depths. This can consist of low sagebrush (*A. arbuscula* or *A. nova*) and big sagebrush (*A. tridentata*) communities. A sagebrush canopy cover of 15-25 % with heights of 10-12 inches above the snow is critical to survival of sage grouse."

Local Sage Grouse Working Groups have been formed to " assist in development of sage grouse management efforts that achieve local population goals " (IDFG 1997, Appendix B). This framework is consistent with the public land habitat management objectives of the Idaho Sage Grouse Management
Plan and should help the local working groups with habitat-related issues for BLM-administered public lands.

## **III. Habitat Assessment Process**

This assessment process is designed hierarchically to complement the step-down analysis direction associated with ICBEMP. It primarily provides guidance at the subbasin (mid-scale), watershed (fine-scale) and project or site-specific levels. Regional or large-scale information are discussed briefly. Information sources and assessment processes vary depending on the scale and project-specific needs.

## A. Large-scale Information and Assessment Use

Large-scale sage grouse population and habitat data include information generated at the national and regional levels. Regional vegetation (e.g., GAP data) and sage grouse distribution maps, historical and current, are available from a variety of sources.

The ICBEMP provides general management direction at the regional scale and associated science documents provide additional sagebrush steppe and sage grouse information (Wisdom et al. 1999). Habitat restoration directions for rangelands (includes sagebrush steppe) are outlined and priority restoration subbasins have been identified. Directions are also provided for terrestrial source habitats in priority watersheds, which have also been identified.

### B. Mid-Scale Information and Assessment Use

Subbasin reviews are intended to provide an understanding of how management activities in subbasins fit in with the broad-scale ecosystem and public land management emphasis. Broad habitat and population status and condition assessments are appropriate for this scale. Identifying important sage grouse habitats, existing and potential, is important at this level. More detail should be added at the watershed or site-specific levels as needed.

### 1. Idaho Sage Grouse Habitat Planning Map

Except for a few areas, suitable, current sagebrush steppe vegetation data are lacking to delineate existing and potential habitats at the sub-basin scale. Fires throughout southern Idaho change the landscape patterns so quickly that vegetation mapping efforts soon become obsolete unless updated regularly. Until current vegetation mapping data are available that can discern important vegetation community differences (e.g., sagebrush canopy cover classes, or differentiate perennial grasses from annual grasses or low density sagebrush areas) we will rely on more qualitative information suitable for subbasin planning needs. We have developed the "Sage Grouse Habitat Planning Map " to meet these needs (Appendix A describes mapping process). This map is not provided in this framework document but is available at all Idaho BLM offices and will be available on the Idaho BLM Internet site.

The general purpose of this map is to provide a relatively simple but widely applicable mid-scale, statewide map showing general habitat conditions. Historical and current sage grouse distribution and other habitat information were used to define extent of habitat areas. Five polygon types were used to describe sagebrush steppe habitats based on the following definitions:

Key Habitat Areas: These are generally large-scale, intact sagebrush steppe areas that provide sage grouse habitat.

<u>Restoration Habitats</u>: Areas that currently are or were historically sage grouse habitat that, if restored, would provide better habitat at some time in the future.

<u>Restoration Type 1 (R1)</u>: Sagebrush-limited areas with acceptable understory conditions in terms of grass species composition. Includes native and seeded perennial grass rangelands. These are important areas to protect from wildfire and encourage sagebrush establishment and retention. Inexpensive management treatments may be needed (e.g., sagebrush and/or forb seedings).

<u>Restoration Type 2 (R2)</u>: Existing sagebrush cover in these areas may or may not be adequate to meet the needs of sage grouse, but understory herbaceous conditions are poor. Undesirable plant species such as cheatgrass (*Bromus tectorum*), medusahead rye (*Taeniatherum caput-medusae*) or other exotic plants are common to dominant. Expensive management treatments are needed for restoration.

<u>Restoration Type 3 (R3)</u>: Areas where junipers are encroaching into sage grouse habitat areas. Opportunities exist for improving habitat through appropriate fire management response, prescribed fire, chemical or mechanical means.

<u>Linkage Habitat:</u> Corridors or areas joining Key and/or Restoration Habitats, through which sage grouse currently move or may eventually move or occupy. Protection from wildfire is important, to facilitate sagebrush establishment or retention.

This map will be used for subbasin reviews or other mid-scale or state-wide planning efforts to:

a. Define the analysis areas for sage grouse in Idaho. *BLM activities outside of the areas identified as key or restoration areas will not be considered as existing or potential habitat for sage grouse.* This may not apply to other sagebrush obligate species.

b. Identify watersheds where sage grouse will be an important emphasis for land use management decision-making.

c. Plan and prioritize fire suppression, fuels management and prescriptive activities needed for habitat protection.

d. Plan and prioritize sage grouse large-scale habitat restoration efforts.

This map will be updated annually to keep information current. We fully anticipate that this map will become more refined as our information concerning sage grouse habitat improves.

### 2. Mid-scale Habitat Assessment Schedule for Ongoing Programs

Because of the large land area involved (>8 million acres of BLM-administered land in Idaho) sage grouse habitat assessments for ongoing programs such as livestock grazing permits will occur over several years. Therefore, it is important that the sequence of evaluations be systematically planned and

designed to address those regions where habitats are most important, most susceptible to change or have the greatest restoration potential. In addition, these priorities must be considered with other BLM management priorities such as ongoing Endangered Species Act and Clean Water Act compliance efforts. We will use existing processes, the S&G 10-year implementation schedule or subbasin review schedules, to accomplish this melding of priorities and long-term assessment planning. BLM Districts will review these schedules and make necessary adjustments to address important sage grouse habitats and priority restoration areas.

### C. Fine-Scale Information and Assessment Use

Generally, fine-scale is geographically defined by watersheds (DOA/DOI 1995). However, in some cases the fine-scale information for sage grouse may more appropriately be collated at the allotment level depending on local needs. Allotments vary in size from as small as 40 acres to greater that 250,000 acres. In most areas, particularly where small allotments dominate the landscape watersheds should be the fine-scale assessment unit. However, in areas where large allotments (>100,000 acres) dominate the landscape then these may be appropriate fine-scale units. This flexibility allows for better integration of assessment and decision-making processes.

At this level, understanding land uses and the distribution, importance and spatial context of seasonal habitats on the landscape is important for designing appropriate and efficient site-level assessments. A variety of information sources should be reviewed at this level before going into the field for data collection. It is important at this stage that known historic and existing breeding, brood-rearing and winter habitats are identified and mapped and the Sage Grouse Planning Maps further refined. Detailed mapping is not expected and Field Offices should use the best available information.

### 1. Sage Grouse Lek Attendance Data

Current and historical lek information can help to define areas of management and evaluation emphasis. Connelly et al. (*in press*) recommends intensive habitat management for an area 3.2 km (2 miles) around leks for non-migratory populations and 18 km (11 miles) for migratory populations. Sage grouse in Idaho are mostly migratory (pers. commun. J. Connelly, IDFG; Connelly and Markham 1983, Gates 1983, Robertson 1991) and until radio-tagging studies indicate otherwise, we will address habitat needs of sage grouse assuming they are migratory. With this in mind, delineating nesting habitat using the 2-mile radius around an active lek must be applied with caution. This delineation may help to define areas of management emphasis but most remaining large tracts of sagebrush likely provide habitat. In addition, unless recent, intensive lek inventories have been completed historic leks will be used to define these important existing breeding areas where sagebrush vegetation is still dominant on the landscape. Idaho has large, remote areas of BLM-administered public lands that provide habitat but are difficult to inventory for sage grouse lek attendance.

### 2. Other Historic and Current Sage Grouse Observation Information

Besides leks, historic and current information on sage grouse observations associated with nesting, broodrearing and wintering areas can be collated at the watershed scale, where available information from local citizens, agency files, and other sources should be used.

### 3. General Vegetation and Habitat Information

a. <u>Breeding and Winter Habitats:</u> At this scale sagebrush habitat availability and fragmentation patterns are important to consider in relation to the specific pasture or site you are evaluating. Refining the Sage Grouse Habitat Planning Map is important at this stage. Field Offices are not expected to do detailed vegetation mapping but rather make broad delineations based on readily available information. Efforts should be made to further delineate sagebrush steppe vegetation into the following cover types:

(1) **sagebrush/perennial grass areas:** areas with generally *at least* 5% sagebrush canopy cover and a native or seeded perennial grass understory,

(2) **sagebrush/annual grass areas:** areas with generally *at least* 5% sagebrush canopy cover and an annual grass unerstory,

(3) **perennial grasslands:** native or seeded grasslands with generally < 5% sagebrush canopy cover,

(4) **annual grasslands:** areas dominated by annual grasses with generally < 5% sagebrush canopy cover, and

(5) **juniper encroachment areas:** sagebrush or perennial grassland areas with juniper encroachment occurring.

There are a variety of information sources that can help delineate these areas and many are existing GIS data layers though availability varies between BLM Field Offices:

Ecological Site Inventory (ESI) maps Soil maps Historic wildlfires - files, maps and dates Project files and maps of fire rehabilitation efforts Fuels management files and maps Project files and maps of land treatments (e.g., seeding and spraying projects) Any available vegetation maps (e.g., GAP maps) Aerial photography Elevational models and topographic maps

b. <u>Late Brood-rearing Habitat</u>: A number of moist or mesic vegetation communities provide latebrood-rearing habitat. Sage grouse generally will move to higher elevations as summer progresses in search of succulent forbs and insects (Schroeder et al. 1999). For some areas this movement can be fairly dramatic (Connelly et al.1988, Connelly et al. *in press*). For other areas where nesting is occurring at higher elevations this movement may not be far. *At this scale it is important to delineate those broodrearing areas on public lands that are potentially significant*. Field staffing constraints will limit ability to evaluate *all* potential late-brood-rearing habitats so that identifying those of particular concern is important at this stage. Wet meadow complexes, sagebrush areas adjacent to agricultural fields, perennial streams, and lakes, ponds or lakebeds with sagebrush in close proximity are typical late brood-rearing habitats. Riparian and wet meadow areas within very steep canyons are not used by sage grouse and should not be considered brood-rearing habitat (pers.commun. J. Klott, BLM). Several information sources are important to use at this scale:

National Wetland Inventory (NWI) maps Water rights files Riparian Proper Functioning Condition (PFC) assessments and maps Aerial photography, particularly color infra-red

Late brood-rearing habitats are diverse in terms of vegetation communities. The only common feature that distinguishes suitable brood-rearing habitats is that they are generally rich in forbs and insects (Schroeder et al. 1999, Connelly et al. *in press*). Soil disturbance may promote forbs over grasses and other rhizominous plants. However, this does not imply that riparian or wetland areas with downcutting, erosion and general dessication of the wetland or mesic community is preferred habitat for sage grouse (Connelly et al. *in press*). Availability of forbs in the late summer is the important common denominator of good brood-rearing areas.

At this scale existing information for certain late brood-rearing habitats can be used to improve efficiencies. Most perennial streams on BLM lands in Idaho have been evaluated for PFC with files and photographs (videography in some cases) available. In addition, water rights files contain pictures of developed and undeveloped water sources. This information should be reviewed to determine where field assessments may be warranted. Depending, existing information may be adequate for an assessment. *Generally, we will assume that riparian areas in PFC or functioning-at-risk with upward trend are meeting or moving towards meeting the habitat needs for sage grouse.* 

### 4. General Land Use Information

At this scale some general public land use information can be helpful, dependent on the assessment needs. Such information includes, but not limited to:

Grazing allotment and pasture boundaries Range improvement projects (e.g., spring developments, pipelines) Developed recreation areas Utility corridors Military sites Roads

### 5. Data Compilation

Preferably, as much of the fine-scale information as possible should be displayed on GIS-generated maps contingent on the availability of GIS support. Efforts to compile these data are ongoing throughout the State in cooperation with State and other federal agencies.

## D. Project-level Information and Site Assessments

Project or site level assessments will involve either qualitative or quantitative data collection depending on management needs. The site level procedures are to be used for a variety of purposes including general habitat assessments to characterize current habitat conditions to project-specific evaluations that may be for an S&G evaluation of a grazing allotment, a proposed land exchange or proposed prescribed fire project.

Generally, allotment pastures will be a very important subset for any habitat assessment effort because:

- a. Livestock stocking rates and seasons-of-use for individual pastures can affect existing sage grouse habitats. Habitat conditions within a particular cover type can vary greatly between pastures.
- b. Livestock stocking rates and seasons-of-use for individual pastures can affect restoration potential and need to be considered in any restoration effort.
- c. Pastures are the analysis unit for Rangeland S&G 's already ongoing throughout Idaho and grazing decisions are usually specific to individual pastures.

### 1. Qualitative Versus Quantitative Assessment

This assessment framework allows considerable flexibility in data type and detail depending on local needs. Assessment field worksheets (Appendix B) can be filled out without quantitative data collection. While this flexibility is provided, biologists are encouraged to initially quantify all measurements to calibrate their visual estimation abilities. In addition, biologists should quantify their evaluations if issues for an area are complex or controversial. In these situations other information such as livestock utilization rates and patterns of use are important to also have. Random selection of evaluations sites is not required though for some areas this approach may be needed. In many cases, other data are available that should be used in conjunction with this evaluation process. By allowing for qualitative assessments, particularly for lower priority sites, more time and effort can be concentrated on in-depth assessments of the more complex areas. Site evaluation aids such as photo guides are being developed to assist in visual evaluations.

### 2. Site Selection

Information collated at the fine-scale level should be used to help select sites. However, at this level more detailed land use information should be reviewed prior to site selections, depending on needs. These information needs include, but are not limited to:

Area-specific fire and fire rehabilitation information Livestock use information at the pasture level (class, stocking rates, season of use, utilization patterns) Livestock watering sites in pasture or area of concern Ecological Site Inventory data Rangeland health and PFC assessments Other land uses in the area of concern that may affect habitat conditions

Once the additional area-specific information is assembled for the area of concern, evaluation sites can be selected. The number of evaluation sites selected will vary depending on the landscape complexity and level of potential conflict. These sites should be selected by an interdisciplinary team. There are some general rules that will be followed in evaluation site location:

### Breeding Habitat:

a. Sage grouse tend to nest more on flat to slightly sloping lands. Evaluation sites should not be located on steep slopes and slopes > 40% should not be considered nesting habitat (pers. commun., J. Connelly, IDFG).

b. Evaluation sites will be located at least 1/4 mile from livestock watering areas.

c. Where possible, existing key use areas set up for rangeland trend monitoring should be used but only if they' re representative.

d. Generally, sage grouse nest in big sagebrush (*Artemesia tridentata spp.*). Small inclusions of big sagebrush within vast expanses of low sagebrush (*Artemesia arbuscula*) are common in many areas. These inclusions provide important nesting habitat while the surrounding low sagebrush sites may provide early brood-rearing habitat. In these situations it will be important to evaluate nesting conditions in the big sagebrush inclusions rather than the low sagebrush sites.

e. Where present, representative evaluation sites will be selected from the following major cover types (see Definition and discussion in previous section):

- sagebrush/perennial grass areas
- sagebrush/annual grass areas
- perennial grasslands
- annual grasslands
- juniper encroachment areas

### Late Brood-rearing Habitat:

a. Important late brood-rearing sites identified at the mid-level should be evaluated. A variety of riparian, wetland and upland communities may provide brood-rearing habitat.

b. Riparian areas and wet meadows located in deep canyon areas will not be considered as late brood habitat (e.g., Bruneau River, Salmon Falls Creek, etc.).

c. Evaluation sites will not be located in designated livestock trailing stream crossings or water gaps.

### Winter Habitat:

a. Low elevation, fragmented sagebrush areas may provide important winter habitat.

b. Winter and breeding habitat will overlap in many areas although low sagebrush areas associated with wind swept ridges are often used.

### 3. Evaluation Timing

Habitat assessments must be done at the proper time of year. For example, forbs in the sagebrush uplands are very important early in the year for nesting sage grouse hens and early broods. Forbs remain important through the summer though sage grouse will move to higher elevations and more mesic or wetland areas in search of forbs and insects.

<u>Breeding Habitat:</u> Habitat evaluations must be done in May-June as soon as broods are hatched. Timing within this 2-month time frame will vary depending on elevation and annual climatic conditions. Late Brood-rearing Habitat: Evaluations must be done July - October, unless an adequate assessment can be done with existing data. Where late brood-rearing habitat may be a local habitat need or where controversy is anticipated, biologists are encouraged to conduct field assessments during the July-October period.

Winter Habitat: Evaluations can be done at any time since sagebrush distribution, cover and height are the only factors of concern.

Annual climatic conditions need to be noted on field forms. Winter and spring precipitation can affect annual forb abundance and cover during the breeding season.

### 4. Field Evaluation Matrices and Data Collection Methods

Field evaluation worksheets (Appendix B) for breeding, late brood-rearing and winter habitats were developed using the Sage Grouse Management Guidelines (Connelly et al., *in press*). For the purpose of standardizing evaluations, discrete ranges of numeric values were used for some habitat indicators to define suitable, marginal and unsuitable habitat. Suitable habitats meet the protective cover (sagebrush and herbaceous indicators) and food (forb indicators) needs of sage grouse while marginal and unsuitable habitat do not. Late brood-rearing and winter habitat matrices are mostly qualitative, emphasizing the need for succulent forbs during the summer and diversity of sagebrush densities and heights in the winter.

It is important to note that not all the indicators need to be in the "suitable habitat" category for a site to be considered as suitable. For example, if a site had suitable breeding habitat conditions for all indicators except sagebrush canopy cover (site had 30% canopy cover) then a site rating of suitable would be appropriate. However, if a site had suitable habitat conditions for all indicators except sagebrush canopy cover was only 5% then this site would be unsuitable since sage grouse must have sagebrush for nesting. Overall site evaluations will be based on best professional judgement with interdisciplinary involvement.

Quantitative field evaluation methods for the habitat indicators (canopy cover measurements, height measurements, etc.) are provided in Appendix C. These methods are consistent with guidance developed by an interagency technical team for rangeland vegetation monitoring (USDI 1996) and Field Office staffs are encouraged to reference this publication for additional guidance.

a. <u>Breeding habitat:</u> Nesting cover and food availability are key components of breeding habitat suitability. Generally, sagebrush stands with a robust understory of grasses and forbs provide excellent sage grouse habitat (Table 1).

Habitat Feature	Indicator	Suitable Habitat	Marginal Habitat	Unsuitable Habitat
Nesting Cover	Big sagebrush canopy cover	> 15% but < 25%	10-14% or 26-35%	<10% or >35%
Nesting Cover	Big sagebrush height	15-30 inches	10-14 inches or 31-40 inches	<10 inches or >40 inches
Nesting Cover	Big sagebrush growth form	Spreading form, few if any dead branches	Mix of spreading and columnar growth forms present	Tall, columnar growth form with dead branches
Nesting Cover	Herbaceous perennial grass and forb height	>7 inches	5 - <7 inches	< 5 inches
Nesting Cover & Food	Perennial grass canopy cover	> 15%	5 - 14%	<5%
Nesting Cover & Food	Forb canopy cover	> 10%	5 - <10%	<5%
Food	Forb richness <sup>1</sup>	High	Low	Very low

TT 1 1 NT /	1 1 1	1 1 1 1 1	1 6 1	· 1· / C	.1 1	1	· · ·
Table I Nestin	and early broo	d_rearing habita	t teatures and	indicators to	hr the h	nahitat acce	ecoment matrix
rable r. restin	g and carry broo	u louing naona	i reatures and	marcators it	Ji the h	aonal asso	cosment matrix

<sup>1</sup>Relative to ecological site descriptions.

At this time it will be important to record any site potential considerations that affect suitability. There will be areas that have suitable sagebrush cover but soil conditions and/or dominant grasses provide for unsuitable nesting conditions (e.g., dominant grasses such as Sandberg's bluegrass (*Poa sandbergii*) may not have the growth form to meet perennial herbaceous height criteria). The evaluation worksheets provide for these notations, which will be very important later when evaluations are summarized at the project area level. Adequate justification as to site potential problems must be provided.

At least one field worksheet (Appendix B) will be filled out for each of the major cover types present within the project area of concern. If the area of concern has more than one pasture then at least one worksheet per cover type per pasture is required.

b. <u>Late Brood-rearing Habitat</u>: Food availability (forbs) is the primary habitat feature of importance to sage grouse brood-rearing areas. Healthy riparian, wet meadow and upland plant communities are important where these habitats provide the brood-rearing habitat. Forb abundance, diversity and availability are crucial. Agricultural fields can provide important sage grouse brood-rearing

habitat if good escape cover is nearby (Connelly et al. *in press*). In these cases sagebrush cover on adjacent BLM-administered lands will be the important habitat indicator. However, proximity of good escape cover is important for all brood-rearing areas.

Habitat Feature	Indicator	Suitable Habitat	Marginal	Unsuitable Habitat
Food	Riparian and wet meadow plant community	Mesic or wetland plant species dominate wet meadow or riparian area	Xeric plant species invading wet meadow or riparian area	Xeric plant species along water 's edge or near center of wet meadow
Cover and Food	Riparian and wet meadow stability	No erosion evident; some bare ground may be evident but vegetative cover dominates the site	Minor erosion occurring and bare ground may be evident but vegetative cover dominates the site	Major erosion evident; large patches of bare ground
Food	Forb availability in uplands and wetland areas	Succulent forbs are readily available in terms of distribution and plant structure	Succulent forbs are available though distribution is spotty or plant structure limits effective use	Succulent forbs are not available due to site condition or plant structure
Cover	Proximity of sagebrush cover	Sagebrush cover is adjacent (< 100 yards) to brood-rearing area	Sagebrush cover is in close proximity (100 - 300 yards ) of brood- rearing areas	Sagebrush cover is unavailable (> 300 yards).

Table 2. Late brood-rearing habitat features and indicators for the habitat assessment matrix.

Field worksheets (Appendix B) will be filled out for areas that were identified as important late broodrearing areas during the watershed or fine-scale review. Recent, existing information (e.g., PFC assessment and photographs)should be used in conjunction with a field assessment and in some cases can be used instead of a field visit, where appropriate. However, availability of forbs during the summer and fall is the primary habitat feature of concern for these brooding areas and site visits are encouraged.

c. <u>Winter Habitat:</u> Sagebrush cover and availability during the winter are the most important habitat indicators for the food and cover needs of sage grouse (Table 3). Topographic features can provide additional variety of habitats.

Habitat Feature	Indicator	Suitable Habitat	Marginal Habitat	Unsuitable Habitat
Cover and Food	Sagebrush canopy cover	10-30%	5- 9% or >30%	< 5%
Cover and Food	Sagebrush height	Normal height relative to site potential	Hedged shrubs, slightly shorter relative to site potential	Severely hedged shrubs and short relative to site potential

Table 3. Winter habitat features and indicators for the habitat assessment matrix.

Field worksheet (Appendix B) can be filled out at any time and should, in many areas, use the same data set as that collected for the breeding habitat matrix. Wintering areas identified at the watershed or fine-scale should be evaluated. Breeding and winter habitat will overlap in many areas. It will be important to

remember in these areas that sagebrush cover needs in the winter are slightly different than during the breeding season. An area with sagebrush canopy cover exceeding 30% may not provide suitable nesting habitat but may provide important, suitable winter habitat.

### 5. Organizing Site Evaluations at the Project Area Level

For many public land uses (e.g., livestock grazing permits, habitat restoration projects) organizing the site assessments for the project area will be needed. For small or vegetatively uniform pastures one or two field evaluation sites will adequately characterize current habitat. However, for large and/or complex pastures multiple site evaluations may be necessary. It is important to remember that the purpose of these evaluations is to not only evaluate existing conditions but also provide information on restoration needs. An unsuitable rating for a pasture is not necessarily a "bad " evaluation or a negative reflection on management. For example, using this assessment process, a fire rehabilitation seeding with suitable grass and forb cover but unsuitable sagebrush cover would be classified as currently unsuitable sage grouse habitat. However, the habitat assessment would also indicate that the area may be a priority restoration site for sagebrush seeding. The fact that the grass and forb cover are in the suitable range also may indicate that livestock stocking rates and/or season-of-use would complement restoration goals and expenditure of restoration funds.

At this level organizing evaluations by seasonal use periods (breeding, late brood-rearing and wintering habitats), cover type and pasture is appropriate. Summary forms in Appendix D are provided to help in this regard.

## IV. Data Management

As assessments are completed, information will be summarized at the District level. Habitat assessment progress will be collated on a state-wide basis annually concurrently with updating the sage grouse habitat planning map. This reporting process and a GIS-based data management system will be developed during FY 2000 while this framework is being field tested and reviewed.

## V. Use of Assessment Framework in Decision-Making Processes

The purposes of and uses of this framework are to:

- 1. Identify important remaining sage grouse habitat areas and priority habitat restoration areas.
- 2. Evaluate and document existing sage grouse habitat suitability and habitat restoration needs.

3. Assist in evaluating land uses on public lands that may affect sage grouse habitat conditions or habitat restoration efforts.

4. Assist in evaluating attainment of pertinent land use plan objectives and Standard 8 of Idaho's Standards for Rangeland Health for sage grouse.

All Field Offices will use this assessment framework for subbasin reviews, watershed analyses, S&G evaluations, LUP evaluations, or any proposed projects that may affect existing or potential sage grouse habitat. Overall goals, consistent with LUPs and BLM policies will be to (1) protect and maintain existing suitable habitats, (2) improve degraded habitats to suitable conditions, and (3) restore habitats to suitable conditions, where most feasible and important for long-term recovery.

This habitat assessment framework does not address potential land uses that may directly affect the birds or their behavior and use of areas (e.g., transmission line mortalities, structures in or near leks or wintering areas that may provide perch sites for raptors). Additional instructions will be provided for these types of land uses and related potential effects.

## **VI. Definitions**

**Annual Grassland:** Areas dominated by either cheatgrass or medusahead rye generally with less than 5% shrub canopy cover present.

**Breeding Habitat:** Leks, nesting and early brood-rearing occur in breeding habitats (Connelly et al. *in press*).

**Condition:** The state of historical, current, or potential elements. May be a quantitative or qualitative descriptor.

**Habitat Indicator:** Component or attribute of habitat that can be observed and/or measured that provides evidence of habitat suitability.

Juniper Encroachment Areas: Sagebrush or perennial grassland areas with juniper encroachment occurring.

**Key Habitat Areas:** These are generally large-scale, intact sagebrush steppe areas that provide sage grouse habitat. Term is used specifically for the Sage Grouse Planning Map.

**Land Use Plan:** Land use plans means a resource management plan or management framework plan, developed under the provisions of 43 CFR 1600. These plans are developed through public participation in accordance with the provisions of the Federal Land Policy and Management Act of 1976 and establish management direction for resource uses of public lands (43 CFR 4100).

Late Brood-rearing Habitat: Variety of habitats used by sage grouse from late June to early November. Habitats used include, but not limited to, meadows, farmland, riparian areas, dry lakebeds, sagebrush areas (Connelly et al. *in press*).

**Lek:** Breeding display area. For sage grouse, leks are usually open areas surrounded by sagebrush (Connelly et al. *in press*).

**Perennial Grassland:** Area dominated by perennial native or introduced grasses with generally less than 5% canopy cover of shrubs.

**Proper Functioning Condition:** Lentic riparian areas are functioning properly when adequate vegetation, landform, or debris is present to: dissipate energies associated with wind action, wave action, and overland flow from adjacent sites, thereby reducing erosion and improving water quality; filter sediment and aid floodplain development; improve flood-water retention and ground water recharge; develop root masses that stabilize islands and shoreline features against cutting action; restrict water percolation; develop diverse ponding characteristics to provide the habitat and the water depth, duration, and temperature necessary for fish production, waterbird breeding , and other uses; and support greater biodiversity (USDI 1999).

**Potential:** (a) Capable of being, but not yet in exisitence; latent. (b) The ecological community that would be established if all successional sequences of its ecosystem were completed without additional human-caused disturbance under present environmental conditions; often referred to as "potential natureal community." (DOA/DOI, Regional Ecosystem Office 1995).

Sagebrush Areas: Areas with generally at least 5% sagebrush canopy cover.

**Umbrella Species:** Species with large area requirements, which if given sufficient protected habitat area, will also provide habitat for many other species (Noss 1990).

**Watershed:** Any area of land that drains to a common point. A watershed is smaller than a river basin or subbasin, but it is larger than a drainage or site. The term generally describes areas that result from the first subdivision of a subbasin, often referred to as a " fifth field watershed" (DOA/DOI, Regional Ecosystem Office 1995).

Winter Habitat: Sagebrush habitats that provide access to food and cover during the winter (Connelly et al. *in press*).

## Appendix A

## Sage Grouse Habitat Planning Map Directions

## SAGE GROUSE HABITAT PLANNING MAP

## Objective

Create a relatively simple, widely applicable landscape-scale habitat map showing sage grouse distribution and general habitat conditions, using available information.

## **Purpose and Need**

Concerns over sage grouse population trends and habitat quality or quantity have increased. Habitat mapping efforts have occurred or are occurring in certain areas, but techniques, scales, time-frames, and resolutions vary. Vast areas remain unmapped in terms of a consistent methodology that transcends administrative boundaries.

There is an immediate need for a single, overall spatial portrayal of general sage grouse habitat conditions in order for conservation planning to move forward. At present, it is not practical to wait for completion of vegetation mapping efforts before such a landscape-scale, general habitat map is created.

The Sage Grouse Habitat Planning Map will serve several purposes including:

1. Assisting field staff to quickly identify areas that sage grouse will be of primary concern, and those areas where sage grouse will not be an issue,

2. Generally outlining areas in need of restoration with respect to sage grouse habitat quality,

3. Serving as a tool for planning and prioritizing fire suppression, fuels management and prescription activities at the Field, District and State Office levels,

4. Graphically portraying the degree of sage grouse habitat fragmentation on the landscape,

5. Providing large scale information at the State-wide level on habitat conditions after merging of Field Office maps; and

6. Serving as an educational tool for explaining current sage grouse habitat conditions to resource users, cooperators, and interested parties.

### Habitat Definitions with General Management Recommendations

**Key Habitat Areas:** These are generally large-scale, intact sagebrush steppe areas that provide sage grouse habitat. Small inclusions of perennial grasslands, either native or introduced, or other habitats (e.g., mountain mahogany) may be present.

Management recommendation: These areas are extremely important to protect from wildfire. Habitat conditions should be improved, where needed.

Note: Key Habitat Areas will, in many cases, encompass the extent of the circles created by inscribing the 2-mile buffer around leks or lek complexes, but may also include areas of intact habitat well beyond or between the buffer zones. In some cases, biologists may suspect sage grouse occupancy but documentation is lacking; this should not preclude classification as Key Habitat. Local biologists should

use professional judgement in determining the extent of the habitat polygons in such cases, with an explicit goal of conserving occupied and potentially occupied sage grouse habitat.

### **Restoration Habitats**:

<u>Restoration Type 1 (R1)</u>: Sagebrush-limited areas with acceptable understory conditions in terms of grass species composition. Includes native and seeded perennial grass rangelands.

Management Recommendation: Areas are very important to protect from wildfire and maintain or restore sagebrush and forb communities, where needed. Restoration costs are relatively inexpensive for these areas.

### Note: Such areas are often a result of wildfires or seedings.

<u>Restoration Type 2 (R2)</u>: Existing sagebrush cover in these areas may or may not be adequate to meet the needs of sage grouse, but understory herbaceous conditions are poor. Undesirable plant species such as cheatgrass (*Bromus tectorum*), medusahead rye (*Taeniatherum caput-medusae*) or other exotic plants are common to dominant. Expensive management treatments are needed for restoration.

Management Recommendation: Management treatments, such as prescribed fire, chemicals, or seeding are encouraged for certain R2 areas, contingent on site-specific analysis. Opportunities also exist for managing wildfire via Appropriate Management Response to achieve restoration objectives. Restoration can be very expensive.

Note: These areas often result initially from the expansion of invasive exotic herbaceous species into native or marginal seeded rangelands, and are then exacerbated and eventually maintained by frequent wildfire. Lack of direct management intervention will likely lead to perpetual dominance by the invasive species, a shortening of fire return intervals, and loss of shrubs, depending on the site.

Juniper encroachment areas (R3): Sagebrush areas that have juniper encroachment dominate the landscape.

Management Direction: Opportunities exist for improving sage grouse habitat quality and quantity through the use of Appropriate Management Response to wildfire, prescribed fire, chemical or mechanical means. Follow-up rehabilitation with seeding or chemicals may or may not be necessary, contingent on site-specific conditions.

Note: Some sage grouse habitats occurring at or near the sagebrush-steppe-juniper woodland interface are at risk to juniper encroachment or have already been rendered unsuitable for sage grouse due to juniper expansion. Retarding juniper expansion in such situations, with a goal of shrub-steppe restoration, may be advisable. <u>Linkage Habitat</u> Corridors or areas joining Key and/or Restoration Habitats, through which sage grouse currently move or may eventually move or occupy.

Management recommendations: Protection from wildfire is extremely important for these linkage areas. Restoration efforts in Linkage Habitats, where needed, should be a priority emphasis.

Note: Certain areas or corridors may be used or hypothesized to be used primarily as movement corridors by sage grouse; or could be used as such if habitat conditions were adequate. Linkage areas are of particular concern to migratory sage grouse populations, which may winter and summer in areas separated by vast distances. Protection of intervening corridors may be important, even though breeding-nesting-brood rearing may not occur or have been documented there. The Linkage concept also has merit with respect to non-migratory (resident) sage grouse populations in fragmented habitats. Linkage habitats may not be relevant in all areas (e.g. large, contiguous shrub-steppe habitats), hence their inclusion in the map is contingent on recommendations by local biologists. In general, most linkage habitats will likely be characterized as one or more Restoration types or possibly as Key Habitat. Thus, in delineating a Linkage polygon,, it is important to first describe the appropriate habitat quality category (Key Habitat Area, R1, R2, R3); then, crosshatch or otherwise flag the particular Linkage polygon(s).

### **Map Preparation Process**

1. Compile up-to-date sage grouse lek maps, data, and 1:100,000 land status maps. It is extremely helpful, but not necessary, to have these data available at the same scale (1:100,000) and a GIS plot of all historic and occupied leks. The term *occupied lek* as defined here is one where at least one strutting male has been documented in at least one of the past five years. While the *Guidelines for Management of Sage Grouse Populations and Habitats* (Connelly et al. *in press*) define an occupied lek as one attended by *two* or more males, in at least *two* of the past five years, this definition may be too restrictive in certain situations. Often it is logistically impossible to visit all leks each year, resulting in incomplete data. In a given five-year span, a particular lek may be visited only occasionally, in some cases only once or twice depending on accessibility. In other situations, especially at smaller leks, where counts of males have been in decline, documentation of even one male may be useful in describing the current distribution of breeding activity and delineation of associated habitats.

A 2-mile (3.2 km) radius around each lek, via GIS, helps to portray use *areas* as opposed to points (leks), and is a useful means of showing the general extent of potentially occupied breeding-early brood habitat, particularly for non-migratory populations. In addition, plotting the circular area for *occupied* leks using a distinguishing color (e.g. red) further helps to identify currently occupied areas from historically occupied areas. Since most sage grouse in Idaho are or may be migratory, biologists should use available data and professional judgement in defining Key Habitat Areas and not limit their delineation to the 2-mile radius around known historic and current leks.

2. Meet with local federal and state biologists to delineate existing Key Habitat Areas, Restoration and Linkage Habitat polygons onto the 1:100,000 land status maps. The intent is to develop a broad, landscape-scale map so polygons will usually be very large depending on habitat heterogeneity and the biologist 's knowledge of the area. Landscapes with a fragmented ownership pattern or complex mix of rangeland-agricultural interfaces may include smaller polygons, as deemed appropriate.

3. After delineating polygons, coordinate with GIS staff to create mylars and digitizeor scan the polygons into a GIS. Create one theme for the Linkage polygons, and one encompassing the exist habitat and restoration polygons. This will allow users to overlay Linkage areas onto the existing habitat and restoration habitat polygons, as needed. For consistency between Field Offices, color code Key Habitat

Areas as Red; R1 habitats as light green; R2 habitats as medium green; R3 habitats as dark green; and linkage zones as crosshatching. Field Office GIS staff should coordinate closely, to ensure the use of identical colors, layouts etc. to facilitate merging of maps at District and Statewide scales.

4. Develop and plot planning maps at appropriate scales, (1:100,000 scale or higher). Since the map polygons were initially delineated at 1:100,000 scale, and specific polygon boundaries are thus somewhat subjective, creation of finer scale (e.g. 1:24,000) maps will proportionally amplify errors. Additional detail can be added at finer scales (e.g., delineating sagebrush-dominated annual grasslands from annual grasslands without shrubs).

5. Store GIS data and 1:100,000 maps in safe, accessible location. These maps will be updated annually to incorporate new habitat information, make corrections and changes due to fires or other land use changes.

## Appendix B

**Field Assessment Worksheets** 

#### Sage Grouse Habitat Assessment Worksheet - Breeding Habitat (5/23/01) Date: Project or Allotment Name/#: Pasture Name/#: Site #: FO: Legal Description: T. R. Section 1/4, 1/4 GPS File #: , **Evaluator(s): Ecological Site:** Site Info. (circle one): Arid Site, **Mesic Site** UTM: Landscape Site (circle one): Key Habitat, **R3** R1, R2, Cover Type (circle one): Sagebrush, Perennial Grassland (native, introduced), Annual Grassland with Sagebrush, Juniper Area Annual Grassland. **Habitat Indicator** Suitable Habitat **Marginal Habitat Unsuitable Habitat** Average Sagebrush Canopy $\geq$ 15% but $\leq$ 25% 10-<15% or >25% <10% Cover Average Sagebrush Height 15-30" **Mesic Site** 10-14" or > 30" <10" **Arid Site** 12-30" 10-11" or >30" <10" **Sagebrush Growth Form** Spreading form, few, Tall, columnar growth Mix of spreading and if any, dead branches form with dead columnar growth for most plants forms present branches for most plants **Average Grass and Forb Height** <u>></u>7" 5 - < 7" < 5" **Average Perennial Grass Canopy Cover Mesic Site** >15% 5 - <15% <5% **Arid Site** <u>≥10%</u> 5 - <10% < 5% Average Forb Canopy Cover **Mesic Site** <u>≥10%</u> 5 - <10% < 5% **Arid Site** < 3% <u>≥ 5%</u> 3 - <5% Forbs common with **Preferred Forb Abundance and** Forbs common but Forbs rare to sparsely Diversity<sup>1</sup> at least a few only 1 or 2 preferred present preferred species species present present **Overall Site Evaluation**

**Rationale for Overall Rating and Comments:** 

**Comments on Restoration Potential:** 

<sup>1</sup>Relative to site potential and site guides.

### **General Directions:**

- 5. Sites should be located on flat to slightly sloping lands. Slopes greater than 40% are unsuitable nesting habitat.
- 6. Breeding habitat must be evaluated as close to the end of nesting as possible (May- June). For low elevation areas this will be May, for higher elevation areas it will be June.
- 7. Precipitation can affect annual forb growth if precipitation is an interpretation factor then this should be noted in the comment section.
- 8. Good nesting habitat may be provided disproportionately in small inclusions of big sagebrush surrounded by low sagebrush. In these situations nesting conditions should be measured in the big sagebrush patches. However, the low sagebrush community likely provides important pre-nesting and early brood-rearing habitat and should be evaluated for the forb composition indicators (canopy cover, abundance and diversity).

Worksheet Directions:

1. Fill out all site location information at top of sheet. Most of the information should be self explanatory except for the following:

Arid Site = Sites are generally in the 10-12" precipitation zone and *Artemesia tridentata wyomingensis* is the common big sagebrush sub-species in the area.

Mesic Site = Sites are generally in a >12" precipitation zone and *Artemesia tridentata vaseyana* is the common big sagebrush sub-species in the area.

2. A. Each indicator must be marked as either suitable, marginal or unsuitable.

B. Numeric values should be written in when quantitative data are collected and recorded on provided field data forms.

C. The Site Preferred Forb Abundance and Diversity Form should be used to determine preferred forb abundance and diversity suitability.

D. Qualitative evaluations should only have a in the box.

3. If site potential is a factor for an indicator being either marginal or unsuitable put an asterisk (\*) by the indicator and discuss in the comments section. Referencing site potential as per the site guides is recommended.

- 4. Overall site evaluation is based on professional judgement, not all indicators need to be in the suitable range for an overall suitable evaluation. Where needed, explain rationale in comments section.
- 5. There will be unique field situations that will need professional judgement in data interpretation for the evaluation form. The most obvious example of a unique situation is illustrated by a site dominated by Sandberg's bluegrass. Due its density on the site it could skew the average height measurements of grasses downward even though the site has good nest screening cover present. A site dominated by short statured forbs such as Hood's phlox could also have the same skewing effect on the data. In these situations the biologist must use his/her professional judgement and explain the rationale for the data interpretation as it pertains to sage grouse habitat needs.
- 6. If site potential is a factor for an overall evaluation of marginal or unsuitable put an asterisk(\*) after
  "Overall Site Evaluation " in the last row. Explain rationale in notes section.
- 7. Attach field data sheet(s) used for this site evaluation.

Sage Gro	use Habitat Assessn	nen	t Worksheet - Late Bro	ood-rearing (5/23/01)						
Date:		Pro	oject or Allotment Name/#:							
Pasture Name/#:			Site #:	FO:						
Legal Description: 7	r. R. Section	,	1/4, 1/4	GPS File #:						
Evaluator(s):		Ec	ological Site:	UTM #						
Landscape Site (circ	ele one): Key Habitat ,	R1,	R2, R3							
Site Description (circle one): riparian area/perennial stream, riparian area/intermittent stream, wet meadow, lakebed, upland sagebrush site										
Habitat Indicator	Suitable Habitat		Marginal Habitat	Unsuitable Habitat						
Riparian and Wet Me	adow Communities:									
Riparian and wet meadow plant community	Mesic or wetland plant species dominate wet meadow or riparian area		Xeric plant species invading wet meadow or riparian area	Xeric plant species along water's edge or near center of wet meadow						
Riparian and wet meadow stability	No erosion evident; some bare ground may be evident but vegetative cover dominates the site		Minor erosion occurring and bare ground may be evident but vegetative cover dominates the site	Major erosion evident; large patches of bare ground						
Forb availability	Succulent, green forbs are readily available in terms of distribution and plant structure		Succulent, green forbs are available though distribution is spotty or plant structure limits effective use	Succulent, green forbs are scarce or not available						
Proximity of sagebrush cover	y of Sagebrush cover is adjacent to brood-rearing area (<100 yards) Sagebrush cover is i proximity (> 100 yards) 300 yards) of brood-		Sagebrush cover is in close proximity (> 100 yards but < 300 yards) of brood-rearing areas	Sagebrush cover is unavailable (> 300 yards)						
Overall Riparian/W	Vet Meadow Site Evaluation									
Upland Sagebrush Co	ommunities:									
Forb availability	Succulent, green forbs are readily available in terms of distribution and plant structure		Succulent, green forbs are available though distribution is spotty or plant structure limits effective use	Succulent, greeen forbs are scarce or not available despite favorable growing conditions						
Ove	erall Upland Site Evaluation									
Comments:										

General Directions:

- 8. Worksheet should be filled out for areas identified as important late brood-rearing habitats during fine-scale review.
- 9. Riparian areas and wet meadows located in deep canyon should not be considered brood-rearing habitat.
- 10. Evaluation sites should not be located in designated livestock stream crossings or water gaps.

Worksheet Directions:

- 1. Site Description: Identify what type of habitat is being evaluated.
- 2. Put a in the appropriate suitability category for each indicator that best describes the site.
- 3. Forb availability and plant structure:

A. In some cases forbs may be present on the site but trampling or grazing intensity may affect availability.

B. Upland sites should only be evaluated if green, succulent forbs are present at the time of the site visit. Evaluating an area after forbs have desicated is not advised even if site may provide late brood-rearing habitat

## Sage Grouse Habitat Assessment Worksheet - Winter Habitat (5/23/01)

Date:		Pro	Project or Allotment Name/#:							
Pasture Name/#:			Site #:		FO	:				
Legal Description: 7	F. R. Section	,	1/4, 1/4,			GPS File #:				
Evaluator(s):		Oth	ner Location Info.	:						
Ecological Site:			UTM:							
Landscape Site (circ	ele one): Key Habitat ,	R	1, R2,	R3						
Site Description:										
Habitat Indicator	Suitable Habitat		Marginal	Habitat		Unsuitable Habitat				
Sagebrush canopy cover	10-30%			5- 9% or >30%		< 5%				
Sagebrush height (availability during the winter)	Generally tall or a diversity of sagebrush heights present relative to species and site potential		Some tall pla more modera relative to	nts but generally te to short plants o species and site potential		Poor height diversity with generally short plants relative to species and site potential				
Overall Site Evaluation	on									
Comments:										

General Directions:

1. Form should be completed for areas that were identified as winter areas during the fine-scale review.

Worksheet Directions:

- 1. Site Description: provide a brief description of the site.
- 2. Sagebrush Canopy Cover: Insert the canopy cover into the appropriate suitability box. If it was measured using line intercept or line point transect put in the measured value. If you visually estimated the percent then use the .
- 3. Sagebrush Height: Measuring sagebrush heights above the snow during the winter would be difficult for many areas. Since the evaluation site is located in a known or suspected wintering area sagebrush heights in the area relative to sagebrush species and ecological site is an important habitat indicator. Put a in the appropriate suitability category that best describes the site.

# Appendix C

Field Methods

Equipment:

Tape, 100-foot Stakes for tape (at least two spikes; old, medium-large screwdrivers work well) Daubenmire frame 20 x 50 cm Yardstick (for measuring shrub and grass/forb heights) Compass Random numbers table, wristwatch with second hand, or calculator with random function etc. Camera and print film, extra camera battery; extra film. Photo cards and markers; or small dry-erase board and marker Topographic map with project area, general cover types, and pasture boundaries delineated Aerial photographs Soil Survey/Ecological Site Guides GPS unit Pencils Colored pencils for sketching plant communities Calculator

Protocol:

1. Sites have been selected stratified by major cover type and pasture (see framework document for directions).

2. Randomly select a compass azimuth, using a random numbers generator, wristwatch with second hand, or other objective means. Make sure transect is at least 0.25 miles from disturbances such as roads, water sources etc.

3. Anchor a 100-foot tape with a stake (spike, screwdriver, etc.) and extend it snugly along the random azimuth. Secure end with a second stake.

4. As a minimum, accurately locate the transect's location on a 1:24000 USGS map. Use GPS and differentially correct if at all possible. It will be important to be able to return to the area for follow up monitoring or photos in some instances.

5. On the data form, record shrub canopy cover by species using the line intercept method. Record cover increments to the nearest 0.1 ft or other convenient increment (e.g., inches). Record only live (green) canopy. Ignore spaces or gaps in the canopy less than 2 inches across. Gaps in the live canopy in excess of 2 inches will not be included as canopy intercepts. It may also be helpful to separately record dead/decadent shrub cover if it appears to be a significant component of the community; however only live sagebrush cover will be of consequence to the habitat assessment for sage grouse.

6. At each 5-foot increment along the tape:

a. Place a 20 x 50 cm Daubenmire frame (n=20 plots per transect). For each plot, estimate and record cover for perennial grasses, annual grasses, perennial forbs, annual forbs. Note predominant species.

b. Record the height of the nearest sagebrush plant.

c. At each 5-foot increment point record the maximum " natural" or droop height of the nearest perennial grass or perennial forb within a 2.5-foot,  $180^{\circ}$  arc around the point that ends at the tape line. [Natural = the highest point of a leaf or seed stalk is measured with no straightening by the observer]. This includes seed stalks when they contribute to the body of the plant that provides screening cover. There will be instances (e.g., certain *Poa* spp.) when only a few, sparse seed stalks are present and extend well above the body of the plant that provides the cover.

In these cases the bulk or droop height of the plant *exclusive of the seed stalks* should be measured. This will require some professional judgement on the part of the biologist. If no plants are within this arc then record a dash and move on to the next point.

7. Summarize data at the bottom of each form.

8. Photographs. At least one photograph must be taken at each transect/ evaluation area. Photos will prove invaluable in locating evaluation areas in subsequent years. They will also be of substantial utility in the office when preparing evaluation documents and documenting habitat condition.

a. Complete a Photo Card, showing, as a minimum, the date, location, allotment, and sagebrush canopy cover percentage.

b. With the photo card near the "zero" end of the tape, take a general photo of the area, sighting down the tape from eye level, showing landmarks in the background, if possible.

c. In a representative location along or near the tape, place the photo card near the base of a sagebrush plant, and take a tangential close-up photo from near ground level (2-3 ft) toward the shrub/ground interface, to document herbaceous conditions and cover.

d. Optional: take one or more other close-ups or panoramic photos as needed.

9. Depending on the complexity of the evaluation area, several line transects within a cover type may be necessary to characterize the area using this technique.

10. Complete the Site Preferred Forb Abundance and Diversity Form.

										Perennial Forb Avg. Ht. (Optional):										

### Line-Point Intercept Method (transect or step-point techniques) (5/23/01)

### Equipment:

Tape, 100-foot (optional) Stakes for tape (at least two spikes; old, medium-large screwdrivers work well) Pin flag or Pointer or Other Point Intercept Device: straight piece of wire or rod at least 30" long and less than 2.5mm in diameter. (see Appendix XX for photos) Yardstick (for measuring shrub and grass/forb heights) Compass Random numbers table, wristwatch with second hand, or calculator with random function etc. Camera and print film, extra camera battery; extra film. Photo cards and markers; or small dry-erase board and marker Topographic map with project area, general cover types, and pasture boundaries delineated Aerial photographs Soil Survey/Ecological Site Guides GPS unit Pencils Colored pencils for sketching plant communities Calculator

### Protocol:

Sites have been stratified by major cover types and pastures prior to field evaluation (see framework document for more directions).

If you use a tape:

1. Anchor the tape with a steel pin and pull tape out 100 feet. Keep tape as taught and straight as possible. Anchor tape on far end.

2. Begin at "0 " end of tape.

3. Every 2 feet drop the pin flag or pointer to the ground so that it falls precisely vertically and touches the near side of the tape at the correct mark (every 2 feet for 50 marks).

4. Record the species when possible using the scientific name acronyms (e.g., *Artemesia tridentata wyomingensis* = ARTRw). When this can 't be done use the following abbreviations: S = Shrub; PG = Perennial Grass; PF = Perennial Forb; AG = Annual Grass; AF = Annual Forb.

5. Canopy Cover and Measurements:

A. Start by recording the plant with the highest leaf or stem touching the pin. Record only live canopies of shrubs and live or residual cover of herbaceous plants (remember that residual plant cover can be very important for sage grouse nesting) under the "Species" column using the species acronyms.

B. Record the next plant with the next highest live leaf or stem touching the pin as described in Step

- 4. Record these under the "Species" column within the "Lower Layers" columns.
- 6. Height Measurements:

A. Shrubs: Record the maximum height of the shrub that is touched by the pin.

B. Perennial Grasses and Forbs: Record maximum "natural " or droop height of the perennial grass or perennial forb. [Natural = the highest point measured with no straightening by the observer]. This includes seed stalks when they contribute to the body of the plant that provides screening cover. There will be instances (e.g., certain *Poa* spp.) when only a few, sparse seed stalks are present and extend well above the body of the plant that provides the cover. In these cases the maximum droop height of the plant *exclusive of the seed stalks* should be measured. This will require some professional judgement on the part of the biologist (see illustration).

7. Proceed to next point or intercept and repeat.

8. Review the data for sample size adequacy, particularly the grass and forb heights. If data are insufficient for a good sample size then the transect should be extended another 100 feet or 50 points (or to whatever is necessary).

9. Summarize data at the bottom of each form. Only one hit per lifeform per point can be used in the summary.

Sagebrush Canopy Cover = # of sagebrush hits divided by the total number of transect points. PG Canopy Cover = # of perennial grass hits divided by total number of transect points Forb Canopy Cover = # of perennial and annual forb hits divided by total number of transect points. There may be instances where a perennial and annual forb hit is recorded for one point. In these instances the upper layer hit is the only one that should be included for that point in calculating combined cover.

Annual Grass Canopy Cover = # of annual grass hits divided by total number of transect points Annual Forb Canopy Cover = # of annual forb hits divided by total number of transect points Other Shrub Canopy Cover = # of shrub hits divided by total number of transect points.

Avg. Sagebrush Height = sum total of all sagebrush recorded heights divided by total number of sagebrush measured.

Avg. Perennial Grass and Perennial Forb Heights Combined (Avg. PG&PF Heights) = sum total of all perennial grass and perennial forb recorded heights divided by total number measured. Avg. Perennial Grass Height = sum total of all perennial grass recorded heights divided by total number of perennial grass measured.

Avg. Perennial Forb Height = sum total of all perennial forb recorded heights divided by total number of perennial forb measured.

10. Photographs. At least one photograph must be taken at each transect/ evaluation area. Photos will prove invaluable in locating evaluation areas in subsequent years. They will also be of substantial utility in the office when preparing evaluation documents and documenting habitat condition.

a. Complete a Photo Card, showing, as a minimum, the date, location, allotment, and sagebrush canopy cover percentage.

b. With the photo card near the "zero" end of the tape, take a general photo of the area, sighting down the tape from eye level, showing landmarks in the background, if possible. A cover board or meter stick should be in the picture for a frame of reference.

c. In a representative location along or near the tape, place the photo card near the base of a sagebrush plant, and take a tangential close-up photo from near ground level (2-3 ft) toward the shrub/ground interface, to document herbaceous conditions and cover. A cover board or meter stick should be in the picture for a frame of reference.

d. Optional: take one or more other close-ups or panoramic photos as needed.

11. Complete the Site Preferred Forb Abundance and Diversity Form.

If you use step-point method:

1. Determine the number of paces between points prior to starting. If the area you are evaluating is large then you may want to have more paces between points in order to cover more land area.

2. Select a focal point on the horizon to focus on.

3. Take the selected number of paces toward the focal point staying on a straight line. You must walk in a straight line and maintain a constant pace length through sagebrush or other shrubs. If this is difficult to do because of shrubs heights, it's recommended that you use a tape to help you stay on a straight line. Drop the pin flag just out from the tip of your foot so that it falls precisely vertical.

4. Follow direction 4-11 under the above line transect directions.

Comments on Abundance and Diversity:

Site Summary (see directions)	Suitable	Marginal	Unsuitable
Circle One of the Following:	Forbs are common with at least a few preferred species present	Forbs are common but only 1 or 2 preferred species present	Forbs are rare to sparsely present

Directions:

1. Walk around the area and observe the relative abundance and diversity of forbs. Subjectively put observed forbs into one of the abundance criteria:

Rare Sparse Common

The expected abundance of forbs is related to the ecological site and biologists are encouraged to visit reference areas and refer to site guides for calibration.

2. Determine the overall site evaluation by circle one of the suitability categories. It is important to remember that a site may have several preferred forbs present that are only rare or sparsely distributed. These sites may be suitable due to the combined abundance of the species and the species diversity. Species diversity determines the difference between suitable and marginal. Unsuitable sites are lacking in abundance and diversity.

## Site Evaluations Summary Form

## Sage Grouse Habitat Summary Evaluation Sheet

Date:			Project or Allotment Name/#:								
<b>Project Description:</b>											
Recorder:			FO:		5 <sup>th</sup> HUC #:						
Habitat Use Period	Pasture/ Site No.	Cover Type	Dominant Species	Ecological Site	Habitat Evaluation Results	Site Potential Limiting? (Y/N)	Estimated % of Project Area				

#### **Directions:**

Summarize information from the field worksheets using this form.

**Date:** Date this form was filled out.

Project or Allotment Name: Identify project or allotment being evaluated.

Watershed (5<sup>th</sup> HUC): Identify the watershed(s) that the project is in.

Project Description: Describe the project (e.g., S&G evaluation, prescribed fire project; restoration project, land exchange, etc.).

Habitat Use Period: Use one of the following: Breeding (B), Brood-rearing (BR), Wintering (W).

Pasture/Site No.: Should correspond with Field Worksheet Pasture and/or Site Numbers.

**Cover Type:** Use one of the following or other unique descriptor: Sagebrush (SG), Perennial Grassland - native (PGN), Perrenial Grassland - Seeded Non-native (PGS), Annual Grassland (AG), Annual Grassland with Sagebrush Cover (AGSG), Juniper (J), Riparian (R), Wet Meadow (WM), Lakebed (LB), Spring (SP). Should correspond to habitat type on Field Worksheet.

Dominant Species: List the primary shrub and/or understory grass species. Intended for upland areas. Optional for brood-rearing habitats. Use species codes.

Ecological Site: Use appropriate name of ecological site descriptor from site guidesor soil surveys (upland sites only).

Habitat Evaluation Results: Transfer site evaluation summary from Field Worksheets here: Suitable (S), Marginal (M) or Unsuitable (US).

Site Potential Limiting ? (Y/N): Indicate here if site potential limits achieving suitable habitat objectives. Response needed for all sites identified as marginal or unsuitable habitats.

Estimated % of Pasture or Project Area: Estimate based on available information.

### APPENDIX B-3 SPECIAL STATUS PLANT REPORT

	Segment
Appendix E	Photographs of Plant Species Documented on Federal Lands within the ROW Corridor

## 1.0 INTRODUCTION

The special status plant survey was conducted on approximately 450 acres of accessible federal lands within the right-of-way (ROW) corridor for the proposed 230 kilovolt (kV) Vantage to Pomona Transmission Line (ca 32.5 miles of ROW corridor centerline) between the existing Pomona Heights Substation near Yakima, Washington, and the Vantage Substation located adjacent to the Columbia River and north of Beverly, Washington. This work was conducted to provide information about special status plants that have the potential to occur on federal lands specific to the proposed project. Sage Grouse assessment and noxious weed surveys were coordinated at the same time as the special status plant surveys, but these are discussed in separate reports, Appendix B-2 and Appendix B-4.

## 2.0 METHODS

Qualified botanists documented target special status plant species on accessible federal lands within the ROW corridor for each alternate route segment. Federal lands were considered inaccessible due to: restricted access on the Yakima Training Center (YTC); access issues crossing private lands; dangerously steep terrain; and excessively long distances (greater than one mile) to hike from car to the ROW corridor. Three surveys were conducted to address the different phenology (timing of flowering and/or fruiting) of the target special status plant species. Federal lands that were accessed included Bureau of Reclamation (Reclamation), Bureau of Land Management (BLM), YTC, and U.S. Fish and Wildlife Service (USFWS). Pre-construction clearance surveys will be identified and detailed in the Plan of Development (POD).

#### **Surveyor Qualifications**

Special status plant surveys were conducted by botanists who have the following minimum qualifications:

- An academic background (bachelor's degree or higher in botany) or equivalent experience in plant taxonomy;
- The taxonomic experience to identify, through personal knowledge or the use of technical floras, most species encountered in the field, and an understanding of how to contact taxonomic experts for species that they are unable to identify;
- The skills to use GPS to adequately map occurrences of special status plant species; and
- Familiarization of the potential special status plant species in the project area.

#### **Field Preparation**

The special status plant species list was developed by compiling a list of all special status species known to project counties (Benton, Grant, Kittitas, and Yakima), data which was accessed from the Washington Natural Heritage Program (WANHP; 2010) and BLM (M. Boyter, pers. comm. March 2011) (Appendix A). This study followed BLM Procedures for Vegetation Inventory and Rare Plant Clearances, which was provided by the BLM. The list was further refined by only including those species with special status from the USFWS (USFWS 2011), and WANHP (2010), Inter-agency Special Status / Sensitive Species Program (ISSSSP) species (2008a, b). Most special status plant species occur in highly specific habitats, which require an understanding of the associated plant community, co-occurring species, geology, soils, elevation, and topographic location for each species.

Sources of information for plant species included the *Vascular Plants of the Pacific Northwest: Vols. I-V* (Hitchcock et al. 1969), *Flora of the Pacific Northwest* (Hitchcock and Cronquist 1973), the WANHP

plant guide (WANHP and BLM 2005), *Field Guide to the Rare Plants of Washington* (Camp and Gamon 2011), WANHP special status plant data within the study corridor, BLM (M. Boyter, pers. comm. March 2011), species-specific literature, and botanists' personal knowledge of the species.

Each species was evaluated for whether it should be targeted during surveys. All special status plant species known to occur within 0.25 mile of the alternative route segments were automatically included as target species. In addition, all special status plant species that are known to occur on or near the YTC were also included (Fort Lewis Directorate of Public Works 2010). Species documented or suspected to occur on the BLM Spokane District were not automatically included due to the large area encompassed; although species were given additional consideration as target species if they were documented or suspected to occur on the BLM Spokane District. All species were then evaluated by assessing their habitat requirements and elevation with the elevation (400 to 2,850 feet) and GAP vegetation within 0.25 mile of the alternate routes. Species associated with forested habitats and high elevations were typically removed from the list, while species associated with sagebrush steppe, basalt cliffs, rivers, etc. were included. Wetlands and riparian areas occur on federal lands along the alternative route segments, so species associated with these habitats were also included.

The phenology for each species is important since many special status plant species can only be accurately identified when they are flowering and/or fruiting. The phenology of all target special status species was assessed to determine when and how many surveys would be needed to accurately survey for all special status plant species. Based on this, complete surveys were determined to be needed during April/May and June/July so that all species are surveyed (preferably late April to mid-May and mid-June to mid-July). A third survey was also determined to be needed for wetlands and riparian areas in mid-August, to address special status plants associated with these habitats that have a late-summer phenology, including Ute ladies'-tresses (*Spiranthes diluvialis*), a federally threatened plant species.

#### **Field Survey**

The first two surveys (May 16-25 and June 22-29, 2011) took place in all habitats within accessible federal lands. The third survey (August 8-10, 2011) took place only at wetlands and riparian areas along accessible federal lands. During the first two surveys, wetland and riparian habitat were identified to focus the area for the final survey. A complete pedestrian survey was conducted for the target special status plant species on accessible federal lands with a 25 meters separation between surveyors, covering the 160 foot (ca 49 meter) ROW corridor. Botanists walked roughly parallel intuitive meandering transects so that habitats most likely to support special status plant species were most intensively surveyed. The survey was floristic, meaning that all taxa were identified to the level necessary to determine if they are special status plant species (except if the plant was in an unidentifiable stage; i.e., from grazing).

All methods followed the BLM Procedures for Vegetation Inventory and Rare Plant Clearances, which was provided by the BLM botanist. An OR/WA BLM GeoBOB Flora/Fauna Survey Form (V. 1.4) was completed for each of the route segments surveyed, by landowner (includes information on survey location and acreage, observers, date(s) surveyed, plant species encountered, target special status plant species, and habitat/environmental conditions).

Habitat and plant community information collected to support sage grouse habitat assessment Appendix B-2 was used for assessing potential suitable habitat for special status plants. In addition, the following information was collected during the surveys: names of all plant species observed and whether it is a dominant species, presence and percent cover of cryptogamic crusts, moisture/ disturbance/soil

conditions, and elevation/aspect/slope. This was largely done during the May survey, but additional species and observations were added during the June and August surveys.

If any target special status plant species were discovered, information about each species/location were filled out in an OR/WA BLM GeoBOB Site and Observations Form (V. 1.4; includes information on species, location, observers, date observed, phenology, reproduction/health, threats, associated species, and habitat/environmental conditions). A survey-grade GPS was used to document the survey route and the occurrence of target special status plant species discovered.

Very steep slopes and other conditions that posed a safety hazard were not surveyed. Very steep slopes are typically avoided for installation of transmission line structures or structures are installed using special methods such as helicopters, minimizing ground disturbance. In addition, botanists communicated with YTC personnel to ensure surveys were coordinated with training activities.

## 3.0 RESULTS

Of the 674 acres of federal lands within the 160 foot wide ROW, 450 acres were accessible and surveyed. The remaining 224 acres of federal lands that were not surveyed were inaccessible due to restricted access on the YTC, access issues crossing private lands, dangerously steep terrain, and excessively long distances to hike from car to the ROW corridor.

Eight occurrences of special status plants were located, including two occurrences of hedgehog cactus *(Pediocactus simpsonii var. robustior)*, three occurrences of Columbia milkvetch (*Astragalus columbianus*), one occurrence of caespitose evening-primrose (*Oenothera caespitosa ssp. caespitosa*), and two occurrences of Nuttall's sandwort (*Minuartia nuttallii* var. *fragilis*) (Table 1). Columbia milkvetch, caespitose evening-primrose and Nuttall's sandwort occurrences were located during the May surveys, but some were confirmed and expanded during the June surveys. Hedgehog cactus was located during the May and June surveys, but was not determined to be a special status plant until after the surveys were complete. Therefore, its mapped location is based on notes and retrospective mapping. Columbia milkvetch, caespitose evening-primrose, and Nuttall's sandwort have the status as BLM Sensitive species, although Columbia milkvetch is also a USFWS Species of Concern. Washington state status also varies, so that Nuttall's sandwort is a state Threatened species and the other two are state Sensitive species. Hedgehog cactus is currently a Washington State Sensitive species and listing as a BLM Sensitive species is anticipated in the future (Brooks, personal communication 2011).

No other species in Appendix A were located on accessible federal lands within the ROW corridor of the route segments. As with all special status plant surveys, there is always the potential that a special status plant occurs but is not detected, especially where there are annual species that may remain in the seedbank. In addition, multiple surveys were conducted for nearly all species during their species-specific optimal phenology for surveying.

## TABLE 1SPECIAL STATUS PLANT SPECIES LOCATIONS AND HABITAT SUITABILITY FOR SPECIAL STATUS PLANTS<br/>ON FEDERAL LANDS, BY ROUTE SEGMENT

Route	Special Status Plants Documented	Suitable Habitat	Marginal Habitat	Unsuitable Habitat	Unknown Habitat
1a	none	4 acres (all sagebrush/perennial grassland)	none	1 acre	none
1b	Nuttall's sandwort ( <i>Minuartia nuttallii</i> var. <i>fragilis</i> ) and hedgehog cactus ( <i>Pediocactus simpsonii var. robustior</i> )	55 acres of suitable habitat (predominantly sagebrush/perennial grassland, with some intermittent stream or dry gully)	34 acres	31 acres	122 acres
1c	none	none	trace	2 acres	trace
2a	none	none	none	none	none
2b	Basalt milkvetch (Astragalus columbianus)	26 acres (predominantly sagebrush/perennial grassland, with some intermittent stream or dry gully)	3 acres	15 acres	9 acres
2c	none	none	none	none	trace
2d	Basalt milkvetch (Astragalus columbianus)	6 acres (predominantly sagebrush/perennial grassland, with some intermittent stream or dry gully)	8 acres	none	6 acres
3a	none	none	none	none	none
3b	Basalt milkvetch ( <i>Astragalus columbianus</i> ), caespitose evening-primrose ( <i>Oenothera caespitosa</i> <i>ssp. caespitosa</i> ), and Nuttall's sandwort ( <i>Minuartia</i> <i>nuttallii</i> var. <i>fragilis</i> )	62 acres (sagebrush/perennial grassland, basalt cliff, and riparian; with a small amount of rock, water body, and intermittent stream or dry gully)	14 acres	32 acres	63 acres
3c	none	106 acres (predominantly sagebrush/perennial grassland, with a small amount of riparian, water body, and intermittent stream or dry gully)	54 acres	20 acres	trace

Habitats classified for the Sage-Grouse Habitat Assessment Report (Appendix B-2) were used to estimate potentially suitable habitat for special status plants on all federal lands within each route segment. Unsuitable habitat included agriculture; developed, road, or firebreak; irrigation canal; and watered poplar. Marginal habitat included annual grassland, rabbitbrush/annual grassland, and sagebrush annual grassland. Suitable habitat included basalt cliff, rock, sagebrush/perennial grassland, aspen, tree, intermittent stream or dry gully, riparian, and water body. Unknown habitat was too coarsely defined to estimate and included grassland, perennial grassland, and shrubland. Table 1 shows a comparison of the results by link and Appendix B shows the data used for making these calculations. Appendix C shows a list of all plant communities that were documented on accessible federal lands within each link.

Based on this information, Link 1B has two special status plant occurrences and provides better habitat for special status plants compared to Link 1C. Link 2B also has one special status plant occurrence and provides better habitat for special status plants compared to Link 2C; and 2D also has one special status plant occurrence and some suitable and marginal habitat. Link 3B has three special status plant occurrences compared to none for Link 3C. Link 3C appears to have more suitable habitat, but Link 3B has more species-specific habitats (basalt cliffs and rocks) and a substantial amount of habitat of unknown suitability, so Link 3B likely has better habitat for special status plants too.

A list of all plant species documented during the surveys is provided in Appendix D. Photographs of most occurrences documented are provided in Appendix E. The BLM has requested that GeoBOB survey forms and special status plant site observation forms be filled out for the surveys, and these will be provided separately. The GeoBOB survey forms provide more information about the environmental conditions along each link. The GeoBOB site observation forms provide more information about each special status plant species occurrence. The list of target special status plants in Appendix A indicates during which survey(s) each species was targeted, and this is designed to be used with the GeoBOB survey forms.

### 4.0 SUMMARY

Special status plant occurrences were documented in Routes 1b, 2b, 2d, and 3b. These four routes plus Route 3c had the highest amount of potentially suitable habitat for special status plants. This information should be used to compare the potential effects of the proposed project to special status plant species on federal lands. In addition, WANHP data on special status plant occurrences that are mapped as intersecting the ROW corridor should be included in comparing potential effects, although most of these occurrences include large buffers so it is difficult to accurately determine whether these occurrences truly intersect the ROW corridor.

Camissonia pygmaea	dwarf evening-primrose	BLM-S, WS	DOC	DOC	Sagebrush and lower foothills; unstable soil or gravel in steep talus slopes, dry washes, banks and roadcuts; growing with big sagebrush and wild buckwheat.	May to July		Х	
Camissonia scapoidea ssp. scapoidea	naked-stemmed evening- primrose	BLM-S, WS	DOC		Mostly in the sagebrush desert; especially on rocky or sandy soil; 600-900 ft.	May to July	Х	х	
Carex comosa	bristly sedge	BLM-S, WS	DOC		Marshes, lake shores, and wet meadows; 50-2000 ft.	May to August	Х	х	Х
Carex macrochaeta	large-awn sedge	BLM-S, WT	SUS		Marshes, shores and other moist or wet open places, often near the beach.	mid-May to July; summer	Х	х	
Cistanthe rosea	rosy pussypaws	BLM-S, WT	SUS		Sagebrush desert to arid montane forest; within low swales in sandy soil among big sagebrush; 520-530 ft.	May to June	Х	х	
Collomia macrocalyx	bristle-flowered collomia	BLM-S, WS	DOC		Dry, open places at lower elevations; sparsely vegetated and associated with sagebrush steppe; a cryptogram crust is present on the rocks and soil; early spring, flowers ephemeral; 850-2,100 ft.	April to May	x		
Cryptantha gracilis	narrow-stem cryptantha	BLM-S, WS	DOC		Talus and pockets of silt; associated with sagebrush steppe; in Washington this species has been found in talus and pockets of silt; 1,250-2,680 ft.	May to June	X	X	

Scientific Name	Common Name	Status <sup>1,2,3</sup>	SUS/DOC on BLM or YTC <sup>4</sup>	DOC <sup>1</sup> within 0.25 mile or within TRS of Alt Routes <sup>5</sup>	Habitat Required <sup>6</sup>	Phenology <sup>6</sup>	May Target	June Target	August Target
Cryptantha leucophaea	gray cryptantha	SOC, BLM-S, WS	DOC	DOC	Dry, often sandy places; with sparse vegetation, usually on slopes but sometimes on flats; near the Columbia and lower Yakima rivers; 300-2500 ft.	April to May	х		
Cryptantha rostellata	beaked cryptantha	BLM-S, WT	DOC	DOC	Dry, open places; 600-2,900 ft.	April to June	Х		
Cryptantha scoparia	miner's candle	BLM-S, WS	DOC		Dry, open slopes and flats, commonly among sagebrush; gravel bars and alluvial slopes and thin gravelly soil over basalt; 1,200-1,280 ft.	May to July	х	х	
Cryptantha spiculifera	Snake River cryptantha	BLM-S, WS	DOC	DOC	Sandy knolls and badlands and talus at low elevations; dry, open, flat or sloping areas in stable or stony soils.	April to July	х	х	
Cuscuta denticulata	desert dodder	WT			Occurs on various shrubs ( <i>Artemisia</i> and <i>Chrysothamnus</i> ) within desert areas; 880 ft.	June to September		х	
Eatonella nivea	white eatonella	BLM-S, WT	DOC		Dry, sandy desert or volcanic areas; populations are on bare soil in sparsely vegetated sagebrush steppe, associated with other annuals.	April to May	x		
Eleocharis rostellata	beaked spike-rush	WS	DOC	DOC	Marshes and boggy sites around lakes, in alkaline or highly calcareous areas, often around hot springs; also in coastal salt marshes; 500-1,850 ft.	June to September		х	Х
Erigeron basalticus	basalt daisy	SOC, BLM-S, WT	DOC	DOC	Cliff crevices on basalt cliffs, in rocky canyons; Yakima River and Selah Creek. Associated with the Yakima Basalt Formation, which occurred during the late Miocene; 1,250-1,500 ft.	May to June	X	Х	
Erigeron piperianus	Piper's daisy	BLM-S, WS	DOC	DOC	Dry, open places, often among sagebrush; 400-2,250 ft.	May to June	Х	Х	

Scientific Name	Common Name	Status <sup>1,2,3</sup>	SUS/DOC on BLM or YTC <sup>4</sup>	DOC <sup>1</sup> within 0.25 mile or within TRS of Alt Routes <sup>5</sup>	Habitat Required <sup>6</sup>	Phenology <sup>6</sup>	May Target	June Target	August Target
Eriogonum codium	Umtanum desert buckwheat	C, WS	SUS		Flat to gently sloping microsites near the top of the steep, north-facing basalt cliffs near salt scrub habitats overlooking the Columbia River; restricted to the exposed top of the basalt Lolo Flow. Assoc. include spiny hopsage, <i>Phacelia linearis</i> , <i>Cryptantha pterocarya</i> , <i>Camisonia minor</i> , and cheatgrass; 1,100-1,320 ft.	May to late- August	x	x	
Hackelia diffusa var. diffusa	diffuse stickseed	BLM-S, WT	DOC		Shaded areas, cliffs, talus, wooded flats, and slopes; along and near the Columbia River; 300-1,200 ft.	May to June	х	х	
Hackelia hispida var. disjuncta	sagebrush stickseed	BLM-S, WS	DOC		Rocky, unstable talus slopes and cliffs, usually with little other vegetation; 600- 2,100 ft.	May to July	х	х	
Heterotheca oregona var. oregona	Oregon goldenaster	BLM-S, WT	SUS		On sand and gravel bars along rivers; chiefly west of the Cascade Mountains but also occasionally along their eastern base; 2,600 ft.	June to September		Х	
Iliamna longisepala	longsepal globemallow	BLM-S, WS	DOC		Dry open hillsides and gravelly streamsides of sagebrush and open ponderosa pine forests; lower levels on the east side of the Cascade Mountains; 500-4,500 ft.	June to September		Х	
Juncus hemiendytus var. hemiendytus	dwarf rush	WT			Mud flats, the edge of vernal pools, and moist to wet meadows; 2,300-2,430 ft.	May to July	Х	Х	
Juncus howellii	Howell's rush	BLM-S, WT	SUS		Moist ground in the mountains; 2,840 ft.	July to August			Х
Juncus uncialis	inch-high rush	BLM-S, WS	DOC		Open fields to montane meadows; swales, moist places and vernal pools; associated with channeled scablands and mound and swale topography; 2,100-2,290 ft.	June to August		X	Х
Lipocarpha aristulata	awned halfchaff sedge	BLM-S,WT	SUS	DOC	Wetlands along the Columbia River, wet soil and mud in bottomlands; sandbars and beaches; 328-1,312 ft.	June to September		Х	Х
Lobelia kalmii	Kalm's lobelia	WE	DOC	DOC	Marl or peat bogs, along shores and in other wet places.	late July to August			Х

Scientific Name	Common Name	Status <sup>1.2.3</sup>	SUS/DOC on BLM or YTC <sup>4</sup>	DOC <sup>1</sup> within 0.25 mile or within TRS of Alt Routes <sup>5</sup>	Habitat Required <sup>6</sup>	Phenology <sup>6</sup>	May Target	June Target	August Target
Loeflingia squarrosa var. squarrosa	loeflingia	WT			Low swales within sandy areas and associated with <i>Artemisia tridentata</i> ; 400-500 ft.	May	Х		
Lomatium serpentinum	Snake Canyon desert- parsley	BLM-S, WS	DOC		Lower elevations just above river level in moderately deep sandy or rocky soil and/or open rocky slopes.	April to June (July)	X	х	
Lomatium tuberosum	Hoover's desert-parsley	SOC, BLM-S, WS	DOC	DOC	Loose rocky slopes and basalt drainage channels; rocky hillsides; 600-2,300 ft.	March to May	х		
Micromonolepis pusilla	red poverty-weed	WT			Desert regions, often on alkaline soils; salt-encrusted soil around/beneath Sarcobatus shrubs; 1,950-2,210 ft.	April to June	X	х	
Mimulus jungermannioides	hepatic monkeyflower	SOC, WX			Moss mats on cliffs at the eastern end of the Columbia River gorge and Deschutes River; 500-3,300 ft.	May to late- August	х	х	
Mimulus suksdorfii	Suksdorf's monkey- flower	BLM-S, WS	DOC		Open, moist or rather dry places, from the valleys and foothills to rather high elevations in the mountains; associated with sagebrush steppe.	May to August	x	Х	
Minuartia nuttallii ssp. fragilis	Nuttall's sandwort	BLM-S, WT	DOC	DOC	Dry basalt scree slopes, open, gravelly benches, or limestone talus from open sagebrush hills to alpine slopes; 5,413- 7,874 ft.	April to May (August)	x	x	
Nicotiana attenuata	coyote tobacco	BLM-S, WS	DOC	DOC	Dry, sandy bottom lands, dry rocky washes, and in other dry open places; 400- 10,000 ft.	June to August		х	
Oenothera caespitosa ssp. caespitosa	caespitose evening- primrose	BLM-S, WS	DOC	DOC	Talus slopes, road cuts, and dry hills; as well as along the flat river terrace of the Columbia River; associated with <i>Artemisia tridentata</i> or <i>Artemisia rigida</i> ; 400-1,200 ft.	June to August	x	x	
Ophioglossum pusillum	Adder's-tongue	BLM-S, WT	DOC		Meadows, pastures, old fields, roadside ditches, and flood plain woods in seasonally wet, rather acid soil; circumboreal, but not at the highest latitudes; 40-2,300 ft.	June to September		X	

Scientific Name	Common Name	Status <sup>1,2,3</sup>	SUS/DOC on BLM or YTC <sup>4</sup>	DOC <sup>1</sup> within 0.25 mile or within TRS of Alt Routes <sup>5</sup>	Habitat Required <sup>6</sup>	Phenology <sup>6</sup>	May Target	June Target	August Target
Orthotrichum praemorsum	bryophyte	SOC, WE			Rocks, rarely lava, dry montane areas; middle elevations		Х	Х	
Oxytropis campestris var. wanapum	Wanapum crazyweed	SOC, BLM-S, WE	DOC		Gravelly floodplains of the Columbia River; big sagebrush/bluebunch wheatgrass.	May to June	х		
Pediocactus simpsonii var. robustior	Hedgehog cactus	BLM-STR, WS		DOC	Thin, rocky soil on ridge tops, desert valleys, and low mountains; found at elevations from 1000 to 4000 feet in Washington; associated with <i>Artemisia</i> <i>rigida</i> .	May to August	*	*	*
Penstemon eriantherus var. whitedii	fuzzytongue penstemon	BLM-S, WS	DOC		Dry, open places in between shrubs; in the plains, valleys, and foothills, sometimes ascending to moderate elevations in the mountains; associated with <i>Artemisia</i> <i>tridentata</i> , <i>Purshia tridentata</i> , <i>Salvia</i> <i>dorrii</i> , <i>Eriogonum</i> sp., and <i>Chysothamnus</i> <i>nauseosus</i> ; 525-3,835 ft.	May to June	x	х	
Penstemon wilcoxii	Wilcox's penstemon	BLM-S, WS	SUS		West facing slopes of small canyons, and in dry and rocky habitats; open or often wooded, sometimes rocky places, from the foothills to moderate elevations in the mountains; associated species include <i>Holodiscus discolor, Physocarpus</i> <i>malvaceus, Rosa</i> sp., and <i>Symphoricarpos</i> <i>albus</i> ; 2,300-4,200 ft.	May to June (July)	х	Х	
Phacelia tetramera	dwarf phacelia	BLM-S, WS	DOC		Alkaline flats, sinks, depressions, and washes; occurs in <i>Artemisia</i> <i>tridentata/Poa secunda</i> and <i>Artemisia</i> <i>rigida/Poa secunda</i> plant communities; 1,200-2,200 ft.	April to June	X	X	
Physaria douglasii ssp. tuplashensis	White Bluffs bladderpod	C, WT	SUS		Big sagebrush/bluebunch wheatgrass association, restricted to dry, barren, nearly vertical exposures of calcium carbonate soil.	June to July		Х	

Scientific Name	Common Name	Status <sup>1,2,3</sup>	SUS/DOC on BLM or YTC <sup>4</sup>	DOC <sup>1</sup> within 0.25 mile or within TRS of Alt Routes <sup>5</sup>	Habitat Required <sup>6</sup>	Phenology <sup>6</sup>	May Target	June Target	August Target
Polyctenium fremontii var. fremontii	Fremont's combleaf	BLM-S, WT	DOC		Gravelly clay, sagebrush desert, damp or wet meadows, near shallow ponds, stony swales, dried vernal pools, and banks and beds of vernal streamlets. In Washington the species occurs on a plateau, close to a road in the shallow silty loam soil of a vernal pond depression within sagebrush steppe and lithosol communities; 2,300 ft.	May to June	Х	х	
Polygonum austiniae	Austin's knotweed	WT			Dry to moist flats or banks, from the sagebrush plains into the lower mountains, often in <i>Pinus ponderosa</i> forest.	June to August		X	Х
Rorippa columbiae	Columbia Cress	SOC, BLM-S, WE	DOC	DOC	Moist, sandy or cobbly soil, such as river floodplains and ephemeral ponds. Associated with the Columbia River, snow -fed streams and lakes, wet meadows, irrigation ditches and roadside ditches; apparently requires wet soil throughout the growing season.	(April) July to October			x
Rotala ramosior	lowland toothcup	BLM-S, WT	SUS		Wet, swampy places, lakes and pond margins, and along free-flowing river reaches in association with <i>Juncus</i> and <i>Eleocharis</i> species; 200-2,259 ft.	June to August		X	Х
Scouleria marginata	marginate splashzone moss	WT	DOC		On rocks in streams and rivers in splash zone	July to October			Х
Sidalcea oregana var. calva	Wenatchee Mountain checker-mallow	E, WE	SUS		Dry forests to moist meadows; sagebrush plains, meadowland, and ponderosa pine forest; 1,900-3,200 ft.	May to June (mid-August)		X	
Silene seelyi	Seely's silene	SOC, BLM-S, WS	SUS		Cliffs and talus slopes; basalt and granitic crevices on rock outcrops in absence of other species; 1,500-7,000 ft.	May to August	x	X	
Sisyrinchium sarmentosum	pale blue-eyed grass	SOC, BLM-S, WT	SUS		Dry to moist meadows, swampy areas, sealevel to moderate elevations in the mountains.	July to August		Х	

Scientific Name	Common Name	Status <sup>1,2,3</sup>	SUS/DOC on BLM or YTC <sup>4</sup>	DOC <sup>1</sup> within 0.25 mile or within TRS of Alt Routes <sup>5</sup>	Habitat Required <sup>6</sup>	Phenology <sup>6</sup>	May Target	June Target	August Target
Spiranthes diluvialis	Ute ladies'-tresses	T, WE	SUS		Moist meadow habitats along floodplains, oxbows, and stream and river terraces; subirrigated or spring-fed abandoned stream channels and valleys; and lakeshores; specifically, swales, narrow meander channels, and similar wetland and riparian habitats in valley bottom landscapes that retain moisture through late-summer.	mid-July to August			Х
Spiranthes porrifolia	western ladies-tresses	BLM-S, WS	SUS		Moist swampy areas, wet meadows, along streams, in bogs, and on seepage slopes. At some Washington locations, is known to be associated with special status plant species <i>Ophioglossum pusillum</i> .	(May) July to September		X	X
Tauschia hooveri	Hoover's tauschia	SOC, BLM-S, WT	DOC	DOC	Sagebrush scablands, often barren rocky clay.	March to May	x		
Texosporium sancti- jacobi	woven-spored lichen	BLM-S, WT	DOC		In the Pacific Northwest, <i>T. sancti-jacobii</i> , is found in arid to semi-arid shrub steppe, grassland or savannah communities up to 3,300 ft. (1,000 M) in elevation.	April to June	X	Х	
Utricularia minor	lesser bladderwort	WA-STR, WR1	SUS		In shallow, standing or slow moving water; circumboreal; 135-4.000 ft.	June to August		х	Х

<sup>1</sup>ISSSSP=Inter-agency Special Status / Sensitive Species Program species (ISSSSP) 2008<sup>ab</sup>, <sup>2</sup>WAHNP 2010. <sup>3</sup>USFWS 2011. <sup>4</sup>Habitat required and phenology data are based on Hitchcock et al. (1969), Hitchcock and Cronquist (1973), WANHP and BLM (2005), WANHP (2010), and Camp and Gamon (2011). Key: E – Federal Endangered; T – Federal Threatened; C – Federal Candidate; SOC – Federal Species of Concern; BLM-S – BLM Washington Sensitive; BLM-C – BLM Washington Candidate; BLM-STR – BLM Washington Strategic; WE – Washington State Endangered; WT – Washington State Threatened; WC – Washington State Candidate, WS – Washington State Sensitive; WR – Washington State Rare; WM – Washington State Monitor; WR1 – Washington State review group 1; and WX – Washington State possibly extinct or extirpated. SUS/DOC (suspected or documented) on BLM or YTC<sup>4</sup> is based on ISSSSP (2008a,b) and Fort Lewis Directorate of Public Works (2010). DOC within 0.25 mile or within TRS of Alternates<sup>5</sup> is based on data which was accessed from the Washington Natural Heritage Program (WANHP; 2010) and BLM (M. Boyter, pers. comm. March 2011). Habitat required and phenology data<sup>6</sup> are based on Hitchcock et al. (1969), Hitchcock and Cronquist (1973), WANHP and BLM (2005), WANHP (2010), and Camp and Gamon (2011). \**Pediocactus simpsonii var. robustior* (hedgehog cactus) was not determined to be a special status plant until after the surveys were complete, so it's mapped location is based on notes and retrospective mapping.

<sup>1</sup>Suitability for special status plant species is defined as the potential of each habitat to support special status plant species listed in Appendix A. Unsuitable habitats have zero potential to support any of the special plant species. Marginal habitats have potential to support fringe habitat for some of the special status plant species, and/or are generally lower quality habitats in the field. Suitable habitats have the potential to support characteristic habitat for some of the species, and/or are generally higher quality habitats in the field. Habitats with unknown suitability do not provide enough information to designate them into the marginal or suitable habitats, but do have enough information to determine they are not unsuitable.

<sup>2</sup>Habitats are based on survey results on federal lands (federal surveyed=FS), estimates of inaccessible federal lands that were estimated from aerial interpretation (federal unsurveyed=FU), and the sum total of both of these plus estimates of non-federal lands based on aerial interpretation (ALL). Trace (T) is indicated where land area was 0.49 or less acres. See *Sage Grouse Habitat Assessment Report* (2011) for methods and full results.

### APPENDIX C - LIST OF PLANT COMMUNITIES AND ASSOCIATED ROUTE SEGMENTS

#### APPENDIX C LIST OF PLANT COMMUNITIES AND ASSOCIATED ROUTE SEGMENTS

Habitat	Plant Community or Dominant Species Present-Common Name	Plant Community or Dominant Species Present-Scientific Name	Priority	Route
Perennial grasslands	Crested wheatgrass*	Agropyron cristatum		1b, 1c, 2b
	Bluebunch wheatgrass-Sandberg bluegrass,	Pseudoroegneria spicata-Poa secunda, Lithosolic		
Perennial grasslands	Lithosol*	Phase	2	1a, 1b, 2b, 2d
Sagebrush/perennial grass areas	Stiff sagebrush	Artemisia rigida	*	3с
Sagebrush/perennial grass areas	Stiff sagebrush-Bluebunch wheatgrass*	Artemisia rigida-Pseudoroegneria spicata		1b
Sagebrush/perennial grass areas	Stiff sagebrush- Sandberg bluegrass*	Artemisia rigida-Poa secunda	3	1b, 2b, 2d, 3b, 3c
Sagebrush/perennial grass areas	Big sagebrush- Western wheatgrass	Artemisia tridentata-Pascopyrum smithii		3b
Sagebrush/perennial grass areas	Big sagebrush-Bluebunch wheatgrass*	Artemisia tridentata-Pseudoroegneria spicata	3	1a, 1c, 2b, 3b, 3c
Sagebrush/annual grass areas	Big sagebrush-Cheatgrass*	Artemisia tridentata-Bromus tectorum		1b, 3b, 3c
Sagebrush/perennial grass areas	Big sagebrush-Idaho fescue	Artemisia tridentata-Festuca idahoensis	3	1b
Sagebrush/perennial grass areas	Big sagebrush- Sandberg bluegrass*	Artemisia tridentata-Poa secunda	3	1b, 2b, 2d, 3b, 3c
Sagebrush/perennial grass areas	Big sagebrush-Needle and thread*	Artemisia tridentata-Hesperostipa comata	1	3b, 3c
Annual grasslands	Non-native annual grassland*	Bromus tectorum		1a, 1b, 1c, 2b, 2d, 3c
Rabbitbrush/annual grass areas	Rubber rabbitbrush-Cheatgrass*	Ericameria nauseosa -Bromus tectorum		1b, 3b, 3c
Perennial grasslands	Saltgrass	Distichlis spicata	1	3с
Perennial grasslands	Basin Wildrye-Saltgrass*	Leymus cinereus-Distichlis stricta	1	1a, 3b
Forb	Arrowleaf buckwheat-Sandberg bluegrass	Eriogonum compositum-Poa secunda	3	2b
Forb	Shrubby buckwheat	Eriogonum microthecum		3b, 3c
Forb	Rock buckwheat-Sandberg bluegrass*	Eriogonum sphaerocephalum-Poa secunda	3	2b, 3c
Forb	Strict buckwheat-Sandberg bluegrass	Eriogonum strictum-Poa secunda		2b
Forb	Thyme buckwheat-Sandberg bluegrass	Eriogonum thymoides-Poa secunda	3	1b, 3c
Perennial grasslands	Idaho fescue-Parsnipflower buckwheat	Festuca idahoensis-Eriogonum heracleoides		1b
Aspen	Quaking aspen-Chokecherry	Populus tremuloides-Prunus virginiana	*	1b
Bitterbrush	Antelope bitterbrush-Needle and thread	Purshia tridentata-Hesperostipa comata	1	3c
Riparian	Coyote willow-Giant reed	Salix exigua-Phragmites australis		3c
Intermittent stream/Dry gully	Greasewood-Saltgrass	Sarcobatus vermiculatus-Distichlis spicata	2	1b
Annual grasslands	Cereal ryegrass	Secale cereale		3c
Perennial grasslands	Sand dropseed- Sandberg bluegrass*	Sporobolus cryptandrus-Poa secunda	2	3с
Perennial grasslands	Needle and thread-Sandberg bluegrass	Hesperostipa comata-Poa secunda	1	1a, 1b, 2d, 3b, 3c

<sup>1</sup>Plant community names are predominantly based on Steppe Vegetation of Washington (Daubenmire 1970). Where it is not based on Daubenmire 1970, it is based on documenting the dominant tree, shrub, grass, and/or forb species present. An asterisk (\*) indicates that the community is a dominant community in at least one link within the ROW corridor. Priority plant community status is based on list of 2009 WANHP Priority Rare Plant Communities or Wetlands <u>http://www1.dnr.wa.gov/nhp/refdesk/plan/CommunityList.pdf</u> (WANHP 2009).

## APPENDIX D – List of Plant Species Documented on Federal Lands within the ROW Corridor, by Route Segments

Apiaceae	Lomatium triternatum	Nine-leaf biscuitroot		Х					Х			Х
Apiaceae	Pteryxia petraea	Rockloving wavewing					Х				Х	Х
Apocynaceae	Apocynum cannabinum	Indian hemp									Х	
Apocynaceae	Apocynum sp.	Dogbane										Х
Asclepiadaceae	Asclepias speciosa	Showy milkweed	Х	Х					Х		Х	Х
Asteraceae	Achillea millefolium	Common yarrow	Х	Х			Х		Х		Х	Х
Asteraceae	Acroptilon repens	Russian knapweed									Х	
Asteraceae	Agoseris aurantiaca	Orange agoseris		Х								Х
Asteraceae	Agoseris retrorsa	Spearleaf agoseris		Х			Х				Х	Х
Asteraceae	Ambrosia acanthicarpa	Flatspine bur ragweed									Х	Х
Asteraceae	Antennaria dimorpha	Low pussytoes		Х			Х		Х		Х	Х
Asteraceae	Artemisia dracunculus	Tarragon									Х	
Asteraceae	Artemisia rigida	Scabland sagebrush		D			D		D		D	D
Asteraceae	Artemisia tridentata	Big sagebrush	D	D	Х		D		Х		D	D
Asteraceae	Artemisia tridentata ssp. tridentata	Basin big sagebrush					Х				D	Х
Asteraceae	Artemisia tridentata ssp. wyomingensis	Wyoming big sagebrush	Х	Х	Х				Х		D	D
Asteraceae	Balsamorhiza careyana	Carey's balsamroot	Х	Х			Х		Х		Х	D
Asteraceae	Balsamorhiza hookeri	Hooker's balsamroot		Х								Χ
Asteraceae	Balsamorhiza rosea	Cutleaf balsamroot		X					X			
Asteraceae	Centaurea diffusa	Diffuse knapweed	Х	Х	Х						X	D

FAMILY	SPECIES	COMMON NAME	<b>1</b> a	1b	1c	2a	2b	2c	2d	<b>3</b> a	3b	3c
Asteraceae	Centaurea sp.	Knapweed										Х
Asteraceae	Chaenactis douglasii	Douglas' dustymaiden	Х	Х	Х		Х		Х		Х	Х
Asteraceae	Chondrilla juncea	Rush skeletonweed										Х
Asteraceae	Chrysothamnus viscidiflorus	Yellow rabbitbrush	Х	D	Х		Х		Х		D	D
Asteraceae	Cirsium arvense	Canada thistle	Х	Х							Х	Х
Asteraceae	Cirsium sp.	Thistle (native)			Х		Х				Х	
Asteraceae	Cirsium undulatum	Wavyleaf thistle		Х								
Asteraceae	Conyza canadensis	Canadian horseweed										Х
Asteraceae	Crepis acuminata	Tapertip hawksbeard		Х					Х			Х
Asteraceae	Crepis atribarba	Slender hawksbeard	Х	Х	Х		Х		Х		Х	Х
Asteraceae	Crepis intermedia	Limestone hawksbeard		Х								
Asteraceae	Crepis modocensis	Modoc hawksbeard		Х					Х		Х	Х
Asteraceae	Crepis occidentalis	Largeflower hawksbeard		Х								
Asteraceae	Crepis runcinata	Fiddleleaf hawksbeard		Х								
Asteraceae	Ericameria nauseosa	Rubber rabbitbrush	Х	D	Х		Х		Х		D	D
Asteraceae	Erigeron corymbosus	Longleaf fleabane	Х	Х								
Asteraceae	Erigeron filifolius	Threadleaf fleabane	Х								Х	Х
Asteraceae	Erigeron foliosus	Leafy fleabane										Х
Asteraceae	Erigeron linearis	Desert yellow fleabane	Х	Х			Х		Х		Х	Х
Asteraceae	Erigeron poliospermus	Purple cushion fleabane		Х			Х				Х	Х
Asteraceae	Erigeron pumilus	Shaggy fleabane	Х	Х			Х		Х		Х	Х
Asteraceae	Erigeron sp.	Fleabane	Х	Х					Х		Х	Х
Asteraceae	Eriophyllum lanatum	Common woolly sunflower	Х	Х			Х		Х		Х	Х
Asteraceae	Grindelia squarrosa	Curlycup gumweed		Х								
Asteraceae	Haplopappus sp.	Goldenweed		Х								
Asteraceae	Helianthus cusickii	Cusick's sunflower		Х			Х					
Asteraceae	Hymenopappus filifolius	Fineleaf hymenopappus		Х								
Asteraceae	Hypochaeris radicata	Hairy cat's ear										Х
Asteraceae	Iva axillaris	Poverty weed										Х
Asteraceae	Lactuca serriola	Prickly lettuce	Х	Х	Х				Х		Х	Х
Asteraceae	Layia glandulosa	Whitedaisy tidytips	X	Х							X	D
Asteraceae	Lygodesmia juncea	Rush skeletonplant					Х					
Asteraceae	Machaeranthera canescens	Hoary tansyaster	Х	Х			Х		Х		Х	D
FAMILY	SPECIES	COMMON NAME	1a	1b	1c	2a	2b	2c	2d	<b>3</b> a	3b	3c
--------------	-------------------------------------	----------------------------	----	----	----	----	----	----	----	------------	----	----
Asteraceae	Madia exigua	Small tarweed		Х								
Asteraceae	Madia gracilis	Grassy tarweed		Х			Х				Х	
Asteraceae	Madia sativa	Coast tarweed										Х
Asteraceae	Microseris laciniata	Cutleaf silverpuffs									Х	
Asteraceae	Microseris nutans	Nodding microseris							Х			Х
Asteraceae	Microseris sp.	Silverpuffs										Х
Asteraceae	Nestotus stenophyllus	Narrowleaf mock goldenweed		Х			Х		Х		Х	Х
Asteraceae	Northocalais troximoides	Sagebrush false dandelion	Х	Х			Х		Х			Х
Asteraceae	Onopordum acanthium	Scotch thistle		Х								
Asteraceae	Senecio vulgaris	Old-man-in-the-Spring										Х
Asteraceae	Solidago sp.	Goldenrod		Х							Х	
Asteraceae	Sonchus oleraceus	Common sowthistle										Х
Asteraceae	Stenotus lanuginosus	Woolly mock goldenweed										Х
Asteraceae	Stephanomeria paniculata	Tufted wirelettuce		Х							Х	Х
Asteraceae	Stephanomeria minor	Narrowleaf wirelettuce		Х							Х	Х
Asteraceae	Taraxacum officinale	Common dandelion		Х							Х	Х
Asteraceae	Tetradymia canescens	Spineless horsebrush		Х							Х	Х
Asteraceae	Townsendia florifer	Showy Townsend daisy		Х			Х		Х		Х	Х
Asteraceae	Tragopogon dubius	Yellow salsify	Х	D	Х		Х		Х		Х	D
Asteraceae	Tragopogon lamottei	Jack-go-to-bed-at-noon		Х								
Asteraceae	Xanthium strumarium	Rought cocklebur										Х
Betulaceae	Alnus incana	Gray alder		Х								
Betulaceae	Betula sp.	Birch									Х	
Boraginaceae	Amsinckia menziesii var. intermedia	Common fiddleneck										Х
Boraginaceae	Amsinckia lycopsoides	Tarweed fiddleneck										Х
Boraginaceae	Amsinckia menziesii	Menzies' fiddleneck	Х	Х					Х			
Boraginaceae	Amsinckia tessellata	Bristly fiddleneck		Х	Х		Х		Х		Х	Х
Boraginaceae	Cryptantha circumscissa	Cushion cryptantha		Х							Х	Х
Boraginaceae	Cryptantha flaccida	Weakstem cryptantha		Х								Х
Boraginaceae	Cryptantha pterocarya	Wingnut cryptantha		Х			Х				Х	Х
Boraginaceae	Cryptantha simulans	Pinewoods cryptantha							Х			
Boraginaceae	Cryptantha sp.	Cryptantha		Х					Х			Х
Boraginaceae	Hackelia diffusa var. arida	Sagebrush stickseed										Х

FAMILY	SPECIES	COMMON NAME	<b>1</b> a	1b	1c	2a	2b	2c	2d	<b>3</b> a	3b	3c
Boraginaceae	Lithospermum ruderale	Western stoneseed	Х	Х							Х	Х
Boraginaceae	Myosotis laxa	Bay forget-me-not		Х								
Boraginaceae	Myosotis stricta	Strict forget-me-not		Х								
Brassicaceae	Alyssum alyssoides	Pale madwort	Х	Х								
Brassicaceae	Arabis cusickii	Cusick's rockcress		Х								
Brassicaceae	Arabis lignifera	Desert rockcress		Х								
Brassicaceae	Arabis sp.	Rockcress									Х	
Brassicaceae	Cardaria draba	Hoary cress		D								
Brassicaceae	Chorispora tenella	Crossflower	Х	Х	D		D					Х
Brassicaceae	Descurainia pinnata	Western tansymustard	Х	Х	Х		Х		Х		Х	Х
Brassicaceae	Descurainia incana	Mountain tansymustard										Х
Brassicaceae	Descurainia sophia	Herb sophia	Х	Х							Х	Х
Brassicaceae	Draba sp.	Draba									Х	Х
Brassicaceae	Erysimum asperum	Western wallflower										Х
Brassicaceae	Erysimum occidentale	Pale wallflower							Х		Х	Х
Brassicaceae	Lepidium densiflorum	Common pepperweed		Х	Х							Х
Brassicaceae	Lepidium latifolium	Broadleaved pepperweed		Х	Х							D
Brassicaceae	Lepidium perfoliatum	Clasping peppergrass	Х	Х	Х		Х				Х	Х
Brassicaceae	Lepidium sp.	Pepperweed					Х					Х
Brassicaceae	Nasturtium officinale	Watercress		Х								Х
Brassicaceae	Phoenicaulis cheiranthoides	Wallflower phoenicaulis		Х							Х	
Brassicaceae	Physaria douglasii ssp. douglasii	Twinpod									Х	Х
Brassicaceae	Sisymbrium altissimum	Tall tumblemustard	Х	D	Х		Х		D		Х	D
Brassicaceae	Sisymbrium loeselii	Small tumbleweed mustard			Х		Х					Х
Brassicaceae	Thelypodium integrifolium	Entireleaved thelopody		Х								
Brassicaceae	Thelypodium laciniatum	Cutleaf thelepody									Х	
Brassicaceae	Thelypodium milleflorum	Manyflower mustard									Х	
Brassicaceae	Unknown Brassicaceae sp.	Mustard										Х
Cactaceae	Opuntia polyacantha	Plains pricklypear	Х									
Cactaceae	Pediocactus simpsonii var robustior	Hedgehog cactus		Х								
Campanulaceae	Mertensia longiflora	Small bluebells		Х								Х
Caprifoliaceae	Sambucus nigra ssp. cerulea	Blue elderberry		Х								
Caprifoliaceae	Symphoricarpos occidentalis	Western snowberry		Х								

FAMILY	SPECIES	COMMON NAME	1a	1b	1c	2a	2b	2c	2d	<b>3</b> a	3b	3c
Caryophyllaceae	Arenaria franklinii	Franklin's sandwort		Х					Х			Х
Caryophyllaceae	Holosteum umbellatum	Jagged chickweed	D	D	D		D		D		D	D
Caryophyllaceae	Minuartia nuttallii ssp. fragilis	Nuttall's sandwort		Х							Х	
Caryophyllaceae	Moehringia macrophylla	Largeleaf sandwort	Х									
Caryophyllaceae	Silene menziesii	Menzies' campion		Х								
Caryophyllaceae	Spergularia rubra	Red sandspurry			Х		Х					Х
Chenopodiaceae	Bassia hyssopifolia	Fivehorn smotherweed									Х	Х
Chenopodiaceae	Bassia scoparia	Burningbush	Х	Х	Х						Х	D
Chenopodiaceae	Chenopodium album	Lambsquarters	Х				Х				Х	Х
Chenopodiaceae	Chenopodium simplex	Mapleleaf goosefoot		Х								
Chenopodiaceae	Chenopodium leptophyllum	Narrowleaf goosefoot		Х								
Chenopodiaceae	Grayia spinosa	Spiny hopsage		Х			Х		Х		D	D
Chenopodiaceae	Krascheninnikovia lanata	Winterfat										Х
Chenopodiaceae	Salsola tragus	Prickly Russian thistle	D	D	D		D		Х		Х	D
Chenopodiaceae	Sarcobatus vermiculatus	Greasewood		Х								
Clusiaceae	Hypericum perforatum	Common St. Johnswort									Х	
Commelinaceae	<i>Tradescantia sp.</i> (near residential areas, possible horticultural escape)	Spiderwort			X							
Convulvulaceae	Convolvulus arvensis	Field bindweed		Х							Х	
Cornaceae	Cornus sericea ssp. sericea	Redosier dogwood		Х								
Crassulaceae	Sedum sp.	Stonecrop										Х
Cyperaceae	Carex douglasii	Douglas' sedge		Х								
Cyperaceae	Carex spp.	Sedge		Х							Х	
Cyperaceae	Schoenoplectus tabernaemontani	Softstem bulrush										Х
Elaeagnaceae	Elaeagnus angustifolia	Russian olive									Х	D
Equisetaceae	Equisetum arvense	Field horsetail									Х	
Equisetaceae	Equisetum hyemale	Scouring rush horsetail									D	
Euphorbiaceae	Chamaesyce glyptosperma	Ribseed sandmat		Х							Х	Х
Fabaceae	Astragalus caricinus	Buckwheat milkvetch		Х							Х	Х
Fabaceae	Astragalus columbianus	Columbia milkvetch					Х		Х		Х	
Fabaceae	Astragalus filipes	Basalt milkvetch	Х	Х							Х	Х
Fabaceae	Astragalus leibergii	Leiberg's milkvetch									Χ	
Fabaceae	Astragalus lyallii	Lyall's milkvetch		Х							Х	

FAMILY	SPECIES	COMMON NAME	<b>1</b> a	1b	1c	2a	2b	2c	2d	<b>3</b> a	3b	3c
Fabaceae	Astragalus purshii	Woollypod milkvetch	X	Х			Х		Х		Х	Х
Fabaceae	Astragalus reventiformis	Yakima milkvetch	Х	Х								
Fabaceae	Astragalus sclerocarpus	Woollypod milkvetch									Х	Х
Fabaceae	Astragalus spaldingii	Spalding's milkvetch							Х			
Fabaceae	Astragalus speirocarpus	Threadstalk milkvetch		Х			Х				Х	Х
Fabaceae	Astragalus succumbens	Columbia milkvetch	Х						Х		Х	
Fabaceae	Cleome lutea	Yellow spiderflower									Х	
Fabaceae	Lotus unifoliolatus var. unifoliolatus	American bird's-foot trefoil									Х	
Fabaceae	Lupinus argenteus	Silvery lupine									Х	Х
Fabaceae	Lupinus pusillus	Rusty lupine									Х	
Fabaceae	Lupinus sericeus	Silky lupine	Х	Х			Х		Х		Х	Х
Fabaceae	Lupinus sp.	Lupine	Х	Х			Х		Х			
Fabaceae	Lupinus sulphureus	Sulphur lupine	Х	Х					Х		Х	
Fabaceae	Medicago polymorpha	Burclover	Х		Х						Х	Х
Fabaceae	Medicago sativa	Alfalfa		D							Х	Х
Fabaceae	Melilotus alba	Sweetclover	Х								Х	Х
Fabaceae	Melilotus officinalis	Yellow sweet-clover	Х									Х
Fabaceae	Oxytropis campestris (not var. wanapum b/c fewer than 17 leaflets)	Field locoweed									х	
Fabaceae	Psoralidium lanceolatum	Lemon scurfpea									Х	D
Fabaceae	Trifolium macrocephalum	Largehead clover		Х							Х	
Fabaceae	Trifolium sp.	Clover									Х	
Fabaceae	Vicia americana	American vetch		Х								Х
Geraniaceae	Erodium cicutarium	Redstem stork's bill		Х	Х		Х		Х		Х	Х
Grossulariaceae	Ribes aureum	Golden currant		Х								
Grossulariaceae	Ribes cereum	Wax currant		Х								
Hydrangeaeceae	Philadelphus lewisii	Lewis' mock orange									Х	
Hydrophyllaceae	Hydrophyllum capitatum	Ballhead waterleaf		Х							Х	
Hydrophyllaceae	Nemophila breviflora	Basin nemophila		Х								
Hydrophyllaceae	Phacelia hastata	Silverleaf phacelia	Х	Х					Х		Х	Х
Hydrophyllaceae	Phacelia heterophylla	Varileaf phacelia		Х								
Hydrophyllaceae	Phacelia linearis	Threadleaf phacelia	X	Χ			Х		Х		Х	Х
Hydrophyllaceae	Phacelia ramosissima	Branching phacelia	Х									

FAMILY	SPECIES	COMMON NAME	<b>1</b> a	1b	1c	2a	2b	2c	2d	<b>3</b> a	3b	3c
Juncaceae	Juncus arcticus ssp. littoralis	Mountain rush		X								Х
Juncaceae	Juncus sp.	Rush									Х	D
Lamiaceae	Agastache occidentalis	Western giant hyssop		Х								
Lamiaceae	Agastache urticifolia	Nettleleaf giant hyssop		Х			Х					
Lamiaceae	Mentha arvensis	Wild mint		Х								
Lamiaceae	Nepeta cataria	Catnip		Х								
Lamiaceae	Salvia dorrii	Purple sage	Х	Х					Х		D	D
Liliaceae	Allium acuminatum	Tapertip onion		Х							Х	Х
Liliaceae	Allium amplectens	Narrowleaf onion									Х	
Liliaceae	Allium scilloides	Fragile onion		Х								
Liliaceae	Asparagus officinalis	Garden asparagus									Х	
Liliaceae	Brodiaea coronaria	Crown brodiaea										Х
Liliaceae	Triteleia hyacinthina	White brodiaea									Х	Х
Liliaceae	Calochortus macrocarpus	Sagebrush mariposa lily	Х	Х			Х		Х		Х	Х
Liliaceae	Maianthemum stellatum	Starry false lily of the valley		Х								
Liliaceae	Triteleia grandiflora var. grandiflora	Largeflower triteleia		Х			Х		Х		Х	Х
Liliaceae	Zigadenus paniculatus	Foothill deathcamas	Х	Х							Х	Х
Liliaceae	Zigadenus venenosus	Meadow deathcamas		Х					Х		Х	Х
Loasaceae	Mentzelia albicaulis	Whitestemm blazingstar					Х				Х	Х
Loasaceae	Mentzelia laevicaulis	Smoothstem blazingstar	Х								Х	Х
Lythraceae	Lythrum salicaria	Purple loosestrife										Х
Malvaceae	Sphaeralcea grossulariifolia	Gooseberryleaf globemallow									Х	
Marsilaceae	Marsilea vestita	Hairy waterclover										Х
Moraceae	Morus alba	White mulberry									Х	
Onagraceae	Camissonia andina	Blackfoot River evening primrose		X								Х
Onagraceae	Camissonia hilgardii	Hilgard's suncup		Х								
Onagraceae	Camissonia minor	Small eveningprimrose										Х
Onagraceae	Chamerion angustifolium	Fireweed									Х	
Onagraceae	Epilobium ciliatum ssp. glandulosum	Fringed willowherb										Х
Onagraceae	Epilobium brachycarpum	Tall annual willowherb	Х	Х	Х		Х				Х	Х
Onagraceae	Gaura mollis	Velvetweed		Х								Х
Onagraceae	Gayophytum diffusum	Spreading groundsmoke		Х								

FAMILY	SPECIES	COMMON NAME	1a	1b	1c	2a	2b	2c	2d	3a	3b	3c
Onagraceae	Oenothera caespitosa var. caespitosa	Caespitose evening primrose									Х	
Onagraceae	Oenothera pallida	Pale evening primrose	Х	Х			Х				Х	D
Orobanchaceae	Orobanche californica	California broomrape		Х							Х	
Orobanchaceae	Orobanche corymbosa	Flat-top broomrape	Х						Х		Х	Х
Orobanchaceae	Orobanche fasciculata	Clustered broomrape									Х	Х
Orobanchaceae	Orobanche pinorum	Conifer broomrape										Х
Orobanchaceae	Orobanche uniflora	Oneflowered broomrape										Х
Pinaceae	Pinus contorta	Lodgepole pine									Х	
Plantaginaceae	Plantago lanceolata	Narrowleaf plantain									Х	Х
Plantaginaceae	Plantago major	Common plantain										Х
Poaceae	Achnatherum hymenoides	Indian ricegrass	Х	Х			Х		Х		Х	D
Poaceae	Achnatherum thurberianum	Thurber's needlegrass									Х	Х
Poaceae	Agropyron cristatum	Crested wheatgrass	Х	D	D		D				Х	D
Poaceae	Avena sativa	Common oat										Х
Poaceae	Bromus arvensis	Field brome		D	Х				Х		Х	Х
Poaceae	Bromus hordeaceus	Soft brome	Х	Х								
Poaceae	Bromus tectorum	Cheatgrass	D	D	D		D		D		D	D
Poaceae	Dactylis glomerata	Orchardgrass									Х	
Poaceae	Dichanthelium acuminatum	Western panicgrass										Х
Poaceae	Distichlis spicata	Saltgrass	Х	Х			Х				D	Х
Poaceae	Elymus caninus	Bearded wheatgrass										Х
Poaceae	Elymus elymoides	Squirreltail	Х	D			Х		Х		Х	Х
Poaceae	Elymus lanceolatus	Thickspike wheatgrass		Х								
Poaceae	Eremopyrum triticeum	Annual wheatgrass										Х
Poaceae	Festuca idahoensis	Idaho fescue	Х	Х	Х		Х		Х		Х	Х
Poaceae	Hesperostipa comata	Needle and thread	Х	Х			Х		Х		Х	D
Poaceae	Hordeum jubatum	Foxtail barley	Х	Х								Х
Poaceae	Hordeum marinum	Seaside barley		Х	Х							
Poaceae	Hordeum murinum	Mouse barley			Х		Х				Х	Х
Poaceae	Hordeum vulgare	Common barley										Х
Poaceae	Koeleria cristata	Prairie Junegrass										Х
Poaceae	Leymus cinereus	Basin wildrye	Х	Х	Х		Х				Х	Х
Poaceae	Leymus triticoides	Beardless wildrye										Х

FAMILY	SPECIES	COMMON NAME	1a	1b	1c	2a	2b	2c	2d	<b>3</b> a	3b	3c
Poaceae	Pascopyrum smithii	Western wheatgrass	Х	Х							Х	Х
Poaceae	Phalaris arundinacea	Reed canarygrass										Х
Poaceae	Phragmites australis	Common reed										Х
Poaceae	Poa bulbosa	Bulbous bluegrass	Х	Х	Х		Х		Х		Х	Х

Polygonaceae	Eriogonum heracleoides	Parsnipflower buckwheat		Х							Х	Х
Polygonaceae	Eriogonum maculatum	Spotted buckwheat										Х
Polygonaceae	Eriogonum microthecum	Slender buckwheat	Х	Х							Х	Х
Polygonaceae	Eriogonum niveum	Snow buckwheat		Х					Х		Х	D
Polygonaceae	Eriogonum nudum	Naked buckwheat										Х
Polygonaceae	Eriogonum pyrolifolium	Shasta buckwheat	Х	Х							Х	Х
Polygonaceae	Eriogonum sphaerocephalum	Rock buckwheat	Х	Х			Х				Х	Х
Polygonaceae	Eriogonum strictum	Blue Mountain buckwheat		Х			Х		Х		Х	Х
Polygonaceae	Eriogonum thymoides	Thymeleaf buckwheat		Х			Х		Х		Х	Х
Polygonaceae	Eriogonum vimineum	Wickerstem buckwheat										Х
Polygonaceae	Oxytheca dendroidea	Narrowleaf oxytheca		Х								
Polygonaceae	Polygonum aviculare	Prostrate knotweed									Х	
Polygonaceae	Polygonum lapathifolium	Curlytop knotweed		Х								Х
Polygonaceae	Polygonum sp.	Knotweed	Х									Х
Polygonaceae	Rumex crispus	Curly dock										Х
Polygonaceae	Rumex venosus	Veiny dock										Х
Portulacae	Lewisia rediviva	Bitter root		Х					Х			Х
Portulaceae	Cistanthe umbellata	Mt. Hood pussypaws									Х	Х
Portulaceae	Claytonia parviflora	Streambank springbeauty		Х								
Portulaceae	Claytonia perfoliata	Miner's lettuce		Х							Х	Х
Primulaceae	Dodecatheon conjugens	Bonneville shootingstar										Х
Ranunculaceae	Aquilegia formosa	Western columbine		Х								
Ranunculaceae	Ceratocephala testiculata	Curveseed butterwort		Х	Х		D					Х
Ranunculaceae	Clematis ligusticifolia	Western white clematis		Х							D	
Ranunculaceae	Delphinium glaucum	Sierra larkspur		Х								
Ranunculaceae	Delphinium nuttallianum	Twolobe larkspur					Х		Х		Х	Х
Ranunculaceae	Delphinium sp.	Larkspur										Х
Ranunculaceae	Ranunculus sp.	Buttercup		Х								

FAMILY	SPECIES	COMMON NAME	1a	1b	1c	2a	2b	2c	2d	<b>3</b> a	3b	3c
Ranunculaceae	Ranunculus uncinatus	Woodland buttercup		Х								
Ranunculaceae	Thalictrum occidentale	Western meadow-rue		Х								
Rhamnaceae	Frangula purshiana	Cascara buckthorn										Х
Rosaceae	Amelanchier alnifolia	Saskatoon serviceberry									Х	
Rosaceae	Prunus virginiana	Chokecherry		Х								
Rosaceae	Purshia tridentata	Antelope bitterbrush	Х	Х							D	D
Rosaceae	Rosa woodsii	Woods' rose		Х							Х	
Rubiaceae	Galium aparine	Stickywilly	Х	Х							Х	Х
Rubiaceae	Galium multiflorum	Shrubby bedstraw	Х	Х							Х	Х
Salicaceae	Populus alba	White poplar									Х	Х
Salicaceae	Populus balsamifera ssp. trichocarpa	Black cottonwood	Х	Х							Х	
Salicaceae	Populus tremuloides	Quaking aspen		Х								
Salicaceae	Salix amygdaloides	Peachleaf willow										Х
Salicaceae	Salix exigua	Narrowleaf willow		Х								Х
Santalaceae	Comandra umbellata	Bastard toadflax	Х								Х	Х
Scrophulariaceae	Castilleja cervina	Deer Indian paintbrush		Х								Х
Scrophulariaceae	Castilleja thompsonii	Thompson's Indian paintbrush	Х	Х			Х				Х	Х
Scrophulariaceae	Collinsia parviflora	Maiden blue eyed Mary		Х							Х	Х
Scrophulariaceae	Linaria dalmatica	Dalmatian toadflax	Х	Х								Х
Scrophulariaceae	Lithophragma parviflorum	Smallflower woodland-star		Х							Х	Х
Scrophulariaceae	Mimulus gutattus	Common monkey-flower		Х								
Scrophulariaceae	Orthocarpus barbatus	Grand Coulee owl's-clover										Х
Scrophulariaceae	Penstemon acuminatus	Sharp-leaf penstemon										Х
Scrophulariaceae	Penstemon deustus	Scabland penstemon									Х	
Scrophulariaceae	Penstemon gairdneri	Gairdner's beardtongue		Х								Х
Scrophulariaceae	Penstemon glandulosus var. chelanensis	Stickystem penstemon		Х								
Scrophulariaceae	Penstemon richardsonii var. richardsonii	Richardson's penstemon		Х							Х	
Scrophulariaceae	Penstemon sp.	Penstemon	Х	Х							Х	Х
Scrophulariaceae	Penstemon speciosus	Royal penstemon	Х	Х								Х
Scrophulariaceae	Verbascum thapsus	Common mullein	Х	Х							Х	Х
Scrophulariaceae	Veronica americana	American speedwell		Х								
Selaginellaceae	Selaginella wallacei	Wallace's spikemoss	Х	D			D		Х			Х
Solanaceae	Solanum tuberosum	Irish potato										Х

FAMILY	SPECIES	COMMON NAME	1a	1b	1c	2a	2b	2c	2d	<b>3</b> a	3b	3c
Typhaceae	Typha latifolia	Broadleaf cattail										Х
Ulmaceae	Ulmus pumila	Siberian elm	Х								Х	
Urticaceae	Urtica dioica	Stinging nettle		Х								
Valerianaceae	Plectritis macrocera	Longhorn plectritus	Х	Х								Х
Verbenaceae	Verbena bracteata	Bigbract verbena	Х	Х							Х	Х
Violaceae	Viola trinervata	Rainier violet		Х			Х				Х	Х
Zygophyllaceae	Tribulus terrestris	Puncturevine	Х									Х

APPENDIX A TARGET NOXIOUS WEED SPECIES LIST

# 1.0 INTRODUCTION

The noxious weed survey was conducted on approximately 450 acres of accessible federal lands within the right-of-way (ROW) corridor for the proposed 230 kilovolt (kV) Vantage to Pomona transmission line (ca 32.5 miles of ROW corridor centerline) between the existing Pomona Heights Substation near Yakima, Washington, and the Vantage Substation located adjacent to the Columbia River and north of Beverly, Washington. This work was conducted to provide information about noxious weeds specific to the proposed project. Habitat assessment and special status plant surveys were coordinated at the same time as the noxious weed surveys, and these are both discussed in separate reports. Appendix B-2 and Appendix B-3.

Each year, the State Noxious Weed Control Board adopts, by rule (WAC 16-750), the State Noxious Weed List. This list determines which plants will be considered noxious weeds and where control will be required in Washington State. This approach allows control activities of land owners - both public and private - to be prioritized towards the protection and enhancement of Washington's agriculture and natural areas in the most cost-effective manner.

There are three classes of noxious weeds on the state noxious weed list. These include:

- Class A: Non-native species that are limited in distribution in Washington. State law requires that these weeds be eradicated.
- Class B: Non-native species that are either absent from or limited in distribution in some portions of the state but very abundant in other areas. The goals are to contain the plants where they are already widespread and prevent their spread into new areas.
- Class C: Non-native plants that are already widespread in Washington State. Counties can choose to enforce control, or they can educate residents about controlling these noxious weeds.

Once the State Noxious Weed list is adopted, county and district weeds lists are created from the updated State Noxious Weed List. County weed lists include all State Class A weeds and Class B weeds designated by the state for control their area according to WAC 16-750. Counties and districts can then select additional Class B weeds and Class C weeds that they will require control of in their area.

# 2.0 METHODS

Qualified botanists documented target noxious weed species on accessible federal lands within the ROW corridor for the alternate route segments. Federal lands were considered inaccessible due to: restricted access on the Yakima Training Center (YTC); access issues crossing private lands; dangerously steep terrain; and excessively long distances (greater than one mile) to hike from car to the ROW corridor. Three surveys were conducted to address the different phenology (timing of flowering and/or fruiting) of target special status plant species. The noxious weed survey was coordinated with the second special status plant survey, which occurred during June 22-29, 2011. Incidental observations of noxious weeds that were observed during the May 16-25 and August 8-10, 2011 were documented if not already previously mapped. Federal lands that were accessed included Bureau of Reclamation (Reclamation), Bureau of Land Management (BLM), YTC, and U.S. Fish and Wildlife Service (USFWS). Preconstruction clearance surveys will be identified and detailed in the Plan of Development (POD).

### **Surveyor Qualifications**

Noxious weed surveys were conducted by botanists who have the following minimum qualifications:

- An academic background (bachelor's degree or higher in botany) or equivalent experience in plant taxonomy;
- The taxonomic experience to identify, through personal knowledge or the use of technical floras, most species encountered in the field, and an understanding of how to contact taxonomic experts for species that they are unable to identify;
- The skills to use GPS to adequately map occurrences of special status plant species; and
- Familiarization of the potential special status plant species in the project area.

### **Field Preparation**

The list of target noxious weeds was developed to include those designated by the Washington State Noxious Weed Control Board (2011), plus any additional noxious weeds designated by the project counties (Benton, Grant, Kittitas, and Yakima). Sources of information for noxious weed species included the *Vascular Plants of the Pacific Northwest: Vols. I-V* (Hitchcock et al. 1969), *Flora of the Pacific Northwest* (Hitchcock and Cronquist 1973), *Noxious Weeds that Harm Washington: Eastern and Western Washington Field Guides* (WSNWCB 2009a,b), *Weeds of the West* (Whitson et al. 2000), and botanists' personal knowledge of the species.

### **Field Survey**

A complete pedestrian survey was conducted during June 22-29, 2011 for the target noxious weed species on accessible federal lands with a 25 meters separation between surveyors, covering the 160 foot (ca 49 meter) ROW corridor. Botanists walked roughly parallel intuitive meandering transects while they were targeting habitats most likely to support special status plant species. The survey was floristic, meaning that all taxa were identified to the level necessary to determine if they are special status plant or noxious weed species (except if the plant was in an unidentifiable stage; i.e., from grazing).

A survey-grade GPS was used to document the occurrence of target noxious weed species discovered. For each noxious weed species occurrence discovered, the following attributes were documented: species name, date, surveyor name(s), estimated number of plants, estimated cover, and estimated land area occupied. Very steep slopes and other conditions that pose a safety hazard were not surveyed. Very steep slopes are typically avoided for installation of transmission line structures or structures are installed using special methods such as helicopters, minimizing ground disturbance. In addition, botanists communicated with YTC personnel to ensure surveys were coordinated with training activities.

# 3.0 RESULTS

Of the 674 acres of federal lands within the 160 foot wide ROW corridor, 450 acres were accessible and surveyed. The remaining 224 acres of federal lands that were not surveyed were inaccessible due to restricted access on the YTC, access issues crossing private lands, dangerously steep terrain, and excessively long distances to hike from car to the ROW corridor.

Twenty noxious weed species were documented on accessible federal lands, including 11 Washington Class B species and nine Washington Class C species (Table 1 and Table 2). No Washington Class A species were documented. The control of Washington Class C species is at the discretion of each county. Grant, Kittitas, and Yakima Counties require control of all of the Class C species found during the survey, exept for reed canarygrass (*Phalaris arundinacea*). This species is not listed for control in any of the counties (Noxious Weed Control Board of Grant County (2011), Kittitas County Noxious Weed Control Board (2011), and Yakima County Noxious Weed Board (2011)). Horseweed (*Conyza canadensis*) is listed as a Kittitas County Class C weed and control is required in that County.

		Sp	ecies Background	1,2,3,4,5,6	Legal No Stat		
Species Name	Life Span	Growth Habit	Reproductive Mechanisms	Suitable Habitat	Washington	County	Location of Species (Route Segment)
Russian knapweed Acroptilon repens	perennial	forb	creeping roots, seeds	Disturbed land such as cultivated fields, orchards, pastures and roadsides.	Class B	G, K, Y	3b
Burningbush <i>Bassia scoparia</i> (= <i>Kociah</i> <i>scoparia</i> )	annual	forb	seeds	Cultivated fields, roadsides, ditch banks and waste areas.	Class B	G	1a, 1b, 1c, 3b, 3c
Hoary cress <i>Cardaria draba</i>	perennial	forb	creeping roots, seeds	Moist, open unshaded areas. Can invade irrigated pastures, ditch banks, roadsides and waste areas. Typically does not invade arid rangelands.	Class C	G, K	1a, 1b
Diffuse knapweed <i>Centaurea</i> diffusa	annual, perennial	forb	seeds	Disturbed areas, dry pasturelands, and meadows.	Class B	G, K, Y	1a, 1b, 1c, 2b, 3b, 3c
Rush skeletonweed <i>Chondrilla</i> juncea	perennial	forb	seeds	Disturbed cropland, rangeland, roadways, and waste areas.	Class B	G, K, Y	3с
Canada thistle Cirsium arvense	perennial	forb	creeping roots, seeds	Wide habitat range and fairly adaptable. Disturbed open areas with moderate moisture conditions. Along roadsides, railroad ROW, rangeland, forestland, cropland, and abandoned fields.	Class C	G, K	1a, 1b, 3b, 3c
Field bindweed Convolvulus arvensis	perennial	vine, forb	creeping roots, seeds	Disturbed cultivated and waste areas.	Class C	G, K	2b, 3b
Horseweed <i>Conyza</i> <i>canadensis</i>	annual	forb	seeds	Pastures, meadows, cultivated fields, along roadways and in waste areas.		К	3c
Common St. Johnswort <i>Hypericum</i> <i>perforatum</i>	perennial	forb	seeds, short runners	Disturbed sunny, well-drained areas with gravelly or sandy soils.	Class C	G	3b

### TABLE 1 SPECIES BIOLOGY AND LIST OF NOXIOUS WEED LOCATIONS BY ROUTE SEGMENT

		Sp	ecies Background	Legal No Stat			
Species Name	Life Span	Growth Habit	Reproductive Mechanisms	Suitable Habitat	Washington	County	Location of Species (Route Segment)
Common catsear <i>Hypochaeris</i> <i>radicata</i>	perennial	forb	seeds	Disturbed sites, waste areas, pastures and cultivated fields.	Class B	G, K	3c
Perennial pepperweed <i>Lepidium</i> <i>latifolium</i>	perennial	forb/herb	rhizomes, seeds	Wet areas, ditches, roadsides and cropland.	Class B	G, K, Y	1b, 1c, 3c
Dalmatian toadflax <i>Linaria dalmatica</i> ssp. <i>dalmatica</i>	perennial	forb/herb	creeping roots, seeds	Well-drained, coarse textured soils. Disturbed areas such as roadsides, gravel pits, rangelands and waste areas.	Class B	G, K, Y	1a
Purple loosestrife <i>Lythrum</i> salicaria	perennial	forb	rhizomes, seeds	Aquatic sites along ditches, streams, ponds, and lake shores.	Class B	G, K, Y	3с
Scotch thistle Onopordum acanthium	biennial	forb/herb	seeds	Areas with high soil moisture. Frequently associated with waterways, bottoms of gullies, draws and roadsides.	Class B	G, K, Y	1b, 1c, 3b, 3c
Reed canarygrass <i>Phalaris</i> <i>arundinacea</i>	perennial	grass	large rootstalks	Wet meadows, marshes, pastures, lake margins and ditches.	Class C		3c
Common reed (nonnative genotype) <i>Phragmites</i> <i>australis</i>	perennial	subshrub , shrub, graminoi d	rhizomes, seeds	Marshes, river edges, shores of lakes and ponds, roadsides, disturbed areas.	Class B	G	3c
Russian thistle Salsola iberica (=S. kali)	annual	forb	seeds	Disturbed dry sites such as cultivated dryland agriculture and over-grazed rangelands.	Class C	K	1a, 1b, 1c, 2b, 2d, 3b, 3c
Cereal rye <i>Secale cereale</i>	annual	graminoi d	seeds	Roadsides, waste areas and open rangeland.	Class C	G	3с
Groundsel <i>Senecio</i> <i>vulgaris</i>	annual, biennial	forb	seeds	Disturbed sites such as roadsides, railroad beds and pastures.	Class C	G	3с
Puncturevine Tribulus terrestris	annual	forb/herb	seeds	Pastures, cultivated fields, waste sites, along highways and roads.	Class B	G, K, Y	1a, 3c

<sup>1</sup>Burningbush and Russian thistle were not mapped due to their ubiquitous and often dominant nature across most accessible federal lands. <sup>2</sup>Horseweed, common cat's-ear, groundsel, and puncturevine were not determined to be noxious until after the surveys were complete. Information is based on notes and retrospective mapping.

Figures 1 and Figure 2 show the known distribution of all noxious weeds found on accessible federal lands for each route segment. All noxious weed species were mapped, except for two species because of their ubiquitous and often dominant nature across most accessible federal lands. These include kochia *(Kochia scoparia;* Class B) and Russian thistle (*Salsola iberica;* Class C). In addition, some species shown in the maps were not determined to be noxious until after the surveys were complete, so their mapped distribution is based on notes and retrospective mapping. These include horseweed (*Conyza canadensis*), common cat's-ear (*Hypochaeris radicata*), groundsel (*Senecio vulgaris*), and puncturevine (*Tribulus terrestris*). Some of these species were partially mapped in the field and all occurred on Reclamation lands.

Route 3c had the largest number of Class B and C noxious weed species (13 species) and occurrences (36), which were associated with the irrigation canals and agricultural lands on the Reclamation lands (Table 3). Routes 1a, 1b, 1c, and 3b also had a substantial number of noxious weed species. Routes 2c and 2d had the fewest number of noxious weed species documented. Many other areas where noxious weeds were documented were characterized by vectors for weed establishment and spread, such as roads, the YTC fire breaks, areas with past fire events, riparian areas, and agricultural lands and associated irrigation canals.

ROUTE	CLASS A	CLASS B	CLASS C							
1a	0	4	3

# 4.0 **RECOMMENDATIONS**

A Noxious Weed Management Plan will be prepared for the proposed 230 kV Vantage to Pomona Transmission Line project to address what measures will be implemented by Pacific Power and its contractors to treat and prevent the establishment and spread of noxious weeds. This plan will address the following components:

- Regulations related to noxious weeds and weed management.
- List of all noxious weeds relevant to the project area, and whether they are known to occur within the ROW corridor.
- Mitigation measures for preventing the establishment and spread of noxious weeds.
- Mitigation measures for treating noxious weeds without damaging sensitive resources.
- Procedures for monitoring and documenting weed control activities during construction and for three years after construction is completed.

Pacific Power is committed to preventing the establishment and spread of noxious weeds during construction, operation, and maintenance of the proposed project.
