DOE OFFICE OF INDIAN ENERGY
The Five-Step Development Process
Step 3: Project Refinement
Project Ownership

Financing structure is highly dependent on size of the project and the capital available for a given project:

- Tribe owns the project (cash purchase or debt)
- Tribe hosts the project and buys the electricity (power purchase agreement)
- Tribe partners with private sector and co-owns the project (uncertainties about receipt of tax benefits)
Financing Options and Sources of Capital

- Cash on hand (e.g. reserves, trust, cash flow from other activities)
- Grants from third parties
- Renewable Energy Incentives (e.g. SASH)
- Monetizing green attributes (e.g. RECs)
- Debt
- Energy savings performance contracts (ESPCs) and Utility Energy Savings Contracts (UESCs)
- Tax equity investors seeking tax incentives

Project Scale

Facility: single-building system
Primary goals: offset building energy use, costs
Development timeline: 1 month to 1 year
10 kW @ $3.50/Watt
$35,000

Community: multiple buildings/campus
Primary goals: Offset community energy costs, promote energy self-sufficiency
Development timeline: 6 months to 2 years
100 kW @ $2.75/Watt
$275,000
1000 kW @ $2.25/W
$2,250,000
Paying for the Project

Three Major Costs to Develop a Project

- **Feasibility** – this is the project potential analysis
- **Preconstruction** – permitting, environmental
- **Construction** – engineering, procurement of equipment, and actual construction of plant

PV panels installed on Grand Ronde Tribal Housing Authority carport.
42 kW: Combination of tribal funds and state incentives
Photo from GRTHA, NREL 31797

Costs and Cash Flows Example (Hypothetical, without tax credits)

For facility and community projects, cash flow will largely depend on the retail electricity rate, production, “load shape”, and presence of net metering
Levelized Cost of Energy (LCOE)

• Measures lifetime costs divided by energy production, captured in $/MWh or ¢/kWh

• Calculates present value of the total cost of a) building and b) operating a power plant over an assumed lifetime

• Allows the comparison of different technologies (e.g., wind, solar, natural gas) of unequal life spans, project size, different capital cost, risk, return, and capacities

Critical to making an informed decision to proceed with development of a facility or community energy project.
### Simplified LCOE Concept

Adapted from European Wind Energy Association, “Economics of Wind Energy.”

### Using LCOE

Calculating and comparing LCOE can:

- Measure value across the longer term, showing probable life-cycle costs
- Highlight opportunities for Tribes to develop different scales of projects (facility, community, or commercial)
- Inform decisions to pursue projects on an economic basis, compared to utility rates

Most renewable energy projects have zero fuel costs (with biomass being the possible exception)
Net Metering

- Contract with utility that compensates generators for electricity fed onto the grid (i.e. not consumed onsite)
- Commonly, compensation is at the retail rate (though this is under dispute in many states)
- Can be a critical component to realizing return on investment for facility and community projects
Paying for it – Small-Scale

- Tribal Funds
- Grants
- Incentives
- RECs

10 kW @ $3.50/W
$35,000

Direct Ownership Structure

Primarily for facility and community-scale projects

The Tribe is the owner in this structure and self-generates its electricity
Hypothetical Solar Project: Direct Ownership

- 10 kW
- Installation on rooftop of small administrative building, Southern California
- Offset SCE GS-1 Rate (assume 1% annual increase)
- $35,000 capital cost
- Cash purchase
- No incentives, no REC sales

### 30-Year Analysis

<table>
<thead>
<tr>

<tr>
<td>LCOE</td>
<td>15.16 ¢/kWh</td>
</tr>
<tr>
<td>Electricity cost without system</td>
<td>$12,492</td>
</tr>
<tr>
<td>Electricity cost with system</td>
<td>$9,690</td>
</tr>
<tr>
<td>Net savings with system</td>
<td>$2,802</td>
</tr>
<tr>
<td>Payback period</td>
<td>11.6 years</td>
</tr>
</tbody>
</table>

Below average retail rate?

Acceptable timeframe?

Paying for it – Mid-Scale

- 100 kW @ $2.75/W
- $275,000

- Tribal Funds
- Grants
- Incentives
- RECs
- Loans
Ownership with Debt

The Tribe finances portion or all of the project with a loan. Can be recourse or nonrecourse debt. The Tribe and Electricity Users are responsible for payments, and the utility is responsible for payments to the Tribe. Debt is serviced from utility bill savings. Potential sources of debt/loans include:

- Tribal Economic Development Bonds (TED)
- Commercial bank loans
  - Credit enhancements (e.g., loan guarantees)
- Other Tax Credit Bonds (QECB/CREBS)
- Other
Hypothetical Solar Project: Loan Finance

- 100 kW
- Ground-mount installation serving an office complex, Southern California
- Offset SCE GS-2 Rate (assume average 17% demand charge offset annually)
- $275,000 capital cost, 100% debt financed
- 20-year loan, 6% interest rate
- No incentives, no REC sales

<table>
<thead>
<tr>

Paying for it – Large Scale

- 1 MW @ $2.25/W
- $2,250,000

- Tribal Funds
- Grants
- Incentives
- RECs
- Loans
- Tax Credits?
**Primary Federal Tax Credits and Incentives**

<table>
<thead>
<tr>
<th></th>
<th>PTC</th>
<th>ITC</th>
<th>Accelerated Depreciation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Value</strong></td>
<td>Tax credit of 2.3¢/kWh</td>
<td>Tax credit of 30% of project costs</td>
<td>Depreciation of eligible costs according to an annual schedule</td>
</tr>
<tr>
<td><strong>Primary Technology</strong></td>
<td>Wind</td>
<td>Solar</td>
<td>Can be taken with either PTC or ITC</td>
</tr>
<tr>
<td><strong>Basis</strong></td>
<td>Energy produced over 10-year period</td>
<td>Eligible project cost. Credit taken at the time the project is placed in service</td>
<td>Qualifying project cost. If used with ITC, basis is reduced by half of the credit (i.e. 85% of qualifying costs)</td>
</tr>
</tbody>
</table>

**Issues w/ Tax Credits**

- Tribes cannot directly use tax benefits because they have no federal tax liability
  - Project still may be able to benefit—i.e. reduced cost of energy
- “Tax exempt” entities cannot partner with, or be party to a lease with a taxable entity on a project that receives tax benefits—“Pickle Rules”
  - IRS has opined that Tribes are not “tax exempt” (though still explicitly prohibited from receiving accelerated depreciation benefits as per Section 168 of Internal Revenue Code
### Solutions

- Power purchase agreement (PPA)
- Use of “blocker corporations” (i.e. taxable entity, such as an LLC) to partner or be party to a lease with a taxable entity
- 2013 Private Letter Ruling – Tribes are not “tax-exempt” entities (more on that in a minute...)
- New market tax credits

### Third-Party Power Purchase Agreement

The customer agrees to **host** the system and **purchase** the electricity

- **Host** of Renewable Energy Generation Equipment
- Revenue from electricity sales
- Renewable Energy Developer and Financial Partner
- Various project finance structures
- Tax Benefits
- Remaining electricity needs
- Renewable electricity at fixed prices
- Worth ~50% of the cost of a solar system
- Local Utility
- Remaining electricity needs

Worth ~50% of the cost of a solar system
Power Purchase Agreement (PPA) Considerations to Weigh

**Advantages**

- No/low up-front costs
- No O&M
- Benefit from tax incentives
- Locked-in energy price
- Path to ownership

**Disadvantages**

- May not beat current electricity rates
- Tough economics for small projects
- Higher transaction costs
- REC and project ownership requirements

March 8, 2013 IRS Private Letter Ruling – 111532-11

“Based on your representation that the Renewable Energy Assets qualify as energy property under § 48 and our conclusion that an Indian tribal government is neither a governmental unit described in § 50(b)(4) nor an organization exempt from tax imposed by Chapter 1 for purposes of § 50, we conclude that Tribe may elect to pass investment credits associated with the Renewable Energy Assets to Lessee under § 50(d)(5).”

(A PLR, is a written statement issued to a specific taxpayer that interprets and applies tax laws to that taxpayer’s represented set of facts. A PLR may not be relied on as precedent by other taxpayers or by IRS personnel.)
New Market Tax Credits

- 39% tax break
  - 5% in first 3 years
  - 6% in last 4 years
  - Net value: 20% due to financing complexity, number of parties

- CDE can shop credits to investors
  - Renewable energy project must be aligned with CDE mission
  - CDEs take time to establish

- Examples
  - 1 MW PV City of Denver’s buildings
  - 1.65 MW PV in Salt Lake City

Hypothetical Solar Project: PPA vs. Tribe Ownership

- 1 MW
- Ground-mount installation in Southern California
- $2,250,000 capital cost
- No REC sales

<table>
<thead>
<tr>
<th></th>
<th>PPA</th>
<th>Tribe-Owned</th>
</tr>
</thead>
<tbody>
<tr>
<td>Developer-owned, tax equity monetizes ITC and MACRS. Tribe can purchase project after tax benefits fully vest</td>
<td>100% debt-financed (20 year term, 6.5% interest), no tax benefits</td>
<td></td>
</tr>
<tr>
<td>Year 1 PPA Price: 15.17¢/kWh</td>
<td>LCOE: 16.04¢/kWh</td>
<td></td>
</tr>
<tr>
<td>Tribe-Owned</td>
<td>50% debt-financed (20 year term, 6.5% interest), 50% equity (6% IRR) no tax benefits</td>
<td></td>
</tr>
<tr>
<td>LCOE: 17.32¢/kWh</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
On-Request Technical Assistance

Apply for up to 40 hours of in-depth technical assistance to:

• Address a specific challenge
• Fulfill a need that is essential to a current project’s successful implementation

Two categories of technical assistance:

1. **Strategic Energy Planning**—an on-site workshop that walks tribal leaders and staff through a nine-step planning process

2. **Project Development Support**—Expert guidance and analysis that helps address specific project barriers. Examples include:
   - Third-party independent reviews of transmission studies, financing structures, lease agreements, project reports
   - Modeling and analysis (or assistance using modeling/analysis tools)
   - Pre-feasibility transmission Studies
   - Interconnection agreement facilitation
   - Economic evaluations
   - System design reviews

Learn more and apply online: energy.gov/indianenergy/technical-assistance
Procurement Process for Facility- and Community-Scale Projects

Step 1: Develop and Issue RFP

Step 2: Make Selection

Step 3: Negotiate Contracts

Potential Project Partners to Procure

- Consider GSA as a resource for procurement: http://www.gsa.gov/portal/category/20998
- Project developer
- Engineering, procurement, and construction (EPC) contractor
- Environmental permits contractor
  - May apply to some community projects, but not to others

Request for Proposals (RFP) Process Outline

1. Develop RFP
   - Timeline: 1 month to 1 year (depends on project scale and site complexity)
   - Who creates the RFP: project leader, contract officer/lawyer, site manager(s), energy manager and technology expert. RFP writers will receive input from utility, tribal leaders, and stakeholders
   - RFP content
2. Issue RFP
   Tribal, federal, and industry networks
3. Administer the RFP
   - Proposal meeting(s)
   - Site tour(s) – can be concurrent with proposal meeting
   - Q&A process – ensure all developers get same information
4. Evaluate Criteria
   - Should be a clear process with well defined criteria
   - Evaluation panel recommended to consist of an odd number of members (typically 3 to 7)
5. Award Contract
   Four approaches
Develop RFP

Key Elements of the RFP

• Type of procurement:
  – Purchase
  – Power purchase agreement (PPA)
  – ESPCs
  – Other finance structure

• Technical specification (scope of work)

• Criteria for evaluating proposals: 3–5 of most important project aspects
  – Proposed project solution that meets specified criteria
  – System performance guarantee
  – Developer experience, track record, and customer satisfaction
  – Developer financial health/longevity
  – Maintenance plan
  – Reasonable timelines
  – Other

Develop RFP cont.

Key Elements of the RFP

• Description of RFP administration process
  – Typically 2–5 months
  – Key dates: proposal meeting(s), sites visit(s), proposal due date
  – Description of how questions will be handled and answered

• Defining responsible parties
  – Who is responsible for permits
  – Who is responsible for interconnection agreements
  – Who is responsible for applying for incentives

• Any preferences on parties allowed to submit proposals
  – Small business
  – Minority-owned
  – Other

• Land use agreements
  – Address site access and land use issues as relevant to ownership model
RFP Technical Specifications

Define Scope of Work

- What is the project scale
- Type of renewable energy technology
- Site information:
  - Location
  - Interconnection requirements as known
  - Applicable codes and standards
  - Roof structure, soils, other (as applicable and available)
  - Site prep: fencing, roads, grading limitations, etc.
  - Installation requirements: min/max heights of equipment, vegetation mitigation, design standards for structural/electrical
- Equipment minimum standards and warranties
- Expected minimum performance (recommended) or capacity
- Strategy for training maintenance and operations staff
- Commissioning plan

RFP Evaluation Criteria

Two Typical Approaches

- Best value:
  - Typically 3–5 criteria with weighting based on importance
  - Score proposal on each criteria
  - Somewhat subjective and can lead to contentious, time-consuming evaluations but good method to capture best value
- Low price, technically acceptable
  - Proposals initially stripped of pricing/cost information
  - First evaluation determines proposals that meet technical hurdle
  - Technically acceptable proposal with lowest cost gets award
  - More transparent process but may not capture best value
RFP Award Contract

Choose One of These Four Typical Approaches

1. Award based on proposal: awarded solely on merits of proposal
2. Award with discussion: awarded on proposal but contingent on clarifying discussions
3. Award with discussion and negotiation: awarded on proposal but contingent on further negotiation
4. Award with best proposal:
   - Best proposals are short-listed
   - Short-listed proposals asked for best final proposal revision
   - Award based on final proposal revision

Summary: Project Procurement and Implementation

• Procurement strategy will vary depending on the project scale and financing solution selected
• Increasingly more complex for larger projects
• Post procurement issues are critical as these are very long term assets and relationships
• Save time and money by considering GSA pricing
Project Risk: Community- and Facility-Scale

<table>
<thead>
<tr>
<th>Phases</th>
<th>Risks</th>
<th>Risk Assessment Post Step 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Development</td>
<td>• Poor or no renewable energy resource assessment</td>
<td>Low; site picked</td>
</tr>
<tr>
<td></td>
<td>• Not identifying all possible costs</td>
<td>Low; detailed model</td>
</tr>
<tr>
<td></td>
<td>• Incorrect estimation of long-term “community” energy use (energy efficiency first)</td>
<td>Low; final projection</td>

Tribal Case in Point: Refine the Project

Campo Band of the Kumeyaay Nation, CA

- Challenges
  - Requested technical assistance in reviewing developer-generated plans for a wind farm on its reservation
  - With an existing wind farm already on-site and some experience with wind development, Campo was interested in potential ownership options in the proposed new project and sought assistance with evaluating them

- DOE Technical Assistance
  - Validated data collected through anemometer testing
  - Provided tribal leadership with background information on partnerships and ownership options
  - Briefed tribal leaders and staff on various project ownership configurations

“The Tribe was pleased with the sale-leaseback ownership option and determined that it was a more realistic path to ownership for them.”

—Colton Heaps, NREL

Activity

- RFP Ranking
Types of GSA Support

- Global Supply
- Multiple Award Schedule Contracts
- Airline CityPairs Program
- Travel Program
- Excess Personal Property*
- Vehicle Leasing* and Acquisition
- SmartPay2 Purchase Card Program

*Not available to Tribes or Tribal Designated Housing Entities using Native American Housing Assistance and Self Determination Act of 1996 authority/funding

GSA Multiple Award Schedules

- GSA establishes long-term, government-wide contracts with commercial firms to provide access to millions of commercial products and services at volume-discount pricing
- Why use them?
  - Competition requirements have been met
  - Indian preference still applies
  - Best-value determination required
- Compliant with environmental requirements
- Discounts negotiated for you
Identify Key RFP Selection Criteria

Identify key criteria, risks, and other elements that you think should be priorities when evaluating responses to a Request for Proposal (RFP)

Sample Selection Criteria

Cost and Equipment
Project Cost
Amount of electricity to be produced
Type of equipment to be installed (and overall design plan)
LCOE
Cost assumptions for any Adders (e.g. trenching, panel upgrades, roof slope, etc.)
Proposed payment schedule

Others

Exercise
Evaluate the following mock responses to an RFP that was issued to get bids to install a 1 MW PV system that the Tribe would finance and own. Based on your identified selection criteria, which of the RFP responses is most appealing and which is least appealing, and why?

RFP Response 1:
- Nameplate Capacity proposed
  - 1 MW

- Technology:
  - Module Type: Thin-film PV (U.S. made)
  - Fixed Tilt
  - Central/string inverters

- 5 year Workmanship guarantee

- Production guarantee: No

- Team Experience: Experienced project team with both solar and conventional fuel power projects mostly from previous employers. However, the firm is only 2 years old and its solar experience has been primarily in the residential sector.

- Local Employment and Job Creation: The firm is local and has presented a plan to use local labor and subcontractors

- Subcontracting: The firm will procure subcontractors based on existing relationships, proven project outcomes, and cost. The Tribe can request specific contractors be used, but increased costs will be passed on to the Tribe

- Proposed Contract Price: $2,250,000
RFP Response 2:

- Nameplate Capacity proposed
  - 1 MW

- Technology:
  - Module Type: Crystalline PV from tier one provider (not U.S manufactured)
  - Fixed tilt racking
  - Micro inverters

- 5 year Workmanship guarantee

- Production guarantee: No

- Team Experience: The Company has significant experience with solar projects of comparable size but has a limited local presence.

- Subcontracting: The firm will procure subcontractors based on existing relationships, proven project outcomes, and cost.

- Local Employment and Job Creation: The firm is willing to encourage its subcontractors to hire and train tribal members as part of the project

- Proposed Contract Price: $2,750,000
RFP Response 3:

- Nameplate Capacity proposed
  - 850 kW

- Technology:
  - Module Type: High efficiency Crystalline PV from tier one provider
  - Fixed tilt racking
  - Central/String Inverters

- 10 year Workmanship Guarantee

- Production Guarantee: Yes

- Team Experience: The firm has significant solar project experience in other regions of the US, including other tribal solar projects. They have also presented several team members with excellent solar backgrounds. However, they do not have significant local experience.

- Subcontracting: The firm intends to use its preferred contractors as much as possible.

- Local Employment and Job Creation: Not addressed in response

- Proposed Contract Price: $3,000,000
