DOE Bioenergy Technologies Office (BETO) 2015 Project Peer Review

Novel Electro-Deoxygenation Process for Bio Oil Upgrading

March 24, 2015
Thermochemical Conversion

S. (Elango) Elangovan

Goal Statement

- Demonstrate the techno-economic feasibility of upgrading biomass derived pyrolysis oil using electro-deoxygenation process
- Move technology from concept stage (TRL 1) to practical, applied R&D at TRL 2-3

| Technical Area Objective | Relevance of Innovation |
|---------------------------------|--|
| Carbon Efficiency | Deoxygenation of both organic and aqueous phase of bio-oil prior to phase separation |
| Hydrogen Efficiency | In-situ hydrogen generation from steam present in bio-oil |

- Advance DOE-BETO goal of producing bio-oils with desirable qualities for making hydrocarbon transportation fuels
- Enable acceptance of widely varied non-food, "high impact" biomass based bio-oil feedstocks to produce fuels that are similar to those found in crude oil derived products.

Quad Chart Overview

Timeline

Project start date: October 1, 2013

Project end date: September 30, 2016

• Percent complete: 33%

Budget

| | FY 14 Costs | Total Planned Funding (FY 15-Project End Date) |
|-----------------------------|----------------|---|
| DOE Funded | \$ 485,820 | \$ 2,118,326 |
| Cost Share (Ceramatec) | \$ 169,044 | \$ 581,456 |
| Cost Share (Drexel Univ) | | \$ 75,776 |

Barriers

- Bio-Oil stabilization and improved catalysts for deoxygenation
- Removal of hydroprocessing steps with processing inline with fast pyrolysis
- Understanding of coking and contamination issues within process
- High C efficiency by utilization of aqueous phase of bio-oil
- Technical target: Integration of deoxygenation process and pyrolysis unit

Partners

PNNL (20%):

Pyrolysis Integration

Drexel University (10%):

LCA

Technology Holding, LLC:

TEA consultancy

Project Overview

Bio-Oil as a fuel Source

- Low heating value, incomplete volatility, acidity, instability, and incompatibility due to <u>oxygenated organic compounds</u>
- Elimination of oxygen by current processes is inefficient; requires hydrogen; amenable to only centralized processing
- Ceramatec has demonstrated oxygen removal from CO₂/steam mixture and proposed extending the concept to deoxygenation of bio-oil

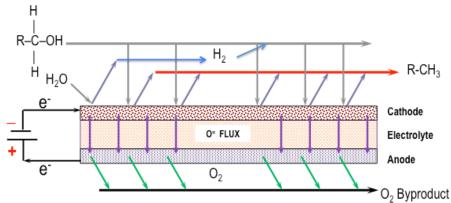

Program Objectives

- 1. Demonstrate technical feasibility of electrochemical deoxygenation (EDOx) reactor at bench scale
- 2. Integrate the EDOx reactor with a bench scale pyrolysis reactor
- 3. Perform overall process simulation
- 4. Perform life cycle analysis and overall techno-economic modeling
- 5. Prepare a preliminary commercialization plan

Approach (Technical)

- Oxygen ion based membrane electrolyzer
 - Technology has been demonstrated for electrolysis of CO₂-steam mixture to produce CO+H₂ mixture by using electric energy
- Unique Aspects:
 - Direct removal of oxygen from bio-oil compounds
 - In-situ generation of hydrogen from steam electrolysis for indirect deoxygenation

- Removed oxygen is electrochemically transported across the membrane and is a high purity valuable byproduct
- Y1 Go/No-Go Decision Points to show Proof of Concept
 - 60% efficiency of deoxygenation using model compounds
 - 30% efficiency of deoxygenation and 75% C and H efficiency using aqueous fraction of bio-oil

Approach (Management)

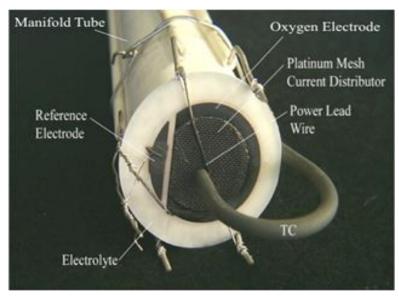

- Critical success factors
 - Technical: Demonstration of bio-oil deoxygenation at high (85%)
 C and H efficiency
 - Market: Adaptation of distributed pyrolyzers with economical access to bio-mass
 - Business: Investment in manufacturing infrastructure for large scale production of electrolysis units
- Potential challenges
 - Direct integration of EDOx units with a pilot scale pyrolyzer
 - Electrode poisoning from contaminants in pyrolysis vapors
- Project structure
 - Ceramatec: Leading R&D company in solid oxide electrolysis
 PNNL: A national lab with extensive pyrolysis experience
 Drexel: University to evaluate LCA and TEA aspects of overall process
 - Monthly teleconference among team members and quarterly milestone updates to DOE

CERAMATEC TOMORROW'S CERAMIC SYSTEMS

Technical Accomplishments/Progress/Results

Test Set-up

Electrochemical Button Cell

- Preliminary screening of deoxygenation capability
- ~ 2 cm² electrode active area
- Stirred reactor configuration
- Evaluation of operating conditions

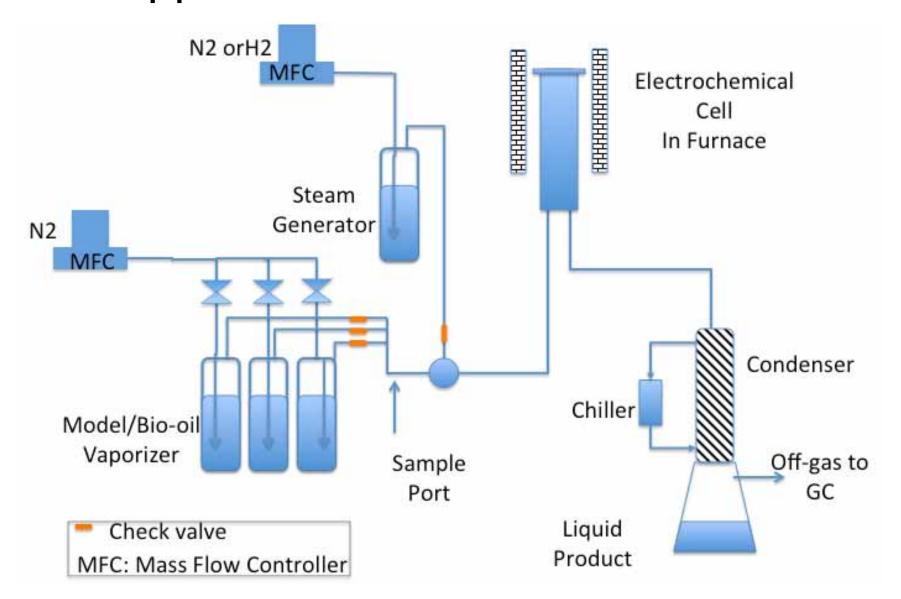

Electrochemical Stack

- Larger scale testing ~50 cm² active area
- Typically 10 cell stacks
 - longer residence time
 - No mixing of fresh inlet and product stream

Test Apparatus Schematic

Selected Model Compounds

- Acetic acid
- Acetol (hydroxyacetone)
- Levoglucosan
- Furfural
- Methyl-2-cyclopenten-1-one

- xyacetone) Guaiacol
 - Syringol

Phenol

Methanol

- Model Compounds:
 - Selected to cover representative compounds from carbohydrate and lignin fractions
- Bio-oil Testing:
 - Only aqueous fraction selected more stable to reheating
- Integrated DeOX unit will face slip stream entire bio-oil vapor prior to condensation

Technical Accomplishments: LCA/Process Modeling

- Life Cycle Inventory:
 - Forest residue harvest and farmed tree harvest (Southern Pine) as feedstock
 - Completed for feedstock, additional computation being finalized to complete fuel conversion segment of the fuel production LCI model
- ASPEN+ Modeling:
 - Material and energy balance modeling of fast pyrolysis to bio-oil
 - Model Compounds: Fufural and levoglucosan

Advanced Bio-oil Markets

- Harvesting equipment and energy
- Transportation steps

Feedstocks:

Woody biomass(Forest residues)

- Electricity
- Feedstock provides thermal energy

Technologies:

- Fast Pyrolysis
- Electro de-oxygenation

- Petroleum blendstock
- Bio-char (co-product)

Transportation fuel market:

- -Substitute for gasoline, diesel, or petroleum blendstock
 -Co-products may be land
- -Co-products may be land applied (sequestration)

Technical Accomplishments/ Progress/Results **Summary**

- Year 1 Technical Objectives/Results
 - 60% efficiency of deoxygenation from mixtures of model compounds
 - 30% efficiency of deoxygenation and 75% C and H efficiency using aqueous fraction of bio-oil

Elemental Balance Between Feed and Product

| | Syringol Cell 32 | Guaiacol Cell 35 1.3 V | BioOil Cell 39 |
|----------|---------------------|---------------------------|-------------------|
| Carbon | 23.3% | 10.1% | 15.8% |
| Hydrogen | 2.3% | -3.7% | -24.9% |
| Oxygen | -47.2% | -25.5% | -24.6% |

Relevance

23

- BETO Multi-Year Program Plan of Using Bio-oil as source of fuel
 - Project demonstrated feasibility of deoxygenation of bio-oil.
 - Both model compounds and aqueous phase of pinewood pyrolysis oil showed oxygen loss via electrochemical means
 - High C and H efficiency was indicated
- EDOx unit can be potentially integrated to pyrolysis unit to stabilize bio-oil prior to cooling
- Project objective is to demonstrate integrated operation of EDOx with pilot scale pyrolysis unit at PNNL
- Successful project will enable hydrogen-free, integrated operation of pyrolyzer to provide stable pyrolysis oil product
- Ceramatec's parent company CoorsTek is the largest technical ceramics manufacturer. Ceramatec will seek to team with a bio-oil producer to demonstrate the technology at TRL 4 – 5.

Future Work

- Process improvement to reach project milestone of 60% efficiency of deoxygenation and 85% C and H efficiency using aqueous phase of bio-oil
 - Evaluation of catalyst with high selectivity for non-oxygenated compounds
 - Improved feed system to introduce entire aqueous phase of bio-oil vapor
 - Elimination of system leaks through improved seals and product collection
 - Integration of gas product in overall mass balance
- Engineering prototype of integrated Electro-EDOx design
 - Final stack design integrated at PNNL
- Completion of TEA and Modeling Efforts
 - ASPEN+ and LCA

Summary

- A novel electrochemical means of deoxygenation demonstrated
 - 1. No external hydrogen feed
 - 2. Electric input allows distributed, small scale operation
 - 3. Integration with pyrolyzer will allow upgrading prior to bio-oil cooling
- 2. Feasibility demonstrated with button cells and stacks using standard electrolysis electrodes
 - 1. Model compounds showed 25 to 47% oxygen removal
 - 2. Bio-oil showed 25% oxygen removal
- 3. When matured, electrochemical process will addres techno-economic challenges of upgrading of bio-oil
- 4. Integrated testing of EDOx unit with PNNL's pilot scale pyrolyzer planned
