Current Medications

Percocet	10/325 Five tablets daily
Robaxin	500mg three tablets daily
Losartan	50mg Once Daily
Humira	1 injection every 2 weeks
Valium	10mg ½ to 1 tab as needed
Meloxicam	15mg Once Daily
Generic Imodium	4mg in the morning and 4mg at bedtime
Zantac	150mg at bedtime
Pyridium	200mg as needed
Omeprazole	40mg in the morning
Zolpidem	5 to 10mg at bedtime
Acetaminophen	1300mg twice daily. Only take when I must due to stomach issues.
Ondansetron	4mg as needed
Fluticasone Propionate	100mcg twice daily
Diclofinac Gel	3% Daily on feet and heels
Lidocaine Ointment	5% Daily on feet and heels
Lidocaine Patch	5% as needed on my back
Relyyt Patch	.0025-5% One to two times daily on back

Discontinued Medications

Oxycodone	15mg Three times daily
Morphine	10mg Four times daily
Butrans Patch	10mcg/h One patch per week.
Fentanyl	12mcg/h One patch every 3 days
Norco	10/325 Three times daily
Soma	350mg 1 to 3 daily
Tramadol	100mg in the morning 100mg at bedtime
Lyrica	150mg in the morning and 150mg at bedtime
Klonopin	1 tab nightly (I do not like these, makes me feel intoxicated for 36 hours)
Hyoscyamine	1.5mg daily
Tylenol # 3	As Needed
Pantoprazole	40mg in the morning
Cymbalta	30mg daily later raised to 60mg daily
Meloxicam	15mg daily
Celebrex	400mg daily
Flexiril	5mg at bedtime (usually break into smaller doses due to lingering effects)
Voltaran	As needed
Temazepam	15mg at bedtime (asked for different one, this one leaves a LONG hangover effect)
Minocycline	100mg in the morning and 100mg at bedtime for two weeks
Amoxicillin	1000mg in the morning and 1000mg at bedtime for two weeks
Sevella	MIS TITR PAK
Tadalafil	5mg daily
Dicyclomine	As needed only per GI Dr. Amaro
Neurocet	1 Capsule Daily
Xifaxan	550mg 3 times a day for 14 days
Magnesium	250mg daily
Zinc	50mg daily
Stemtek	2 Capsules Daily
CBD Oil	250mg 25 drops Daily

There is probably more, but I can no longer keep up with meds that have come and gone.

Commenter No. 154: Sonia Schendel

This testimony was interrupted because it exceeded the minimal time limit for public comment. This document is being submitted so that the full statement may be on the record.

My name is Sonia Schendel and I am deeply upset by DOE's DEIS which breaks its legally binding 2010 AOC promise for a full clean up at the site. Every one of the cleanup options in the DEIS violates the AOC, leaving in place from 39% to 100% of the contamination, when the AOC bars consideration of any leave in place alternatives. Any failure to do a full clean up, as promised, is unacceptable, posing continued risks to offsite communities. The heavy rains we have just experienced should remind us of the pollution that runs off that hill and will continue to until there is full cleanup.

Among its various excuses for not doing the cleanup, in all of the DEIS options DOE proposes to not clean up about 300 thousand cubic yards of soil that they contaminated by claiming what they purport to be a biological exemption. But they are grossly misrepresenting this biological exemption, which is strictly limited in the AOC and for which they do not qualify.

In the 2010 AOC it was stated that the entire site must be cleaned up to local background levels. It allowed a very narrow exception to be considered only to the extent that the U.S. Fish and Wildlife Service, and I quote:

issues a Biological Opinion with a determination that implementation of the cleanup action would violate Section 7(a)(2) or Section 9 of the ESA, and no reasonable and prudent measures or reasonable and prudent alternatives exist that would allow for the use of the specified cleanup standard in that portion of the site.

There has, however, been no such Biological Opinion from the U.S. Fish and Wildlife Service. The exemption does not apply.

Indeed, the US Fish and Wildlife Service did issue a Biological

154-1

154-2

154-3

154-1

154-2

154-3

NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a discussion of this topic and DOE's response. As noted in Section 2.4 of this CRD, the 2010 Biological Opinion referenced in your comment has very little applicability to the current situation in terms of impacts on Braunton's milk-vetch and its critical habitat, which would be far more severe as a result of the soil and seedbank removal required for cleanup to AOC LUT values.

At the time the Draft EIS was issued, DOE had been involved in ongoing meetings with the USFWS and CDFW for several years (see Appendix E, Table E-4 of this EIS) and the Biological Assessment required as part of Section 7 consultation had not yet been submitted. Hence, there was no Biological Opinion from the USFWS at the time the Draft EIS was released. The USFWS has now issued a Biological Opinion

Commenter No. 154 (cont'd): Sonia Schendel

Opinion several years ago to EPA for its preparatory work for the cleanup, which was to involve cutting down much of the vegetation so a radiation survey could be done. It concluded no problem; mitigation measures could be done, and that indeed, the cleanup of the contamination was critical for protecting biological resources.

The DOE DEIS, however, says that they are not going clean up anything in any of their self-declared biological exemption areas. DOE has no right to declare these areas or decide for themselves how to handle them. Furthermore, the guidelines say that if biological resources are identified mitigation measures are to be taken, not that DOE could avoid cleanup altogether.

DOE is rather shamelessly trying to use the claim of conservation of natural resources as an excuse to break its obligations to clean up the toxic damage it did to those resources. They are claiming to want to protect the environment and species by not cleaning up the contamination, when really all they are doing is hurting the ecosystem as a whole by proposing to leave these deadly chemicals and radiation in place. If they were concerned about the environment, they wouldn't have polluted it in the first place. Breaking the legally binding cleanup obligations would be an outrage, in terms of environmental wellbeing, species wellbeing and the wellbeing of general human health.

154-4

(see Appendix J) for remediation of SSFL. This Final EIS reflects the results of the Biological Opinion on the exemptions areas in Area IV and the NBZ. As discussed in Chapter 2, Section 2.3.2, of this Final EIS, soils within the boundary of an exemption area that have higher concentrations of chemicals or radionuclides (above human health or environmental Risk Based Safety Levels [RBSLs]), that is, those that pose a risk to human health or to plants and animals would be subject to focused removal actions. Application of exemptions would be based on the process described in the USFWS Biological Opinion for biological resources and NHPA Section 106 Programmatic Agreement (being developed in consultation with the SHPO and other consulting parties, including the federally recognized Santa Ynez Band of Chumash Indians and non-federally recognized tribes, and DTSC) for cultural resources. DOE acknowledges that DTSC would have to approve the cultural exemptions, the biological exemptions are specifically allowed in the 2010 AOC.

Please see the responses to comments 154-1 through 154-3. As discussed in Chapter 2, Section 2.1 of this Final EIS, consideration of conservation of natural resources in the development of the Conservation of Natural Resources Alternative would help to meet cleanup objectives by being protective of the environment (conserves natural resources) and health and safety of the public and workers while avoiding some of the technical challenges and potential adverse environmental impacts associated with cleanup to the 2010 AOC LUT values. The Conservation of Natural Resources Alternative does not "leave these deadly chemicals and radiation in place." The alternative focuses on where contamination posing human health or ecological risk exists and targets those locations for cleanup. Following soil cleanup, Area IV will be safe for use by recreationists and ecological receptors.

**Commenter No. 155: Congressman Brad Sherman,
Member of Congress, U.S. House of Representatives**

155-1

155-2

155-1 DOE acknowledges your concern about complete cleanup of SSFL consistent with the 2007 Consent Order and the 2010 AOC. It is DOE's mission to remediate sites to ensure that they are protective of human health and the environment. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

With respect to the alternatives evaluated in this Final EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. This EIS analyzed an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In response to public input since the 2010 AOC was signed, the EIS also analyzed alternatives that determine cleanup levels by considering risk to human health, ecological risks, and the protection of natural resources. The use of a risk assessment approach for soil cleanup is consistent with that used by DOE throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Note that DTSC is preparing an environmental impact report under CEQA that also analyzes alternatives for the cleanup of Area IV and the NBZ, as well as those portions of SSFL which are the responsibilities of NASA and Boeing. The *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* was issued by DTSC in September of 2017 (DTSC 2017b).

Over the operation history of the site, there have been 272 numbered structures in Area IV. As the missions for the buildings ended, they were decontaminated and removed. Today only 22 structures, 18 DOE-owned and 4 Boeing-owned, remain within Area IV. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ.

As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an

**Commenter No. 155 (cont'd): Congressman Brad Sherman,
Member of Congress, U.S. House of Representatives**

off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act (Also see Chapter 3, Figure 3-19 of this EIS).

Please refer to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for a discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

- 155-2** Please refer to Section 2.9, “Options for Transportation of Waste from SSFL,” of this CRD for a discussion of this topic and DOE’s response. As described in Chapter 4, Section 4.8.1 and Appendix H of this Final EIS, the transportation risks are very small. Air quality impacts from proposed offsite haul truck transport would be minimal, due to the relatively low emission rates of vehicles used for site remediation and offsite transportation of soil. See Chapter 4, Section 4.6.4.2, of this Final EIS for additional discussion of air quality impacts.

Commenter No. 156: Rabbi Jay A. Strear,
American Jewish University (AJU)

OFFICE OF RABBI JAY A. STREAR
SENIOR VICE PRESIDENT

April 13, 2017

Ms. Stephanie Jennings
NEPA Document Manager, SSFL, Area IV EIS
U.S. Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 93063

Re: DOE/EIS-0402, Draft Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory

American Jewish University ("AJU") thanks the U.S. Department of Energy ("DOE") for the care and effort put into the Draft Environmental Impact Statement ("Draft EIS") for Remediation of Area IV and the Northern Buffer Zone ("NBZ") of the Santa Susana Field Laboratory ("SSFL").

AJU owns and operates the Brandeis Bardin Campus ("BBC"), a 2,878-acre Jewish camp and educational center situated immediately to the north and northwest of Area IV and the NBZ. The continued health and safety of the BBC's campers, staff and visitors are AJU's highest priorities regarding the campus, and we take very seriously our obligation to do whatever is necessary to assure its continued safety. In addition, we are ever mindful of the importance of assuring the safety of the areas surrounding BBC and the well-being of inhabitants and users of those areas. Accordingly, it is AJU's position that any cleanup must adhere to all applicable federal and state laws, but should appropriately balance the remedial goals with any potential adverse impacts remediation activity would cause to either human safety or the environment in and surrounding SSFL. Consistent with that, AJU fully endorses a responsible, thorough, and effective cleanup of SSFL.

As AJU lacks the technical expertise to fully evaluate the Draft EIS and the various alternatives presented, we have retained Tetra Tech, Inc. ("Tetra Tech") to help us identify areas where there may be potential concerns and/or open questions arising out of the remediation alternatives presented in the Draft EIS. Tetra Tech's DEIS Review Technical Memorandum is incorporated by reference into this comment letter to the DOE. We respectfully request that the DOE respond to the issues identified in the attached Technical Memorandum so that we can more fully understand and evaluate the various alternatives presented in the Draft EIS.

Finally, AJU wishes to express its support for the designation of the SSFL as open space. An open space designation would protect the environment, safeguard animal and plant habitats, and preserve sacred/historic sites and artifacts, like those of the Native American Chumash and NASA/DOE, while also inspiring greater recreational use of this historically unique area.

Thank you for your consideration.

Rabbi Jay A. Strear

156-1

156-1 All comments in the attached Review Technical Memorandum have been responded to individually.

156-2

156-2 DOE does not own any property in Area IV or the NBZ and therefore cannot determine the ultimate land use. As discussed in Chapter 2, Section 2.2.3, of this Final EIS, the property owner, Boeing, has committed to preserve the land as open space for the public's benefit. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. They permanently bind the property, regardless of who owns the land. North American Land Trust will monitor and enforce the easement.

1.0 INTRODUCTION

On behalf of American Jewish University (AJU), Tetra Tech conducted an independent technical and scientific review of the DOE/EIS-0402 *Draft Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory* (DEIS). This technical memorandum presents the findings of this analysis.

2.0 SCOPE OF WORK

The purpose of this review is to assist AJU in analyzing the potential impacts of the cleanup alternatives proposed in the DEIS on AJU's Brandeis Bardin Campus (BBC), which is situated to the north and northwest of the Santa Susana Field Laboratory (SSFL).

This analysis provides Tetra Tech's technical evaluation of the DEIS soil remediation alternatives, the potential effects of those alternatives on the BBC, and a practitioner's evaluation of whether the DEIS analysis was conducted in accordance with the National Environmental Policy Act (NEPA; 42 United States Code [USC] 4321 et seq.), Council on Environmental Quality (CEQ) Regulations Implementing the Procedural Provisions of NEPA (40 Code of Federal Regulations [CFR] 1500-1508), and the Department of Energy (DOE) NEPA Implementing Procedures (10 CFR Part 1021). The analysis also considers the impact on the environment from the soil remediation alternatives considered in the DEIS.

3.0 BACKGROUND

The DEIS is intended to inform Federal decision makers about remediation of contaminated soil and groundwater, building demolition, restoration of impacted environment, and disposal of chemical and radioactive waste at Area IV and within the Northern Buffer Zone (NBZ) of the SSFL in Ventura County, California. The DEIS analyzes the potential environmental impacts of a variety of alternatives for conducting cleanup activities in Area IV and the NBZ.

Currently, for soil remediation, DOE's proposed action is to implement the technical requirements of the *2010 Administrative Order on Consent for Remedial Action* (2010 AOC) between DOE and the California Department of Toxic Substances Control (DTSC). Under this alternative, the cleanup must meet the Look-Up Table (LUT) values for residual chemicals and radionuclides in soil that were established in accordance with the 2010 AOC (DTSC 2010). This proposed action is detailed in the DEIS, and referred to herein, as the AOC Alternative.

The AOC LUT values are considerably more stringent than what would be typically be applied in a standard risk-based cleanup, and DOE recognizes that there are substantial hurdles to achieving remedial goals consistent with the 2010 AOC. Therefore, consistent with the requirements of NEPA, DOE has proposed multiple cleanup alternatives in the DEIS. These are the "no action" alternative, the Cleanup to Revised LUT Values Alternative (herein the "Revised LUT Alternative"), and the Conservation of Natural Resources Alternative (herein the "Conservation Alternative").

Response side of this page intentionally left blank.

**Commenter No. 156 (cont'd): Rabbi Jay A. Strear,
American Jewish University (AJU)**

4.0 GROUNDWATER

4.1 OVERVIEW

The region of influence (ROI) for Groundwater Resources is defined as Area IV, the NBZ, and offsite areas to the north of the NBZ, where groundwater discharges at the surface through seeps and springs. Groundwater plumes where contaminants exceed the Maximum Contaminant Levels (MCLs) exist within the ROI. Known groundwater plumes are primarily in Area IV, although up to three plumes may extend into the NBZ.

The impact thresholds are groundwater quality and the quantity of groundwater available to vegetation and wildlife. Cleanup goals for groundwater have not been established. While the scope of the groundwater analysis is generally commensurate with industry practice, the DEIS analysis is missing some critical information which is necessary to fully analyze and compare potential impacts of the various alternatives. The information gaps and areas needing further analysis are described below.

4.2 ANALYSIS OF ALTERNATIVES

The DEIS concludes that implementing the soil remediation alternatives would result in minor adverse or beneficial impacts. The relative level of impact across the four soil remediation alternatives is:

- AOC Alternative: no adverse impact/minor beneficial impacts
- Revised LUT Alternative: no adverse impact/minor beneficial impacts
- Conservation Alternative: no adverse impact/minor beneficial impacts
- No Action Alternative: minor adverse impact

Assessing the validity of these conclusions, however, is challenging given that the DEIS is missing some critical factual descriptions and substantive analysis. First, the DEIS contains minimal discussion of subsurface hydrology, especially as it relates to the possible migration of groundwater plumes, how well-defined the plumes are in terms of vertical and lateral extent, and potential hydrologic connectivity to on- and off-site seeps and springs. The DEIS should disclose how well plume stability has been defined and, for stable well-defined plumes, consider monitored natural attenuation (MNA) as the preferred remediation alternative. The DEIS should disclose hydrologic connectivity between existing plumes and seeps and springs, especially those on neighboring property, and the potential impacts of contaminated groundwater reaching the surface at these features. Adding a discussion of these parameters would provide a better understanding of whether groundwater on neighboring properties, such as the BBC, could be impacted.

In addition, the DEIS states that the soil remediation alternatives would not involve the withdrawal or injection of groundwater (DEIS pages S-50, 4-46, and 4-52). However, the DEIS also states that shallow groundwater may be encountered at Building 4024 and that dewatering may be required. If groundwater is shallow enough that it may be encountered when removing this building, it is possible groundwater could be encountered during soil removal elsewhere at the site. The DEIS should better substantiate the claim that groundwater would not be encountered during soil removal or analyze the potential impacts of encountering shallow

156-3

156-3
cont'd

156-4

156-3 DOE has performed additional groundwater investigations and reported the results in the *Draft RCRA Facility Groundwater Remedial Investigation Report, Area IV, Santa Susana Field Laboratory, Ventura County, California* (CDM Smith 2018a). Chapter 3, Section 3.4, of this Final EIS was updated with information from this report. A new section, Chapter 3, Section 3.4.2, "Hydrogeologic Study Areas," has been added to the Final EIS which provides additional detail on the subsurface hydrology. Additional description of the nature and extent of contaminant plumes has been added to Chapter 3, Section 3.4.3 this Final EIS, as requested by the commenter. Groundwater discharge to surface water (seeps) is described in Chapter 3, Sections 3.3 and 3.4 of this EIS. The Draft RCRA report includes a discussion of the presence or absence of contaminants in seeps and artesian wells located downgradient of specific plumes. Only tritium has been detected in seeps and artesian wells (at a concentration of 1,271 picocuries per liter, well below the maximum contaminant level [EPA's tritium concentration limit in the Safe Drinking Water Act] of 20,000 picocuries per liter) in a seep located downgradient of the tritium plume. The Draft RCRA Report is included as a reference for this Final EIS and is available for review on DOE's website. Also, please refer to the Topic of Interest, "Offsite Impacts" (Section 2.7 of this CRD) for a discussion of this topic and DOE's response.

156-4 Chapter 4, Section 4.4.2 of this Final EIS, has been revised to clarify that the "shallow" groundwater potentially found at the Building 4024 basement is 40 feet below ground surface. The maximum depth of soil excavation is expected to be much less than 40 feet below ground surface and in many areas will be limited by the depth to bedrock, typically less than 5 feet below the surface, although soil depth in the Burro Flats area can be 5 to 10 feet and sometimes up to 20 feet thick (Chapter 3, Section 3.2.2 of this EIS). The maximum soil excavations are expected to be much less than 40 feet below ground surface. Therefore, proposed soil excavation would not be expected to come in contact with groundwater nor involve the withdrawal of groundwater. Appendix D, Section D.6.1 of this Final EIS, has been revised to state the range of depths used in determining soil volumes.

Commenter No. 156 (cont'd): Rabbi Jay A. Strear,
American Jewish University (AJU)

groundwater on areas of the site. The DEIS could do this by providing an analysis of depth to groundwater in relation to soil excavation depths for each soil remediation alternative. Where groundwater could or would be encountered during soil removal, the DEIS should describe how that water, which could have concentrations of contaminants exceeding the MCLs, would be managed, tested, and disposed. Adding this information would provide information essential to understanding the amount of dewatering that could be associated with the soil remediation alternatives and the sampling, transport, and disposal activities that would be necessary to manage it. Any groundwater with concentrations of contaminants exceeding the MCLs could require off-site disposal, which could increase the number of truck trips associated with the project. This in turn could affect the DEIS' analysis of transportation and traffic and the amount of waste that would need to be managed.

156-4
cont'd

4.3 POTENTIAL IMPACTS TO AMERICAN JEWISH UNIVERSITY

Based on the known extent of groundwater plumes, as depicted in the DEIS, it is unlikely that groundwater at the BBC is currently impacted. According to the DEIS, the soil remediation alternatives would have no adverse or minor beneficial impacts on groundwater and would not adversely impact groundwater on neighboring properties such as the BBC. However, as stated above, the DEIS should be edited to include a discussion of (1) plume stability and potential migration, (2) hydrologic connectivity between known plumes and off-site springs and seeps, and (3) potential for groundwater to be encountered during soil remediation and management of any groundwater encountered so that the potential impacts on groundwater at neighboring properties, including the BBC, can be more fully assessed.

156-5

156-5 See responses to comments 156-3 and 156-4.

5.0 SURFACE WATER

5.1 OVERVIEW

The ROI for Surface Water Resources (including stormwater) is defined as the existing surface water quality and hydrology of Area IV, the NBZ, and the ROI, which includes all drainages from Area IV and the NBZ as they extend off site and to their confluence with the larger downstream collectors, Bell Creek and Arroyo Simi. The analysis is focused on surface water quality and stormwater runoff quantity and velocity. No reference is made to other DEIS sections that provide overlapping or contributing analyses. Generally, the DEIS impact analysis sufficiently addresses surface water impacts caused by soil erosion and sediment loading, including those to stormwater. However, as discussed below, the DEIS lacks an adequate analysis of whether chemical and radiological contaminants may affect neighboring properties in the event of major flooding. This deficiency deprives the public of information necessary to assess the relative merits of the soil remediation alternatives. Also, Section 4.3 should restate the Chapter 2 finding that annual water use for each of the soil remediation alternatives would be within the capacity of the Calleguas Municipal Water District.

156-6

156-6 Under the Action Alternatives for soil remediation, DOE proposes to first remove soil that poses the greatest risk (soils containing contaminants above risk-based safety levels). Soil would be removed in a manner intended to control runoff and movement of contaminants onto the Brandeis-Barden property under normal weather events. The duration of this portion of the soil remediation would be roughly the same under all three Action Alternatives Removal of the remainder of the soil being remediation under each alternative would pose no appreciable risk to Brandeis-Barden. It is possible that an extreme weather event could result in rainfall that would exceed the capacity of the stormwater system and the SWPPP-mandated best management practices instituted during remediation. If this were to happen, the concentrations of any chemical or radiological constituents that may be carried by the water would be much less than they are in the soil on site. DOE considered the concentrations on site (below risk-based levels after remediation) and the dilution that would occur if they were transported off site and determined that a quantitative analysis is not warranted.

156-7

156-7 Chapter 4, Section 4.3 address impacts on the surface water within and adjacent to Area IV. The discussion of impacts on the water supply due to water use during soil remediation in Section 4.1 is a separate issue.

5.2 ANALYSIS OF ALTERNATIVES

The DEIS makes the correct findings that impacts on surface water and stormwater under this project are generally scalable by the amount of proposed surface area disturbance. The relative level of impact across the four alternatives (in descending order) is:

**Commenter No. 156 (cont'd): Rabbi Jay A. Strear,
American Jewish University (AJU)**

- 1. AOC Alternative
- 2. Revised LUT Alternative
- 3. Conservation Alternative
- 4. No Action Alternative

The impact analysis is focused on the typical stormwater issues of soil erosion and sediment loading, but does not address potential chemical and radionuclide contamination of stormwater from the soils being disturbed. This issue did not appear to be addressed in the DEIS outside of the Surface Water section, so analysis and mitigation measures, as necessary, should be provided to address the potential waterborne transportation of these contaminants. In particular, if the level of chemical and radionuclide contaminants in stormwater would vary among the alternatives, due to the nature of the areas being disturbed, the analysis should explain any meaningful differences and potential mitigation measures. If any such impacts are identified, mitigation could include expanding the capacity of the retention ponds or adding retention facilities so that all stormwater can be captured on site until it can be tested and determined safe for release. Analysis and mitigation measures, as necessary, should also be provided to address the effects on downstream water bodies if the capacity of the NPDES stormwater control system is exceeded.

156-6
cont'd

Further, the DEIS figures do not indicate the locations of all surface water features referenced in the text, including Meier Canyon, Arroyo Simi, and Bell Creek, which makes it difficult for a reader to interpret the DEIS' analysis of impacts. At a minimum, arrows indicating the direction of stormwater flow for the drainages that extend off the Figure 3-15 map should be added.

156-8

156-8 Chapter 3, Figure 3-16 of this Final EIS was revised to incorporate the features identified in this comment.

5.3 POTENTIAL IMPACTS TO AMERICAN JEWISH UNIVERSITY

The project site contains a stormwater control facility system that diverts stormwater away from the BBC. Absent any remediation activity at the SSFL, this water would ordinarily flow toward BBC and become incorporated into the natural ecosystem, and it is unclear whether the long-term impacts to BBC of the water diversion have been evaluated. Further, major flooding could overwhelm this system and cause untreated stormwater to flow toward the BBC. The DEIS identifies potential impacts due to the potential release of untreated stormwater resulting from exceedance of the capacity of the existing National Pollutant Discharge Elimination System (NPDES) stormwater control facilities. During soil remedial activities, the BBC could be affected both by the physical impacts of flooding due to increased stormwater flow that exceeds the capacity of the existing NPDES stormwater control facilities, as well as by the chemical and radionuclide contaminants that could be transported by that stormwater. The extent of the impacts caused by the latter issue cannot be determined based on the information provided in the DEIS, but there is no question that impacts which may be caused by chemical and radionuclide contaminants would be exacerbated by a more intense cleanup such as the AOC Alternative. The significantly longer duration of the AOC Alternative relative to the other alternatives also increases the likelihood of such an event. It is critical that analysis of these potential impacts be included in the DEIS. Each of these issues needs to be discussed and assessed in the Final EIS.

156-6
cont'd

In its Record of Decision, DOE should commit to implementation of Mitigation Measures SW-1 and SW-2, which would reduce the amount of soil transported in stormwater and implement additional measures if the capacity of the stormwater control system is exceeded, to reduce the potential for the physical impacts of flooding and the impacts from chemical and radionuclide contaminants present within stormwater at the BBC. Additionally, to better address potential

156-9

156-9 Mitigation Measures SW-1 and SW-2 were reviewed in preparing this Final EIS and both were modified (SW_2 was modified as suggested by the commenter) (see Chapter 6, Table 6-2). As discussed in Chapter 1, Section 1.7, of the EIS, DOE's decision pursuant to the analysis in this Final EIS will be announced in a Record of Decision(s) (ROD[s]) that will be issued no sooner than 30 days after the EPA Notice of Availability of this Final EIS is published in the *Federal Register*. DOE would prepare and implement a mitigation action plan for those mitigation commitments made in the ROD.

**Commenter No. 156 (cont'd): Rabbi Jay A. Strear,
American Jewish University (AJU)**

occurrences under the project, Mitigation Measure SW-2 should be modified to indicate that measures “would be added” and to add actual exceedance of the NPDES stormwater control system design capacity as another trigger for adding those measures or developing and implementing additional measures.

156-9
cont'd

6.0 TRANSPORTATION AND TRAFFIC

6.1 OVERVIEW

The DEIS’ analysis of transportation and traffic includes an assessment of project-generated traffic and its impact on traffic conditions on area roads; exposure to radiation from transport of radioactive waste and potential accidents involving a release of radioactive waste; risk of traffic accidents and fatalities; and effects on pavement condition. Transportation and traffic impacts would occur over 10 years under the AOC Alternative and around 2 years under the Revised LUT and Conservation Alternatives. While the scope of the transportation and traffic analysis is commensurate with industry practice, the DEIS analysis underestimates impacts due to the way significance is defined. The analysis would more meaningfully assess potential impacts if a volume-to-capacity analysis is added, as described below.

156-10

6.2 ANALYSIS OF ALTERNATIVES

As presented in the DEIS, implementing any of the soil remediation alternatives would result in adverse traffic impacts. The relative level of impact across the four alternatives (in descending order) is:

- AOC Alternative: substantial adverse impact
- Revised LUT Alternative: moderate adverse impact
- Conservation Alternative: moderate adverse impact
- No Action Alternative: no adverse impact

Table 1 presents the impacts of the soil remediation alternatives. The no action alternative would have no impacts above baseline conditions and therefore is not shown in Table 1.

Among the soil remediation alternatives, the greatest adverse impact is caused by the AOC Alternative. As shown in Table 1, the number of truck trips associated with the AOC Alternative is almost five times that of the Revised LUT and Conservation Alternatives and the number of rail trips is more than six times that of the other soil remediation alternatives.

The annual number of worker commute trips would be approximately the same under all of the soil remediation alternatives; however, the trips would continue for ten years under the AOC Alternative but would cease after about two years under Revised LUT or Conservation Alternatives. The total number of work commute trips would be about five times more under the AOC Alternative compared with the Revised LUT and Conservation Alternatives.

Traffic on Woolsey Canyon Road would increase up to 7.3 percent, and the LOS would degrade from B to C for 9 years under the AOC Alternative and for approximately 2 years under the Revised LUT or Conservation Alternatives. Lines of traffic could form behind slow-moving trucks, causing frustrated motorists to pass in unsafe conditions. All project-generated traffic

156-10 As reported in Chapter 4, Section 4.8.2, and Appendix H, Section H-13 for traffic potentially attributable to DOE activities, for the final EIS DOE performed a detailed analysis of traffic flow quality for selected SSFL-area intersections and road segments considering operational factors such as control delay, LOS, and V/C ratios. In Chapter 5, Section 5.5.8.2, of the final EIS, DOE a performed a similar analysis to analyze cumulative traffic impacts assuming 96 daily heavy-duty truck round trips by DOE, NASA, and Boeing. Section 4.8.2, Section H.13, and Section 5.5.8.2 of the Final EIS were revised to document the changes in LOS ratings and V/C ratios that could potentially occur on affected road segments in the SSFL vicinity. The potential changes in V/C ratios were assessed against the thresholds for impact significance as listed in the L.A. CEQA Thresholds Guide (LA 2006). Also refer to the response to comment 146-78.

Commenter No. 156 (cont'd): Rabbi Jay A. Strear,
American Jewish University (AJU)

would enter and exit through the gate at the northeast corner of the SSFL and disperse from there onto roads that are generally north and east of the SSFL.

As shown in Table 1, the AOC Alternative would result in a higher number of traffic accidents and fatalities (up to 3 fatalities), while the other soil remediation alternative are not expected to result in any fatalities. According to the numbers in the DEIS, more deaths would occur from traffic accidents under the AOC Alternative than would result from exposure to contaminants in soil under any of the alternatives, including the no action alternative.

All of the soil remediation alternatives would result in a traffic safety risk because trucks turning right onto Valley Circle Boulevard from Woolsey Canyon Road may enter the oncoming lane.

The AOC Alternative would also have approximately four to five times the adverse impact on pavement condition compared to the other soil remediation alternatives, causing pavement repairs to be needed sooner. Radiation exposure and the risk of latent cancer fatalities (LCF) would be very small under all of the alternatives.

Table 1. Impacts of Soil Remediation Alternatives on Traffic and Transportation

	AOC Alternative	Revised LUT Alternative	Conservation Alternative
Radioactive waste shipment – truck	<ul style="list-style-type: none"> 6,830 truck trips 0 LCF 0 (up to 0.3) fatalities 	<ul style="list-style-type: none"> 6,830 truck trips 0 LCF 0 (up to 0.3) fatalities 	<ul style="list-style-type: none"> 3,530 truck trips 0 LCF 0 (up to 0.1) fatalities

Response side of this page intentionally left blank.

Commenter No. 156 (cont'd): Rabbi Jay A. Strear,
American Jewish University (AJU)

The DEIS likely underestimates traffic impacts due to the way the impact thresholds are defined. The DEIS impact threshold related to roadway performance is “change the LOS rating on an evaluated traffic route” (DEIS page 4-128). Using this criterion, only one substantial impact is identified. However, most of the roadways affected by project traffic are currently operating at LOS D or below. Use of the LOS system to identify impacts to such underperforming roadways can mask traffic impacts that are not severe enough to change the LOS grade, but are nevertheless significant. Accordingly, use of a more granular traffic impact analysis, such as volume to capacity ratio (V/C), is warranted in order to more transparently assess impacts from project-generated traffic. Given the much greater number of truck trips, and the significantly longer period of time in which trucks would be making trips to and from the site, those impacts are likely to be most substantial under the AOC Alternative.

The DEIS states that in the event of an accident involving a radiological release, local emergency personnel would likely be the first responders to arrive on the scene (DEIS page 4-100). The analysis seems to assume that all local first responders along the routes (which could span hundreds of miles and pass through numerous communities) would have sufficient training to respond to such an incident. The DEIS should include a more in-depth analysis and, if appropriate, best management practices (BMP) and/or mitigation measures to ensure local emergency personnel along the route are informed that radioactive waste would be shipped through their jurisdiction and have an opportunity to augment their training, if needed, so they would be fully prepared to respond should this type of accident occur. The DEIS states that in the event of an accident involving a radiological release, persons living within 50 miles could be exposed (DEIS page 4-101).

6.3 POTENTIAL IMPACTS TO AMERICAN JEWISH UNIVERSITY

The BBC attracts campers and visitors who travel to the BBC on roads affected by project-generated traffic, and who would therefore be exposed to the risks created by project-generated traffic that are summarized in Section 6.2. These risks include possible traffic fatalities under the AOC Alternative. Other risks include possible exposure in the event of an accident involving a radiological release, as the BBC is within 50 miles of areas where such an accident could occur. BBC visitors traveling Woolsey Canyon Road, Valley Circle Boulevard, and other roads affected by project-generated traffic would be exposed to traffic delays due to increased amounts of traffic and deteriorated pavement condition, which can cause flat tires and other incidents. BBC visitors traveling Woolsey Canyon Road would also be impacted by degradation of LOS, slow-moving vehicles, and to unsafe turning movements at the intersection with Valley Circle Boulevard.

To reduce traffic impacts affecting the BBC and the community in general, DOE should commit to implementation of Mitigation Measures TR-1, TR-2, and SE-1 in its Record of Decision. TR-1, which would distribute truck traffic on multiple routes, would minimize traffic delays. TR-2 would improve the safety of truck turning movements from Woolsey Canyon Road onto Valley Circle Boulevard, and SE-1 would contribute funds for timely pavement repair. DOE is further encouraged to identify and adopt additional mitigation measures to minimize transportation impacts.

156-10
cont'd

156-11 Chapter 4, Section 4.8.1, of this EIS describes the important characteristics of the SSFL wastes, the locations of offsite disposal facilities, and the rules and regulations governing the transports of radioactive materials. The regulations include those issued by the U.S. Department of the Transportation (DOT), in 49 CFR Part 173, governing the transport and packaging of radioactive wastes and emergency response guidelines, and applicable U.S. Department of the Homeland Security regulations on the management of the nuclear and radiological incidents. More detailed information on the applicable regulations is provided in Appendix H, Sections H.3 and H.4, of this EIS. This EIS states that, because of the very low concentrations of radioactive material contained in the contaminated soils, building debris, and other waste addressed in this EIS, transport of radioactive waste from site cleanup would pose a very small risk to human health and the environment, even under accident conditions that result in, the spill of an entire truck shipment (about 23 tons) of contaminated soil. Nonetheless, the radioactive materials would be transported with appropriate placards and labeling. Because of the abundance of these types of shipments on the roads, State highway and local patrols and first responders are familiar with these types of shipment and are knowledgeable about appropriate responses. The risk associated with any spillage or dispersal of the SSFL wastes is considered very low. As shown in Table 4-48 of the EIS, there would be less than a 4×10^{-9} (1 chance in 250 million) of an LCF among the population within 50 miles of the transportation route.

156-11

156-11
cont'd

156-12

156-12 Chapter 6 of the EIS identifies several transportation and traffic mitigation measures that DOE is considering. As discussed in Chapter 1, Section 1.7, of the EIS, DOE's decision pursuant to the analysis in this Final EIS will be announced in a ROD(s) that will be issued no sooner than 30 days after the EPA Notice of Availability of this Final EIS is published in the *Federal Register*. In accordance with DOE regulations (10 CFR 1021.331), DOE would prepare and implement a mitigation action plan for those mitigation commitments made in the ROD(s).

Commenter No. 156 (cont'd): Rabbi Jay A. Strear,
American Jewish University (AJU)

7.0 AIR QUALITY/DUST

7.1 OVERVIEW

The DEIS' air quality analysis is presented in two ways. First, the DEIS contains a discussion of the total air emissions that would result from each soil, building demolition, and water treatment alternative. This discussion is straightforward, but the DEIS would benefit from a more comprehensive analysis of the comparison among the different remediation alternatives.

Second, air quality is discussed in terms of the estimated annual and daily air emissions. This analysis is relevant as air regulations and thresholds are set in these terms. Air quality in the region is regulated and monitored as three domains (Ventura County, South Coast Air Basin, and Outside Ventura County/South Coast Air Basin), and peak annual and daily emissions are presented for each domain. The DEIS discusses the estimated annual and daily air concentrations from combinations of the soil, groundwater, and building clean-up activities using a range for the soil remediation alternatives, since the soil and groundwater remediation and building demolition activities would be occurring at the same time, each contributing to the overall levels of contaminants in the air at any given time. Looking at the emissions in this manner is the way the regulators consider air emissions and is helpful for purposes of comparing emissions with regulatory thresholds and standards. However, the DEIS should also discuss the estimated annual and daily air emissions from each soil remediation alternative by itself in order to present a simpler comparison for the public.

The potential for airborne radiological particulates and for the spread of *Coccidioidomycosis* spores (i.e., San Joaquin Valley Fever or Valley Fever) is discussed in Section 12 ("Human Health").

The potential human health impacts associated with radionuclides from dust emissions during remediation work were only discussed for remediation workers. There is no discussion of the potential human health impacts to the members of the public surrounding the site associated with radionuclides from dust emissions during the remediation activities. The human health impacts to the public associated with airborne radionuclides were discussed for hypothetical scenarios only after the completion of the remediation work (for onsite residents and recreational users).

As discussed below, additional information is necessary for the DOE and the public to understand and evaluate the comparative air related impacts associated with each alternative.

7.2 ANALYSIS OF ALTERNATIVES

Total Air Emissions

Table 2 presents the total air emissions to be expected from the soil removal alternatives, as presented in the DEIS. These totals are independent of the amount of time it would take to complete the clean-up activities under each alternative or the specific amount of annual or daily emissions to be expected.

The DEIS presents the total air emissions for each soil remediation alternative, but a comparative discussion would be more helpful to the public. For example, Table 2 helps put the total emissions in better perspective by positioning the Conservation Alternative as a baseline, and

156-13

156-13 Regarding the scheduling of each proposed alternative, Chapter 2, Sections 2.3.2, 2.4.1, and 2.4.2 of this Final EIS identify how many years it would take to complete the proposed soil remediation alternatives. Also, Table 2-6 in Section 2.4.4 of this Final EIS presents the annual number of truck trips for each remediation alternative over the projected duration of the cleanup activities. (After consideration of budget and operational constraints, DOE has incorporated a more realistic estimate of an average of 16 truck round trips per day on Woolsey Canyon Road.) Chapter 4, Sections 4.6.1.2, 4.6.1.3, and 4.6.1.4, of this Final EIS also identify how many years it would take to complete each soil remediation alternative. To provide more clarity on the magnitudes and durations of emissions estimated for each soil remediation alternative, Final EIS Section 4.6.1 presents estimates of peak annual emissions for each action alternative and discusses the factors that affect the emissions, such as miles driven by haul trucks between SSFL and proposed disposal facilities.

156-13
cont'd

156-14

Schedules of activities used to estimate emissions in this Final EIS for the four combinations of action alternatives are presented in the following document - *EIS for Remediation of Area IV and the NBZ of the SSFL – Final Air Emissions Calculation Methods* (Leidos 2018b). Annual scheduling factors are presented in the first table of Attachments 1.A, 1.B, 1.CRez, and 1.C-OS. This document is available on the project website at <https://www.ssflareaiveis.com> at the following location: click on "References", then click on the "References for Chapters 1 through 8", and then scroll down the page and this document is available as Leidos 2018b.

156-14

Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts, including adding an offsite human health impact assessment by modeling potential releases of windblown dust to a variety of offsite receptors. The Draft EIS qualitatively discussed risks from coccidioidomycosis, also known as Valley Fever. Little data exist to quantify the effects of construction activities on the local epidemiology of coccidioidomycosis. Therefore, a quantitative assessment of the risks associated with coccidioidomycosis is not possible. However, additional qualitative discussion of the risks of Valley Fever was added to this Final EIS, including some limited quantitative study results.

156-13

**Commenter No. 156 (cont'd): Rabbi Jay A. Strear,
American Jewish University (AJU)**

comparing the AOC and Revised LUT Alternatives' emissions to those of the Conservation Alternative. While the Revised LUT Alternative would increase air emissions relative to the Conservation Alternative, the AOC Alternative's emissions are much higher, resulting in a 342 to 813% increase. The range of impacts that would result from such a substantial increase needs to be described and analyzed.

156-13

Annual and Daily Air Emissions

Air regulations are written to address concentrations of constituent in the air and to restrict the amount that can be emitted on an annual and daily basis. The discussion of annual and daily emission thresholds in the DEIS is adequate when comparing the potential remediation activity at the site to regulatory thresholds. However, the DEIS does not discuss the emissions in a way that allows the lay reader to evaluate and compare the annual and daily emissions from the different soil remediation alternatives and the resulting potential impacts to the public because these emissions are conflated with those of other remediation activities.

156-13
cont'd

Annual and daily emission thresholds apply to the amount of pollutants to be emitted into the air during specific time periods. These thresholds apply to the total amount of pollutants being emitted into the air during that time period regardless of the amount emitted by individual actions/sources. For example, the emissions from the soil removal activities and the groundwater remediation activities could each be below the threshold when looked at individually, but taken together, they could result in an exceedance of a threshold. Since the different remedial actions could take place at the same time, the DEIS discusses peak annual and daily emissions for each air domain in terms of different combinations of the clean-up activities. This approach allows for discussion of the potential remediation actions in terms of the regulatory thresholds.

However, that discussion alone does not present enough information to the reader to evaluate the difference in daily and annual emissions from the individual soil remediation alternatives. In Tables 4-34 and 4-35 of the DEIS, the annual and daily air emissions from the soil remediation

156-13
cont'd

Response side of this page intentionally left blank.

**Commenter No. 156 (cont'd): Rabbi Jay A. Strear,
American Jewish University (AJU)**

activities are presented as a range without identifying the amounts from the individual soil remediation alternatives. Since the DEIS fails to describe the schedule and intensity for these various remediation activities, it is not made clear to a layman that while the Cleanup to AOC LUT Values alternative has the greatest total air emission, it would have less daily and annual emissions due to the work being spread out over ten years. Without the potential schedule of activities, the discussion of potential impacts of the activities could be misleading.

The DEIS should include a more thorough discussion of how the estimated annual emission rates for the different remediation alternatives relate to the intensity of the remediation activities. For example, it should be made more apparent to the reader that while the AOC Alternative has the greatest total amount of nitrogen oxides (360 tons), it would have a lower annual emission rate due to taking place over 10 years (an average of 36 tons/year), compared to the Revised LUT Alternative with a lower total of nitrogen oxides (140 tons) but a higher average annual emission rate (70 tons/year).

Currently, the DEIS assumes that if the estimated peak annual and peak daily air emissions from the actions in the alternatives would not exceed regulatory thresholds then there are no adverse impacts to health or the environment. Yet, when it is estimated that annual peak emission thresholds for nitrogen oxides would be exceeded, there is no discussion of the potential health impacts, only a statement that the conditions would occur intermittently. If the regulatory threshold is the criteria for no health impacts, the DEIS should discuss the health impacts of any exceedance of the thresholds.

This information should be presented simply in the DEIS and be expanded into the difference in health impacts on various receptors from higher emissions over a shorter time frame versus lower emissions over a longer time frame.

Particulates

The DEIS states that the dust emissions from the remediation activities would be below applicable air quality thresholds. However, those thresholds are for health impacts resulting only from the physical form of the particulates. They do not consider that dust from the remediation activities may include chemical and radionuclide constituents. The DEIS does not discuss the chemical- and radiation-related health impacts from the dust emissions (both direct inhalation and exposure pathways to dust that has settled on surfaces).

In the discussion of impacts to remediation workers, the DEIS states: "Considering the risks from exposure to chemicals and radionuclides in soil that are projected for an onsite suburban resident, it is expected that the risks to workers involved in soil remediation would be very small and were not estimated." This is an erroneous comparison. The DEIS states that the assumption for calculating the risk to the onsite suburban resident was that the resident would be present *after* the completion of the remediation work. The workers would be exposed to the radionuclide levels *before and during* remediation activities. The comparison is not logical and should be reassessed to ensure the DEIS adequately considers workers' safety.

Moreover, the DEIS does not discuss the impacts to the potential public receptors *during* the remediation activities. The decision being assessed in the DEIS is not only whether to do the remediation activities (i.e., No Action versus Action), but how to accomplish the activities (i.e.,

156-13
cont'd

156-15

156-14
cont'd

156-16

156-14
cont'd

156-15 The qualification of "no adverse impacts" mentioned in the comment is not used in the air quality analysis of this Final EIS, as any increase in exposure to an air pollutant could potentially be adverse. In addition, the regulatory thresholds used in the analysis do not identify levels below which no human health impacts would occur, but rather are indicators for the potential of pollutants to contribute to an exceedance of an ambient air quality standard if they exceed the thresholds. This is the crux of the air quality analysis, as mentioned in the Impacts Analysis section of Chapter 4, Section 4.6, of this Final EIS. In this Final EIS, DOE (after consideration of budget and operational constraints) has incorporated a more realistic estimate of 16 truck round trips per day on Woolsey Canyon Road. The impacts of this reduction in truck traffic have been incorporated into the analysis of all four of the soil remediation action alternatives. This Final FEIS demonstrates that by complying with applicable rules and regulations, emissions from proposed sources would not exceed any applicable emission threshold and therefore would not contribute to an exceedance of any ambient air quality standard. Therefore, further discussion of potential human health impacts as requested in the comment, is unnecessary.

156-16 Under all action alternatives, workers would be protected in accordance with DOE regulations (e.g., 10 CFR Parts 835 and 851) and DOE Orders. Worker radiation protection practices would be employed so that doses are as low as reasonably achievable. The onsite resident exposures that are being compared to the worker exposures were the onsite resident exposures for the No Action Alternative (current conditions). The amount of contamination and the pathways of exposure would be the same for an onsite resident (under the No Action Alternative) and a worker under all of the action alternatives but the worker exposure time would be significantly less. As discussed in Chapter 4, Section 4.9 of the Draft EIS, the risks that may be received by an onsite suburban resident are only slightly different from those that may be received from exposure to soil containing background quantities of chemicals and radionuclides (background soil). This would also be true for remediation workers. While the disturbance of soil under the soil remediation action alternatives could result in the suspension of chemical or radioactive constituents in larger quantities for soil removal than that from the activities of an onsite suburban resident. DOE worker safety/radiation protection requirements would address the additional safety concerns faced by workers and would f control worker exposure.

Commenter No. 156 (cont'd): Rabbi Jay A. Strear,
American Jewish University (AJU)

which action alternative). Providing the current public health risk information (No Action) and the risk after the clean-up activities does not allow for comparison of the remediation action alternatives. The DEIS should include discussion of the health impacts from the chemical and radionuclide constituents in the dust to workers and the public in a way that the lay reader can compare and contrast the impacts from the different remediation alternatives.

7.3 POTENTIAL IMPACTS TO AMERICAN JEWISH UNIVERSITY

The DEIS estimates that peak annual and peak daily air emissions would not exceed regulatory thresholds within Ventura County, so there should be no air quality exceedances at the BBC under any of the alternatives (or combination of alternative soil clean-up, groundwater treatment, or building demolition actions). Nevertheless, any of the three cleanup alternatives would emit airborne pollutants into the local environment, leaving a lower threshold for exceedances from emissions from other sources. Such impacts are greatest for the short term under the "Cleanup to Revised LUT Values, Building Removal, and Groundwater Treatment" combination of alternatives, which would emit greater annual and daily quantities of air pollutants, and last the longest under the "Cleanup to AOC LUT Values, Building Removal, and Groundwater Treatment Alternatives" combination of alternatives

Increasing annual and daily air emissions are related to increased incidences of respiratory diseases, and increased aggravation of asthma and other respiratory diseases in persons who already have these conditions. The DEIS should discuss the impacts to nearby sensitive receptors.

In addition, the dust from the remediation activities would include some chemical and radionuclide constituents. Due to its proximity to SSFL, the BBC would receive some of these dust emissions. Because they are not assessed in the DEIS, the chemical- and radiation-related health impacts of dust inhalation and other pathways cannot be determined; however, such impacts would be mitigated by the selection of the Revised LUT or Conservation Alternatives, either of which will generate significantly less total dust than the AOC Alternative. These chemical- and radiation-related health impacts of dust inhalation also should be addressed (both direct inhalation and exposure pathways to dust that has settled on surfaces). These impacts are discussed more thoroughly in Section 12, below.

In its Record of Decision, DOE should commit to implementation of Mitigation Measure AQ-1 to use a greener clean-up fleet of off-road vehicles and on-road trucks, which would reduce overall project impacts on air quality and potential impacts to the BBC by reducing the annual and daily emissions of volatile organic compounds, carbon monoxide, and nitrogen oxides.

156-14
cont'd

156-17

156-17 In response to public comments, DOE has added quantitative evaluations for an onsite recreational user, and offsite resident health impacts from the chemical and radionuclide constituents in the dust for all alternatives. The results of the modeling are included in Chapter 4, Section 4.9 of this Final EIS.

156-18

156-18 This Final EIS includes analyses of the potential for emissions from the proposed cleanup activities to impact sensitive receptors within each analysis domain; sensitive receptors would not be exposed to substantial pollutant concentrations. (Please see Chapter 4, Sections, 4.6.4.1, 4.6.4.2, and 4.6.4.3 of this Final EIS)

156-14
cont'd

156-19

156-19 Comment noted. This Final EIS incorporates a variation of Draft EIS Mitigation Measure AQ-1 as a goal to mitigate emissions from the proposed usages of off-road equipment and on-road trucks. DOE revised the wording of this initiative in this Final EIS to more clearly state the goal that individual on-road trucks within the project fleet would be no more than 5 years old during each year of cleanup activities. As discussed in Chapter 1, Section 1.7, of the EIS, DOE's decision pursuant to the analysis in this Final EIS will be announced in a ROD(s) that will be issued no sooner than 30 days after the EPA Notice of Availability of this Final EIS is published in the *Federal Register*, DOE would prepare and implement a mitigation action plan for those mitigation commitments made in the ROD(s).

American Jewish University (AJU)**

8.0 INFRASTRUCTURE

8.1 OVERVIEW

Project-related water needs for onsite remediation (e.g., dust control, backfill compaction, and source removal) would be obtained from the Calleguas Municipal Water District (CMWD). All water used for these purposes would be potable. The use of potable water to accomplish remediation goals may adversely affect the community by forcing other water users to implement measures to achieve water conservation goals driven by the ongoing drought in Southern California. This is particularly so under the AOC Alternative, which uses approximately five times as much potable water as the other two soil remediation alternatives. The DEIS, however, does not address this potential impact.

156-20

156-20

This Final EIS provides estimates of the current and projected imported and local water supply for CMWD (see Chapter 3, Section 3.1.1.2) and compares the water use for the alternatives against this water supply. The local water supply estimate used does not include the effect that the proposed 25 percent statewide and 20 percent CMWD reduction in water use would have on the water supply requirements. In this Final EIS, DOE has included recent information on demand for water from the Calleguas Municipal Water District.

8.2 ANALYSIS OF ALTERNATIVES

Water use for these activities is estimated to be 16,000 gallons of water per day for 250 days per year, an annual water use of about 4 million gallons (about 12 acre-feet). This use rate is consistent across the soil remediation alternatives. The total water use for each soil remediation alternative is therefore a function of the time it would take to complete the remediation:

- AOC Alternative: 10 years, 40 million gallons
- Revised LUT Alternative: slightly more than 2 years, 8.3 million gallons
- Conservation Alternative: 2 years, 8 million gallons

Water use under the soil remediation alternatives potentially could be reduced through measures such as surfactant application to assist in dust control.

156-20
cont'd

The DEIS discusses the impacts of water use in terms of CMWD's system capacity and states that the water needed for the remediation activities is within the system capacity, but the DEIS should also discuss the amount of water demand from the remediation activities in terms of the current annual level of water use in the CMWD. This would allow for more context to ascertain the significance of the water required for the SSFL remediation. CMWD has set a goal of 20 percent annual use reduction in response to drought conditions in the state.¹ Each of the cleanup alternatives will increase demand on the system and shift responsibility to other CMWD customers to achieve the target reduction. However, without current CMWD water demand information, the DEIS does not give the community an opportunity to assess the extent to which that additional responsibility will fall on them.

8.3 POTENTIAL IMPACTS TO AMERICAN JEWISH UNIVERSITY

While the water required to conduct any of the cleanup alternatives does not directly affect AJU, water use is an important consideration for the community and the state as a whole due to California's current drought conditions and the need, as expressed by California and CMWD officials, to significantly reduce water consumption. With the remediation activities increasing the demand for water, efforts to reduce the area's water consumption will fall more heavily on other local users. For AJU, forced conservation measures could result in higher water prices and/or a deprivation of water for other non-essential purposes, such as irrigating and maintaining

American Jewish University (AJU)

the BBC grounds. Other CMWD customers may experience similar adverse impacts with respect to their usage of water.

9.0 AESTHETICS AND VISUAL RESOURCES

9.1 OVERVIEW

Aesthetics and visual resources are addressed in the Land Resources sections of the DEIS (Sections 3.1 and 4.1). The SSFL and surrounding vicinity is a relatively undeveloped area within a large highly urbanized area that contains unique rock outcroppings and semi-arid vegetation. The analysis of aesthetics and visual resources includes an assessment of project impacts on scenic vistas, scenic resources (such as trees, rocks, and historic buildings), visual character of the area, and light and glare.

The DEIS does not adequately assess visual impacts caused by the remediation for several reasons detailed below. Among other things, the DEIS only analyzes viewshed impacts from within the SSFL; it does not consider how the remediation alternatives will impact views from neighboring properties, including from the BBC. The DEIS also states that long-term visual impacts will be minimal or non-existent under the AOC Alternative, but that conclusion is based on an assumption that is contradicted elsewhere in the document. The DEIS also does not adequately consider long-term aesthetic impacts in the event that an adequate volume of backfill meeting LUT soil quality requirements is not available to replace the 933,000 cubic yards that would be removed under the AOC Alternative. These analytical flaws suggest that visual impacts are likely to be more adverse than they are presented in the DEIS.

9.2 ANALYSIS OF ALTERNATIVES

The DEIS states that the principal difference among the soil remediation alternatives is that visual quality would be impaired for 10 years under the AOC Alternative compared with approximately 2 years under the Revised LUT or Conservation Alternatives. The relative level of impact across the four soil remediation alternatives (in descending order) is:

1. AOC Alternative: moderate adverse impact
2. Revised LUT Alternative: minor adverse impact
3. Conservation Alternative: minor adverse impact
4. No Action Alternative: no adverse impact

The DEIS is missing several important analyses, each of which would show the magnitude of impacts of the AOC Alternative to be even greater than is currently stated in the DEIS.

First, the DEIS uses an impact threshold of altering scenic resources "alongside a state scenic highway" and then dismisses this area from further analysis because the SSFL is not on a state scenic highway. This is not an appropriate impact threshold given the site's context, namely that it is situated within one of few relatively undeveloped areas in a vast urbanized area and is bordered by neighbors that value scenic resources, such as AJU and several surrounding parks and open space areas. The DEIS should be revised to alter this impact threshold to one that is suitable to the area's context and then conduct the impact analysis accordingly.

Second, the DEIS analyzes impacts on three viewpoints within the SSFL to determine impacts on scenic vistas. However, the SSFL is situated on a hill and is part of the viewshed of several

156-20
cont'd

156-21 The commenter is correct that the visual analysis does not evaluate potential impacts on the views from neighboring properties including areas such as the Brandeis-Barden property. The northern boundary of Area IV includes a ridge of bedrock that rises more than 1,900 feet above sea level. The main portion of Area IV subject to soil remediation is about 1,800 feet above sea level. This ridge affectively blocks any view of Area IV from the Brandeis-Barden property. Activities to remove soil from stream drainages in the NBZ may be visible from some locations on the Brandeis-Barden property, but would be confined to the lower laying stream drainage channels, would generally use smaller construction equipment, and would be of relatively short duration. The hill top forming the southern boundary of Area IV is partially visible from portions of Simi Valley north of Los Angeles Boulevard. But given the hill is endangered species habitat and therefore within an area in which the exemption process would be applied, soil remediation would consist of a focused removal of soils containing contaminants above risk-based levels for the hill side.

156-21

156-22

156-23

156-22 As noted in the response to comment 156-21, Area IV is shielded from view from Brandeis-Barden property by a tall sandstone ridge. Nonetheless, the comment is accurate for Area IV onsite views; the biological resources section does state that areas with native vegetation including woodlands may never fully recover thus impacting the future onsite views. The visual quality section in this Final EIS was revised to incorporate the impact of a failure of the native vegetation to fully recover and to be more consistent with the conclusions of the biological resources analysis.

156-24

156-21
cont'd

156-23 The volume of backfill soil DOE estimates is required under the Cleanup to AOC LUT Values Alternative to replace the 881,000 cubic yards removed is 660,000 cubic yards. DOE does not intend to initiate removal of soil in Area IV without an adequate source of backfill identified. A source of backfill will be identified in the Soil Remedial Action Implementation Plan that must be approved by the DTSC prior to initiation of soil remediation activities. Therefore, the environmental impacts mentioned in the comment would not occur. Please refer to Section 2.3, "Suitable Backfill Soil," of this CRD for further discussion.

156-24 Note that the criterion related to being alongside a State scenic highway is one of four criteria identified in this EIS for evaluating aesthetics and visual quality. Other criteria include causing substantial adverse impacts on a scenic vista and degrading the existing

**Commenter No. 156 (cont'd): Rabbi Jay A. Strear,
American Jewish University (AJU)**

neighboring properties to which scenic vistas are important, including the BBC and several surrounding parks and open space areas. The DEIS should be revised to include a viewshed analysis from these properties.

156-21
cont'd

Third, the DEIS states that while short-term impacts would be adverse, long-term impacts would be beneficial because the affected area would be returned "to a stabilized, revegetated state." However, the DEIS' biological resources section states that areas with native vegetation, including woodlands, may never fully recover. This could occur under any of the soil remediation alternatives; however, it is most likely and could be most pronounced under the AOC Alternative since that alternative would involve the greatest amount of habitat disturbance. The DEIS should be revised to examine the long-term adverse impacts on aesthetics and visual resources in relation to impacts on vegetation and native habitat.

156-22
cont'd

Finally, the DEIS also does not adequately consider the long-term aesthetic impacts in the event that an adequate volume of backfill meeting AOC LUT soil quality requirements is not available to replace the 933,000 cubic yards that would be removed under the AOC Alternative. If an adequate volume of soil cannot be sourced, the remediation would potentially leave the SSFL with unsightly pockmarks or unusual gradations that would adversely impact the area's aesthetics. The DEIS should be revised to state how the site would be restored if an adequate volume of backfill meeting AOC LUT requirements cannot be found and analyze related impacts not only on aesthetics and visual resources, but also on biological resources and soils.

156-23
cont'd

9.3 POTENTIAL IMPACTS TO AMERICAN JEWISH UNIVERSITY

The BBC has views of the surrounding area, including the SSFL. These views, which give the observer the feeling of being in a relatively undisturbed landscape, are part of the appeal of outdoor recreation at the BBC, and as such are an important scenic resource to surrounding property owners. These views would be adversely impacted during the AOC Alternative's 10-year project period, when project-related equipment and activities would be visible from the BBC.

156-21
cont'd

These important scenic resources would also be impacted after the end of the project period. As stated in the DEIS, up to 130 acres of vegetation and wildlife habitat outside of the exemption areas, including up to 51 acres of relatively undisturbed native habitat, would be affected under the AOC Alternative. Additional vegetation and habitat inside the 101 acres of proposed exemption areas could also be affected under the AOC Alternative. The acreage impacted under the Revised LUT or Conservation Alternatives would be approximately half to one-quarter of that for the AOC Alternative. As explained in the DEIS, it "may not be possible to restore native vegetation" (DEIS page 4-58) in some areas. Therefore, adverse impacts on scenic views from the BBC and the associated perception of recreating in a relatively undisturbed area would be permanently adversely impacted because views of areas where native vegetation was removed would not be as pleasing or as congruous with the surrounding environment after project completion. This is particularly so in the event that an adequate volume of soil is not obtainable to meet the AOC's soil purity requirements, in which case the SSFL would presumably remain unfilled or pock-marked.

156-22
cont'd

156-23
cont'd

visual character or quality of the site and surroundings. The visual resource threshold is based on how and where the site can be viewed by the general public. This Final EIS was revised to acknowledge a greater disruption of the aesthetics during and immediately following remediation. However, it is assumed that restoration efforts would be reasonably successful in restoring the visual character of the site to its pre-remediation condition. Long-term impacts to aesthetics may be somewhat degraded by the removal of buildings, but the aesthetics would be consistent with an "open space" future land use and improved over current conditions.

**Commenter No. 156 (cont'd): Rabbi Jay A. Strear,
American Jewish University (AJU)**

10.0 GEOLOGY AND SOILS

10.1 OVERVIEW

Some of the soils at the SSFL contain chemicals and radioactive materials. The levels of contamination were determined through site sampling in accordance with regulatory agency requirements. Among the chemicals most frequently observed in soils at concentrations exceeding AOC LUT values were polychlorinated biphenyls, polycyclic aromatic hydrocarbons, dioxins, petroleum chemicals, mercury, and metals (antimony, cadmium, chromium VI, mercury, selenium, and silver).

Because there were no established LUT values for radionuclides, field action levels consisting of either the background values for radionuclides or the specific confidence level minimum detection concentration were used, as applicable. Cesium-137 and strontium-90, and to a lesser extent plutonium 239/240, were those most frequently observed above the field action levels. The field action levels were exceeded in 291 samples for cesium-137, 153 samples for strontium-90, and 14 samples for plutonium 239/240. Eight other site-related radionuclides equaled or exceeded their respective field action levels in 5 or fewer samples, with 3 radionuclides (tritium, nickel-59, and europium-154) equaling or exceeding the field action levels in only one sample each.

The estimated volume of soil containing chemical concentrations above AOC LUT concentrations is 1,410,000 cubic yards. The estimated volume of soil containing radionuclides above AOC LUT values is 91,000 cubic yards. About 97 percent (by volume) of soil containing radionuclides above AOC LUT values also contains chemicals above Revised LUT values.

Relative to the other alternatives, the AOC Alternative would require the removal of a very significant amount of soil, which would need to be replaced with backfill that may not be available due to the AOC's stringent requirements for soil quality. If an adequate volume of soil cannot be sourced, the remediation would potentially leave the SSFL with unsightly pockmarks that would adversely impact not just the area's aesthetics, but also its usability for biological habitats and recreation. The DEIS does not adequately address the adverse impacts associated with this potential outcome of the AOC Alternative.

10.2 ANALYSIS OF ALTERNATIVES

The amount of soil that would be disturbed varies significantly among the clean-up alternatives. [Table 3](#) provides a comparison of the impacts of the soil remediation alternatives on geology and soils.

Table 3. Impacts of Soil Remediation Alternatives on Geology and Soils

Parameter	No Action Alternative	Soil Remediation Action Alternatives		
		AOC Alternative	Revised LUT Alternative	Conservation Alternative
Volume of soil removed (cubic yards)	Not applicable	933,000	192,000	148,000
Area of disturbed soil (acres)	Not applicable	130	40	32

156-25 156-25 See the response to comment 156-23.

**Commenter No. 156 (cont'd): Rabbi Jay A. Strear,
American Jewish University (AJU)**

All soil remediation action alternatives would adversely impact soil resources. Potential impacts from soil removal and backfilling would include loss of soil due to erosion and loss of soil function if the backfill is not compatible with the requirements of native plants within Area IV or the NBZ. The amount of erosion would be approximately proportional to the area disturbed by the removal activities under each alternative. The backfill should have similar texture, pH, and nutrient status compared to native soils on site to support native plant communities.

If sources for this large quantity of comparable quality backfill cannot be located, then DTSC, DOE, and the United States Environmental Protection Agency (EPA) would enter into a consultation process, and DTSC would determine the best available source of backfill.

The discussion of backfill states that the backfill material assessed to date would have levels of chemical and radioactive constituent concentration values that would not meet the AOC LUT concentration values. The text should disclose which chemical and radioactive constituents would likely exceed the AOC standards by presenting a quantitative comparison of chemical and radiological constituents in site soil to representative backfill soil. The DEIS should also assess the potential impacts that would occur if sufficient backfill soils are not located despite the agency consultation process.

10.3 POTENTIAL IMPACTS TO AMERICAN JEWISH UNIVERSITY

Impacts to AJU associated with the removal of soil are discussed above in Sections 6.0 (Transportation and Traffic), 7.0 (Air Quality/Dust) and 9.0 (Aesthetics and Visual Resources). In each instance, adverse impacts are significantly greater under the AOC Alternative because that alternative requires a significantly greater volume of soil removal.

The DEIS states that it may not be possible to find 933,000 cubic yards of backfill soil that meets the AOC's standards. The fact that backfill may not meet AOC standards raises a question as to whether the SSFL would be left with excavations that cannot be backfilled. This would certainly impact AJU and other community members because it would adversely affect the area's visual characteristics, as some or all of the area may be left with unsightly pockmarks. It could also affect the area's usability as a recreational area and as habitat for biological resources, and it may pose a health and safety concern due to the presence of holes and uneven ground surface. If it is possible that excavations would be left unfilled, associated impacts should be addressed in these sections of the DEIS.

It is important to note that the potential unavailability of adequate backfill soil is due to the usually stringent soil quality requirements imposed by the AOC Alternative. Under these requirements, soil that would be acceptable for most remediation and development projects cannot be used at the SSFL due to trace levels of contaminants that are not, as a general matter, perceived to be a threat to human health or the environment. DOE and the community should question whether removing and replacing such large quantities of soil with non-native soil that is of similar chemical and radiological content serves the public interest. This question should be discussed in more depth in the DEIS by including a quantitative comparison of chemical and radiological constituents in site soil to representative backfill soil. An objective analysis would shed light on whether the AOC Alternative is a practical remedial option.

156-26

156-25
cont'd

156-26
cont'd

156-26
cont'd

156-26

The EIS includes a discussion of the technical issues associated with implementing the 2010 AOC in Chapter 2, Section 2.3.3.1. In support of the issues related to finding an acceptable backfill source, this Final EIS includes a revision that adds Tables D-9 through D-12 in Appendix D comparing the results of the evaluated backfill soil samples to the AOC LUT values. For example, Final EIS Appendix D, Section D.6.2 presents soils test results for the Gillibrand facility in Simi Valley. These data show that soil samples would exceed LUT values for antimony, anthracene, and phenanthrene and the EIS states in Section D.6.2 that none of these results is at a level that would pose a risk to human health or the environment. Similar information is provided in Section D.6.2 for other backfill source locations.

**Commenter No. 156 (cont'd): Rabbi Jay A. Strear,
American Jewish University (AJU)**

11.0 BIOLOGICAL RESOURCES

11.1 OVERVIEW

The ROI for Biological Resources is Area IV, the NBZ, and downslope areas that could be affected by runoff, erosion, or sedimentation from activities occurring at Area IV and the NBZ. The analysis is focused on impacts on undisturbed native habitat, aquatic and wetland habitats, sensitive species, designated critical habitat, and nesting birds protected by the Migratory Bird Treaty Act.

The DEIS analysis should include a more robust analysis of biological resource impacts within the proposed exemption areas. Without this analysis, the community and the DOE are deprived of information necessary to assess the impact of the soil remediation alternatives on sensitive species and habitats, as well as the indirect impacts that the remediation alternatives may have on nearby land. The DEIS should also consider the long-term impact to biological resources in the event that an adequate volume of backfill cannot be located to replace soil that would be removed under the AOC Alternative.

11.2 ANALYSIS OF ALTERNATIVES

Table 4 presents the impacts of the soil remediation alternatives on biological resources. As shown, implementing the AOC Alternative would adversely affect up to four times as much vegetation and habitat as the other soil remediation alternatives.

Table 4. Impacts of Soil Remediation Alternatives on Biological Resources

	Vegetation and topsoil removal	Disturbance of undisturbed native habitat	Impacts to wetlands and aquatic habitats	Impacts to critical habitat for two ESA-listed species ^a	Disturbance in exemption areas ^b
AOC Alternative ^c	130 acres	51 acres	<1 acre	130 acres	101 acres
Revised LUT Alternative	40 acres	17 acres	0.4 acre	40 acres	50 ^d
Conservation Alternative	32 acres	13 acres	0.4 acre	32 acres	40 ^d
No Action Alternative	None	None	None	None	None

Notes:
 ESA Endangered Species Act
 a Overlap specifically with designated critical habitat is not quantified in the DEIS; impacts are based on total area to be disturbed.
 b The acreage of disturbance in exemption areas is currently unknown; however, the DEIS states that 101 acres of the total of 220 acres of exemption areas contain chemical or radioactive constituents exceeding AOC LUT values. Although efforts would be made to minimize disturbance in these areas, some level of disturbance is likely if AOC LUT values are to be achieved. Note that the exemption areas contain wetlands and aquatic habitat, although this is not quantified in the DEIS.
 c This acreage does not include the proposed exemption areas, which are an additional 101 acres where, although effort would be made to minimize effects, biological resources would still be adversely impacted and/or AOC values would not be achieved in all locations.
 d Not quantified in DEIS. Estimates are based on visual assessment of DEIS Figures 2-4 and 2-5.

156-27

156-25
cont'd

156-27

The purpose of the biological exemption areas is to minimize impacts to resources within these areas. Therefore, if there were no chemicals or radioactive constituents within these areas that posed a risk to public health or the environment, the areas would not be disturbed and the impacts would be zero. However, if levels of constituents in these areas pose a risk to human health and the environment, as determined using risk-based screening levels (RBSLs), DOE would remove them through carefully planned, focused removals to minimize impacts. This EIS identifies 54 acres that would be treated through monitored natural attenuation (many of which otherwise would have been subject to the exemption process) and an additional 77 acres in Area IV and the NBZ in which the exemption process would be applied. Of this area, the Final EIS identifies 4 acres in which active cleanup measures would be used for the protection of biological and cultural resources. No cleanup activity would be required in the remaining areas. (Additionally, a significant amount of the area identified in the draft EIS as containing sensitive biological resources subject to the exemption process are now, in this final EIS, being treated using monitored natural attenuation, see Appendix D of this final EIS). The degree of disturbance caused by removal actions within the areas where the exemption process would be applied would vary from one such area to another, depending on the nature and extent of the removal actions required (see Chapter 4, Section 4.5, for a discussion of the impacts). The process and controls that will be used to ensure minimal impacts also may vary from area to area and are included in the U.S. Fish and Wildlife Service Biological Opinion (see Appendix J of this EIS). Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for further discussion.

Section 3 – Public Comments and DOE Responses

**Commenter No. 156 (cont'd): Rabbi Jay A. Strear,
American Jewish University (AJU)**

The rightmost column of [Table 4](#) also contains an assessment of the likely impacts within the proposed exemption areas, which are not quantified in the DEIS. The estimates presented in the table are based on a visual assessment of DEIS Figures 2-4 and 2-5. Sensitive biological resources in the proposed exemption areas include two species protected under the Endangered Species Act (ESA), critical habitat for these two ESA-listed species, potential habitat for a third ESA-listed species, one species listed under California's ESA, multiple plants listed on California's Rare Plant Rank, and birds protected under the Migratory Bird Treaty Act.

The DEIS analysis focuses on impacts outside the proposed exemption areas and states that the level of disturbance within the proposed exemption areas would be minimized and would be determined after agency consultation. The proposed exemption areas represent the most biologically (and culturally) sensitive areas at the project site. In addition, the proposed exemption areas overlap areas where contaminants may exceed the AOC cleanup levels on up to 101 acres, which represent 78 percent of the acreage outside the proposed exemption areas.

Even if impacts within the proposed exemption areas are minimized through measures developed during agency consultation, the proposed exemption areas represent a large land area and impacts on biological (and cultural) resources in these areas could be substantial. Further, because biological resources interact at the ecosystem level, the substantial disturbance outside the proposed exemption areas would disrupt biological resources within the proposed exemption areas (see DEIS page 4-61).

The DEIS should be amended to contain a more robust analysis of impacts within the proposed exemption areas. Even though consultation is not complete, assumptions could be made so that impacts within the proposed exemption areas could be analyzed at a similar level of detail as impacts outside the proposed exemption areas. If the DEIS is edited to include this analysis, the magnitude of the impacts of the AOC Alternative will be shown to be even greater than is currently stated in the DEIS due to the significantly greater disruption that the AOC Alternative requires. This additional analysis should include specific information about:

- Anticipated numbers of "takes" of listed species
- Projected amount of disturbance in designated critical habitat
- Projected impacts to wetlands and aquatic habitats
- Estimated acreage of vegetation disturbance, topsoil removal, and native habitat disturbance
- Potential impacts to movement corridors and regional populations
- Impact associated with increase of non-native invasive species both on-site and regionally

The DEIS states that impacts to critical habitat for two species listed under the ESA (Braunton's milk-vetch, a plant, and California red-legged frog) would be "minimized through the use of focused removal actions" and would be "similar" for all three active soil remediation alternatives (DEIS page S-51, Table S-7). However, these claims are not substantiated because the DEIS does not adequately analyze impacts within the proposed exemption areas, including specific impacts to critical habitat for these species and anticipated number of takes. This analysis should not be deferred to agency consultation but should be included in the DEIS so that effects are

156-28

156-28 See the response to comment 156-27. At the time the Draft EIS was issued, the Biological Assessment required as part of Section 7 consultation had not yet been submitted. The USFWS has now issued a Biological Opinion (see Appendix J) for remediation of SSFL. The Biological Opinion provides USFWS conclusions regarding the impact of actions on each species.

156-28
cont'd

**Commenter No. 156 (cont'd): Rabbi Jay A. Strear,
American Jewish University (AJU)**

disclosed to the public and can be evaluated by interested members of the public, such as neighboring property owners, whose own biological resources will in turn be impacted.

|| 156-28
cont'd

The DEIS should also be amended to address adverse effects on biological resources, such as ability to provide suitable habitat for species of special concern and native species of flora and fauna, if enough backfill or suitable backfill cannot be obtained.

|| 156-25
cont'd

11.3 POTENTIAL IMPACTS TO AMERICAN JEWISH UNIVERSITY

Indirect impacts on biological resources at the BBC are likely to occur under any of the three alternatives, but would be most pronounced under the AOC Alternative. Such impacts are necessarily difficult to predict due to the complexity of the local ecosystem. Among other things, the removal of native habitat, including woodlands, could force the relocation of wildlife populations to habitable areas on the BBC, with unknown consequences for flora and fauna currently on the BBC. Removal of native vegetation could allow invasive species to flourish, and the incidence of invasive species at the BBC could also increase. These impacts would significantly outlast the duration of the cleanup, and may become permanent if flora and fauna are not able to reestablish themselves on the SSFL property following the cleanup.

To reduce biological impacts that would affect the BBC and the area's ecosystem functioning and ecological services in general, DOE should commit to implementation of Mitigation Measures BR-1 and BR-2 in its Record of Decision. BR-1 would mitigate impacts on threatened and endangered species, and BR-2 would mitigate impacts on wetlands, both of which would support the area's natural and biological resources and their continued functioning.

|| 156-29

156-29 As described in response to comment 156-28, the USFWS has now issued a Biological Opinion (see Appendix J) for remediation of SSFL. The USFWS-issued Biological Opinion concurs that the proposed action would not likely jeopardize the continued existence of a federally listed species or result in adverse modification of critical habitat. The Biological Opinion provides information on the potential impacts of the remediation actions, and the ability of the mitigation measures to limit these impacts. As stated in response to comment 156-27, this EIS identifies 4 acres in Area IV and the NBZ in which the exemption process would be applied and carefully planned, focused removal of contaminants found at levels above risk-based screening levels would be performed.

12.0 HUMAN HEALTH

12.1 OVERVIEW

Appendix G of the DEIS provides an evaluation of human health risk from current conditions and future conditions (100 years in the future, assuming no remediation occurs but that there is radionuclide decay), the results of which are summarized in Sections 3.9 and 4.9 of the DEIS. Risks for a hypothetical suburban residential receptor (350 days per year, 24 hours per day, for 30 years) are provided as well as risks to a recreational receptor (75 days per year, 8 hours per day, for 30 years). Results for both radionuclide exposure and chemical exposure are provided and were calculated using site-specific risk-based screening levels. Exposure pathways included are inhalation of particulates and radionuclides, incidental soil ingestion, and dermal contact (chemicals only) or other external exposure (radionuclides only). Ingestion of homegrown fruits and vegetables is not included; groundwater as a source of drinking water is also not included in the risk assessment. Those pathways are properly excluded as neither is likely to be complete.

The risk assessment also calculated risks to remediation workers while remediation is occurring. However, these exposure scenarios are not relevant to AJU and off-site receptors, and are therefore not further discussed in this report.

The analysis of risks is consistent with the agreed-upon methodology for the SSFL; however, the DEIS does not adequately assess the risk that offsite users will be exposed to pathogens present in the dust generated by the soil remediation alternatives. Such impacts are greatest under the

|| 156-14
cont'd

**Commenter No. 156 (cont'd): Rabbi Jay A. Strear,
American Jewish University (AJU)**

AOC Alternative, which would generate significantly more dust – and do so over a much greater time horizon – than the Revised LUT or Conservation Alternatives.

|| 156-14
cont'd

12.2 ANALYSIS OF ALTERNATIVES

The risk assessment shows that the current site-related radionuclide risk (from Subarea 5B in Area IV, without uranium and thorium decay products and excluding risks from background radionuclides) is 2.3E-5, compared to the background risk of 1.9E-5. Based on these calculations, the removal of soil under any of the alternatives will not appreciably change the risk (a current total of 4.2E-5 to the hypothetical residential receptor, half of which is related to background). The site-related risk to the recreational receptor, which, although still highly conservative, is a more likely exposure scenario, was calculated from sampling data averaged over the NBZ and Area IV combined, and totaled 7E-6 (excluding background and uranium and thorium decay chain radionuclides). This risk is related only to cesium-137 (at 4.5E-6) and tritium (2.4E-6), and the tritium concentration represents only one detection that was above the field action level. The risks associated with background concentrations of arsenic and uranium and thorium decay chain products present greater risks (totaling over 7E-5), and there would be no measureable decrease in human health risk to a recreational receptor from soil removal.

The current and hypothetical future risks associated with site-related chemicals in the NBZ and Area IV are below the background risk, as shown in Appendix G and summarized in Section 4.9 of the DEIS. The removal of soil from the NBZ would not result in a meaningful reduction of risk to human receptors.

The DEIS does not analyze potential off-site exposure related to dust and particulates for off-site receptors while remediation is occurring. Although dust suppression is part of the remediation plan, dust may still be generated by the use of heavy equipment on unpaved areas of the site, excavation of soil, and transport of removed soil to disposal facilities. In addition, any stockpiled soil that is temporarily stored on-site while awaiting transport may be subject to wind dispersion. The DEIS should include an analysis of this exposure pathway for the three action alternatives to show that it is either not significant to off-site receptors or that it is potentially significant and that steps will be taken to control any off-site dust dispersion.

|| 156-14
cont'd

In addition, page 3-107 of the DEIS requires correction: the text states that Table 3-22 presents risk-based screening levels (RBSL) for noncarcinogens based on a hazard index of 0.1, but the RBSL footnote for Table 3-22 indicates that the RBSLs are based on a hazard index of 1.0; the table is correct. Note also that tables in Appendix G present the RBSLs at a hazard index of 0.1. To avoid confusion, the RBSLs should be presented at one consistent hazard index.

|| 156-30

156-30 This Final EIS was revised to correctly and consistently present the relationship between the RBSLs and hazard indices.

12.3 POTENTIAL IMPACTS TO AMERICAN JEWISH UNIVERSITY

There is no appreciable benefit to the BBC from any of the three soil remediation alternatives in the NBZ, as human health risks under existing conditions are already below standard regulatory action levels. The removal of soil from the NBZ would not appreciably lower human health risk because the highest risks – which are themselves well below action levels – are posed by naturally occurring constituents. The removal of soil from Area IV also should not impact human health risks for users of the BBC, as long as dust suppression is implemented and water runoff from activities related to removal actions is contained. However, the action alternatives

|| 156-14
cont'd

Commenter No. 156 (cont'd): Rabbi Jay A. Strear,
American Jewish University (AJU)

themselves, and in particular the AOC Alternative, may cause adverse health impacts to users of the BBC.

As described in Section 7 of the DEIS, Valley Fever is caused by a fungus (*Coccidioidomycosis*) that lives in soil. According to the California Department of Public Health (CDPH), Division of Communicable Disease Control (2016), spores of this fungus occur in areas with dry dirt and desert-like weather conditions, such as those at SSFL. Spores of the fungus are carried with dust and Valley Fever is contracted when those spores are inhaled. The CDPH warns that people may contract the disease if they participate in recreational activities where dirt and soil are disturbed or work in jobs where dirt and soil are disturbed. Further, they recommend staying indoors on windy days or when the air contains dust. It stands to reason that the massive amount of soil that would be removed under the AOC option would greatly increase the risk of people becoming ill from Valley Fever due to an increase in release of spores and dust to air. Any option that decreases soil disturbance would pose less risk than the AOC Alternative, and relative to the AOC Alternative, the Revised LUT and Conservation Alternatives will remove much less soil from the site, require fewer trips of trucks containing soil, and reduce the period in which heavy equipment is disturbing soil on-site from ten to approximately two years. Each of these factors will reduce the risk that those who live or visit areas near the SSFL may contract Valley Fever.

13.0 SUMMARY OF POTENTIAL IMPACTS

Table 5 below presents a summary of the project effects, in which the intensity of adverse effects is categorized as substantial, moderate, minor, or negligible. Substantial adverse effects are those that would exceed the impact thresholds as defined in the DEIS. Moderate adverse effects are those that would be considerable but would not exceed the DEIS impact thresholds. Minor effects are those that would be noticeable or measurable but minimal. Negligible adverse effects are those that would be so slight as to generally not be noticeable. To provide an overview of effects, the table presents only the highest degree of adverse effect. For example, if both minor and moderate adverse effects are expected, moderate adverse effects are listed; if both minor and moderate adverse effects are expected, minor adverse is listed.

As shown in the table, the AOC Alternative would have much greater adverse impacts than the other soil remediation alternatives. The AOC Alternative would have substantial adverse impacts on five resource areas, compared to substantial impacts on just one resource area for the other soil remediation alternatives. Impacts from implementing the AOC Alternative would be greater than those of the other alternatives for 75 percent of the resource areas that would result in adverse impacts.

Impacts that would be greater under the AOC Alternative include, but are not limited to:

- Use 40 million gallons of potable water
- Increase the risk of Valley Fever
- Disturb critical habitat for two endangered species
- Disturb native habitat for many wildlife species
- Increase soil erosion and landslide potential
- Increase fugitive dust emissions
- Increase truck traffic
- Cause up to three traffic fatalities

156-14
cont'd

Response side of this page intentionally left blank.

Commenter No. 156 (cont'd): Rabbi Jay A. Strear,
American Jewish University (AJU)

The one area where all of the soil remediation alternatives would have substantial adverse impacts is consumption of potable water (Section 4.1). Although water consumption would be substantial under all of the alternatives due to California's water shortage, the AOC Alternative would consume four to five times as much water as the other soil remediation alternatives (40 million gallons for the AOC Alternative versus around 8 million gallons for the others).

The risk calculations demonstrate that no soil removal action is strictly necessary to protect human health. Current on-site human health risks are already within the range of acceptable risk (1E-6 to 1E-4) and will decline over time due to natural attenuation. The current hypothetical risk (on-site, residential scenario) that is not associated with background concentrations of arsenic, uranium, and thorium has been calculated at no greater than 2.3E-5 (which is less than the lifetime risk of being struck by lightning²), and the incremental hazard index is 0.1. Under the recreational scenario, the incremental cancer risk falls to 7E-6 and the incremental hazard index is 0.42. These would be the highest risks that are site-related and that would remain in place (but decrease over time) if no removal actions occur. These risks and hazard indices do not indicate any need for soil remediation actions to occur. Further, given that these values are based on upper bound estimates both of exposure concentration and site use, it is unlikely that such risks would ever be realized.

In contrast, the AOC Alternative will result in multiple adverse impacts for the community around the SSFL, including most notably:

- Causing up to 3 traffic fatalities resulting from the additional truck trips that the AOC Alternative requires;
- Increasing air emissions that are related to increased incidences of respiratory diseases, and increased aggravation of asthma and other respiratory diseases in persons who already have these conditions;
- Increasing the risk of Valley Fever, which although often mild and treatable, can be severe or fatal to at-risk persons (such as pregnant women and persons with compromised immune systems); and
- Using 40 million gallons of potable water for dust suppression and other activities, in an area that has been experiencing drought conditions for several years.

While both the Revised LUT and Conservation Alternatives will also affect surrounding areas, the scope and scale of those alternatives are mild compared with the AOC Alternative, and their adverse impacts are substantially less severe. At the same time, the health risk outcomes of all three alternatives are comparable. As with any environmental action considered under NEPA, it is incumbent on the decision maker to carefully consider these costs and benefits when selecting among the available alternatives.

² The lifetime odds of being struck by lightning are 1 in 13,000 per the National Oceanic and Atmospheric Administration (<http://www.lightningsafety.noaa.gov/odds.shtml>).

Ms. Stephanie Jennings
NEPA Document Manager, SSFL, Area IV EIS
US Department of Energy
4100 Guardian St Suite 160 Simi valley, CA 93063

Re: DOE EIS Area IV and Northern Buffer Zone of the Santa Susana Field Laboratory

Dear Ms. Jennings,

I provide these comments as a concerned citizen, resident of Bell Canyon, literally at the doorstep of SSFL, stakeholder and taxpayer. Thank you for giving me the opportunity to comment on the DOE's SSFL Draft Environment Impact Statement. This document is well researched, develops alternatives with their benefits and consequences, and allows for a future selection of a cleanup method.

157-1

I support the Conservation of Resources alternative, which satisfies the National Contingency Plan, The California Health Act, NEPA and the US EPA guidelines, and includes development of alternatives, the use of risk assessment and incorporates area averaging. The existing AOC agreement between DOE and DTSC does not satisfy any of these laws and regulations, requires an unachievable cleanup date of 2017, and needs to be re-opened for amendment at the very least. This alternate more accurately identifies those areas for remediation that present threats to human health and balances the risks to the affected community by undertaking a cleanup with less excavation, diesel/dust, other pollution and truck traffic.

157-2

I am also in favor of natural attenuation with monitoring, where appropriate, for soil remediation and groundwater. The groundwater is confined and contained by the bedrock

157-1 Thank you for your comment.

157-2 DOE acknowledges your support for the Conservation of Natural Resources Alternative. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. Please also refer to Section 2.3, "Suitable Backfill Soil," of this CRD. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

As discussed in Chapter 2, Section 2.3.2, of this EIS, one potentially effective form of onsite remediation would be to use monitored natural attenuation for management of certain low-concentration, petroleum-contaminated (TPH) soil. DOE has estimated that this onsite treatment method would reduce the amount of soil to be considered for removal at Area IV and the NBZ by about 620,000 cubic yards, with corresponding reductions in truck traffic and emissions of air pollutants. This or any other onsite treatment method would have to be approved by DTSC.

DOE acknowledges that an acceptable source of backfill that meets the LUT values has not been identified and notes the importance of a backfill soil that would support native plant communities. As described in Section 2.4 of this Final EIS, backfill soils that meet the higher concentration limits under the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resource Alternative should be easier to locate, although it still could be a challenge to identify backfill with similar physical, chemical, and microbial characteristics that could support re-establishment of native vegetation. DOE plans to identify a source of backfill in the Soil Remedial Action Implementation Plan that must be approved by the DTSC prior to initiation of soil remediation activities. Refer to Section 2.3, "Suitable Backfill Soil," of this CRD for discussion of the responsibilities and actions necessary to identify a backfill source.

Commenter No. 157 (cont'd): Ronald B. Ziman

characteristics, current water management tactics and local treatment. Exposing communities to the risks associated with transporting large volumes of minimally contaminated soil to be ultimately naturally attenuated in landfills, when that soil could safely be naturally attenuated or treated on site is irrational and is without justification. Where deemed safe and feasible, the maximum amount of soil should remain on site for either treatment, in-situ treatment or sequestration to protect the public while naturally attenuating. The "Million Dollar Hole" might be considered as a site for potential on-site sequestration for those contaminated soils deemed inadvisable to transport through communities to a landfill. This assumes that the hole would be properly lined to shield the fill from the water table such that any substances placed in that hole would not leech into the groundwater, further contaminating it.

The existing AOC define a severely flawed process and should not be selected for implementation. This contractual agreement contains a list of chemicals that are to be removed from the DOE site that was compiled from unknown sources without consideration of toxicity to humans or the environment. The substances sampled use cleanup targets that are unrealistically low background or detection levels beyond the lab's acceptable confidence standards. The document does not have any consideration of end use, toxicity or health threats to people or the environment and it does not comply with any of the federal and state laws or regulations governing such cleanups. It ignores Section 6.8 of the California Health and Safety code which is California law and requires risk evaluation before cleanup. It precludes risk assessment, NEPA and CEQA, among other laws as noted. My understanding is that there was no legal evaluation prior to signing this document which is pre-decisional in that no alternatives can be considered and risk ignored. Yet what everyone wants is to minimize risk. It would appear that this document is not legal.

Furthermore it requires point-by-point sampling for 132 substances with extraordinarily low standards that almost guarantee detection of something in all areas tested requiring removal of unnecessarily massive amounts of soil. Finding soil for backfill of the excavations will be impossible given the numerous substances tested for, the unusually tight criteria and the point-by-point sampling. State law requires that the environment be restored. Even in the unlikely event that some backfill were to be found that meets the stringent requirements of the AOC, it would not begin to restore the habitat that will be destroyed. The fact that backfill clean enough to meet the stringent and unrealistic levels of the AOC is nowhere to be found only serves to underscore how unrealistic it is to attempt to clean up to these standards. By criteria defined in the AOC, no place in California is safe. The cleanup to AOC standards will put communities at unnecessary risk from transport of soil with little, if any, lowering of risk from toxicity of substances located at SSFL.

Another alternative uses risk assessment for the Look Up Table values. This method accounts for toxicity and threats to human health. It reduces the number of substances that would trigger rejection of soil by approximately 80 %. However the point-by-point sampling method indicates a high probability of soil rejection and will require unavailable backfill. This was not the method used at Hunter's Point and is not

157-2
cont'd

157-3

157-2
cont'd

157-4

157-2
cont'd

157-3 Onsite disposal options were eliminated from analysis in this EIS because the 2010 AOC does not allow onsite burial or landfilling (excavating and burying) of contaminated debris or soil. Boeing owns the land in Area IV and the NBZ. DOE's intent is to complete its cleanup responsibilities, then relinquish the land to Boeing's control. DOE does not want any enduring responsibility for a landfill created on site.

157-4 DOE acknowledges your observations and concerns regarding the 2010 AOC. As a point of clarification – the AOC, Section 4.0 indicates that DTSC is to prepare an analysis under CEQA. The DTSC is preparing a *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). Section 7.11, requires that DOE actions taken pursuant to the order be undertaken in accordance with applicable local, State, and Federal laws and regulations, which would include NEPA. This clause recognizes that DOE must comply with NEPA, as do Sections 6.1 and 6.2 of the AOC. Section 6.1 acknowledges DOE's obligation to prepare an EIS and ROD(s) pursuant to a court order. Section 6.2 recognizes the need to complete an environmental review that meets the requirements of the court order. DOE did have legal representation during the negotiation of the 2010 AOC.

Commenter No. 157 (cont'd): Ronald B. Ziman

considered normal methodology for cleanups such as SSFL. Point by point methodology creates a bad precedent for future cleanups. I am not in favor of this alternative.

The No Action alternative should also be rejected. This site is leased by DOE from Boeing. If DOE does not clean up the site, that action would not comply with Boeing's commitment to clean their property to the EPA suburban residential standard for ultimate use as open space.

I note that cultural and biological exceptions are not in the draft. There is the issue of the 5% exception noted in the AOC that is neither invoked nor taken into account in the DEIS. It should be included.

I have concerns that trucking large volumes of soil will create risk to the communities on multiple levels. Diesel air pollution is now associated with many adverse health consequences to people. These include, but are not limited to, increased morbidity and mortality from carcinogenicity, adverse pulmonary consequences, stroke, heart disease and dementia. Truck traffic statistics demonstrate predictable frequencies of traffic accidents creating additional incremental risk to local communities. The currently proposed truck routes take trucks through highly populated areas that already have significant traffic. The stress of additional truck traffic through areas without the elasticity to absorb such traffic will further significantly add to traffic congestion and result in serious negative impacts on local communities for years. Safety and quality of life should not be ignored, and must be balanced with the benefits those residents will derive from these cleanup actions. How is the issue of added wear and tear to the roads to be addressed? In my view this requires additional budgeting for repairs. During and after the cleanup repair of the roads will also add to the deterioration of quality of life, congestion and disruption for those who commute, which is just about everyone.

I recommend that air monitoring be located both on site and in the affected communities. After all, the cleanup is being done to protect the communities at risk. It should not unnecessarily imperil the health of the communities around SSFL. Air safety monitoring should also be done for San Joaquin Valley Fever (Coccidioidomycosis) which is endemic in the soil in the Western San Fernando Valley. Air dispersion of soil as fugitive dust is a well known means of transmission of the infectious spores. Increased incidence of Valley Fever is well documented following grading projects, which is, in essence, much of the cleanup activity that will be taking place at SSFL. It should be noted that BMP for dust control has not been shown to be effective at reducing the risk of Valley Fever associated with those grading projects.

In conclusion, in my opinion, the DOE should select the Conservation of Natural Resources alternative since it represents a scientific cleanup and follows federal and state laws and regulations while minimizing adverse consequences to the site, the environment, the archaeology, the history, the ecology and the surrounding communities. Where feasible this should be combined with attenuation and treatment on site. The recent DOE public hearings were highly confrontational with testimonial examples of various cancers and emotional anecdotal information, which in the past led to Senate Bill 990 and

**157-2
cont'd**

157-5

157-6

157-7

157-8

157-9

**157-2
cont'd**

157-5 As discussed in Chapter 2, Section 2.3.2 of this Final EIS and shown in Table 2-3 and Figure 2-2, DOE identified proposed exemption areas to protect biological and cultural resources and accounted for these areas in soil volume estimates. Please refer to "Application of Exemptions under the 2010 Administrative Order on Consent" (Section 2.4 of this CRD) for a discussion of this topic and DOE's response. The 5 percent exemption is for unforeseen circumstances and would be invoked as necessary, subject to DTSC approval, as remediation planning and implementation proceed.

157-6 Air quality impacts from proposed offsite haul truck transport would be minimal, due to the relatively low emission rates of these vehicles. As discussed in Final EIS Chapter 4, Section 4.6.4.2, the air quality analysis estimates that unmitigated diesel particulate matter (DPM) emissions generated by a 2021 average California truck fleet within the entire South Coast Air Basin analysis domain under the nearby disposal site scenario would amount to less than 31 pounds per year, or about 0.4 pounds during a peak day (based on 32 truck round trips per peak day) (Leidos 2018b; Tables 1.A-23 and 1.A-24; [DPM is about 20 percent of the PM10 values in these tables]). These emissions would occur over about 160 miles of roadway that span a large portion of the SCAB. As a result, populations adjacent to roadways proposed for the transport of materials from the SSFL would be exposed to very low DPM emissions from project haul trucks and likely would experience no noticeable health effects from these emissions.

157-7 As reported in Chapter 4, Section 4.8.2, and Appendix H, Section H-13, for traffic potentially attributable to DOE activities, for the final EIS DOE performed a detailed analysis of traffic flow quality for selected SSFL-area intersections and road segments considering operational factors such as control delay, LOS, and V/C ratios. In Chapter 5, Section 5.5.8.2, of the final EIS, DOE a performed a similar analysis to analyze cumulative traffic impacts assuming 96 daily heavy-duty truck round trips by DOE. Section 4.8.2, Section H.13, and Section 5.5.8.2 of the Final EIS were revised to document the changes in LOS ratings and V/C ratios that could potentially occur on affected road segments in the SSFL vicinity. The potential changes in V/C ratios were assessed against the thresholds for impact significance as listed in the L.A. CEQA Thresholds Guide (LA 2006). Also refer to the response to comment 146-78

DOE needs to complete remediation of SSFL Area IV and the NBZ to comply with applicable requirements for cleanup of radioactive and hazardous substances. DOE needs to remove the remaining DOE structures in Area IV of SSFL and clean up the affected environment in Area IV and the NBZ in a manner that is protective of the environment and the health and safety of the public and workers. The EIS considers

Commenter No. 157 (cont'd): Ronald B. Ziman

eventually to the AOC. Now, with more data and information available, it is clear that a conservation alternative for SSFL is best cleanup for everyone.

Thank you, again, for allowing me to comment on the DOE's DEIS.

Sincerely,

Ronald B. Ziman, MD, FACP, FAAN
Associate Clinical Professor, David Geffen School of Medicine, UCLA

|| 157-2
cont'd

alternatives to accomplish these tasks, and each alternative addresses the potential impacts that implementing the alternative could have on several resource areas, including human health and safety, biological and cultural resources, ground and surface water resources, air quality, and transportation and traffic impacts. After publication of the Final EIS, DOE's decision will be issued in a Record of Decision published in the *Federal Register*, and this decision will reflect the consideration and balancing of the potential impacts on all evaluated resource areas.

157-8 The EIS evaluates the impacts on pavement due to the passage of heavy trucks qualitatively, but these evaluations were informed quantitatively through calculations of the number of equivalent single-axle loads (ESALs) traveling over the pavement structure on the evaluated roads. An ESAL is the damage caused to pavement by a single 18,000-pound vehicle axle, and can be considered a unit of pavement damage. The number of ESALs for a road was determined by multiplying the ESALs for a particular type of vehicle (particularly a heavy-duty truck) by the annual number of vehicles of that type traversing the road, and then summing the results over all vehicle types and the total number of years of truck traffic. See Appendix H, Section H.13.3.2, for additional information.

DOE calculated pavement ESALs for each alternative and combination of action alternatives addressing DOE remediation activities in Area IV of SSFL (Chapter 4), as well as the remediation activities in other SSFL areas by Boeing and NASA (Chapter 5), and considered these ESALs when determining whether an alternative, combination of action alternatives, or combination of actions by DOE, Boeing, and NASA could require pavement repair sooner than was anticipated when the evaluated road was last paved. This analysis was performed in Sections 4.8.2 and 5.5.8.2 of the EIS. In addition, Section 4.12 includes an analysis of the potential impacts on infrastructure and municipal services and local government revenue due to DOE's activities, while Section 5.5.12 includes a similar analysis for combined DOE, Boeing, and NASA activities. These analyses include the potential for local economic impacts due to the need to repair road pavement sooner than anticipated.

157-9 This Final FEIS demonstrates that by complying with applicable Ventura County Air Pollution Control District (VCAPCD) Rules, combustive and fugitive dust emissions generated from cleanup activities proposed by the DOE would produce less than significant air quality impacts on locations outside of the SSFL boundary. Direct transport of these emissions to a distance of nearly one mile to the nearest residence or farther would further dilute these pollutant concentrations to well below any level of health concern.

Commenter No. 157 (cont'd): Ronald B. Ziman

The proposed cleanup activities would adhere to a fugitive dust control plan that identifies a variety of measures to minimize emissions and therefore to comply with VCAPCD Rule 55 – Fugitive Dust. Personnel would visually monitor the proposed cleanup activities on a real time basis and if there were any noticeable increase in emissions, such as fugitive dust, they would quickly implement measures to mitigate their intensities, thereby avoiding any substantial air pollutant exposure to the public.

DOE, NASA, and Boeing each implemented their respective baseline air monitoring programs in early 2018 for their areas of responsibility at SSFL. For DOE the program includes a meteorological station within Area IV and four air monitors along the perimeter of Area IV (as described in NASA/Boeing/DOE 2017). The perimeter stations include two along the north border near the SRE and RMHF, one along the western border, and one along the southern border. DOE is operating the system to establish a pre-remediation baseline. The system will continue to operate during remediation activities to monitor any potential air pollutant releases of concern. If the air monitoring network indicates any elevated levels of air pollution, onsite staff would take action to mitigate the releases to acceptable levels. A description of the DOE air monitoring system was added to Chapter 3, Section 3.6.1 of this Final EIS.

Regarding the impact of DPM emissions from proposed haul truck transport activities to adjacent communities, please see the response to comment 157-6.

Regarding testing for the presence of Valley Fever, Chapter 4, Section 4.9.2.6 of this Final EIS indicates that there are no commercially available tests to reliably test the soil for *Coccidioides* spores before working in a particular location (CDC 2014; HESIS 2013). Soil testing is currently only done for scientific research, and the available methods to detect *Coccidioides* in the soil do not always detect the spores, even when they are present (CDC 2014). Because the spores may be present in the soil, reasonable precautions would be taken to reduce potential for exposure. For example, the fugitive dust control plan mentioned above will include measures to reduce the risk of spreading Valley Fever that focus on fugitive dust controls recommended by the VCAPCD to minimize fungal spore entrainment, as well as minimizing worker exposure (VCAPCD 2003).

Due to the low air pollutant impacts on nearby residents that would occur from the proposed cleanup activities, DOE's visual monitoring and perimeter air monitoring stations are adequate to identify the need for any corrective actions to mitigate unacceptable air emissions.

Simi Valley, CA 93063

Re: Comments regarding Draft EIS for Remediation of Area IV and the NBZ of the SSFL.

Ms. Jennings,

I am delighted to find the document to be an extensive examination of the proposed action and the four alternatives under consideration to accomplish the goal of acceptable environmental remediation endpoint for the US Department of Energy at the Santa Susana Field Laboratory.

The DEIS appropriately includes a range of alternatives.

I appreciate the DOE contemplating the effects and consequences for a range of project alternatives. The cleanup of SSFL is unique in that it has not followed the established pathway for environmental remediation in the United States, i.e. RCRA corrective action for active sites, CERCLA for those closed. Members of the interested community are therefore at a disadvantage when it comes to understanding the unusual nature of the cleanup and its various impacts. The DOE contributed to a better community understanding of the project (and its consequences) by including a range of alternatives.

The expected minimum quantity of soil to be excavated is too low.

The supporting analysis for the soil removal quantities (D.6.1) does not consider the impacts of the 'not to exceed value' requirement for the AOC removal implementation. At least one EPA guidance document acknowledges the consequence of higher soil removal quantities under the "not to exceed value" as compared to the "area averaging" method¹.

The DEIS apparently did not consider the natural variations of the subsurface bedrock topography when arriving at the soil removal quantity estimates. In my direct experience performing and overseeing excavations at the SSFL, I have observed the soil/bedrock interface to be crenulated and difficult to predict. The amount of soil excavated was usually greater than expected.

¹ Industrial Economics Inc., and H. Rouhani, "Draft guidance on surface soil cleanup at hazardous waste sites: implementing cleanup levels", Environmental Protection Agency, Office of Emergency and Remedial Response, EPA Document no. 9355.0-91, May 2004.

158-1

158-1 Thank you for your comment.

158-2

Since the Draft EIS was prepared, DOE has independently checked the estimate of the soil volume associated with cleaning up to the 2010 AOC LUT values. Based on the characterization data and an improved understanding of the soil depth over uneven bedrock across Area IV and the NBZ, DOE is not as uncertain about the upper limit of the soil volume estimate as it was at the time the Draft EIS was prepared.

158-2

In this Final EIS, DOE has retained the analysis of the 881,000 cubic yards of soil that would be removed from SSFL under the Cleanup to AOC LUT Values Alternative. Under the 881,000 cubic yard scenario, 115,000 cubic yards of soil for the cultural and biological resources exemptions and 620,000 cubic yards for monitored natural attenuation of TPH would not be removed. However, DOE has added a sensitivity analysis to assess the potential impacts of a larger volume of soil under the Cleanup to AOC LUT Values Alternative. This sensitivity analysis evaluates the impacts of removing 1,900,000 cubic yards of soil, including the volume of soil associated with the cultural and biological resources exemptions, the volume of soil associated with monitored natural attenuation of TPH, and a 20 percent uncertainty factor.

Commenter No. 158 (cont'd): Brian Sujata

Given the nature of the cleanup requirements and the natural variation of the various factors used to estimate the soil excavation quantities, the DOE should establish an appropriate error range (which may be as high as fifty percent) to accurately describe the project outcomes to the community and revise the EIS accordingly.

158-2
cont'd

The replacement soil quantities are too low.

The DOE proposes to replace only two feet of soil at certain excavated areas. In locations where greater than two feet of soil is removed, the replacement of only twenty four inches is too little to minimize long-term impacts to the natural vegetation and biota. The DOE should replace the excavated soils with equal quantities of replacement soil in all areas and revise the EIS accordingly.

158-3

The impacts of using replacement materials having a different soil texture must be considered.

The most extreme alternative proposes to remove surface soil from nearly fifty percent of the 290-acre Area IV. Yet the DEIS focused on the chemical properties without considering the environmental impacts caused by the physical texture of the replacement materials. A widespread change to the soil texture will cause large impacts to the biota, erosion, groundwater recharge and so forth. The DOE should specifically consider and revise the EIS to present the environmental impacts of using replacement soils having a different soil texture classification.

158-4

Alternatives requiring replacement soil should be rejected as infeasible.

Since the DOE was unable to locate a source for the replacement soil that meets the chemical-based removal standard, alternatives involving the removal of significant volumes of should be rejected. It makes no sense to use replacement soil having greater contaminants than those removed.

158-5

In closing, I would like to Thank you and your staff for the opportunity to comment on the subject document. I look forward to working with you and your staff in the future.

Best Regards,

Brian Sujata
Thousand Oaks, California

158-3 In this Final EIS, DOE is retaining the 75 percent backfill replacement assumption based on professional judgment. DOE believes that the common practice of recontouring soil to provide for an adequate soil cover overall will be effective; thus, 100 percent replacement is not necessary. Note also that large areas of Area IV have been graded as part of site development, so the original contours are not known, allowing leeway in final contours following soil remediation and replacement.

Please also note that Boeing is the land owner, not DOE. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. DOE believes that 75 percent replacement with recontouring can return the land to a condition similar to its previous topography and that this action would be consistent with the long term preservation goals of the Conservation Values at the Property as identified in the Boeing open space land use covenant (Ventura County 2017a, 2017b).

158-4 Soil texture refers to the weight percentages of clay, silt, and sand particles within a sample of soil for example, soil containing approximately 40 percent sand, 40 percent silt, and 20 percent clay is classified as loam soil. Soil texture is an important soil characteristic influencing soil's water-holding capability, permeability, and workability. For any of the Soil Remediation Alternatives evaluated in the EIS, areas where soil is removed will require backfilling with clean soil to maintain non-erosive land contours and to support restoration of a self-sustaining native vegetation cover. Chapter 4, Sections 4.5.1 of the EIS acknowledges that if this backfill is substantially different than that originally present, it may not support vegetation similar to that present before development of Area IV. Soil texture would be an important consideration when locating suitable backfill.

158-5 Please refer to Section 2.3, "Suitable Backfill Soil," of this CRD, for further discussion of this topic.

Ms. Stephanie Jennings
NEPA Document Manager
SSFL Area IV EIS
US Department of Energy
4100 Guardian St., Suite 160
Simi Valley, CA 9063

Dear Ms. Jennings,

The US Department of Energy (DOE) sets its mission to ensure America's security and prosperity by addressing its energy, environmental and nuclear challenges through transformative science and technology solutions. DOE's past and proposed actions regarding the Area IV Santa Susana Field Laboratory run directly counter to this mission.

As you well know, DOE entered into a Consent Order for Corrective Action in 2007 with the Department of Toxic Substances control along with other parties responsible for the toxic contamination of SSFL IV. DOE along with these parties agreed to a full cleanup of soil and groundwater by 2017. That deadline has come and gone. In 2010, DOE and NASA signed an Administrative Order on Consent with the DTSC committing to a full cleanup of soil with contamination levels above background by 2017. This deadline too has passed. DOE is now proposing several leave in place alternatives to the original no leave in place agreement. DOE has neither the legal authority nor the right to usurp DTSC mandates and self-determine the extent to which it will clean up its own contamination.

DOE has proposed four cleanup alternatives which would leave significant quantities of contamination onsite. Of particular note are the Conservation of Natural Resources and the No Action alternative. The Conservation of Natural Resources alternative, in a bid to protect sensitive flora and fauna in the area, will leave anywhere from 89.5% to 99% of chemically and radioactively contaminated soil with the flora and fauna in the area. The No Action alternative, proposes doing nothing. This soil left behind will and currently has been leeching through the groundwater and into local drainage routes. Samples taken from drainage sources show chemical and radioactive contamination levels well above toxic levels flowing with the water.

The Department of Energy needs to realize that this Draft Environmental Impact Statement is not an opportunity to create clever money saving alternatives. It is a report meant

159-1

159-2

159-3

159-2
cont'd

159-4

159-2
cont'd

- 159-1 DOE's predecessor agency established what became known as the Energy Technology Engineering Center as a location at which various technologies related to nuclear energy were tested. As a result of operations conducted in accordance with accepted practices at the time, as well as inadvertent releases, soil, buildings, and groundwater, became contaminated with chemicals and radionuclides. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. As stated in Chapter 1, Section 1.1 of this EIS, DOE's purpose and need is to complete remediation of SSFL Area IV and the NBZ to comply with applicable requirements for cleanup of radiological and hazardous substances. These requirements include regulations, orders, and agreements. To this end, DOE needs to remove the remaining DOE structures in Area IV of SSFL and clean up the affected environment in Area IV and the NBZ in a manner that is protective of the environment and the health and safety of the public and workers.
- 159-2 NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. In addition, as discussed in Chapter 1, Section 1.3 of this EIS, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision pursuant to NEPA. DOE recognizes that the 2010 AOC is a legally binding agreement with the DTSC and that DTSC has regulatory authority over aspects of DOE's cleanup of Area IV and the NBZ. In accordance with the 2010 AOC, Section 7.11, "Compliance with Applicable Laws and Regulations," all actions taken by DOE pursuant to the order will be undertaken in accordance with applicable local, State, and Federal laws and regulations. This clause recognizes that DOE must comply with NEPA, as do Sections 6.1 and 6.2 of the AOC. Section 6.1 acknowledges DOE's obligation to prepare an EIS

Commenter No. 159 (cont'd): Anonymous

to properly analyze and determine the level of required cleanup according to the 2010 AOC look up table values. The very fact that alternatives are even being proposed is alarming to the extreme. By proposing alternatives for cleanup both below the scope and threshold of originally agreed upon safe levels, DOE has shown that it is both cognizant and uncaring of the potential for harm inflicted upon the American people. If DOE proceeds with any alternative course of action other, it will have demonstrated the value of money over American lives.

In short, DOE has both a moral and legal obligation to cleanup SSFL Area IV to the 2010 AOC agreed upon levels. Failure to do so constitutes clear and present ongoing harm to the local community and the local environment.

**159-2
cont'd**

and ROD(s) pursuant to a court order. Section 6.2 recognizes the need to complete an environmental review that meets the requirements of the court order.

This EIS analyzes an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities (the AOC LUT values). In response to public input received, and consistent with its obligations under NEPA, DOE also analyzed alternatives that are based on risk to human health as well as the protection of natural resources. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The incorporation of a No Action Alternative is a legal requirement under Federal NEPA regulations and it forms a basis for which to compare the impacts of the action alternatives. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ.

None of the action alternatives analyzed in this Final EIS would leave chemical or radionuclide contamination at concentrations that would pose a risk to human health or ecological receptors (refer to Section 2.5, "Toxicity of Soil Contaminants," of this CRD).

- 159-3** DOE recognizes DTSC's authority under the AOC and the Resource Conservation and Recovery Act. DOE recognizes that DTSC need to approve soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC and DOE-prepared RCRA closure plans for building demolition.
- 159-4** Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

Subject: Ventura County Air Pollution Control District Comments on the Draft
Environmental Impact Statement for Remediation of Area IV and the
Northern Buffer Zone of the Santa Susana Field Laboratory, Ventura County,
California

Dear Ms. Jennings,

Thank you for the opportunity to review and comment on the subject document. As the local governmental agency responsible for air quality in Ventura County, we wish to submit the following comments on this project.

The project site is south of Simi Valley in Ventura County and is therefore within our jurisdiction for air quality. The Draft Environmental Impact Statement (DEIS) analyzes the potential environmental impacts of three alternatives for cleanup activities of 290 acres in Area IV of the Santa Susana Field Laboratory (SSFL) and the adjoining Northern Buffer Zone (NBZ). Remediation is needed to clean up residual chemicals and radionuclides from past operations in the area.

Clean up activities involve separate alternatives for removal of DOE-owned facilities; remediation of radiologically and chemically impacted soil and groundwater; disposal of resulting waste and restoration of the affected environment. The No Action Alternative of continued maintenance would not increase air emissions from the project site.

Chapter 4.6 of the DEIS, *Air Quality and Climate Change*, addresses air quality impacts of the project. Proposed activities discussed in the *Impact Assessment Methodology* section of this discussion include the use of fossil fuel-powered, off-road construction equipment, on-road heavy-duty trucks, and worker commuter vehicles generating combustive emissions. Equipment and vehicles performing earthmoving and demolition activities would also generate fugitive dust. Transport of waste materials to offsite facilities will generate emissions and are evaluated within three domains: Ventura

Response side of this page intentionally left blank.

Ventura County Air Pollution Control District

S. Jennings
 U.S. Department of Energy
 April 11, 2017
 Page 2

County and the area adjacent to SSFL, the South Coast Air Basin, and regions beyond Ventura County.

Section 4.6.4.1, *Ventura County Domain*, addresses air quality impacts that would occur within Ventura County from the groups of combined alternatives and presents emissions in terms of peak annual emissions. Unmitigated project emissions are presented in Table 4-34, *Peak Annual Emissions Under the Combined Action Alternatives*, and Table 4-35, *Peak Daily Emissions Under the Combined Action Alternatives*.

Chapter 5.11.2, *Potential Environmental Consequences of Combined Action Alternatives*, evaluated three combinations of action alternatives that would result in the highest potential air quality impacts. This discussion indicates that peak annual emissions under all three evaluated combinations would be well below the indicator emissions thresholds for Ventura County. Elevated levels of PM₁₀ would result from fugitive dust from operation of equipment and trucks on unpaved surfaces and trucks on paved roads internal to SSFL. DOE would implement measures to control fugitive dust emissions from the proposed activities, including measures to comply with VCAPCD Rule 55, Fugitive Dust. Mitigation of these emissions are discussed in Green Cleanup Impacts on Page 4-83, as well as Chapter 6, Section 6-1, *Measures to Minimize Impacts and Mitigation Measure*, on Page 6-11.

Table 5-3, *Preliminary Estimated Soil Volumes for Transportation*, indicates that 933,000 cu. yds. of soil would be removed from the site. Contaminated soil and demolition debris would be transported off site by 96 heavy-duty trucks/day. In addition to this, Cleanup to the more stringent Administrative Order on Consent for Remedial Action (AOC) Look-Up Table (LUT) would also involve 130 acres of land, 700,000 cu. yds. of backfill, 116,000 truck round trips, and 62,500 round trips of passenger vehicles. The difference in soil volume estimates between the Cleanup to AOC LUT and either the Cleanup to Revised LUT Values Alternative or Conservation of Natural Resources Alternative is at least 741,000 cu. yds. Disposal of 741,000 cu. yds. of soil would result in 55,575 truck round trips and 36,245 truck round trips for backfill.

Indicators of Projected Air Quality Impacts

The DEIS utilized EPA's Prevention of Significant Deterioration and federal conformity thresholds as indicators of the project's air quality impacts, depending upon whether an area is or is not in attainment of the NAAQS for the air pollutant of interest.

In the case of criteria pollutants for which the project region is in attainment of a NAAQS, the analysis compared the increase in annual air pollutant emissions estimated for each proposed alternative to the EPA Prevention of Significant Deterioration

Response side of this page intentionally left blank.

Commenter No. 160 (cont'd): Michael Villegas,
Ventura County Air Pollution Control District

S. Jennings
U.S. Department of Energy
April 11, 2017
Page 3

threshold for new major sources of 250 tons per year of a pollutant; the result was used as an indicator of projected air quality impacts.

In the case of criteria pollutants for which the project region is not in attainment of a NAAQS, the analysis compared the increase in proposed annual emissions to the applicable pollutant threshold that requires a conformity determination for that region. For example, for Ventura County, the analysis used the following annual thresholds: (1) 50 tons of VOC and nitrogen oxides; (2) 100 tons of PM₁₀; and (3) 250 tons of carbon monoxide, sulfur dioxide, and PM_{2.5}.

If proposed emissions exceeded a Prevention of Significant Deterioration or conformity threshold, further analysis was conducted to determine the degree of impacts. In such cases, if proposed emissions would not contribute to exceedance of an ambient air quality standard or would conform to the approved State Implementation Plan, then the impacts would not exceed regulatory thresholds of concern.

The Ventura County Air Pollution Control District (District or VCAPCD) has recommended impact thresholds for VOCs and NOx of 25 pound per day for projects in most areas of the county subject to environmental assessment under the California Environmental Quality Act. These thresholds would be appropriate for this project as well. The thresholds are presented in Chapter 3, *Air Quality Significance Thresholds*, of the District's Ventura County Air Quality Assessment Guidelines (Guidelines).

The Guidelines also present recommended guidance for assessing potential impacts of other air pollutants, such as fugitive dust and toxic air contaminants (See Chapters 3 and 6). Such assessments may require use of appropriate air quality models and protocols.

We recommend that the air quality significance thresholds presented in the Guidelines be considered to assess the potential air quality impacts of the subject project. The Guidelines are available at <http://vcapcd.org/pubs.htm#Planning>.

Nonradiological Risk

Section H.6.2 (page H-14) of Volume 2 discusses nonradiological risk associated with the generation of air pollutants by the transport vehicles used during shipment of material from the facility to disposal sites. The risk is concerned with potential fatalities from emissions of particulates and sulfur dioxide from the material haul trucks as they pass through urbanized areas to the disposal sites, particularly the densely populated areas of the San Fernando Valley. However, for the reasons stated in this section, the calculation of the risk was not presented in the DEIS.

160-1

160-2

160-1
cont'd

160-1 DOE acknowledges the authority of the VCAPCD to regulate air quality in Ventura County and to set guidelines for air quality assessments. As a result, this Final EIS air quality analysis follows much of the guidance presented in the Ventura County Air Quality Assessment Guidelines (2003) (Guidelines). For example, it includes substantial mitigation of proposed construction-related emissions, as recommended in Section 7.4 of the Guidelines. Also, consistent with the Guidelines, Section 3.3.1, this EIS determines whether emissions from proposed activities would produce localized impacts that would contribute to an exceedance of an ambient air quality standard. However, DOE believes that the 25 pounds per day VOC and NOx (ozone precursors) emission thresholds recommended by the Guidelines and requested by the commenter to evaluate the significance of proposed emissions within Ventura County are overly conservative.

When the VCAPCD updated the Guidelines in 2003, the County was in severe nonattainment area for the national ambient air quality standard (NAAQS) for ozone, whereas it is now a serious nonattainment area for ozone (one level less stringent than severe). The South Coast Air Basin adjacent to Ventura County is in extreme nonattainment of the NAAQS for ozone (two levels more stringent than serious). To determine the significance of proposed operational emissions for CEQA purposes, the South Coast Air Quality Management District (SCAQMD) in the South Coast Air Basin uses VOC and NOx thresholds of 55 pounds per day (SCAQMD 2018). Based on 365 days per year, these SCAQMD daily thresholds equate to 10 tons per year, which are the applicable VOC and NOx annual conformity de minimis thresholds for an extreme ozone nonattainment area. Based on 365 days per year, the applicable VOC or NOx annual conformity de minimis thresholds of 50 tons per year for a serious ozone nonattainment area such as Ventura County equate to 274 pounds per day, which is substantially higher than the 25 pounds per days thresholds recommended by the Guidelines.

This Final EIS uses pollutant emission thresholds for purposes of determining the significance of proposed air quality impacts that focus on the existing air quality conditions within Ventura County: (1) an EPA Prevention of Significant Deterioration (PSD) threshold of 250 tons per year for pollutants that attain a NAAQS and (2) a general conformity de minimis threshold for pollutants that do not attain a NAAQS (50 tons per year of VOC or NOx as is the case for Ventura County). DOE also considers these thresholds to be appropriate and adequate for purposes of evaluating air quality impacts within Ventura County from the proposed SSFL project alternatives, as they are based on approved regulations (EPA 2018a, 2018b).

Page 4

Considering the number of material haul trips that will pass through the highly populated areas of the San Fernando Valley, we highly recommend that the human health risks of diesel particulate emissions from the haul trucks be assessed using an appropriate air quality model and protocols. This has been done for other projects in California involving large numbers of material haul trucks. One such example was Wayne J Sand and Gravel, located in an unincorporated area of Ventura County north of Moorpark, California. The analysis was conducted in 2015 using the California Air Resources Board HARP2 model to determine the human health risks of the project. The health risk assessment for the SSFL should also consider the cumulative human health impacts of the project along with those of the Boeing and NASA cleanup operations.

160-3

160-4

The HARP2 model implements the 2015 OEHHA Air Toxics Hot Spots Risk Assessment Guidelines. HARP2 uses the USEPA AERMOD dispersion model to determine offsite concentrations of pollutants. Excess cancer risks were calculated assuming 30 years of exposure, with exposure beginning in the third trimester (prior to birth). The CARB/CAPCOA Risk Management Guidance was used to define breathing rates, with the 95th percentile daily breathing rate (DBR) used for age groups less than 2 years old and the 80th percentile DBR for other age groups. Per OEHHA, only inhalation risks were calculated for DPM emissions.

160-3
cont'd

Risks were calculated at gridded receptors located every 100 meters around the Wayne J facility to a distance of 1,500 meters and every 500 meters to a distance of 10,000 meters. Additional receptors were located at nearby residences and at several intersections of interest along the haul truck routes. No schools, hospitals, or other sensitive receptor types are located in the area.

Fugitive Dust

The DEIS concludes that elevated levels of fugitive dust (PM₁₀ and PM_{2.5}) from operation of equipment and trucks on unpaved surfaces and trucks on paved roads internal to facility may occur. As a result, the DEIS states that DOE would implement measures to control fugitive dust emissions from the proposed activities, including measures to comply with Ventura County Air Pollution Control District Rule 55, *Fugitive Dust*, which restricts emissions of fugitive dust from being visible beyond the property line of a source. Therefore, the DEIS concludes that these controls and restrictions would ensure that emissions of fugitive dust from the combined action alternatives would not contribute to an exceedance of a PM₁₀ ambient air quality standard at any offsite location.

The District concurs with the DEIS that elevated levels of fugitive dust may occur as a result of on-site and off-site facility operations. The District also concurs with the measures that DOE has committed to implement to minimize fugitive dust levels. However, the DEIS does not substantiate its conclusion that the dust measures would, in

160-5

160-2 This Final EIS takes into consideration potential impacts of fugitive dust and toxic air contaminants (TACs) and their applicable impact criteria identified in Chapter 3 of the Guidelines. As discussed below, DOE does not believe that use of the referenced air quality models and protocols is necessary.

Regarding commenter's statement that assessment of potential impacts of other air pollutants, such as fugitive dust, may require use of appropriate air quality models and protocols, given the heightened concerns the public has regarding the environmental effects of the proposed soil excavation activities, DOE would achieve very high control levels on all sources of fugitive dust. To meet this goal DOE would implement fugitive dust minimization measure 6-1, identified in Chapter 6, Table 6-1, of this EIS. The need to comply with VCAPCD Rule 55, which restricts emissions of fugitive dust from being visible beyond the property line of a source, also would require DOE to achieve very high control levels on all sources of fugitive dust. The proposed cleanup activities would adhere to a fugitive dust control plan which identifies a variety of measures that would minimize emissions. For each remediation activity, minimization measures would be proactively identified for implementation. In addition, personnel would visually monitor the proposed cleanup activities on a real-time basis and if there were any noticeable increase in emissions, such as fugitive dust, they would quickly implement measures to mitigate their intensities. For fugitive dust, these could be either additional controls identified in minimization measure 6-1, such as more water application or minimization of activities, or other additional techniques. Proactively and reactively addressing emissions thereby would avoid any substantial offsite air pollutant impacts. As a result, these controls and restrictions would ensure that emissions of fugitive dust from any combined action alternative would not contribute to an exceedance of a PM₁₀ or PM_{2.5} ambient air quality standard at any offsite location. This qualitative approach to evaluating fugitive dust impacts is adequate due to the expected very high level of dust control achieved by minimization measure 6-1 and therefore a more rigorous approach using air dispersion modeling would be unnecessary to arrive at this same conclusion.

Regarding the commenter's statement that assessment of potential TAC impacts may require use of appropriate air quality models and protocols, this EIS in Chapter 4, Section 4.6.4.1, demonstrates that the proposed cleanup activities would produce relatively moderate levels of combustive air emissions (less than 100 pounds per day of any individual pollutant, such as NO_x) and since these emissions would occur intermittently from mobile sources over a large portion of Area IV, throughout approximately 3.1 miles of roads internal to SSFL, and within Woolsey Canyon Road between the site gate and the Los Angeles County boundary, they would be substantially

Commenter No. 160 (cont'd): Michael Villegas,
Ventura County Air Pollution Control District

S. Jennings
U.S. Department of Energy
April 11, 2017
Page 5

fact, not contribute to an exceedance of a PM₁₀ ambient air quality standard at any offsite location. Therefore, the District recommends that fugitive dust generated by the proposed activities be assessed to determine if they would cause or contribute to ambient PM₁₀ levels at any offsite location. The assessment should also consider the cumulative impacts of the project with those of the Boeing and NASA cleanup operations.

The assessment should be done with an appropriate air quality model and should consider two scenarios: one without the benefit of the proposed dust control measures (uncontrolled scenario) and one with the benefit of the proposed dust control measures (controlled scenario). Additional measures should be proposed if the modeling indicates that project activities, with the benefit of the proposed control measures, would cause or contribute to an exceedance of a PM₁₀ ambient air quality standard at any offsite location.

Mitigation Measure AQ-1

This mitigation measure for air quality and climate change impact proposes the following:

- For off-road equipment, the lower of EPA Non-road Tier 3 emission standards or California average fleet emission factors for a given pollutant.
- For on-road trucks, a fleet with trucks no more than 5 years old.

We recommend that off-road equipment be Tier 4. Tier 4 is EPA's most stringent set of engine emission standards for off-road, diesel-powered equipment, such as dozers and road graders. Tier 4 final has now been required on all new off-road diesel-powered equipment for at least 5 years (depending on engine size), so such equipment should be available for the project.

We concur that the on-road haul truck fleet for the project be no more than 5 years old.

General Comments Regarding Equipment Requiring a VCAPCD Permit

The clean-up operation would need to comply with several VCAPCD rules and policies. In addition, some proposed soil clean-up operations would have equipment which would require a VCAPCD Permit to Operate. VCAPCD Rule 23, *Exemptions from Permit*, provides a list of equipment that does not require a VCAPCD permit.

As part of the Best Available Control Technology (BACT) analysis for the VCAPCD Permit to Operate, VCAPCD staff will be considering provisions of VCAPCD Rule 74.29, *Soil Decontamination Operations*, SCAQMD Rule 1166, *Volatile Organic Compound Emissions from Soil Decontamination*, and the VCAPCD Air Toxics Review of Permit Applications policy.

160-5
cont'd

160-6

160-5
cont'd

160-7

160-8

diluted in the atmosphere. As a result, the proposed cleanup activities would produce minimal off-site impacts of TACs and resulting health impacts. The impact of TACs from proposed offsite haul truck transport also would be minimal, due to the relatively low emission rates of these vehicles. For example, this Final EIS air quality analysis estimates that unmitigated diesel particulate matter (DPM) emissions generated by a 2021 average California truck fleet would amount to 0.02 grams per mile (see Table 1.A-14 of Leidos 2018b [DPM is about 20 percent of the PM10 values in these tables]). Therefore, during a peak year of activity (2021), the project haul truck fleet would generate about 0.2 pounds per year, or 0.001 pounds during a peak day (based on 32 heavy-duty truck round trips per peak day) of DPM within the 0.4 mile segment of Woolsey Canyon Road between the SSFL gate and the Los Angeles County boundary. As a result, populations adjacent to the roadway would be exposed to very low DPM emissions from project haul trucks and likely would experience no noticeable health effects from these emissions. These qualitative approaches to evaluating TACs impacts are adequate due to the low levels of TACs that would occur from proposed sources and therefore a more rigorous approach using air dispersion and risk modeling would be unnecessary.

160-3

Regarding the need to evaluate the impact of DPM emissions from proposed haul truck trips within Ventura County with the use of a health risk assessment (HRA), please see the response to comment 160-2. With regard to the impact of DPM emissions from proposed haul truck trips within the San Fernando Valley and South Coast Air Basin (SCAB), DOE notes that due to revisions in the proposed scheduling of soil remediation activities, the average heavy-duty truck round trips per day evaluated in this Final EIS was reduced to 16 from 32 to 48 in the Draft EIS. The air quality analysis in Final EIS Chapter 4, Section 4.6.4.2 estimates that during a peak year of activity (2021), unmitigated DPM emissions generated by a 2021 average California truck fleet within the entire South Coast Air Basin analysis domain under the nearby disposal site scenario would amount to less than 31 pounds per year, or about 0.4 pounds during a peak day (based on 32 heavy-duty truck round trips per peak day) (Leidos 2018b; Tables 1.A-23 and 1.A-24; [DPM is about 20 percent of the PM10 values in these tables]). These emissions would occur over about 160 miles of roadway within the SCAB. As a result, populations adjacent to roadways proposed for the transport of materials from the SSFL would be exposed to very low DPM emissions from project haul trucks and likely would experience no noticeable health effects from these emissions. Given these very low DPM emissions and resulting expected impacts, it is unnecessary to perform an HRA to arrive at the same determination.

Also please see the response to comment 160-8.

**Commenter No. 160 (cont'd): Michael Villegas,
Ventura County Air Pollution Control District**

S. Jennings
U.S. Department of Energy
April 11, 2017
Page 6

For any engines utilized at the site, the BACT analysis would include a review of any applicable California Air Resources Board (CARB) Air Toxics Control Measures, U.S. EPA National Emissions Standards for Hazardous Air Pollutants (NESHAP) for stationary reciprocating internal combustion engines (RICE), as well as air district rules for internal combustion engines.

If storage tanks are used in the clean-up operation, the BACT analysis may include compliance with VCAPCD Rule 71.2, *Storage of Reactive Organic Compound Liquids*.

Excavation operations would be required to comply with VCAPCD Rule 55, *Fugitive Dust*. In the interest of implementing the best management practices to minimize dust, the applicable provisions of South Coast Air Quality Management District (SCAQMD) Rule 403, *Fugitive Dust*, should also be implemented.

The VCAPCD Air Toxics Review of Permit Applications policy will require a Health Risk Assessment for the soil clean-up operation, prior to granting a Permit to Operate.

General Comments on Haul Truck Emissions

VCAPCD staff has reviewed Tables 5-3 and 5-4 on pages 5-18 and 5-19 of the EIS Summary. It would be beneficial for us to have the fuel use and number of potential truck trips in Ventura County, along with information on the emission factors utilized (as opposed to references to CARB and EPA documents). This information will assist us in reviewing the potential impacts from the trucks based on the Health Risk Assessment.

Sincerely,

Michael Villegas
Air Pollution Control Officer

c: Ventura County Air Pollution Control Board

160-8
cont'd

160-9

- 160-4 As noted in the preceding response, DOE does not believe it is necessary to perform a quantitative health risk assessment of impacts associated haul trucks. However, a discussion of potential cumulative impacts on human health for an onsite or offsite resident or recreational user from DOE, NASA, and Boeing remediation activities was added to Section 5.5.9 of this Final EIS. The risks for residential exposure scenario in Area IV were calculated assuming the exposure was for 24 hours per day, 350 days per year, for 26 years. The 350 days per year assumes the resident is traveling away from home 2 weeks per year, and the 26 years is the assumed time the a resident will live on the same property. That doesn't leave any time for exposure on an adjacent property. Although the recreational user's time on site is not nearly as much as that for a resident, the assumed exposure time of 8 hours a day, 75 days per year, for 26 years for recreational activities (e.g., hiking) is sufficient to address the total recreational exposure, regardless of which area is being traversed. (Any time spent on adjacent property subtracts from the time available on the Area IV property.) The cumulative risks to the recreational user from exposure both onsite and offsite should be no greater than the recreational user risks presented in Chapter 4, Section 4.9, Table 4-63. Estimates of the offsite residential risks from the combined DOE, NASA and Boeing activities was qualitatively evaluated The offsite impacts shown in this SSFL Area IV EIS for DOE remediation activities (see Table 4-63) would be three to eight orders of magnitude below an acceptable cancer risk range of 1 in 10,000 to 1 in 1 million. Impacts to offsite individuals from NASA and Boeing remediation activities would be expected to be in a similar range.
- 160-5 Regarding the need (1) to substantiate the conclusion that proposed dust measures would ensure that proposed activities would not contribute to an exceedance of a PM10 ambient air quality standard at any offsite location, (2) to assess potential fugitive dust impacts with the use of air dispersion modeling, and (3) to apply additional fugitive dust control measures to the proposed activities, please see the response to comment 160-2. This response discusses an unmitigated scenario that would include implementation of a variety of fugitive dust control measures (minimization measure 6-1) and it also identifies the mechanism to apply further controls (mitigate) if there is any noticeable increase in emissions. DOE is committed to complying with the VCAPCD Rule 55 regarding control of fugitive dust and the ambient PM10 standards.
- 160-6 Cumulative impacts on air quality (including to ambient PM10 levels) and climate change from DOE, NASA, and Boeing remediation activities are addressed in Chapter 5, Section 5.5.6 of this Final EIS.

Commenter No. 160 (cont'd): Michael Villegas,
Ventura County Air Pollution Control District

- 160-7** Given that the project schedule to begin soil remediation activities has been delayed about 2 years to 2021 (compared to the schedule in the Draft EIS), there would be many more pieces of Tier 4 equipment available in the California equipment fleet. Therefore, Mitigation Measure AQ-1 was revised in this Final EIS to include as a goal that off-road equipment have engines that comply with the EPA Tier 4 non-road emission standards.
- 160-8** Chapter 8, Section 8.1.5 of this Final EIS states that air emissions from the proposed cleanup activities would be regulated by the VCAPCD and Table 8-3 identifies potential VCAPCD rules that would apply to the proposed cleanup activities. Table 8-3 in this Final EIS was revised to include the additional VCAPCD rules identified in the comment. The EIS air quality analysis assumes that mainly mobile sources of combustive emissions (e.g., construction equipment, trucks, etc.) would be used for the proposed cleanup activities. These sources would not require a VCAPCD permit to operate. Nevertheless, contractors that take part in the cleanup activities would have to operate all emission sources in compliance with their applicable VCAPCD rules and regulations. This would include potentially obtaining permits to operate stationary sources, such as diesel-powered generators. This EIS states that the proposed cleanup activities would have to comply with VCAPCD Rule 55 – Fugitive Dust (Section 4.6.4.1). In EIS Table 6-1, Minimization Measure 6-1 identifies techniques that DOE would implement to minimize fugitive dust emissions and to comply with Rule 55. This measure has been updated to include applicable control measures identified in SCAQMD Rule 403. DOE does not feel a health risk assessment is needed for this EIS, but, as necessary to obtain a Permit to Operate, DOE will develop a Health Risk Assessment.
- 160-9** Emission factors and truck trips used to estimate emissions in this Final EIS for the four combinations of action alternatives evaluated for air impacts are presented in Attachments 1.A, 1.B, 1.CRez, and 1.C-OS of the reference, EIS for Remediation of Area IV and the NBZ of the SSFL – Final Air Emissions Calculation Methods (Leidos 2018b). Emission factors developed to estimate the implementation of Mitigation Measure AQ-1 are provided in Attachment 1.D. Data used to estimate emissions from the SSFL cumulative projects are provided in Attachment 1.E. Data used to estimate fuel usages for the four combinations of action alternatives are provided in Attachment 1.F. Regarding the need to assess potential TACs impacts from trucks with the use of an HRA, please see the responses to comments 160-2 and 160-3.

Ms. Stephe Jennings

NEPA Document Manager

SSFL Area IV EIS

U.S. Department of Energy

4100 Guardian Street, Suite 160

Simi Valley, CA 93063

Re: *Comments on Draft Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory*

Dear Ms. Jennings:

Consumer Watchdog is deeply troubled by the draft EIS that DOE has issued for the cleanup of the parts of the Santa Susana Field Laboratory for which it is responsible.

In 2010 DOE entered into a legally binding Administrative Order on Consent (AOC) requiring cleanup to background. In 2012 DOE promised that any EIS would be limited to alternative ways to carry out those requirements. It has now broken both commitments.

All alternatives in the draft EIS violate the AOC. All alternatives are outside DOE's authority, as it is legally bound by the AOC and by the state's regulatory authority. Polluters don't get to decide how much of their pollution to clean up.

We are also concerned by ambiguity in the draft EIS as to the demolition of structures and disposal of resulting debris. The AOC requires cleanup to background and includes in that requirement structures, debris, and anthropogenic materials. It further requires disposal of all waste with radioactivity above background at licensed low-level-radioactive-waste sites. The draft EIS seems to suggest that the proposed cleanup may not fully comply with those requirements. We would strongly oppose any effort by DOE to break out of those requirements of the AOC as well.

Sincerely,

Liza Tucker
Consumer Advocate

161-1

161-2

161-3

161-4

- 161-1 DOE acknowledges your preference for cleanup in accordance with the 2010 AOC. Regarding the comment that all alternatives violate the AOC, refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD, which describes how the Cleanup to AOC LUT Values Alternative incorporates technical elements of the AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. As new data has become available, DOE has considered those data and adjusted its thinking and evaluations accordingly; including in regard to the alternatives that needed to be evaluated in the EIS. For example, DOE's understanding of the implementability of cleanup in accordance with the 2010 AOC has evolved since 2012. As discussed in Chapter 2, Section 2.3, of this Final EIS DOE determined that there were technical issues with implementing a cleanup according to the 2010 AOC. As a consequence, DOE developed two alternatives to the Cleanup to AOC LUT Values Alternative that meet the purpose and need of being protective of the health and safety of the public and the environment. These two risk-based alternatives, the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative, are presented in Chapter 2, Section 2.4 of this Final EIS. This latter use of a risk assessment approach for soil cleanup in these two alternatives is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.
- 161-2 DOE recognizes DTSC's authority with respect to the AOC and the Resource Conservation and Recovery Act. DTSC's authority and role in cleanup of Area IV is discussed in Chapters 1 and 2 of the EIS.
- 161-3 As presented in Chapter 2, Section 2.5 of this Final EIS, all DOE structures would be removed under the Building Removal Alternative and disposed of in accordance with applicable laws and regulations and the acceptance criteria of disposal and/or recycle facilities. Chapter 2, Section 2.5 and Appendix D were revised to clearly indicate waste from structures/facilities with a radioactive history is assumed to be radioactive. Regardless of its history, each DOE building in Area IV would be surveyed in accordance with an approved survey plan to determine the disposition of building materials during and after demolition.

Commenter No. 161 (cont'd): Liza Tucker,
Consumer Watchdog

161-4 It is DOE's preferred alternative to remove all 18 of the DOE buildings, including foundations and subterranean structures from Area IV. Any residual radioactivity that may remain in the soil near or under the DOE buildings would be addressed as part of soil remediation activities. DOE will comply with all applicable requirements for removal and disposition of building materials.

Re: San Fernando Valley Audubon Society Comments on the Draft
Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone
of the Santa Susana Field Laboratory (Draft SSFL Area IV EIS) (DOE/EIS-0402)

Dear Ms. Jennings:

INTRODUCTION

The purpose of this letter is to provide comments on behalf of the San Fernando Valley Audubon Society (SFVAS) regarding the U. S. Department of Energy Draft Environmental Impact Statement (DEIS) on the Remediation of Santa Susana Field Laboratory (SSFL) Area IV and the Northern Buffer Zone.

BACKGROUND

SFVAS INVOLVEMENT

SFVAS, founded in 1906, is an approximately 1800 member chapter of the National Audubon Society organized as a charity under Section 501(c) (3) of the Internal Revenue Code. The chapter boundaries include the zip code areas comprising the SSFL. SFVAS has been actively involved in conserving bird life and their habitats since its founding more than one hundred years ago. More recently, SFVAS has been attempting to conserve birds and their habitats at SSFL, as well as assuring that the site is remediated in a reasonable manner that is protective of public health and other positive values. To these ends, SFVAS established a scientific program of bird monitoring at the lab in 2011 that is continuing. In addition to bird banding, the program includes regular censuses of birds throughout the site, including Area 4 and the Northern Buffer Zone (NBZ). As the representative of SFVAS, the first author of these comments has participated in almost every meeting of the former Public Participation Group organized by the Department of Toxic Substances Control (DTSC) and the several technical advisory groups under the auspices of the Environmental Protection

Response side of this page intentionally left blank.

Commenter No. 162 (cont'd): Mark B. Oskow and David A. Weeshoff,

San Fernando Valley Audubon Society

Agency and the responsible parties, the Soil Treatment Investigation Group, and attended the educational program known as the Groundwater University. The first author is currently a Section 106 consulting party. SFVAS has submitted comments during meetings and field visits and written comments concerning a number of documents; such as the National Aeronautics and Space Agency's (NASA's) Draft Environment Impact Statement concerning the remediation of NASA's areas of responsibility at SSFL.

In addition, SFVAS members have visited the site, often including Area 4 and the NBZ, for recreational and educational purposes, as well as in connection with the bird monitoring program. Activities have included a portion of the SFVAS annual Birdathon (a twenty-four hour period of competitive effort to maximize bird observations among competing groups), bird walks, hikes, tours, and other events organized by The Boeing Company. The first author has also led educational tours at the site for college classes. All of these activities are as unpaid volunteers, as befits a charitable organization.

ENVIRONMENTAL CONCERNS

As noted above, SFVAS has been involved in the conservation of birds and their habitats for over a century. However, events of recent years have added levels of urgency to conservation needs in the San Fernando Valley area as spreading development continues to chew up the last remaining open spaces surrounding the valley. SSFL is one those spaces now under the most serious threat from unnecessary and potentially destructive remediation activities. These activities mostly fall under the aegis of the Administrative Order on Consent (AOC) issued by DTSC and signed by the DOE under considerable pressure from certain elected officials and their supporting pressure groups.

PUBLIC HEALTH CONCERNS

For a variety of reasons, Americans have a heightened awareness about chemicals (including radionuclides) in the environment as having potential adverse impacts on health, including cancer. Such concerns are not necessarily exaggerated. However, they must be placed into a proper context, and assertions about *particular* relationships between chemical contamination and health impacts must be adequately documented according to sound scientific principles relating cause to effect.

As a first consideration, the background within which health impacts are occurring (or have occurred) must be taken into account. We live in what has been described as a "sea of carcinogens." These exist as products of human activity in our air, water, food, household products and furnishings, toys, building materials, streets and highways, vehicles and their emissions, and so on.

However, there are many more natural agents of cancer in our air, water, and food. Articles have been written about the contribution of carbon-14, a naturally occurring isotope of carbon, to cancer rates. Potassium 40, a naturally occurring isotope of potassium accounting for almost fifty percent of the element's abundance, may also be implicated with lower probability. The DEIS properly mentions these isotopes as possible carcinogenic agents. Naturally occurring radiological material (NORM), such as uranium, is also common in some areas, as at SSFL Area 4 and the NBZ. Radon, an inert gas that is radioactive, is common in many areas of the San Fernando Valley, and is responsible for most of the

Response side of this page intentionally left blank.

Commenter No. 162 (cont'd): Mark B. Oskow and David A. Weeshoff,
San Fernando Valley Audubon Society

background radiation nationwide to which people are exposed.

Naturally occurring carcinogens are common in food. For example, hydrazine is found naturally at high levels in mushrooms. Bruce Ames, the inventor of the Ames test, has documented hundreds of such substances in food at levels at or higher than found in the surrounding environment, and he has written dozens of scientific, peer-reviewed papers on the subject (for example, Ames, 1998). Ames and collaborators issued a news release (available at http://www.berkeley.edu/news/media/releases/97legacy/11_01_97a.html) concerning the exaggerated impact of synthetic chemicals in the environment causing cancer (Sanders, 1997). This is but one of many dozens of such studies produced on the subject.

Closer to home, the western San Fernando Valley potable water supply, which consists almost exclusively of water imported from the Los Angeles Aqueduct or from the California Aqueduct, contains cancer causing substances, both naturally occurring and otherwise. These include arsenic and, until several years ago, relatively high levels of carcinogenic trihalomethanes (THM's), by-products of chlorination, found in the Valley Circle Boulevard area of West Hills, a neighborhood not far from SSFL. Until approximately fifteen years ago, the potent carcinogen, N-nitrosodimethylamine (NDMA) may have been present in drinking water originating from the California Aqueduct, the source of water provided to the San Fernando Valley at times via connections to Metropolitan Water District. Furthermore, it is well known that wildfires in the Los Angeles/Ventura County area produce large quantities of dioxins and other carcinogens. Such fires are frequent in the area. Additional fires resulted from the Northridge Earthquake and the 1992 Los Angeles riots. A particular problem for Southern California in general has been the prevalence of backyard barbecues, which produce airborne carcinogens and changes in barbecued food that have been linked to cancer when consumed.

In addition, some biological agents, such as viruses and fungi, may also cause cancer. It is estimated that 15 to 20% of cancers are caused by viruses, such as the human papilloma virus. (University of New South Wales, 2017; available at <https://www.rcpa.edu.au/getattachment/8b3fba52-ecb5-4a6b-9788-62b6bc5e7536/How-do-Viruses-Cause-Cancer.aspx>.) A recent study by Caparaso (summarized by Miller, 2017; available at <http://www.livescience.com/58504-how-time-zones-may-affect-cancer-risk.html>), found that increasing distance from the eastern boundary of a time zone is correlated with increasing cancer risk. Injuries may also initiate sequences of events leading to cancer. Some pharmaceuticals have also been implicated as carcinogens. Similar lines of reasoning apply to many other adverse impacts thought to be caused by environmental agents (or, in some cases, the lack thereof; such as, in hypothyroidism resulting from a deficiency of iodine in the diet).

Regardless of the plethora of potential environmental agents that can cause cancer, heredity must also be considered. There is a known hereditary basis for some forms of certain cancers, in particular for retinoblastoma, neuroblastoma, breast cancer, and a few others. Merely finding a cluster of a particular cancer is not evidence, in itself, of an environmental cause, and clusters themselves must be carefully defined in order to demonstrate that they are not simply random occurrences. Proper application of inferential statistics in such analyses is critical in such instances. The *post hoc* re-calculation by Morgenstern (2008) of the probability that a *selected* group of retinoblastoma instances in the western San Fernando Valley constitutes a "cancer cluster" is an example of the abuse of

Response side of this page intentionally left blank.

Commenter No. 162 (cont'd): Mark B. Oskow and David A. Weeshoff,
San Fernando Valley Audubon Society

fundamental principles of statistical inference (commonly referred to as “cherry picking” data). In this case, Morgenstern selected a group of years from a restricted region in which retinoblastoma cases occurred and compared the probability of their occurrence to a much larger grouping of years and regions in which cases both occurred *and* did not occur to draw the conclusion that the selected data represented a cluster in contrast to the previous conclusion of the California Cancer Registry. In so doing, Morgenstern ignored the years during which retinoblastoma cases did not occur. Those years of zero occurrences of retinoblastoma in the target area cannot be simply or legitimately dismissed as irrelevant. Such restricted selection of data violates principles of random and independent sampling upon which inferential statistics are based. These types of poorly executed applications of statistics must be firmly rejected.

Cancer may also be initiated via viral mediation transmitted through sexual contact or through blood transfusions. A review article in *Wired* magazine (Wolverton, 2013; see https://www.wired.com/2013/05/al_argcancer/) suggested that the vast majority of cancers are caused by accumulated random mutations in DNA occurring during normal cellular division, and have nothing to do with hereditary or environmental factors. A recent article in the *Los Angeles Times* (Healy, March 24, 2017) gave additional appropriate attention to this unfortunate truth while the molecular biological basis of the issue is dealt with in research papers by Tomasetti and Vogelstein (2015) and Tomasetti *et al.* (2017). The *Times* article is particularly germane with respect to childhood cancers, which generate enormous concern and correspondingly intense emotional reactions on the part of parents with children victimized by cancer. The author states, “The new research also finds that childhood cancers appear almost entirely driven by randomly occurring mutations.” This is cold comfort to a parent who has lost or is caring for a child with cancer. However, it underlines the principal that the cause of a cancer in an individual case must be carefully determined according to sound scientific principles. Forcing blame on relatively distant events at SSFL in both space and time is not conducive to creating an understanding of cancer causation, nor does it advance efforts to improve diagnoses or treatments, not only of cancer but of other conditions as well.

Furthermore, even if an environmental cause can be inferred, after other potential causes are ruled out, it is more likely that the actual cause originated from a more proximate and widely encountered common source, such as the potable water supply, than from distant wind-blown or random encounters with contaminants, especially when there is no evidence that actual wind-blown contaminants were disseminated in the area or where actual evidence of exposure is lacking. The mere finding, for example, that the wind blows over SSFL from particular directions more frequently than from other directions initially towards a particular area of concern may be interesting, but it is not evidence that something in the wind caused cancer in that area. Direct evidence originating from the area of concern demonstrating that winds actually blowing over that *particular* area arise from the direction of SSFL is needed. In addition, evidence is needed that either contaminants are being deposited in the area or that the air in the area has unhealthful levels of suspect contaminants in it and inhalation of it is unavoidable at the relevant elevations. No such evidence has been produced. One could construct a large, if not infinite, number of wind rose scenarios demonstrating winds blowing over from other facilities in the San Fernando Valley where carcinogens might have originated. None of these would be considered reliable evidence that something in the wind has contributed to cancer in areas downwind. Furthermore, those same winds, including those blowing over SSFL, are likely to blow over many areas where no evidence of increased

162-1

162-1

Thank you for your comment. It has been included in the Administrative Record for the EIS. Please refer to Section 2.7, “Offsite Impacts,” and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 162 (cont'd): Mark B. Oskow and David A. Weeshoff,
San Fernando Valley Audubon Society

cancer incidence, cancer clusters, or other adverse health impacts have been found. In fact, such winds typically blow over areas where there is *reduced* cancer incidence! One need only to examine the map illustrating the instances of retinoblastoma in the San Fernando Valley in Morgenstern (2008, slide 12, attributed to the Los Angeles County Cancer Surveillance Program) to see that this is true.

On the other hand, water running off from SSFL is confined to certain, mostly inaccessible, channels. It is not used as a potable water source and does not contribute to groundwater used as a potable water source. Moreover, there are no contaminants found in surface water run-off leaving the SSFL that are found at unhealthful levels, as indicated by recent data collected at outfalls. Surface water run-off is strictly regulated by the Los Angeles Regional Water Quality Control Board pursuant to the National Pollutant Discharge Elimination System.

Given these facts, there is simply no basis for inferences that contaminants at SSFL have caused cancer, or any other illness for that matter, in nearby communities. Assertions that they do are a grave disservice to our communities, in that they freeze efforts to investigate the actual causes of cancer (or other ailments). As an additional consequence, much needed resources that might otherwise be used for such investigations are diverted to beating up the "straw man" of SSFL. To make matters worse, resources that are badly needed for the remediation of contaminated DOE sites in other parts of the country will be squandered on an unnecessarily strict clean-up at SSFL that will actually increase adverse health and environmental impacts.

ECOLOGICAL EVIDENCE CONCERNING ABSENCE OF CANCER IMPACTS FROM CONTAMINANTS AT SSFL

In addition to what has been described in the preceding section, there are several lines of evidence from ecological conditions observed at SSFL that argue forcibly against drawing any inferences suggesting that contaminants there are now causing cancers either on the site or in surrounding communities.

Avian studies and considerations

- The first of these, and perhaps the most important, derives from nearly six years of intensive study of bird life at SSFL by SFVAS. When planning for the study began in 2010, the horror stories about horrendous contamination present there from radionuclides, dioxins, PAH's, PCB's, TCE, perchlorate, etc. were (as they still are) making the rounds. Early expectations were of finding relatively large numbers of dead, dying, weak, or mutant individuals, as well as an avian community depauperate in terms of species and numbers. In fact, documentation and quantification of such findings was desired and formed part of the rationale for initiating the program. Follow-up studies were envisioned for sampling avian tissues to test for suspected carcinogens or other chemicals that might be related to those findings in order to home in on the causes so that solutions could be appropriately tailored. But, as time went by, it became obvious that the avian assemblage was quite normal for the types of habitats in the area. Surprisingly, there was not *any* evidence of adverse impacts from contamination on birds. This is not a question of comparing cancer, mutation, or tumor rates at SSFL with more pristine

San Fernando Valley Audubon Society

environments. It is a question of realizing that there are none that present any observable symptoms; that is, zero, zilch, nada.

- Coincidentally, more and more published data were encountered about levels of certain contaminants found in birds ranging from the high Arctic to Argentina and points in between. While the vast majority of these studies found no impact on avian populations, reproduction rates, behavior, morphology, or other parameters, there are significant exceptions. One very well-known example is the impact of selenium intoxication on birds nesting at Kesterson National Wildlife Refuge, where embryos, hatchlings, and young birds were found to have all sorts of mutations -- so much so that refuge managers had to scare birds away from the area to avoid further impacts. There are a number of other such conclusive studies. Recently, a toxic pit filled with acidic copper mining waste in Montana has been in the news for causing acute avian mortality. The point is that, if unusual mortalities, mutations, or other adverse impacts to birds from contaminants at SSFL were occurring, they would have been detected.

Birds have been well known for centuries as sensitive environmental monitors. The "canary in the coal mine" is the classic example. In addition, it is not well-known, but, like humans, birds suffer from a variety of cancers and tumors, as listed below.

- Cancers unique to birds – these include air sac carcinomas, and cloacal cancers.
- A broad array of internal cancers – those found in kidneys, liver, stomach, glands (ovary, testicle, thyroid and pituitary), muscles or bones.
- Squamous cell carcinoma – or skin cancer, usually appears on the wing tips, toes, and around the beak and eyes.
- Papilloma –benign skin tumor, usually due to viral infection. Occurs on the skin or in stomach lining. Can develop into cancer.
- Fibrosarcoma –cancer of the connective tissues, is a growth over a long bone, often seen in the leg or wing, usually in parrot species. When cancer grows, the skin over it may ulcerate, (to the bird's picking at it), or it may spread to other organs (metastasize).

Overall cancer and tumor incidence in humans is, of course, age-related. A similar consideration is that many birds, especially parrots, raptors, and some others are among the longest living terrestrial creatures. Parrots have been known to live well over 100 years. However, even tiny birds, such as some species of hummingbirds found in the Simi Hills can live 5 to 10 (or longer) years, despite most having to endure the hazards of migration twice every year. That life span is more than enough time for many cancers to develop, and birds do not necessarily succumb to cancer quickly any more than humans do. Furthermore, for most species, the affected individuals will have likely produced offspring to which they have passed on whatever genetic predispositions towards cancer they might be carrying. Therefore, barring environmental effects, cancer rates should remain relatively stable over time scales shorter than those where evolutionary selective drivers would come into play. Such factors make it possible to determine whether cancer rates are changing in a given area, where environmental contaminants may be having an impact.

Consider the logic of the argument. As some people testified at the two DOE hearings on the DEIS, infant children (less than a few years old and some one year old or less) in our

Response side of this page intentionally left blank.

Commenter No. 162 (cont'd): Mark B. Oskow and David A. Weeshoff,
San Fernando Valley Audubon Society

region have developed neuroblastoma or retinoblastoma, although that is, thankfully, rare. On the other hand, childhood leukemia is a major killer of young children, with approximately 16,000 cases per year diagnosed in the U. S. (Assuming rough population proportionality, approximately 160 cases would be expected in the City of Los Angeles/Ventura County area, with roughly one percent of the U. S. population, and approximately 40 cases each year in the San Fernando/Simi Valley area, assuming one fourth of the regional population. This may seem like a small number, but, after several years or more, these numbers add up. The result is that children with leukemia are not particularly rare, including those with the rarer forms of the disease. The region has specialty hospitals for the care and treatment of children with cancer; for example, St. Jude's Hospital.) Other cancers occur with lower frequencies in very young children. Up until relatively recently, most of these children would have died very young. The obvious inference to be drawn here is that cancer can develop in very young animals, be they humans, rats, horses, beavers, bears, or birds -- you name it. In spite of alarmist pronouncements to the contrary by certain speakers at the hearings, cancer does not even need one year to develop. Advances in diagnostics have increased the likelihood of detecting cancer in its early stages or at all and have also facilitated the ability to ascribe cancer origins to the appropriate organ tissues even after metastasis has occurred.

As implied above, it is axiomatic that birds are more sensitive than humans to most environmental contaminants. This is partly due to the life styles of wild birds and partly to their physiological characteristics, which include very high metabolic, heart rates, respiration rates, body temperatures, blood pressures close to the physiological maximum, and others related to their high energy needs. It should be easy for any open-minded individual to realize that, in contrast to humans, birds are in intimate and unavoidable contact with the stark realities of their natural environment every second of every day. They walk, hop, and run barefooted whenever they are on the ground or in contact with any other substrate. They drink water and eat food where they can find it opportunistically. They do not have the luxury of careful food selection. They nest, lay eggs, and raise their young where nest sites are available. They have no other option. There is no "clean" refuge to which they can flee, no nutritional experts to tell them what to eat, no labels on their food to inform them of possible harmful substances they might consume, no potable water from which to drink (except where humans have provided it), no refuge from air or water pollution. There are no signs on their water sources telling them whether it is safe to drink, nor on their nest cavities to inform them of the presence of toxins. They have no way of knowing whether the dirt they are scratching in for seeds or insects contains toxins or carcinogens, or whether the worm or mouse they just ate lived its short life in contaminated soils. Furthermore, it is well known that many toxins, including carcinogens, accumulate and many of those magnify up the food chain. All birds are consumers in the ecological sense, and many are top predators. One need only to think honestly about this in order to understand why birds are more sensitive to toxins, even without considering of their physiological predispositions.,

After four years or so into the study, a summary of findings was released to the public via brief articles in the San Fernando Valley Audubon Society newsletter, the *Phainopepla*, (Osokow, 2014a; Vol.65, #4, Aug.-Sept. 2014) and, subsequently, through the SSFL CAG on August 1, 2014 (see CAG web page at <http://ssflcag.net>, August 1, 2014). The principal finding was that there was no evidence of adverse impacts on birds from SSFL contaminants. The impact of the drought on bird numbers was later summarized and those findings, which documented the severe impact from drought, was made available to the public via the same

162-3
cont'd

Response side of this page intentionally left blank.

Commenter No. 162 (cont'd): Mark B. Oskow and David A. Weeshoff,
San Fernando Valley Audubon Society

newsletter (Osokow, 2014b; *Phainopepla*: Vol.65, #5, Oct.-Nov. 2014). Later, the foldout brochure on the birds of the SSFL, documenting our observations of bird species, was created (Dunn and Osokow, 2016). That brochure registers a full complement of birds present on the site – now consisting of 138 species, a substantial number considering the absence of large or permanent water sources at SSFL.

Food web evidence

However, there are additional lines of evidence of the lack of impacts of contaminants on wildlife at SSFL that take into account a variety of other observations. Perhaps the most obvious and important is the presence of a fully functioning food chain -- beginning with a healthy diversity of vegetation fed upon by a host of invertebrates, mammalian herbivores (including squirrels, pocket gophers, harvest mice, wood rats, deer, and others), and birds. Then, there are a variety of middle level predators (such as snakes, salamanders, lizards, frogs and toads, raccoons, skunks, and more bird species). Further up the food chain, there are the top predators (including coyotes, gray fox, bobcat, mountain lion, and raptors). The area is as rich with wildlife as almost any in Southern California. It is a fully functioning ecosystem harboring rare, threatened, or endangered species. It is an area offering great potential for the study of wildlife, ecosystem structure, function, and other ecological topics – some of great importance to understanding human impacts on the environment, including ecosystem responses to contaminants.

162-3
cont'd

Evidence from burrowing animals

An additional line of evidence for a lack of impact from contamination comes from the observation of an abundance of burrowing animals. This includes, among others, rabbits, ground squirrels (a population apparently recently decimated by drought but now rebounding), pocket gophers, harvest mice, and the snakes that consume them. These animals live and breathe underground most of the time. They, literally, eat dirt. By their continual burrowing, they churn and mix the soil, seeds, detritus and whatever else is in the soil. If there were impacts from contaminants in soil, wouldn't their populations be affected? But, the simple fact is, these animals thrive at SSFL. Small mammal burrows can be found even in the supposedly most contaminated areas, as determined by extensive soil testing. Furthermore, if contaminants impacted these species, we would likely see impacts further up the food chain. But, as noted earlier, we don't see that either.

162-3
cont'd

Evidence from amphibian abundance

The last line of evidence discussed here concerns the abundance of amphibians in SSFL ponds. Silvernale Pond is the largest and easiest to observe. It receives run-off from contaminated areas, including Area 4, throughout its catchment. Every spring, when there is sufficient water, thousands, possibly tens or even hundreds of thousands, of tadpoles, primarily of California toads and pacific chorus (tree) frogs can be seen in this and other ponds at SSFL. (Notably, this year thousands of tadpoles are being seen in Bell Creek, which drains from Area 4.) Amphibians are generally regarded as the taxonomic group most sensitive to environmental contaminants in aquatic environments, because they live in intimate contact with the water and sediments of their homes and must take oxygen from the water by way of gills or porous skin that allows contaminants in the water to pass directly into the bloodstream of these animals. A large number of studies have demonstrated a

162-3
cont'd

Response side of this page intentionally left blank.

Commenter No. 162 (cont'd): Mark B. Oskow and David A. Weeshoff,
San Fernando Valley Audubon Society

connection between contaminants in water or sediments and mutations in amphibians. Silvernale Pond is visited two or three times per month by SFVAS observers as part of the bird monitoring program. During those visits, efforts are made to find mutant amphibians in season. Although we do not claim to be performing a systematic study there, we can state that no mutated individuals have ever been found. This is so, despite the fact that the sediments are known to have what some would consider to be relatively high levels of contaminants. In addition to the lack of mutations, observation that these populations continue to thrive and are reproducing by the (tens of) thousands annually is incontrovertible evidence that contaminants are not causing harm to these species. There can be little doubt that discharges from these ponds or run-off from the site does not harm humans, which do not drink or have any other contact with these waters, living or working miles away or even at the site.

PUTTING IT ALL TOGETHER

Based on the foregoing, it is clear that the impacts of environmental contaminants at SSFL, including those alleged to contribute to cancer, have been greatly exaggerated. The upshot of this is that, pursuant to the AOC, DOE may be about to engage in very destructive clean-up activities that, at the very least, will devastate wildlife habitat and prevent recovery for decades by, among other impacts, outright destruction of vegetation, bird nest sites, burrows, animal themselves, and removing irreplaceable topsoil. Furthermore, at the very least, it will cause substantial inconvenience and hazard to communities on the eastern side of the Simi Hills adjacent to SSFL to appease human health concerns that are entirely spurious. There will be a heavy increase in truck traffic along already congested thoroughfares in West Hills, Woodland Hills, Canoga Park, and Chatsworth that are becoming even more congested day by day as numerous residential and commercial developments are built, including a massive development on the old Rocketdyne site at Canoga Avenue and Victory Boulevard to include 2,500 residences, a number of smaller developments, and the even more massive Promenade 2035 development fronting on Topanga Canyon Boulevard, a principal route to U. S. 101 from SSFL, now in the planning stages.

As a result, serious vehicle accidents involving trucks from SSFL transporting highly concentrated toxic wastes through these neighborhoods become ever more likely. A single spill from a truck carrying concentrated radiological waste through these areas would cause havoc similar to that of a "dirty bomb," while the likelihood of fatal vehicle collisions or pedestrian deaths, including those of small children on their way to or from school, playgrounds, or houses of worship, would far exceed any theoretical impacts from cancer or other health impacts from contaminants on the site. At the same time, emergency vehicles will be subjected to increasing delays, thereby jeopardizing the timely rescue of victims needing rapid attention, and the severely limited emergency routes available for the public to escape disasters (such as earthquakes) will be in gridlock. Furthermore, an accident involving the spill of hazardous waste carried by these trucks could severely impact the Los Angeles River directly or via one or more of its tributaries with unpredictable effects on birds and other wildlife using these streams. These impacts to communities through which contaminants are to be transported are casually and euphemistically referred to as an "increase in traffic" by supporters of the AOC. However, it is clear that such activities will seriously impact these neighborhoods for ten years or more, if the AOC is implemented. A number of SFVAS members, including the first author, live adjacent to the probable routes.

162-3

162-1
cont'd

162-4

162-5

162-6

- 162-4 DOE acknowledges your preference for an alternative that minimizes the impact on wildlife habitat. In addition to the information in Section 2.1, Preferences for a Cleanup," please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD. DOE needs to complete remediation of SSFL Area IV and the NBZ to comply with applicable requirements for cleanup of radiological and hazardous substances. DOE needs to remove the remaining DOE structures in Area IV of SSFL and clean up the affected environment in Area IV and the NBZ in a manner that is protective of the environment and the health and safety of the public and workers. The EIS evaluates alternatives to accomplish these tasks, and each alternative addresses the potential impacts that implementing the alternative could have on several resource areas, including human health and safety, biological and cultural resources, ground- and surface water resources, air quality, and traffic. As discussed in Chapter 1, Section 1.7, of the EIS, DOE's decision pursuant to the analysis in this Final EIS will be announced in a Record(s) of Decision (ROD[s]) that will be issued no sooner than 30 days after the EPA Notice of Availability of this Final EIS is published in the Federal Register. This decision will reflect the consideration and balancing of the potential impacts on all evaluated resource areas.
- 162-5 In the EIS, DOE addresses the potential impacts that that could occur from remediation of Area IV and the NBZ on human health and other resource areas. In the case of soil remediation and using the Conservation of Natural Resources (Open Space Scenario) Alternative as an example, leaving soil containing low concentrations of chemicals and/or radionuclides on site reduces the number of truck trips from the site. But removing soil with low concentrations of chemicals or radionuclides, as would be the case under the Cleanup to AOC LUT Values Alternative, would result in more truck trips from the site. Regarding potential traffic impacts, Chapter 4, Section 4.8.2, and Appendix H, Section H-13, documents a detailed analysis of traffic flow quality for selected SSFL-area intersections and road segments for traffic in the SSFL-area that may be attributable to DOE remediation activities. In Chapter 5, Section 5.5.8.2, of the final EIS, DOE a performed a similar analysis to analyze cumulative traffic impacts attributable to remediation actions by DOE, Boeing, and NASA. Other sections of Chapter 5 address other projects that could impact Ventura County and the South Coast Air Basin. Please also refer to the response to comment 146-78.
- 162-6 DOE acknowledges that cleanup actions and the consequential need for waste transport from SSFL would increase traffic levels on the roads in the vicinity of the site. As indicated in Appendix H, Table H-22, of this EIS, during the 2 to 3 years required for building demolition under the Building Removal Alternative, the traffic on Woolsey Canyon Road could increase during workdays by up to 5.2 percent above

Commenter No. 162 (cont'd): Mark B. Oskow and David A. Weeshoff,
San Fernando Valley Audubon Society

DEFICIENCIES IN THE DRAFT EIS

However, the Draft EIS is seriously deficient in not considering the impact of a major earthquake occurring during clean-up activities, including transport of contaminants through the western San Fernando Valley and along freeways or at SSFL itself. For example, an earthquake during the transport of contaminants increases the likelihood of vehicle collisions, as drivers are caught by surprise and vehicles swerve across traffic lanes or are struck by collapsing structures, such as power lines, or by flying debris, such as shattered glass. For another example, vehicles traveling on elevated highways, such as freeways, stand a chance of falling suddenly from as much as several stories of height when freeways collapse. The containers used to transport hazardous waste are designed to withstand impacts from relatively minor impacts, compared to those that might result from such a fall or other impacts caused by an earthquake.

In addition, the probability of occurrence of all accidents discussed in the previous paragraphs, as well as in the DEIS, is increased under earthquake scenarios, as is the likely severity of the impacts from any incident or combination of incidents. These possibilities must be taken into consideration when calculating vehicle accident risk and the severity of the possible incidents when evaluating the potential adverse impacts of the clean-up on the western San Fernando Valley communities and beyond. Those adverse impacts include probable increases in the incidence of cancers and other health effects to the communities adjacent to SSFL, consequences that supporters of the AOC claim to want to reduce by enforcing the clean-up standards based on the look-up table values, and to communities all along some transport routes even outside of the immediate area. The longer the period of time during which the clean-up occurs, the more likely it is that a major earthquake will occur, and the more vehicles involved in transporting wastes, the more likely it is that they will be impacted by an earthquake. Similar considerations apply to other earthquake impacts. These are not merely theoretical considerations. An earthquake is likely to occur during the remediation period. The last major earthquake affecting the San Fernando Valley was the Northridge Earthquake of 1994. That event was separated from the previous major earthquake, the Sylmar Earthquake of 1971, by approximately twenty-three years. The interval between the Northridge Earthquake and the present time has been approximately twenty-three years.

Furthermore, the adverse impacts on natural, cultural, and historical resources at SSFL will be exacerbated from an earthquake occurring during clean-up activities at the site. For example, the loosening of soils as part of an excavation process in areas in close proximity to rare or protected plant species could result in their suffocation by mobilized soils carried by wind, water, or gravity. Liquefaction may be a threat in some areas. Any such dispersion of contaminated soils due to earthquake effects complicates clean-up, increases the hazard to on-site visitors and workers, and increases costs. Streams, including Bell Creek and the Los Angeles River, ponds, and run-off in general would also be impacted by such events as a result of formerly compacted soils being loosened and mobilized.

As is clear from the above account, objections to the repercussions of the AOC are not merely about an increase in traffic, and any assertions to that effect reveal a disgraceful ignorance about what is at stake in this process. At the heart of the matter is the unnecessarily "strict" standard of soil clean-up to be imposed by the AOC. While cleaning

162-7

162-8

162-9

baseline conditions. During soil remediation operations under the soil remediation action alternatives, which would occur after building demolition operations, the traffic on Woolsey Canyon Road could increase during workdays by about 3.3 percent above baseline conditions. The duration of soil remediation operations would range from about 2 years under the Conservation of Natural Resources Alternative (both scenarios) to 26 years under the Cleanup to AOC LUT Values Alternative. Traffic increases on other roads in the SSFL area would be smaller than those on Woolsey Canyon Road.

The additional traffic would represent a minimal increase in the potential for traffic accidents over the entire period of site remediation. This is because the accident rate is on the order of 1 per ten-million kilometers, and the distance traveled on the roads in the vicinity of SSFL (e.g., Woolsey Canyon Road, Valley Circle Boulevard, and Plummer Street) is about 8 kilometers. Note that the average fatality rate in the United States is about 1 per 100 million vehicle kilometers, per the 2015 statistics for national traffic fatalities as documented by the National Highway Traffic Safety Administration (NHTSA 2015). Therefore, no fatalities would be expected in the vicinity of the SSFL from transport of various materials from and to the site.

DOE also notes that none of the trucks would be carrying "concentrated radiological waste;" instead, cleanup of Area IV and the NBZ involves removal of materials having low concentrations of chemicals and radionuclides. The reader is referred to Chapter 3, Section 3.9.5, of this EIS for summary information on the concentrations of chemical and radioactive constituents in soil, buildings, groundwater, and contaminated bedrock. For accidents involving transport of radioactively contaminated soil from SSFL, Chapter 4, Section 4.8.1 and Appendix H of this Final EIS presents calculations of the greatest potential risks in terms of the population and individual doses that could occur from the airborne release of contaminated soil in an urban environment. As indicated in Appendix H, Section H.7.5, the maximum dose to the exposed public within a 50-mile radius, assuming the released materials became airborne, would be about 0.0064 person-rem (or 6.4 person-millirem) in the highest population density area along the transportation route. The dose to an individual potentially receiving the largest dose (maximally exposed individual) was calculated to be 0.004 millirem. This is a very small dose; by comparison, the average dose from natural background radiation in the United States is about 360 millirem per year. If the same radioactively contaminated soils were spilled into a river, because the contamination is bound within the soil matrix, the consequences would be much smaller than those resulting from a release into the air. This is because most of the materials would settle to the bottom of the streambed and any dissolved chemicals would be diluted by the water flow and become less concentrated as the river flows downstream.

Commenter No. 162 (cont'd): Mark B. Oskow and David A. Weeshoff,
San Fernando Valley Audubon Society

up the site to a suburban residential risk-based standard would not entirely eliminate the risks from the transport of contaminants (and uncontaminated material for that matter) to nearby communities and beyond, nor would it entirely eliminate such risks to natural, cultural, or historical resources, it would reduce the risks to more acceptable levels.

In addition, adverse impacts of the clean-up at SSFL itself would likely be far more severe under earthquake scenarios that under normal conditions.

LEGAL ISSUES

The legal reasons asserted in support of the AOC are no less spurious than those alleging current health impacts originating from SSFL. DOE has been bombarded with arguments from well-organized and belligerent proponents of the AOC claiming that DOE is bound by it and that it was signed voluntarily.

In the first case, it is questionable as to whether DOE even had the legal right to enter into the AOC. DOE is a department of the executive branch of government. It does not pass legislation. DOE's signing of the AOC has so far avoided formal legal scrutiny; however, it is likely in violation of the Supremacy Clause of the U. S. Constitution (Article VI, Clause 2; see decision by 9th Circuit Court of Appeals in *The Boeing Company v. Rafael, 2014*). It is probable that DOE is legally barred from unilaterally deciding to waive the rights of the United States. There must be a specific act of Congress authorizing such an action.

The second assertion, that the AOC was signed voluntarily, is clearly preposterous. At the time the AOC was signed, Senate Bill (SB) 990 was state law. This legislation required DOE (and the other responsible parties) to clean up their sites to a rural agricultural standard (in itself an absurd requirement, given the history of the site) and to meet other obligations or to face penalties. The AOC is built upon the legal framework of SB 990, which is mentioned in the AOC in a manner indicating that the AOC derives its authority from it pursuant to contingent changes in the California Health and Safety Code. DOE was, therefore, under the duress of signing the AOC or else face the penalties prescribed therein. SB 990 has since been found to be unconstitutional in *Boeing v. Rafael (supra)*. It is unlikely that DOE would have signed the AOC were it not for the duress of SB 990 and that presented by various elected officials promoting it. This includes the impacts of political interference from various congressional, state, and local elected officials, some of whom controlled the purse strings of DOE and other agencies, as well as exercising great influence over certain personnel decisions. The upshot of this is that the signing of the AOC by DOE can in no way be considered "voluntary."

It is worthy of note that during the entire history of the site, the City and County of Los Angeles, Ventura County, the City of Simi Valley, and all potential regulatory agencies of the State of California somehow avoided responsibility for the operations at the site in accordance with the standards they now wish to retroactively impose. Where were these entities when the site was in operation? Where was their concern and regulatory oversight? The current interest of these entities in the well-being of those claiming to have experienced adverse health impacts must, under the circumstances, be regarded with suspicion. Political expediency and economic exploitation of the responsible parties are likely the true motives, as these regulatory entities are as much responsible for any contaminated conditions at the site as the identified "responsible parties."

**162-9
cont'd**

162-10

162-11

162-7 DOE disagrees with the comment that this Final EIS is deficient for not evaluating the impact of a major earthquake occurring during clean-up activities. DOE acknowledges that during an earthquake, there is a higher potential for road accidents, but because of the short duration of an earthquake, these instances of increased accidents would not change the traffic accident rates that are measured over long time periods and vehicle miles traveled. Traffic accidents during an earthquake would mainly involve fender benders or other property damage. In a condition similar to the 1989 San Francisco earthquake with the partial collapse of Interstate 880, there is a potential that a transporter containing any hazardous material could be at risk of damage and release of its content. The severity of the consequences of such an accident would depend on the nature of the cargo and the conditions of the event. For accidents involving radioactively contaminated soil waste from SSFL, please refer to the response to comment 162-6.

162-8 . Rock and soil movement during a seismic event could result in direct physical injury or mortality for plants and animals and damage to cultural resources. This would be the most important concern for a seismic event and would occur regardless of any remediation activities and therefore is not discussed in this EIS. In addition, Chapter 4, Section 4.2.1.2, of this EIS, describes the potential impacts of soil erosion whether from precipitation, gravity, or wind. The impact of soil erosion from seismic activity would be expected to be similar to erosion via these other physical processes. In addition, the mitigation measures described in Chapter 6 would help to reduce any soil erosion during and after an earthquake. There are no potential liquefaction zones on SSFL (California Department of Conservation 1998, State of California Seismic Hazards Zone - Calabasas Quadrangle, Official Map, Division of Mines and Geology, February 1).

162-9 DOE acknowledges your support for the Conservation of Natural Resources Alternative. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. Please note that in this Final EIS, DOE evaluates two scenarios under the Conservation of Natural Resource Alternative. The first scenario reflects cleanup levels based on a suburban resident without a garden as was done in the Draft EIS. The second scenario establishes cleanup levels based primarily on a recreational user, with some constituents being further limited by ecological risk.

162-10 The commenter is referred to Final EIS Chapter 2, Sections 2.1 and 2.2 for discussions regarding the history and legality of the AOC. DOE entered into the 2010 Agreement on Consent under the authority granted the Department in the Atomic Energy Act

Commenter No. 162 (cont'd): Mark B. Oskow and David A. Weeshoff,
San Fernando Valley Audubon Society

SFVAS POSITION

THE DRAFT EIS

SFVAS appreciates the effort put into the DEIS by DOE to meet the requirements of the National Environmental Policy Act (NEPA). Aside from the failure to address earthquake scenarios and a few minor errors or omissions that are not dispositive, we believe the DEIS adequately represents all of the major issues and most of the minor ones; including, the site history, environmental context, purpose and need, alternatives dismissed and remaining, and impacts of the various remaining clean-up alternatives on the natural, cultural, and historical resources at SSFL. In preceding paragraphs, we have addressed some issues concerning the impacts of a clean-up on adjacent communities undertaken pursuant to the AOC. We do not believe those pertaining to truck accident potential and impacts were adequately covered in the DEIS; hence, our attention to these matters. Although, the DEIS mentions "sabotage" in passing, we must also mention here the possibility of hijacking, for potential terrorist purposes, of trucks hauling hazardous wastes, especially where radionuclides are involved. These issues are especially important as they pertain to potential contamination the Los Angeles River, which is "waters of the United States," or its tributaries from spills during transport. Such contamination could have severe consequences for the river system's environment, including that of the Sepulveda Basin and the Lower Los Angeles River, which is classified as an Important Bird Area by the National Audubon Society. (An Important Bird and Biodiversity Area (IBA) is an area identified using an internationally agreed set of criteria as being globally important for the conservation of bird populations.) The river is currently the target of planned restoration as part of the multi-agency Los Angeles River Revitalization Project. In addition, the river is becoming increasingly popular as a fishing destination, and fish from the river or its tributaries are consumed by thousands of people annually. On the other hand, significant contamination from SSFL does not reach the river or off-site segments of its tributaries, as it is captured by treatment systems and "best management practice" systems that have already been in place at SSFL for years. As noted above, this is borne out by recent analyses available from the Los Angeles Regional Water Quality Control Board.

In particular, we appreciate the honesty of the DEIS in summarizing the lack of evidence for off-site health effects and, therefore, the absence of justification for performing a clean-up according to rural agricultural or background standards; *i.e.*, the lookup table values of the AOC. Furthermore, we greatly appreciate the courage represented by the DEIS exercised in the presence of powerful and vindictive non-governmental organizations, hostile individuals, and their favored elected officials.

Based on substantial evidence from a variety of ecological and epidemiological sources, including a number of studies commissioned by various governmental agencies, there is no basis for a clean-up to a rural agricultural or background standard as a means of protecting public health. SFVAS supports a clean-up of Area IV and NBZ soils to a risk-based suburban residential standard, as described in Alternative 4, the Conservation of Natural Resources program. This is a far stricter standard of clean-up than is actually needed for a site that is to be maintained as open space with no permanent dwellings or agricultural activities. This standard provides an extra level of protection that should satisfy all but the

162-12

162-13

162-12
cont'd

162-9
cont'd

(AEA). The AEA authorizes DOE to "advance the goals of restoring, protecting and enhancing environmental quality, and assuring public health and safety" (42 U.S.C. 7112(13)).

DTSC did not enforce SB 990 with respect to DOE, so DOE was under no duress attributable to SB 990 when the 2010 AOC was negotiated. The 2010 AOC states that DTSC agreed that compliance with the 2010 AOC would constitute DOE compliance with applicable provisions of the California Health and Safety Code (Section 1.6), including Senate Bill 990. However, after the law was declared unconstitutional, SB 990 was no longer enforceable.

162-11 Please see the response to comment 621-10.

162-12 Thank you for your comments. Please see the response to comment 162-7 and 162-8 for a discussion of the impacts from an earthquake during remediation.

162-13 Chapter 4, Section 4.8.1, of this EIS states that, because of the very low concentrations of radioactive material in the contaminated soil, building debris, and other waste addressed in this EIS, transport of these wastes would pose a very small risk to human health and the environment, even under accident conditions. In fact, the spill of an entire truck shipment (about 20 tons) of contaminated soil would not constitute a reportable quantity as defined in U.S. Department of Transportation regulations in 49 CFR 172.101, Appendix A, Table 2. Because the waste materials would contain radioactive material in such low concentrations, they would not be an attractive asset for high-jacking or use as terrorism threat.

Please refer to the response to comment 162-6 regarding the potential risks associated with an accident resulting in a spill into a river.

Commenter No. 162 (cont'd): Mark B. Oskow and David A. Weeshoff,
San Fernando Valley Audubon Society

most oversensitive individuals or groups or those whose true motivation has little to do with bringing about an effective clean-up of the site grounded in science.

|| 162-9
cont'd

Concerning the demolition and removal of the remaining buildings and the clean-up of groundwater, the 2007 Agreement on Consent provides an adequate framework for these programs, and the DEIS analyzes them sufficiently. Therefore, no further comment appears needed at this time.

|| 162-14

162-14 Thank you for your comment. It has been included in the Administrative Record for the EIS.

CONCLUSION

In conclusion, DOE should proceed to adopt an alternative for soil clean-up specified in the EIS other than that supposedly dictated by the AOC. SFVAS favors a soil clean-up according to the Conservation of Natural Resources Alternative. We emphatically reject assertions that remediating the area according to the AOC will reduce impacts to public health. On the contrary, we believe that such a process will create additional and greater threats to public health than currently exist from the site.

Ms. Stephe Jennings
NEPA Document Manager, SSFL, Area IV EIS
U. S. Department of Energy
4100 Guardian Street
Simi Valley, CA 93063

Dear Ms. Jennings,

I am pleased to submit these comments on the Draft Area IV EIS, not only as a former worker, community stakeholder, and member of the SSFL CAG, but as a knowledgeable nuclear professional with almost 60 years of experience who is familiar with most of the technical disciplines involved in developing the information for the EIS and preparing the DEIS.

I would like to commend the Department for its diligence in preparing the draft which presents evaluations of reasonable remediation alternatives in strict compliance with NEPA. The technical data accurately reflects the information that has been developed in recent years and the evaluations are sufficiently detailed to allow the decisionmakers to compare the benefits, risks, and costs of the alternatives in reaching their decisions.

Two important conclusions are made that should strongly influence any public discussion of the DEIS and the eventual Record of Decision. As stated in Table 4-60 under the No Action Alternative, for a hypothetical future suburban resident, "Cancer risk and toxicity impacts from chemical and/or radionuclides in Area IV and the NBZ are comparable to or less than the risk determined for background soil." This clearly means that SSFL now poses no additional risks from soil to off-site residents, and that it is questionable whether any soil removal is necessary to protect unlikely future on-site residents under any land use scenario. It is highly unlikely that any local stakeholder would spend their own money to remove soil from their own backyard if they were told that the risk was comparable to or less than the risk determined for background soil. The expenditure of tax dollars to remove such soil from a distant site cannot be justified.

The second conclusion is that the AOC's as written are unworkable and are in need of revision. On Page S-26, DOE discusses Acceptable Error Rate and Background Data AOC LUT Failures. With the DTSC-accepted error rate in sample analysis of 5 percent, and the AREA IV 116 chemicals and 16 radionuclides of concern, DOE would likely be remediating clean soil, not just contaminated soil. Also, when comparing the background soil results with the AOC LUT values, it was found that 42 percent of the samples exceeded their respective AOC LUT values in at least one analyte. Thus, if the point-by-point, AOC remediation decision process was applied to the background study locations, they would be declared contaminated and subject to soil remediation.

163-1

163-1 Thank you for your comment.

163-2

163-2 Thank you for your comment. It has been included in the Administrative Record for the EIS. Note that the risk assessments in this Final EIS (Section 4.9) have been revised for a better comparison of the site risks to background and expanded to include quantitative risks for both onsite and offsite exposures for all alternatives.

163-3

163-3 Thank you for your comment. It has been included in the Administrative Record for the EIS. Please refer to Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

Commenter No. 163 (cont'd): Abraham Weitzberg Ph.D.

As stated on Page S-28: "DOE concluded that low AOC LUT values, coupled with the false positive issues and the inability to accurately distinguish TPH from a range of other organic molecules, resulted in data showing almost the entirety of Area IV to exceed an AOC LUT value for at least one chemical." On the same page DOE addresses the issue of replacement soil, considering onsite and offsite borrow sites for soil meeting the chemical AOC LUT values, and packaged soil products sold by home improvement stores. DOE concludes: "Based on this initial evaluation and given the low AOC LUT values, it appears unlikely that replacement soil meeting the AOC requirements can be found." The absurdity of the exceedingly low AOC LUT values should be apparent to any objective observer or decisionmaker.

The already 10-year delay in starting final remediation will extend for another several years while detailed plans are developed, approved, and funded, even if the 2010 AOCs were to be modified and lawsuits are not brought by the same parties who stopped the implementation of the 2007 agreements. There is now sufficient information to make the required remediation decisions based on this DEIS with the knowledge that SSFL is truly a somewhat contaminated industrial site that does not pose any unusual risks to the surrounding communities.

Whether or not the 2010 AOC's will be modified, it is still possible to make very justifiable SSFL remediation decisions based on the information contained in this DEIS. Based on the discussion in Section S.11.2 Potential Environmental Consequences of Combined Action Alternatives and Appendix J Cost Benefit Analysis, I reach the following logical conclusions. A clear distinction can be made between the costs, risks and benefits of the High Impact Combination and the Low Impact Combination. Because the selection of a soil remediation alternative will have no impact on Groundwater Resources these decisions are fully decoupled and may be made separately. Similarly, the Building Demolition activity is common to all scenarios except the No Action Alternative, allowing the soil decision to be made independently.

Cancer risk for all remedial action alternatives would fall within the USEPA target cancer risk range of 1×10^{-4} to 1×10^{-6} , and are therefore acceptable. Cost estimates for the remedial action alternatives range from \$468 million for the Cleanup to AOC LUT Values to \$124 million for the Conservation of Natural Resources, with \$168 MM for the intermediate Cleanup to Revised LUT Values. Because of the increased severity of the environmental impacts of either of the LUT approaches, and acceptable risk from all alternatives, there is no justification for choosing any alternative except the Conservation of Natural Resources Alternative for soil remediation.

The preferred choice for Groundwater Remediation should be Monitored Natural Attenuation, because, with the exception of the FSDF TCE plume and the RMHF Leach Field Sr-90, all of the chemical plumes will reach acceptable levels after 10-20 years of monitoring with no other action. While the Sr-90 in the bedrock will take 50-150 years to reach drinking water quality levels, it is highly unlikely that SSFL would be used as a source of drinking water in any credible scenario in the foreseeable future. The minimal risk from these groundwater plumes does not warrant any remedial action other than monitoring, even with minimum environmental consequences from such remediation.

Therefore, the DOE preferred alternative should be the Low Impact Combination of Conservation of Natural Resources plus building Removal plus Monitored Natural Attenuation. While some might suggest that the Cleanup to Revised LUT Values for soil, which removes

163-4

163-4 There are several regulatory actions that must be completed before Area IV and NBZ site cleanup activities covered by this Final EIS could begin: (1) DTSC must issue a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC must conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC would need to approve soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC would need to approve DOE-prepared RCRA closure plans for building demolition. DOE agrees the agreements for concerning groundwater remediation and building demolition could occur before those concerning soil remediation.

163-5

163-4
cont'd

163-5 DOE acknowledges your support for the combination of the Conservation of Natural Resources, Building Removal, and Groundwater Monitored Natural Attenuation Alternatives. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

163-5
cont'd

Commenter No. 163 (cont'd): Abraham Weitzberg Ph.D.

radionuclides to AOC levels and chemicals to risk based levels, represents a reasonable compromise, I contend that no compromise is necessary simply to assuage the angst of individuals who have an irrational fear of radiation, no matter how small or close to background the dose. As a taxpayer, I believe that the Department should not waste the additional estimated \$44 million, damage the additional acres, or inflict the additional truck traffic on the surrounding communities. Choosing the Low Impact Combination is in the best interests of the future use of the site as open space, minimizing the negative effects of remediation on the environment, and avoiding the waste of taxpayer dollars.

Sincerely,

Abraham Weitzberg

Commenter No. 164: Henning Cohrt

From: [REDACTED]
To: [Jennings, Stephanie](#)
Subject: Comment on DOE's Draft EIS for SSFL Cleanup
Date: Tuesday, April 11, 2017 8:01:41 PM

U.S. Department of Energy NEPA Document Manager, SSFL Area IV EIS
Stephanie Jennings
[REDACTED]

Regardless of whether a causal link between the contamination of the SSFL and various cancers in the surrounding areas can be proven, the fact that such severe contamination exists in close proximity to large residential areas shall be reason enough for the DOE to ensure a thorough cleanup.

The inactivity of the DOE and others with respect to addressing this issue will only make the problem worse, and a future solution more difficult.

Therefore, neither of the alternatives proposed in the Draft EIS are acceptable.

The DOE has the moral obligation to stand by its commitment made in 2010, at a minimum.

We are the tax payers, and we demand that the taxes we pay are used to protect us from avoidable threats to our health and life.

Sincerely,

Henning Cohrt

164-1

164-2

164-1
cont'd

164-1 DOE acknowledges your concern and refers you to Section 2.1, "Preferences for Cleanup," of this CRD for a discussion of commenters' preferences for cleanup of SSFL.

DOE disagrees with the implication that Area IV and the NBZ are severely contaminated. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. DOE's purpose in preparing this EIS is to evaluate alternatives for completing cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

164-2 DOE acknowledges your preference for cleanup in accordance with the 2010 AOC. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent" of this CRD. With respect to the alternatives evaluated in this Final EIS Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. To meet this obligation this EIS evaluates alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. In addition to a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, this EIS evaluated alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup levels (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). The use of a risk assessment approach is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

Subject:
Attachments:

Dear Ms. Jennings,

Please consider this as my first comment on the DOE's Draft Environmental Impact Statement.

In order to consider the various alternatives under the DOE Draft Environmental Impact Statement (DOE DEIS) for AREA IV and the Northern Buffer Zone (NBZ) of the Santa Susana Field Laboratory (SSFL), I had to review the 2010 DOE Administrative Order on Consent (2010 AOC).

In the past few days, I reviewed a Power Point presentation by DTSC's Former Project Director Rick Brausch who negotiated the 2010 AOC with the DOE. In it, Mr. Brausch stated that the AOC:

["http://www.dtsc-sfsl.com/files/lib_pub_involve/meeting_agendas/meeting_agendas_etc/64728_AgreementsInPrinciple_09-22-10.pdf"](http://www.dtsc-sfsl.com/files/lib_pub_involve/meeting_agendas/meeting_agendas_etc/64728_AgreementsInPrinciple_09-22-10.pdf)

"Resolves disagreements over interpretations and implementation of SB 990 (Kuehl, 2007)"

I then read the Amicus Brief by the Federal Department of Justice in the case of Boeing V DTSC (Director Debbie Raphael and predecessors).

Response side of this page intentionally left blank.

Commenter No. 165 (cont'd): Christine Rowe

I have now reread the complete decision of the Federal Court of Appeals regarding SB 990.

It is my opinion that based on this ruling that California, despite its agreement status with the NRC, does not have the ability to direct the Department of Energy on the cleanup of radioactive materials because the cleanup of radioactive materials falls under federal authority and is controlled by Congress.

Furthermore, it is my opinion, that DTSC has no authority for remediation of radionuclides, and any authority under the Atomic Energy Act would fall to the California Department of Public Health (CDPH).

It is also my opinion that DTSC cannot apply a cleanup standard for radionuclides at a federal site that would be greater than would be applied to a private company. And Boeing, in this case, had its commercial licensing for radioactive materials with CDPH.

It is my opinion that DOE entered the AOC's at a time that SB 990 was the applicable law of the State. However, SB 990 was upheld as unconstitutional under the Federal Supremacy Clause among other orders.

It is my opinion that DTSC should be working in strict cooperation not only with DOE on the radiological cleanup, but also with CDPH for decisions related to the risks of radionuclides to the community from this site. DTSC should request from the Governor that CDPH play an active role in this site.

While CERCLA can apply to some federal sites, again, the laws would not apply in my opinion to clean up any radioactive site beyond that which the Federal EPA would require.

I am sure that you are aware that when the EPA determined that this site would qualify as a Federal Superfund Site, the EPA also determined that SB 990 would not be an ARAR (Applicable Relevant or Appropriate Requirement). It is my opinion that the EPA would have required that the site be cleaned up based upon risk and end use. Therefore, their cleanup standard would have been based upon The Boeing Company's stated end use which is open space / parkland which I believe is referenced in the SB 990 litigation.

165-1

165-1

As noted in Chapter 1, Section 1.1, of this Final EIS, DOE would comply with applicable requirements for cleanup of radiological and hazardous substance, including regulations, orders, and agreements. Chapter 8 of this Final EIS presents the environmental, safety, and health laws, regulations, orders, and permits that apply or may potentially apply to the proposed alternatives evaluated in the EIS. Federal, State of California, and DOE environmental, safety, and health requirements, as well as applicable local Ventura County and Los Angeles County, California, requirements are summarized in Section 8.1 of this Final EIS.

165-2

165-2

Thank you for your comment. It has been included in the Administrative Record for the EIS.

165-3

165-3

Thank you for your comment. DTSC's policies and actions are not under DOE's control. Because the comment is not on the scope or content of this EIS, no additional response is provided. It has been included in the Administrative Record for the EIS.

165-4

165-4

This EIS analyzed an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. But, it also analyzed alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup levels. In this Final EIS, DOE added a scenario under the Conservation of Natural Resources Alternative that reflect future use of the land as open space (see Chapter 2, Section 2.4).

Commenter No. 165 (cont'd): Christine Rowe

Very specific references are made to the DOE in this ruling by the 9th Circuit Court of Appeals.

|| 165-4
cont'd

In conclusion, it is my opinion based upon the original ruling by Judge Conti that the DOE must do a complete Environmental Impact Statement, and the DOE was obligated to consider multiple alternatives.

|| 165-5

165-5 Thank you for your comment.

It is my opinion that NEPA requires the DOE to consider reasonable alternatives before choosing an action.

Furthermore, it is my opinion that the DOE cannot consider an alternative that could permanently and irrevocably harm The Boeing Company's property without a formal letter stating this position.

|| 165-6

165-6 DOE acknowledges your comment. DOE would work with Boeing to minimize damage to the Boeing property.

It is my opinion that the soil volume that is considered under the AOC Alternative would irrevocably damage The Boeing Company's property. And the ruling also states that SB 990 is unconstitutional because Boeing cannot sell or transfer its property until the groundwater is cleaned up - a time period referenced in the ruling as 50,000 years!

It is my understanding that the litigation PSR - LA et al v DTSC and CDPH et al including The Boeing Company as the real party of interest has delayed the demolition of the remaining Boeing facilities in AREA IV. This has, in my opinion, prevented final sampling under those remaining Boeing facilities, and may have delayed the DTSC Programmatic Draft Environmental Impact Report?

|| 165-7

165-7 As stated in Chapter 1, Section 1.3, of this Final EIS, DOE has suspended demolition and removal activities of its remaining facilities at SSFL until it completes this Final EIS and associated ROD(s). DOE does not believe that the presence of the 4 Boeing buildings in Area IV substantially affects the analysis performed or the conclusions in this Final EIS. Comments on the DTSC environmental impact report are outside the scope of this DOE EIS.

As a result of what I have read to date, I will recommend, as I have in the past, that the DOE remove its remaining radiological facilities as soon as they can obtain the funds from Congress. And I also recommend that DOE first and foremost remove the radiological contamination to local Background or Look Up Table values.

|| 165-8

165-8 DOE acknowledges your support for removal of the remaining radiological facilities at Area IV as well as your support for removal of radiological contamination to local background or LUT values. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

However, I would have to point out that this recommendation is not based upon my perceived risk, but rather based upon fears and misinformation communicated to the community from various antinuclear groups.

Commenter No. 165 (cont'd): Christine Rowe

There is a qualifier to my reference to local Background levels. As you know, the Federal EPA did Background testing in the same geological formations as the SSFL site. It is my opinion that local Background would have been the highest value plotted at the Background site - not the USL 95 for each radiological contaminant of concern. Those would have been real numbers found in Background, not necessarily anomalies that should have been thrown out as outliers.

Furthermore, I would want verification of whether any radionuclides were detected on the SSFL site greater than in previous years that would indicate if even trace amounts of Cesium 137 and Strontium 90 had made their way to the SSFL site from Fukushima.

If so, we may need to add those values to the original Background numbers to set the radiological Look Up Table values for those radionuclides. Since the AOCs require anything above the Look Up Table to be cleaned up, these very small values could be significant enough to cause a larger radiological cleanup.

My recommendations for a chemical cleanup would be based upon risk to both human and other biological receptors. I have to read more in the DOE DEIS to determine if I want to choose one of the two lesser cleanup alternatives - their costs, their remediation time, and their number of trucks do not very greatly.

One final thought - all of your scenarios I believe are based upon about a 100 trucks a day moving in each direction. Since my community of West Hills will be greatly impacted by this cleanup and much of the truck traffic as well as the airborne contamination from the soil disturbance, I would prefer:

- 1) Limit the trucks to 50 per day - no more than six per hour in each direction; no trucks should run during school drop off and pick up times or when it is dark.
- 2) Limit the cleanup time to a longer time to be more protective of the community based upon the Woolsey Canyon routes, the airborne contamination, the Governor's Water Restrictions based upon the drought, and other community risk related criteria, and all Federal, State, and Local applicable laws.

Respectfully submitted,

Christine L. Rowe

39 year resident of West Hills within about 5 miles of the SSFL site periphery

165-9

165-10

165-9 DOE recognizes that the removal of the upper level results from the background data set prior to statistically determining a background value affected the LUT comparison value. The same higher background concentrations are likely present in Area IV. This makes differentiating background concentrations from contamination difficult. Regarding the Fukushima accident fallout, EPA had completed the majority of its sampling prior to the time of the accident. Prior to EPA's study DOE had performed numerous soil removal actions for radionuclides. EPA's results are consistent with prior knowledge of where radionuclides should be found. The final LUT values for radionuclides have not been established. DOE will re-evaluate the degree of required cleanup for radionuclides at that time.

165-10 Thank you for your comments regarding suggested impact limitations. They have been included in the Administrative Record for this final EIS.

As discussed in Chapter 2, for the Final EIS DOE revised the EIS analysis to reflect a more realistic average of 16 heavy-duty truck round trips per day for soil removal activities, although on some days the number of daily truck shipments could increase to 32. This revision extended the projected time for completion of the soil remediation alternative involving the greatest number of heavy-duty truck shipments, the Cleanup to AOC LUT Values Alternative, from the 10 years evaluated in the draft EIS to the 26 years evaluated in the Final EIS. DOE evaluated transport of waste from SSFL down Woolsey Canyon Road, then via multiple local roadways to local freeways. Shipments would occur during daylight hours.

Considering all remediation activities at Area IV and the NBZ (i.e., soil remediation, building removal, and groundwater remediation), daily shipments attributable to DOE remediation activities would not exceed 32 and generally would be considerably less. However, NASA and Boeing could also be making shipments of waste, backfill, and equipment during some of the same years that DOE would be making shipments of waste, backfill, and equipment. As discussed in Chapter 2, Section 2.4.4, of this Final EIS, DOE, NASA, and Boeing have entered into a transportation agreement (Boeing 2015a) through which they would manage the daily number of trucks allowed on Woolsey Canyon Road to no more than 96. The potential cumulative impacts of site remediation by DOE, NASA, and Boeing are evaluated in Chapter 5 of the EIS, including the risks associated with transport of waste and material and the potential impacts on traffic in the SSFL area. DOE expects that daily heavy-duty truck shipments potentially as high as 96 per day from DOE, NASA, and Boeing would only occur for a few years. Note that if the total number of cumulative shipments was reduced from

Commenter No. 165 (cont'd): Christine Rowe

an average of 96 per day to 50 per day, it would reduce annual environmental impacts such as annual risks from material transport or annual water use but would not reduce the overall impacts attributable to the projected cumulative operations but would spread them over a longer period of time. Water use by DOE for site remediation activities is estimated for each action alternative and combination of alternatives in Chapter 4, Section 4.1, and by DOE, NASA, and Boeing in Chapter 5, Section 5.5.1.

2 THE BOEING COMPANY V. RAPHAEL

Submitted May 31, 2013*
Pasadena, California

Filed September 19, 2014

Before: Alfred T. Goodwin, Andrew J. Kleinfeld,
and Barry G. Silverman, Circuit Judges.

Opinion by Judge Kleinfeld

SUMMARY**

Environmental Law

The panel affirmed the district court's decision that a California law governing cleanup of a federal nuclear site violated the doctrine of intergovernmental immunity.

The Boeing Co. challenged the validity of California's Senate Bill 990, which prescribes cleanup standards for radioactive contamination at Santa Susana Field Laboratory. SB 990 requires that the site be made suitable for subsistence farming, a more demanding standard than that imposed by a plan adopted by the federal Department of Energy.

* The panel unanimously concludes this case is suitable for decision without oral argument. See Fed. R. App. P. 34(a)(2).

** This summary constitutes no part of the opinion of the court. It has been prepared by court staff for the convenience of the reader.

Response side of this page intentionally left blank.

Commenter No. 165 (cont'd): Christine Rowe

THE BOEING COMPANY V. RAPHAEL 3

The panel held that Boeing had standing because as landowner, it established injury in fact.

The panel held that SB 990 violated the doctrine of intergovernmental immunity because it regulated DOE's cleanup activities directly in violation of the Supremacy Clause. In addition, SB 990 discriminated against the federal government and Boeing as a federal contractor hired to perform the cleanup of the Santa Susana site.

The panel did not reach the question of whether the federal laws governing nuclear materials and cleanup of hazardous substances preempted the state law. It also did not reach Boeing's claim under 42 U.S.C. § 1983 for a declaratory judgment and an injunction.

4 THE BOEING COMPANY V. RAPHAEL

OPINION

KLEINFELD, Senior Circuit Judge:

We affirm the district court’s decision that a California law governing cleanup of a federal nuclear site violates the doctrine of intergovernmental immunity. Because we decide that the state law impermissibly regulates and discriminates against the federal government and its contractor, we do not reach the question of whether the federal laws governing nuclear materials and cleanup of hazardous substances preempted the state law. We need not reach Boeing’s Section 1983 claim for a declaratory judgment and an injunction.

FACTS

The federal government made and tested rockets, nuclear reactors, and various nuclear applications for war and peace at the Santa Susana Field Laboratory beginning shortly after World War II. When built in the 1940s, this lab was far from people, thirty miles from Los Angeles in Ventura County. Los Angeles grew, though, and now over 150,000 people live within five miles of the site and half a million people live within ten miles.

When the state law challenged in this case was promulgated, 452 acres of the 2,850 acre lab site were federally owned and managed by the National Aeronautics and Space Association (“NASA”). Most of the site, the remainder, was owned by Boeing, a defense contractor, which acquired the land from another defense contractor, Rockwell International Corporation, in 1996. Rockwell International and its predecessor, North American Aviation, had occupied or owned the land since 1947. (For

Response side of this page intentionally left blank.

Commenter No. 165 (cont'd): Christine Rowe

THE BOEING COMPANY V. RAPHAEL 5

convenience, we refer to Boeing and its predecessors, Rockwell International and North American Aviation, as "Boeing.") Since the 1950s, the federal Department of Energy ("DOE") and its predecessor agencies have leased 90 acres of the site from Boeing, where it built and operated 16 nuclear reactors of various sorts and over 200 facilities for nuclear research.

These two federal agencies, DOE and NASA, hired Boeing to assist in the nuclear research and rocket testing. Most of Boeing's work was as a contractor on behalf of the federal government, though it also did some commercial work on its own account at the site. Boeing operated one commercial nuclear reactor under a license from the Atomic Energy Commission. It also handled what the California statute calls "radiological contaminants" under licenses from the State of California to perform activities involving the use of x-ray machines, calibration devices, gas chromatographs, smoke detectors, and various gauges.

All this work created a terrible environmental mess. It also created tremendous benefits, for war and peace, but the government's work unarguably imposed tremendous harm to the environment. The soil, ground water, and bedrock were seriously contaminated. Disasters and foolishness added to the environmental harm.

In 1959, one of the reactors experienced a partial meltdown that released radioactive gases into the atmosphere for three weeks. This partial meltdown accounts for about 90% of the radioactive contamination. Much of the rest came from other nuclear reactor accidents, an open burn pit for sodium-coated materials, and numerous fires and accidents at the "Hot Lab." The "Hot Lab" was used for cutting up spent

Commenter No. 165 (cont'd): Christine Rowe

6 THE BOEING COMPANY V. RAPHAEL

nuclear fuel from the site's reactors and spent fuel shipped to the lab from elsewhere in the United States. Radioactive material was also dumped at various locations around the site. One disposal procedure consisted of shooting barrels of toxic substances with shotguns to make them explode and burn.

The federal government, not Boeing, appears from the record to be responsible for the radioactive pollution. Though Boeing conducted some commercial nuclear work at the site, no radioactive contamination has been traced to Boeing's private activity. It is undisputed in this case that the site's radioactive contamination either resulted from federal activity or is indistinguishable from federal contamination.

That is not to suggest that the pollution was merely wanton. The United States Air Force and NASA used the site to test rocket engines for ballistic missiles and space exploration. In the 1940s, the Air Force hired Boeing to help develop the Navaho guided missile system. The Air Force and NASA also used Boeing to test liquid-propellant rocket engines, many of which were used in the space program. But over 500,000 gallons of the solvent used to clean rocket engines and launch sites, trichloroethylene, contaminated the soil, along with heavy metals and other toxins. A trichloroethylene containment system was implemented in 1961, after which Boeing did its private commercial testing, but the damage was already done. California concedes that it cannot identify any chemical contamination that resulted from non-federal activity and that, to the extent that there is any contamination from Boeing's private activity, it cannot be distinguished from federal contamination.

All this nuclear and rocket research is over now. DOE ended its nuclear research at Santa Susana in the 1980s. In

Commenter No. 165 (cont'd): Christine Rowe

THE BOEING COMPANY V. RAPHAEL 7

1996, DOE decided to close its research center and removed many of the facilities. The Air Force's and NASA's rocket research ended in 2006. Operations at the site now are limited to trying to clean it up. Different aspects of the cleanup are carried out under different federal and state authorities. The federal government supervised the cleanup of radioactive contamination, and the California Department of Toxic Substances Control supervised the cleanup of chemical contamination under generally applicable state law.

The subject of this litigation is a state's authority, as opposed to the federal government's authority, to regulate the cleanup of radioactive pollution. The issue is whether the state may mandate more stringent cleanup procedures, not generally applicable within the state, to a particular site where the federal government undertook to clean up nuclear contamination it created. In the circumstances of this case, the answer is no.

So far, the federal Department of Energy, as successor to the Atomic Energy Commission, has supervised and implemented the cleanup of radioactive material. Under the Atomic Energy Act, DOE is responsible for establishing a comprehensive health, safety, and environmental program for managing DOE's nuclear facilities nationwide.¹ DOE has implemented that authority by issuing orders that set health and safety limits for radioactive releases and cleanup and site-closure procedures.²

¹ 42 U.S.C. §§ 2121(a)(3), 2201.

² See DOE Orders 435.1, 458.1, 5400.1, 5400.5, available at <https://www.directives.doe.gov/directives>. DOE Order 435.1, *Radioactive Waste Management*, and its accompanying manuals set forth requirements

Response side of this page intentionally left blank.

Commenter No. 165 (cont'd): Christine Rowe

8 THE BOEING COMPANY V. RAPHAEL

To clean up the radioactive contamination, DOE hired Boeing. Boeing conducted a study of the contamination at Santa Susana. The soil, bedrock, and groundwater contamination has been extensively sampled and analyzed. Different parts of the site have different sorts of pollutants, since rocket testing was done in some areas, and nuclear research in others. In 2003, DOE adopted an environmental assessment for cleaning up radioactive waste in the area where nuclear research was performed. This federal plan proposed to clean it up to standards suitable for industrial, recreational, and even suburban residential use. As a cleanup contractor, Boeing is actively cleaning up the Santa Susana site on behalf of DOE. Boeing pays a portion of the cleanup costs and will bear the portion of costs not paid by or recovered from the federal government. The federal government sets the standard for the entire cleanup of radioactive materials (the only waste at issue in this case) and directs Boeing's conduct.

Not everyone was satisfied with the DOE plan. The federal Environmental Protection Agency ("EPA"), the State of California, and various advocacy groups have challenged both the plan and DOE's decision to prepare an environmental assessment as opposed to an environmental impact statement. The question whether an environmental impact statement should be prepared is not before us in this litigation. A federal district court injunction in another case prohibits DOE from transferring ownership, possession, or

for managing radioactive waste including characterization, treatment, disposal, and monitoring. DOE Order 5400.5, *Radiation Protection of the Public and the Environment*, addresses cleanup standards that DOE contractors are required to implement during decontamination and decommissioning activities.

THE BOEING COMPANY V. RAPHAEL 9

control over anything in the primary area of radioactive contamination until it prepares an environmental impact statement.³

Non-radioactive chemical pollutants are regulated differently from radioactive pollutants.⁴ The California Department of Toxic Substances Control regulates the cleanup of chemical contamination, pursuant to an agreement with EPA authorizing state control, under a different federal statute from the one applicable to radioactive materials.⁵ The various state and federal agencies involved, and Boeing, agreed upon an order from California's Department of Toxic Substances Control to clean up the chemical contamination to a level adequate for suburban residential use. That order does not address the cleanup of radioactive materials.

This case arises from the State of California's decision to extend its control to cleanup of radioactive pollutants. In October 2007, California passed Senate Bill 990, "Cleanup of Santa Susana Field Laboratory," prescribing cleanup standards for both radioactive and chemical contamination.⁶ The statutory standard requires that the site be made suitable for "suburban residential or rural residential (agricultural)

³ *Natural Res. Def. Council, Inc. v. Dep't of Energy*, No. C-04-04448 SC, 2007 WL 1302498, at *22 (N.D. Cal. May 2, 2007).

⁴ *United States v. Manning*, 527 F.3d 828, 833 (9th Cir. 2008).

⁵ California operates a federally approved hazardous waste management plan pursuant to the Resource Conservation and Recovery Act, 42 U.S.C. § 6926. This plan covers only chemical contamination, not radioactive materials. 42 U.S.C. §§ 6903(5), (27), 6905(a).

10 THE BOEING COMPANY V. RAPHAEL

[use], whichever produces the lower permissible residual concentration” for each contaminant found at the site.⁷ The state statute does not further define the “rural residential (agricultural)” standard, but the federal EPA “agricultural” standard apparently intended by the state statute assumes “consumption of farm products for a subsistence farmer,” getting all his or her vegetables, fruit, meat, fish, and milk from the land, along with incidental consumption of soil and inhalation of dust.⁸ In effect, Senate Bill 990 (“SB 900”) would require that hypothetical subsistence farmers could live safely on their farms eating nothing but their chickens, eggs, crops, and cheese and drinking their milk from their cows eating the grass, in this patch of nuclear and chemical toxic waste in the Los Angeles suburbs.

Boeing and the federal agencies contend that this standard is more demanding than the usual practice under state and federal law of setting a cleanup level commensurate with a site’s reasonably foreseeable use.⁹ It may well be

Commenter No. 165 (cont'd): Christine Rowe

THE BOEING COMPANY V. RAPHAEL 11

unreasonable to foresee subsistence farming at the site. The record does not show why this standard was adopted, or whether subsistence farming of this sort was contemplated for the Los Angeles suburbs. The subsistence farming standard is more stringent than the suburban residential standard required by the agreed-upon order governing the cleanup of non-radioactive chemicals. DOE's cleanup procedures specifically rejected the state law's standard as "not a reasonable scenario for the site." Boeing has made a public commitment to dedicate the site for public use as open space parkland, not subsistence farming. But reasonable foreseeability of subsistence farming is not the controlling issue in this case. The relevant tension in this case is the state's authority to impose its subsistence farming standard as against the less stringent federal industrial, recreational, and residential standard.

Until SB 990's cleanup standard is met, the state law makes it a crime for "[any] person or entity [to] sell, lease, sublease, or otherwise transfer" the land.¹⁰ The "Statement of Uncontroverted Facts," not disputed by the California Department of Toxic Substances Control, says that remediating the groundwater to the California standard "could take as long as 50,000 years."

Boeing filed this lawsuit in federal district court challenging the validity of the California statute, SB 990, controlling cleanup of the Santa Susana Laboratory grounds. Boeing argued, and the district court agreed, that the federal government had preempted the field of regulation of nuclear safety, and alternatively that cleanup of radioactive materials at the Santa Susanna site is a federal activity, so state

12 THE BOEING COMPANY V. RAPHAEL

regulation of how the federal government cleans it up violates the Supremacy Clause and the doctrine of intergovernmental immunity.

The California Department of Toxic Substances Control (“California”) appeals. We vacated oral argument to give the government an opportunity to file an amicus brief, which it did. The federal government agrees with the district court that the state law, SB 990, is unconstitutional under the Supremacy Clause and alternatively, because Congress has preempted the field.

ANALYSIS

The case was decided on summary judgment, so we review de novo.¹¹

I. Standing

California does not challenge Boeing’s standing, but some advocacy groups as amici curiae do. Their argument is that Boeing suffers no injury in fact from SB 990 because as a federal contractor, it will be paid for its work and bears no other costs. We disagree. The law prohibits Boeing from transferring its own real property, injury enough.¹² Even if the federal government does pay for all the cleanup work, the estimated 50,000 year delay in transferability (based on estimated time for cleanup of groundwater to be completed)

¹¹ *United States v. Manning*, 527 F.3d 828, 836 (9th Cir. 2008).

¹² *Andrus v. Allard*, 444 U.S. 51, 64 n.21 (1979) (“Because the regulation they challenge restricts their ability to dispose of their property, appellees have a personal, concrete, live interest in the controversy.”).

Commenter No. 165 (cont'd): Christine Rowe

THE BOEING COMPANY V. RAPHAEL 13

is indeed an injury in fact to Boeing as landowner. Nor has the federal government agreed to cleanup the entire site at its own expense to SB 990's standards. California concedes that Boeing will pay the portion of the cleanup expenses not borne by the federal government. Injury in fact is clear.

II. Intergovernmental Immunity

Under the Supremacy Clause, "the activities of the Federal Government are free from regulation by any state."¹³ Accordingly, state laws are invalid if they "regulate[] the United States directly or discriminate[] against the Federal Government or those with whom it deals."¹⁴ SB 990 is invalid on both grounds.

A. Direct Regulation of the U.S. Government

SB 990 regulates the Department of Energy's cleanup activities directly. SB 990 authorizes California's Department of Toxic Substances Control to "use any legal remedies available" under the State's hazardous waste laws "to compel a responsible party or parties to take or pay for appropriate removal or remedial action necessary to protect the public health and safety and the environment at the Santa Susana Field Laboratory site."¹⁵ DOE is a "responsible party" with respect to radioactive contamination. All of the contamination at Santa Susana is the result of federal activity

¹³ *Mayo v. United States*, 319 U.S. 441, 445 (1943).

¹⁴ *North Dakota v. United States*, 495 U.S. 423, 435 (1990); *United States v. City of Arcata*, 629 F.3d 986, 991 (9th Cir. 2010).

14 THE BOEING COMPANY V. RAPHAEL

or is indistinguishable from contamination caused by federal activity. In addition, SB 990's legislative findings state that the Act is necessary in large part because of federal activity at the site and because "DOE declined to follow the 1995 Joint Policy [between EPA and DOE] and chose to instead rely on less protective cleanup standards."¹⁶

The federal Department of Energy has accepted responsibility for the cleanup of radioactive contamination, and it is actively conducting the cleanup through its cleanup contractor, Boeing. SB 990 affects nearly all of DOE's decisions with respect to the cleanup, including the environmental sampling that is required, the cleanup procedures to be used, and the money and time that will be spent. The state law requires an application of more stringent cleanup standards than federal laws and DOE's cleanup procedures do. Whether state law is better or worse does not affect state authority, just whether the state regulates federal activity.

The federal government's decision to hire Boeing to perform its cleanup work does not affect the legal analysis. In *Goodyear Atomic Corp. v. Miller*, the Supreme Court held that "a federally owned facility performing a federal function is shielded from direct state regulation, even though the federal function is carried out by a private contractor, unless Congress clearly authorizes such regulation."¹⁷ In *Gartrell Construction Inc. v. Aubry*, we held that California's licensing requirements for construction contractors were preempted to the extent that they applied to federal

Commenter No. 165 (cont'd): Christine Rowe

THE BOEING COMPANY V. RAPHAEL 15

contractors.¹⁸ California argues that Boeing must “stand in the government’s shoes” in order to assert immunity from state regulation. The cases that California cites to are inapposite as they discuss generally applicable state tax laws, which resulted in merely an increased economic burden on federal contractors as well as others. These tax laws did not regulate what the federal contractors had to do or how they did it pursuant to their contracts.

SB 990 directly interferes with the functions of the federal government. It mandates the ways in which Boeing renders services that the federal government hired Boeing to perform. The state law replaces the federal cleanup standards that Boeing has to meet to discharge its contractual obligations to DOE with the standards chosen by the state. It overrides federal decisions as to necessary decontamination measures. Unlike the tax cases, SB 990 regulates not only the federal contractor but the effective terms of federal contract itself.

Thus, SB 990 violates intergovernmental immunity unless Congress has clearly and unambiguously authorized California to exercise authority over the Department of Energy with respect to radioactive materials. “It is well settled that the activities of federal installations are shielded by the Supremacy Clause from direct state regulation unless Congress provides ‘clear and unambiguous’ authorization for such regulation.”¹⁹

¹⁸ 940 F.2d 437, 441 (9th Cir. 1991).

Commenter No. 165 (cont'd): Christine Rowe

16 THE BOEING COMPANY V. RAPHAEL

There is no clear congressional authorization in the Atomic Energy Act that would allow California to regulate DOE's cleanup of radioactive materials at Santa Susana. The agreement entered between California and the Atomic Energy Commission in 1962 does not affect the immunity analysis. The 1962 agreement was made pursuant to the 1959 amendment to the Atomic Energy Act that allowed the Atomic Energy Commission to transfer licensing authority over nuclear materials to states, pursuant to individual agreements with individual states.²⁰ Congress sought, among other things, "to recognize the need, and establish programs for, cooperation between the States and the Commission with respect to control of radiation hazards associated with the use of [nuclear material]."²¹ The Act provides that states "shall have authority to regulate the materials covered by [an] agreement for the protection of the public health and safety from radiation hazards."²² Under the 1962 agreement, California's Department of Public Health has licensed Boeing's *commercial* nuclear work at Santa Susana.

The 1962 agreement does not grant California any authority to regulate the federal government. The Atomic Energy Commission's regulations implementing the 1959 amendment explicitly state that exemptions from federal licensing authority under the agreement between states and the Commission "do not apply to agencies of the Federal

Commenter No. 165 (cont'd): Christine Rowe

THE BOEING COMPANY V. RAPHAEL 17

government.”²³ So even within “Agreement States,” such as California, the federal agencies remain subject to the federal government’s exclusive regulatory authority. The 1962 agreement references these regulations, and no language under the agreement indicates that the AEC was ceding authority to regulate federal activities to state agencies. Subsequent administrative developments make this clear.²⁴

Our conclusion is consistent with the history of the Atomic Energy Act and Congress’s response to other attempts by states to regulate federal activities. Section 2018 of the Atomic Energy Act provides that nothing in the Act affects state regulatory authority over the “generation, sale, or transmission of electric power produced through the use of nuclear facilities licensed by the Commission.”²⁵ In 1965, Congress added the following to Section 2018: “*Provided*, That this section shall not be deemed to confer upon any

²³ 27 Fed. Reg. 1350, 1352 (1962) (codified at 10 C.F.R. § 150.10).

²⁴ The Atomic Energy Commission was abolished in 1974, and its duties divided between the Nuclear Regulatory Commission (“NRC”) and the Energy Research Development Administration, subsequently turned into the cabinet-level Department of Energy. The Nuclear Regulatory Commission, now with the authority to enter into agreements with states, makes it clear that the agreement with states “does not transfer regulatory authority to the States over . . . [a]ctivities of Federal Agencies located in Agreement States.” NRC Procedure SA-500, *Jurisdiction Determinations* 2 (Sept. 25, 2007). NRC also requires the Agreement States to provide exemptions for NRC’s and DOE’s prime contractors performing work on government-owned or controlled sites from licensing requirements. Statement of Policy, 46 Fed. Reg. 7543 (Jan. 23, 1981). *Cf.* 10 C.F.R. §§ 30.12, 40.11, 70.11 (exempting NRC’s and DOE’s prime contractors from licensing requirements under the Atomic Energy Act).

18 THE BOEING COMPANY V. RAPHAEL

Federal, State, or local agency any authority to regulate, control, or restrict any activities of the Commission.”²⁶ Congress added this proviso to overrule a Ninth Circuit opinion, *Maun v. United States*, 347 F.2d 970 (9th Cir. 1965), which interpreted the section to allow a municipality to prohibit transmission lines that the Atomic Energy Commission sought to build in order to carry out its own activities.²⁷

The Resource Conservation and Recovery Act (“RCRA”)²⁸ does not authorize California to regulate DOE’s cleanup of radioactive contamination. RCRA allows states to operate a hazardous waste management plan applicable to federal facilities so long as the state regulates “in the same manner, and to the same extent, as any person is subject to such requirements.”²⁹ But RCRA excludes from its coverage radioactive materials regulated under the Atomic Energy Act.³⁰ So RCRA does not apply to the radioactive contamination in this case.

Nor does the Comprehensive Environmental Response, Compensation, and Liability Act (“CERCLA”)³¹ save SB

THE BOEING COMPANY V. RAPHAEL 19

990. Under CERCLA, states may obtain authority to clean up certain hazardous waste sites by obtaining EPA approval and entering into a “cooperative agreement.”³² Unlike RCRA, some provisions of CERCLA cover nuclear materials. The definition of “release” includes releases of nuclear materials except in certain situations.³³ EPA includes “radionuclides” in the list of “hazardous substances.”³⁴ And CERCLA contains a federal immunity waiver clause with respect to state laws concerning removal and remedial of hazardous substances. However, the waiver does not apply “to the extent a State law would apply any standard or requirement to [federal] facilities which is more stringent than the standards and requirements applicable to facilities which are not owned or operated by [the federal government].”³⁵ SB 990 applies more stringent requirements to Santa Susana than to non-federal facilities because it requires cleanup to a standard suitable for subsistence farming, rather than for the site’s reasonably foreseeable future use. Under the state’s generally applicable process, the future use would be determined by considering a number of site-specific factors such as current use, county general plans, and topography. It is undisputed that the subsistence farming has not been so determined as a land use assumption for the Santa Susana site.

Commenter No. 165 (cont'd): Christine Rowe

20 THE BOEING COMPANY V. RAPHAEL

Therefore, we conclude that SB 990 regulates the federal government directly in violation of the Supremacy Clause.

B. Discrimination Against the U.S. Government and Its Contractors

SB 990 also violates intergovernmental immunity because it discriminates against the federal government and Boeing as a federal contractor. "A state or local law discriminates against the federal government if it treats someone else better than it treats the government."³⁶ California does not dispute that "SB 990 singles out Boeing, DOE, NASA and the [Santa Susana Field Laboratory] site for a substantially more stringent cleanup scheme than that which applies elsewhere in the State." The fact that Santa Susana is especially contaminated does not render the law non-discriminatory because California's generally-applicable environmental laws do not impose the SB 990 radioactive cleanup standards at the Santa Susana site.

The federal government's decision to hire Boeing to perform the cleanup rather than using federal employees does not affect our immunity analysis on this ground. When the state law is discriminatory, a private entity with which the federal government deals can assert immunity.³⁷ In *Davis v. Michigan Department of Treasury*, a retired federal employee challenged Michigan's taxation of his federal retirement

³⁶ *United States v. City of Arcata*, 629 F.3d 986, 991 (9th Cir. 2010) (internal quotation marks omitted).

³⁷ *North Dakota v. United States*, 495 U.S. 423, 435 (1990).

Commenter No. 165 (cont'd): Christine Rowe

THE BOEING COMPANY V. RAPHAEL 21

benefits.³⁸ Michigan argued that only the federal government, not private entities or individuals, are immune from state laws.³⁹ The Supreme Court disagreed because the state law at issue discriminated against federal employees by exempting from state taxation retirement benefits paid to state employees, but not those paid to federal employees.⁴⁰ The Supreme Court held that

It is true that intergovernmental tax immunity is based on the need to protect each sovereign's governmental operations from undue interference by the other. But it does not follow that private entities or individuals who are subjected to discriminatory taxation on account of their dealings with a sovereign cannot themselves receive the protection of the constitutional doctrine. Indeed, all precedent is to the contrary.⁴¹

Likewise, Boeing cannot be subjected to discriminatory regulations because it contracted with the federal government for the nuclear research and now the cleanup of radioactive contamination.

SB 990 specifically targets Santa Susana because of the radioactive pollution created by federal activity on the site

22 THE BOEING COMPANY V. RAPHAEL

and because “DOE declined to follow the 1995 Joint Policy [between EPA and DOE] and chose to instead rely on less protective cleanup standards.”⁴² SB 990 applies more stringent cleanup standards than generally applicable state environmental laws. By doing so, SB 990 discriminates against the federal government and against Boeing as a federal contractor. Therefore, it is invalid under the doctrine of intergovernmental immunity.

The 2010 Administrative Orders on Consent from the California Department of Toxic Substances Control that DOE and NASA agreed to do not affect the analysis of SB 990. Both Orders set a radioactive cleanup standard for the soil in certain areas of Santa Susana. They do not set cleanup standards for bedrock or groundwater, and SB 990 does. Any waiver clauses included in the Orders have no effect beyond the term of the Orders.

III. Severability

We agree with the district court that the terms of SB 990 are unseverable. California concedes that applying SB 990 only to chemical cleanup is impossible without gutting the Act because the Act sets cleanup standards in part by requiring that “the cumulative risk from radiological and chemical contaminants at the site shall be summed.”⁴³ We decline to construe SB 990 as limited to non-radioactive cleanup because it would “require us to examine and rewrite most of the statute in a vacuum as to how the various

Commenter No. 166: Christine Rowe

From: Christine Rowe
To: Jennings, Stephanie
Date: Thursday, April 13, 2017 11:17:24 PM
Subject: Department of Energy Draft Environmental Impact Statement Comment
Attachments: Radon in Ventura County and Los Angeles County around the SSFL site.jpg
 DOE to LARWQCB MCLS for Radium and Uranium.jpg
 Radon Map showing High Radon Potential in West Hills.jpg

Dear Ms. Jennings,

In my recent review of technical documents, I had seen a reference to a previous cleanup standard for AREA IV of the SSFL at what I believe was 9.8 pi /gm. I recall that number because I contacted a health physicist to try to determine what that level means in terms of health risk.

The DOE should have a health physicist on staff available to the community to respond to questions like this one.

In the process of an online search for that document, I happened upon this document from the DOE to the WaterBoard.

http://www.etc.energy.gov/Library/Cleanup_and_Characterization/Groundwater/1%20SSFL%20FSD%20GWIM%20Implementation%20Plan_Sept_2015%20DRAFT.pdf

This document is important in that it references the MCLS for radionuclides which include radium and uranium. Why is that important? Please see the screen shot attached.

It is my opinion that most people in our community do not understand that we have low levels of uranium and its daughters in our local environment. Radon is a daughter in the uranium decay chain. I have spent a great deal of time on this recently because I found a new interactive map for California related to radon risk:

<http://maps.conservation.ca.gov/cgs/radon/>

The attached screen shot shows the levels of Radon that could potentially be on our homes. In the bright red areas of this map, it indicates the potential for 20 percent of the homes to have radon levels greater than 4 pi / liter. Why is this important? Because the potential for naturally occurring radionuclides in my area - the Radon level - is close to the levels set for MCLS. So to me, it would be important to understand what levels of these radionuclides both at the SSFL site as well as in the communities around the site are from naturally occurring sources. How much radium would you need to get to 4 pi/ liter of radon?
<https://certmapper.cr.usgs.gov/data/PubArchives/radon/georadon/2.html>

I think it is important to my community to have FACT SHEETS on the following issues:

- 1) The levels of naturally occurring radionuclides in the communities surrounding the SSFL site.
- 2) A fact sheet that specifically addresses the previous cleanup standards of the SSFL site, especially at the SRE and around other reactors which are referenced as "other partial meltdown locations".
- 3) Fact sheets related to each nuclear operational area - SNAP, SRE, RMHF, etc, that are written in the language that stakeholders can understand not in numbers which we have to calculate - for example : 10 - 6 equals what risk of cancer?
- 4) A fact sheet based on the historical documents and the SRE Expert Panel Workshop.

I had hoped that the WaterBoard staff would weigh in on the DOE DEIS because of the potential soil removal and its impacts on what will eventually become exceedences not only at the Outfalls for The Boeing Company's storm water permit, but also for the whole Regional Board basin plan. I do hope that the WaterBoard did weigh in during this comment period.

I will continue my search for that source of the previous cleanup standard for AREA IV as referenced by the EPA I believe someplace? Maybe I read it in their Final Radiological Survey for AREA IV document or in one of their Fact Sheets? I do not know. I was unable to find it when I looked for it in the various chapters of the DEIS.

Respectfully submitted,

Christine L. Rowe

166-1

166-1 The previously used soil cleanup-goal/release-criteria for Cs-137 under the EA (DOE 2003) was 9.2 picocuries per gram and was based on a dose based cleanup standard of 15 millirem per year (the EPA dose standard at the time). The activity concentration that equates to 15 millirem per year varies by radionuclide; for example the corresponding activity concentration for Sr-90 is 36 picocuries per gram.

166-2

166-2 While there are no health physicists on the local DOE staff at SSFL, DOE has access to health physicists throughout DOE complex should it be necessary to consult with one.

166-3

166-3 DOE appreciates the commenter's interest in researching the information relative to cleanup of SSFL, including the surrounding environment. DOE has been proactive in informing the public about the range of subjects relative to remediation and cleanup of Area IV and the NBZ. From December 2008 through April 2015, DOE published CleanUpdate, a newsletter about DOE's activities at SSFL Area IV and topics of community interest. Past issues have addressed co-located sampling, groundwater studies, the AOC, biological studies, soil background studies, and other timely topics related to the history and cleanup of SSFL Area IV and the NBZ. Links to these newsletters and other documents about DOE's activities at SSFL, including site characterization reports, site operations and history, the seven-part "Groundwater U" held in the spring of 2011, the SRE accident and workshop, and much more information are available on the Energy Technology Engineering Center website at <http://www.etc.energy.gov/>. DOE has also prepared fact sheets and posters relative to the EIS and its activities at SSFL in conjunction with scoping meetings and the public hearing on the Draft EIS are also available on the Energy Technology Engineering Center website. Specific information may be found as follows:

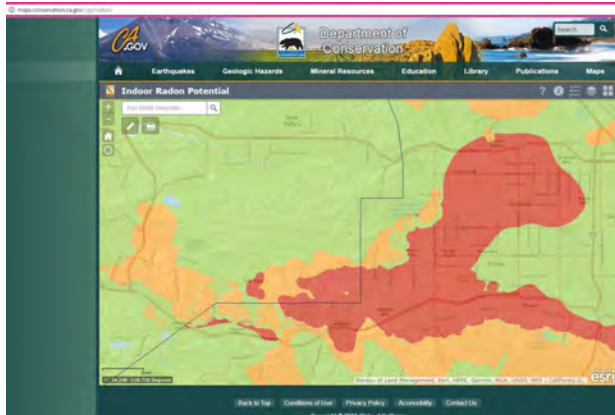

- The results of the most recent EPA radiological survey and sampling program for Area IV and the NBZ can be accessed at http://www.etc.energy.gov/Char_Cleanup/EPA_Soil_Char.html. This study was completed in December 2012.

Commenter No. 166 (cont'd): Christine Rowe

- Throughout site operations and afterward, DOE implemented a number of removal actions to remediate soil, bedrock, and structures (e.g., buildings, transformers, and parking lots) with concentrations of radionuclides or chemicals that exceeded the cleanup standards used at the time. The most notable of these removal actions are summarized in Chapter 3, Section 3.2.5.3, of this Final EIS.
- Information about the various nuclear research programs conducted at Area IV, and the facilities at which these programs took place, can be obtained searching the DOE Energy Technology Engineering Center website.
- Chapter 3, Sections 3.9.5 and 3.9.6, of this Final EIS contain summaries of the 1959 SRE accident and the SRE Expert Panel Workshop. Additional information can be found at http://www.etec.energy.gov/Operations/Major_Operations/SRE_Accident.html and http://www.etec.energy.gov/Community_Involvement/Public%20Meetings/SRE_Workshop.html.
- Chapter 4, Section 4.9.1, of this final EIS provides an overview of the risk assessment process, including an explanation of human health impact assessment terms and methodology to assist the reader in understanding the potential human health impacts in the EIS.

166-4 As described in Chapter 4, Section 4.3.1 of this Final EIS, with the implementation of best management practices and Mitigation Measures SW-1 and SW-2, remediation activities are not expected to produce exceedances of NPDES permit limits at the land owners (Boeings) outfalls.

Subject: Re: Department of Energy Draft Environmental Impact Statement Comment
Attachments: EPA HISTORICAL SITE ASSESSMENT REFERENCES SB 990.jpg

Dear Ms. Jennings,

In my search for that previous cleanup level for radionuclides, I found this reference by the EPA that references that the standards needed to comply with SB 990. At the date of this document, in October 2010, I do not believe that the AOCs had been signed yet.
[https://yosemite.epa.gov/r9/sfund/r9sfdocw.nsf/3dc283e6c5d6056f88257426007417a2/4e0a55fc2b26ad62882579de00781794/\\$FILE/ATTSAVU3.pdf/Draft%20HSA-5B_10_25_2010.pdf](https://yosemite.epa.gov/r9/sfund/r9sfdocw.nsf/3dc283e6c5d6056f88257426007417a2/4e0a55fc2b26ad62882579de00781794/$FILE/ATTSAVU3.pdf/Draft%20HSA-5B_10_25_2010.pdf)

This is, to me, further proof that the DOE was working under SB 990 at the time of the radiological survey and the DOE sampling with DTSC.

This is further justification why the "AOC should go away" - it was written to comply with SB 990 which was found to be unconstitutional and is not risk based.

Respectfully submitted,

Christine L. Rowe

167-1

Thank you for your comment. It has been included in the Administrative Record for the EIS.

Commenter No. 167 (cont'd): Christine Rowe

Santa Susana Field Laboratory
Historical Site Assessment
Draft Technical Memorandum: Area IV, Sabarea HSA-5B **October 2010**

The objective of the HSA component of the radiological study is to provide a comprehensive investigation that identifies, collects, organizes, and evaluates historical information relevant to nuclear research operations as it pertains to radiological contamination in the Area IV Study Area. Once these areas have been identified, potential areas where radiological contamination may exist at the site will be identified for gamma scanning or sampling.

This work is being executed by HGL under EPA Contract EP-S7-05-05, Task Order (TO) 0038 under the technical direction and oversight of EPA Region 9. In accordance House Resolution (HR) 2764, the Department of Energy (DOE) is funding EPA's Area IV Study. DOE elected to fund EPA's study with funding allocated under the American Recovery and Reinvestment Act (ARRA) of 2009. An important regulatory consideration for planning cleanup work at SSFL is California State Senate Bill 990 (SB 990), which can be interpreted to require that the SSFL site be thoroughly remediated to background levels for both chemical and radioactive contamination, as determined by the California Department of Toxic Substances Control (DTSC), before any sale, lease or transfer of all or any part of the SSFL property.

**DEPARTMENT OF ENERGY SANTA
SUSANA FIELD LABORATORY DRAFT
ENVIRONMENTAL IMPACT
STATEMENT
APRIL 13, 2017**

**COMMENTS BY
CHRISTINE L. ROWE
B.S. IN HEALTH EDUCATION - CSUN**

Response side of this page intentionally left blank.

PURPOSE AND NEED

- **The Purpose and Need for the Draft Environmental Impact Statement is two fold in my opinion:**
- **1) For the Department of Energy to comply with the National Environmental Policy Act; and**
- **2) To comply with the ruling by Judge Samuel Conti for the Department of Energy to complete an Environmental Impact Statement:**
- **http://www.etec.energy.gov/Library/Cleanup_and_Characterization/EIS/MSJ_ORDER.pdf**

168-2

168-2

The purpose and need statement in an EIS is not the purpose and need for preparing the EIS. CEQ and NEPA regulations (40 CFR 1502.13) state an EIS “shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives, including the proposed action.” As stated in Chapter 1, Section 1.1 of this Final EIS, DOE needs to complete remediation of SSFL Area IV and the NBZ to comply with applicable requirements for cleanup of radiological and hazardous substances. These requirements include regulations, orders, and agreements. To this end, DOE needs to remove the remaining DOE structures in Area IV of SSFL and clean up the affected environment in Area IV and the NBZ in a manner that is protective of the environment and the health and safety of the public and workers.

TO PROTECT PUBLIC HEALTH, PUBLIC SAFETY, AND THE ENVIRONMENT

- 1) The purpose of commenting in this format is to allow me to show screen shots from various documents and websites which are technical in nature.
- 2) The cleanup of the Santa Susana Field Laboratory site should be based upon the Risks to local residents today and throughout this cleanup; the potential risks along the truck routes; the potential risks to the future users of the SSFL site; particular risks should be paid to the impacts on the Brandeis Bardin Camp, residents of Bell Canyon, Dayton Canyon, and Runkle Canyon; and the risks to the communities in which the landfills are located.

168-3

168-3

Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts. This Final EIS (see Section 4.9) also evaluates risks to future onsite recreational users.

Commenter No. 168 (cont'd): Christine Rowe

NEEDS ASSESSMENT

COMPREHENSIVE NEEDS ASSESSMENT

Summary of Foundation Concepts

- A "need" is a discrepancy or gap between "what is" and "what should be"
- A "needs assessment" is a systematic set of procedures that are used to determine needs, examine their nature and causes, and set priorities for future action.
- In the real world, there is never enough money to meet all needs. Needs assessments are conducted to help program planners identify and select the *right job* before doing the *job right*.

Response side of this page intentionally left blank.

MY GOALS

- **As an undergrad in Health Education at Cal State University, Northridge, I was taught how to perform a Needs Assessment.**
- **It is my opinion that the Decision Makers to date have been “reactive to media and community concerns” rather than requesting scientifically based studies to inform them regarding the future courses of action.**
- **As an Santa Susana Field Laboratory (SSFL) Technical Stakeholder for more than ten years, my comments will be based on the Department of Energy’s Draft Environmental Impact Statement**

Response side of this page intentionally left blank.

Commenter No. 168 (cont'd): Christine Rowe

2007 CONSENT ORDER

In 2007, DTSC issued the *Consent Order for Corrective Action* (2007 CO) (DTSC 2007) to DOE, NASA, and Boeing (as respondents), pursuant to DTSC's authority over hazardous waste under the California Health and Safety Code, Section 25187. The 2007 CO requires the respondents to clean up all chemically contaminated soils¹ and groundwater at SSFL to risk-assessment-based levels. The risk-assessment-based levels are based on a suburban resident scenario established for SSFL in the *Final Standardized Risk Assessment Methodology Revision 2 Addendum, Santa Susana Field Laboratory, Ventura County, California* (SRAM) (MWH 2014),² which assumed a receptor would be present on the site 24 hours per day, 350 days per year, for 30 years. The 2007 CO required further

¹ The 2010 AOC (DTSC 2010a) superseded the 2007 CO (DTSC 2007) with respect to cleanup of chemically and radioactively impacted soils; however, it incorporated the 2007 CO by reference for groundwater remediation. The 2010 AOC also added building demolition.

² The 2007 CO cited a 2005 version of the SRAM Work Plan. The currently applicable version of the SRAM (MWH 2014) was issued in 2014.

Response side of this page intentionally left blank.

2010 ADMINISTRATIVE ORDER ON CONSENT

The SRAM (MWH 2014) describes a risk-assessment methodology for determining the areas that would need remediation. A hypothetical future suburban residential land use was identified for the evaluation of risk; other plausible receptors (such as recreational users or workers) were also identified.

In 2010, DOE entered into the 2010 AOC (DTSC 2010a) with DTSC. The 2010 AOC superseded the 2007 CO with respect to soil remediation and changed the framework for the soils characterization and cleanup process for Area IV and the NBZ.³ The 2010 AOC stipulated that the soils cleanup standard would be based on LUT values, which are: (1) for chemicals, local background concentrations or method detection limits⁴ for those chemicals whose method detection limits exceed local background concentrations, and (2) for radionuclides, local background concentrations or minimum detection limits for radionuclides whose detection limits exceed local background concentrations. The 2010 AOC defines the minimum detection limit for a radionuclide as the smallest amount of activity that can be quantified for comparison with regulatory limits.⁵ The 2010 AOC indicates that, for soil remediation decisions, DOE is to compare the concentration of any chemical or radionuclide in each individual sample (not an average of samples in an area) with its respective LUT value. Thus, any soil samples that do not meet the LUT values for all chemicals or radionuclides would require a cleanup action to be taken.

The 2010 AOC (DTSC 2010a) identified characterization activities for both chemical and radiological contaminants and requires DOE to prepare a Soils Remedial Action Implementation Plan (SRAIP)⁶ describing where soil cleanup will occur, any areas proposed for exemptions to protect biological or cultural resources, and any areas proposed for *in situ* or onsite treatment to

Response side of this page intentionally left blank.

Commenter No. 168 (cont'd): Christine Rowe

2010 ADMINISTRATIVE ORDER ON CONSENT

³ The 2007 CO remains in effect for groundwater remediation.

⁴ Per the 2010 AOC, "detection limit" means the method reporting limit, which is the lowest concentration at which an analyte can be confidently detected in a sample and its concentration can be reported with a reasonable degree of accuracy and precision.

⁵ In its *Final Technical Memorandum, Look-Up Table Recommendations, Santa Susana Field Laboratory Area IV Radiological Study* (HGL 2012b), EPA stated: "In exercising independent technical judgment, as identified in Section 3.2 of the 2010 AOC (DTSC 2010a), EPA recommends an adjustment to the BTVs [background threshold values] and minimum detectable concentrations [limits] (MDCs) to include appropriate consideration for [method uncertainty] to ensure an acceptably low decision error rate of approximately 5 percent. This adjustment is not believed by EPA to be contrary to the 2010 AOC requirement that LUT values incorporate BTVs and laboratory MDCs." The memorandum also stated: "For purposes of this technical memorandum, and for the appropriate use of BTVs, it is important to note that the MDC is not used as a detection decision criterion. Rather, the MDC is understood to represent a level of activity at which the associated uncertainty becomes predictably constrained to a level that is useful for defining a substitute cleanup value when the BTV is not practically or technologically supported by the laboratory data. The use of the MDCs in this case, defined as "the smallest amount of activity that can be quantified for comparison with regulatory limits," is consistent with the 2010 AOC requirements and definitions."

⁶ The 2010 AOC requires DOE to prepare a SRAIP that includes a site description and history and a description of the nature and extent of radiological and chemical contamination, planned remedial actions, proposed exemptions, proposed areas for onsite treatment, proposed mitigations to address environmental impacts, and schedule. DOE may prepare multiple SRAIPs to address different implementation phases. DOE anticipates submitting the first of three planned SRAIPs to DTSC at the same time that DTSC issues the final program environmental impact report.

Response side of this page intentionally left blank.

THE 2010 CONSENT ORDER – HOW DID WE GET THERE?

- In August 2007, DTSC signs the 2007 Consent Order with The Boeing Company, NASA, and the Department of Energy (DOE)
- In October 2007, Senate Bill 990 is signed into law by Governor Schwarzenegger. This bill becomes a part of the State Health and Safety Code.
- In the meantime, the Federal Environmental Protection Agency has been asked to determine if the whole SSFL site qualifies as a Federal Superfund site. Historically, the whole SSFL site (to the best of my understanding) was not considered, and it had been previously assessed for radionuclides – it did not “score”, it was assessed for chemicals – it did not “score”.
- In December 2007, the SSFL site was determined to be eligible for listing as a Federal Superfund site based upon the Groundwater contamination site wide:
- <https://www3.epa.gov/region9/superfund/santanusana/SSFL-PASI-report-r2-complete.pdf>

168-4

168-4

As described in Chapter 1, Section 1.3 of this Final EIS, in December 2007 EPA released a Hazard Ranking Survey of SSFL and recommended further assessment. Based primarily on trichloroethylene in groundwater under Area I and II, the score exceeded the threshold for listing on the National Priorities List. In January 2009, the State of California indicated that it did not support listing on the National Priorities List. EPA decided not to list SSFL on the National Priorities List and DTSC continued as the lead regulatory agency.

Commenter No. 168 (cont'd): Christine Rowe

EPA SSFL PRELIMINARY SITE ASSESSMENT

The following pertinent Hazard Ranking System (HRS) factors are associated with the site:

- A release of TCE to the groundwater beneath the SSFL site is well documented. Analytical data indicate that both the shallow aquifer and the deeper Chatsworth Formation aquifer have been contaminated with TCE. Although other contaminants have been detected, TCE is the compound detected with the highest concentration and greatest frequency.
- TCE was detected in the groundwater as early as 1980. Records indicated that TCE was detected in a drinking water well at a concentration of 9 parts per billion (ppb), which exceeded the State and Federal drinking water limits of 5 ppb. Approximately 330 people were subjected to contaminated groundwater from this drinking water well. The well was shut down due to the contamination, and bottled drinking water was provided. The groundwater beneath the SSFL site continues to be contaminated, with current concentrations of TCE as high as 110,000 ppb.
- The groundwater beneath the SSFL site forms a regional groundwater high, therefore, there are no up gradient sources of contamination.
- Currently, there are approximately 7,624 people that receive groundwater from a blended municipal drinking water system that is located between a 3-4 mile radius from the site.
- Groundwater beneath the SSFL site discharges to the surface water at 28 spring/seep locations. Recent data indicated that TCE has been detected at one of the spring/seep locations. The SSFL site and surrounding land support habitat for endangered and threatened species. These species have the potential to be exposed to surface water contamination at the site.

The 2009 Consent Order

- After SB 990 became law, DTSC tried to work with the three Responsible Parties: The Boeing Company, NASA, and the DOE, to incorporate SB 990 into the 2007 Consent Order.
- Meetings were held at the DTSC Chatsworth office as well as a meeting with the West Hills Neighborhood Council Board members
- In October 2009, the Statute of Limitations on SB 990 had run out. It is my opinion, based on documents that I read at that time, that The Boeing Company was not being given the same reservation of rights to litigate in the future as was DTSC, NASA, and the DOE.

AGREEMENT IN PRINCIPLE - WHAT DOES IT DO?

www.dts-csfl.com/files/0_p4i_jr/volve/meeting_agendas/meeting_agendas_etc/64728_AgreementInPrincipleB-22-11.pdf

A Path Forward

- Resolves disagreements over interpretations and implementation of SB 990 (Kuehl, 2007)
- Fast forwards the process to where it will likely end up (years from now)
- Provides certainty to all and eliminates concerns about the unknown outcome of "process"
- Takes advantage of U.S.EPA's ongoing site survey and soil sampling work **and** U.S.EPA's expertise on radiological contamination

Response side of this page intentionally left blank.

Commenter No. 168 (cont'd): Christine Rowe

SB 990 – WHAT DOES IT REQUIRE?

SB 990

- What it says:
 - Requires cleanup standards for radioactive and chemical contaminants based on “rural residential” land use assumptions
 - Includes the pathways: ingestion of soil, dermal contact with soil, inhalation of dust, ingestion of fruits and vegetables, beef, milk, poultry, eggs, swine, and fish, assumed to be produced on the site.
 - Clarifies that risk due to both radioactive and chemical contaminants must be added
 - Requires uses of the State Superfund process

Response side of this page intentionally left blank.

NINE BALANCING CRITERIA

Nine Balancing Criteria

1. Overall protection of human health and the environment
 2. Compliance with Applicable, Relevant and Appropriate Requirements
 3. Long-term effectiveness and permanence
 4. Reduction of toxicity, mobility, or volume
 5. Short-term effectiveness
 6. Implementability
 7. Cost
 8. State acceptance
 9. Community acceptance
-

**THE ADMINISTRATIVE ORDERS ON
CONSENT – WHAT DO THEY DO?**

1.6. Compliance with State Law. DTSC agrees that compliance with this Order and the 2007 Order shall constitute DOE's full and complete compliance with all applicable provisions of Chapters 6.5 and 6.8 of Division 20 of the California Health and Safety Code (the California Hazardous Waste Control Law, Sections 25100 *et seq.* of that Code, and the California Hazardous Substances Account Act, Sections 25300 *et seq.* of that Code), including specifically, but not limited to, California Senate Bill 990 (Stats. 2007, c. 729), which has been codified as Section 25359.20 of the California Health and Safety Code, but only with respect to the application of these provisions to radiologic or chemical contamination of soil at the Site or any contiguous radiologic or chemical contamination of soil emanating from within Area IV or the Northern Buffer Zone, within or without the SSFL boundaries, identified by EPA in its radiologic characterization survey or by DTSC as part of the investigation of chemical contaminants.

Response side of this page intentionally left blank.

**WHAT THE ADMINISTRATIVE ORDERS
ON CONSENT DO NOT REQUIRE**

- Development of risk assessments will not be required.
- As identified by EPA in its rad survey and by DTSC as part of the investigation of chemical contaminants, DOE will remediate the areal extent of any contiguous radiologic or chemical contamination of soil that emanates from within Area IV even to the extent that it migrates beyond

https://www.dtsc.ca.gov/SiteCleanup/Projects/Upload/SSFL_FS_Order_1107.pdf

FACT SHEET November 2007

DTSC Issues Order to Boeing and NASA to Take Action on Sage Ranch

On November 1, 2007, the Department of Toxic Substances Control (DTSC) issued an Imminent and Substantial Endangerment Order (Order) to The Boeing Company (Boeing) and the National Aeronautics and Space Administration (NASA) for the cleanup of Asbestos Containing Material (asbestos) and polycyclic aromatic hydrocarbons (PAHs) along the northern boundary (please see the map on page two) of the Santa Susana Field Laboratory (SSFL). The SSFL is located in the Santa Hills in the south-eastern portion of Ventura County, California, approximately 30 miles northwest of downtown Los Angeles.

DTSC issued this order under its authority in the California Health and Safety Code. Since the contamination is on adjacent property and potentially accessible to the public, DTSC is requiring quick action and is sending this fact sheet to inform the community of the cleanup activities. During the development of the Order, we briefed community representatives regarding the sampling results and the need for cleanup.

The Mission of the Department of Toxic Substances Control is to provide the highest

THE LOS ANGELES REGIONAL WATER QUALITY CONTROL BOARD ORDERS BOEING TO HIRE THE BOEING EXERT STORM WATER PANEL

INTERIM SOURCE REMOVAL ACTION

In 2013, Boeing completed its Interim Source Removal Action to improve water quality in two drainage locations in the northern and southeastern portions of the Santa Susana site. This effort involved identifying, evaluating and remediating areas of soil to remove constituents believed to be affecting stormwater runoff.

Boeing minimized the potential impact on streambeds and habitats by conducting biological surveys before targeted field work began in 2009. The Santa Susana Stormwater Expert Panel developed stabilization measures to prevent rainy season erosion and enhance long-term restoration.

Before any soil was removed from the site, it was sampled and characterized to determine the presence of any chemical or radiological constituents. All excavated soil was transported by trucks, using appropriate protective measures, to facilities that are legally permitted to dispose of such soils.

While the Regional Board oversees the ISRA activities, it worked closely with the agency responsible for the final site-wide cleanup, the California Department of Toxic Substances Control, as well as Ventura County, California Fire and Wildlife and the U.S. Army Corps of Engineers.

"SRE Workshop

Aerial view of the Sodium Reactor Experiment facility.

Some people believe that the July 1959 accident involving the Sodium Reactor Experiment was the worst nuclear accident in US history. Others believe the accident was much more benign. In response to stakeholder requests for more information about what happened, DOE hosted an informational workshop on August 29, 2009 designed to explore the diverse expert and community perspectives on what occurred prior to, during, and immediately after the accident.

The workshop began with presentations from three independent experts: Dr. Paul Pickard of Sandia National Laboratories, Dr. Thomas Cochran of the Natural Resources Defense Council, and Dr. Richard Denning of Ohio State University. Over 185 workshop attendees then had an opportunity to ask questions of these experts. Finally, community members had an opportunity to provide their own perspectives on what occurred."

ATSDR REVIEW OF SSFL

ATSDR Public Health Assessment

The Agency for Toxic Substance and Disease Registry (ATSDR) is a part of the Center for Disease Control (CDC) which is operated by the Federal Department of Health and Human Services (DHHS). The ATSDR received a request to conduct a public health assessment at the Santa Susana Field Laboratory (SSFL). ATSDR held meetings with the public in the Fall of 1999 to identify health concerns and completed a preliminary site evaluation in December 1999.

- [Draft Preliminary Site Evaluation Santa Susana Field Laboratory \(SSFL\), Ventura County, California, December 1999](#)

The preliminary site evaluation executive summary states that *"preliminary results of the exposure pathway analyses for air, ground water and surface water, and soil and sediment indicate that it is unlikely that people living in communities near the site have been exposed to substances from the site at levels that would have resulted in adverse health effects"*.

The ATSDR recommended further studies to assess potential off site exposure pathways to contaminants, update the prior state cancer registry studies, and perform public outreach. As a result, ATSDR contracted with the Eastern Research Group (ERG), who in turn issued a sole source contract to the University of California at Los Angeles (UCLA) to assess potential off site exposure. [Click here](#), for more information about the UCLA offsite exposure studies.

Morgenstern Cancer Study Results 1

Results: Associations between distance from SSFL and cancer incidence differed by type of cancer outcome. Standardized incidence rate ratios were close to 1, indicating little or no association, for total cancers and radiosensitive cancers among adults, but the incidence rate of chemosensitive cancers was slightly elevated during both follow-up periods in the population living within 2 miles of SSFL. Results for the 9 specific cancers revealed some elevated incidence rates between 1988 and 1995 among persons living within 2 miles of SSFL. Specifically, the standardized incidence rate ratio was greater than 1.6 for cancers of blood and lymph tissue, bladder, thyroid, and upper aerodigestive tract. Between 1996 and 2002, the rate ratio among persons living within 2 miles of SSFL was greater than 1.6 for thyroid cancer. There were too few childhood cancers to yield informative results.

Discussion: The strongest and most consistent association observed in this study was for thyroid cancer, which was associated with distance from SSFL in both follow-up periods. This finding may have public-health significance because perchlorate, a component of rocket fuel used in large quantities at SSFL, is known to disrupt thyroid function; it has been shown to induce thyroid tumors in laboratory animals, and there is evidence from two other investigations that perchlorate migrated offsite to contaminate the groundwater in areas surrounding SSFL. In addition, findings from one of those other studies suggest that the 1959 partial meltdown of a nuclear reactor at SSFL could have released appreciable amounts of radioactive cesium and iodine, which might have increased the incidence of thyroid cancer in the population surrounding SSFL. Furthermore, our results for cancers of the bladder, blood and lymph tissue, and upper aerodigestive tract are consistent with associations observed in the UCLA Worker Study between mortality from these cancers and occupational exposures to radiation and chemicals.

It is important to recognize that associations observed between distance from SSFL and the incidence of specific cancers are based on small numbers of cases in the region closest to SSFL. Thus, these associations are estimated imprecisely and may represent chance findings. In addition, observed associations may have been biased by certain methodologic limitations—use of distance from SSFL as a crude proxy measure for environmental exposures, mobility of the residential population before and during the follow-up period, and lack of information on other cancer risk factors, such as cigarette smoking and socioeconomic status, that might distort the observed associations.

Commenter No. 168 (cont'd): Christine Rowe

The problems with the Morgenstern study in my opinion

- 1) Dr. Morgenstern was influenced by the Cohen / Katner offsite exposure assessment which as I have stated – they did not respond to peer review. When I read that peer review response, it left me with many questions related to the accuracy of the offsite exposure study.
- 2) Dr. Morgenstern is of the understanding and references a “1959 partial meltdown” at the SSFL site which he indicates could have released “appreciable amounts of radioactive cesium and iodine.”

**DR. PAUL PICKARD'S OBSERVATIONS REGARDING
IODINE AND CESIUM AFTER THE 1959 SRE INCIDENT**

Observations and Comments

- Existing documentation from 1959 provides a reasonable description of the SRE accident and causes
- Fuel and cladding damage causes and mechanisms are consistent with current understanding
- The inventory was re-calculated using current tools and data, which confirmed original inventory estimates for important fission products
- Conclusions:
 - Absence of iodine radionuclides in the cover gas is consistent with known chemical mechanisms
 - Metal fuel and sodium form nonvolatile iodides
 - Similar observations from EBR-II and other experiments
 - From this review, primary release should have been noble gases
 - The July accident itself should not have resulted in major releases of volatile fission products

Response side of this page intentionally left blank.

WHAT IS THE PROBLEM – BACK TO THE NEEDS ASSESSMENT QUESTION

- 1) **The first problem is that the media and local activist groups continue to perpetuate the “Meltdown Myth”**
- 2) **The second problem is that these groups are using old data including the Katner study from 2003 to “prove” offsite risk in the surrounding communities**
- 3) **The third problem is that these people lead local residents to believe that their cancers and other illnesses are caused by the SSFL site**
- 4) **The fourth problem is that even the epidemiologists cannot prove or disprove whether a cancer was caused by the SSFL site**
- 5) **The fifth problem is that very few people are looking at the health studies, and they turn to people who they believe are “experts” rather than, to the best of my understanding, find the appropriate experts at the California Cancer Registry.**
- 6) **Some local activists dispute the findings of Dr. Thomas Mack of USC who did a study surrounding the SSFL for DTSC in 2014.**

168-5

168-5

Thank you for your comment. It has been added to the Administrative Record for the EIS. Chapter 3, Sections 3.9.5 and 3.9.6, of this Final EIS contain information about accidents at Area IV, including the 1959 SRE accident, which was the only accident that caused a measureable release of radioactive material. At the time of the accident it was estimated that the accident resulted in the release (over a 2-month period) of about 28 curies of radioactive noble gases such as krypton-85, in low, controlled concentrations that met Federal requirements (see Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD). Additional information about the 1959 SRE accident can be found at http://www.etec.energy.gov/Operations/Major_Operations/SRE_Accident.html.

168-6

168-6

Thank you for your comment. It has been included in the Administrative Record for the EIS. Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD presents additional discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

**Dr. Mack's Five Mile Radius from the
SSFL map**

Response side of this page intentionally left blank.

Commenter No. 168 (cont'd): Christine Rowe

Dr. Mack's Conclusions

Conclusion

- It is not possible to completely rule out any offsite carcinogenic effects from SSFL
- No evidence of measureable offsite cancer causation occurring as a result of emissions from the SSFL was found.
- Further, no evidence of any cancer causation by any environmental factor was found.

Response side of this page intentionally left blank.

Additional Concerns

- It is my opinion as a stakeholder of the SSFL community for greater than ten years that:
- 1) Most people do not understand what a cancer cluster is;
- 2) Most people do not understand the difference between correlation and causation;
- 3) When you or a loved one or friend has cancer or another illness, you want to find a cause;
- 4) It is my opinion that most people would prefer to believe that a cancer is caused by an environmental factor that is out of their control – such as the SSFL site, rather than look at other potential causes which could be genetic in nature, be something that was ingested by the mother during pregnancy (teratogen), something in the food that the mother or the child has eaten, or even the risks associated with airborne contaminates or traffic.

Back to SB 990 – What happened to the litigation of Boeing V DTSC?

Before: Alfred T. Goodwin, Andrew J. Kleinfeld,
and Barry G. Silverman, Circuit Judges.

Opinion by Judge Kleinfeld

SUMMARY**

Environmental Law

The panel affirmed the district court's decision that a California law governing cleanup of a federal nuclear site violated the doctrine of intergovernmental immunity.

The Boeing Co. challenged the validity of California's Senate Bill 990, which prescribes cleanup standards for radioactive contamination at Santa Susana Field Laboratory. SB 990 requires that the site be made suitable for subsistence farming, a more demanding standard than that imposed by a plan adopted by the federal Department of Energy.

Response side of this page intentionally left blank.

The 9th Circuit Court of Appeals Conclusions on SB 990

THE BOEING COMPANY V. RAPHAEL 3

The panel held that Boeing had standing because as landowner, it established injury in fact.

The panel held that SB 990 violated the doctrine of intergovernmental immunity because it regulated DOE's cleanup activities directly in violation of the Supremacy Clause. In addition, SB 990 discriminated against the federal government and Boeing as a federal contractor hired to perform the cleanup of the Santa Susana site.

The panel did not reach the question of whether the federal laws governing nuclear materials and cleanup of hazardous substances preempted the state law. It also did not reach Boeing's claim under 42 U.S.C. § 1983 for a declaratory judgment and an injunction.

Response side of this page intentionally left blank.

Commenter No. 168 (cont'd): Christine Rowe

**9th Circuit Court of Appeals re SB 990 -
2**

4 THE BOEING COMPANY V. RAPHAEL

OPINION

KLEINFELD, Senior Circuit Judge:

We affirm the district court's decision that a California law governing cleanup of a federal nuclear site violates the doctrine of intergovernmental immunity. Because we decide that the state law impermissibly regulates and discriminates against the federal government and its contractor, we do not reach the question of whether the federal laws governing nuclear materials and cleanup of hazardous substances preempted the state law. We need not reach Boeing's Section 1983 claim for a declaratory judgment and an injunction.

Response side of this page intentionally left blank.

Commenter No. 168 (cont'd): Christine Rowe

**9th Circuit Court of Appeals on SB 990 –
My interpretation – the State of California cannot dictate the how to
cleanup radioactive waste on a DOE site per Federal law**

The subject of this litigation is a state's authority, as opposed to the federal government's authority, to regulate the cleanup of radioactive pollution. The issue is whether the state may mandate more stringent cleanup procedures, not generally applicable within the state, to a particular site where the federal government undertook to clean up nuclear contamination it created. In the circumstances of this case, the answer is no.

So far, the federal Department of Energy, as successor to the Atomic Energy Commission, has supervised and implemented the cleanup of radioactive material. Under the Atomic Energy Act, DOE is responsible for establishing a comprehensive health, safety, and environmental program for managing DOE's nuclear facilities nationwide.¹ DOE has implemented that authority by issuing orders that set health and safety limits for radioactive releases and cleanup and site-closure procedures.²

168-7

168-7 DOE entered into the 2010 Agreement on Consent under the authority granted the Department in the Atomic Energy Act (AEA). The AEA authorizes DOE to “advance the goals of restoring, protecting and enhancing environmental quality, and assuring public health and safety” (42 U.S.C. 7112(13)). The commenter is referred to Final EIS Chapter 2, Sections 2.1 and 2.2 for discussions regarding the history and legality of the AOC.

DTSC did not enforce SB 990 with respect to DOE, so DOE was under no duress attributable to SB 990 when the 2010 AOC was negotiated. The 2010 AOC states that DTSC agreed that compliance with the 2010 AOC would constitute DOE compliance with applicable provisions of the California Health and Safety Code (Section 1.6), including Senate Bill 990. However, after the law was declared unconstitutional, SB 990 was no longer enforceable.

Commenter No. 168 (cont'd): Christine Rowe

**9th Circuit Court of Appeals on DTSC's authority
to regulate the cleanup of chemical
contamination**

Non-radioactive chemical pollutants are regulated differently from radioactive pollutants.⁴ The California Department of Toxic Substances Control regulates the cleanup of chemical contamination, pursuant to an agreement with EPA authorizing state control, under a different federal statute from the one applicable to radioactive materials.⁵ The various state and federal agencies involved, and Boeing, agreed upon an order from California's Department of Toxic Substances Control to clean up the chemical contamination to a level adequate for suburban residential use. That order does not address the cleanup of radioactive materials.

This case arises from the State of California's decision to extend its control to cleanup of radioactive pollutants. In October 2007, California passed Senate Bill 990, "Cleanup of Santa Susana Field Laboratory," prescribing cleanup standards for both radioactive and chemical contamination.⁶ The statutory standard requires that the site be made suitable for "suburban residential or rural residential (agricultural)

Response side of this page intentionally left blank.

The 9th Circuit Court of Appeals interprets SB 990 requirements

10 THE BOEING COMPANY V. RAPHAEL

[use], whichever produces the lower permissible residual concentration” for each contaminant found at the site.⁷ The state statute does not further define the “rural residential (agricultural)” standard, but the federal EPA “agricultural” standard apparently intended by the state statute assumes “consumption of farm products for a subsistence farmer,” getting all his or her vegetables, fruit, meat, fish, and milk from the land, along with incidental consumption of soil and inhalation of dust.⁸ In effect, Senate Bill 990 (“SB 900”) would require that hypothetical subsistence farmers could live safely on their farms eating nothing but their chickens, eggs, crops, and cheese and drinking their milk from their cows eating the grass, in this patch of nuclear and chemical toxic waste in the Los Angeles suburbs.

Boeing and the federal agencies contend that this standard is more demanding than the usual practice under state and federal law of setting a cleanup level commensurate with a site’s reasonably foreseeable use.⁹ It may well be

Response side of this page intentionally left blank.

Commenter No. 168 (cont'd): Christine Rowe

**9th Circuit Court of Appeals – continued from previous slide –
RE: “the state’s authority to impose its subsistence farming
standard as against the less stringent federal industrial,
recreational, and residential standard.”**

THE BOEING COMPANY V. RAPHAEL 11

unreasonable to foresee subsistence farming at the site. The record does not show why this standard was adopted, or whether subsistence farming of this sort was contemplated for the Los Angeles suburbs. The subsistence farming standard is more stringent than the suburban residential standard required by the agreed-upon order governing the cleanup of non-radioactive chemicals. DOE’s cleanup procedures specifically rejected the state law’s standard as “not a reasonable scenario for the site.” Boeing has made a public commitment to dedicate the site for public use as open space parkland, not subsistence farming. But reasonable foreseeability of subsistence farming is not the controlling issue in this case. The relevant tension in this case is the state’s authority to impose its subsistence farming standard as against the less stringent federal industrial, recreational, and residential standard.

Response side of this page intentionally left blank.

**The WOW Factor –
California does not challenge Boeing’s standing, but
some advocacy groups as amici curiae do.”**

I. Standing

California does not challenge Boeing’s standing, but some advocacy groups as amici curiae do. Their argument is that Boeing suffers no injury in fact from SB 990 because as a federal contractor, it will be paid for its work and bears no other costs. We disagree. The law prohibits Boeing from transferring its own real property, injury enough.¹² Even if the federal government does pay for all the cleanup work, the estimated 50,000 year delay in transferability (based on estimated time for cleanup of groundwater to be completed)

Response side of this page intentionally left blank.

Commenter No. 168 (cont'd): Christine Rowe

**9th Circuit Court of Appeals – continued from page 12 –
50,000 years to cleanup the Groundwater!**

THE BOEING COMPANY V. RAPHAEL 13

is indeed an injury in fact to Boeing as landowner. Nor has the federal government agreed to cleanup the entire site at its own expense to SB 990's standards. California concedes that Boeing will pay the portion of the cleanup expenses not borne by the federal government. Injury in fact is clear.

Response side of this page intentionally left blank.

SB 990 IS INVALID – “DOE is a “responsible party” with respect to radioactive contamination.”

168-7
cont'd

Under the Supremacy Clause, “the activities of the Federal Government are free from regulation by any state.”¹³ Accordingly, state laws are invalid if they “regulate[] the United States directly or discriminate[] against the Federal Government or those with whom it deals.”¹⁴ SB 990 is invalid on both grounds.

A. Direct Regulation of the U.S. Government

SB 990 regulates the Department of Energy’s cleanup activities directly. SB 990 authorizes California’s Department of Toxic Substances Control to “use any legal remedies available” under the State’s hazardous waste laws “to compel a responsible party or parties to take or pay for appropriate removal or remedial action necessary to protect the public health and safety and the environment at the Santa Susana Field Laboratory site.”¹⁵ DOE is a “responsible party” with respect to radioactive contamination. All of the contamination at Santa Susana is the result of federal activity

Response side of this page intentionally left blank.

Commenter No. 168 (cont'd): Christine Rowe

**9TH CIRCUIT COURT OF APPEALS RELATED TO SB
990'S IMPACT ON THE DOE CLEANUP**

The federal Department of Energy has accepted responsibility for the cleanup of radioactive contamination, and it is actively conducting the cleanup through its cleanup contractor, Boeing. SB 990 affects nearly all of DOE's decisions with respect to the cleanup, including the environmental sampling that is required, the cleanup procedures to be used, and the money and time that will be spent. The state law requires an application of more stringent cleanup standards than federal laws and DOE's cleanup procedures do. Whether state law is better or worse does not affect state authority, just whether the state regulates federal activity.

Response side of this page intentionally left blank.

Commenter No. 168 (cont'd): Christine Rowe

9TH CIRCUIT COURT OF APPEALS – “SB 990 directly interferes with the functions of the federal government.”

SB 990 directly interferes with the functions of the federal government. It mandates the ways in which Boeing renders services that the federal government hired Boeing to perform. The state law replaces the federal cleanup standards that Boeing has to meet to discharge its contractual obligations to DOE with the standards chosen by the state. It overrides federal decisions as to necessary decontamination measures. Unlike the tax cases, SB 990 regulates not only the federal contractor but the effective terms of federal contract itself.

Thus, SB 990 violates intergovernmental immunity unless Congress has clearly and unambiguously authorized California to exercise authority over the Department of Energy with respect to radioactive materials. “It is well settled that the activities of federal installations are shielded by the Supremacy Clause from direct state regulation unless Congress provides ‘clear and unambiguous’ authorization for such regulation.”¹⁹

Response side of this page intentionally left blank.

Commenter No. 168 (cont'd): Christine Rowe

**9TH CIRCUIT COURT OF APPEALS REGARDING CONGRESSIONAL
AUTHORIZATION AND THE ATOMIC ENERGY ACT**

There is no clear congressional authorization in the Atomic Energy Act that would allow California to regulate DOE's cleanup of radioactive materials at Santa Susana. The agreement entered between California and the Atomic Energy Commission in 1962 does not affect the immunity analysis. The 1962 agreement was made pursuant to the 1959 amendment to the Atomic Energy Act that allowed the Atomic Energy Commission to transfer licensing authority over nuclear materials to states, pursuant to individual agreements with individual states.²⁰ Congress sought, among other things, "to recognize the need, and establish programs for, cooperation between the States and the Commission with respect to control of radiation hazards associated with the use of [nuclear material]."²¹ The Act provides that states "shall have authority to regulate the materials covered by [an] agreement for the protection of the public health and safety from radiation hazards."²² Under the 1962 agreement, California's Department of Public Health has licensed Boeing's *commercial* nuclear work at Santa Susana.

Commenter No. 168 (cont'd): Christine Rowe

**9TH CIRCUIT COURT OF APPEALS REGARDING
THE STATE'S RCRA AUTHORITY**

The Resource Conservation and Recovery Act ("RCRA")²⁸ does not authorize California to regulate DOE's cleanup of radioactive contamination. RCRA allows states to operate a hazardous waste management plan applicable to federal facilities so long as the state regulates "in the same manner, and to the same extent, as any person is subject to such requirements."²⁹ But RCRA excludes from its coverage radioactive materials regulated under the Atomic Energy Act.³⁰ So RCRA does not apply to the radioactive contamination in this case.

Response side of this page intentionally left blank.

Commenter No. 168 (cont'd): Christine Rowe

9TH CIRCUIT COURT OF APPEALS RE CERCLA – *“However, the waiver does not apply to the extent a State law would apply any standard or requirement to (federal) facilities which is more stringent than the standards and requirements applicable to facilities which are not owned or operated by (the federal government).”*

THE BOEING COMPANY V. RAPHAEL 19

990. Under CERCLA, states may obtain authority to clean up certain hazardous waste sites by obtaining EPA approval and entering into a “cooperative agreement.”³² Unlike RCRA, some provisions of CERCLA cover nuclear materials. The definition of “release” includes releases of nuclear materials except in certain situations.³³ EPA includes “radionuclides” in the list of “hazardous substances.”³⁴ And CERCLA contains a federal immunity waiver clause with respect to state laws concerning removal and remedial of hazardous substances. However, the waiver does not apply “to the extent a State law would apply any standard or requirement to [federal] facilities which is more stringent than the standards and requirements applicable to facilities which are not owned or operated by [the federal government].”³⁵ SB 990 applies more stringent requirements to Santa Susana than to non-federal facilities because it requires cleanup to a standard suitable for subsistence farming, rather than for the site’s reasonably foreseeable future use. Under the state’s generally applicable process, the future use would be determined by considering a number of site-specific factors such as current use, county general plans, and topography. It is undisputed that the subsistence farming has not been so determined as a land use assumption for the Santa Susana site.

Response side of this page intentionally left blank.

Commenter No. 168 (cont'd): Christine Rowe

9TH CIRCUIT COURT OF APPEALS – “SB 990 also violates intergovernmental immunity because it discriminates against the federal government and Boeing as a federal contractor.” “California does not dispute that “SB 990 singles out Boeing, DOE, NASA and the (Santa Susana Field Laboratory) site for a substantially more stringent cleanup scheme than that which it applies elsewhere in the State.”

B. Discrimination Against the U.S. Government and Its Contractors

SB 990 also violates intergovernmental immunity because it discriminates against the federal government and Boeing as a federal contractor. “A state or local law discriminates against the federal government if it treats someone else better than it treats the government.”³⁶ California does not dispute that “SB 990 singles out Boeing, DOE, NASA and the [Santa Susana Field Laboratory] site for a substantially more stringent cleanup scheme than that which applies elsewhere in the State.” The fact that Santa Susana is especially contaminated does not render the law non-discriminatory because California’s generally-applicable environmental laws do not impose the SB 990 radioactive cleanup standards at the Santa Susana site.

Response side of this page intentionally left blank.

Commenter No. 168 (cont'd): Christine Rowe

My Conclusions regarding the AOCs based on the 9th Circuit Court of Appeals Ruling

- 1) The State of California – DTSC has the right to require certain cleanup standards for the SSFL site which they did with the 2007 Consent Order between DTSC and all three Responsible Parties.
- 2) The Department of Energy has committed to the 2007 Consent Order, and has agreed to cleanup the property – Area IV and the Northern Buffer Zone – to a residential standard.
- 3) The Boeing Company owns the land that is contaminated, according to the 9th Circuit Court of Appeals, by federal contracts.
- 4) Due to the 9th Circuit Court of Appeal ruling on SB 990, Boeing will cleanup its portion of the SSFL site to a residential standard, but has stipulated that the end use will be open space / parkland.
- 5) It is my opinion that the AOC's are void because they are directly and inextricably tied to SB 990 which was found to be unconstitutional.
- 6) It is my understanding based on this ruling that the State RCRA laws due not cover radioactive waste. And even CERCLA would not require a cleanup higher than is required by non federal facilities.
- 7) "California does not dispute that "SB 990 singles out Boeing, DOE, NASA and the (Santa Susana Field Laboratory) site for a substantially more stringent cleanup scheme than that which it applies elsewhere in the State."
- 8) In conclusion, it is my opinion, that the DOE and NASA should both be complying with the 2007 Consent Order, and therefore, the need to consider the DOE AOC cleanup alternative would be *potentially illegal and irresponsible* because it does not require a human health risk assessment.

168-8

168-9

168-10

168-11

168-8 At this time, DOE has not made any specific cleanup decisions. DOE has identified its Preferred Alternative(s) in Chapter 2, Section 2.7 of this Final EIS.

DOE's preferred alternative for soils remediation is the Conservation of Natural Resources, Open Space Scenario. DOE's preferred alternative for building demolition is the Building Removal Alternative. Under this alternative DOE would demolish the 18 DOE-owned buildings in Area IV and transport the resulting waste off site for disposal. DOE's preferred alternative for groundwater remediation is a combination of the Monitored Natural Attenuation Alternative and the Treatment Alternative.

The selected clean-up remedies will be identified in the ROD(s). DOE signed the 2007 Consent Order and the 2010 AOC and will follow processes outlined in those documents that lead to cleanup (e.g., preparation a Corrective Measures Study for groundwater and a Soil Remedial Action Implementation Plan for soil).

168-9 Boeing owns approximately 2,400 acres of land at SSFL. This land includes Area IV and the NBZ, the land that DOE addresses in this Final EIS. Boeing's cleanup of its other land at SSFL is outside the scope of this DOE EIS. However, as discussed in Chapter 1, Section 1.5, of this EIS in 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site.

168-10 DOE acknowledges that SB 990 was found to be unconstitutional. Please refer to the response to comment 168-7. This EIS analyzed an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities

168-11 This Final EIS evaluates the human health risk of performing remediation under each alternative and the post remediation risk of any contamination left behind under each alternative. Under the Cleanup to AOC LUT Values Alternative, contaminants would be cleaned up to background or minimum detection limits except in exemptions areas. Clean up to background or minimum detection limits would result in no incremental risk and therefore would not require a risk assessment. Cleanup levels in the exemption areas would be protective of human health and the environment. The human health risk of contamination left in these areas is evaluated in this Final EIS.

Commenter No. 168 (cont'd): Christine Rowe

From the DOE DEIS – Alternatives based on risk to workers and to members of the public
I support a Risk based cleanup based on the 2007 Consent Order which is what Boeing will be doing on their portion of the SSFL site.

168-12

168-12

DOE acknowledges your support for a risk-based cleanup based on the 2007 Consent Order (cleaning radionuclides to “background” and chemicals based on risk), or if necessary, cleanup based on the Cleanup to Revised LUT Values Alternative. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information.

DOE’s assumptions in the EIS about truck traffic in the SSFL vicinity are based on a Transportation Agreement between DOE, NASA, and Boeing that limits the total number of heavy-duty truck loads departing SSFL from DOE, NASA, and Boeing activities to 96 trucks per day (Boeing 2015a). After consideration of budget and operational constraints, DOE has incorporated a more realistic estimate of 16 truck round trips per day on Woolsey Canyon Road for DOE soil removal activities. The impacts of this reduction in truck traffic has been incorporated into the analysis of all three of the soil remediation action alternatives. This change would reduce the daily and annual risks and other environmental impacts, however, it would not reduce the overall risks or impacts determined for an alternative but would only spread them over a longer period of time.

Section 3 – Public Comments and DOE Responses

Resource Area	Alternatives			
	Soil No Action	Cleanup to AOC LUT Values	Cleanup to Revised LUT Values	Conservation of Natural Resources
Human health	<p>Workers</p> <p>Estimated exposures from monitoring and maintenance activities would be prevented from elevated and radionuclide exposure and potential health through respiratory with DOE implemented the worker safety and radiation protection.</p> <p>Valley Area:</p> <p>There would be no change in the risk of exposure to the flight support field from these three alternatives.</p> <p>Members of the public:</p> <p>Hypothetical Outer Suburban Resident - Cause risk and radionuclide exposure from elevated soil in the residential area of the SSFL site comparable to or less than those determined for background soil.</p> <p>Hypothetical Outer Suburban User - Cause risk and radionuclide exposure from elevated soil in the residential area of the SSFL site comparable to or less than those determined for background soil.</p>	<p>Workers</p> <p>Exposure would be higher than those under the No Action Alternative during 10 years of soil remediation. Radionuclide workers would be prevented from elevated and radionuclide exposure through respiratory with DOE implemented the worker safety and radiation protection. Radionuclide protection practices would be employed on that radionuclide sites see ALARA.</p> <p>Valley Area:</p> <p>This proposal the exposure of workers and the public to higher gamma would be reduced to levels that would be similar to the No Action Alternative because of the removal of soil that would be elevated 90,000 pCi/m² (rad).</p> <p>Members of the public:</p> <p>Classified and radionuclide exposed soil exceeding AOC LUT values would be removed. Therefore, risks to a hypothetical outer suburban resident or occasional user would be less than those under the No Action Alternative.</p>	<p>Workers</p> <p>The duration of higher exposures would be 2 years. Workers would have less exposure to radionuclides compared to those under the Cleanup to AOC LUT Values Alternative, exposure to radionuclides would be the same as under the Cleanup to AOC LUT Values Alternative.</p> <p>Valley Area:</p> <p>The potential for exposure of workers and the public to higher gamma would be reduced to levels that would be similar to the No Action Alternative because of the removal of soil that would be elevated 114,500 pCi/m² (rad).</p> <p>Members of the public:</p> <p>Classified and radionuclide exposed soil exceeding risk assessment based values would be removed. Therefore, risks to a hypothetical outer suburban resident or occasional user would be less than those under the No Action Alternative. Less areas than those under the Cleanup to AOC LUT Values or Cleanup to Revised LUT Values Alternative.</p>	<p>Workers</p> <p>The duration of higher exposures would be 2 years. Workers would have less exposure to radionuclides compared to those under the Cleanup to AOC LUT Values Alternative. Radionuclide protection practices would be the same as under the Cleanup to AOC LUT Values Alternative.</p> <p>Valley Area:</p> <p>The potential for exposure of workers and the public to higher gamma would be reduced to levels that would be similar to the No Action Alternative because of the removal of soil that would be elevated 114,500 pCi/m² (rad).</p> <p>Members of the public:</p> <p>Classified and radionuclide exposed soil exceeding risk assessment based values would be removed. Therefore, risks to a hypothetical outer suburban resident or occasional user would be less than those under the No Action Alternative. Less areas than those under the Cleanup to AOC LUT Values or Cleanup to Revised LUT Values Alternative.</p>

Commenter No. 168 (cont'd): Christine Rowe

DOE AREA IV and NBZ cleanup map based on AOC LUT Values – I support the language to NASA from the Federal EPA regarding cleaning up the radionuclides to “Background” and the chemicals based upon risk. The EPA does not emphasize the term “Background or detect” as per the AOC. Therefore, I would support the “Background” for Radionuclides found at the Background site at their highest levels – i.e.. “true local Background” or cleaning up the radionuclides that are naturally occurring on site to Risk based screening levels.

168-12

Response side of this page intentionally left blank.

Commenter No. 168 (cont'd): Christine Rowe

Soil Remediation Alternatives per the DOE EIS – The DOE did not present an alternative which specifically addresses the 2007 Consent Order or the recommendations by the EPA to NASA. Therefore, my recommendations are as above, or if necessary, would be to state that the Cleanup to the Revised LUT Values would be more protective of human health for the future user. However, to protect the residents offsite today, I recommend extending the cleanup time for all three parties by limiting the number of trucks to 50 per day. This would reduce the air particulate matter over the site which has a potential to blow off. It would also reduce truck emissions.

168-12

Commenter No. 168 (cont'd): Christine Rowe

Waste disposal facilities from the DOE DEIS – Why are we removing non hazardous waste? We are taking a local problem and adding to the “Pollution Burden” of other communities, and our trucks will travel through Environmental Justice communities or in some cases – to their end point – in Environmental Justice communities such as Buttonwillow. DTSC should be requiring a cleanup based on risk due to SB 535 requirements.
<http://oehha.maps.arcgis.com/apps/Viewer/index.html?appid=dae2fb1e42674c12a04a2b302a080598>

Table 4-68 Summary of Waste Disposal Capacities

Disposal Facility	Location	Waste Accepted	Available or Projected Waste Capacity	Projected Waste Acceptance Limit
Auriferous Values	Palmdale, CA	Nonhazardous	20.01 million cubic yards as of February 2013.	2,504 tons per day
Chiquita Canyon	Carson, CA	Nonhazardous	96 million cubic yards as of May 2014.	6,500 tons per day
Mosquito *	El Centro, CA	Nonhazardous	600 million tons of projected capacity	30,000 tons per day *
McGrath	McGrath, CA	Nonhazardous	About 2.5 million cubic yards of disposal capacity	4,000 tons per day
Buttonwillow	Buttonwillow, CA	Hazardous *	Projected capacity is greater than 10 million cubic yards	10,500 tons per day
Westwoodland	Westwoodland, CA	Hazardous *	Design capacity is 5 million cubic yards *	442,000 cubic yards per year
US Ecology in Idaho **	Genoa View, ID	Hazardous	1.5 million cubic yards as of May 2014, with 10 million cubic yards permitted; 20 million cubic yards are cited for future expansion	250 daily to annual limit *
EnergySolutions * at Utah	Chee, UT	LLW/MLLW	Current capacity is greater than 8 million cubic yards; additional capacity would be available subject to licensing or permitting	250 daily to annual limit *
NNSS *	Nye County, NV	LLW/MLLW	237,000 cubic yards as of April 2014, up to 1,950,000 cubic yards of projected capacity *	No daily to annual limit *

CA = California; ID = Idaho; LLW = low-level radioactive waste; MLLW = mixed low-level radioactive waste; NVSS = Nevada National Security Site; NV = Nevada; UT = Utah.
 * Waste delivery under both the truck option and truck/and option (see Section 4.3.1).
 † The indicated limit is for combined truck and waste delivery. The truck-only delivery limit is 1,000 tons per day from Imperial County generators and 4,000 tons per day from Los Angeles County generators. The Mosquito Regional Landfill is not currently accepting waste for disposal.
 ‡ The Buttonwillow and Westwoodland Landfills are also evaluated for disposal of nonhazardous soil generated under the soil remediation alternatives.
 § The Westwoodland facility is currently not accepting waste due to low demand in the California market, but could accept waste in the future if market conditions improve.
 ¶ Waste delivery under both the truck option and truck/and option (see Section 4.3.1).
 †† Only waste determined to be only hazardous would be sent to US Ecology in Idaho.
 ††† There are no permitted daily or annual limits on waste acceptance, limitations on waste acceptance would depend on logistical concerns – that is, the availability of sufficient personnel, equipment, and space to receive disposal units to address the quantity of waste to be received.
 †††† The available volume (237,000 cubic yards) is the capacity in currently constructed disposal units. In DOE's December 30, 2014, Record of Decision (79 Federal Register [FR] 76421) for the Final Site-Specific Environmental Impact Statement for the Continued Operation of the Department of Energy National Nuclear Security Administration Nevada National Security Site and Office of Nevada (DOE 2013b), DOE decided to dispose of up to 48 million cubic feet (1.3 million cubic yards) of DOE LLW and 4 million cubic feet (110,000 cubic yards) of DOE MLLW at NNSS. Additional disposal units will be developed at NNSS consistent with the Record of Decision.
 Note: Data derived from Chapter 3, Section 3.10.

168-13

168-13

As described in Chapter 2 of this Final EIS, only the Cleanup to AOC LUT Values Alternative for soil remediation transports significant quantities of what would be termed nonhazardous waste offsite, which is soil with the presence of some contaminants above background, but below any risk-based levels. This alternative incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. In addition, DOE evaluates two action alternatives for soil remediation, the Cleanup to Revised LUT Values Alternative and the Conservation of Natural Resources Alternative, which consider risks to human health and protection of natural resources to determine cleanup levels. The nonhazardous soil would not put any community at risk. All communities along the transportation route would be subject to the impacts from truck traffic, but as indicated in Chapter 4, Section 4.13.1, there would be not disproportionately high impacts to low-income or minority communities.

Conclusions

- It is obvious that DTSC and the DOE cannot achieve the 2017 deadline set out in the 2007 Consent Order.
- DTSC should be renegotiating the 2007 Consent Order based on risks to the community offsite from the cleanup, based on the use of water, based on the need for clean engines for trucks – 2019 or later models, based on the risk of too many trucks traveling up and down Woolsey Canyon Road at the same time.
- DTSC should be working with all three parties and the other applicable agencies such as the CHP and the DOT regarding the best route to ship the radioactive waste which should go to the Nevada test site.
- No radioactive waste should go on trains per discussion in the DOE DEIS Transportation Chapter.
- All waste should go to the closest landfills possible to reduce emissions and the risk of truck accidents.
- And DTSC must consider the land fill capacities and therefore the risks to those communities from taking waste related to this site and other State mandated cleanups.

168-14

168-15

168-16

168-17

168-18

168-14 Thank you for your comment. Renegotiating the 2007 Consent Order is outside the scope of this Final EIS. Because the comment/statement is not on the scope or content of this EIS, no response is provided. It has been included in the Administrative Record for the EIS.

168-15 Radioactively contaminated waste would be disposed of at a commercial site or the Nevada National Security Site (formerly, the Nevada Test Site) in Nevada. Regardless of the disposal site, the selected routes would be those approved by DOT for hazardous material shipments. DOE would comply with all permitting and notification requirements for transport of radioactive waste and would coordinate with other involved parties as appropriate.

168-16 Transport of radioactive waste by rail is a reasonable option considered in this Final EIS. Use of rail for transport of radioactive waste would depend on a number of factors, including the capabilities of the receiving facility. Because SSFL does not have a direct rail connection, another factor would be the distance to and availability of an intermodal facility with appropriate features. The intermodal facility should have the infrastructure and security for the extended trans-loading of wastes from trucks to railcars. The use of a representative intermodal facility about 50 miles from SSFL was analyzed in this EIS.

168-17 This Final EIS evaluates multiple potential disposal locations for transportation risk assessment purposes. This evaluation provides flexibility in the selection of future disposal locations that are within the ranges evaluated in the EIS. A number of factors will be considered in selecting disposal locations, including environmental impacts, cost, and disposal facility capacity.

168-18 This Final EIS evaluates the potential impacts from transporting each type of waste under each alternative and combination of action alternatives to multiple representative disposal facilities. Included is an evaluation of the impacts of transporting nonhazardous waste (the waste to be generated in the largest volumes for all soil remediation alternatives) to four different nonhazardous waste disposal facilities. For wastes generated by DOE at Area IV of SSFL, Chapter 4, Section 4.10, of this EIS evaluates the impacts on the disposal capacities of each evaluated facility for all EIS alternatives and all combinations of action alternatives. Other EIS sections evaluate other impacts due to waste shipments, including shipments to landfills. For example, Section 4.6 addresses air emissions of pollutants during waste transport, Section 4.8 evaluates the radiological and non-radiological risks from transporting the wastes to the disposal facilities, and Sections 4.12, 4.13, and 4.14 evaluate, respectively, potential

Commenter No. 168 (cont'd): Christine Rowe

socioeconomic impacts, environmental justice impacts, and impacts to sensitive-aged individuals in the vicinities of the disposal facilities. Chapter 5, "Cumulative Impacts," of this EIS includes an analysis of the potential impacts on disposal facility capacities from all wastes generated at SSFL by DOE, NASA, and Boeing.

For purpose of analysis, DOE assumed that all of each type of waste would be shipped to a single disposal facility authorized for that type of waste; in no case did the waste projected for generation from SSFL exceed the capacity of any of the evaluated disposal facilities. In one case and assuming the Cleanup to AOC LUT Values Alternative, the projected waste represented 33 percent of the facility capacity, and the next highest impact on capacity at another facility was less than 6 percent. Nonetheless, DOE recognizes that any disposal facility may receive wastes from multiple sources, including waste from State-mandated remediation efforts. This Final EIS notes that potential impacts on capacity at a given disposal facility may be alleviated by use of multiple disposal facilities (see Chapter 4, Section 4.10.4). Similarly, potential impacts from increased local traffic at a disposal facility, may be alleviated by transporting wastes to multiple disposal facilities, by using multiple routes (as available) for delivery to individual facilities, or by using a combination of truck and rail transport if the disposal facility is rail-accessible (see Chapter 4, Section 4.10.4). The EIS also notes in Chapter 7, Section 7.3, that up to 718,000 cubic yards of nonradiological, nonhazardous waste would be generated by DOE activities with chemical concentrations below risk-based levels (but above AOC LUT values under the Cleanup to AOC LUT Values Alternative). Disposal of this waste in regulated waste landfills would use disposal capacity that could otherwise accept waste with larger levels of chemical contamination.

Commenter No. 169: Christine Rowe

From: Christine Rowe
To: [Jennings, Stephanie](#)

[DOE SSEL DOE DEIS Comments Power Point 2 Christine L. Rowe April 13 2017.pdf](#)

Dear Ms. Jennings,

Attached is my second power point for my comments on the DOE Draft Environmental Impact Statement.

Due to the time, I am submitting what I can to meet your deadline.

Respectfully submitted,

Christine L. Rowe

Response side of this page intentionally left blank.

Commenter No. 169 (cont'd): Christine Rowe

**DEPARTMENT OF ENERGY SANTA
SUSANA FIELD LABORATORY DRAFT
ENVIRONMENTAL IMPACT
STATEMENT
APRIL 13, 2017**

**POWER POINT TWO
COMMENTS by
CHRISTINE L. ROWE
B.S. in Health Education - CSUN**

Response side of this page intentionally left blank.

PURPOSE AND NEED

- 1) The purpose and need of this Power Point is to address potential impacts to the residents surrounding the Santa Susana Field Laboratory site based upon potential airborne contaminants that could be released due to excavation and with backfill.
- 2) A second purpose is to address the potential effects of the trucks trips to the proposed landfill locations based on Tables and other references in the Department of Energy's Draft Environmental Impact Statement (DOE DEIS).
- 3) The third purpose of this presentation is to show the existing "Pollution Burden" at the Santa Susana Field Laboratory (SSFL) site, in the surrounding communities, and along the truck routes to the landfills, and at the landfill locations that are referenced in the DEIS.
- 4) The fourth purpose is to show other potential causes of illness in my community based on my research using a tool from the California Office of Environmental Health Hazard Assessment (OEHHA), an agency that I believe that the DOE should have noticed, but I do not believe that the DOE did so based on Chapter 14 of the DEIS.

169-1

169-1 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

169-2

169-2 Thank you for your comment. It has been included in the Administrative Record for the EIS.

169-3

169-3 Thank you for your comment. It has been included in the Administrative Record for the EIS. Regarding distribution of the Draft EIS, DOE provided copies to the State of California clearinghouse who distributed it to the appropriate State agencies. Also as shown in Chapter 14 of the DEIS, the DEIS was distributed to Cal EPA and the California Office of Environmental Health Hazard Assessment (OEHHA) is a department of that agency. As shown in Chapter 14 of the DEIS, the DEIS also was distributed to the DTSC, a sister agency of OEHHA.

Commenter No. 169 (cont'd): Christine Rowe

Preliminary Estimated Soil Volumes for Transportation

Draft Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory

Table S-3 Preliminary Estimated Soil Volumes for Transportation

Soil Category	Soil Chemical / Radionuclide Classifications	Soil Volumes (cubic yards)
1	Chemicals above AOC LUT values, but below risk-based levels and hazardous waste standards; Radionuclides at or below AOC LUT values	44,000
2	Chemicals above risk-based levels, but below hazardous waste standards; Radionuclides at or below AOC LUT values	52,000
3	Chemicals above hazardous waste standards; Radionuclides at or below AOC LUT values*	49,000
4	Chemicals above AOC LUT values, but below risk-based levels and hazardous waste standards; Radionuclides above AOC LUT values, but below risk-based levels	44,000
5	Chemicals above risk-based levels that may be a hazardous waste; Radionuclides above AOC LUT values*	44,000
6	Chemicals at or below AOC LUT values; Radionuclides above risk-based levels	3,000
Total		933,000

AOC = Administrative Order as Cited for Remedial Action; LUT = Look Up Table
 * A total of 93,000 cubic yards of soil, with and without radionuclides, is estimated to exceed chemical hazardous waste standards.
 † Note: The total does not equal the sum of the individual sources due to rounding.

In accordance with the 2010 AOC, following soil removal, cleanup would be verified by DTSC for chemicals and EPA for radionuclides before backfilling of the excavated areas would start. The verification process would involve collection of confirmatory samples following soil removal, analysis of the samples for constituents of concern, and transmission of the data to the agencies for their review. This verification process could take up to 6 weeks following soil removal.

Response side of this page intentionally left blank.

Air Quality Impacts under the Soil Remediation Alternatives

4.6.1 Soil Remediation Alternatives

Impacts under the soil remediation alternatives are summarized and compared in Table 4-30.

Table 4-30 Air Quality Impacts under the Soil Remediation Alternatives

Resource	Soil No Action Alternative	Soil Remediation Action Alternatives		
		Cleanup to AOC/LUT Values	Cleanup to Revised LUT Values	Conservation of Natural Resources
Air quality	No additional emissions compared to existing conditions	Emissions of pollutants such as VOCs, CO, NOx, SO ₂ , and particulate from onsite activities. Nearly all particulate emissions arise from fugitive dust. Additional emissions would occur from on-road vehicles, including those for transporting waste and backfill.	Emissions of the same types of pollutants as those under the Cleanup to AOC/LUT Values Alternative, but in smaller total quantities.	Emissions of the same types of pollutants as those under the Cleanup to Revised LUT Values Alternative, but in smaller total quantities.
Greenhouse gases	No additional emissions compared to existing conditions	A total of 25,000 to 84,000 metric tons of CO ₂ would be emitted, primarily from vehicles.*	A total of 12,000 to 33,000 metric tons of CO ₂ would be emitted, primarily from vehicles.*	A total of 7,700 to 24,000 metric tons of CO ₂ would be emitted, primarily from vehicles.*

AOC = Administrator Order as Consent for Remedial Action, CO = carbon monoxide, CO₂ = carbon dioxide, LUT = Look-Up Table, NOx = nitrogen oxides, SO₂ = sulfur dioxide, VOC = volatile organic compound

* The range in CO₂ emissions reflects differences in emissions under the nearby and distant disposal site scenarios.

Response side of this page intentionally left blank.

Summary of Waste Disposal Capacities

Table 4-45 Summary of Waste Disposal Capacities

Disposal Facility	Location	Waste Accepted	Available or Projected Waste Capacity	Projected Waste Acceptance Limit
Amigo Valley	Petaluma, CA	Non-hazardous	230 million cubic yards as of February 2013	1,544 tons per day
Chaparral Central	Contra Costa, CA	Non-hazardous	90 million cubic yards as of May 2014	4,500 tons per day
Marques	El Cerrito, CA	Non-hazardous	400 million tons of projected capacity	20,000 tons per day ^a
MLC/Cons	San Rafael, CA	Non-hazardous	allows 1.5 million cubic yards of disposal capacity	4,000 tons per day
Primm/Holmes	Primm/Holmes, CA	Hazardous	Projected capacity is greater than 10 million cubic yards	10,000 tons per day
Whittowood	Whittowood, CA	Hazardous	Design capacity is 1 million cubic yards ^b	940,000 cubic yards per year
US Ecology in Maine ^c	Greenfield, VT	Hazardous	1.3 million cubic yards as of May 2014 with 10 million cubic yards projected. 20 million cubic yards are under the final agreement.	No daily or annual limit ^d
EnergySolutions in Utah	Clive, UT	LLW/MILW	Contract capacity is greater than 8 million cubic yards, additional capacity would be available subject to pricing to permitting.	No daily or annual limit ^e
NNSS ^f	Stow, Nevada, NV	LLW/MILW	23,000 cubic yards as of April 2014, up to 1,000,000 cubic yards of projected capacity ^g	No daily or annual limit ^h

CA = California; ID = Idaho; LLW = low-level radioactive waste; MILW = mixed low-level radioactive waste; NNSS = Nevada National Security Site; NV = Nevada; UT = Utah

^a Waste delivery rates for mixed and special waste only (see Section 4.8.1).

^b The authorized limit is the maximum level and not waste delivery. The truck-rail delivery limit is 1,000 tons per day from Ingersoll. Current processing and 4,000 tons per day from Los Angeles County operations. The MLC/Cons Regional Landfill is not treating accepting waste for disposal.

^c The Brentwood and Whittowood Landfills are also evaluated for disposal of non-hazardous soil generated under the soil installation alternatives.

^d The Whittowood facility is presently not accepting waste due to low demand in the California market, but could accept waste in the future if market conditions improve.

^e Waste delivery under both the mixed and special waste options (see Section 4.8.1).

^f Only waste determined to be safe for transport would be sent to US Ecology in Idaho.

^g There are no projected daily or annual limits in waste acceptance. Submitted low waste acceptance would depend on logistical concerns – that is, the availability of sufficient processing, equipment, and space to move disposal units to within the quantity of waste to be accepted.

^h The annual volume (237,000 cubic yards) is the capacity in transfer containers for disposal units. In DOE's December 16, 2014 Report of Progress ("90 Percent Report" [90] 1641) for the Final Site Environmental Impact Statement for the Ground Disposal of the Department of Energy's "Special Nuclear Waste" (Special Nuclear Waste) (Final EIS) (EIS-04-010) (EIS-04-010) (DOE-01-10), DOE described its disposal of up to 48 million cubic feet (1.5 million cubic yards) of DOE LLW and 4 million cubic feet (100,000 cubic yards) of DOE MILW at NNSS. Additional disposal units will be developed at NNSS consistent with the Record of Decision.

Note: Data derived from Chapter 3, Section 3.10.

Commenter No. 169 (cont'd): Christine Rowe

This page from Chapter 4 page 89 states that: "Under the nearby disposal site scenario, nitrogen oxides emissions would be smaller than the most restrictive indicator threshold (10 tons per year) under the combination of the Cleanup to AOC LUT Values, Building Removal, and Groundwater Treatment Alternatives (2.7 tons per year), but larger than this threshold under the combination of the Cleanup to Revised LUT Values, Building Removal, and Groundwater Treatment Alternatives (12 tons per year)." It is my opinion that this is because the 1st Alternative is extended over 10 years v 2.5 years for the second alternative. This justifies reducing the truck frequency to 50 per day for all three parties in my opinion to a five year cleanup for Alternative 2.

169-4

Chapter 4 – Environmental Consequences

Except for nitrogen oxides, none of the evaluated pollutants would exceed the indicator emission thresholds in any of the evaluated domains outside Ventura County and the South Coast Air Basin under either the nearby or distant disposal site scenario. As shown in Table 4-38, the indicator emission thresholds assumed for these domains range from 10 to 250 tons per year. Under the nearby disposal site scenario, nitrogen oxides emissions would be smaller than the most restrictive indicator emission threshold (10 tons per year) under the combination of the Cleanup to AOC LUT Values, Building Removal, and Groundwater Treatment Alternatives (2.7 tons per year), but larger than this threshold under the combination of the Cleanup to Revised LUT Values, Building Removal, and Groundwater Treatment Alternatives (12 tons per year). Under the distant disposal site scenario, nitrogen oxides emissions would be smaller than the most restrictive indicator emission threshold (25 tons per year) under the combination of the Cleanup to AOC LUT Values, Building Removal, and Groundwater Treatment Alternatives (14 tons per year), but larger than this threshold under the combination of the Cleanup to Revised LUT Values, Building Removal, and Groundwater Treatment Alternatives (51 tons per year).

To define the worst case indicator emission thresholds for the regions outside of Ventura County and the South Coast Air Basin, the most degraded air quality conditions were assumed for any area where trucks would travel between SSFL and offsite disposal facilities. Hence, the worst-case air quality conditions for the domains traversed by trucks to nearby (Batonwillow Landfill) and distant (EnergySolutions in Utah or US Ecology in Idaho) disposal sites occur within the San Joaquin Valley Air Basin and the Mojave Desert Air Basin. The worst-case indicator emission thresholds for nitrogen oxides in these two air basins are 10 and 25 tons per year, respectively. As identified above, under two of the three combinations of action alternatives, peak annual emissions generated by all truck travel between SSFL and either the nearby or distant disposal site location would exceed these worst-case nitrogen oxides emission thresholds. However, haul truck outages occur solely within the San Joaquin Valley Air Basin and Mojave Desert Air Basin would cause emissions that would remain below their applicable nitrogen oxides emission thresholds. Haul truck outages occur within all other air basins also would cause emissions that would remain below their applicable nitrogen oxides emission thresholds (100 or 250 tons per year).

169-4 The comment refers to the Draft EIS air quality analyses performed for the domain outside of Ventura County and the South Coast Air Basin. The differences in peak annual emissions between each cleanup scenario within this analysis domain are not due to averaging the total emissions for each scenario by the number of years needed to complete each scenario, but instead are due to the annual miles travelled by haul trucks under each scenario. For example, during the peak year of activities, all three Alternatives proposed excavating and transporting the same volumes of soils. The Cleanup to Revised LUT Values and Conservation of Natural Resources Alternatives proposed excavation of about 5 times the volume of soils in categories 4-6 versus the AOC LUT Values Alternative during the peak year. Seventy-nine percent of the soils excavated under the Cleanup to AOC LUT Values Alternative would have been categories 1-2 soils. Within the domain beyond Ventura County and the South Coast Air Basin, the round trip distance travelled by a haul truck to a proposed nearby disposal facility is 460 miles for soils in categories 4-6 versus 0 miles for soils in categories 1 and 2. Therefore, under the Draft EIS scenarios, the Cleanup to Revised LUT Values and Conservation of Natural Resources Alternatives would have produced greater peak annual miles travelled by haul trucks and corresponding higher air emissions within this domain compared to the Cleanup to AOC LUT Values Alternative.

Due to the revisions to the descriptions of soil remediation alternatives in the Final EIS, both the Cleanup to AOC LUT Values and Revised Cleanup to LUT Values Alternatives would remove the same amounts of soils in a peak year and therefore would generate equal amounts of emissions during this period. Chapter 4, Section 4.6.1 of this Final EIS is revised to explain how annual emissions generated by the soil remediation alternatives are dependent on the types of remediated soils and the associated disposal locations for these soils. In the Final SSFL Area IV EIS air emissions calculation document (Leidos 2018b), Table 1.A-12 (Total On-Road Vehicle Activity Data for Soil Remediation Cleanup to AOC LUT Values - SSFL Area IV EIS) also presents the round trip distances travelled by haul trucks between the SSFL and proposed disposal facilities for each soil category and analysis domain.

What is CalEnviroScreen?

About CalEnviroScreen

CalEnviroScreen 3.0
FAQ's
Meetings, Workshops, Webinars
Contact CalEnviroScreen

What is CalEnviroScreen?

- CalEnviroScreen is a mapping tool that helps identify California communities that are most affected by many sources of pollution, and where people are often especially vulnerable to pollution's effects.
- CalEnviroScreen uses environmental, health, and socioeconomic information to produce scores for every census tract in the state.
- The scores are mapped so that different communities can be compared. An area with a high score is one that experiences a much higher pollution burden than areas with low scores.
- CalEnviroScreen ranks communities based on data that are available from state and federal government sources.

Response side of this page intentionally left blank.

Commenter No. 169 (cont'd): Christine Rowe

**What are cumulative impacts?
What is Environmental Justice?**

What are cumulative impacts?

- "Cumulative impacts" means exposures and public health or environmental effects from all sources of pollution in a geographic area.
- Cumulative impacts also take into account groups of people that are especially sensitive to pollution's effects, such as young children and people with asthma, and socioeconomic factors, such as poverty, race and ethnicity, and education.
- For CalEPA's definition of cumulative impacts, see the CalEnviroScreen 3.0 report.

What is Environmental Justice?

- State law defines environmental justice to mean "the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation and enforcement of environmental laws, regulations, and policies."
- Environmental justice principles are an important part of CalEPA's goal to restore, protect and improve the environment, and to ensure the health of people, the environment and the economy.
- CalEPA asked OEHHA to develop CalEnviroScreen to identify communities suffering from cumulative impacts of multiple pollutants and people who are vulnerable to pollution's effects.
- Visit CalEPA's Environmental Justice Program page here: [http://www.cal EPA.gov/EnvironmentalJustice](#)

169-5

169-5

As described in Chapter 5, Section 5.1, of this EIS, the "Council on Environmental Quality Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act" (40 CFR Parts 1500-1508) states: "Cumulative impact is the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions, regardless of what agency (Federal or non-Federal) or person undertakes such other actions" (40 CFR 1508.7). Cumulative human health impacts for a post-remediation onsite resident or recreational user from DOE, NASA, and Boeing remediation activities were addressed in Chapter 5, Section 5.5.9 of the Draft EIS. Cumulative human health impacts for the offsite public were added to Section 5.5.9 of this Final EIS. Human health impacts consider exposure to sensitive receptors. Cumulative environmental justice impacts are evaluated in Section 5.5.13. Cumulative impacts on sensitive-aged populations are evaluated in Section 5.5.14.

169-6

169-6

Environmental Justice is similarly defined in Chapter 5, Section 5.5.13, of this EIS. Cumulative environmental justice impacts are evaluated in Section 5.5.13. Cumulative impacts on sensitive-aged populations are evaluated in Section 5.5.14.

Environmental Justice

- It is my opinion in the DOE DEIS, the DOE is taking the position that there are no Environmental Justice impacts because the proposed truck routes go through various routes, through the communities of various socioeconomic status, etc., and therefore, this cleanup by the DOE did not have to address Environmental Justice issues.
- Due to the length of the document, and due to its organization, there was no way for me to search the document in its entirety – over 1500 pages. If Environmental Justice issues were addressed, I apologize.
- That being said, the following slides will address the complex issues – the environmental impacts in the communities surrounding the SSFL site, on the truck routes, and at the end destination areas for some of the landfills in California.

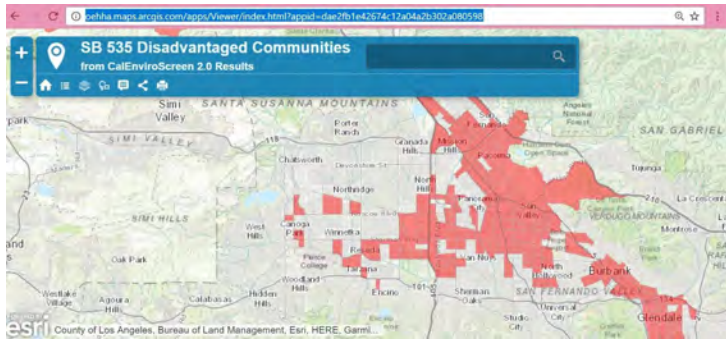

169-7

169-7

Environmental justice issues arise from decisions that disproportionately impact a minority/low income community over another one. In Section 4.13 of the EIS, DOE did evaluate environmental justice impacts in the SSFL vicinity (human health and traffic) and in the vicinities of the evaluated disposal and recycle facilities (traffic). No disproportionately high and adverse impacts were identified in the SSFL region and the regions of the disposal or recycle facilities. It was noted, however, for traffic impacts in the SSFL vicinity that traffic volumes on the evaluated roads, other than Woolsey Canyon Road, could be reduced by using multiple routes to major highway systems. For traffic impacts in the vicinities of the disposal or recycle facilities, impacts at any single facility could be reduced if multiple facilities were used, if multiple routes (as available) were used in the vicinities of individual facilities, or if wastes were shipped to one or more rail-accessible facilities.

Commenter No. 169 (cont'd): Christine Rowe

This map shows the California SB 535 Disadvantaged Communities in the West San Fernando Valley including the Canoga Park Area – which is part of your proposed haul route.

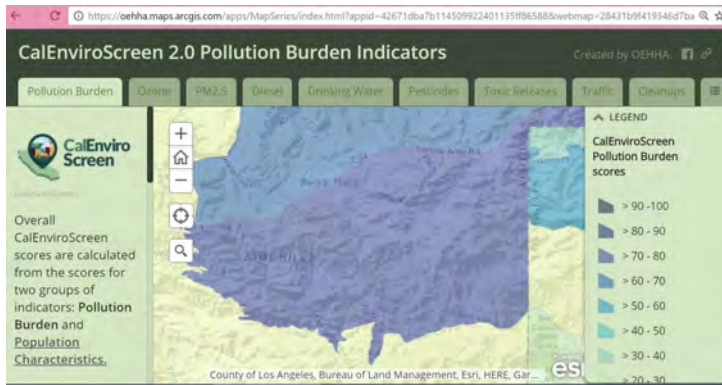

169-8

169-8

DOE compared the information on the map provided in the comment with that in Chapter 3, Section 3.13, of this EIS. The map shows one census tract identified as an SB 535 Disadvantaged Community that abuts one of the proposed transportation routes. As indicated on both the Draft and Final EIS Table 3-43 (census tract 1343.05), this community was identified as a minority community.

Commenter No. 169 (cont'd): Christine Rowe

This map shows the majority of the SSFL site in one census tract to the south – its total pollution burden is high.

169-9

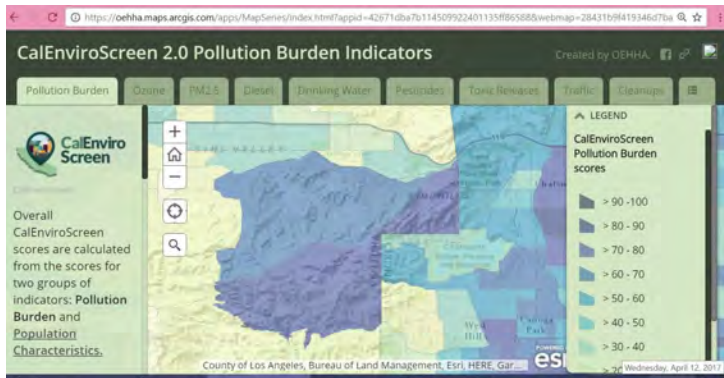

169-9

The CalEnviroScreen website is not maintained or endorsed by DOE. The completion of remediation of SSFL Area IV and the NBZ by DOE, and remediation of other portions of SSFL by NASA and Boeing, should serve to lower the pollution burden score for the census tracts that include SSFL.

Commenter No. 169 (cont'd): Christine Rowe

This screen shot shows the total pollution burden scores surrounding the SSFL site.

Commenter No. 169 (cont'd): Christine Rowe

Pollution Burden Buttonwillow, CA – one of the proposed destinations for a landfill – a Pollution Burden Score of 92 out of 100

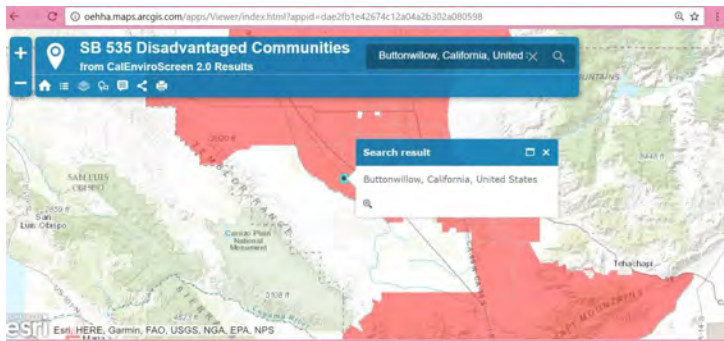

169-9
cont'd

Response side of this page intentionally left blank.

Commenter No. 169 (cont'd): Christine Rowe

Buttonwillow, CA is a SB 535 Disadvantaged Community – therefore, DTSC must, in my opinion, minimize the waste that is sent to this landfill which is, I believe, is the closest landfill to take hazardous waste.

169-10

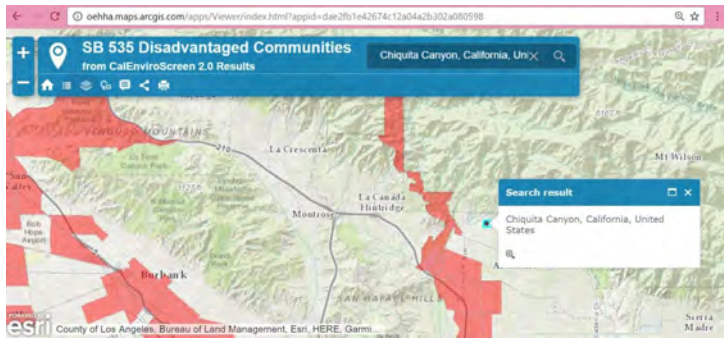

169-10

As discussed in the response to comment 169-6, no disproportionately high and adverse impacts were identified for any minority or low-income community at any of the representative facilities evaluated for receipt of waste from SSFL. The environmental justice analysis in Chapter 4, Section 4.13 of this Final EIS considered the potential impacts at both the Chiquita Canyon and Buttonwillow Landfills. Section 4.13 (e.g., Sections 4.13.1.2 and 4.13.4.2) also point out that the number of truck deliveries to any single facility (and thus the potential for impacts on any community in the vicinity of a facility) could be reduced if multiple facilities were used, if multiple routes (as available) were used in the vicinities of individual facilities, or if waste were shipped to one or more rail-accessible facilities. No decision has been made as to the actual facilities DOE would use for disposal of soils. DOE will consider potential community impacts in that decision.

Commenter No. 169 (cont'd): Christine Rowe

Another landfill – Chiquita Canyon, CA – Close to an SB 535 Disadvantaged Communities location

169-10
cont'd

Response side of this page intentionally left blank.

Commenter No. 169 (cont'd): Christine Rowe

What are the points that I am trying to make with this presentation?

- 1) Due to time constraints – I have to submit this by midnight today – I will have to send a second half of this presentation after midnight which may not be accepted as on time.
- 2) My point, is that we must consider the fact that we live in a highly contaminated environment both in terms of air quality and water quality.
- 3) The cleanup plans for the SSFL site must be based on the risk of the potential migration of toxic contaminants to the groundwater, to the surface water, and to the air – our pathways of exposure.

169-11

169-11 Cumulative impacts from DOE, NASA, and Boeing remediation activities and from other past, present, and future activities in the Region of Influence, are evaluated in Chapter 5 of this Final EIS. As stated in Chapter 1, Section 1.1 of this EIS, all DOE’s action alternatives would clean up the environment in Area IV and the NBZ in a manner that is protective of the environment and the health and safety of the public and workers. Therefore, completion of remediation activities at SSFL would result in a less contaminated local environment.

169-12

169-12 Please see the response to comment 169-11, and please see Section 2.7, “Offsite Impacts,” of this CRD for a discussion and DOE’s response to concerns about offsite impacts.

**DTSC MUST REQUIRE A RISK BASED CLEANUP FOR ALL
THREE RESPONSIBLE PARTIES**

- 1) DTSC has already been through litigation in relation to SB 990.
- 2) The DOE has already been through litigation because they did an Environmental Assessment instead of an Environmental Impact Statement
- 3) DTSC and CDPH are currently being sued for actions relative to landfills – was something sent to a landfill that did not meet its acceptance criteria?
- 4) And DTSC and CDPH are also being sued because DTSC is accused of releasing Boeing's buildings for demolition which falls under Ventura County's domain.
- 5) I believe there is also litigation because DTSC extended the size of the Kettleman landfill? Therefore, DTSC must be sensitive to the amount of waste that is sent to these landfills.
- 6) DTSC must be aware of SB 535 – Disadvantaged Communities – and the potential impacts of sending large volumes of waste to these locations.

169-13

169-13

Thank you for your comment. Renegotiating the 2007 Consent Order is outside the scope of this EIS. DTSC's policies and actions are not under DOE's control. Because the comment/statement is not on the scope or content of the Draft EIS, no response is provided. It has been included in the Administrative Record for the EIS.

In Conclusion

- **DTSC must renegotiate all of the contracts to the 2007 Consent Order with considerations of the current air quality surrounding the SSFL site, the proposed truck routes, water needs, energy to remediate, Environmental Justice Communities, and all other applicable laws including SB 535.**
- **DTSC should support the reduced truck numbers to 50 per day to reduce emissions and the potential for accidents along Woolsey Canyon Road and other traffic routes.**

169-13
cont'd

169-14

169-14 Thank you for your comments regarding proposed changes for local traffic. They have been included in the Administrative Record for the EIS.

As discussed in Chapter 2, for the Final EIS DOE revised the EIS analysis to reflect a more realistic average of 16 heavy-duty truck round trips per day for soil removal activities, although on some days the number of daily truck shipments could increase to 32. This revision extended the projected time for completion of the soil remediation alternative involving the most heavy-duty truck shipments, the Cleanup to AOC LUT Values Alternative, from the 10 years evaluated in the draft EIS to the 26 years evaluated in the Final EIS. DOE evaluated transport of waste from SSFL down Woolsey Canyon Road, then via multiple local roadways to local freeways. Shipments would occur during daylight hours. The EIS evaluates the potential impacts that could occur during shipment of waste and materials, including those from potential accidents, and found these potential impacts to be very small (also see the response to comment 162-6).

Considering all remediation activities at Area IV and the NBZ (i.e., soil remediation, building removal, and groundwater remediation), daily shipments attributable to DOE remediation activities would not exceed 32 and generally would be considerably less. However, NASA and Boeing could also be making shipments of waste, backfill, and equipment during some of the same years that DOE would be making shipments of waste, backfill, and equipment. As discussed in Chapter 2, Section 2.4.4, of this Final EIS, DOE, NASA, and Boeing have entered into a transportation agreement (Boeing 2015a) through which they would manage the daily number of trucks allowed on Woolsey Canyon Road to no more than 96. The potential cumulative impacts of site remediation by DOE, NASA, and Boeing are evaluated in Chapter 5 of the EIS, including the risks associated with transport of waste and material and the potential impacts on traffic in the SSFL area. DOE expects that daily heavy-duty truck shipments potentially as high as 96 per day from DOE, NASA, and Boeing would only occur for a few years. Note that if the total number of cumulative shipments was reduced from an average of 96 per day to 50 per day, it would reduce the annual emissions of airborne pollutants by the three parties as well as other environmental impacts such as annual water use, but it would not reduce the overall risks or impacts attributable to the projected cumulative operations but would spread them over a longer period of time.

April 13th, 2017

U.S. Department of Energy
4100 Guardian St, Suite 160
Simi Valley, CA 93063

Re: *Draft Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory*

Dear U.S. Department of Energy Representatives,

On behalf of Friends of the Los Angeles River (FoLAR), and the 40,000 supporters we represent across the Greater Los Angeles Region, I write in strong support of the City of Los Angeles position regarding the Draft Environmental Impact Statement for the cleanup of the Santa Susana Field Lab. Specifically, we support the position that:

1. The Environmental Impact Statement should be based on remediation of the Department of Energy's Santa Susana Field Lab site levels stipulated in the Administrative Order of Consent and not include consideration of alternatives that violate this Order.
2. Ineligible exemptions utilized in the Draft Environmental Impact Statement that dramatically increase the risk of cancers should be excluded.
3. Alternate transportation plans should be analyzed that include direct conveyance of contaminated materials from the site to rail and other options including the use of fire roads and routes with less impact to residents and reduced traffic impact.

For over three decades, FoLAR has worked to create an enduring vision for the LA River that acknowledges her importance for the revitalization of both urban ecology and urban communities across Los Angeles County. These efforts are now being supported by federal and local revitalization efforts such as U.S. Army Corps of Engineers ARBOR river-restoration project (ARBOR), and the City of Los Angeles River Revitalization Master Plan (LARRMP).

170-1

170-2

170-3

170-4

170-1 The City of Los Angeles' comments have been reviewed and changes to this Final EIS have been made where appropriate. DOE prepared this EIS to address the cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. The EIS evaluates separate sets of alternatives for the three components of the cleanup project: soil remediation, building demolition, and groundwater remediation. Please refer to "Preferences for an Alternative," and 2.2, "Compliance with the AOC," of this CRD for further discussion. Also, refer to Chapter 2, of this EIS for a description of the alternatives evaluated and a summary of the potential environmental impacts.

170-2 DOE acknowledges your preference for cleanup in accordance with the 2010 AOC. NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The Cleanup to Revised LUT Values Alternative and the Conservation of Natural Resources Alternative would help to meet cleanup objectives by being protective of the environment and health and safety of the public and workers while avoiding some of the technical challenges and potential adverse environmental impacts associated with cleanup to the 2010 AOC LUT values. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

170-3 Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a discussion of this topic and DOE's response. There would be no dramatic difference in the risk of cancer among any of the soil remediation action alternatives (see Chapter 4, Section 4.9 in this Final EIS); each of the action alternatives would be protective of human health and the environment.

These efforts are poised to bring numerous benefits for water resource management, public health, economic development, community revitalization, quality of life, and ecological health to all Angelenos throughout the County.

Situated on the headwaters of one of the major tributaries of the LA River - a keystone area for the Los Angeles River watershed - the cleanup of the Santa Susana Field Lab has the potential to significantly impact our efforts to restore the natural, cultural, and ecological heritage of the LA River.

For this and many other reasons, we strongly urge you to include and implement the City of Los Angeles comments in the Draft Environmental Impact Statement for the cleanup of the Santa Susana Field Lab. We look forward to hearing your response and comments.

Sincerely,

Marissa Christiansen
Executive Director
Friends of the Los Angeles River

170-4 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

**Commenter No. 171: Karen DiBiase, Chair Environmental Committee
and L. Joyce Fletcher, President, Woodland Hills Warner Center
Neighborhood Council**

From: Karen DiBiase
Sent: Thursday, April 13, 2017 6:28 PM
To: Jennings, Stephanie
Cc: Joyce Fletcher; Dennis DiBiase; Albert Saur
Subject: Response to DOE's Draft EIS from Woodland Hills-Warner Center Neighborhood Council
Attachments: NC Environmental Letter DOE EIS BM 3.17 SSFL signed.pdf

Dear Stephanie-

Please see the attached letter from the Woodland Hills-Warner Center Neighborhood Council, dated March 8, 2017.

We unanimously voted to support of a "risk-based" cleanup of Area IV and the Northern Buffer Zone of the SSFL, and do not support the extreme cleanup required by the 2010 Administrative Order of Consent (AOC). We are concerned about the environmental impact and exposure to our community by the hauling presumably toxic soil through our Woodland Hills-Warner Center neighborhoods and business districts.

171-1

The WHWCNC supports the removal of soil that presents a risk to human health, which includes radioactive material. We support the removal of soil and chemicals that are above a risk-based level, and we support clean-up on site where possible in order to reduce the amount of truck-loads affecting our nearby communities and highways. We respectfully request the truck routes avoid our populated areas.

171-2

We look forward to working with you on these issues.
Sincerely,

Karen DiBiase
Member of WHWCNC, Area I
Chair of WHWCNC Environmental Committee

171-1 DOE acknowledges your support for cleanup of soil above a risk-based level, on site clean-up where possible in order to reduce the numbers of truck-loads of soil leaving SSFL, onsite treatment of TCE and PCE plumes, and continuing monitoring of groundwater. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

171-2 As discussed in Chapter 2, for the Final EIS DOE revised the EIS analysis to reflect a more realistic average of 16 heavy-duty truck round trips per day for soil removal activities, although on some days the number of daily truck shipments could increase to 32. This revision extended the projected time for completion of the soil remediation alternative involving the most heavy-duty truck shipments, the Cleanup to AOC LUT Values Alternative, from the 10 years evaluated in the draft EIS to the 26 years evaluated in the Final EIS. DOE evaluated transport of waste from SSFL down Woolsey Canyon Road, then via multiple local roadways to local freeways.

Considering all remediation activities at Area IV and the NBZ (i.e., soil remediation, building removal, and groundwater remediation), daily shipments attributable to DOE remediation activities would not exceed 32 and generally would be considerably less. However, NASA and Boeing could also be making shipments of waste, backfill, and equipment during some of the same years that DOE would be making shipments of waste, backfill, and equipment. As discussed in Chapter 2, Section 2.4.4, of this Final EIS, DOE, NASA, and Boeing have entered into a transportation agreement (Boeing 2015a) through which they would manage the daily number of trucks allowed on Woolsey Canyon Road to no more than 96. The potential cumulative impacts of site remediation by DOE, NASA, and Boeing are evaluated in Chapter 5 of the EIS, including the risks associated with transport of waste and material and the potential impacts on traffic in the SSFL area. DOE expects that daily heavy-duty truck shipments potentially as high as 96 per day from DOE, NASA, and Boeing would only occur for a few years. Note that if the total number of cumulative shipments was reduced from an average of 96 per day to 50 per day, it would reduce the annual emissions of airborne pollutants by the three parties as well as other environmental impacts such as annual water use, but it would not reduce the overall risks or impacts attributable to the projected cumulative operations but would spread them over a longer period of time.

In accordance with the transportation agreement, trucks would depart the site between 6:00 a.m. and 7:00 p.m. Regarding the use of truck routes that avoid populated areas, including routes for trucks transporting radioactive material, DOE and DTSC have determined that Woolsey Canyon Road is the most appropriate route from SSFL.

Simi Valley, CA 93063

Re: Summary of EIS about clean-up of Santa Susana Field Laboratory

Dear Ms. Jennings,

On March 8, 2017, at a publicly held meeting, the Woodland Hills-Warner Center Neighborhood Council voted to approve the following motion with a vote of 18 yes, 0 no, 0 abstain.

Motion: The WHWCNC applauds your decision to consider several methods of "cleaning up" in the EIS for remediation of Area IV and the Northern Buffer Zone of the SSFL, formerly occupied and used by the Atomics International Division of North American Aviation, Inc. We have been concerned and worried about the clean-up that was required under the 2010 Administrative Order of Consent (AOC) which stipulated a clean-up to background and no other clean-up considered. We were concerned about the environmental impact of hauling one million cubic yards of presumably toxic soil through our neighborhoods, past our schools, exposing us and our children to material from the trucks that might be blown off on windy days.

As a neighborhood council of the City of Los Angeles, we reaffirm our position taken in 2015 for a "risk-based" cleanup of the NASA area. Applying the same level of clean-up to Area IV should be considered in order to protect the natural resources, wild life, and neighboring communities from excessive transportation of soil for remediation.

We also support your intention of changing the terms of the AOC to allow the decision to be made on the total environmental impact rather than just one very strict one, "background." We also note that in the draft EIS the statement appears that clean-up to background is practically impossible because various carcinogenic carbon-chlorine and related compounds have migrated far down into the soil and into the ground water of the site. Removal of the contamination is not feasible and the terms of the AOC cannot be carried out.

The WHWCNC supports the removal of soil that presents a risk to human health, which includes radioactive material. We support the removal of soil and chemicals that are above a risk-based level. We support clean-up on site where possible in order to reduce the amount of truck-loads affecting our near-by communities and highways. We support the continuing monitoring of the ground water and the on-site treatment of TCE and PCE plumes.

171-1
cont'd

171-3

171-1
cont'd

(Please see the transportation analysis in the DTSC *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* [DTSC 2017b].) Consequently, it is not possible to avoid all populated areas. Please see Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for further discussion of this subject.

171-3 At this time, DOE has not made any specific cleanup decisions. As discussed in Chapter 2, Section 2.3.3, of this Final EIS, based on the uncertainty regarding whether cleanup based on the 2010 AOC (DTSC 2010) could be implemented, DOE evaluated potential alternatives that, when completed, would leave Area IV and the NBZ in a state that is protective of human health and the environment. DOE consulted applicable regulations and guidance in developing two reasonable alternatives to the Cleanup to 2010 AOC LUT Values Alternative. These alternatives are described in Chapter 2, Section 2.4 of this Final EIS. As described in Section 2.4, DOE expects that implementation of any alternative would require changes to the 2010 AOC. The 2010 AOC allows DOE and DTSC to agree upon changes to the AOC to better meet cleanup objectives.

Commenter No. 171 (cont'd): Karen DiBiase, Chair Environmental Committee and L. Joyce Fletcher, President, Woodland Hills Warner Center Neighborhood Council

We respectfully request that the number of truckloads be kept to a cumulative daily maximum of 50, and to transport material during daylight hours only, for driver safety reasons. We also respectfully request the truckloads of radioactive material travel routes that avoid our populated areas, for public safety reasons.

171-2
cont'd

We also recognize that the decision behind the AOC was a story published in a local newspaper about a serious accident at the SRE nuclear reactor in 1959. The published story compared the accident with an accident at a reactor at Three Mile Island in Pennsylvania several years later. The story was based on reports prepared at the time by employees of Atomics International and published in the open literature. The SRE incident was the result of foreign material getting into the sodium coolant and partially blocking flow in some of the tubes containing fuel rods. Some of the fuel elements were damaged and leaked radioactive material into the sodium coolant. As a result very little radioactive material escaped into the environment. In contrast the Three Mile Island accident involved an unintended lowering of the cooling water in a reactor that was shut down but the fuel elements were still very radioactive. At TMI, the hot fuel elements were exposed to the atmosphere and a large amount of radioactive material was released. The writer of the newspaper article about the SRE didn't understand the difference between the two reactors, one cooled with sodium and one with water.

It is a relief, then, to read the newly proposed summary EIS in which several alternate clean-ups are to be considered. The selection is to be made on considering not only the environment of the SSFL area but also the environment of the residents of Woodland Hill and of communities that surround the former Area IV site. We look forward to seeing the final EIS and the decision as to how to proceed.

171-4

Sincerely yours,

L. Joyce Fletcher, President

Woodland Hills-Warner Center Neighborhood Council

171-4 Thank you for your comment. DOE prepared this Final EIS to address the cleanup of those portions of SSFL for which it is responsible – Area IV and the NBZ. The EIS evaluates separate sets of alternatives for the three components of the cleanup project: soil remediation, building demolition, and groundwater remediation. Please refer to Sections 2.1, “Preferences for Cleanup,” of this CRD for further discussion. Also, refer to Chapter 2 of this EIS for a description of the alternatives evaluated and a summary of the potential environmental impacts.

Information on the selection of alternatives for cleanup of SSFL Area IV and the NBZ will be included in the Record(s) of Decision (ROD[s]) for the EIS. The ROD(s) will follow no sooner than 30-days after publication in the *Federal Register* of the EPA Notice of Availability for this Final EIS. The potential environmental impacts presented in this EIS, along with public input, cost, policy, and other factors, will be considered by decision-makers in selecting alternatives for soil remediation, building demolition, and groundwater remediation for implementation. The ROD(s) will present DOE’s decisions regarding cleanup and describe the factors considered in making those decisions.

Commenter No. 172: Mary Wiesbrook,
Save Open Space Santa Monica Mountains

April 13, 2017

RE: Draft EIS for Remediation of Area IV and Northern Buffer Zone at SSFL

A purpose of NEPA is to present a review of environmental impacts from a proposed project that could foreseeably occur from the proposed projects and present alternatives that would result in less environmental damage. We thank DOE for presenting alternatives cleanup scenarios and their impacts on truckloads, earth, air, and water.

We are concerned about the proposed Biological and Cultural Exemption Areas. Remediation for chemicals and risk assessment for Radionuclides must be done within the Conservation of Natural Resources Exception Areas if there is human health risk. These green hatched marked areas seem overly large. Were these areas determined by Fish and Wildlife and the Native Americans? It is critical that DOE take action in any of these natural resources exemption areas if it is demonstrated that levels of soil constituents are a risk to human health and soil removal is necessary. The RMDf and Plutonium (Plutonium Research) Building areas after building removal need to be sampled and tested. Then this area should be cleaned up per agreed on clean up.

We support Cleanup to Revised Look-Up Table Values Alternative. DOE would remove soil exceeding revised LUT values. Chemical cleanup LUT values would be based on the direct exposure pathways for suburban residential scenario. This document states that Boeing is committed to end use of open space recreational. In clean ups done nationally, this end use of open space recreational does not normally require this strict of a clean-up. What's significant here is that: "The radionuclide LUT values would be the same as for the Cleanup to AOC LUT Values Alternative."

This Cleanup to Revised LUT values will: remove 192,000 cubic yards of soil, use 8.3 million gallons of water, generate truck trips of 23,800 round trip truck trips

P.O. BOX 1284 AGOURA HILLS, CA 91376

172-1

172-2

172-3

172-1 Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a discussion of the methods used to establish the exemption areas. The exemption areas shown in the Draft EIS were developed based upon information available at the time the draft was written and will be modified by completion of the biological and cultural resources consultations. The USFWS has now issued a Biological Opinion (see Appendix J) for remediation of SSFL. This Final EIS reflects the results of the Biological Opinion on applying the biological exemption process to soil cleanup locations in Area IV and the NBZ.

As discussed in Chapter 2, Section 2.3.2, of this Final EIS, if levels of chemical or radioactive constituents in exemptions areas pose a risk to human health and the environment, as determined using risk-based screening levels (RBSLs), DOE would remove them through carefully planned, focused removals that would result in minimum disturbance. Soils exposed by the removal of buildings would be characterized and cleaned up according to the alternative selected for soil remediation.

172-2 DOE acknowledges your support for the Cleanup to Revised LUT Values and Groundwater Treatment Alternatives. Please refer to Section 2.1, "Preferences for Cleanup," of this CRD for further discussion of this topic.

172-3 In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. This Final EIS was revised to reflect the covenant, its restriction measures, and a soil cleanup scenario under the Conservation of Natural Resources Alternative consistent with use as open space (e.g., exposure to a recreational user).

Commenter No. 172 (cont'd): Mary Wiesbrook,
Save Open Space Santa Monica Mountains

over 2.5 years for removal and backfill, and impact air quality 28,000 to 84,000 tons a year for 2 years.

Groundwater remediation should be done to the groundwater treatment alternative. Groundwater plumes should be treated using active treatments selected from among pump and treat, enhanced in-place treatment, soil vapor extraction and dewatering. We request that the 2 Simi Valley wells below the SSFL Mountain used for blended drinking water be required to have the wells source water tested for all SSFL Chemicals of Concern and all SSFL Radionuclides. The test methodology should not allow filtering the source water when testing the rads and metals.

Sincerely,

Mary Wiesbrook, Chair and Retired State of California Clinical Laboratory Scientist

172-2
cont'd

172-4

172-4 The testing of utility water supply wells is performed by the water purveyor. DOE recommends that you contact the water company for the sample results.

Commenter No. 173: Pat Tumamait

From: Pat Tumamait
To: [Jennings, Stephanie](#)
Subject: SSFL
Date: Thursday, April 13, 2017 11:10:39 PM

Hello Stephanie, Just a few of comments.

- 1. Any recorded archaeological site must have a 50 foot buffer zone to be left intact. No earth disturbance.
- 2. During the removal of the contaminated soil in or near a recorded archaeological site must be tested to further avoid costly adverse impact to the site.
- 3. A Native American Chumash monitor and a qualified Archaeologist be present during any Earth disturbing activity in or near an Archaeological site.
- 4. In the event that Artifact's are present during the excavation of the contaminated soil and the artifact's can not be collected. I would suggest this material be set aside for review on how to collect these item's.

Sincerely,

Patrick Tumamait

|| 173-1

|| 173-2

|| 173-3

|| 173-4

- 173-1 All archaeological sites have been mapped with a buffer zone to ensure they will not be disturbed during site remediation. Furthermore, all ground-disturbing activities will be performed in accordance with the procedures and protections contained in the NHPA Section 106 Programmatic Agreement. If conditions require cleanup within the buffer zone, so as to protect human health and the environment, cleanup efforts would be performed in a focused manner to minimize adverse effect.
- 173-2 Known archaeological sites that are exempted according to the 2010 AOC process would be protected by a buffer zone included in the GIS (geographic information system) mapping data associated with each site location. If monitoring of cleanup activities finds that a site extends beyond the protected area then DOE would follow the procedures outlined for inadvertent discovery in the NHPA Section 106 Programmatic Agreement being developed in consultation with the SHPO and other consulting parties, including the federally recognized Santa Ynez Band of Chumash Indians and non-federally recognized tribes, and DTSC.
- 173-3 As presented in Chapter 6, Table 6-1, Minimization Measure 11-2, 'Tribal consultation' of this Final EIS DOE will require attendance by and designate a Native American monitor during remedial activities that result in soil disturbance. DOE will also require the presence of an archaeological monitor during any cleanup activities at a known archaeological site, including within the site's buffer zone.
- 173-4 As presented in Chapter 6, Table 6-1, Minimization Measure 11-2, 'Tribal consultation' of this Final EIS any tribal cultural resources encountered during remedial activities will be managed in consultation with Native American stakeholders (e.g., left in place, collected and moved to a secure location, collected for curation). The NHPA Section 106 Programmatic Agreement being developed in consultation with the SHPO and other consulting parties, including the federally recognized Santa Ynez Band of Chumash Indians and non-federally recognized tribes, and DTSC will establish procedures for making eligibility determinations on unevaluated sites, as needed, and inadvertent discoveries, along with procedures to assess effects and resolve adverse effects if they are determined eligible for the NRHP.

Commenter No. 174: Gregory S. Pfeifle

Subject: NEPA Document Manager, Santa Suzana Field Lab (SSFL) Area IV EIS
Date: Sunday, March 12, 2017 8:24:28 PM

I am writing to express my support with the public outcry for clean up of the SSFL, and my support of the Ventura County Board of Supervisors position urging the U.S. Department of Energy to conduct a stringent cleanup of the site. Stalling for 58 years is long enough. It is time to be responsible, to be accountable, and to do the right thing. Stop shifting the blame, avoiding responsibility, kicking the can down the road. Just clean the mess up. I was one of the unfortunate children who grow up near the facility and, in my adult years, lived and worked near the site. In theory, I should have been exposed to the contamination following the "accident" in 1959. Today, I am dealing with a rare form of Leukemia, the only known cause of which is *prolonged or continuous exposure to radiation*.

Do the right thing. Clean up the SSFL !!

Mr. Gregory S. Pfeifle
Newbury Park, CA

174-1

174-2

174-1 DOE acknowledges your concern about complete cleanup of SSFL and your support of the Ventura County Board of Supervisors position on stringent cleanup. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

With respect to the timeliness of DOE's completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a ROD(s) pursuant to NEPA. Information on the selection of alternatives for cleanup of SSFL Area IV and the NBZ will be included in the ROD(s) for the EIS. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) that applies to the entire SSFL site prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

174-2 DOE acknowledges your concerns and refers you to Section 2.1, "Preferences for Cleanup," of this CRD regarding your concern about cleanup of SSFL, as well as Section 2.7, "Offsite Impact," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. DOE's purpose in preparing this EIS is to evaluate alternatives for completing cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

Commenter No. 175: Marshall A. and Ellen Glick

Sent: Sunday, February 19, 2017 1:21 PM
To: The Secretary
Subject: Form submission from: Contact Us

Submitted on Sunday, February 19, 2017 - 13:20

Topic or category: Environment
Affiliation: General Public
Subject: SSFL Contamination Must Be Removed
Message:

As you can see from the forwarded SSFL Work Group email below, the SSFL cleanup is in jeopardy again! The DOE issued a Draft Environmental Impact Statement last month, riddled with poor excuses as to why they should be allowed to leave up to 94% of the contamination in place. We are urging you to take action!

To whom it may concern at the Dept. of Energy. It is critical for public health and safety that the DOE complete the full cleanup (95% left to do) of the SSFL. I beg you to not allow the terrible contamination to be left behind. My family and I are at risk, as are all of the families that will be adversely affected if the contamination remediation is stopped. Please do all you can to get all of this contamination removed.

Marshall A. Glick and Ellen Glick

175-1

175-2

175-1 NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. To meet this obligation this EIS evaluates alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup levels (refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD). The use of a risk assessment approach for soil cleanup is consistent with the approach used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. As discussed in Section 2.2, of this CRD the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. The Cleanup to Revised LUT Values Alternative and the Conservation of Natural Resources Alternative would help to meet cleanup objectives by being protective of the environment and health and safety of the public and workers while avoiding some of the technical challenges and potential adverse environmental impacts associated with cleanup to the 2010 AOC LUT values. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ.

175-2 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for a discussion of commenters’ preferences for cleanup. DOE agrees with placing a high priority on health and safety and remains committed to protecting the health and safety of current and future users of the site and of the residents in the surrounding communities. Please see Section 2.7, “Offsite Impacts,” of this CRD for a discussion and DOE’s response to concerns about offsite impacts.

Commenter No. 176: Mary E. Carr, Executive Director,
Ventura County Medical Association

"ADVOCATES FOR PATIENTS, PHYSICIANS
AND QUALITY MEDICAL CARE"

April 17, 2017

Ms. Stephe Jennings
NEPA Document Manager, SSFL Area IV EIS
US Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 93063

Re: Draft EIS for SSFL Cleanup

Dear Ms. Jennings,

The Ventura County Medical Association (VCMA) is an association of physicians whose purpose is to promote the science and art of medicine, the care and well-being of patients, the protection of the public health, and the betterment of the medical profession; to cooperate with organizations of like purposes; and to unite with similar societies in the State of California as component societies of the California Medical Association.

With this in mind we wish to express our concern regarding potential health risks to the people of Ventura County posed by the continued contamination of the Santa Susana Field Lab site. We are aware of studies showing a trend toward increased incidence of cancer in the areas around the field lab site and continue to support the 2010 cleanup agreement which stipulated removing contaminants to background levels. We expect the US Department of Energy to set the example for all other parties still responsible for contaminated areas in Ventura County.

Sincerely,

A handwritten signature in blue ink that reads "Mary E. Carr".

Mary E. Carr, Executive Director
On behalf of VCMA Board of Governors and Members

Cc: United States Senators Dianne Feinstein and Kamala Harris
United States Representative Julia Brownley
California EPA Secretary Matt Rodriquez
California Department of Toxic Substances Control Barbara Lee

176-1

176-2

- 176-1 DOE shares the commenter's concern regarding potential risks associated with those portions of SSFL for which it is responsible, Area IV and the NBZ. Although some studies have implied a correlation between offsite illness and SSFL, those studies do not show a trend and the authors acknowledge limitations in the studies. Please refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of these studies. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.
- 176-2 DOE acknowledges your support of the 2010 AOC which stipulates removing contaminants to background levels. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

Commenter No. 177: Jennifer McNulty

I moved to [REDACTED], Thousand Oaks, CA in December 1996 when I was 7 months pregnant. That is considered the Lang Ranch area of Thousand Oaks. Years prior to development, I was told by a police officer, that his friend was a fireman who used to regularly accompany the tanker trucks who used to DUMP percolate and other waste from Rocketdyne into the arroyos, and depressions in the land, thinking it would just absorb into the dirt. Apparently most of that fire team died of cancer. In any event... I don't know how many chemicals existed when that land was graded for the new homes. I do know that I became ill with thyroid tumors, and hypothyroid, and in 1999 was diagnosed with thyroid cancer. My typically developing son was often ill when young, and later diagnosed with regressive autism. How much is directly related to contaminants lingering from years later is impossible to know.

I know that Senator Barbara Boxer has tried for years to initiate clean-up operations, and the EPA under Bush put a GAG order on her. It's despicable.

We have spent hundreds of thousands trying to recover our health.

Jennifer McNulty

177-1

177-1

Thank you for your comment. It has been included in the Administrative Record for this Final EIS. Whereas the incidences from the past referred to in the comment may or may not be accurate, they are not relevant to the current effort. DOE's current focus is to complete the cleanup of those portions of SSFL, Area IV and the NBZ, for which it is responsible.

177-2

177-2

Thank you for your comment. It has been included in the Administrative Record for this Final EIS.

177-1

Commenter No. 178: Anonymous

I oppose the cleanup alternatives proposed in the draft EIS, all three of which violate the 2010 Administrative Order on Consent that requires DOE to clean up all detectable contamination. I have lived within 5 miles of the site my whole life and only learned about these issues less than a decade ago. I demand that the DOE cleanup to the standards set in the 2010 AOC, which are actually protective of my health!

Anonymous

178-1

178-1

DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information, including a discussion that explains how the Cleanup to AOC LUT Values Alternative meets with the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background or levels based on laboratory capabilities (AOC LUT values).

Commenter No. 179: Edward Weisner

Thank you for affording me the opportunity to comment on the Draft EIS for Remediation of Area IV and the NBZ of the SSFL. I started working at the Atomic Energy Division of North American Aviation in July 1950. (The name was later changed to Atomics International). I specialized in nuclear engineering. I retired from AI in February 1987. I was involved in selecting the specific site for the Sodium Reactor Experiment (SRE) at the SSFL after the AEC approved its construction. I was also involved in the design of the reactor and in determining the amount of enrichment of the uranium fuel which we then ordered from Oak Ridge National Laboratory. In those days there was no such thing as an Environmental Impact Report.

I think the people who are now involved with cleaning up the site and getting rid of the contamination are doing a great job as evidenced by the quality of the draft EIS. I congratulate them for a job well done!

179-1

179-1 Thank you for your comment.

Commenter No. 180: Anonymous

As a homeowner in the West Hills / Chatsworth area, I support the 2010 AOC requirements that have already been agreed upon by all of the regulatory agencies. I concur with DTSC director Barbara Lee, that “it appears DOE is proposing clean-up approaches that fail to fully recognize the AOC provisions that apply to sensitive plant and animal species located at SSFL.” The site should be cleaned up to the most stringent health and safety standards to protect the natural environment, neighboring communities, children, wildlife, homeowners, and future generations.

I also believe that any companies that profited from the R&D at Area IV should bear the brunt of the costs for the majority of the cleanup. We can not allow profits to be privatized, and pollution to be socialized. That is an unsustainable model. This project has been dragging on for decades, and it’s time for DOE to stop stalling and resisting. Let’s get going on cleaning up this gigantic mess in the way that has already been agreed to, the AOC.

Furthermore, from this day forward, we must all be good stewards of the land, and like our Native American elders, think SEVEN GENERATIONS into the future. Whatever we do to the web of life, we do to ourselves. The scars at Santa Susanna resulted from short-sighted decision-making, and they can not be healed with more short-sightedness.

Thank you for your consideration

180-1

180-2

180-1
cont’d

180-3

180-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD.

NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. To meet this obligation this EIS evaluates alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. This Final EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with the approach used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The Cleanup to Revised LUT Values Alternative and the Conservation of Natural Resources Alternative would help to meet cleanup objectives by being protective of the environment and health and safety of the public and workers while avoiding some of the technical challenges and potential adverse environmental impacts associated with cleanup to the 2010 AOC LUT values. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ.

180-2 The Energy Technology Engineering Center in Area IV of SSFL was a U.S. Government research facility. DOE and its predecessors hired contractors to operate the facility and operations were conducted according laws in effect at the time and the contractual arrangement between the contractor and DOE. As a government facility, DOE is responsible for conducting the environmental remediation of the site.

180-3 Thank you for your comment. It has been added to the Administrative Record for the EIS. DOE evaluated alternatives for contamination removal and site remediation that, when implemented and completed, would leave Area IV and the NBZ in a state that was protective of human health and the environment. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for a discussion of this topic and DOE’s response.

Commenter No. 181: Kristine Stroud-Endo

Please consider a more extensive clean up of this toxic site at Santa Susana. A limited clean up will still leave the surrounding areas at risk of toxins in the environment. It is important to me as I have children and am concerned about this. We are not sure what the short or long term health implications are.

I have heard there are 30 plus children in the area with rare types of cancer.

I would like to see this site cleaned up sufficiently and completely.

Thank you,

Kristine Stroud-Endo

181-1

181-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent” of this CRD for additional information.

181-2

NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

181-1 cont’d

181-2

181-2 DOE acknowledges your concern and refers you to Section 2.7, “Offsite Impacts,” and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. All of the action alternatives evaluated for DOE’s cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

Commenter No. 182: Rebekah Robinson

I lived in Simi Valley for 15 years. I only just recently moved away, but all of my friends and family still live there.

I constantly hear about many people in the community struggling with rare forms of cancer.

SSFL had a few meltdowns. The July 1959 meltdown is the worst in US history and 3rd worst in the world. The experimental facility had NO containment structures not to mention the illegal storing, disposal, and burning of explosive material and hazardous waste.

You know all this though, yet are still choosing to cut corners on clean up! It's unacceptable! We need the best clean up possible to avoid further health problems in the community. The history of this property cut corners in disposal and clean up. Don't cut corners again!!!

Rebekah Robinson

182-1

182-2

182-3

182-1 DOE refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

182-2 Chapter 3, Sections 3.9.5 and 3.9.6, of this Final EIS provide information about accidents at Area IV, including the 1959 SRE accident, which was the only accident that caused a measureable release of radioactive material. Section 3.9.6 explains that at the time of the accident it was estimated that the accident resulted in the release over a 2-month period) of about 28 curies of radioactive noble gases such as krypton-85, in low, controlled concentrations that met Federal requirements. The release was estimated to result in a maximum radiation dose at the location of the nearest resident of 0.018 millirem. Using current risk factors, this dose would have resulted in a risk of a fatal cancer to an exposed individual of 1×10^{-8} (one chance in about 93 million). A 1999 study by ATSDR estimated a maximum dose to a potentially exposed individual of 0.005 millirem with an even smaller risk of a fatal cancer.

Because of public concern about the SRE accident, DOE hosted an informational workshop on August 29, 2009, with testimony from three independent experts (see http://www.etec.energy.gov/Community_Involvement/Public%20Meetings/SRE_Workshop.html). Two of these experts supported the estimate made at the time of the accident. They stated that releases at the time of the accident should have primarily involved noble gases, with only small releases of volatile fissions products such as iodine and cesium isotopes. One of the two experts was skeptical of the estimates of large health effects being experienced by individuals and the population. The third expert concluded that available information was inadequate to resolve the fraction of the noble gases and fission products that may have been released. This expert did not quantify public risks from the accident but thought that the risk to the maximally exposed individual was smaller than the risk of cancer from other causes, but that the collective exposure could have resulted in some cancers in the population.

With respect to the statements regarding burning radioactive and chemical waste in open pits, the Former Sodium Disposal Facility was used from 1956 to 1978 to clean alkali metals (sodium and potassium/sodium mixtures) from metallic components and other materials, and also received chemical waste and radionuclides. The facility was remediated during the 1990s and released for unrestricted use (i.e., declared clean) in

Commenter No. 182 (cont'd): Rebekah Robinson

1998 by the California Department of Health Services (now California Department of Public Health). Additional information can be found at http://www.etec.energy.gov/Operations/Support_Ops/FSDF.html. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ.

- 182-3** DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup" and Section 2.2, "Compliance with the 2010 Administrative Order on Consent" of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

Regarding potential health problems related to SSFL, please refer to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 183: Nancy Ryan

The DOE needs to follow through and complete the clean up agreement made in 2010. I am appalled they are backing out.

Nancy Ryan

|| 183-1

183-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 184: Megan Cleveland

Urging a full clean-up of the site. The health risks to the surrounding community are much too high to play around with.

Megan Cleveland

184-1

184-1

DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup” of this CRD for additional information.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD). The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Commenter No. 185: Mark and Renee Dauw

I am emailing you today to urge your department to do a full clean up of the Santa Susana Field Laboratory.

This mess is absolutely affecting the adults and most alarming, the youth of this community. We should know, because we live in West Hills at the top of Ingomar Street, approximately 2 miles as a crow flies from the facility and my teenage daughter was diagnosed with a very rare form of leukemia last May, 2016. She is currently a senior in high school and has had to endure so much this year and it is heart-breaking. Her leukemia is so rare, that the Oncology Department at Children's Hospital Los Angeles said they have seen very few cases of APL leukemia. My daughter has spent the past year enduring a very rigorous treatment schedule while trying to stay in school and complete her senior year. She is a fighter and has finished her treatments and is cancer free and looking forward to going to college next year. With that said, she will be monitored monthly for the next 3 years having to get monthly blood work and bone marrow biopsies every three months while she is in college. But honestly, will she ever be free from the worry of a relapse? Just as she is starting the most exciting time of her life. My husband and I had no idea that we raised our family in the backyard of a still contaminated site. Although my daughter is extremely fortunate to have been very responsive to her treatment, I know of dozens of other children in our area that are suffering from horrible and rare cancers. PLEASE PLEASE DO SOME SORT OF STUDY ON CHILDHOOD CANCER IN THE AREA. The other studies that have been done on this only focused on adult cancers. Children are far more susceptible to the ill effects of these contaminants.

The areas around this site are some of the most wonderful areas to raise families. We personally live on top of a hill that has beautiful views of the Santa Monica Mountains. This area deserves to have it restored to its original condition and the residents of the surrounding areas deserve to know that they are raising their young children in a safe and healthy environment.

Mark and Renee Dauw

185-1

185-1 DOE acknowledges your preference for a full cleanup of SSFL. Please refer to Section 2.1, "Preferences for Cleanup," of this CRD for a discussion of commenters' preferences for cleanup.

185-2

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

185-2

DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. One of these studies, by the University of Southern California Cancer Surveillance Program, reviewed the incidence of retinoblastoma in children (CSP 2007). The study authors concluded that the incidence of retinoblastoma among children under age 5 residing in the area around SSFL between 1988 and 2005 was slightly, although statistically not significantly, higher than expected based on incidence statewide. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

185-1

Commenter No. 186: Paul Attkisson

As a qualified nuclear operator for US Naval propulsion, I know just how costly and tricky a nuclear clean up is. As a kid growing up in Thousand Oaks, I have received a higher total effective dose than any of my colleagues who work in the industry. Our nuclear reactors have come a long way in terms of safety and containment. I do not foresee any more nuclear meltdowns due to this progress. We know more now. It is worth the investment to properly clean up the radiological risks, since in my opinion, nuclear operators know how to limit the release of radioactive contamination in the rare event of a malfunction. We progressed in technology and safety that even if something were to happen, an accident would not cause the slightest risk to even the nuclear workers at a plant. Safety has grown tremendously over the last decades in the industry. The potential for more dangerous radioactivity is gone.

Now it's time to clean up the past results of experimentation. If we take action to fully clean up the area in the SFV, we not only reduce the risk of cancer in our citizens, but also invest in the overall planetary health in the SFV. The effects of radiation on the environment can leave the SFV barren and decrepit if left untreated or a lackluster clean up is conducted. I urge the DOE to take no short cuts to ensure a safe dose is received by its citizens, and to limit the erosion and embrittlement of the environment in the surrounding counties.

Paul Attkisson

186-1

186-1

DOE acknowledges your preference for a full cleanup of SSFL. Please refer to Section 2.1, "Preferences for Cleanup," of this CRD for a discussion of commenters' preferences for cleanup, and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information regarding soil cleanup alternatives.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Based on current knowledge, there is no cleanup in the San Fernando Valley related to DOE's operations in Area IV.

Also, please refer to Section 2.7, "Offsite Impacts" and Section 2.8, "Cancer and Other Illnesses Near SSFL" of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. All of the action alternatives evaluated are protective of public health and safety and the environment.

Commenter No. 187: Christina Bryan

Please completely clean up The nuclear waste from Santa susana field station affecting the West Hills community.

Many familes live very close to the contamination. My kids are very young and I worry about their health as several small children have developed rare cancers in our community.

Please clean the area as if your own children were living there. Thank you very much.

Christina Bryan

187-1

187-2

187-1 The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD.) This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers. As described in Section 2.7, “Offsite Impacts” of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA’s soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC’s review of the data (included as part of DTSC’s broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

187-2 DOE acknowledges your concern and refers you to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD to get a better understanding of the current state of facilities and contamination in SSFL Area IV and the NBZ. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Also, please see Section 2.8, “Cancer and Other Illnesses Near SSFL” of this CRD for discussion of studies performed regarding illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 188: Laura Cabam

You must do a thorough and immediate clean up of the Santa Susana Field Lab. Failure to do so is putting residents at risk and there have already been many children riddled with ridiculously rare cancers within a 20 mile radius of the site.

188-1

Research into the links between cancer and the chemicals deposited in the earth needs to be done.

188-2

The health and safety of residents is your responsibility and failure to take action is negligent, wrong, and inhumane. Do the right thing.

**188-1
cont'd**

Laura Cabam

188-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD.) This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

188-2 DOE acknowledges your concern and refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for discussion of studies performed regarding illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

Commenter No. 189: Karen Astrachan

Please, do not turn a blind eye to our children's health. They deserve to live in areas that are not knowingly toxic. Do something!! Clean up this mess.

What if it was your child at risk?

Karen Astrachan

189-1

189-1

DOE acknowledges your concern and refers you to Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

Commenter No. 190: Anonymous

Please please conduct a full clean up of the area.

|| 190-1

Too many are sick and terminally ill because of the toxins in the area!!!

|| 190-2

How do you all sleep at night knowing children are at risk??

Anonymous

190-1 DOE acknowledges your desire for a full cleanup of the site. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for a discussion of commenters’ preferences. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD.) This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

190-2 Thank you for your comment. Please see Section 2.8, “Cancer and Other Illnesses Near SSFL” of this CRD for discussion of studies performed regarding illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 191: Rachel Pacio

I find it absolutely unacceptable to leave contaminants on the site!! This is affecting the health of the people and especially children.

|| 191-1
|| 191-2

Using scare tactics to make us think the site migration is more dangerous is not acceptable. Refusing to use less populated roads for the migration, not acceptable.

|| 191-3

Not having a full survey done of the risk to children in our communities, not acceptable.

|| 191-2
cont'd

Rachel Pacio

191-1 Please refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent” of this CRD for a discussion of soil remediation alternatives. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites.

As discussed in Section 2.4 of this Final EIS, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

191-2 DOE acknowledges your concern and refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. One of these studies, by the University of Southern California Cancer Surveillance Program, reviewed the incidence of retinoblastoma in children (CSP 2007). The study authors concluded that the incidence of retinoblastoma among children under age 5 residing in the area around SSFL between 1988 and 2005 was slightly, although statistically not significantly, higher than expected based on incidence statewide. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

191-3 Please refer to Section 2.9, “Options for Transportation of Waste from SSFL,” of this CRD for a discussion of this topic and DOE’s response.

The analyses in this Final EIS were performed to evaluate the potential impacts associated with the various alternatives for cleanup of SSFL. In accordance with NEPA, the EIS evaluates the potential impacts on a variety of resource areas, including traffic,

Commenter No. 191 (cont'd): Rachel Pacio

human health, cultural and biological resources, socioeconomics, and environmental justice. Results of the analyses allow a comparison of potential impacts across all evaluated resource areas as well as the tradeoffs between the alternatives.

DOE's intent is not to generate opposition to the SSFL cleanup or to scare locals out of supporting cleanup, but it is true that the more soil that is removed to clean up the site, the more transportation will be required. Leaving more soil, and consequently low concentrations of chemicals and/or radionuclides on site, reduces the number of truck trips from the site. Conversely, removing the soil with low concentrations of chemicals and/or radionuclides, results in more truck trips from the site. This EIS shows that the transportation risks are very small. Chapter 4, Section 4.8.1 and Appendix H of the EIS provide details of the transportation risk analysis.

Commenter No. 192: Cheryl Devecka

My family was recently relocated from the east coast to Westlake Village, CA.

We are currently renting a home in Westlake and as part of the rental agreement we had to sign a disclosure that we were living in a high risk cancer area.

This bit information was not explained to us and could have very easily been overlooked. The realtor seemed to not have an further information then what was given to us to sign. My husband felt there must be more to the story and started finding information regarding Rocketdyne and the melt down in the 1950's.

Needless to say we were uncomfortable with this new information. I have met numerous young adults in the last year here that have rare cancers.

We plan on moving when our lease is up.

We cannot believe that the people we have met are completely unaware of the situation or feel that it is not a real risk. Drastic measures need to be taken to not only clean up this disaster, but also educate the people that are directly affected but it.

Cheryl Devecka

192-1

192-2

192-3

192-1 As indicated in Chapter 1 of this Final EIS, DOE acknowledges that past activities at SSFL resulted in chemical and radiological releases that impacted soils, buildings, and groundwater. Chapter 1, Section 1.3, of this EIS, contains a brief history of activities at SSFL and describes the radiological and chemical characterization studies performed for Area IV and the NBZ. Additional information about the activities of DOE and its predecessor agency, the Atomic Energy Commission, at Area IV can be found at <http://www.etec.energy.gov/>. Chapter 3, Sections 3.9.5 and 3.9.6, of the EIS provide information about accidents at Area IV, including the 1959 SRE accident, which was the only accident that caused a measureable release of radioactive material. These sections also include information about health studies performed by independent organizations such as the Agency for Toxic Substances and Disease Registry (ATSDR), and the conclusions from those studies. Section 3.9.6 explains that at the time of the accident it was estimated that the accident resulted in the release (over a 2-month period) of about 28 curies of radioactive noble gases such as krypton-85, in low, controlled concentrations that met Federal requirements. The release was estimated to result in a maximum radiation dose at the location of the nearest resident of 0.018 millirem. Using current risk factors, this dose would have resulted in a risk of a fatal cancer to an exposed individual of 1×10^{-8} (one chance in about 93 million). A 1999 study by ATSDR estimated a maximum dose to a potentially exposed individual of 0.005 millirem, less than one-third of the original estimate. This dose would result in a corresponding risk of fatal cancer of less than a third of that original estimate.

Because of public concern about the SRE accident, DOE hosted an informational workshop on August 29, 2009, with testimony from three independent experts (see http://www.etec.energy.gov/Community_Involvement/Public%20Meetings/SRE_Workshop.html). Two of these experts supported the estimate made at the time of the accident. They stated that releases at the time of the accident would likely have involved noble gases, with only small releases of volatile fissions products such as iodine and cesium isotopes. One of the two experts was skeptical of the estimates of large health effects being experienced by individuals and the population. The third expert concluded that available information was inadequate to resolve the fraction of the noble gases and fission products that may have been released. This expert did not quantify public risks from the accident but thought that the risk to the maximally exposed individual was smaller than the risk of cancer from other causes, but that the collective exposure could have resulted in some cancers in the population.

Commenter No. 192 (cont'd): Cherilyn Devecka

Rocket engine testing was a completely separate activity from the nuclear research DOE and its predecessor agency conducted in Area IV; and was conducted in locations other than and physically separated from Area IV, by entities other than DOE. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. In addition, please see Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for a discussion of these topics and DOE's responses. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. DOE will complete contamination removal and site remediation based on the decisions made pursuant to this Final EIS and in compliance with regulatory requirements, including regulations, orders, and agreements.

- 192-2** DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for accurate information about contamination in the area around SSFL and discussions of studies of illnesses related to SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.
- 192-3** DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing the EIS is to evaluate alternatives for those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. Please also refer to the DOE Energy Technology Engineering Center website (see <http://www.etec.energy.gov/>) which describes past activities at SSFL, detailed sampling and monitoring data, public workshops on remediation of SSFL, and other information, including links to remediation activities at SSFL by NASA and Boeing.

**Commenter No. 193: Larissa Webster, RN,
St. John's Pleasant Valley Hospital, Emergency Department**

Full clean up and disclosure required. This is not acceptable in this community and has caused such devastation and catastrophic illnesses. Let's protect any potential patients we can and help protect the health of our population.

Larissa Webster, RN

193-1

193-2

193-1 DOE acknowledges your desire for a full cleanup of the site. Please refer to Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent" of this CRD for a discussion of soil remediation alternatives. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

193-2 DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The available data do not indicate devastation and catastrophic illness in the community. Regardless, DOE's purpose in preparing this Final EIS is to evaluate alternatives for completing cleanup of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the action alternatives evaluated in this EIS would result in a cleanup of Area IV and the NBZ that is protective of public health and safety and the environment.

Commenter No. 194: Breanna Galbraith

As a biology/applied health major, it's crazy to make we that a full clean up has not yet been done, and that families are moving nearby with no real understanding of what the potential dangers are. At the very least there should be an ongoing record of rare cancers and illnesses within certain ranges of the site.

Breanna Galbraith

194-1

194-2

194-1 DOE acknowledges your concern about cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ.

194-2 DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for accurate information about contamination in the area around SSFL and discussions of studies of illnesses related to SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The California Cancer Registry does track incidences of cancer throughout the State. Information on the program if available at <http://www.cccal.org/>.

Commenter No. 195: Susie Ellis

I want to let you know that leaving contaminants on site is not acceptable. Using scare tactics to make us think the site migration is more dangerous is not acceptable. Refusing to use less populated roads for the migration, is also not acceptable. Not having a full survey done of the risk to children in our communities is completely not acceptable.

Susie Ellis

|| 195-1
|| 195-2
|| 195-3

195-1 DOE acknowledges your concern for cleanup of SSFL. Please refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent” of this CRD for a discussion of soil remediation alternatives. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors (refer also to Section 2.5, “Toxicity of Soil Contaminants,” of this CRD). Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

195-2 Please refer to Section 2.9, “Options for Transportation of Waste from SSFL,” of this CRD for a discussion of this topic and DOE’s response.

The analyses in this EIS were performed to evaluate the potential impacts associated with the various alternatives for cleanup of SSFL. In accordance with NEPA, the EIS evaluates the potential impacts on a variety of resource areas, including traffic, human health, cultural and biological resources, socioeconomics, and environmental justice. Results of the analyses allow a comparison of potential impacts across all evaluated resource areas as well as the tradeoffs between the alternatives.

DOE’s intent is not to generate opposition to the SSFL cleanup or to scare locals out of supporting cleanup, but it is true that the more soil that is removed to clean up the site, the more transportation will be required. Leaving more soil, and consequently low concentrations of chemicals and/or radionuclides on site, reduces the number of truck trips from the site. Conversely, removing soil with low concentrations of chemicals and radionuclides requires more truck trips from the site. This Final EIS shows that the transportation risks are very small; Chapter 4, Section 4.8.1 and Appendix H of the EIS provide details of the transportation risk analysis.

Commenter No. 195 (cont'd): Susie Ellis

- 195-3** DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. One of these studies, by the University of Southern California Cancer Surveillance Program, reviewed the incidence of retinoblastoma in children (CSP 2007). The study authors concluded that the incidence of retinoblastoma among children under age 5 residing in the area around SSFL between 1988 and 2005 was slightly, although statistically not significantly, higher than expected based on incidence statewide. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

Commenter No. 196: Anonymous

My daughter who is 2.5 has a rare liver disease only 1 in 18000 kids get. I can't help but wonder living in Simi Valley near Kuehner how this has may have impacted her health. She will need a liver transplant. We must care about the health and safety of everyone especially our children!

Anonymous

196-1

DOE refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 197: Tim Gray

I find it completely unacceptable that the cleanup of the SSFL has not started even though it was agreed upon almost ten years ago. Per the DTSC spokesperson, a draft environmental report has not even been prepared yet. After all these years no report? This looks like negligence to me.

Tim Gray

197-1

197-1 There has been a lot of cleanup performed in Area IV. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation at those portions of SSFL for which DOE is responsible, Area IV and the NBZ.

197-2

197-2 As discussed in Chapter 1, Section 1.9.2, of this Final EIS, DTSC is currently preparing a program environmental impact report (EIR) under CEQA that applies to cleanup of the entire SSFL. The *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (was issued by DTSC in 2017 (DTSC 2017b). DTSC will issue a Notice of Determination for the program EIR identifying the selected remedial actions. Soil cleanup would begin after DOE and DTSC conform the decisions included in the DOE Record of Decision for this EIS and the DTSC Notice of Determination and, in accordance with DTSC's regulatory authority as provided in the AOC, DTSC approves the DOE-prepared soils remediation action implementation plan.

Commenter No. 198: Nicole Eggert

This is my daughter Grace [REDACTED], she was diagnosed with a Leukemia so rare that only 1 out of 1 million kids will ever get it, we had lived in West Hills for nearly four years before diagnosis. We did not know that we were living only miles from a toxic nuclear melt-down in the hills of Simi Valley, the Santa Susana Field Lab. I want you to see what childhood cancer looks like. I want you to see the risk to your family, because the Department Of Energy wants you to think that leaving the waste on site will not cause any harm. "Leaving it be" means more of the contamination will migrate when it is windy or when it rains and people will continue to be exposed. And it's not just a little contamination, it's a lot and even Boeing's risk assessment reports show just how high the risk is today - in some areas, 3 in 10 exposed would get cancer, in other areas of the site, as high as 9 in 10 would. We've found 30 other children with rare cancers who live within 20 miles of the site. I'll be introducing you to them over the next few days. No study has been done on childhood cancers related to the site. We want answers, and we want a full cleanup. I'm asking that everyone lets the DOE know that leaving contaminants on site is not acceptable. Using scare tactics to make us think the site migration is more dangerous is not acceptable. Refusing to use less populated roads for the migration, not acceptable. Not having a full survey done of the risk to children in our communities, is completely not acceptable. It is disgusting and grossly negligent of those who are fighting the correct way to fully clean this site to prevent further harm to those living nearby. I'd like to see how differently those fighting the cleanup would feel if they were forced to live in these neighborhoods with their young children. I'm sure they'd be less concerned about the price of cleanup.

Nicole Eggert

198-1

198-2

198-3

198-1
cont'd

198-4

198-1 DOE acknowledges your concern regarding offsite contamination and health effects at SSFL. Please refer to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for additional information on these subjects.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of the EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Each of the action alternatives evaluated for cleanup of Area IV and the NBZ is protective of the environment and the health and safety of the public.

DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. One of the studies, by the University of Southern California Cancer Surveillance Program, reviewed the incidence of retinoblastoma in children (CSP 2007). The study authors concluded that the incidence of retinoblastoma among children under age 5 residing in the area around SSFL between 1988 and 2005 was slightly, although statistically not significantly, higher than expected based on incidence statewide. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

198-2 DOE acknowledges your preference for a full cleanup of the site and refers you to Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used

Commenter No. 198 (cont'd): Nicole Eggert

for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors (refer also to Section 2.5, "Toxicity of Soil Contaminants," of this CRD). Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

- 198-3** Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

The analyses in this Final EIS were performed to evaluate the potential impacts associated with the various alternatives for cleanup of SSFL. In accordance with NEPA, this EIS evaluates the potential impacts on a variety of resource areas, including traffic, human health, cultural and biological resources, socioeconomics, and environmental justice. Results of the analyses allow a comparison of potential impacts across all evaluated resource areas as well as the tradeoffs between the alternatives.

DOE's intent is not to generate opposition to the SSFL cleanup or to scare locals out of supporting cleanup, but it is true that the more soil that is removed to remediate the site, the larger the transportation effort (i.e., a larger number of truck trips) required. Leaving more soil, and consequently low concentrations of chemicals and/or radionuclides on site, reduces the number of truck trips from the site. Conversely, removing the soil with low concentrations of chemicals and/or radionuclides, results in more truck trips from the site. The EIS shows that the transportation risks are very small; Chapter 4, Section 4.8.1 and Appendix H of the EIS provide details of the transportation risk analysis.

- 198-4** DOE takes its cleanup and financial management responsibility quite seriously. As a Federal agency, DOE is required to evaluate and justify major expenditures of Federal dollars. Because the AOC cleanup is not the normal way DOE, EPA, or California DTSC performs soil cleanups, DOE evaluated the costs and benefits of the AOC cleanup versus what is normally done (that is, a cleanup that is based on risk and future land use). That analysis demonstrated that the AOC cleanup would be much more expensive and with minimal additional protection of public health and the environment. Please see Section 2.7, "Offsite Impacts," Section 2.8, "Cancer and Other Illnesses Near SSFL," and Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for additional information. DOE also refers you to Chapter

Commenter No. 198 (cont'd): Nicole Eggert

3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 199: Amanda Nielsen

I want a study done! I have three beautiful babies and I think it's a complete crime that there has been nothing done to clean this up and protect our families!

Amanda Nielsen

199-1

199-1

DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. One of the studies, by the University of Southern California Cancer Surveillance Program, reviewed the incidence of retinoblastoma in children (CSP 2007). The study authors concluded that the incidence of retinoblastoma among children under age 5 residing in the area around SSFL between 1988 and 2005 was slightly, although statistically not significantly, higher than expected based on incidence statewide. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

Over the life of SSFL, there has been action taken to clean up the site. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of the EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Each of the action alternatives evaluated for cleanup of Area IV and the NBZ is protective of the health and safety of the public and the environment.

Commenter No. 200: Arielle Moss

Please as a mother & member of this community, please clean this mess up!

Arielle Moss

Commenter No. 203: Rachel Guettler

I live in the Santa Susana/Simi Valley area, and I have a newborn. We purchased our home in 2014. I am beside myself with concern about this area. Clean up needs to happen now and it needs to be safe. We have heavy winds and heavy rains. I am horrified as I have seen several childhood cancer cases in our area. Please make this area a top priority for clean up as soon as possible. The public health risk is very serious. Please take human life seriously! Please make this a priority for our children, our community, and our health. The delay has been long enough. This is a serious state, national, and city level issue.

Rachel Guettler

- 203-1 DOE acknowledges your concern and refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE is also concerned with public risk and is preparing this EIS to evaluate alternatives for completing cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.
- 203-2 DOE acknowledges your concern about cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information.

With respect to the timeliness of DOE’s completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record of Decision pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC’s Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Commenter No. 204: Debbie Smith

Leaving contaminants on site is not acceptable and is putting everyone at risk. A full clean up is in order at their expense. Using scare tactics to make us think the site migration is more dangerous is not acceptable.

Debbie Smith

204-1

204-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information.

204-2

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC (including for radioactive constituents) using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. (refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD). It also evaluates two other cleanup alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

204-2

DOE’s intent is not to alarm people, but it is true that the more soil that is removed to remediate the site, the larger the transportation effort (i.e., a larger number of truck trips) (referred to as migration in the comment) that would be required. The analyses in this Final EIS were performed to evaluate the potential impacts associated with the various alternatives for cleanup of Area IV and the NBZ. Results of the analyses allow a comparison of potential impacts and tradeoffs between alternatives. In the case of soil remediation and using the Conservation of Natural Resources (Open Space Scenario) Alternative as an example, leaving soil containing low concentrations of chemicals and/or radionuclides on site reduces the number of truck trips from the site. But, removing soil with low concentrations of chemicals or radionuclides, as would be the case under the Cleanup to AOC LUT Values Alternative, would result in more truck trips from the site. Under any of the soil remediation action alternatives and scenarios, Area IV and the NBZ would be cleaned up to a level that is protective of the public and environment (see Chapter 4, Section 4.9 of this EIS). This EIS also shows that the transportation risks are very small; Chapter 4, Section 4.8.1, and Appendix H of the EIS provide details of the transportation risk analysis.

Commenter No. 205: Rachel Guettler

I wanted to add another comment, which is that I believe that the DOE is responsible for cleaning this up immediately and leaving contaminants on site is not acceptable. Using scare tactics to make us think the site migration is more dangerous is not acceptable. Refusing to use less populated roads for the migration, not acceptable. Not having a full survey done of the risk to children in our communities, is completely not acceptable.

Rachel Guettler

205-1

205-1 DOE acknowledges that it is responsible for the cleanup of area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing cleanup of those portions of SSFL for which DOE is responsible. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. (refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD). It also evaluates two other cleanup alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

205-2

Also, please see Section 2.1, “Preferences for Cleanup,” of this CRD which addresses steps that must be complete before cleanup can resume.

205-3

With respect to the timeliness of DOE’s completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.9.2 of this Final EIS, DTSC is currently preparing a program environmental impact report (Program EIR) under CEQA that applies to cleanup of the entire SSFL. DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC’s Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

205-2

Please refer to Section 2.9, “Options for Transportation of Waste from SSFL,” of this CRD for a discussion of this topic and DOE’s response.

The analyses in this Final EIS were performed to evaluate the potential impacts associated with the various alternatives for cleanup of SSFL. In accordance with NEPA, the EIS evaluates the potential impacts on a variety of resource areas,

Commenter No. 205 (cont'd): Rachel Guettler

including traffic, human health, cultural and biological resources, socioeconomic, and environmental justice. Results of the analyses allow a comparison of potential impacts across all evaluated resource areas as well as the tradeoffs between the alternatives.

DOE's intent is not to generate opposition to the SSFL cleanup or to scare locals out of supporting cleanup, but it is true that the more soil that is removed to remediate the site, the larger the transportation effort (i.e., a larger number of truck trips) required. Leaving more soil, and consequently low concentrations of chemicals and/or radionuclides on site, reduces the number of truck trips from the site. Conversely, removing the soil with low concentrations of chemicals and/or radionuclides, results in more truck trips from the site. The EIS shows that the transportation risks are very small; Chapter 4, Section 4.8.1 and Appendix H of this EIS provide details of the transportation risk analysis.

- 205-3 DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. One of the studies, by the University of Southern California Cancer Surveillance Program, reviewed the incidence of retinoblastoma in children (CSP 2007). The study authors concluded that the incidence of retinoblastoma among children under age 5 residing in the area around SSFL between 1988 and 2005 was slightly, although statistically not significantly, higher than expected based on incidence statewide. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

Commenter No. 206: Sophie

How many more children need to die, before you get this site cleaned up!!! I am absolutely disgusted by this. Clean i my up!

Sophie

|| 206-1

206-1

DOE acknowledges your comment and refers you to Section 2.7, “Offsite Impact,” and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of the EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

Commenter No. 207: Ricki Frost

Please do the right thing and properly clean up this mess! The environment, residents and our future children deserve nothing less!!!

Ricki Frost

|| 207-1

207-1 DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing the EIS is to evaluate alternatives for those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 208: Melissa Patao

As a mother with a two year old son, hearing the multiple stories of children with cancer who live within twenty miles of the nuclear spill site is devastating. How can we in good conscience let this continue to happen and allow these children to die? Would you live near this site with your children? Please consider the answer to that question, and please take action as quickly as possible to clean this site.

Melissa Patao

208-1

208-1 DOE acknowledges your concern and refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

208-2

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 211: Amy Greer

Please, please, please move forward with a full environmental clean up of the Santa Susana Field Lab. My family moved to Moorpark in the early 80's when I was very young. Nobody on either side of my family had any history of thyroid issues. When I was 16 my father had to have his entire thyroid removed due to cancerous cells. I'm now 39 years old and had to have half of my thyroid removed due to precancerous cells in 2010. And most recently my mother had to have half of her thyroid removed as well. My sister suffers from Hashimotos. All four of us living under one roof in Moorpark have had thyroid issues that nobody else in our family has had. That is way more than a coincidence. Now here we are in 2017 and I'm pregnant with my second child, living in Moorpark. I want this to be a safe place for my children to grow up not just due to low crime rates and good public education options. I want their health to be protected! It's unacceptable that a full clean up has not already occurred and that new homes are allowed to be built just down the hill from the horrendous and toxic nuclear spill. Please do the right thing and clean it up!

Amy Greer

211-1

211-1 DOE acknowledges your concern about achieving a full environmental cleanup up of SSFL. DOE's purpose in preparing the EIS is to evaluate alternatives for those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Commenter No. 217: Anonymous

There have been way too many rare cases of cancer within the radius of this spill. This is a priority to the health of many people. If you care about the health of the people in the surrounding area than this MUST be cleaned up! Too many young children are suffering because of this, and I know many many families who will be picking up and moving elsewhere if this is not cleaned up and done as promised, our family included. To put the lives of people at risk to save money is ridiculous.

Committer No. 219: Ashlee Shewell

I am a resident of Simi Valley raising 3 young boys with my husband. When we first moved to Simi Valley almost 7 years ago we came across this horrible story that we still have toxic waste in the hills from a toxic nuclear meltdown many years ago. This toxic waste should not still be here. We need to have a full clean up. The cities surrounding this land are full of families raising children. This is a health risk especially to children. This is not acceptable. Please clean this waste up! We can't have this being a risk to our children.

Ashlee Shewell

219-1

219-1

DOE acknowledges your concern about cleanup of SSFL and refers you to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV" of this CRD to get a better understanding of the current state of facilities and contamination in SSFL Area IV and the NBZ. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing).

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information

219-2

219-2

DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. DOE's purpose in preparing this EIS is to evaluate alternatives for completing cleanup of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the action alternatives evaluated in this EIS would result in a cleanup of Area IV and the NBZ that is protective of public health and safety and the environment.

Commenter No. 220: Leah Oviedo

To Who it May Concern- I am a local resident and I am asking for a full clean up of the site. In my research I have found many children battling rare cancers and all live in the surrounding areas. I am in fear my children or family could be affected due to the site not being cleaned up. This situation reminds me of the case with PG & E and the case Erin Brochivch won. I pray you do the right thing for these families and the community, for everyone's safety and well being. These poor families that have to suffer due to the lack of a full clean up in the area. I request a full clean up so we can all live without being in fear.

Thank you!

Leah Oviedo

220-1

220-1

DOE acknowledges your concern about achieving a full cleanup of SSFL. DOE's purpose in preparing the EIS is to evaluate alternatives for those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated for cleanup of Area IV and the NBZ is protective of the health and safety of the public and the environment.

220-2

220-2

DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

220-1 cont'd

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

Commenter No. 221: Alison McLane

Please remediate radiologically and chemically impacted soil and groundwater, dispose of the resulting waste, and restore the affected environment in the fastest, most thorough fashion necessary.

Alison McLane

221-1

221-1

DOE acknowledges your concern about conducting site remediation, waste disposal, and environmental restoration in a rapid and thorough fashion. It is DOE's mission to remediate sites to ensure that they are protective of human health and the environment. DOE's purpose in preparing the EIS is to evaluate alternatives for those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated for cleanup of Area IV and the NBZ is protective of the health and safety of the public and the environment.

Commenter No. 222: Sara Ahl

The Santa Susana Field Laboratory needs more testing and more cleanup! Too many cancer cases in the area should be enough reason to protect the public!

Sara Ahl

|| 222-1
|| 222-2

222-1 DOE has extensive knowledge of the types, locations, and concentrations of both radiological and chemical contaminants in Area IV and the NBZ of the SSFL. This knowledge derives from the years of environmental sampling conducted at the site by DOE, EPA, and others, resulting in SSFL possibly being one of the most tested of any cleanup site in the country (number of samples per acre). For example, EPA completed its latest radiological characterization study at SSFL in 2012, for which EPA tested a total of 3,735 soil and sediment samples and 215 groundwater and surface water samples. EPA described this study as “one of the most comprehensive technical investigations every undertaken for low-level radioactive contamination” (EPA 2012).

DOE acknowledges your support for additional cleanup of SSFL. DOE’s purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

222-2 DOE acknowledges your concern and refers you to Section 2.7, “Offsite Impacts,” and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 223: Kelsey Jordan

As a resident of Simi Valley, I want all of the waste cleaned up! This is such a great place to live and raise a family, but if living here means I am poisoning my child and giving her higher odds of getting a disease like cancer that is life threatening, it is not worth putting her life in danger. We want it cleaned!

Kelsey Jordan

|| 223-1
|| 223-2

223-1 DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing the EIS is to evaluate alternatives for those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

223-2 The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

DOE acknowledges your concern about cancer in the area and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 224: Anonymous

Full site cleanup is needed. Community education and awareness of associated health issues is also needed.

- 224-1 DOE acknowledges your support for full site cleanup. DOE’s purpose in preparing the EIS is to evaluate alternatives for those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. Each of the action alternatives evaluated for cleanup of Area IV and the NBZ is protective of the health and safety of the public and the environment.
- 224-2 DOE remains committed to communication of health issues to the community through the NEPA process and through public information meetings, the CleanUpdate newsletter, and the Energy Technology Engineering Center website.

Commenter No. 225: Heather Farrell

You MUST fully clean up the old Rockydyne Site. We will. It rest until you do. People are sick, our kids are sick and dying. You have contaminates our city, our soil, our wind, and our water. Please help us

Heather Farrell

|| 225-1
|| 225-2

225-1 DOE acknowledges your concern about full cleanup of the old Rocketdyne site; however, please note that DOE's purpose in preparing the EIS is to evaluate alternatives for completing cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ; cleanups of other portions of SSFL are the responsibilities of NASA and Boeing. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated for cleanup of Area IV and the NBZ is protective of the health and safety of the public and the environment.

225-2 DOE acknowledges your concerns and refers you to Section 2.7, "Offsite Impacts," of this CRD for a discussion about commenters' concerns about dispersion of contamination from SSFL, as well as Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. DOE's purpose in preparing this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

Commenter No. 226: Jyl Fearn

Please do not allow contamination to remain on the site. Please protect our community in anyway necessary, including proper waste cleanup and management necessary. You will affect more than your pocket book. Generations to come can be saved by the action taken now.

Jyl Fearn

226-1

226-1

DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

226-2

The purpose of this Final EIS is to evaluate alternatives for completing cleanup of those portions of SSFL for which DOE is responsible. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). It also evaluates two other cleanup alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. This latter risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

226-2

Thank you for your comment. It has been included in the Administrative Record for the EIS.

Commenter No. 227: Maria C. Rodriguez

You asked for COMMENTS...Well here they are. For years now we have attended meetings for plans to remove the toxic deposits from the Santa Susana Mountain area. Bad enough they covered up the meltdown back in the 50's. So much babble is exchanged and nothing is DONE>NOTHING. Plans don't clean up a mess. ACTION DOES. I had cancer in 2005 and people continue to get cancer within the area range effected. I have lived in Canoga Park/West Hills for 35 years. ENOUGH TALK.GET THE MESS CLEANED UP. MOVE THOSE TRUCKS THROUGH THE CANYONS. MAKE A NEW ROAD IF YOU HAVE TO BUT GET THAT MESS CLEANED UP BEFORE MORE PEOPLE DIE.

Maria C. Rodriguez

227-1

227-1 DOE prepared this EIS as a necessary step towards continued cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Prior to the cleanup evaluated in this EIS, there has been much cleanup previously conducted in Area IV. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. Also, please refer to Section 2.1, "Preferences for Cleanup," of this CRD for a discussion of steps necessary prior to resuming cleanup activities.

227-2

Regarding the statement that there was a cover up of a meltdown in the 1950s, DOE has not kept the SRE accident secret. The accident was reported to local and National media in an August 29, 1959 news release (Atomics International 1959). The accident was also described in detail in a reactor safety textbook, "The Technology of Nuclear Reactor Safety" published in 1964 (Thompson and Beckerley 1964). These and other documents related to operation of SRE can be found at http://www.etec.energy.gov/Library/Historical_Docs.html.

227-3

227-2 Thank you for your comment. It has been included in the Administrative Record for the EIS.

227-3 DOE acknowledges your concerns about cleanup of SSFL and the death of people in the SSFL vicinity. Please refer to Sections 2.1, "Preferences for Cleanup," and 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for discussions of these topics and DOE responses. Also, please see Chapter 3, Section 3.9.5 of this EIS, which summarizes several public health studies and worker health studies at SSFL and presents cancer mortality and incidence rates for the United States, California, and Los Angeles and Ventura Counties.

Please also refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

Commenter No. 228: Anonymous

How many more people are going to have to suffer and die before something is done? My mother was diagnosed last year with a very rare type of uterian sarcoma..... a Thousand Oaks resident for 40 years. I now have two children aged 5 and 2. The thought of them being diagnosed with a late stage, incurable cancer because of something that could have been dealt with and SHOULD HAVE been dealt with by now, is more than I can bear. It should be more than you can bear. Clear those toxins from our community. Make this a priority. What is of higher priority than the health of our children?

Anonymous

228-1

228-1 DOE acknowledges your concern about cleanup of SSFL and refers you to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV" of this CRD to get a better understanding of the current state of facilities and contamination in SSFL Area IV and the NBZ. DOE notes that a lot of cleanup has occurred at SSFL. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing).

228-2

The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

228-2

228-2 DOE acknowledges your concern about clearing toxins from the community. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers. Please also refer to Section 2.8, "Cancer and other Illnesses near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

With respect to the timeliness of DOE's completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or

Commenter No. 228 (cont'd): Anonymous

otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a ROD pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Commenter No. 229: Jennifer Mayo

Please clean up this site thoroughly. Please don't let more people get sick. This area is known to get very windy during Santa Susana winds, and the containment of the contaminants can scatter quickly.

Jennifer Mayo

|| 229-1

Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. DOE proposes to proceed with cleanup in accordance with the alternative selected following this EIS and the DTSC's Program Environmental Impact Report, which is evaluating cleanup of the entire SSFL. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

235-2

DOE acknowledges your preference for a full cleanup of SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options

Commenter No. 235 (cont'd): Sarah Holmes

for cleanup of Area IV and the NBZ. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. This section discusses the alternative that incorporates the technical elements of the 2010 AOC. None of the action alternatives leaves concentrations of chemicals or radionuclides that are dangerous for the intended use of the site as open space.

Commenter No. 236: Julie Kester

As a local citizen, mother & registered nurse I urge you to do the proper clean up of Santa Susana field lab. I remember during my oncology training in nursing school that we learned of the impact and direct cause that environmental toxins have on developing cancer... especially for our young children. We are all “down steam” from these toxins. I am 15 miles away which may sound like a lot but it isn’t. Young children have already died who have obtained cancer from this known area. It’s not okay to do nothing. The ONLY thing that is right to do is to properly clean up the toxins...for the sake of our entire community. It truly is a public health concern Thank you

Julie Kester

236-1

236-1 DOE acknowledges your preference for a full cleanup of SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers. Please also refer to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

236-2

236-2 DOE acknowledges your concern and refers you to Section 2.7, “Offsite Impacts,” of this CRD for a discussion about dispersion of contamination from SSFL, as well as Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

236-1

Commenter No. 237: Meridith Jones

I am ashamed with the DOE and its broken commitment to the local community regarding the Santa Susana field lab cleanup. As a mother of an infant, with many of my friends and family in this area, it is extremely upsetting that the DOE has turned its back on the environment and community surrounding this hazardous area. I challenge the DOE to keep its promise to clean the soil beyond federal standards as was agreed and for the health and wellness of human and environmental life.

Meridith Jones

237-1

237-1

In this EIS, DOE does not propose to breach the 2010 AOC signed with its regulator, DTSC. However NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. To meet this obligation, this EIS evaluates alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup levels (refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD). The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

Commenter No. 238: Laura Aguero

We've found 30 other children with rare cancers who live within 20 miles of the site. No study has been done on childhood cancers related to the site. We want answers, and we want a full cleanup. Leaving contaminants on site is not acceptable. Using scare tactics to make us think the site migration is more dangerous is not acceptable. Refusing to use less populated roads for the migration, not acceptable. Not having a full survey done of the risk to children in our communities, is completely not acceptable.

Laura Aguero

238-1 DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. One of the studies, by the University of Southern California Cancer Surveillance Program, reviewed the incidence of retinoblastoma in children (CSP 2007). The study authors concluded that the incidence of retinoblastoma among children under age 5 residing in the area around SSFL between 1988 and 2005 was slightly, although statistically not significantly, higher than expected based on incidence statewide. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

238-2 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

The purpose of this EIS is to evaluate alternatives for completing cleanup of those portions of SSFL for which DOE is responsible. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). It also evaluates two other cleanup alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

238-3 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

The analyses in this EIS were performed to evaluate the potential impacts associated with the various alternatives for cleanup of SSFL. In accordance with NEPA, the EIS

Commenter No. 238 (cont'd): Laura Agüero

evaluates the potential impacts on a variety of resource areas, including traffic, human health, cultural and biological resources, socioeconomics, and environmental justice. Results of the analyses allow a comparison of potential impacts across all evaluated resource areas as well as the tradeoffs between the alternatives.

DOE's intent is not to generate opposition to the SSFL cleanup or to scare locals out of supporting cleanup, but it is true that the more soil that is removed to remediate the site, the larger the transportation effort (i.e., a larger number of truck trips) required. Leaving more soil, and consequently low concentrations of chemicals and/or radionuclides on site, reduces the number of truck trips from the site. Conversely, removing the soil with low concentrations of chemicals and/or radionuclides, results in more truck trips from the site. This Final EIS shows that the transportation risks are very small; Chapter 4, Section 4.8.1 and Appendix H of the EIS provide details of the transportation risk analysis.

Commenter No. 239: Ashlee

Please clean up this mess!! It's so dangerous for the environment and our health. To many people have already been effected.

Ashlee

Commenter No. 241: Cassandra Moreno

The clean up needs to be done, this has gone on for far too long.
Cassandra Moreno

|| 241-1

241-1

DOE acknowledges your preference for a full cleanup of SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

With respect to the timeliness of DOE’s completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a ROD pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in September 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC’s Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Commenter No. 242: Sloan Rawls

The Santa Susana (SSFL) area is so obviously a cause for health concerns. There are many cases of people dying or getting cancer in the areas of Woodland Hills below it and Simi Valley above it. To deny that is to deny the facts and the dignity of the victims of this sloppy cover-up!!! Children are especially susceptible to toxins and I personally know a child who is a victim of this shameful catastrophe. How can anyone justify leaving toxic nuclear waste to poison and contaminate people and surrounding areas for decades?????? Please, please someone take responsibility or at least be gracious and caring enough to help our community and finally take care of this!! It's been going on long enough. Bureaucracy on this is causing people, children, INFANTS to be gravely ill and die!! Please. Help.

Sloan Rawls

242-1

242-1

DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for discussion of what is known about illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

242-1
cont'd

DOE's purpose in preparing this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. All of the action alternatives evaluated for cleanup of Area IV and the NBZ in this Final EIS are protective of the health and safety of the public and the environment.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ.

242-2

DOE acknowledges your concern about cleanup of toxic nuclear waste. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 242 (cont'd): Sloan Rawls

With respect to the timeliness of DOE's completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record of Decision pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). The establishment and funding of additional epidemiological studies are beyond the scope of this Final EIS.

Commenter No. 249: Elisa Cordova

Please follow through on your promise to COMPLETELY clean up the Santa Susana Field Lab spill this quarter. We have a small baby boy and am currently pregnant with a baby girl. My husband and I just purchased a newly constructed home in Simi Valley that will be ready in April, but we are considering backing out of the home if this issue is not resolved. We will NOT risk our families health if this issue is not corrected. It is terrible that Simi Valley residents live in fear of major disease including cancer may happen to themselves or our kids. We can't keep living with this question of risk hanging over our heads. Please clean up the leak completely! It is urgent and important! Thank you.

Elisa Cordova

250-3

With respect to the timeliness of DOE’s completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3 of this Final EIS, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record of Decision (ROD) pursuant to NEPA. As discussed in Chapter 1, Section 1.9.2 of this Final EIS, DTSC is currently preparing a program environmental impact report (a draft of the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* was issued by DTSC in 2017[DTSC 2017b]) under CEQA that applies to cleanup of the entire SSFL. DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC’s Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

250-2

250-2 DOE acknowledges your concern and refers you to Section 2.7, “Offsite Impacts” and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of these topics. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

250-3

250-3 Please see Section 2.7, “Offsite Impacts,” of this CRD for a discussion and DOE’s response to concerns about offsite impacts.

Commenter No. 251: Anonymous

For the sake of the communities health and lives clean up these toxic sites!!! This is unacceptable!

Anonymous

|| 251-1

251-1 DOE acknowledges your preference for a full cleanup of SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 252: Anonymous

Neuroblastoma. Rare forms of childhood leukemia. Death. Affected families. Tortured lives. Poisoned soil and water. How much longer can the citizens living near the SSFL continue to suffer through the decades while the cleanup is thwarted by officials operating like puppets under the pocketbook of Boeing? The stringent remediation to standards set out in SB990 should never have been fought or deemed unjust. When you have NUCLEAR WASTE at stake, how can a corporation or a city government even call into question issues about how to cleanup the situation... It's all about the money and how deep it cuts you. Well, if only the parents of the 30+ kids with RARE forms of cancer living within the 20 mile radius (and there very well are more cases of cancer of all ages and species- yup, pets!) could afford what Boeing, the DOE and city officials who have denied the stringent cleanup could afford. What about their tax paying dollars? What about their hospital bills, suffering, and faces of death? This is absolutely absurd that it comes down to "leave a comment about this draft." This should've been taken care of decades ago and NEVER COVERED UP. What a tragedy... To officials, to Boeing, to anyone reading this...Just because it's not in YOUR backyard, it doesn't make it right to continue to toxify the area and its inhabitants by not picking up after the horrific nuclear meltdown mess. I'm 200% certain that if you were breathing the toxins from nuclear waste daily in your cushy offices in downtown with fear of your testes shrinking, you'd have made a difference by now...

DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

252-2

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

Commenter No. 255: Cassandra Niehaus

As a mother concerned with the safety of my young children, I would like this site to be completely cleaned up and tested. There have been many reports of child cancer in and around this area and I believe an investigation needs to be conducted. We need to have a clear understanding of the impact and damage this has to the community.

Cassandra Niehaus

255-1

DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

255-2

The purpose of this EIS is to evaluate alternatives for completing cleanup of those portions of SSFL for which DOE is responsible. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities (refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD). It also evaluates two other cleanup alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Results of the analyses allow a comparison of potential impacts across all evaluated resource areas as well as the tradeoffs between the alternatives. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

255-2

DOE acknowledges your concern and refers you to Section 2.7, “Offsite Impacts” and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of these topics. Commenter No. 257: Alexia Liavas

Your automated response to my comment was: DOE will consider your comments during the preparation of the Final EIS for Remediation of Area IV and the NBZ of the SSFL, which is scheduled for completion in late 2016. DOE will issue a Record of Decision (ROD) in early 2017. Is this a joke? Has the final remediation that was “scheduled for the end of 2016” even been addressed? What is the “record of decision” that was supposed to be issued in early 2017?

Alexia Liavas

257-1

257-1

DOE apologizes for any confusion caused by the automated response and thanks you for notifying us that is was out of date. The response was revised to reflect the projected timing for finalizing the EIS and issuing a Record of Decision.

Commenter No. 262: Bonni Tromello, Crossroads in Health

My daughter in law grew up on the East end of Simi Valley, California. Last year she was diagnosed with a rare tumor on her submandibular salivary gland. I have been a Nurse Practitioner for 22 years, and a Nurse for 38 years. In that time I have only seen two such tumors. I have unfortunately seen numerous cases of lymphoma, breast and thyroid cancers in people living in the vicinity of the Santa Susana Field Laboratory. It has become part of my routine health history intake to assess if people have lived nearby. I urge that this area receive the cleanup it deserves, and this great problem not be swept under the rug yet again.

Bonni Tromello
Crossroads In Health

This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 268: Elyse Ryan

The fact that I personally know parents with children dying of rare forms of cancer within miles of my home with my babies living here is beyond frightening. Our babies breathe this air, drink this water, and play in this soil. We MUST care for our children and their future, or what will be left for their children? I am writing to beg the DOE to completely clean up the contaminants left over. There are too many cases of rare cancer in our children within this area. It is absolutely unacceptable. Please take back your humanity, and make the decision with you hearts.

Elyse Ryan
1981

268-1

268-1

DOE acknowledges your concern and refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

268-2

268-2

DOE acknowledges your preference for a full cleanup of SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information.

268-1

Commenter No. 269: Rina Nehdar

There are cancer clusters of children and adults in Oak Park, CA that seem to be a direct cause of the nuclear waste being spread by the winds from the SSL site. We have lost people who are dear to us and it's insane that the company responsible for this contamination isn't paying to clean it up. How many more people that we love must we lose? It won't stop until the clean up happens. Please help!

Rina Nehdar

269-1

DOE acknowledges your concerns and refers you to Section 2.7, "Offsite Impacts," of this CRD regarding your concerns about airborne dispersion of contaminants from SSFL and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

269-2

DOE acknowledges your concern about cleanup of the contamination. DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Appendix K of the EIS includes a cost-benefit analysis of remediation of SSFL Area IV and the NBZ. Cost will be one of the factors considered by DOE when reaching a decision on Area IV and NBZ that will be announced in the *Federal Register* after publication of this Final EIS. Decisions on payment for SSFL remediation will be made in accordance with Federal and State statute and are outside the scope of the EIS.

Commenter No. 270: Anonymous

The Santa Susanna area needs to be cleaned up and cleaned up in the safest way. I am one of the original cancer patients that was linked to the 1989 contamination of Simi Valley. Both my sister and I were diagnosed with thyroid cancer due to growing up in Simi. Diagnosed 3 months apart from each other. My sister has had multiple recurrences of thyroid cancer. I was fortunate that mine didn't come back. But now due to getting cancer we are at high risk for other cancers and other health issues due to the contaminants that Santa Susanna did to our home town. We do have other health issues that have been linked back to the junk we were exposed to as innocent children. No child or adult should have to go through having cancer because of the irresponsibility that Santa Susanna did. They contaminated the water, soil and air over Simi and surrounding areas. Innocent children shouldn't have to pay for this. Do the responsible thing and clean up the area. There has to be a safe way to clean up the area to prevent continued contamination of radioactive contaminants leaking into the valley and still hurting people. I didn't fight for years in the original civil lawsuit to have Santa Susanna still getting away with not cleaning up their mess.

Anonymous

270-1

270-1 DOE acknowledges your concerns and refers you to Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD regarding your concern about cleanup in the safest way, and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

270-2

270-2 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

270-3

270-3 DOE acknowledges your concern about cleanup of the area. DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Please also refer to Sections 2.7, "Offsite Impacts," and 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD.

Commenter No. 271: Eva Soria

It is imperative that DOE act on a FULL clean up of that toxic Santa susana site. The health and safety of the children and people in the surrounding communities are in your hands. Why allow more children to suffer from the toxins in their environment? Why are so many in such a small area getting cancer? Rare forms of cancer? You cannot deny the two are not connected. Take responsibility and do what is right.

Eva Soria

|| 271-1

271-2

- 271-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD). The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.
- 271-2 DOE acknowledges your concerns and refers you to Section 2.7, “Offsite Impacts,” of this CRD regarding your concern about toxins in the environment, and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 272: Jeannine Kowal

The Santa Susana site has been ignored too long. People need and deserve real remedial measures immediately. Just as the rate of cancer increased in Burbank when Lockheed decided to “clean” its ware by burning it into the air, Santa Susana’s ramifications continue to worsen the environment around it by leaching and other known methods of spreading the contamination. There can be no doubt the ramifications to our children and families will be unbearable. Do your jobs and protect the families being effected by the Santa Susana aftermath.

Jeannine Kowal

272-1

272-1 DOE acknowledges your concern about achieving remedial measures at SSFL. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information.

272-2

With respect to the timeliness of DOE’s completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record of Decision pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC’s Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DDTC approval of DOE-prepared RCRA closure plans for building demolition.

272-2

DOE acknowledges your concerns and refers you to Section 2.7, “Offsite Impacts,” of this CRD regarding your concern about dispersion of contaminants from SSFL, and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 273: Dayna Ross

I live within 10 miles of this site. My family has grown up in this area and in the San Fernando valley and witnessed multiple unexplained rare forms of cancer affect multiple children and people that live within a mile radius. I also have a 2 year old and feel so disgusted by our government and their blatant disregard for what is happening. This has been going on for TOO LONG. Stop hiding behind lobbyists and political tyranny. Clean this mess up for good. How dare you allow our earth to be contaminated in such a devastating matter. And more importantly how dare you allow our community become ill and DIE from this careless mistake. Make it right.

Dayna Ross

273-1

273-1 DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

273-2

DOE acknowledges your preference for a cleanup of SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Commenter No. 274: Laura Sheehan

Leaving contaminants on site is not acceptable. Using scare tactics to make us think the site migration is more dangerous is not acceptable. Refusing to use less populated roads for the migration, not acceptable. Not having a full survey done of the risk to children in our communities, is completely not acceptable. There are cancer clusters of children and adults in Oak Park, CA that seem to be a direct cause of the nuclear waste being spread by the winds from the SSL site. It is unfathomable that the company responsible for this contamination isn't paying to clean it up. Clean up needs to happen, and it needs to happen NOW. The responsibility is in your hands, please don't let us down.

Laura Sheehan

274-1

274-1 DOE acknowledges your concerns about cleanup of SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

274-2

Please also refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

274-3

The analyses in this Final EIS were performed to evaluate the potential impacts associated with the various alternatives for cleanup of SSFL. In accordance with NEPA, the EIS evaluates the potential impacts on a variety of resource areas, including traffic, human health, cultural and biological resources, socioeconomics, and environmental justice. Results of the analyses allow a comparison of potential impacts across all evaluated resource areas as well as the tradeoffs between the alternatives.

DOE's intent is not to generate opposition to the SSFL cleanup or to scare locals out of supporting cleanup, but it is true that the more soil that is removed to remediate the site, the larger the transportation effort (i.e., a larger number of truck trips) required. Leaving more soil, and consequently low concentrations of chemicals and/or radionuclides on site, reduces the number of truck trips from the site. Conversely, removing the soil with low concentrations of chemicals and/or radionuclides, results in more truck trips from the site. The EIS shows that the transportation risks are very small; Chapter 4, Section 4.8.1 and Appendix H of the EIS provide details of the transportation risk analysis.

274-2

DOE acknowledges your concerns and refers you to Section 2.7, "Offsite Impacts," of this CRD regarding your concerns about airborne dispersion of contaminants from SSFL, and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

Commenter No. 274 (cont'd): Laura Sheehan

274-3 DOE acknowledges your concern about cleanup of the contamination. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information.

With respect to the timeliness of DOE’s completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a ROD pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC’s Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Appendix K of this Final EIS includes a cost-benefit analysis of remediation of SSFL Area IV and the NBZ. Commenter No. 275: Sarah Stinson

Clean up this mess!!! You are murdering people! How sick is this. Full clean up, don't be horrible people!!!

Sarah Stinson

|| 275-1

275-1

DOE acknowledges your concern about achieving a full cleanup of SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 276: Simina Florea

Hi, Please fully cleanup the Santa Susana Field Lab. Covering it or partially cleaning it up is like applying a bandaid on a broken bone. What will happen in case of a major earthquake? And what about the all those people in the area affected by rare cancer types. Put yourself in those people shoes and see if you still think that partial cleanup is a solution. Thank you,

Simina Florea

276-1

276-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information.

276-2

The purpose of this EIS is to evaluate alternatives for completing cleanup of those portions of SSFL for which DOE is responsible. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities (refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD). It also evaluates two other cleanup alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

276-2

DOE acknowledges your concerns and refers you to Section 2.1, “Preferences for Cleanup,” of this CRD regarding your concern about a proper cleanup, and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE acknowledges that there would be potential risks to site workers in the event of a major earthquake. As addressed in Chapter 4, Section 4.2, of this EIS, risks to workers could occur during soil removal operations in areas where earthquake-induced landslides could occur. Risks to workers during building demolition could occur resulting from building collapse. Risks would be minimal during groundwater remediation operations. The low concentrations of chemicals and radionuclides in Area IV and NBZ soil would not pose an offsite threat as a result of an earthquake.

Commenter No. 277: Stacy M. Barninger

Please properly clean up and remove the waste from this site for the health and safety of the people would live in and around the area. I have two kids under 5 years old and fear for their (and my) long term safety. Thank you,

Stacy M. Barninger

|| 277-1
|| 277-2

277-1 DOE acknowledges your concern about cleanup of SSFL and removal of waste. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

277-2 DOE acknowledges your comment. Please see the response to comment 277-1.

Commenter No. 278: Sheila

I live extremely close to the effected area and just gave birth to my second child whom I was pregnant with while living in the area. My young family lives here and calls this home and now feel unsafe. I want to see this site cleaned up, as had originally been promised, AND a study done within a 20 mile radius of all the cases of childhood cancers occurring - or all cancers for that matter, so we can better understand and be proactive to the health needs of our community and our family. I am an oncology healthcare professional and am disheartened that this has not been cleaned up and is even a discussion. Those making the decision - I would love to know if you would live next door to this area or if you would want your children or grandchildren raised in its backyard. Not all of us have the financial means to pack up and leave and need to be prepared and advocate for this being cleaned up.

Sheila

278-1

278-2

278-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. This Final EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC, as well as alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup levels. The Cleanup to Revised LUT Values Alternative and the Conservation of Natural Resources Alternative would help to meet cleanup objectives by being protective of the environment and health and safety of the public and workers while avoiding some of the technical challenges and potential adverse environmental impacts associated with cleanup to the 2010 AOC LUT values. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. DOE acknowledges that implementation of any alternative would have to be approved by the DTSC.

278-2 DOE acknowledges your concerns and refers you to Section 2.7, “Offsite Impacts” and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of offsite contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ.

Commenter No. 279: Melinda Stern

There are cancer clusters of children and adults in Oak Park, CA that seem to be a direct cause of the nuclear waste being spread by the winds from the SSL site. We have lost people who are dear to us and it's insane that the company responsible for this contamination isn't paying to clean it up. How many more people that we love must we lose? DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

Commenter No. 281: Megan Cruz

Clean up Santa Susana! I'm begging for a full and complete cleanup. Too many kids I know in the area have been affected. Have a heart. Clean it up.

Megan Cruz

|| 281-1
|| 281-2

281-1 DOE acknowledges your preference for a full cleanup of SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

281-2 DOE acknowledges your concerns and refers you to Section 2.1, "Preferences for Cleanup," of this CRD regarding your concern about cleanup of SSFL, and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

Commenter No. 282: Rebecca Newman-Gonchar

To whom it may concern: I have 3 small kids and I'm concerned that there was no study done on the impact of this site or its clean up on the health of kids in the area. We moved to Thousand Oaks about 7 months ago and were surprised to learn about this contaminated site so close to our home, just this weekend. We weren't warned about moving to the area and should have been. Not only is the site soil and buildings contaminated, but who knows what has leaked into the water table, farm lands, or made its way into our communities some other way. I found the EIS summary a little difficult to digest. At 117 pages and with a significant number of referrals to outside documents, values, and agencies, I have to admit I don't feel like the most well-informed community member at this time. However, I can tell you that it sounds like both the no-action plan and the total clean-up plan appear to put my children at risk of inhaling or ingesting contaminated particulates in the air, water, or food... and I can tell you that no where in your report does it talk about how far reaching those particulates may be (so I don't know how far away I need to move to be safe) NOR does it tell me how big an impact the particulates will have on my children's tiny developing bodies (so I can't make an informed decision about their exposure). Here's what I want: 1. I want to know where my kids will be safe from contamination - what's the safe zone? 10-mi radius? 20? 30? I'm 15 miles away... am I safe? 2. I want to know how inhaling or ingesting these particulates will impact my kids - how likely is it that they will develop a rare disease or have learning troubles or suffer some form of cancer? 3. I want the DOE (in a bi-partisan, non-financial way) to take a stand on where the risks outweigh the benefits in terms of cleaning up this land - which option is the best for keeping my little ones safe? 4. I want the land cleaned up to the highest standard that leaves kids (including my own) safe from current or future risk of contamination. I want to be sure my kids and future generations of kids will be safe from harm. And I want it to be done as quickly as possible. You are already missing your 2017 deadline. If you have kids or grandkids or nieces or nephews, take a look at them before making any decisions. What would you want for them? Treat this decision and every decision like it, like what you decide matters to their lives. We are no different because we live here and you do not. Please think about the kids and the future generations of kids. Thank you for your time!

Rebecca Newman-Gonchar

282-1

282-1

282-3

282-1 DOE acknowledges your concerns and refers you to Section 2.7, "Offsite Impacts," of this CRD regarding your concern about contamination in communities due to SSFL and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE acknowledges that there are chemical and radioactive constituents above background levels in parts of that portion of SSFL for which it is responsible, Area IV and the NBZ. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers. As discussed in this EIS, NASA and Boeing are remediating those parts of SSFL for which they are responsible.

This Final EIS includes an analysis of the potential for offsite impacts resulting from potential airborne dispersion of contaminants from SSFL during remediation activities (see Chapter 4, Section 4.9, and Appendices G and K, of this Final EIS). Available data and the modeling performed for this EIS (see Chapter 4, Section 4.9) indicated that it is safe to live near SSFL.

282-2 DOE acknowledges your concern about cleanup of SSFL to the highest standard. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which

Commenter No. 282 (cont'd): Rebecca Newman-Gonchar

summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

With respect to the timeliness of DOE's completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record of Decision pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

- 282-3 DOE's local staff lives in the community. DOE considers all commenters concerns and recognizes that for people in the area of SSFL the cleanup is of the highest priority. Many people have spent many years delving into the issues surrounding the SSFL; DOE acknowledges their efforts and their heartfelt concerns.

Commenter No. 283: Dena Garabedian

My 4 1/2 year old daughter was diagnosed with Acute Lymphoblastic Leukemia (ALL) and underwent 2 1/2 years of intense chemotherapy. We live in Westlake Village and I am convinced our proximity to the nuclear meltdown and eventual lack of proper clean up was the direct cause of her illness. This put her life and health in jeopardy for the REST of her life. PLEASE do the proper cleaning of the site and make it a priority so no other children have to incur the wrath of illness. Thank you,

Dena Garabedian

283-1

DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 289: Ashli Morris

It is disgusting that people have the option to make a community healthy and they are trying to get out of it. It wasn't the communities fault that this happened but it is the governments fault that this hasn't been resolved yet. People live in the surrounding area... and the government is supposed to protect its civilians... where is the support? Where is the protection? You made a mess... now clean it up!

Ashli Morris

289-1

289-1

DOE acknowledges your concern about cleanup of SSFL. It is DOE's mission to remediate sites to ensure that they are protective of human health and the environment. DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS, which summarizes the public health studies that have been performed for the SSFL vicinity, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 290: Anita Vazquez

I believe the DOE should clear up the Santa Susana Field Lab... There are many families who live in the surrounding areas that are being affected by the contaminants. If you lived in the area you too would be concerned and want the best for your family, friends and community. I believe it is in the best interest of everyone to have it cleared up and avoid any future problems that may arise should it be left behind.

Anita Vazquez

|| 290-1
||
|| 290-2

290-1 DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

290-2 DOE acknowledges your concern and refers you to Section 2.1, "Preferences for Cleanup," of this CRD regarding cleanup alternatives, Section 2.7, "Offsite Impacts," of this CRD regarding offsite contamination, and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. Available data and the modeling performed for this Final EIS (see Chapter 4, Section 4.9) indicated that it is safe to live near SSFL.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

Commenter No. 291: Charity Chapman

Dear DOE, Please do what's right and clean this area up for our children. We bought our house in this area, with an understanding that we could raise our family in an environmentally safe location. Furthermore, Boeing, NASA (and any other responsible party) owes it to all of Los Angeles to undo the damage they have perpetrated to our soil and water. Please hold to your promise and do the right thing. Sincerely,

Charity Chapman (concerned Mama of two)

|| 291-1
|| 291-2
|| 291-1
|| cont'd

291-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

291-2 Thank you for your comment. The scope of this EIS is limited to cleanup of DOE's portions of SSFL, Area IV and the NBZ. Boeing and NASA cleanup activities are only considered as part of cumulative impacts (Chapter 5). Cleanup of the entire SSFL, including Boeing, NASA, and DOE activities, is being evaluated by the DTSC in a program environmental impact report. DTSC issued the *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* in September 2017 (DTSC 2017b).

Commenter No. 292: Jill Shaw

Leaving contaminants on site is not acceptable. Please keep our families safe. Using scare tactics to make us think the site migration is more dangerous is not acceptable. Refusing to use less populated roads for the migration, not acceptable. Not having a full survey done of the risk to children in our communities, is completely not acceptable.

Jill Shaw

|| 292-1
|| 292-2
|| 292-3

292-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information.

The purpose of this Final EIS is to evaluate alternatives for completing cleanup of those portions of SSFL for which DOE is responsible. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. (Please refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD.) It also evaluates two other cleanup alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

292-2 Please refer to Section 2.9, “Options for Transportation of Waste from SSFL,” of this CRD for a discussion of transportation topic and DOE’s response.

The analyses in this EIS were performed to evaluate the potential impacts associated with the various alternatives for cleanup of SSFL. In accordance with NEPA, the EIS evaluates the potential impacts on a variety of resource areas, including traffic, human health, cultural and biological resources, socioeconomics, and environmental justice. Results of the analyses allow a comparison of potential impacts across all evaluated resource areas as well as the tradeoffs between the alternatives.

DOE’s intent is not to generate opposition to the SSFL cleanup or to scare locals out of supporting cleanup, but it is true that the more soil that is removed to remediate the site, the larger the transportation effort (i.e., a larger number of truck trips) required. Leaving more soil, and consequently low concentrations of chemicals and/or radionuclides on site, reduces the number of truck trips from the site. Conversely, removing the soil with low concentrations of chemicals and/or radionuclides, results in more truck trips from the site. The EIS shows that the transportation risks are very small; Chapter 4, Section 4.8.1 and Appendix H of the EIS provide details of the transportation risk analysis.

Commenter No. 292 (cont'd): Jill Shaw

- 292-3 DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

Commenter No. 293: Anonymous

A full cleanup is needed. The risks are too high, too many people and CHILDREN developing rare cancers. This needs to be taken care of in the most responsible way possible, taking precious human lives into consideration. The cleanup needs to be complete.

Anonymous

|| 293-1
|| 293-2

293-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

293-2 DOE acknowledges your concerns and refers you to Section 2.1, “Preferences for Cleanup,” of this CRD regarding your concern about complete cleanup of SSFL and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for a discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 294: Christina Martinez

I am a resident of Simi Valley, CA, and have now lived here almost 3 years. Until moving here I had not heard about the nuclear meltdown and resulting contamination. When I found out that had happened, it caused extreme worry for me and my family. We have three children. Simi is a family oriented city and thus the site is surrounded by families and children. It is pertinent that the meltdown and contamination is cleaned up FULLY, and QUICKLY. There is no reason why this should have been left this way for this long. The fact that it is causing severe health problems is even more reason for it to be cleaned up fully and now. Please move on this. Do not delay and argue further. Get it cleaned up!

Christina Martinez

294-1

294-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information.

294-2

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities (refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD). It also evaluates two other cleanup alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

294-2

DOE acknowledges your concerns and refers you to Section 2.1, “Preferences for Cleanup,” of this CRD regarding your concern about complete cleanup of SSFL and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for a discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. Available data and the modeling performed for this EIS (see Chapter 4, Section 4.9) indicated that it is safe to live near SSFL.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this

Commenter No. 294 (cont'd): Christina Martinez

CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

Commenter No. 295: Anonymous

This isn't a coincidence. please clean this up!

295-1 DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 296: Lauren Edson

I would like a full clean-up of the site and a research study done on the health effects people have suffered as a result of the site.

Lauren Edson

|| 296-1

296-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Please see Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

Commenter No. 297: Alex Groh

I lived in Santa Susana for 10 years and was shocked to hear about the historical cover up of the radioactive contamination, and now the potential failure to clean it up?!?! The DOE needs to do the full clean up of this area. How is it even being considered to do a partial job? Was it not enough that they covered up the melt down and contamination? Now you want to partially clean up the mess. Over 30 children contracted extremely rare kinds of cancer because of the radioactive contamination in this area. These cancers are hardly ever seen in the medical field and yet the majority of the cases they are now seeing are clumped up around this area... definitely seems like an extensive cleanup needs to be done. Especially if the DOE and other responsible agencies and companies want to avoid decades of lawsuits. You have the chance to do it right now. So do it right. The health of our citizens depend on it.

Alex Groh

297-1

297-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

297-2

Commenter No. 299: Sasha Holmes

I am a new homeowner to the are of West Hills/Canoga Park that is very close to the SSLA Area. I am also a Mother to two young children that I hope will grow up to be healthy and happy adults. There are so many “what if’s” relating to this clean up, but we are really putting our local families at risk by not completing a full clean up of this site. Would you want your spouses, children and grandchildren to be at risk? I understand the unknowns are there, but why not provide a full clean up so that the unknowns are removed. This is a high priority item that should not be ignored or swept under the run any longer. Thank you for your time and consideration.

Sasha Holmes

Commenter No. 300: Johnny Wong

I am a homeowner in one of the most heavily impacted areas, and have grave concerns about my 7 year old daughter getting cancer from being here. I did not understand the disclosure when I purchased my property two years ago, and would not have bought if I had known the severity of the disaster and possible residual effects. It would be extremely ethical for any companies or the government to attempt to cover up the risks just to save money, and I, as I'm sure any impacted families, would look to legal means to recover should we experience any impact from such actions. I think the cost of litigation and negative publicity in the long run would greatly exceed the cost of cleanup. Please return the land to the way it was before the nuclear incident! How would you feel if you lived here and your kids got cancer???

Johnny Wong

300-1

300-1 DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," of this CRD regarding offsite contamination near SSFL and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

CRD.) This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

Commenter No. 301: Anonymous

Requesting a full clean up of the Santa Susana Field Laboratory. I have lived in Simi Valley all of my 41 years and have known many with cancers and autoimmune disorders in the community. I was interviewed by phone for the 2006 UCLA study on the affects of the SSFL and have reviewed the findings along with several other studies and this issue cannot be ignored. The health of the community has been jeopardized far too long and we deserve better.

304-1 As indicated in Chapter 1, Section 1.3, of this Final EIS, DOE operations at SSFL ended in 1988. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). Most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. DOE is now addressing final cleanup of Area IV and the NBZ, the portion of SSFL for which it is responsible. As stated in Chapter 1, Section 1.1, "Purpose and Need for Agency Action," of this Final EIS, DOE needs to complete remediation of SSFL Area IV and the NBZ to comply with applicable requirements for cleanup of radiological and hazardous substances. These requirements include regulations, orders, and agreements. To this end, DOE would need to remove the remaining DOE structures in Area IV of SSFL and clean up the affected environment in Area IV and the NBZ in a manner that is protective of the environment and the health and safety of the public and workers.

304-2 DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 306: Anonymous

I live extremely close to the effected area and just gave birth to my first child whom I was pregnant with while living in the area. My young family lives here and calls this home and now feel unsafe. I want to see this site cleaned up, as had originally been promised, AND a study done within a 20 mile radius of all the cases of childhood cancers occurring - or all cancer for that matter, so we can better understand and be proactive to the health needs of our community and our family. I am an oncology healthcare professional and am disheartened that this has not been cleaned up and is even a discussion. Those making the decision - I would love to know if you would live next door to this area or if you would want your children or grandchildren raised in its backyard. Not all of us have the financial means to pack up and leave and need to be prepared and advocate for this being cleaned up.

DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

Commenter No. 309: Anonymous

We need a full clean up! There have been multiple cases of extremely rare cancers in children who live in the surrounding areas. We need to uphold the values the conejo area says it lives by, and that is protecting its residents. Only a full clean up will accomplish this.

Commenter No. 310: Anonymous

I own commercial property and conduct a lot of business in the San Fernando Valley. I was considering buying my permanent home and raising children in the San Fernando Valley as well, but will decide against doing so unless the site is cleaned up, as had originally been promised, AND a study done within a 20 mile radius of all the cases of childhood cancers occurring - or all cancers for that matter, so we can better understand and be proactive to the health needs of the local community.

Anonymous

310-1

310-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

310-2

310-2 DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts" and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of offsite contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Commenter No. 311: Lilly Dollenmayer

As a tax payer of this area, I demand that we protect the health of our citizens. The number of unexplainable childhood cancers in our area should be reason enough to do a COMPLETE and IMMEDIATE clean up of the Santa Susana Field Laboratory. It is a crime to not consider the health data recorded and the citizens of our area will not stand for negligence.

Lilly Dollenmayer

311-1

311-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

310-2 DOE acknowledges your concern and refers you to Section 2.7, “Offsite Impacts” and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of offsite contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers. As discussed in this EIS, NASA and Boeing are remediating those parts of SSFL for which they are responsible.

Commenter No. 312: Amy Lehman

My 12 daughter was diagnosed with a very rare cancer in 2013, along with many other children in the Conejo Valley, which I firmly believe is a direct result of the contamination of the SSL site. The DOE and Rock-etydyne have put this community at risk for too long. Anything less than a full clean up is unacceptable. You cannot put profits over health and safety. We need to ensure all radiation and chemicals are removed from the soil and prevent new homes and parks from being built around the site. The delays and stalling have put more and more lives at risk, and the DOE should be fully culpable.

Amy Lehman

312-1

312-1 DOE acknowledges your concern and refers you to Section 2.7, “Offsite Impacts,” of this CRD regarding offsite contamination near SSFL and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

312-2

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). 312-3

312-2 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD). This latter risk assessment approach for soil cleanup is consistent with the approach used by DOE at other DOE sites, by DTSC at other DTSC-regulated sites, and by U.S. Environmental Protection Agency (EPA) at CERCLA sites. As

Commenter No. 312 (cont'd): Amy Lehman

discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

312-3 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts. Also, see Section 2.1, "Preferences for Cleanup," of this CRD for discussion and DOE's response to concerns over alternative selection.

Commenter No. 313: Heather Gibson

Clean up the Santa Susanna hazardous waste site!!! For our children!!!
Heather Gibson

|| **313-1**

313-1 DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

Commenter No. 319: Nichole Fogle

I would like to request a full clean-up from the Santa Susana Field Lab meltdown. I would like a full and complete survey done of the risk to children and others in our communities. I live in Thousand Oaks and have many friends and loved ones in Simi Valley, the Conejo Valley, and the San Fernando Valley. A friend of mine has found at least 30 other children with rare cancers who live within 20 miles of the site. I have two small children and I am very uneasy with the idea that a full clean-up will not be required. At the very least, more research should take place before a decision is made - specifically related to childhood cancer risks and rates in this area. Thank you for hearing my opinion and the voices of families across our communities.

Nichole Fogle

Commenter No. 321: Susan Bealand

In 2012 my granddaughter, Kaitlin Lehman, was diagnosed with Rhabdomyosarcoma. She lives in Newbury Park. The cost of treating this disease, physical, mental, emotional and financial, was absolutely devastating to the entire family. Any agency that denies or refuses to comply with clean up orders related to this atomic disaster is criminally negligent and should be held accountable in every court in the land. Every family who has suffered from this disaster should be allowed to seek millions of dollars in compensation for damages to health. That would make a thorough clean-up look cost effective. Quickly.

Susan Bealand

321-2

Thank you for your comment. It has been included in the Administrative Record for this EIS.

Commenter No. 322: Jennifer

When we are children we are taught early on a few things in life. Saying please and thank you, sharing, no hitting, clean up after yourself, honor your word. Somewhere along the line some forget these things. Some are never taught these things in the first place. I am reminded of this fact more frequently by the minute in these past few weeks. Very few viable silver linings on the horizon. I am genuinely concerned and terrified at the idea of an area such as this one going uncleaned to the fullest potential. Anyone who goes near that area can see it's a barren wasteland. A nuclear accident occurred at this site as well as countless other unmonitored pollutant filed activities and testing were performed in that area. Restrictions and laws were different, science was not as advanced and knowledgeable as it is today. Please require that the land be cleaned of ALL toxins. Carcinogens, emissions, nuclear runoff whatever it is cleaned. I bring us back to those first things we learned as little ones: clean up after yourself. Your room wasn't clean unless it was 100% clean... still isn't even as an adult so WHY are we asking for anything less from anyone else? You don't expect a 30% cleaned hotel room, 30% clean dishes at a restaurant, or a 30% cleaned doctors hand... let's re think this again. Not to mention the countless strange, abnormal diseases and cancers people are struggling an answer for. It's not right that this community should allow this to be swept under the rug any longer. My fiancée's mother has a very bad case of a rare untreatable disease and she has lived in the area since her childhood. I have watched her condition decline rapidly in these last few years. She lived in one of the more densely populated affected areas where more cases of these strange medical occurrences are happening. She is 65. My fiancée struggles with many health problems as well. I have noticed the water quality to be almost toxic and I wonder if it is due to this being a strong contaminant in our soil, air and water. We have already allowed so much time to pass that so much damage has already been done. It's almost heartbreaking to have to plead to our government to have a nuclear site that had an accident cleaned decades later to 100% or as close to it as humanely possible. This company should have been solely responsible, but what happened? Our land and people, animals, water and air, possibly down to a cellular level are contaminated with one of the worst things it can ever come in contact with. It has been long enough!

Jennifer

322-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). This latter approach the use of a risk assessment, is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

322-2 DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

322-3 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

Commenter No. 323: Tanya Calderon

Please clean up Santa Susana immediately!!

Tanya Calderon

|| 323-1

323-1

DOE acknowledges your concern about cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

With respect to the timeliness of DOE’s completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a ROD(s) pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]).

DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS RO ROD(s) D and DTSC’s Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Commenter No. 324: Yun Mei Lee

Please clean up the site. We want our children to be cancer free
Yun mei lee

|| 324-1

324-1 DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 325: Alexandra Loew

Please take the time, care, energy and dollars to properly clean up this site. Please do. It leave the contamination on site. Please take heed of the emergence of child leukemia and other cancers afflicting young fragile and innocent lives - and their families - in the vicinity. Please do the right thing. Please listen to the scientists and doctors. Thank you.

Alexandra Loew

325-2

325-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. 325-2 DOE acknowledges your concern and refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 326: Brittany Adams

I was Diagnosed with Rhabdomyosarcoma lived in Westlake village California in the year 2000 This cancer is extremely rare but it very common in the areas surrounding this toxic site.no doubt related to toxins in ground or ground water etc that originated at SSFL / rocketdyne I had chemotherapy treatment and surgery and feel lucky and blessed cancer free 17 years later. This is a childhood cancer affecting the most vulnerable of people small children and even Infants. In my case a teenager. I am blessed to be alive. Please clean up this toxic mess and help protect the children so they don't have to suffer through treatment or even worse die. Heartbreaking for everyone. Asking you to do the right thing and protect citizens especially the little ones who are so vulnerable to cancer! Clean Up This Mess Thanks

Brittany Adams

326-1

326-1 DOE acknowledges your concerns and refers you to Section 2.7, "Offsite Impacts," of this CRD regarding toxins in the ground or groundwater originating from SSFL and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

326-2

326-2 DOE acknowledges your concern about cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. Commenter No. 330: Ashli Shapiro

I am writing to respectfully request that a full cleanup of SSFL is performed. We know the harmful effects of radiation, and who know what else residents of surrounding areas are being exposed to. There is a cancer cluster in the 20 miles surrounding the site. There shouldn't even be a question of "How much should be cleaned up?" It should be a question of "How QUICKLY can we get this ALL cleaned up?" Thank you - this effects us all.

Ashli Shapiro

DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS

Commenter No. 330 (cont'd): Ashli Shapiro

which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 331: Katheryn Faulconer

I grew up in East Simi Valley. I was diagnosed with stage 2B Invasive Ductal Carcinoma at the age of 33 years old. I started feeling the tumor at 32 years old and was brushed aside by doctors because I was “too young”. That gave the tumor time to grow and also enter my lymph system. I have gone through chemotherapy and five different surgeries since my diagnosis. I have lost my breasts, nipples, hair, and both ovaries. Now I have a one in five chance of dying in the next seven years, based off the statistics. I am negative for BRCA 1 and 2 and I have absolutely zero family history of breast cancer. I have three friends (who are my age and grew up in Simi Valley) also get diagnosed with breast cancer. Two of them have already passed away. Nine people in my graduating class of high school (SVHS 1998) have been diagnosed with cancer so far. And I have other dear friends who have children who are fighting for their lives right now because of their rare childhood cancers they have been diagnosed with who live in Simi Valley. The idea that all of these cancer diagnoses are because of Rocketdyne’s mishaps and cover ups is absolutely disgusting to me. Enough is enough.

Katheryn Faulconer

Commenter No. 333: Rose White

Hello, My name is Rose White and I am a resident of Simi Valley raising 3 young children. I'm writing you today because there needs to be a full clean up done at the Santa Susana Field Site. It's time that measures are taken to have this toxicity removed. The area surrounding is full of families and this potential hazard is unnecessary. Women in the east Ventura County communities of Thousand Oaks, Simi Valley, and western Los Angeles County had invasive cancer rates of 10 percent to 20 percent higher than the rest of California. How many more people need to suffer and even die due to negligence? How many more law suits? How much time and money has been wasted already because of this? Others are hesitant to move to Simi Valley because they have heard of the higher cancer risks. Let's make a better future for all Ventura County residents and clean the Santa Susana Field Site. Thank you for your time. Sincerely,
Rose White

Rose White

333-2

DOE acknowledges your concerns and refers you to Section 2.1, "Preferences for Cleanup," of this CRD regarding cleanup of SSFL and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil

Commenter No. 333 (cont'd): Rose White

and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers. As discussed in this EIS, NASA and Boeing are remediating those parts of SSFL for which they are responsible.

Commenter No. 334: Heather Compton

I am a resident of Simi Valley and I am very concerned about the clean up efforts for the SSFL meltdown. My family personally knows several family who have been impacted by cancer in our area one of which is a teenage boy who was diagnosed with cancer and the only one to have survived. Those who were not as fortunate include two young men and one middle aged women who succumbed to un-treatable cancers of different types and have heard stories of many others. We want to see a FULL clean up of this area and we are NOT on board with leaving up 93% of the contaminants on site. We don't want to watch our children and loved ones suffer through more pain and possible deaths because a company doesn't want to clean up their mess properly. I ask you to please considers all the lives your decision affects.

Heather Compton

Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

With respect to the timeliness of DOE's completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record of Decision pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Commenter No. 337: Laura Paterson

I believe that more research needs to be done, specifically an assessment of pediatric cancers within a 20 mile radius, and/or a full clean up of the site. It is unacceptable to leave known contaminants on site.

Laura Paterson

|| 337-1
|| 337-2

- 337-1 DOE acknowledges your concerns and refers you to Section 2.1, “Preferences for Cleanup,” of this CRD regarding cleanup of SSFL and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.
- 337-2 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 338: Nivole

I demand a full clean up for the safety and futures of my 3 children and the larger community.

Nivole

|| 338-1

338-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

Commenter No. 339: Susie Segovia

This is a call for action. It is imperative that a complete (100%) -clean-up of the SSFL Area IV EIS be completed. Unfortunately, the alternative approach by the DEIS is highly inadequate as it will continue to place our community at risk with the continued toxic exposure. Furthermore, it should be noted that a research study on Cancers/chronic conditions in correlation with the environmental toxins be conducted as a result of the nuclear spill. Finally, I ask for accountability because human lives matter.

Susie Segovia

339-1

339-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information.

339-2

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD). This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

339-2

DOE acknowledges your concern and refers you to Section 2.7, “Offsite Impacts,” of this CRD regarding offsite contamination near SSFL and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

Commenter No. 340: Jamye Waxman

Please clean up the plant and stop Cancer

Jamye Waxman

|| 340-1

340-1 DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 341: Priscilla England

To many cases of cancer have been documented in this area to the point that the probability of coincidence is very low. A full investigation must be done and thorough clean up must be mandated. The innocent people in the surrounding areas deserve safety and we have an obligation to provide a safe and cancer free environment. Investigate the effects of cancer and clean up!

Priscilla England

341-1

341-1

DOE acknowledges your concerns and refers you to Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD regarding cleanup of SSFL, Section 2.7, “Offsite Impacts,” of this CRD regarding offsite contamination near SSFL, and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 342: Michael Bakkenson

It is unacceptable that this site has remained in such a state for so long. Please ensure the contaminants get removed and the site is restored to background standards. My nephew who lived in Chatsworth contracted a rare form of cancer. My own family lives in West Hills-- a few miles away. Please clean it up. There is more to life than whatever is holding the process up.

Michael Bakkenson

342-1

342-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

342-2

There has been a lot of cleanup performed in Area IV. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation at those portions of SSFL for which DOE is responsible, Area IV and the NBZ.

342-2

DOE acknowledges your concerns and refers you to Section 2.1, "Preferences for Cleanup," of this CRD regarding cleanup of SSFL, as well as necessary steps prior to continuing cleanup, and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ.

Commenter No. 343: Katie Rothman

I lived in West Hills in Hidden Lake during my pregnancy in 2009-2010. My son was born in 2010 and diagnosed with a rare cancer in 2012. I wondered if we were living within that 20 mile radius as I believe we were.

Katie Rothman

343-1

Commenter No. 345: Bonnie Klea

Cleanup all of the rads and chemicals. A 45.1 million dollar rad survey shows where all of it is located. The cancer toll around the site is huge. There are 3881 cancer claims from workers, a former retina blastoma cluster, a child leukemia cluster now, former research shows cancer at 2 miles is 60% higher than 5 miles and census tracts that show bladder cancer is 50% higher. What are you waiting for?

Bonnie Klea

Commenter No. 352: Bevin Pike

As a resident of Simi Valley, I am very concerned about the potential effect any residual nuclear and toxic waste will have on our residents and our children. There have been no studies on the effects of these residual wastes on children and with a prevalence of kids with rare cancers in the area, this absolutely needs to be done. Don't let this be the Ford Pinto of our generation, where the cost-benefit analysis is valued over human, and specifically our children's, lives. Abide by your original promises and contracts and perform a full clean up of the site.

Bevin Pike

DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

352-2

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ.

352-2

Thank you for your comment. It has been included in the Administrative Record for the EIS. As a Federal agency, DOE is required to evaluate and justify major expenditures of Federal dollars. DOE performed a cost-benefit analysis of the soil remediation alternatives as part of this EIS (see Appendix K). The results of the analysis show that the cleanup under the Cleanup to 2010 AOC LUT Values Alternative would be much more expensive and with minimal additional protection of public health and the environment compared to the other project soil remediation alternatives

352-3

DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 353: Virginia Dooley

I have two small children and I am extremely concerned about this area.
Please get this area cleaned up as soon as possible.

Virginia Dooley

|| 353-1
|| 353-2

353-1 DOE acknowledges your concern. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Descriptions of the alternatives and a summary of the potential impacts are provided in Chapter 2 of this EIS. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

353-2 DOE acknowledges your concern about cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

With respect to the timeliness of DOE’s completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record of Decision pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC’s Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Commenter No. 354: Anonymous

I urge you to make sure it gets cleaned up from all toxins! We shouldn't live in fear of getting sick. Our city should be a safe city to live in, including the soil & water around us.

- 354-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.
- 354-2 Thank you for your comment. It has been included in the Administrative Record for the EIS.

Commenter No. 355: Shannon

We want the toxic and nuclear waste removed completely! Too many kids in your area are being affected by rare cancers! This is not a coincidence. Please do the right thing and make it safe!

Shannon

|| **355-1**

|| **355-2**

355-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

355-2 DOE acknowledges your concern and refers you to Section 2.7, “Offsite Impacts,” regarding offsite contamination near SSFL and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Descriptions of the alternatives and a summary of the potential impacts are provided in Chapter 2 of this EIS. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

Commenter No. 356: Tammi Pickle

I am requesting full clean up of the Santa Susana site for the health of the citizens of Simi Valley especially for the children living and breathing in this toxic environment. Please do something about this for the health of our beautiful city and citizens.

Tammi Pickle
Citizen of Simi Valley

356-1

356-2

356-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD). This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives. Also please see Section 2.7, “Offsite Impacts” of this CRD. As described in this section, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA’s soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC’s review of the data (included as part of DTSC’s broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

356-2 The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Descriptions of the alternatives and a summary of the potential impacts are provided in Chapter 2 of this EIS. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

Commenter No. 357: Tonia Green

It is ridiculous and inhumane to disregard the evidence of an increase of childhood cancers found in the surrounding areas. It is absolutely unacceptable to turn a blind eye just because you do not want to take responsibility for the consequences of neglecting this site. How dare our children be subjected to these toxins and experimented with. Please do the right thing and clean up the site!

Tonia Green

357-1

357-1 DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," of this CRD regarding offsite contamination near SSFL and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS R ROD(s) OD and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Commenter No. 362: Tabatha Saldivar

We deserve to not live in fear that our children are dying because of the area we live in! Please clean up the Santa Susana Nuclear site! The citizens in Ventura and Los Angeles County did NOT cause this and we SHOULD NOT have to suffer the on-going consequences. Our children deserve the same opportunity as children in non-affected neighborhoods. We aren't going away and we will use the power of social media, local networking and community awareness and involvement to get this corrected. Please do not let this turn into Hinkley, California or Flint, Michigan. Please think of our children and all the children that have already suffered from this catastrophic meltdown.

Tabatha Saldivar

362-1

362-1 DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

362-2

362-2 DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

Commenter No. 363: Nicole Golden

I want all of the terrible waste cleaned up at the santa susana rocketdyne area. It is dangerous and hazardous

Nicole Golden

363-1

363-1

DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information.

The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD.) This latter use of a risk assessment approach for soil cleanup is consistent with the approach used by DOE at other DOE sites, by DTSC at other DTSC-regulated sites, and by U.S. Environmental Protection Agency (EPA) at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

Commenter No. 366: Anonymous

There has to be accountability and responsibility in the clean up of this area. Far too many illnesses tracked in these areas to make them a coincidence. Now corners may be cut? Not fair to the people living in the surrounding areas do you're part as human beings and make the right decision and force 100% clean up.Thank you.

Anonymous

366-1

366-1 There are three responsible parties (DOE, NASA, and Boeing) at SSFL who performed work and there are environmental consequences as a result of this work. Each of the three parties is responsible to remediate the areas where its work was performed. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ.

366-2

Please see Section 2.1, "Preferences for Cleanup," of this CRD regarding your concern about cleanup of SSFL and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 367: Adriana Wendland

I am a resident and concerned about the impact nuclear and toxic waste might have on my children and the children in the community. Please do right be the families that could be impacted.

Adriana Wendland

367-1

367-1

DOE acknowledges your concern and refers you to Section 2.7, “Offsite Impacts,” of this CRD regarding offsite contamination near SSFL and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

Commenter No. 368: Bridgette Rosson

In my opinion, the clean up needs to be 100% done and should have been done decades ago. My sister passed away in 1986 at the age of 17 from Ewing Sarcoma. It is a rare bone cancer. We grew up in Canoga Park between Roscoe and Parthenia. My older kids grew up on West Hills and both have had friends diagnosed with cancer and friends that have passed away from cancer. This has all been in the last 5 years. I think studies need to be done on the rates of cancer in the area, as well as the clean up.

Bridgette Rosson

|| 368-1

|| 368-2

368-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information.

There has been a lot of cleanup performed in Area IV. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation at those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

368-2 DOE acknowledges your concerns and refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

Commenter No. 369: Lisa Hunzeker

My family and I are residents of Thousand Oaks and are extremely concerned about the residual effects of the toxic land from the SSFL and demand a 100% cleanup.

Lisa Hunzeker

||| 369-1

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 370: Heather N. Johnson

Clean up the site! I've been reading about rare forms of cancer being discovered in the communities surrounding the SSFL

Heather N. Johnson

|| 370-1
|| 370-2

370-1 DOE acknowledges your concern about cleanup of SSFL. It is DOE's mission to remediate sites to ensure that they are protective of human health and the environment. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

370-2 DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 371: Robin Williams

Department of Energy,

I have lived in Simi Valley for seven years and have found it to be a wonderful place to raise my three children, but the more I learn about the Rocketdyne meltdown and the lack of remediation at the Santa Susana Field Lab, the more I worry about the health and safety of my children. I now worry about the soil in Simi Valley and even more so our groundwater. I worry about my friends battling cancer and seeing friends children spend more time in a pediatric oncology unit than at their elementary school. My job as a mother is to worry about the health and safety of my children, your job is ensure the complete clean up of any and all areas affected. Anything less than 100% remediation of the Santa Susana Field Laboratory is unacceptable. Please do the right thing for the residents of our city and ensure the clean up is done!

Robin Williams

371-1

DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information.

Commenter No. 372: Anonymous

I would like a full clean up to be done so no more people will suffer cancer from this situation.

Anonymous

|| 372-1

372-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

Commenter No. 373: Sian Jones

Please ensure you decontaminate this site, cancer caused by environmental exposure is real and this site is affecting the local community. You have the ability to do something that may save a life and stop a family suffering, do the right thing!

Sian Jones

|| 373-2

373-1 DOE acknowledges your concern about decontamination of SSFL. DOE's purpose in preparing this Final EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information regarding a complete cleanup of SSFL.

373-2 DOE acknowledges your concerns and refers you to Section 2.7, "Offsite Impacts," of this CRD regarding offsite environmental exposure and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

Commenter No. 374: Amanda Richins

We moved to Simi Valley in 1997, top of Indian Hills to be exact. This month marks 10years since my mom passed away from brain cancer-anaplastic astrocytoma. She had a an MRI prior to moving here from Texas to get a baseline for her headaches. 12yrs later (Dec 2006) she was diagnosed and passed away Feb 2007. Her tumors didn't respond well to medications and she also developed little tumors in separate lobes of the brain which is not characteristic of her cancer. She was only 42, wife, mom of two, ICU nurse, active runner, and road biker. Please clean up the area keep residents safe and ease all our minds. Thank you.

Amanda Richins

374-1

374-1

Thank you for your comment. It has been included in the Administrative Record for the EIS.

374-2

374-2

DOE acknowledges your concern about cleanup of the area. DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 375: Adrianna Jimenez

My family has lived in Ventura County for over a century and we were unaware of the the toxic contaminants until moving to Simi Valley a few years ago. I was heart broken to hear that local residents,many of whom are children, have been diagnosed with cancer. We implore the DOE to follow through with the previous decision to clean up all of toxic contaminants in Santa Susuana and surrounding affected areas. Thank you.

Adrianna Jimenez

375-1

DOE acknowledges your concerns and refers you to Section 2.7, “Offsite Impacts,” of this CRD regarding offsite contamination near SSFL and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

375-2

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. DOE’s purpose in preparing this EIS is to evaluate alternatives for cleanup of Area IV and the NBZ, those portions of the site for which it is responsible. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

375-2

DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. DOE is responsible for the cleanup of area IV and the NBZ. But, as described in Section 2.7, “Offsite Impacts” of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA’s soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC’s review of the data (included as part of DTSC’s broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

Commenter No. 376: Heather McDowell-Lynch

As a resident of Simi Valley I demand that all hazardous and toxic waste be fully removed and cleaned. To do anything less than a complete clean up is condemning an entire community to death and illness. It is not only a civic duty but also a moral one

Heather McDowell-Lynch

Commenter No. 381: Shannon Smith

So scary. Im going to get the heck outa here, ive been in simi since 2008. In 2014 i had my apendix out, found out i had a tumor on my kidney, it was removed and was positive melanoma (cancer). Im going in for a surgery on the 9th to check my uterus for cancer. Ive been spotting in between periods, so thats why im having the test. After i had my appendix out 3 of my Neighbors had their apendix out too and then my son last year. I thought that was a wierd coincidence!! Also my daughters friend that lives in our complex had childhood leukemia!! Im so freaking out right now..... Please clean up santa suzanna!! I love living out here, the community is amazining, but i have children and i will not risk their lives by living by a toxic waste. Have you no heart? How has this not been taken care of. There are many more children and adults that i have read about, that have some sort of illness, or cancer!!

Commenter No. 382: Heather Olson

I have 2 toddlers at home and I live with the fear of my boys getting cancer from this site like so many other children in the area. Please clean up 100% of the contaminants on the site. Do it at any cost! Do it for my children and their future. These children are too young and are so innocent and haven't lived enough of the good life yet, they shouldn't be put at risk to have to go through fighting cancer or disease by something that can be prevented. You wouldn't want your children to be put in this situation, by not cleaning this up 100% you would be doing it to ours. Please, please, please help us take the risk away from our children!

Heather Olson

Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 384: Anonymous

Nothing less than a full cleanup is unacceptable! The fact that over the last 40-50 years that this has remained toxic in an area in the San Fernando Valley with hundred of thousands of residents affected is immoral. Boeing and the Department of Energy has been NEGLIGENT in not cleaning up this site to the fullest extent possible. I support a compete and FULL cleanup and anything less would be criminal. The obligation of the DOE and BOEING is clear and their immediate action needs to be undertaken and the site needs to be repaired to the preexisting condition.

Anonymous

384-1

384-1 DOE acknowledges your preference for a full cleanup and refers you to Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

384-2

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

384-2

DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

Commenter No. 385: Sara Macaluso

I strongly urge the DOE to pay attention to the parents who have begun to map cases of cancer in children around the Santa Susana Nuclear Waste facility. As a mother of a young child in the area I am terrified for his long-term health and fearful that lack of attention to this issue puts him at continued risk. Apparently the DOE has cited truck exhaust and other environmental concerns in regards to cleaning up this Waste site, but concern for the health of our children - and the risk of life-threatening cancers - far outweighs any environmental concerns. Please do the right thing by the children in this area and investigate the possible cancer cluster and do what is necessary to ensure the health and safety of our children.

Sara Macaluso

385-1

385-1

DOE acknowledges your concern and refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. The evaluation allows a comparison of the potential impacts that implementing each alternative could have on all resource areas, including human health and safety, biological and cultural resources, ground and surface water resources, air quality, and traffic. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

Commenter No. 386: Alejandra Ortega

To whom this may concern. Please hear our hearts Cry for all the innocent kids,our children and the parents Who have to pay the consequences for irresponsible Accidents and testing! I'm seeing more and more people Suffering cancer problems at such a young age and We suffer watching them die and go through agony. Please help make our community a place where we can live Without the worries of who gets cancer next. The Cleaning of the nuclear spill is crucial.

Alejandra Ortega

386-1

386-1

DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

386-2

386-2

DOE acknowledges your concern about cleanup of Area IV at SSFL. DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Committer No. 387: Sandra Andrade

Please do a complete clean up of the SSFL. I currently live in Santa Paula but I lived in Chatsworth on Poema Pl while I was pregnant with my first child Sophia. At the age of 2 years old she was diagnosed with stage 4 neuroblastoma. We were told by her oncologist that neuroblastoma is encoded in the baby's DNA in the first trimester. Sophia passed away in 2014 after a 2 1/2 year battle with childhood cancer. Please clean this mess up fully to help prevent cancer in more children.

Sandra Andrade

|| 387-1

|| 387-2

|| 387-1
cont'd

387-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act. Please see Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 387 (cont'd): Sandra Andrade

- 387-2 DOE thanks you for your comment and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 388: Dollirae Gray, Thomas and Gray Services

To Whom It May Concern: Please do ALL that you can to clean up the toxic waste in the SSFL area. I have four children and I want them to grow up in a safe environment. I want to see this done as soon as possible so that more children are spared the tragedy of childhood cancers. Please help us.

Dollirae Gray
Thomas and Gray Services

Commenter No. 390: Paula Roth

As a resident of the nearby areas potentially affected by the nuclear waste in said site, I request that the DOE stick to their original promise and eliminate all the waste, not just a part of it, and that this elimination be done in a safe fashion for not only the population but also the environment. It is absolutely unacceptable to even suggest that this radioactive, potentially lethal waste be left on site to naturally degrade over decades and decades. The impacts of such actions are not only shameful and outright irresponsible but potentially actionable. Please do not endanger the lives of our community, our work force, our children.

Paula Roth

390-1

390-1

DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information.

390-2

Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

Commenter No. 392: Daniel Paletz

As likely one of only a few people to comment and to have read the reports it makes zero sense to not spend the \$468 million to reduce the hazard levels to something that is nearly insignificant. The populations that live in the area are tax payers and home owners who will face the human and financial cost of not conducting a full cleanup. As a father of three young children I expect government to provide the fundamental function of safety to our community. I can be reached for further comment, but I am heartbroken for the families watching. Their children die because government continues to not act. I suggest each employee of this agency sacrifice their first born if they opt to not to clean up the land completely.

Daniel Paletz

392-1

392-1 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information.

392-2

The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

Commenter No. 393: Rachel Nygren

I grew up in the Thousand Oaks area and only a few years ago, at the age of 38, did I learn about the Santa Susana site and how bad the spill was. This is insane that it is just a few miles from so many homes. Our children and families are suffering the consequences of this site not being properly cleaned up. DO NOT allow this to be swept under the rug. The site MUST be cleaned appropriately and in a timely manner.

Rachel Nygren

393-2

393-2

DOE acknowledges your concern about cleanup of SSFL. DOE’s purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information.

Commenter No. 394: Charity Chapman

Hello again, I also felt compelled to write a bit of my story as a Mom of two little people who were born and raised in this area. My son has had CHRONIC mystery medical illnesses. The result has been now at age 12, he is off all normal food (dairy, wheat & eggs), has had pneumonia too many times to count and other ailments. My daughter at 8 has had mysterious stomach problems, including gastritis (that seems to refuse to heal). She is also off all normal food and eats a very restricted diet (and sadly) is sick often. They have both missed far more than their allotted amount of school. We are in the zone where apparently many toxic substances have blown or otherwise made their way down to a group of people who definitely cannot handle it. What this dirty site is doing to our kids is unthinkable. Please, please clean this mess up completely, so my kids and all the other kids in this area can have a fair shot at a healthy life.

Sincerely,

Charity Chapman

394-1

394-1 Thank you for your comment. It has been included in the Administrative Record for this EIS.

394-2 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

394-2

The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent" of this CRD.) This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives. Also see Section 2.7, "Offsite Impacts" of this CRD. As described in this section, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

Commenter No. 395: Anonymous

I think you owe it to our community to fully clean up the toxic environment that you created. It is highly suspicious the number of rare cancers that have popped up in children and adults closest to the site. These our people's lives we are talked about and a price cannot be put on that.

Commenter No. 397: Victoria Axworthy

The original AOC agreement signed in 2010 should be honored. 100% clean up should be the only acceptable solution to this terrible and historic disaster. My grandfather worked at the Santa Susana labs, my family grew up hearing the stories not to drink the Simi water and reading regularly about all the cancer found in people living in the Knollwood area of Simi. Any alternative that leaves our community without the safety of a full clean up is not acceptable. Take care of this issue the right way. The melt down was initially hidden away from public knowledge and as a result has caused irreparable harm and damage to the lives of many, do not do yet another disservice to the residents here.

Victoria Axworthy

397-1

397-1

DOE acknowledges your support for cleanup in accordance with the 2010 AOC. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information, including necessary steps prior to continuing cleanup.

397-2

The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD.) This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

397-2

DOE acknowledges your concerns and refers you to Section 2.7, “Offsite Impacts,” of this CRD regarding offsite contamination and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Chapter 1, Section 1.3, of this EIS contains a brief history of activities at SSFL. Additional information about the activities of DOE and its predecessor agency, the Atomic Energy Commission, at Area IV at SSFL can be found at <http://www.etec.energy.gov/>. Information about the 1959 SRE accident can be found at http://www.etec.energy.gov/Operations/Major_Operations/SRE_Accident.html.

Commenter No. 397 (cont'd): Victoria Axworthy

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. Looking forward, the purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

Commenter No. 398: Cassandra Burns

We want all waste eliminated from this area removed and fir the area ti be completely decontaminated. Too many people and specifically children are diagnosed with and are fighting, rare cancers. We must ensure proper measures are taken to completely remove any and all contamination from this site once and for all.

Cassandra Burns

- 398-1** DOE acknowledges your support for cleanup in accordance with the 2010 AOC. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information, including necessary steps prior to continuing cleanup. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.
- 398-2** DOE acknowledges your concern and refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 399: Anonymous

Please clean up this toxic mess! We need to protect our children no more cancer!!

Anonymous

|| 399-1

399-1

DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing this Final EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 400: Nichole Simpson

There is an obligation to this community and surrounding impacted communities to continuously make every and all efforts over the upcoming years to provide a safe environment in the waters, air and soil. Those individuals and children within these communities especially Simi Valley may have endured unnecessary exposures because of minimal clean up efforts. We are a country of Standard and we must maintain that standard within each and every community. DOE's support on this matter in respect to health safety codes and regulations is vital.

Nichole Simpson

400-1

400-1 Thank you for your comment. It has been added to the Administrative Record for the EIS. DOE agrees that protection of the environment is an obligation. As stated in Chapter 1, Section 1.1, "Purpose and Need for Agency Action," of this Final EIS: "DOE needs to remove the remaining DOE structures in Area IV of SSFL and clean up the affected environment in Area IV and the NBZ in a manner that is protective of the environment and the health and safety of the public and workers."

400-2

400-2 DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," of this CRD regarding offsite contamination near SSFL and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

400-3

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ.

400-3

DOE will complete contamination removal and site remediation based on the decisions made pursuant to this Final EIS and in accordance with applicable regulatory requirements. Chapter 8 of this Final EIS presents the environmental, safety, and health laws, regulations, orders, and permits that apply or may potentially apply to the proposed alternatives evaluated in the EIS. Section 8.1 identifies Federal and State of California laws, regulations, orders, and other requirements, and includes those governing health and safety of both workers and the public. The requirements of applicable regulations will be incorporated as appropriate into implementation of the selected alternatives.

Commenter No. 400 (cont'd): Nichole Simpson

In accordance with CEQA, the Department of Toxic Substance Control (DTSC) must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017a]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Commenter No. 401: Jennifer Shewbert

I would like to see a 100% cleanup. As a resident who lives within 5 miles of the site, I expect a solution. We have a toddler, and I hate to think of the mess.

Jennifer Shewbert

|| 401-1
|| 401-2

- 401-1 DOE acknowledges your preference for 100 percent cleanup of the site. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.
- 401-2 DOE acknowledges your concern and refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. Commenter No. 407: Jennifer Rodionoff

I am a parent of two children, 8 and 10 years old. My husband and I purchased a home in Agoura Hills at 6301 Pisces Street shortly before my ten year old was born. We were horrified to learn about the Santa Susanna Field Lab incidents when our children were still toddlers, and that there is an established “cancer cluster” in Oak park, which was within walking distance of our home. How could it be that the site of the worst nuclear disaster in our country was five miles from our home and we had NO idea?! How could it be that in this great country such a disaster was and is still is such a mystery to the general public, that no mandatory disclosures exist, and worse that no one has cleaned up the mess yet?! We moved when my son was 6 and my daughter 4 to Westlake Village, with the clear intention of getting further away from the disaster. But are we far enough away? Have we escaped any damage from our exposure? Frighteningly, time will tell. In the meantime it is imperative that our government and the responsible parties fix this problem immediately and clean up that mess. In our country we are quick to point fingers at other “third world,” “backwards,” and even “corrupt” nations. This disaster proves we are truly the biggest offender of all. Please the time is now to fix this outrageous wrong once and for all.

Jennifer Rodionoff

407-1

407-1 DOE acknowledges your concern and refers you to Section 2.7, “Offsite Impacts,” of this CRD regarding offsite contamination near SSFL and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. Available data and the modeling performed for this EIS (please see Chapter 4, Section 4.9) indicated that it is safe to live near SSFL.

407-2

407-1
cont'd

407-2 Chapter 1, Sections 1.3 and 1.4, of the EIS contains a brief history of activities at SSFL and describes the radiological and chemical characterization studies performed for Area IV and the NBZ. Additional information about the activities of DOE and its predecessor agency, the Atomic Energy Commission, at Area IV can be found at <http://www.etec.energy.gov/>. Chapter 3, Sections 3.9.5 and 3.9.6, of the EIS provide information about accidents at Area IV, including the 1959 SRE accident, which was the only accident that caused a measureable release of radioactive material.

407-3

Chapter 3, Section 3.9.6, of this Final EIS explains that at the time of the accident it was estimated that the accident resulted in the release (over a 2-month period) of about 28 curies of radioactive noble gases such as krypton-85, in low, controlled concentrations that met Federal requirements. The release was estimated to result in a maximum radiation dose at the location of the nearest resident of 0.018 millirem. Using current risk factors, this dose would have resulted in a risk of a fatal cancer to an exposed individual of 1×10^{-8} (one chance in about 93 million). A 1999 study by ATSDR estimated a maximum dose to a potentially exposed individual of 0.005 millirem with an even smaller risk of a fatal cancer.

Because of public concern about the accident, DOE hosted an informational workshop on August 29, 2009, with testimony from 3 independent experts (see http://www.etec.energy.gov/Community_Involvement/Public%20Meetings/SRE_Workshop.html). Two of these experts supported the estimate made at the time of the accident. They stated that releases at the time of the accident should have primarily involved noble gases, with only small releases of volatile fissions products such as iodine and cesium isotopes. One of the two experts was skeptical of the estimates of large health effects being experienced by individuals and the population. The third expert concluded that available

Commenter No. 407 (cont'd): Jennifer Rodionoff

information was inadequate to resolve the fraction of the noble gases and fission products that may have been released. This expert did not quantify public risks from the accident but thought that the risk to the maximally exposed individual was smaller than the risk of cancer from other causes, but that the collective exposure could have resulted in some cancers in the population.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. DOE will complete contamination removal and site remediation based on the decisions made pursuant to this Final EIS and in compliance with regulatory requirements, including regulations, orders, and agreements. Please also refer to Section 2.1, "Preferences for Cleanup," of this CRD regarding your concern about cleanup of Area IV, as well as Section 2.7, "Offsite Impacts," of this CRD regarding your concern about being in proximity to SSFL.

- 407-3 DOE acknowledges your concern about cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

With respect to the timeliness of DOE's completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record of Decision pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC

Commenter No. 407 (cont'd): Jennifer Rodionoff

in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Commenter No. 408: Rachella Felix

My family and I currently reside in West Hills. I have 2 little ones, a 1 year old and a 3 year old. I was pregnant with both of them when we first moved to the location. I'm concerned with the future of their health as well as my husband's and my own health. We need a full clean up of the nuclear spill or else I'm highly considering moving out of our new home.

Rachella Felix

408-1**408-1**

DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," of this CRD regarding offsite contamination near SSFL. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this Final EIS is to evaluate alternatives for completing remediation at those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Available data and the modeling performed for this EIS (see Chapter 4, Section 4.9 of this EIS) indicated that it is safe to live near SSFL.

408-2**408-2**

DOE acknowledges your preference for full cleanup. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 409: Cindy Kirschenmann

This is unexceptable that big corporations and big government can live by a different standard. When a decision is made to clean it up to a certain standard and big corporations chose to cheapen their responsibility. It's like your parents telling you to clean your room and all you do is throw you junk in the closet, instead of actually cleaning. I say grow up!

Cindy Kirschenmann

409-1

409-1

DOE acknowledges your concern about cleanup of the site. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. - 410-1 DOE acknowledges your concern about the proper cleanup of SSFL. DOE's purpose in preparing this Final EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.
- 410-2 Thank you for your comment. It has been included in the Administrative Record for the EIS.

Commenter No. 411: Garry Wormser

Please seriously consider another route other than Woolsey Canyon Road for moving contaminated waste from the Santa Susana test site. The noisy trucks carrying contaminated substances have been destroying the roadway and polluting the atmosphere for the past decade. The 2,000 residents who live in mobile and private homes adjoining the roadway want it stopped now, not after 116,000 additional road trips ten years from now. I understand that a route down the other side of the mountain to a rail spur actually exists and could be made practical at minimum cost. Thank you.

Garry Wormser
Resident, Summit Mobile Home Community

411-1

411-1 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

Commenter No. 412: Megan McNaught

I have been a resident of Simi Valley for the past decade, and currently work as a pediatric hematology/ oncology nurse at Children's Hospital Los Angeles. I am very concerned about the Santa Susana Field Lab's toxic and nuclear waste being in close proximity to myself and the children in my neighborhood, and am concerned about the long-term effects it may have on our health and quality of life. In my professional career, I have seen hundreds of children and their families suffer through the devastation and loss of childhood cancer. Many of these children have come from my own community, or those immediately surrounding. My co-workers, many of whom have been working much longer than I have but who live in areas more than 20 miles from the SSFL site, are shocked by the number of patients I personally know who have come through our doors in just the past 3 years. This has to stop! I am appalled that the Department of Energy has recently decided not to uphold the 2010 AOC and their promise to do a complete cleanup of the site. I do not support the alternative plans that would leave as much as 39%, 91% or 99% of the contaminants on the site to naturally decompose for an additional seventy years. Seventy years more of children being exposed to carcinogens is unacceptable! I have seriously considered whether I would have to move out of my community once I decide to start my own family, if the DOE refuses to FULLY clean up the SSFL site. I am also deeply concerned that no studies have been done on the pediatric population to date. We have preliminary evidence of a pediatric cancer cluster in the area but this information is not being considered by the DOE. As a pediatric hematology/ oncology nurse and Simi Valley resident, I find this deeply troubling and I would like more research before the site is declared "safe" by the DOE. The SSFL site must be FULLY cleaned up, and done in as safe a way as possible, utilizing back roads and trains for transportation vs main roads and highly populated areas. It is unacceptable for the DOE to try to back out of a legal agreement for a full clean up, but it is even more appalling that the DOE would even consider exposing untold numbers of future residents and children to the harmful effects of nuclear waste.

Megan McNaught

412-2
cont'd

412-1 DOE acknowledges your concerns and refers you to Section 2.1, "Preferences for Cleanup," of this CRD regarding cleanup of SSFL, Section 2.7, "Offsite Impacts," of this CRD regarding offsite contamination near SSFL, and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

412-2 DOE acknowledges your preference for a complete cleanup of SSFL in accordance with the 2010 AOC. Please refer to Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. The EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) The use of a risk assessment approach for soil cleanup is consistent for cleanup actions by DOE at sites throughout the United States, by DTSC at other

Commenter No. 412 (cont'd): Megan McNaught

DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Please also note that the comment about leaving large quantities of contaminants to naturally decompose over 70 years is inaccurate. In Chapter 2, Section 2.3.2, of this EIS DOE assumed that about 620,000 cubic yards of soil containing certain hydrocarbons (TPH) could be remediated by monitored natural attenuation, a process that was projected to require about 70 years. If this remediation technique was used for this soil, there would be restrictions on access of the area being remediated to preclude any risk to members of the public.

- 412-3 DOE acknowledges your support for the full cleanup of the SSFL site. Please refer to Section 2.1, "Preferences for Cleanup," of this CRD for a discussion of this topic and DOE's response. Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

Commenter No. 413: Joshua Walker

Please do not back out of the full cleanup that was promised. The claims that the area is safe belies the fact that so many rare cancers are experienced by many within a small radius of the site. At the very least, a comprehensive survey of those living / have lived in the area and their health issues vs. public norms ought to be established. This site is very possibly extremely damaging to the surrounding communities, and if it is, it MUST be cleaned up. Thank you.

Joshua Walker
Eternity Bible College

|| 413-1
||
413-2

413-1 DOE acknowledges your preference for full cleanup. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public

413-2 DOE acknowledges your concerns and refers you to Section 2.1, “Preferences for Cleanup,” of this CRD regarding cleanup of SSFL, Section 2.7, “Offsite Impacts,” of this CRD regarding offsite contamination near SSFL and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

Commenter No. 414: Lillian Radosavcev

My husband and 2 young kids live in Simi Valley, less than 5 miles away from the SSFL lab area. A new development is being built right behind our home (Runkle Canyon development) and many (including young families) are purchasing new homes in this area. The construction may be exposing harmful waste and I petition for the DOE to conduct a FULL cleanup of the SSFL, clearing out 100% of all contaminated site. There are too many children that have or have had cancer surrounding the SSFL and knowing that contaminated soil can seep into the waterway, where children may play, is of utmost alarm. Please conduct a thorough child cancer study for the surrounding SSFL area and provide the public with your results. This decision cannot be made lightly and we must protect our children and their future children. Again, I petition for a FULL (100%) clean-up of the SSFL area. Thank you for your consideration.

Lillian Radosavcev

414-1

414-1 DOE acknowledges your concerns and refers you to Sections 2.1, “Preferences for Cleanup,” and 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD regarding your concern about a 100 percent cleanup of SSFL, Section 2.7, “Offsite Impacts,” of this CRD regarding offsite contamination, and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The focus of DOE’s efforts and the purpose of this Final EIS are to address remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. As indicated in Chapter 1, Section 1.3 of this EIS, NASA and Boeing are responsible for cleanup of other portions of SSFL. Existing data and analysis in this EIS indicate that all of the action alternatives evaluated in this EIS are protective of public health and safety and the environment. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

414-2

414-2 DOE acknowledges your preference for a 100 percent cleanup of SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information.

Commenter No. 415: Alice Clark

I want full clean up of the SSFL. I go out of my way to not buy locally grown produce and will not eat out of the soil. Partial clean up is not enough. There are way too many cases of rare cancers and other unusual diseases in Simi Valley and neighboring areas. This is a known danger. We have to sign waivers saying we know what happened there and not to eat from fruit trees. This is not okay. It is time to take responsibility and fully clean the area, no matter the cost.

Alice Clark

|| 415-1

|| 415-2

|| 415-3

415-1 DOE acknowledges your preference for full cleanup of SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

415-2 DOE acknowledges your concerns and refers you to Section 2.1, “Preferences for Cleanup,” of this CRD regarding your concern about the full cleanup of SSFL, Section 2.7, “Offsite Impacts,” of this CRD and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

415-3 Thank you for your comment. It has been included in the Administrative Record for the EIS. As a Federal agency, DOE is required to evaluate and justify major expenditures of Federal dollars. DOE performed a cost-benefit analysis of the soil remediation alternatives as part of this EIS (see Appendix K). The results of the analysis show that the cleanup under the Cleanup to 2010 AOC LUT Values Alternative would be much more expensive and with minimal additional protection of public health and the environment compared to the other project soil remediation alternatives

Commenter No. 416: Anonymous

If any mature oak trees are removed during the cleanup they should be replaced with 10 mature oak trees. The replacement oak trees should be at least 8 feet tall and in 72 inch box containers. The survival rate of oak trees this size is much higher than 5 gallon size oak trees. 10 young, 5 gallon size oak trees survival rate is very low and they take years to be the size of tree they would replace. Plus, an irrigation system must be provided for the first 5 years of the new trees life. This will increase their chance of survival. The planting of other native plants should also be approved by recognized botany experts. Thank you,

416-1

Thank you for your comments. They have been included in the Administrative Record for the EIS and will be considered during the development of the Tree Management and Preservation Plan and Revegetation and Habitat Restoration Plan identified in Chapter 6, Table 6-1, "Measures to Minimize Impacts of Demolition and Remediation Activities at SSFL and the NBZ."

Commenter No. 417: Angelique Hamane

Your mission is, “to study environmental issues affecting West Hills, to promote awareness to the public and the WHNC Board of Directors, and to take action which would have impact on the resolution of those issues to the benefit of the community.” Please abide by your mission statement and completely clean up the contamination site along West Hills. Many peoples’ lives are adversely affected. Thank you!!

Angelique Hamane

- 417-1
- 417-2
- 417-3

- 417-1 DOE notes that your comment appears to address the mission of the West Hills Neighborhood Council, Environment Committee. Because the comment is not on the scope or content of this EIS, no response is provided. It has been included in the Administrative Record for the EIS.
- 417-2 DOE acknowledges your preference for complete cleanup. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.
- 417-3 Thank you for your comment. It has been included in the Administrative Record for the EIS.

Commenter No. 418: Joseph Klein

SSFL is a wonderfully bypassed natural and cultural resource that needs to be preserved to a risk-based standard since it is dedicated to an open space level of use. This is earthquake country, and the land is fractured to incredible depth! Excavating to that level to get the last increment of contaminated soil would convert the Santa Susana portion of the Simi Hills to a pit hundreds of feet deep! Let's do this in a reasonable way, and let us, and our mammal and avian friends, enjoy this historical urban island together!

Joseph Klein

418-1

418-1 DOE acknowledges your support for a risk-based standard applied to cleanup. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. Please also note that DOE does not own the property in Area IV or the NBZ and cannot determine the ultimate land use for the property. As discussed in Chapter 1, Section 1.5, of this Final EIS, the property owner, Boeing, intends to preserve the land as open space for the public's benefit. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site.

418-2

418-2 As described in Chapter 3, Section 3.2.2, of this EIS, soils in Area IV and the NBZ are typically less than 5 feet thick although soils depths can reach 20 feet in some areas. As described in Chapter 2, Section 2.6.3 of this Final EIS, DOE does not anticipate removing bedrock except 1,050 cubic yards of rock in a small area of strontium-90 contamination under the Groundwater Treatment Alternative. DOE plans to backfill areas of removed soil and bedrock (75 percent replacement) and to recreate the contours of the current land surface to the extent possible; no large pits would be produced.

418-3

418-3 Thank you for your comment. It has been included in the Administrative Record for the EIS.

Commenter No. 419: Anonymous

Please clean up this toxic site completely for the sake of the residents that live in the area. Don't do a half-ass job and don't keep treating the situation like it's no big deal. People clearly are sick and/or dying because of the chemicals and nuclear/radiological waste in the ground, air and water.

Anonymous

|| 419-1

|| 419-2

419-1 DOE acknowledges your preference for a complete cleanup of the site. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

419-2 DOE acknowledges your concerns and refers you to Section 2.7, "Offsite Impacts," of this CRD regarding the potential for contamination of the ground, air, and water and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The data and analyses in this EIS indicate that all of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

Commenter No. 420: Anonymous

The people, most importantly the children, living around the Santa Susana Field Laboratory deserve the full clean up as initially proposed. It is already putting the future health of our kids at risk. No one deserves to have this threat in their backyards. It shows the negligence of these companies if there is not a full cleanup.

Anonymous

420-2

DOE acknowledges your preference for full cleanup. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information.

Commenter No. 421: Lauren Dionne

I would like to urge the department of energy to push for a complete remediation of the Santa Susana site. Leaving toxic chemicals behind is an environmental and health disaster waiting to happen. What if it was one of your children that were effected by a cancer that is linked to local area half assed clean up attempts? I can bet that you would make an effort to ensure that future generations do not have to deal with the ramifications of leaving toxic chemicals 'dormant'. The sound and water conservation is absolutely the least of the worries at that site, and should not be the reason behind leaving toxic chemicals unchecked. With the runoff into the Los Angeles River and the Santa Ana winds blowing the topsoil around, it is an ongoing environmental disaster.

Lauren Dionne

421-1

421-1 DOE acknowledges your preference for complete remediation of SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

421-2

421-3

421-2 DOE agrees with placing a high priority on health and safety and remains committed to protecting the health and safety of current and future users of the site and of the residents in the surrounding communities. In response to comments, DOE has added a quantitative evaluation of onsite worker and offsite resident impacts for all alternatives. The results of the modeling are included in Chapter 4, Section 4.9 of this Final EIS.

421-3

Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

Commenter No. 422: Molly Thatcher

My name is Molly Thatcher and I am a resident of Thousand Oaks raising 3 young children. I'm writing you today because there needs to be a full clean up done at the Santa Susana Field Site. It's time that measures are taken to have this toxicity removed. The area surrounding is full of families and this potential hazard is unnecessary. Women in the east Ventura County communities of Thousand Oaks, Simi Valley, and western Los Angeles County had invasive cancer rates of 10 percent to 20 percent higher than the rest of California. How many more people need to suffer and even die due to negligence? How many more law suits? How much time and money has been wasted already because of this? Others are hesitant to move to Simi Valley because they have heard of the higher cancer risks. Let's make a better future for all Ventura County residents and clean the Santa Susana Field Site. Thank you for your time.

Molly Thatcher

422-1

422-1 DOE acknowledges your preference for a full cleanup of SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

422-2

422-2 DOE acknowledges your concerns and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. The data and analyses in this EIS indicate that all of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

Commenter No. 423: Lauren Sullivan

I am concerned regarding the increased cancer and other diseases near the toxic spill site. I think more research needs to be done to prove the site safe/ clean the site.

Lauren Sullivan

|| 423-1
 ■ 423-2

423-1 DOE acknowledges your concerns and refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. DOE’s evaluation in this EIS indicates that all of the action alternatives are protective of public health and safety and the environment.

DOE has extensive knowledge of the types, locations, and concentrations of both radiological and chemical contaminants in Area IV and the NBZ of the SSFL. This knowledge derives from the years of environmental sampling conducted at the sites by DOE, EPA, and others, resulting in SSFL possibly being one of the most tested of any cleanup site in the country (number of samples per acre). For example, EPA completed its latest radiological characterization study at SSFL in 2012, for which EPA tested a total of 3,735 soil and sediment samples and 215 groundwater and surface water samples. EPA described this study as “one of the most comprehensive technical investigations every undertaken for low-level radioactive contamination” (EPA 2012).

DOE will remediate Area IV and NBZ, the portions of SSFL for which it is responsible, in consideration of this detailed information as augmented by additional information that may be obtained during the remediation process. DOE’s purpose in preparing this EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. All of the action alternatives evaluated in this EIS would result in a proper cleanup of those areas of SSFL for which DOE is responsible, Area IV and the NBZ, and be protective of human health and the environment.

423-2 DOE acknowledges your concern about cleanup of SSFL. DOE’s purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 424: Lisa Hothan

If there is any reasonable doubt (even the tiniest) this matter needs to be handled. You have a very close community begging for your attention. It seems harder to ignore it, then to just offer them what they are asking.

Lisa Hothan

427-1 DOE acknowledges your concern about a 100 percent cleanup of the site. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

427-2 DOE acknowledges your concerns and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. DOE's purpose in preparing this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the action alternatives evaluated are protective of public health and safety and the environment.

Commenter No. 428: Concerned Mom

Clean up the Santa Susana WASTE. Our children are dying of cancer because of it. This is NOT acceptable. Ever. Hundreds of innocent children and adults too are dying because you refuse to clean up the waste.

Concerned Mom

|| 428-1
|| 428-2

428-1 DOE acknowledges your concern about cleanup of SSFL waste. DOE's purpose in preparing this Final EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

428-2 DOE acknowledges your concerns and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. The data and analyses in this EIS indicate that all of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

Commenter No. 429: Anonymous

Dear Ms. Jennings.

I appreciate the opportunity to provide comment on the SSFL Area IV EIS I support a cleanup of the site to a risk-based standard that is fully protective of public health. I do NOT support alternative that increase, rather than decrease, the threat to the public health, unnecessarily destroy wildlife and habitat, and threaten important cultural resources. A risk-based clean-up of SSFL Area IV properly balances all needs, and achieves conservation goals of protecting wildlife, including more than 138 observed bird species. As open space is increasingly developed in and around the Los Angeles area, a large undeveloped area like the SSFL -- which is guaranteed by The Boeing Company, which owns 85% of the site, to remain undeveloped -- is increasingly precious to the wildlife that we all value. Other alternatives proposed in the EIS involve transporting large amounts of contaminated soil on public streets and highways -- many years' worth of trucks hauling away many hundreds of thousands, if not millions, of cubic yards and supposedly replacing them with better soil from an, as yet, undetermined and, probably, non-existent, source with little or no consideration for natural, cultural, and historical resources. Such proposals are unnecessarily destructive and expensive. More, they are inconsistent with cleanups implemented elsewhere. These cleanups have been shown sufficient in achieving cleanup goals, shown to be fiscally effective, protective of public health, and importantly, preserves open space. Thank you for the opportunity to provide these comments.

Anonymous

429-1

429-1

DOE acknowledges your support for a risk-based standard applied to cleanup. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Please also note that DOE does not own the property in Area IV or the NBZ and cannot determine the ultimate land use for the property. As discussed in Chapter 1, Section 1.5, of this Final EIS, the property owner, Boeing, intends to preserve the land as open space for the public's benefit. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site.

Commenter No. 430: Sarah Velazco

Please clean it up! This is very sad and negligent!

Sarah Velazco

|| 430-1

430-1 DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing this Final EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 431: Stephen Wolfe

As a resident of Ventura County and as a parent and especially grandparent, I am appalled that the Department of Energy has recently decided not to uphold its 2010 agreement to perform a thorough cleanup of the Santa Susana Field Lab site. I do not support the DoE's alternative plans, which would leave a large percentage (or perhaps nearly all) of the contaminants on the site to decompose for an additional 70 years. I am very concerned about the close proximity to my children of the SSFL's well-documented toxic and nuclear waste, and I am concerned about the long-term effects that waste may have on their health and quality of life. The DoE has announced these plans to renege on its commitments despite preliminary evidence of a pediatric cancer cluster in the area around the site, and has refused to conduct more research into such health impacts. I ask the DoE to fulfill its 2010 commitments to a full cleanup of the SSFL site. Thank you.

Stephen Wolfe

431-1

431-1 DOE acknowledges your preference for a thorough cleanup of SSFL in accordance with the 2010 AOC. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. This Final EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

431-2

Please also note that in Chapter 2, Section 2.3.2, of this EIS, DOE assumed that about 620,000 cubic yards of soil containing certain hydrocarbons (TPH) could be remediated by monitored natural attenuation, a process that was projected to require about 70 years. If this remediation technique was used for this soil, there would be restrictions on access of the area being remediated to preclude any risk to members of the public.

431-1
cont'd

431-2

431-2 DOE acknowledges your concerns and refers you to Section 2.7, "Offsite Impacts" and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of offsite contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Commenter No. 431 (cont'd): Stephen Wolfe

CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The most up-to-date data available about contamination in Area IV and the NBZ are summarized in this EIS and included in the cited references (e.g., *Chemical Data Summary Report, Santa Susana Field Laboratory, Ventura County, California* [CDM Smith 2017] and *Final Radiological Characterization of Soils Area IV and the NBZ* [HGL 2012b]).

DOE has not announced plans to renege on its commitments. What DOE has done is prepare this EIS to evaluate alternatives for accomplishing the cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. For soil remediation, those alternatives included the Cleanup to AOC LUT Values Alternative as well as alternatives that establish cleanup levels based on risk and the future use of SSFL of those portions. Using the most current data available, DOE performed the analyses in Chapter 4, Section 4.9, of this EIS, which indicate that all of the action alternatives evaluated in this EIS are protective of public health and the environment.

Establishing and funding of additional epidemiological studies are beyond the scope of this EIS.

Commenter No. 432: Janet Neuwalder

Deal with this. It is mandatory to take responsibility and clean up the site. Do not leave the community, our local area, and Earth in jeopardy. Just because the tax payers can not see it, does not mean it is not real or happening and affecting us all. Be responsible. Do not ignore or abandon the problem.

Janet Neuwalder

432-1

432-1

DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing this Final EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 433: Shannon Lopez

While I have recently moved to nearby Oxnard, I grew up in Moorpark and know countless survivors and victims of cancer, including a large number of childhood cancers. I am appalled that the Department of Energy has recently decided not to uphold its 2010 agreement to perform a thorough cleanup of the Santa Susana Field Lab site, including affected soil and groundwater. I do not support the DoE's alternative plans, which would leave a large percentage (or perhaps nearly all) of the contaminants on the site to decompose for an additional 70 years. I am concerned about the long-term effects that the toxic waste may have on the health and quality of life; pediatric cancer has disrupted and in some cases destroyed families across Simi Valley and Moorpark. The DoE has announced these plans to walk away from its prior commitments despite preliminary evidence of a pediatric cancer cluster in the area around the site, and has refused to conduct more research into such health impacts. I ask the DoE to fulfill its 2010 commitments to a full cleanup of the SSFL site as soon as possible so that this area no longer has to bear the brunt of the close proximity to this dangerous site. Thank you.

Shannon Lopez

433-1

433-1 DOE acknowledges your concerns and refers you to Section 2.7, "Offsite Impacts" and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of offsite contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

434-1 Thank you for your comment. It has been included in the Administrative Record for the EIS.

434-2 DOE acknowledges your preference for 100 percent cleanup of chemical and nuclear toxics. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 435: Anette Power

It is imperative for the Department of Energy, NASA and Boeing to do what they promised and conduct a thorough cleanup of the toxic contamination at the Santa Susana Field Lab site!! I want more studies to see how many cancer cases are linked to this toxic material already. There is evidence that there is a pediatric cancer cluster in the community of Simi Valley and the greater Conejo Valley. As a resident of Conejo Valley, and a parent, and the aunt of a child who died of infant acute leukemia this is of course a very real risk, one that has to be mitigated at any economic cost! Sincerely,

Anette Power

435-1

435-1 DOE acknowledges your preference for a thorough cleanup of toxic contamination at SSFL. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

435-2

435-2 DOE acknowledges your concerns and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

Commenter No. 436: Tanya Hopper

I believe this needs to be cleaned up because it's defiantly affecting the people in the area. My husband was diagnosed with colon cancer in June of 2016 at the age of 31. He lived in Simi Valley off of tapo canyon for years for at least 20 years and now has cancer. He would play and hike frequently on the premises. He had friends as a kid that had thyroid cancer. This absolutely needs to be taken seriously and cleaned properly. There are way too many kids that are suffering and Young adults and young families that are suffering.

Tanya Hopper

|| 436-1

436-2

436-1 DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. Establishing and funding of additional epidemiological studies are beyond the scope of this EIS.

440-2

DOE acknowledges your preference for full cleanup of the SSFL site in accordance with the 2010 AOC. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 441: Anonymous

Hello. PLEASE, you must clean up the Santa Susana Field Lab! I grew up just north of the intersection of Topanga and Roscoe... and my step father died at age 63 of Salivary Gland cancer. Additionally one of my neighborhood friends suffered Thyroid cancer at a very young age. I now live in Simi Valley and the toxins at this location continue to be of great concern to me. This mess MUST be cleaned up immediately. That is has taken this long is a travesty. PLEASE get this done ASAP! Thank you.

441-1 DOE acknowledges your concern about cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

With respect to the timeliness of DOE’s completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a ROD pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b])

DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC’s Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

441-2 DOE acknowledges your concerns and refers you to Section 2.7, “Offsite Impacts,” and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 442: Sheriden Mansfeld

Please require Boeing to clean up the site. Tests have proven that there are toxic substances in the soil. The Conejo Valley is a beautiful community. My parents moved to Oak Park in the 80's not knowing about the nuclear waste. I live with my family in Agoura Hills and I am scared for the safety of my children everyday. I won't let them grow vegetables in our backyard because of my fear of toxic chemicals leaching into the food. I'm scared of drinking our filtered tap water because of what may be leaching into our water. My best friends mother was recently diagnosed with non-hodgkin lymphoma, which is due to radiation exposure. She has lived in Westlake Village for 40 years. Please make them clean up the mess they inherited. How many innocent children need to die before you do something about it. What is more important, children's safety or a group of wealthy executives. This clean up will leave a minuscule dent in their financial well being. Trump plans to increase military spending and the company will make up for any loss here in a minute. Meanwhile, you will have improved the health of so many people. It seems like a very easy decision. Thank you.

Sheriden Mansfeld

|| 442-1

442-1 DOE acknowledges your concern about cleanup of SSFL. Because DOE, rather than Boeing, has the responsibility for remediation of Area IV and the NBZ, DOE has prepared this Final EIS to address the completion of cleanup within these portions of SSFL. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

442-2

442-2 DOE acknowledges your concerns and refers you to Section 2.7, "Offsite Impacts," of this CRD regarding your concern about toxic chemicals within food and water and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

442-3

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

442-3

Thank you for your comment. The scope of this EIS is limited to cleanup of DOE's portions of SSFL, Area IV and the NBZ. Financial activities of Boeing and other companies are outside the scope of this EIS. DOE is funded by Congress as part of the Federal government budgeting process.

Commenter No. 443: Peter Nicholson

Golden Rule pretty much applies here. Would the decision makers that desire to turn their backs on this long standing disaster buy a house anywhere near this cancer causing space? Would you want your pregnant wife drinking the water, breathing the air and being exposed to all this nastiness? Are you ready to raise a special needs child? Have you been to the schools in the area and spent the day with all the special needs kids? The obvious answer is No. So how about be a decent human being and continue to fix this till it's truly fixed? Is it so hard to do the right thing?

Peter Nicholson

443-1

443-1 DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

Commenter No. 444: Jenna Cittadino

It is absolutely necessary to clean up this area. Shame on Boeing for putting residents lives' at risk for years and for destroying the natural environment! The community of Oak Park and Agoura Hills is frightened about the situation and appalled at the lack of concern of Boeing for taking responsibility for its actions.

Jenna Cittadino

|| 444-1
|| 444-2

444-1 DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing this Final EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

444-2 Thank you for your comment. It has been included in the Administrative Record for the EIS. Please note that there are three responsible parties (DOE, NASA, and Boeing) at SSFL who performed work and there are environmental consequences as a result of this work. Each of the three parties is responsible to remediate the areas where its work was performed. The focus of DOE's actions and the purpose of this EIS are to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ.

Commenter No. 445: Anonymous

This ongoing issue needs to be dealt with immediately. Over 400,000 residents live within seven miles of this hazardous site. The health and well being of these residents is at risk. It is shameful that this has not already been taken care of. A date was set 10 years ago, a promise was made that the clean up would be completed by 2017 and at this point it has yet to even begin. Please take action now to ensure that residents of this area will no longer be in danger.

Anonymous

445-1

DOE acknowledges your concern and refers you to Section 2.7, “Offsite Impacts,” of this CRD for accurate information about offsite contamination and to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

445-2

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

As discussed in Chapter 1, Section 1.3, of this EIS, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record of Decision pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). Cleanup will continue following completion of these actions.

445-2

DOE acknowledges your concern about cleanup of the site. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on

Commenter No. 445 (cont'd): Anonymous

Consent,” of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

With respect to completion of cleanup by 2017, please refer to Chapter 2, Section 2.2.3 of this EIS. In addition, please refer to Chapter 1, Section 1.3 of this EIS, which discusses the order issued by the U.S. District Court for the Northern District of California (Case No. 3:04-CV-04448-SC, May 2, 2007) that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision pursuant to NEPA. In accordance with CEQA and consistent with Section 4 of the 2010 AOC, DTSC is preparing an environmental impact report (EIR) that addresses cleanup of all of SSFL (including areas for which NASA and Boeing are responsible). The *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* was issued by DTSC in 2017 (DTSC 2017b). The completion of both the CEQA and NEPA processes and certain regulatory actions must occur before DOE can complete the comprehensive cleanup of soils and groundwater in Area IV and the NBZ. The regulatory actions required include the following: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC’s Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition. In June of 2017, DOE initiated communications with DTSC to discuss schedules and other appropriate matters that would facilitate cleanup activities (DOE 2017a).

Commenter No. 446: Loren Gmachl

As a resident of Ventura County, I am appalled that the Department of Energy has recently decided not to uphold its 2010 agreement to perform a thorough cleanup of the Santa Susana Field Lab site. I do not support the DoE's alternative plans, which would leave a large percentage (or perhaps nearly all) of the contaminants on the site to decompose for an additional 70 years. I am very concerned about the close proximity to our county's children of the SSFL's well-documented toxic and nuclear waste, and I am concerned about the long-term effects that waste may have on their health and quality of life. The DoE has announced these plans to renege on its commitments despite preliminary evidence of a pediatric cancer cluster in the area around the site, and has refused to conduct more research into such health impacts. I ask the DoE to fulfill its 2010 commitments to a full cleanup of the SSFL site. Thank you.

Loren Gmachl

446-1

446-1 DOE acknowledges your preference for a thorough cleanup of SSFL in accordance with the 2010 AOC. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. The EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

446-2

446-1
cont'd

Please also note that the comment about leaving large quantities of contaminants to naturally decompose over 70 years is inaccurate. In Chapter 2, Section 2.3.2, of this EIS, DOE assumed that about 620,000 cubic yards of soil containing certain hydrocarbons (TPH) could be remediated by monitored natural attenuation, a process that was projected to require about 70 years. If this remediation technique were used for this soil, there would be restrictions on access of the area being remediated to preclude any risk to members of the public.

446-2

DOE acknowledges your concerns and refers you to Section 2.7, "Offsite Impacts" and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of offsite contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to

Commenter No. 446 (cont'd): Loren Gmachl

Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The most up-to-date data available about contamination in Area IV and the NBZ are summarized in this EIS and included in the cited references (e.g., *Chemical Data Summary Report, Santa Susana Field Laboratory, Ventura County, California* [CDM Smith 2017] and *Final Radiological Characterization of Soils Area IV and the NBZ* [HGL 2012b]).

DOE has not announced plans to renege on its commitments. What DOE has done is prepare this EIS to evaluate alternatives for accomplishing the cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. For soil remediation, those alternatives included the Cleanup to AOC LUT Values Alternative as well as alternatives that establish cleanup levels based on risk and the future use of SSFL of those portions. Using the most current data available, DOE performed the analyses in Chapter 4, Section 4.9, of this EIS, which that indicate that all of the action alternatives evaluated in this EIS are protective of public health and the environment.

Establishing and funding of additional epidemiological studies are beyond the scope of this EIS.

Commenter No. 447: Sharon Hanson

Whatever mess you made, you need to clean it up. We all must be responsible for damage to the environment. We only have one earth. Thanks

Sharon Hanson

447-1

447-1

DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing this Final EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 448: Roger Allen Soto

Just try to preserve all Chumash and Rocket history that is left my father worked on top of the hill along with other great people

Roger Allen Soto

|| 448-1

448-1

It is DOE's mission to leave DOE's portion of SSFL in a condition that is protective of human health and the environment. This includes preserving the history of SSFL to the extent possible. Section 106 of the NHPA requires that DOE avoid, minimize, or mitigate adverse effects to historic properties, and NEPA requires mitigation of significant impacts. DOE is consulting with DTSC regarding cultural resources that may be exempted from cleanup while protecting human health. DOE also is developing an NHPA Section 106 Programmatic Agreement in consultation with the SHPO and other consulting parties, including the federally recognized Santa Ynez Band of Chumash Indians and non-federally recognized tribes, and DTSC that will describe the steps necessary to achieve this end.

Commenter No. 449: Stephanie

I am requesting that you move on this and do the clean up that is necessary for our community's safety. Having been a homeowner here for 30 plus years I have watched many close friends suffering from increased symptoms of rheumatoid arthritis. And not just older people but the children of friends. I am also concerned because there are Chumash cultural sites in this area that are inaccessible to the people who value and hold these places as sacred. It is time to start valuing the land we live on and try to work together to restore what has been damaged and to carefully proceed when new ideas for certain developments come up. In spite of the current political climate there are many who would agree with my statement. I am grateful that California as a state is working to maintain its integrity when dealing with environmental issues. Thank you for opening this up to the public for comments.

Stephanie

|| 449-1

|| 449-2

|| 449-3

449-1 DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing this Final EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

449-2 Thank you for your comment. It has been included in the Administrative Record for the EIS.

449-3 DOE currently cooperates with Boeing, the landowner, to provide access to Area IV and the NBZ for Native American traditional uses and access to traditional resources. Once the cleanup is complete, however, DOE will no longer have responsibility at SSFL. Access or restrictions on access would be arranged through Boeing or through the land trust that will manage the conservation easements set up by Boeing. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b).

Commenter No. 450: Sandra Paperny

I have one question for you, if your children lived anywhere near the Santa Susana Field Lab would you hesitate for a split second to clean up 100% of it? I know the answer already. HELL NO! We bought our beautiful home less than 2 years ago and now that I have learned about the radiation and toxins surrounding it, and I feel forced to sell it this year unless you clean up 100% of that toxic site. I'm not alone. I know thousands of other parents who are doing the same now that this issue has been brought to light. Who in their right mind would put their babies in any kind of cancerous risk! It brings me to tears thinking about the children that are being exposed to radiation and those that are suffering because of that horrific disaster so many years ago. This is the greatest nation in the world, yet you would deliberately ignore the beautiful San Fernando Valley. We are a very dense, upper income, LA suburb and I demand that you clean up the Santa Susana Field Lab quickly and properly!

Sandra Paperny

450-1

450-1 DOE acknowledges your preference for 100 percent cleanup of SSFL. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

450-2

450-2 As referenced by the comment, the SRE accident occurred many years ago. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

450-1

DOE acknowledges your concerns about risks of cancer and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 451: Jennifer Moore

Hello, I wrote the following letter to Melissa Bumstead, an advocate for clean up of SSFL in our community. She suggested sharing the letter with you guys in hopes that you could see the impact and fear many members living here are feeling/have felt about the SSFL still having contaminants on site. I beg of you as a mother to please do a full clean up. We love our community, our home and Simi Valley, but if my family is at risk and nothing is to be done I will do everything in my power to protect them even if that means leaving. Thank you, Jennifer Moore Hi Melissa, I am a resident of Simi Valley, east Simi, to be precise. My husband and I bought a home here in 2015 when I was 8 months pregnant with our son. We had been living in west Los Angeles prior to be close to my husbands job. In 2015 we decided we wanted to raise our son in a quiet, safe community and chose Simi (it was a reasonable commute). I am now 3 months pregnant with our second child and just stumbled upon the information you have been providing the community about the Santa Susana Field Laboratory. I feel stupid now thinking back on signing documents with our real estate agent. She said a few words regarding the incident at the SSFL, but also the year it occurred and we didn't ask any questions or do any research on what in the world she had briefly mentioned since it seemed like it occurred too long ago to possibly affect us. I am now sick to my stomach almost every day since I've done research on this following the information you've given. We love to garden and have planted fruits and vegetables extensively in our backyard. I'm cringing at the fact that our fridge has been due to change its water filter for who knows how long and water is all my son and I drink! I'm terrified of the harm my family could someday endure because of where our home is located. I'm even more terrified of the thought of losing any one of them prematurely due to this. I have signed the petition on change.org and written them for a full clean up like you've suggested, we are going to change the water filter on the fridge... my question to you mother to mother though is, should we leave? Should we take a hit selling our home and try and relocate to Valencia or another outskirt that is safer and my husband could still commute to the city? I'm losing sleep over this and I just feel like time is of the essence with these children coming down with cancers at such a young age. I don't know what to do and I'm scared. My heart goes out to you and the strength that you have to fight this battle with your daughter and I applaud all of the work you are doing with the community.

Jennifer Moore
Local Resident of East Simi Valley

451-1

451-1 DOE acknowledges your concern about a full cleanup of SSFL. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

451-2

451-2 DOE acknowledges your concerns and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. To address your concern about your drinking water, all water providers perform routine characterization of the water they supply and will provide a copy of a report on water quality upon request.

451-2

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

Commenter No. 452: Anonymous

To Whom it May Concern, I am a former resident of the Conejo Valley, and would like to interject my voice of concern on the Santa Susana cleanup plans. I am baffled that corporations are becoming a sense of our communities to the extent of not removing toxic chemicals. My father used to work for Edwards Airforce Base, and I dare say that Boeing has the surplus money to pay for this cleanup...but don't go down the accounting trail to see how much they contribute to such causes, because Boeing hires people just for the sole purpose of confusing those who inquire about their checks and balances. And I am not talking about an accountant, I am talking about accountability, or lack thereof. I believe that these soil standards should be investigated by an unknown independent party sanctioned by our government, funded by the waste contributors. I want to see hard data on this! You can't even get this when looking at most utilities websites! Please clean up the soil! Implement fees for violating codes, but don't adjust the codes around the fees. Thank you.

452-1

DOE acknowledges your concern about cleanup of toxic chemicals of soil. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

452-2

452-3

452-2

Thank you for your comment. The scope of this EIS is limited to cleanup of DOE's portions of SSFL, Area IV and the NBZ. The activities of Boeing are outside the scope of this EIS. DOE is funded by Congress as part of the Federal government budgeting process.

452-1
cont'd

452-3

The soil standards were established by California DTSC. Any comments regarding the standards should be addressed by DTSC.

Commenter No. 453: Kristine Hatton

It is unacceptable to do anything less than a 100% clean up to the site.
You owe it to the children and families living in and around Simi Valley.

Kristine Hatton

|| 453-1

453-1 DOE acknowledges your preference for 100 percent cleanup of the site. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 454: Jenna

This needs to be cleaned up 100%... do the right thing!!!!

Jenna

454-1 DOE acknowledges your preference for 100 percent cleanup of the site. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 455: Ryann Moresi

My name is Ryann Moresi. I have lived in Thousand Oaks for 22 years. I am contacting you in regards to the Santa Susana Field Lab. As a resident and a parent I am very concerned about the Santa Susana Field Lab's toxic and nuclear waste being in close proximity to my children, and I am concerned about the long-term effects it may have on their health and quality of life. I have had a few friends who's children has tragically suffered from cancer from contaminants from this site. I have known about the SSFL meltdown for 3 years and I am appalled that the Department of Energy has recently decided not to uphold the 2010 AOC and their promise to do a complete cleanup of the site. I do not support their alternative plans that would leave as much as 39%, 91% or 99% of the contaminants on the site to naturally decompose for an additional seventy years. I am appalled by the fear tactics the DOE is using to convince our community that the clean up would be more harmful to us than the remaining contaminants. They have refused to consider using less populated roads and want to truck the contaminants 60 miles through our city instead of utilize local rail stations. Finally, I am deeply concerned that no studies have been done on the pediatric population to date. We have preliminary evidence of a pediatric cancer cluster in the area but this information is not being considered by the DOE. As a parent I find this deeply troubling and I would like more research before the site is declared "safe" by the DOE. I have considered moving far away from here because of the SSFL contaminants and out of fear of safety for our children. I ask that you uphold our desire to see a full clean up of the SSFL site. I appreciate your time and involvement on my, and my children's behalf.

Sincerely,

Ryann Moresi

455-1

455-1 DOE acknowledges your concerns and refers you to Section 2.7, "Offsite Impacts," of this CRD for accurate information on contamination in the area and to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

455-2

455-2 DOE acknowledges your preference for a complete cleanup of SSFL in accordance with the 2010 AOC. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. The EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

455-3

455-1
cont'd

455-2
cont'd

Please also note that the comment about leaving large quantities of contaminants to naturally decompose over 70 years is inaccurate. In Chapter 2, Section 2.3.2, of this EIS, DOE assumed that about 620,000 cubic yards of soil containing certain hydrocarbons (TPH) could be remediated by monitored natural attenuation, a process that was projected to require about 70 years. If this remediation technique was used for this soil, there would be restrictions on access of the area being remediated to preclude any risk to members of the public.

455-3

Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of the transportation topic and DOE's response.

The analyses in this EIS were performed to evaluate the potential impacts associated with the various alternatives for cleanup of SSFL. In accordance with NEPA, the EIS

Commenter No. 455 (cont'd): Ryann Moresi

evaluates the potential impacts on a variety of resource areas, including traffic, human health, cultural and biological resources, socioeconomics, and environmental justice. Results of the analyses allow a comparison of potential impacts across all evaluated resource areas as well as the tradeoffs between the alternatives.

DOE's intent is not to generate opposition to the SSFL cleanup or to scare locals out of supporting cleanup, but it is true that the more soil that is removed to remediate the site, the larger the transportation effort (i.e., a larger number of truck trips) required. Leaving more soil, and consequently low concentrations of chemicals and/or radionuclides on site, reduces the number of truck trips from the site. Conversely, removing the soil with low concentrations of chemicals and/or radionuclides, results in more truck trips from the site. The EIS shows that the transportation risks are very small; Chapter 4, Section 4.8.1 and Appendix H of this EIS provide details of the transportation risk analysis.

Commenter No. 456: Shannon Parsons

This needs to be 100% cleaned up. Anything else is unacceptable. We should not have to worry about our children being at risk simply because we live near the site.

Shannon Parsons

456-1

456-1

DOE acknowledges your concern about 100 percent cleanup of the site. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

Commenter No. 463: Allison Stanley

I live at the foothills right below this site and have 2 small children. I am terrified that one of them will be diagnosed with cancer caused by the contamination, and I am not a paranoid person. It is absolutely ridiculous and embarrassing that with all of the ridiculous regulations out there for useless things, that this major issue is being ignored.

Allison Stanley

463-1

463-1 DOE acknowledges your concern and notes that the issue is not being ignored. There are three responsible parties (DOE, NASA, and Boeing) at SSFL who performed work and there are environmental consequences as a result of this work. Each of the three parties is responsible to remediate the areas where its work was performed.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. Commenter No. 472: Gerald Goldman

It appears as though the Jun 17 time frame is being missed. This process needs to accelerate to ensure a more timely clean up.

Gerald Goldman

472-1

472-1

The 2017 date referred to by the commenter was established in the 2007 Consent Order and the 2010 AOC signed by DOE and the DTSC. DOE and DTSC have taken and are continuing actions that are necessary prior to physical work being undertaken to clean up those parts of SSFL for which DOE is responsible, Area IV and the NBZ. Those actions include DOE completing the NEPA process and DTSC completing an environmental impact report (EIR) in accordance with CEQA; The *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). Other necessary actions are DOE development and DTSC approval of detailed cleanup plans that reflect the results of the DOE EIS and DTSC EIR. DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition. In June 2017, DOE initiated communications with DTSC to discuss schedules and other appropriate matters that would facilitate cleanup activities (DOE 2017a).

Commenter No. 473: Andrea Estes

It is unacceptable that this has not been cleaned up yet. Why is it taking so long?

Andrea Estes

473-1

473-1

DOE acknowledges your concern about cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

With respect to the timeliness of DOE’s completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, of this Final EIS, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record of Decision pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC’s Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 475: Anonymous

You need to clean this mess up!!! 100%!!! People at Hope Chapel are getting cancer and dying! We have continually sent one of our church members to Washington to lobby congressmen about this situation. That was when the Democrats were in power. now our lobbyist says that the Republicans are useless, and don't care about people. Since the Republicans are in power and refuse to work with our representative (Melissa Bumstead} so, YOU need to fix this!!!!!! She was in tears about this change in administration. Our pastor Jeff Fischer's sister died and our usher Ed Hendley's Mother died. The Bumsteads have millions of dollars in hospital bills for their daughter Gracie's cancer, which you need to pay for them. THIS IS TOTALLY IRRESPONSIBLE! She was born near the site and grew up there until she got cancer at 4 years old. Then she had to live at the hospital. That is your fault! We ask that the site is cleaned up 100% and that millions in restitution go to the individuals named in this letter. GOD IS NOT HAPPY WITH YOU! NEITHER ARE THE CHILDREN WHO ARE DYING! CLEAN UP and PAY UP! otherwise you might be going to hell.

Covering up the radioactive area would be best. They could pour cement over the area and no more radioactive material will be able to escape the site.

Anonymous

476-1

476-1

Area IV has been subject to numerous prior soil cleanups to remove radionuclide impacted soils (see Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD). What remains today are about 12 locations with elevated radionuclides identified by EPA and DOE and the review of those data by EPA and DTSC. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. Onsite disposal options were eliminated from analysis in this EIS because the 2010 AOC does not allow onsite burial or landfilling (excavating and burying) of contaminated debris or soil. Boeing owns the land in Area IV and the NBZ. DOE’s intent is to complete its cleanup responsibilities, then relinquish the land to Boeing’s control. DOE does not want any enduring responsibility for a landfill created on site. In addition, covering the site with concrete would not be consistent with Boeings plans for future open space land use.

Commenter No. 477: Marcia Gould

I have the same questions since this disaster hit our area--why hasn't this been corrected once and for all! Right now, however, I want to know why new construction was allowed at the corner of Valley Circle Blvd. and Roscoe Blvd. without FINAL positive closure on this matter. I contacted the construction company a couple months ago and asked about the contamination under the homes. I was told that the problem had been solved and I would receive information explaining this. Well, months later, I have received nothing. What's happening with the Brandeis-Bardin facility in Simi Valley? Children and adults are at the facility constantly. Some live there. Discovered in the early 1990's and still unsafe, when will the public actually find positive closure--real positive closure??

Marcia Gould

477-1 DOE acknowledges your concern about cleanup of SSFL. DOE acknowledges your concern about cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

With respect to the timeliness of DOE's completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record of Decision pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). Cleanup will begin following completion of these regulatory actions.

477-2 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

Commenter No. 478: Brenna Gutell

I am very concerned that the SSFL has not been cleaned up & I think they should do the clean up specified in the law that was passed. I grew up in the valley as did my husband & this concerns us very much. We currently live in Oak Park & have two young children, we are very much concerned at how this has & will impact our health. We want to see a full clean up of this toxic, contaminated land.

Brenna Gutell

|| 478-1

478-1 DOE acknowledges your preference for a full cleanup of the site. 479-1 Thank you for your comment. It has been added to the Administrative Record for the EIS.

Commenter No. 480: Rand & Shirley Malmin

SSFL issues start with a 20 cover-up of all the real issues so all of the responsible parties should be held responsible today for all that transpired since 1959. I just read a post from someone you grew up within 2 mi of SSFL; that post included the effects of radiation on the animal life in that area= two headed lizards....etc. My family has been affected by me only 22 years after 1959. I was affected by the radiation that was in the dark black smoke that was caused by the burning of the remains of SSFL debris. My youngest son contracted Leukemia at age 2 [NO LEUKEMIA IN OUR FAMILIES], had chemo & radiation treatments, both of our sons have psoriasis, & my youngest son has psoriasis bad with arthritis so bad he has pain all day every day affecting his ability to stand for most jobs [HE WANTS TO WORK AS LITTLE AS HE CAN] Listen to the magnitude of the reports of cancers in the SIMI area [how close do you want to get to SSFL?]. AND RESPONSIBLE PARTIES ARE SAYING TODAY, "NOTHING WAS WRONG AT SSFL", and want us to believe that the first 20-yr-cover-up was for nothing WRONG at SSFL. Twenty-years later, the 1959 WORST RADIOACTIVE ACCIDENT IN HUMAN HISTORY is admitted. How does great America deal with this? SO FAR, IT HAS BEEN DEALT WITH BY IGNORING THE FACTS!

Rand & Shirley Malmin

As discussed in Chapter 1, Section 1.3, of this Final EIS, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record of Decision pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Commenter No. 486: Mark S. Hunter, Pasadena Audubon Society

I support the “risk-based cleanup” as the best choice among the possible cleanup plans when the interests of all the parties, plus the environment itself, are considered.

Mark S Hunter
Pasadena Audubon Society

486-1

486-1

DOE acknowledges your support for a risk-based cleanup. DOE’s purpose in preparing this Final EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 487: Leonard Goodman

Before I retired, I had the opportunity to conduct a number of team (EPA, clean up contractor, affected populations' representatives) studies for EPA Superfund Sites in Texas. The planned work was clean up of highly contaminated (toxic hydrocarbons) soils. A deadly detail that often threatened the success of achieving toxic contamination removal was lack of a proven, verifiable method for detecting contamination down to ppm levels. There is no point in planning and claiming to remove toxic material 'A' until only 'x' ppm remain if such success cannot be proven to those who are likely to dispute the claimed success. During the studies I conducted, EPA and contractor representatives were confident the proven, verifiable detection techniques would be available when needed even though they could not identify a potential technique. The attitude was, don't worry about 'minor details'. If a 'minor detail' leads to unsuccessful completion of a critical step, like proving an intended result was achieved, then there is the potential for wasting millions of dollars when a clean up project is halted and/or litigation ensues.

Leonard Goodman

487-1

487-1

It is DOE's plans to only use proven and reliable analytical techniques when it has samples analyzed confirming that it has met project cleanup goals.

Commenter No. 488: Jennifer Aguilar

Please clean up your mess. Innocent children should not pay the price of negligence and bureaucracy.

Jennifer Aguilar

|| 488-1

488-1 DOE acknowledges your concern about cleanup of SSFL. It is DOE's mission to remediate sites to ensure that they are protective of human health and the environment. DOE's purpose in preparing this Final EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Commenter No. 489: Cletus Stein

the peace farm It is immoral to not be serious about cleaning up the governments toxic, antihuman wastes. Unless you do this and do it well and completely, our descendents will curse you and all of our generation together. May God have mercy on you,... and us!

Cletus Stein

489-1

489-1

DOE acknowledges your concern about cleanup of the site. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 490: Celeste Jale

Dear Ms. Jennings and the Department of Energy,

My name is Celeste Jale and I am a of resident Woodland Hills, California. I request the Department of Energy and NASA uphold the Administrative Order on Consent with the California Department of Toxic Substances Control for a cleanup to “background” levels of the Santa Susana Field Laboratory, signed in 2010, to be completed by 2017. A background level means that 100% of the contamination on the SSFL would be removed to a toxic waste facility. Furthermore, I ask that you desist in using scare tactics to keep residents from demanding a safe and complete cleanup, and turn to common sense and viable methods for success. In the Department of Energy’s DEIS (Draft Environmental Impact Statement) they list the only dangers of the cleanup to be the potential for “truck accidents” or “smog from trucks.” The cleanup will be safe due to the federal, state and local laws that will direct the cleanup to control dust and prevent contaminants from traveling offsite during the cleanup process. There are two service roads that pass little to no homes, yet the Department of Energy says in the DEIS that they will need to take the most heavily populated roads to a rail station sixty miles away. The closest station is only a few miles away, but the DEIS does not mention this as an option. Also, if they use covered conveyor belts (which is a viable option) there wouldn’t need to be as many trucks. Again, these options have been left out of the DEIS. Instead, only the least sophisticated methods have been presented as a scare tactic. For the health of our community and the future children who will be here, use the innovation and science available to us in 2017 and effectively, and safely, remove this contamination immediately.

Thank you for your attention,

Celeste Jale

490-1

490-1 DOE acknowledges your preference for 100 percent cleanup of SSFL in accordance with the 2010 AOC. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

490-2

490-2 DOE’s intent is not to alarm people, but it is true that the more soil that is removed to clean up the site, the larger the transportation effort (i.e., a larger number of truck trips) that would be required. The analyses in this Final EIS were performed to evaluate the potential impacts associated with the various alternatives for cleanup of Area IV and the NBZ. Results of the analyses allow a comparison of potential impacts and tradeoffs between the alternatives. In the case of soil remediation, and using the Conservation of Natural Resources Alternative as an example, leaving more soil, and consequently low concentrations of chemicals and radionuclides on site, reduces the number of truck trips from the site and associated transportation risk and air quality impacts. But, the potential impacts to a site user following cleanup would be highest for this alternative. Conversely, removing the soil with low concentrations of chemicals and/or radionuclides, as would be the case under the Cleanup to AOC LUT Values Alternative, would result in more truck trips from the site and increases the transportation risk and air quality impacts. But, the potential impacts to a site user following cleanup would be the lowest for this alternative. Although the cleanup level under the soil remediation action alternatives and scenarios are different, Area IV and the NBZ would be cleaned up to a level that is protective of the public and environment regardless of the alternative or scenario. (Please see Chapter 4, Section 4.9 of this Final EIS.)

490-1
cont’d

DOE agrees with the commenter’s statement regarding the cleanup being conducted safely. Regardless of the cleanup alternative selected and implemented, DOE would comply with the laws, regulations, and processes that have been established to protect the public and workers.

Regarding comments related to transportation of waste from SSFL, please refer to Section 2.9, “Options for Transportation of Waste from SSFL,” of this CRD for a discussion of this issue and DOE’s response.

Commenter No. 491: Anonymous

Please do the right thing and do what you would do for your own children. And clean up the whole site 110%. Thank you for your time. Remember this earth is what we have to past down so we need to take care of it. It is all of our responsibility.

Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for a discussion of this topic and DOE's response. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 496: Amy Staskiel

I have read the EIS proposal, and it is a disgrace! I urge you to keep your commitment to the earth and to our communities to cleanup up all of the contamination at SSFL. Anything less is unacceptable.

Amy Staskiel

496-1

496-1

DOE acknowledges your preference for cleanup of all of the contamination at SSFL. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 497: Scott Wheeler

Do not break your obligation to clean up all of the nuclear and chemical contamination at the Santa Susana Field Laboratory! I have done the numbers and there is no doubt that some of my friends and family have died because of this.

Scott Wheeler

497-1

497-1

DOE acknowledges your preference for complete cleanup of nuclear and chemical contamination at SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for a discussion of this topic and DOE's response. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 498: Breanne Steen

As a Simi Valley resident, I stand firm in our request to have 100% clean up at the Rocketdyne site. Please do not let us down.

Breanne Steen

|| 498-1

498-1

DOE acknowledges your preference for complete cleanup of 100 percent cleanup of the Rocketdyne site. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 499: Stephanie Lascala

Please properly clean up this site so that our children are no longer being exposed to toxic chemicals, and pollutants. Clean it up 100% NOT under 10% ---- get the correct facts & info ---

Stephanie Lascala

499-1

499-1

DOE acknowledges your preference for 100 percent cleanup of the site. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Please also refer to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for a discussion of this topic and DOE’s response. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 500: Erica Watkins

Do what is right. 100% clean up now. You will all sleep better at night knowing that you did the right thing. Do it for the kids. Do it for the healthy future of our community.

Erica Watkins

|| 500-1

500-1

DOE acknowledges your preference for 100 percent cleanup of the site. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 501: Christine Call

Please stop putting lives at risk by not doing the right thing for the residents near the SSFL Area IV EIS. This has been going on way too long.

Christine Call

501-1

501-1

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ.

With respect to the completion of environmental remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record of Decision pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Commenter No. 502: Jason Graf

Anything other than a full and complete clean up of the toxic material at Santa Susana Field Laboratory is unacceptable and a danger to public health in the surrounding communities. The fact that this issue is still being debated is atrocious.

Jason Graf

502-1

502-1

DOE acknowledges your preference for a full and complete cleanup of SSFL. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 503: Angie Moore

To the DOE - I hope that you will live up to your promise from many years ago to completely clean up the nuclear & chemical waste at the Santa Susanna Field Laboratory. Those of us who live in the area have worked together for so long to get closure on this problem that poses serious safety & health problems for the residents of this area. The time to get the job done is NOW! The citizens of the surrounding communities deserve to be spared further worry about this mess in our backyard. Please do the right thing and clean up the SSFL!

Angie Moore

Commenter No. 510: Richard S. Zive

It is with great sadness that I read the agreed to terms of the ruling to clean up the Santa Susana field lab properties are now being tried to be broken. I have lived in the part of Simi that has been constantly encroached on by ground water contamination from the SSFL. I have watched a neighbor die in the past two years who used to work at the lab. I thought he was in his mid to late 80's but he was actually in his early 70's. I have seen the pockets of cancer in Chatsworth where to many people in a small area were dying from cancers caused by the field lab. Children born with birth defects or stillborn. And now the DOE wants to change the ruling agreement? What kind of animals are running this joke of a "concerned" Government agency? All involved from the DOE should be asked if they would be willing to live in any of the areas that are now listed as "Cancer clusters" caused by the contamination from the Field lab. My guess is none of them would be willing to risk there families to this kind of contamination but the are willing to risk ours. I now question if any of this might have something to do with my daughters death. When we moved into our house in Simi she was fine but after about 10 years in the house she started to develop manic/depression, Paranoia, other mental issues until she accidentally over dosed on her medications at the age of only 27. She was our only child and now I am living with the guilt that I may have moved her into an area that may have poisoned her? Come on can't we get this area cleaned up so no one else has to know the pain and grief that my wife and I plus many other families have already faced? This is a great shame on our State and Country that they would ever consider leaving any contaminated soil on that property. They claim it would cause to much damage to the environment? How much Damage has it done through the contamination? I no longer hear or see any of the mountain Lions or even Bob Cats that I used to hear and sometimes see when I first moved here. What happened to them??? Is it the same fate the spade foot toad is facing? The more I read and wright about this the more I am considering moving not just out of Simi Valley but completely out of the State of California, Where I was born.

Richard S Zive

510-1 DOE acknowledges your concern about cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for a discussion of this topic and DOE's response. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. The EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

510-2 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

510-3 DOE refers you to Section 2.7, "Offsite Impacts," of this CRD for accurate information on contamination in the area and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for a discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

Commenter No. 511: Vanessa Renee Keller

It is inhumane what occurred and a sound cleanup of the waste MUST happen..the people demand a cleanup :) I demand a cleanup! :))u

Vanessa Renee Keller

|| 511-1

511-1 DOE acknowledges your concern about cleanup of waste at SSFL. DOE's purpose in preparing this Final EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. Commenter No. 517: Jennifer Shaw

RE: The Environmental Impact Report for planned PARTIAL remediation of radioactive substances and toxic/hazardous substances in Area IV at the Santa Susana Field Lab: My husband and I bought a home in Simi Valley, northwest of the Field Lab, in 1981. There was a gigantic field across the street from our home and we could see the entire panorama of the Field Lab's northern front face. We lived in that home between 1981 and 1995, with our 2 children who grew up both in utero and on foot there. During that time our home was constantly blasted with dirt from the hills south east of us when the Santa Ana winds would blow. The dirt would come down the chimney, into our cars, our garage, and our back patio where our children played. It is clear to me, now, that radioactive dirt blowing off the Field Lab could be part of the dirt which blew on our home and on us. That potentially radioactive dirt continues to blow on Simi Valley residents and their homes to this day. Mechanically the Area IV blowing dirt is the same as the lead-laden dirt from Exide Technologies which has blown all over East L.A. for years. The information about the mechanics of airborne toxic dirt contamination is well known to DTSC, yet in the Area IV EIR DTSC didn't share what they know about the means of airborne dirt contamination harming nearby humans. DOE, EPA and DTSC all know there are widespread cancer deaths in the communities surrounding the Field Lab. Our family has seen a close friend's mother die of cancer. She lived in a house on Royal Ave at the foot of Meier Canyon in Simi Valley for 30 years. As you know that's north of Area IV. Our personal friend Peggy F, who lived in a house near the bottom of Meier Canyon, also "died young" of cancer. Three of our women friends who live in the Santa Susana Knolls all came down with cancer while living there. Each afternoon the prevailing winds blow the Field Lab's dirt into their neighborhood. I am convinced the contaminated dirt blowing off the Field Lab harmed all of them, and yet the discussion of stopping dirt blowing off site is sorely lacking in the EIR. You environmental regulators don't want to admit it, the communities surrounding the Field Lab have been rife with sick and dying children with childhood cancers. Living downwind of the Field Lab causes those cancers at a rate greater than those in the general population. While you regulators can look at those childhood deaths merely as a number, I want to illustrate to you what soil contamination at the Field Lab blowing in

517-1

517-1 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

517-2

517-2 DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," of this CRD regarding your concern about airborne dispersion of contaminants from SSFL and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for a discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

The environmental monitoring program for Area IV is extensive and addresses the potential for the spread of contamination from Area IV to offsite areas. The results of this monitoring program are provided in annual environmental monitoring reports. (Please see http://www.etec.energy.gov/Environmental_and_Health/ASER.html.) Information about this monitoring program can be found at the Energy Technology Engineering Center website (<http://etec.energy.gov>).

517-2

This Final EIS was revised to address the potential for, and possible public impacts from, airborne dispersion of contaminants during remediation activities.

Commenter No. 517 (cont'd): Jennifer Shaw

the prevailing wind brought to just one family living in the hills east of the Field Lab: LOSING SKYLER by Vince Neil, Published in People Magazine October 16, 1995 “IT WAS EARLY APRIL, AND SKYLAR came down with flu-like symptoms, so Sharise kept her home from preschool. It didn’t seem anything to be concerned about. But that night, Skylar doubled over in pain and couldn’t walk. Sharise took her to West Hills Medical Center. At the time, I was away at a pro-celebrity car race. When I returned to the hotel, I got a message to call a friend. He said, “Dude, Sharise is looking for you. Skylar’s in the hospital.” I got a sick feeling as I tracked Sharise down. She was hysterical. She said “Skylar has cancer!” Skylar was rushed into the emergency room and opened up. The doctors thought her appendix had ruptured, but it hadn’t. The problem was in an area behind her stomach, where they removed a tumor the size of a softball. I associated cancer with old people. What could this child have put in her body to get cancer? It took me an hour to get to the hospital. As soon as I saw Sharise’s family crying, my heart sank. Finally, I saw Skylar in intensive care hooked up to tubes and machines. It scared the hell out of me. A few hours after surgery, in her half-sleep, she was talking about Cinderella. She was more awake the next day and very scared. She didn’t know what was going on. She just wanted to know when she was going home. The doctors had told us that Skylar needed to be transferred to Children’s Hospital in Los Angeles, where they could make sure they had gotten all the fragments of the tumor, which had ruptured around her abdomen. All Sharise and I could tell her was, “Soon, honey, you can go home.” A CAT scan indicated tumors on both kidneys; it looked bad. Later that week doctors operated to remove the tumors, but after they opened her up, they decided to leave everything intact and try-saving the kidneys and shrinking the tumors using chemo and radiation. But Skylar remained in a lot of pain. Within a month, despite the treatments, a tumor on her right kidney that would eventually grow to 6½ pounds began pushing her abdomen against her lungs, making it hard for her to breathe. At one point, Skylar said, “Daddy, I’m never going home, am I?” I said, “Of course you are.” Sharise and I never gave up hope. We brought Skylar’s dance clothes and toys to the hospital. We watched videos and sang songs. It was hard, but she recovered from the operation. Finally, even though she was getting shots of morphine for

the pain, the doctors decided she could go home and do chemo as an outpatient. We brought Skylar to Sharise's house at the end of May. It was the first time in more than a month that she was in her own bedroom, but her stomach hurt constantly. After four days we took her back to the hospital. Doctors found she had a bowel obstruction from the previous surgery—some scar tissue had formed on her intestines and twisted them—and Skylar had her third operation within two months. She said to Sharise, "Mommy, I don't want to die." We reassured her, telling her, "You're going to go to sleep for a little bit, and when you wake up, Mommy and Daddy will be right here." But inside we were really scared. Following the operation, she whimpered, "Dad, please don't let them cut me anymore." What do you tell a child? Skylar's tears ripped at my heart. Meanwhile her breathing got worse, a fast panting that resulted from the right kidney's big tumor pressing against her lungs. Her color was bad. You could actually see bones through her skin. I hated telling her she needed another operation, but there wasn't a choice. The surgeons wanted to remove the right kidney. When they opened her up several days later, they found the cancer had spread to her liver and intestines and the muscles in her back. Removing the monstrous tumor from the right kidney would have caused so much bleeding, Skylar would have died on the table. So the surgeon patched her up and hoped for a miracle. About a week later, on June 3, Skylar stopped breathing. The doctors put her on a respirator and gave her medication that essentially paralyzed her so that she wouldn't expend unnecessary energy. Over the next two weeks she continued to fight. I don't know how. Throughout the ordeal, I've wondered why this happened to someone who never got a chance to live. I've nearly destroyed myself asking if she was being punished for something I'd done. I've blamed myself because cancer runs on my mother's side of the family. When I search for a reason for Skylar's death, it's as if she has opened my eyes to all the suffering other children and their parents are going through. On July 26, Skylar underwent an operation to remove the tumor that had overtaken her body. The doctors explained it was extremely risky, but if she was going to have any chance at beating the cancer, this was it. I had no idea if I was saying goodbye forever. Ten hours later the doctors returned. They had removed the 6½-pound tumor, the size of a football, and had also taken out her right kidney, half

Response side of this page intentionally left blank.

Commenter No. 517 (cont'd): Jennifer Shaw

her liver, part of her diaphragm, a piece of muscle in her back and the tumor inside her left kidney. She eventually regained consciousness, but about a week later she underwent another operation to deal with a possible infection from the previous surgery. After that, she got worse. Her remaining kidney wasn't working well, and her lungs began failing. The doctors told us she was slipping away. We called our families and told them it was time to say goodbye. Skylar was on painkillers and remained unconscious. I knew she could hear me, though, so before I left that night, I told her I loved her. I had just gotten home when Sharise called. "Her vital signs are dropping," she said. "You'd better come back." I just started crying. Skylar was dying. It took a while for me to get to the hospital. In the meantime, Sharise sat by Skylar's side as "Skylar's Song" played in the background. Finally, Sharise told her, "Don't be scared, sweetie. Go to sleep now. It's all right." Minutes later, Skylar passed away. I got to the hospital 10 minutes after she died. Her little body lay on the bed. I told myself that at least she wasn't in pain anymore, but I've never experienced anything as sad as being in that room. On Aug. 18, Skylar was buried in a tiny pink casket. At the service, we celebrated her life. Since then my girlfriend and I have gone to the cemetery often. I've been sleeping with the blanket Skylar died in because it still smells like her. Nothing's changed at home—her room is exactly the same. But there are too many painful memories, so in November I'm moving to Las Vegas. Immediately after the funeral, I went out of town, running away from reality. But then I couldn't run anymore. I returned to L.A. and started talking to a therapist who has really helped me deal with grieving. Sometimes I think Skylar is still here, and I think I'm insane. But my therapist says that's normal. It's part of letting go and the healing process. If you've never gone through this, it's hard to know what you're supposed to feel. I think of Skylar every day. I know someday the loss won't hurt as much as it does now. But I loved Skylar very much, and that will never go away." IT IS CLEAR THAT PARTIAL REMEDIATION WON'T STOP THE CANCER CAUSING DIRT FROM LEAVING AREA IV. REMEDIATE TO BACKGROUND!

Jennifer Shaw

Ms. Stephie Jennings
 NEPA Document Manager
 SSFL Area IV EIS
 US Dept. of Energy
 4100 Guardian St., Suite 160
 Simi Valley, CA 93063

Dear Ms. Jennings,

I am writing this statement to address the concerns I have about the Draft Environmental Impact Statement (DEIS) and how the Department of Energy (DOE) is trying to break out of its commitment to the 2010 Administrative Order on Consent (AOC) and a full cleanup of the SSFL. I specifically want to address the DOE's proposal for a natural attenuation method for soil remediation at SSFL. In the DEIS, DOE claims that there are 150,000 cubic yards of soil where TPH and PAH are the only contaminants, which make the soil amenable for remediation via natural attenuation. They claim it will take up to 15 years for the PAHs and 70 years for the TPH to biodegrade below LUT values. In other words, DOE wants to set aside 150,000 cubic yards contaminated with extremely harmful substances and do nothing to prevent them from migrating into the surrounding area of the SSFL for decades. The 15 and 70 year time frames are cited from CDM Smith 2015b, who gives a range of 0.42 to 69 years for TPH natural attenuation and 5 to 15 years for PAH natural attenuation. These numbers however, are actually taken from a team of researchers at the College of Engineering at the California Polytechnic State University in San Luis Obispo. Led by Professor Yarrow M. Nelson and his team of graduates, the "Nelson studies" of the Cal Poly team are the main bodies of research behind the rates of natural attenuation for TPH and PAH cited by the DEIS. After reading those studies, it is clear that every conclusion points to the fact that natural attenuation is not a solution that works, in fact, the Nelson studies prove that natural attenuation is not a solution at all. The Nelson 2014 study for the Feasibility of Natural Attenuation in the Soil of the Santa Susana Field Laboratory contains several assumptions and errors that make the entire study not applicable for SSFL conditions. Firstly, this study uses calculations with data that is not site-specific to SSFL soil. It is important to point out that

520-1

520-1 DOE acknowledges your preference for full cleanup of SSFL in accordance with the 2010 AOC. Please refer to Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for a discussion of this topic and DOE's response. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

520-2

The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. The EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

With respect to your comment about natural attenuation, in Chapter 2, Section 2.3.2, of this EIS, DOE assumed that about 620,000 cubic yards of soil containing certain hydrocarbons (TPH) could be remediated by monitored natural attenuation, a process that was projected to require about 70 years. If this remediation technique was used for this soil, there would be restrictions on access of the area being remediated to preclude any risk to members of the public.

With respect to your comment about extending the deadline for cleanup past 2017 of Area IV completion of cleanup by 2017, please refer to Chapter 2, Section 2.2.3 of this EIS. In addition, please refer to Chapter 1, Section 1.3, which discusses the order issued by the U.S. District Court for the Northern District of California (Case No. 3:04-CV-04448-SC, May 2, 2007) that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed

Commenter No. 520 (cont'd): Anonymous

Professor Nelson and his Cal Poly team acknowledge that without access to actual soil samples from SSFL, they make a great degree of forecasting that render the results from their calculations appropriate only for “illustration purposes” (Nelson 2014, 22). Regardless, the team carried forward with the hypothetical calculations and after conducting a literature review on published first-order rate constants for TPH and PAHs to apply to SSFL, the team came up with a median first-order rate of 0.005 ppm/day. In this study, the first-order rate constants are the rates at which contamination naturally attenuates. Compounds that are more reactive/ exposed to the environment degrade faster than those that are more recalcitrant. Aside from the hypothetical numbers that the Cal Poly SLO team used in their sample calculation for the natural attenuation rates in the SSFL soil, there are several factors that the researchers themselves acknowledge make their 70 year prediction unsubstantiated. First, the natural process of weathering, where the environment breaks down the soil, may impede contaminant degradation, by removing the more bioavailable compounds and leaving behind the more recalcitrant ones. This would increase the amount of time for the soil to naturally attenuate. (Nelson 2014, 22). Second, the first-order rate constant that they used may not remain linear considering that “the more easily biodegradable fractions of the hydrocarbon mixture will biodegrade first, leaving the more recalcitrant compounds towards the end” (Nelson 2014, 22). Therefore the claim of 70 years cannot be this exact. The first-order rate constant would vary the amount of time for degradation because it focuses on how fast different compounds degrade. The compounds that would be more difficult to naturally attenuate could take much longer in comparison to the others that degraded first. Third, “some fraction of the hydrocarbons will likely remain sequestered in the soil matrix and unavailable for biodegradation” (Nelson 2014, 22). The study explicitly states that many of the harmful toxins in the soil are probably going to be there for an extremely long amount of time as they are not available for biodegradation! Once again, the impedes the 70 year claim in the DEIS, and demonstrates how the DOE is breaking the agreement with the AOC clean up standards because these compounds could remain in the soil for an infinite amount of time. All of these factors lead the Cal Poly SLO team to conclude their study by disclaiming that “longer remediation times than those calculated may be required at

an EIS and issued a Record of Decision pursuant to NEPA. In accordance with CEQA and consistent with Section 4 of the 2010 AOC, DTSC is preparing an environmental impact report (EIR) that addresses cleanup of all of SSFL (including areas for which NASA and Boeing are responsible). The *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* was issued by DTSC in 2017 (DTSC 2017b). The completion of both the CEQA and NEPA processes must occur before DOE can complete the comprehensive cleanup of soils and groundwater in Area IV and the NBZ. DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition. In June 2017, DOE initiated communications with DTSC to discuss schedules and other appropriate matters that would facilitate cleanup activities (DOE 2017a).

520-2 As stated in this EIS, monitored natural attenuation for soil with TPH is proposed for locations with “low concentrations” of these contaminants. (Simple polycyclic aromatic hydrocarbons may be amenable to natural attenuation and would be evaluated on a location-by-location basis during development of soil remediation plans.) These would be locations where these chemicals do not pose a risk to human health and the environment, and removal of the low concentrations would do more environmental harm than good. Chapter 2, Section 2.3.2 of this Final EIS for additional information. DOE recognizes that it could apply enhanced biological treatment processes for higher concentrations of TPH chemicals, however those locations are collocated with PCB and metals (for example) and biological treatment would not reduce PCB or metals concentrations to LUT values.

Commenter No. 520 (cont'd): Anonymous

SSFL” (Nelson 2014, 22). The very study that the DOE based its claim on is honestly saying that the time lengths they calculated for natural attenuation are not sufficiently accurate, and SSFL attenuation may take longer than what they calculated. The DOE should not be taking this research and making such a strong claim when the researchers themselves who conducted the study are clearly stating flaws in the science. The CDM Smith 2015b, which the DEIS cited for the 70 years claim, also uses the Nelson 2015c study. This study discusses microcosm experiments conducted with soil samples from Area IV of the SSFL concluded natural attenuation to be an ineffective solution for decontaminating the soil. The study took 9 soil samples from the SSFL soil and EFH concentration were 20-40 times higher than the current clean up goals and PAH concentrations ranged from 87 to 45,139 µg/kg. These ranges are completely hypothetical and are not amendable with the actual values in SSFL. Nonetheless, the study continued and the researchers found that after 8 months, EFH concentrations were 5 times higher “compared to the initial or 4-month samples analyzed by EMAX”. This means that this study tried to see how natural attenuation could lower the values the concentrations, but the researchers ended up finding that the concentrations of these compounds increased. The DOE cannot trust natural attenuation when the research is saying that this method is not only ineffective, but could potentially make the concentrations worse than before! The study claimed that the reason for this difference is “a difference in the data analysis methods between these two laboratories”. As for PAH, concentrations decreased slightly in some soil samples, but they were “not statistically significant”. Even for PAH concentrations, the decrease would not even be sufficient for degrading the toxic compounds at SSFL. Lastly, the original piece cited by the DEIS, CDM Smith 2015b, also cited Nelson 2015a which can be easily summarized by the last sentence of the study: “Although the focus of this investigation was on natural attenuation, the findings suggest that more active bioremediation methods should also be further explained”. Yarrow Nelson himself summarized his work by saying that natural attenuation will not be sufficient for SSFL. Nelson feels that different methods that have “active bioremediation” - meaning, using different organisms to speed up degradation, need to be analyzed. The DOE is putting the people living near SSFL at danger by making outrageous claims, such as

the 70 years for natural attenuation. Yarrow Nelson, the researcher who conducted studies for natural attenuation, clearly states that this would not be a sufficient method for the SSFL site. Furthermore, the DOE is breaking their promise with the 2010 AOC by highly considering natural attenuation methods. SSFL should have already been cleaned by this year, but the DOE has already extended the deadline which is causing people who live near these areas to fall ill. The DOE needs to take responsibility and uphold the 2010 AOC requirements.

DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing this Final EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 522: Margaret Abate

I have lived in the shadow of the SSFL for 26 years. I raised my 3 children here. As the years went by friends and neighbors of all ages developed cancers. I began to learn about this facility and the its radioactive history from a mother who lost her teenage daughter to cancer. Those of us living in the shadow of this poison pit have had commitment and promises broken so many times it is really criminal. The DOE and US Government is responsible for protecting its citizens from sites like this. Keep your commitments. Anything less is unacceptable.

Margaret Abate

522-1

522-1 Thank you for your comment. It has been included in the Administrative Record for the EIS.

522-2

522-2 DOE acknowledges your concern about protecting citizens from sites like SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Committer No. 523: Arline Mathews

The government called it “defense” and secretly installed ten reactors at the missile factory. IT IS NOT DEFENSE, WHEN YOU KILL OFF YOUR OWN PEOPLE. A Univ. Of Ill. study found that many more cancers would happen to millions of people here in the L.A. and Ventura area, as a result of the radioactivity and hazardous waste left behind. There never was cancer in my family but my son died of Glioblastoma - a rare cancer of the brain, and his son got leukemia. I believe that the Government. is responsible. We have a right to have it cleaned up to background. Any court would find that the victim should be made whole again, whether something was ab accident or otherwise.

Arline Mathews

523-1

523-1

Chapter 1, Section 1.3, of this Final EIS contains a brief history of activities at SSFL. Additional information about the activities of DOE and its predecessor agency, the Atomic Energy Commission, at Area IV can be found at <http://www.etec.energy.gov/>. As indicated in this section, SSFL was developed as a remote site to test rocket engines and to conduct nuclear energy research. These activities occurred in physically separate areas at SSFL, the nuclear energy research activities being conducted in Area IV of SSFL, which physically comprises about 10 percent of the land area at SSFL. Activities at Area IV did not include the manufacture of missiles but did include nuclear energy research and development; manufacture, disassembly, and management of nuclear reactor fuel; testing liquid metal processes and developing liquid metal components; and other energy-related work. Additional information about Area IV operations is at http://www.etec.energy.gov/Operations/Operations_Work.html.

Please refer to Sections 2.7, “Offsite Impacts”, and 2.8, “Cancer and Other Illnesses Near SSFL”, of the CRD for discussions of these topics and DOE’s responses. See also Chapter 3, Section 3.9.5, of this EIS, which presents comparative data on cancer mortality and incidence rates for the United States, California, and Los Angeles and Ventura Counties.

523-2

523-2

DOE refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of studies of illnesses in the vicinity of SSFL and author-acknowledged limitations of those studies. DOE is not aware of a University of Illinois study related to SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

525-1

DOE refers you to Section 2.7, "Offsite Impacts," of this CRD for accurate information on contamination in the area around SSFL and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

If the comment is referring to the SRE accident, it was cleaned up a long time ago. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

Committer No. 526: Patrick Russo

The mess Rocketdyne, the AEC, DOE, and NASA have left atop the SSFL is disgusting. These agencies are directly responsible for the death of hundreds of innocent people who unknowingly developed illnesses as a result of exposure to the Radioactive contamination left behind from the projects these agencies undertook. The ability these agencies have to say “technically these illnesses cannot be proven to have resulted from the radioactive disaster we created” is appalling. The contamination atop the hill is responsible for thousands of cases of cancer and other rare illnesses. Just living with in 40 miles of the disaster site puts all citizens at risk for there lives. I would like to personally thank these agencies for creating a superfund sight. Horrible.

Patrick Russo

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

Commenter No. 527: Christopher Rubin

Clean it up! For the sake of our children, grandchildren, and all future generations.

Christopher Rubin

|| 527-1

527-1

DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 528: Jon P Scott

The Santa Susana Lab area needs to be cleaned up. I lived in Bell Canyon, a community a few mile away from the site. I used to walk my dog and we would cross the “seasonal” creek and my dog died of cancer of the paws. I moved into Bell Canyon in 1980 and in 1985 I developed a malignant melanoma on my neck. It was removed just before it entered my blood stream. In 1990 I was an intervenor in the case against Rocketdyne because they wanted to extract plutonium from metal fuel rods on the site and then transport them to another state. I won that battle and I urge you to not let this site be left in the shape it is in. Here is a link to my intervenor status. <https://www.nrc.gov/docs/ML0725/ML072540509.pdf> I moved out of Bell Canyon because it is a dangerous place to live. This facility needs to be FULLY cleaned up before more innocent people lose their lives. This facility is dangerous and it’s a known fact and has been documented that many former workers have developed cancer and have died because of exposure of deadly chemicals, still on that property. I URGE YOU YOU HAVE THIS AREA CLEANED UP COMPLETELY!!!

Jon P Scott

528-1 DOE acknowledges your preference for full cleanup of SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. Please also refer to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for a discussion of this topic and DOE’s response. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

528-2 DOE refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL.

DOE’s purpose in preparing this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the action alternatives evaluated are protective of public health and safety and the environment.

Commenter No. 529: Dr. Jennifer Stirewalt

I urge you to continue the cleanup process on Santa Susana field laboratory. I personally suffer from autoimmune arthritis and recently my husband was diagnosed with fibromyalgia both diseases I feel may be the result of environmental toxin exposure. . I also have many friends and clients that suffer from disorders that are thought to be rare diseases but are quite the norm in Simi Valley. As a veterinarian I also see this trend in my Animal patients as well. I remain extremely concerned about this issue and will continue to raise awareness until something is done to remedy the situation. Covering it up and walking away is not the answer. Everyone’s health is at stake. Something must be done! Sincerely,

Dr. Jennifer Stirewalt

DOE’s purpose in preparing this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the action alternatives evaluated are protective of public health and safety and the environment.

Commenter No. 530: Sarah Dowthwaite

To whom it may concern,

The Santa Susana Field Laboratory has been a wasteland for nearly half a century. High levels of radiation and nuclear waste in the soil have long been preventing development along the beautiful hills of Simi Valley. Now, more than ever, a proper clean-up plan must be made, as there is new housing under construction less than a mile from the site, the closest large-scale development yet. Those who live closest to the site have seen the consequences: namely, rare cancers and illnesses linked to radiation and toxic substances. The dangers that lurk beneath the ground are especially dangerous as they're at a high point and trickle down to the valleys with wind, rain, and streams. There is no question to the severity of the problem. This is an issue long ignored in the history of Simi Valley and thus few efforts have been made to resolve it. An adequate site clean-up that leaves little to no contaminated soil left needs to be executed fully and swiftly. The solution is clear but has taken almost fifty years to be properly implemented. We cannot afford to wait any longer. I ask that as you finalize the plans for the Santa Susana Field Lab cleanup, you consider the health and safety of those near the site, especially as construction continues to encroach into the hills and more people will be populating the surrounding area.

Sarah Dowthwaite

530-1 As indicated in Chapter 1 of this Final EIS, DOE acknowledges that past activities at SSFL resulted in chemical and radiological releases that impacted soils, buildings, and groundwater, and intends to complete remediation of SSFL Area IV and the NBZ in compliance with applicable requirements (including regulations, orders, and agreements) for cleanup of radioactive and hazardous substances.

Chapter 1, Section 1.3, of this Final EIS, contains a history of the SSFL site that summarizes DOE's past activities in Area IV, including previous cleanup efforts. Additional information can be obtained from the DOE Energy Technology Engineering Center website (see <http://www.etec.energy.gov/>). DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. This Final EIS is being prepared in accordance with NEPA to evaluate alternatives for completing the remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. This EIS will inform Federal decisions about remediation of contaminated soil and groundwater, building demolition, restoration of the impacted environment, and disposal of chemical and radioactive waste. DOE will complete contamination removal and site remediation at Area IV and the NBZ based on the decisions made pursuant to this Final EIS and in accordance with all regulatory requirements. As discussed in Chapter 1, Section 1.5, of the this Final EIS, in 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site.

530-2 DOE acknowledges your preference for cleanup of the site. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL

Commenter No. 530 (cont'd): Sarah Dowthwaite

for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. Please also refer to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for a discussion of this topic and DOE’s response. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

As discussed in Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD, in prior cleanup actions DOE has removed most of the buildings in Area IV as well as much of the soil contamination associated with past practices. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Each of the alternatives evaluated, including No Action Alternatives required by NEPA, consider the potential risks to human health as well as protection of natural resources to determine cleanup levels. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

530-3 DOE acknowledges your concerns and refers you to Section 2.7, “Offsite Impacts,” of this CRD regarding your concern about dispersion of contamination into the valleys and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ.

Commenter No. 531: Monzelle Brock

The suggestions the DOE has proposed will still leave toxic wastes behind. It will continue to migrate and contaminate nearby communities. There is a strong possibility that myself and 2 immediate neighbors have developed hypothyroidis as we have lived at the west end of Simi Valley for over 45 years, and we all were diagnosed in close proximity to each other in time. Simi Valley is a 9 mile slope ending at the west end, and water leaches out from our rocky terrain when it rains. and collects here at the west end. (The city has installed pumps to control our over-flooded curbsways.) This, plus reading in the Star this past week about a cluster of elementary school children with brain cancer which is apparently attributed to Rocketdyne's tests in the article make me feel very strongly that the site should be completely cleaned up to help avoid future consequences, especially with our young. (and why would anybody want to save a monument of the launch test site as a reminder? It's contaminated too!)

Monzelle Brock
Retired L.V.N.

535-2 Thank you for your comment. It has been included in the Administrative Record for the EIS.

Commenter No. 536: Geoff Stradling

Sir/Madam - I am writing to ask you to complete your obligation to clean up all of the nuclear and chemical contamination at the Santa Susana Field Laboratory. Removal of the contamination is crucial to life of humans, plants, and other animals in the area around the SSFL. I ask you - would you want to live in a sea of nuclear waste? Would you want your grandchildren to? What will we tell future generations if we leave our mess behind?

Geoff Stradling

536-1

536-1

DOE acknowledges your preference for cleanup of contamination at SSFL. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance of the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

DOE does not understand the comment about letting people live in a sea of nuclear waste. Any radioactive waste that was generated as part of operations or due to previous cleanup activities has been removed. As discussed in Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD, in prior cleanup actions DOE has removed most of the buildings in Area IV as well as much of the soil contamination associated with past practices. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible.

Commenter No. 537: Elizabeth Wilson

This must be cleaned up NOW. Please make this happen.

Elizabeth Wilson

|| 537-1

537-1

DOE acknowledges your concern about cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

With respect to the timeliness of DOE’s completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, of this Final EIS, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record of Decision pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC’s Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Commenter No. 538: Josette & Yvette Howard

I want to make sure that you are going to clean up every part of the contamination that needs to be cleaned up so that our families can be safe. You promised to clean up everything until it was completed. So please do so until everything is clean.

Josette & Yvette Howard

538-1

DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing this Final EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 542: Teresa Uribe McGilvray

Please stand on your commitment to clean up the SSFL! We have friends and family who have already paid the price of this contaminated area. I beg that you do not look the other way as new buildings, parks and recreation centers are built on this un-cleaned, toxic area. Our lives and that of our children depend on you keeping your promise to clean this area... or leave it barren!! If you think it is safe than I would encourage you to buy and live in this area with your families. All lives matter. Money can wait! Please keep your promise and don't be swayed by big business. You are selling out the health and lives of thousands of people while knowing what lies below and around them...poison!

Thank you,

Teresa Uribe McGilvray

542-1

542-2

542-1

DOE acknowledges your concern about cleanup of SSFL. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

DOE acknowledges your concerns and notes that the future use of Area IV and the NBZ, those parts of SSFL that DOE is responsible for remediation and are addressed in this EIS, is as open space. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. This Final EIS includes revised text that acknowledges the land use covenant and evaluates cleanup levels that reflect the planned use as open space. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

Regarding concerns about contamination and health impacts, refer to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for additional information. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 543: Wendy Blommendahl

Honor your 2013 commitment. 100% cleanup is necessary. No exceptions. I was born and raised in Simi and have an unbelievable number of health problems and have to take about 20 medications every day. I am only 40 years old, but I am already disabled. My diagnoses: Systemic Lupus Erythematosus w/ nephritis, autoimmune hepatitis, fibromyalgia, Sjogren's, Interstitial Cystitis, migraines, asthma, osteopenia, hypothyroidism, depression, CPTSD, Avascular Necrosis right hip (replaced), left hip osteoarthritis & labral tear (repaired), pancreatic cysts (removed), pituitary Rathke's cleft cyst, spinal stenosis, bulging discs DON'T LET PEOPLE CONTINUE TO LIVE IN NUCLEAR WASTE. How can that be right?

Wendy Blommendahl

|| 543-1

543-1 DOE acknowledges your concern about 100 percent cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Any radioactive waste that was generated as part of operations or due to previous cleanup activities has been removed. As discussed in Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD, in prior cleanup actions DOE has removed most of the buildings in Area IV as well as much of the soil contamination associated with past practices. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

543-2 Thank you for your comment. It has been included in the Administrative Record for this EIS.

Commenter No. 544: Maria Aguirre

Your job is to keep us safe. Please do that.

Maria Aguirre

|| 544-1

544-1 DOE agrees with placing a high priority on health and safety and remains committed to protecting the health and safety of current and future users of the site and of the residents in the surrounding communities.

Commenter No. 545: Anonymous

In 2010, the Department of Energy, NASA and the CA Department of Toxic Substances Control (DTSC) agreed to the Administrative Order on Consent (AOC) for a clean-up of the Santa Susana Field Laboratory (SSFL) to background levels by 2017. I request the Department of Energy keeps the AOC contract and removes 100% of the contamination be removed to a toxic waste facility, by any means necessary. The Dept of Energy is responsible for ensuring the removing the toxic contaminants in the Santa Susana Field Laboratory area. The delays must stop and the clean-up must begin. Your agency is already behind schedule and the newest scare tactics for delay are unsubstantiated. I request the Department of Energy stops spreading inaccurate information regarding the “dangers” of clean-up and removal process. According to the Draft Environmental Impact Statement (DEIS), the only danger to the public is potential truck accidents or smog from trucks. None of these are particularly dangerous, and neither come close the actual danger to the lives of children who live in the contaminated SSFL area. By following federal, state, and local laws the Dept of Energy can take all necessary precautions to ensure a safe and complete clean-up. I request the Dept of Energy utilize the service roads, nearby rail stations and build covered conveyor belts to remove the contaminants, bypassing the need to use heavily populated roads and/or traveling to a farther rail station 60 miles away. No more excuses. Start the clean-up now.

Anonymous

545-1

545-1 DOE acknowledges your preference for 100 percent removal of SSFL contamination. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

545-2

In addition, please refer to Chapter 1, Section 1.3 of this EIS, which discusses the order issued by the U.S. District Court for the Northern District of California (Case No. 3:04-CV-04448-SC, May 2, 2007) that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision pursuant to NEPA. In accordance with CEQA and consistent with Section 4 of the 2010 AOC, DTSC is preparing an environmental impact report (EIR) that addresses cleanup of all of SSFL (including areas for which NASA and Boeing are responsible); the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE can begin the comprehensive cleanup of soils and groundwater in Area IV and the NBZ following the completion of both the CEQA and NEPA processes and following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC’s Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition. In June of 2017, DOE initiated communications with DTSC to discuss schedules and other appropriate matters that would facilitate cleanup activities (DOE 2017a).

545-2

DOE’s intent is not to alarm people, but it is true that the more soil that is removed to remediate the site, the larger the transportation effort (i.e., a larger number of truck trips) that would be required. The analyses in this EIS were performed to evaluate the potential impacts associated with the various alternatives for cleanup of Area IV and the NBZ. Results of the analyses allow a comparison of potential impacts and tradeoffs

Commenter No. 545 (cont'd): Anonymous

between the alternatives. In the case of soil remediation and using the Conservation of Natural Resources Alternative as an Example, leaving more soil, and consequently low concentrations of chemicals and/or radionuclides on site, reduces the number of truck trips from the site and associated transportation risk and air quality impacts. But, the potential impacts to a site user following cleanup would be highest for this alternative. Conversely, removing the soil with low concentrations of chemicals and/or radionuclides, as would be the case for Cleanup to AOC LUT Values Alternative, would result in more truck trips from the site and increases the transportation risk and air quality impacts. But, the potential impacts to a site user following cleanup would be lowest for this alternative. Although the cleanup level under the soil remediation action alternatives and scenarios are different, Area IV and the NBZ would be cleaned up to a level that is protective of the public and environment regardless of the alternative (see Chapter 4, Section 4.9).

DOE agrees with the commenter's statement regarding the cleanup being conducted safely. Regardless of the cleanup alternative selected and implemented, DOE would comply with the laws, regulations, and processes that have been established to protect the public and workers.

545-3 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

Commenter No. 546: Sarah Casey

But the potential impacts to a site user following cleanup would be highest for this alternative. Conversely, removing the soil with low concentrations of chemicals or radionuclides, as would be the case under the Cleanup to AOC LUT Values Alternative, would result in more truck trips from the site thus will increase the transportation risk and air quality impacts. But the potential impacts to a site user following cleanup would be lowest under this alternative. Although the cleanup levels under the three soil remediation action alternatives and scenarios, Area IV and the NBZ would be cleaned up to a level that is protective of the public and environment regardless of the alternative. (Please see Chapter 4, Section 4.9 of this EIS.)

DOE agrees with the commenter's statement regarding the cleanup being conducted safely. Regardless of the cleanup alternative selected and implemented, DOE would comply with the laws, regulations, and processes that have been established to protect the public and workers.

546-3 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

Commenter No. 547: Marie Garside

Please uphold your commitment for the fullest clean up of the SSFL Area IV EIS. Only a full clean up is acceptable to the residents of Simi Valley and it will work toward protecting our health in the future.

Marie Garside

547-1

547-1

DOE acknowledges your preference for full cleanup of SSFL Area IV. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 548: Tessa Mykel

Ms. Stephe Jennings
 NEPA Document Manager
 SSFL Area IV EIS
 US Department of Energy
 4100 Guardian Street, Suite 160
 Simi Valley, CA 93063

Dear Ms. Jennings,

I am deeply concerned about the impact the contaminants at the Santa Susana Field Laboratory will have on the environment and on the surrounding communities, unless DOE is held responsible for cleaning up its toxic mess. DOE signed the AOC in 2010, agreeing to a full clean-up of the Santa Susana Field Lab. In its Draft EIS, DOE proposes four alternatives that either leave 39%, 91%, 99%, or 100% of the contamination at SSFL not cleaned up. All of these alternatives violate the 2010 AOC, a legally binding agreement, leaving dangerous radionuclides and toxic chemicals on the site to continue to harm neighboring communities. DOE's Draft EIS fails to acknowledge that the AOC is a legally binding agreement, which DOE has chosen to ignore. As the polluter, DOE does not have the authority to decide how much of the mess that it made is going to get cleaned up. The decision rests with DTSC for the chemicals under the Resource Conservation and Recovery Act, even if there were no AOC. The AOC also gives authority to DTSC in terms of remediation goals for radionuclide contamination. DOE claims that a protective cleanup poses undue harm to the environment and that the contamination poses little risk. On the contrary and in all truth, the contamination poses a very significant risk to public health in all DOE's options, a risk that far outweighs environmental concerns of cleanup, which can be mitigated. Most of the cleanup is occurring in areas that are already disturbed by DOE activities. DOE was not concerned about the environment when it was polluting the land, nor about trucks when they were driving up to SSFL every day bringing hazardous loads of spent commercial nuclear fuel from around the country. I urge the DOE to scrap this EIS and comply with the 2010 AOC. If DOE moves forward with any of the alternatives that it outlined in the Draft EIS, human health and the environment will suffer.

Sincerely,

Tessa Mykel

- | | |
|---------------------|--|
| 548-1 | 548-1 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts. |
| 548-2 | 548-2 DOE acknowledges your preference for a complete cleanup of SSFL in accordance with the 2010 AOC. Please refer to Section 2.1, "Preferences for Cleanup," of this CRD for additional information. |
| 548-3 | 548-3 The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. This EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. |
| 548-4 | 548-4 DOE recognizes that the AOC is a legally binding agreement and also recognizes DTSC's authority over the cleanup at SSFL. DOE recognizes that DTSC needs to approve soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC and DOE-prepared RCRA closure plans for building demolition. NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for |
| 548-2 cont'd | |

Commenter No. 548 (cont'd): Tessa Mykel

agency action. This Final EIS analyzes an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In response to public input since the 2010 AOC was signed, this EIS also analyzes alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ.

548-4 DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation at those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Potential risks to public health and safety under all proposed alternatives are presented in Chapter 4, Section 4.9, and Appendices G and K, of this EIS. Each of the action alternatives evaluated in this EIS is protective of the environment and the health and safety of the public and workers.

Commenter No. 549: Lauren Hammersley

My 6 year old daughter Hazel is a Simi Valley resident and is fighting cancer for the second time! When we moved to Simi, we were made aware of the meltdown, but were assured that it was safe to live here. But after her diagnosis, we began meeting way too many families in our surrounding communities that had children suffering from similar diseases, and like Hazel's, some wer very rare forms of cancer. We began researching and have been appalled by the things we have learned, and especially by the DOE and their willingness to not live up to their responsibilities with a full clean up. So I am here to DEMAND for that full clean up, on behalf of my daughter, all of the children like her in our communities and all future generations!

Lauren Hammersley

549-1

549-1 DOE acknowledges your concerns and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

549-2

549-2 DOE acknowledges your preference for full cleanup of SSFL Area IV. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public

Commenter No. 550: Sarah Miller

It is completely unacceptable that my children's children will have to live in the SSFL mess. This should have been cleaned up years ago. I propose that any and all involved in trying to extend or cancel FULL cleanup in the Santa Susana hills, be required to live in the Knolls for a minimum of 20 years if this passes. FULLY CLEAN UP THE MESS. You are exposing our families to chemicals that should have been fully cleaned up directly after the incident occurred. You have now wasted time expecting the public to forget it and it has had years of high winds and rain to spread these chemicals throughout Simi Valley and its surrounding communities. Full and immediate cleanup is required.

Sarah Miller

550-1

550-1

DOE acknowledges your concern about full cleanup of SSFL. Please refer to Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

550-2

550-1
cont'd

Regarding your comment about a mess that should have been cleaned up years ago, DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible.

Regarding your comment about immediate cleanup, please refer to Chapter 1, Section 1.3 of this EIS, which discusses the order issued by the U.S. District Court for the Northern District of California (Case No. 3:04-CV-04448-SC, May 2, 2007) that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision pursuant to NEPA. In accordance with CEQA and consistent with Section 4 of the 2010 AOC, DTSC is preparing an environmental impact report (EIR) that addresses cleanup of all of SSFL (including areas for which NASA and Boeing are responsible; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE can begin the comprehensive cleanup of soils and groundwater in Area IV and the NBZ following the completion of both the CEQA and NEPA processes and following completion of the following regulatory actions: (1) DTSC issues a Notice

Commenter No. 550 (cont'd): Sarah Miller

of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition. In June of 2017, DOE initiated communications with DTSC to discuss schedules and other appropriate matters that would facilitate cleanup activities (DOE 2017a).

550-2 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

Commenter No. 551: Ronald B. Ziman, MD, FACP, FAAN

It is my intent that these personal comments be added to my prior comments and not replace them. Thank you for providing a Draft EIS that includes various alternatives, as required by law. I applaud the DOE for having the courage to act lawfully and resist the pressures placed upon it by radical and irrational elements. The EIS development is intended to be scientifically based without undue political influence. To exclude alternatives as prescribed by the AOC before proper site characterization and designating a cleanup process that does not take into account risk, the proven methodology of the widely accepted and long standing EPA cleanup standards, final planned land use or the law would have been unlawful, unjustified and unconscionable. It would not be making a rational cleanup plan based on facts, but rather ignoring the facts in favor of a predetermined and unnecessarily aggressive, destructive and costly cleanup plan. The AOC itself is internally conflicted, inconsistent and illegal. It states, in part, that it will not contradict law, yet it requires that no cleanup alternatives be considered other than that which it defines. This violates both federal and state law. What we know today is that the site contains physical remains of a rich and unique Native American cultural heritage in addition to its national historical value. We also know that though there are some areas that require cleanup, the level of the soil contamination largely does not pose significant risk for open space use. David Krupp, Ph.D., Director of the Griffith Observatory, is a widely respected archeoastronomer. He is also very familiar with the SSFL site. He is on record indicating that this site is unique throughout the world. In his opinion it is of World Heritage quality and would qualify for such designation. The cleanup, as predefined in the AOC, would destroy this historical and cultural site beyond repair. Its educational and historical value would be forever lost to the United States and the world as a result of the cleanup as predetermined by the AOC. Despite claims to the contrary, there is no evidence of SSFL having caused disease to those living in the neighboring communities. I live in Bell Canyon. As a physician, of which I am one of many living here, neither I nor the other doctors would place ourselves or our families at increased health risk if we felt otherwise. As a physician neuroscientist on faculty at UCLA I am in the unique position to be able to critically review and understand the health and epidemiological data that has been developed, collated, reviewed and published by

551-1

551-1 DOE acknowledges the commenters concern for the Cleanup to AOC LUT Values Alternative. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

551-2

551-2 DOE recognizes the breadth of resource values in Area IV and the NBZ and intends to protect human health without unduly damaging the environment. This is reflected in the range of alternatives DOE developed and analyzed, which allows a comparison of impacts among the various resource areas, including cultural resources. Also, please see Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for a discussion of how DOE’s alternatives and Preferred Alternative relate to the technical elements of the 2010 AOC; Section 2.1, “Preferences for Cleanup” of this CRD for DOE’s process for determining the final selection of an alternative; and Section 2.4, “Application of Exemptions under the 2010 Administrative Order on Consent,” of this CRD for a discussion of the process that will be used to determine exemptions DOE’s preferred alternative for soils remediation is the Conservation of Natural Resources, Open Space Scenario. DOE is identifying this as the preferred alternative because it is consistent with the risk assessment approach typically used at other DOE sites, other DTSC-regulated sites, and EPA CERCLA sites that accounts for the specific future land use of the site. Use of a risk assessment approach is consistent with the process being employed by Boeing for the land it owns at SSFL and recognizes the Grant Deeds of Conservation Easement and Agreements (Ventura County 2017a, 2017b) that commit Boeing’s SSFL property, including Area IV and the NBZ, to remaining as open space habitat. This scenario uses a standard risk assessment approach that is protective of human health and the environment rather than LUT values (action levels). The 2010 AOC allows DOE and DTSC to agree upon changes to the AOC to better meet cleanup objectives.

551-3

Commenter No. 551 (cont'd): Ronald B. Ziman, MD, FACP, FAAN

the Public Health Department , various academic institutions and private contractors. Having said that, there is an additional health concern that the DOE's DEIS appears to have overlooked. The AOC cleanup plan will require removing much of the soil in area IV down to bedrock. This will change the surface water drainage pattern which is defined by the topography, transforming the new drainage to conform with the topography of the underlying bedrock in many places. The current AOC does not allow for modification related to drainage.. The amount of soil removed per the AOC will depend on ongoing testing for detectable contaminants at depth and therefore is subject to change. To date no soil has been identified to replace that which will be removed to be able to establish good drainage. The reasonable development of a drainage plan for what will be a gigantic grading project without predetermined soil excavation or the ability to replace soil is simply not possible. California, including Southern California, has just experienced one of the wettest winters on record. The health departments have already expressed concern to the public that this year's wet winter will translate into an unusually heavy mosquito infestation, carrying with it an increased risk of mosquito borne diseases such as West Nile virus and Avian Flu. Los Angeles County has already recorded cases of West Nile Virus infection in people this year. Last year there were 153 cases and 6 deaths documented in Los Angeles County by the LA County Public Health Department. Another 7 cases were documented in Ventura County by its Health Department. Because of limited testing, these numbers are undoubtedly low relative to the actual number cases that were never tested. There is also the potential for the introduction of the Zika virus into California, which would then be added to the list. Improper and unknown drainage patterns will result from grading without having any grading plan or control of the final drainage due to the absence of replacement soil and the bedrock defining the post cleanup topography in many areas. There is the likely development of undesirable drainage patterns resulting in stagnant pools on the property. This would lead to new, fertile and potentially disease laden mosquito breeding grounds, posing an increased risk to anyone visiting the property. What risks there would be to the surrounding communities is unknown, but it is also potentially increased. I am unaware that this has been considered. To my knowledge there have been no studies addressing these concerns.

|| 551-3
cont'd

551-4

551-3 Thank you for your comment. It has been included in the Administrative Record for the EIS. DOE refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for discussion of the studies referred to in the comment. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

551-4 The alternatives under consideration in this EIS and the mitigation measures developed to minimize potential impacts to water quality and downstream flood control capacity were not configured to eliminate runoff from the project area. The alternatives and mitigation measures have instead been configured to control the rate of runoff from the site to more closely match existing runoff rates and limit the potential for increases in erosion from the site or downstream. As a result, the controlled drainage of the site during and following precipitation events would not result in new areas of standing water at the conclusion of the typical rainfall period of December through May that could contribute to new mosquito development habitat.

Commenter No. 551 (cont'd): Ronald B. Ziman, MD, FACP, FAAN

For additional reasons as submitted in my prior comments to DOE, as well as the above, I am therefore in favor of the cleanup with the least removal or disturbance of soil. This would result in the least impact on the topography, its drainage patterns and propensity for the development of new mosquito breeding areas. It is ironic that the excessive, impractical and costly cleanup defined by the AOC, purportedly to protect the public, really creates new and increased dangers which would otherwise be avoidable. Again, thank you for considering my comments.

Sincerely,

Ronald B. Ziman, MD, FACP, FAAN Board Certified in Internal Medicine, Neurology and Vascular Neurology Associate Clinical Professor of Neurology, David Geffen School of Medicine, UCLA Stakeholder and Resident of Bell Canyon Co Chair, SSFL Community Advisory Group

551-5

551-5 DOE acknowledges your support for a cleanup that would involve the least removal or disturbance of soil. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

Commenter No. 552: Anonymous

I am requesting you hold to your word to clean up al the detectable contamination at SSFL/

|| 552-1

552-1 DOE acknowledges your preference for cleanup of detectable contamination at SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 553: Sheilah Abernathy

I live in Moorpark and have several friends that have children who have battled cancer or are now fighting for their life at this time. I am a blood donor at Children’s Hospital Los Angeles to help these children as well as providing meals, grocery shopping, etc. Please get the Santa Susana Field Laboratory cleaned up completely as soon as possible. Pets as well as humans are losing their lives to new strains of cancer as well as more common cancers. The toxins in the Simi Valley area should have been cleaned up a long time ago.

Sheilah Abernathy

553-1

553-1 DOE refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

553-2

553-2

553-2 DOE acknowledges your concern about cleanup of toxins in the Simi Valley area. Please refer to Section 2.1, “Preferences for Cleanup,” of this CRD for additional information.

553-1

Regarding your comment about toxins that should have been cleaned up years ago, please note DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible.

Regarding your comment about immediate cleanup, please refer to Chapter 1, Section 1.3 of this EIS, which discusses the order issued by the U.S. District Court for the Northern District of California (Case No. 3:04-CV-04448-SC, May 2, 2007) that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision pursuant to NEPA. In accordance with CEQA and consistent with Section 4 of the 2010 AOC, DTSC is preparing an environmental impact report (EIR) that addresses cleanup of all of SSFL (including areas for which NASA and Boeing are responsible); the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE can begin the comprehensive cleanup of soils and groundwater in Area IV and the NBZ following the completion of both the CEQA and NEPA processes and following completion of the following regulatory actions: (1) DTSC issues a Notice

Commenter No. 553 (cont'd): Sheilah Abernathy

of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition. In June of 2017, DOE initiated communications with DTSC to discuss schedules and other appropriate matters that would facilitate cleanup activities (DOE 2017a).

Commenter No. 554: Karen Berman

Clean up Santa Susanna facility as promised. No more cancer. You have been poisoning our community for decades2

Karen Berman

554-1 DOE acknowledges your preference for full cleanup of SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

554-2 DOE acknowledges your concerns and refers you to Section 2.7, "Offsite Impacts," of this CRD for accurate information on offsite contamination and discussion of impacts following cleanup.

Commenter No. 555: Kimberly Gilbert

I grew up in Simi and had a number of friends pass away to cancer. This is the cause. This needs to be cleaned up. We are fellow humans and we deserve the right to a healthy life just as the people who did this to our community. Why do they think this is ok to leave a community to suffer the risk of their health based on their mistakes? I work in Quality Assurance and understand the effect this will have on the community as I understand all the steps to keep people healthy. This must be cleaned up 100%. Not 1 not 5, but 100%.

Kimberly Gilbert

555-1

555-1

DOE acknowledges your concerns and refers you to Section 2.1, “Preferences for Cleanup,” of this CRD regarding your concern about site cleanup and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

555-2

DOE acknowledges your preference for 100 percent cleanup of the site. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 556: Robert Guenther

I am a resident of Simi Valley, a neighboring community. I am in shock that nearly 60 years after one of the worst contaminating events in history this is still debated whether or not to clean up this mess. It's simple: CLEAN IT UP! If this was in the backyards of the decision makers and company/agency executives this would not be debated, it would be done already! Make it so, we can't wait another 70+ years for this to "magically" go away on it's own.

Robert Guenther

556-1

556-1

DOE acknowledges your concern about cleanup of SSFL. DOE is not debating whether to clean up those portions of SSFL for which it is responsible, Area IV and the NBZ. Rather, this evaluates alternatives for accomplishing the cleanup. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ.

Commenter No. 557: Art St. Clair

It is clear the golden age of American responsibility is over - so glad my father isn't alive to see the defense industry he worked for so proud to pursue a few bucks over the welfare of the citizen's of the Country that gave it life.

Art St. Clair

557-1

557-1

DOE takes its cleanup and financial management responsibility quite seriously. As a Federal agency, DOE is required to evaluate and justify major expenditures of Federal dollars. DOE performed a cost-benefit analysis of the soil remediation alternatives as part of this EIS (see Appendix K). The results of the analysis show that the cleanup under the Cleanup to 2010 AOC LUT Values Alternative would be much more expensive and with minimal additional protection of public health and the environment compared to the other project soil remediation alternatives.

Commenter No. 558: Darlynn Childress

In 2010, the Department of Energy, NASA and the CA Department of Toxic Substances Control (DTSC) agreed to the Administrative Order on Consent (AOC) for a clean-up of the Santa Susana Field Laboratory (SSFL) to background levels by 2017. I request the Department of Energy keeps the AOC contract and removes 100% of the contamination be removed to a toxic waste facility, by any means necessary. The Dept of Energy is responsible for ensuring the removing the toxic contaminants in the Santa Susana Field Laboratory area. The delays must stop and the clean-up must begin. Your agency is already behind schedule and the newest scare tactics for delay are unsubstantiated. I request the Department of Energy stops spreading inaccurate information regarding the “dangers” of clean-up and removal process. According to the Draft Environmental Impact Statement (DEIS), the only danger to the public is potential truck accidents or smog from trucks. None of these are particularly dangerous, and neither come close the actual danger to the lives of children who live in the contaminated SSFL area. By following federal, state, and local laws the Dept of Energy can take all necessary precautions to ensure a safe and complete clean-up. I request the Dept of Energy utilize the service roads, nearby rail stations and build covered conveyor belts to remove the contaminants, bypassing the need to use heavily populated roads and/or traveling to a farther rail station 60 miles away. No more excuses. Start the clean-up now.

Darlynn Childress
Suburban Women’s Advocacy Network

558-1

558-1 DOE acknowledges your preference for 100 percent removal of SSFL contamination. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

558-2

Regarding your comment about beginning cleanup, please note, DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible.

558-3

In addition, please refer to Chapter 1, Section 1.3 of this EIS, which discusses the order issued by the U.S. District Court for the Northern District of California (Case No. 3:04-CV-04448-SC, May 2, 2007) that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision pursuant to NEPA. In accordance with CEQA and consistent with Section 4 of the 2010 AOC, DTSC is preparing an environmental impact report (EIR) that addresses cleanup of all of SSFL (including areas for which NASA and Boeing are responsible); the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE can begin the comprehensive cleanup of soils and groundwater in Area IV and the NBZ following the completion of both the CEQA and NEPA processes and following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform

558-1
cont’d

Commenter No. 558 (cont'd): Darlynn Childress

the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition. In June of 2017, DOE initiated communications with DTSC to discuss schedules and other appropriate matters that would facilitate cleanup activities (DOE 2017a).

- 558-2 DOE's intent is not to alarm people, but it is a true that the more soil that is removed to remediate the site, larger the transportation effort (i.e., a larger number of truck trips) that would be required. The analyses in this EIS were performed to evaluate the potential impacts associated with the various alternatives for cleanup of Area IV and the NBZ. Results of the analyses allow a comparison of potential impacts and tradeoffs between the alternatives. In the case of soil remediation and using the Conservation of Natural Resources Alternative as an example, leaving more soil and consequently low concentrations of chemicals and/or radionuclides on site reduces the number of truck trips from the site and associated transportation risk and air quality impacts. But the potential impacts to a site user following cleanup would be highest for this alternative. Conversely, removing the soil with low concentrations of chemicals or radionuclides, as would be the case under the Cleanup to AOC LUT Values Alternative, would result in more truck trips from the site thus will increase the transportation risk and air quality impacts. But the potential impacts to a site user following cleanup would be lowest under this alternative. Although the cleanup levels under the three soil remediation action alternatives and scenarios are different, Area IV and the NBZ would be cleaned up to a level that is protective of the public and environment regardless of the alternative (see Chapter 4, Section 4.9).

DOE agrees with the commenter's statement regarding the cleanup being conducted safely. Regardless of the cleanup alternative selected and implemented, DOE would comply with the laws, regulations, and processes that have been established to protect the public and workers.

- 558-3 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

Commenter No. 559: Millie Reina

I had a daughter I raised in Simi Valley and she passed away from angiosarcoma cancer as she turned 28. Don't let this keep happening to our children. She was beautiful inside and out with a bright future.

Millie Reina

The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

Commenter No. 564: Martita

One of the first things we teach our children is to “own it and fix it”. They know if they make a mess, they are responsible for cleaning it up. Please do your part and do as promised ; clean up the SSFL and do it in an efficient and careful way. Don’t use shortcuts to give false promises and leave toxicity behind. Our children and our future generations don’t have price tags! Please don’t compartmentalize the problem to help you sleep better at night ; we as parents ask for a full clean up of the SSFL!

Martita

564-1

564-1

DOE acknowledges your preference for a full cleanup of SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 565: Sarah Cortell

To Whom it May Concern:

I'm a resident of the Chatsworth Lake Manor area, and a real estate broker for the past 18 years. I'm writing these comments as I'm unable to see the benefit of any clean-up at such a delayed date after the contamination, and I'm concerned for the residents of my neighborhood. Other than the mandate to clean the site, I'm not seeing a well founded reason or benefit to doing so, except for maybe for the contractor who lands the bid. I think the astronomical amount of money that would be spent for the clean up to AOC LUT values, could be better spent in just as an astronomical number of ways. This is a ludicrous proposal. I don't believe any action should be taken, but if forced to choose an option, I will go with the Conservation of Natural Resources Alternative. Whatever action is taken, I hope there is serious consideration for the health, quiet enjoyment of property, and property values for the residents in the immediate areas. Yes, "NIMBI" ism is alive and well. If a direct route to the 118 freeway is feasible, that's great, but bringing thousands of diesel trucks through residential neighborhoods is simply unacceptable. Even if they are split between Lake Manor and Roscoe, it will still pose a serious impact on our neighborhoods. Not to mention the potential risk of death to recreational bicyclists when we have thousands of trucks larger than these small streets were designed to handle. If we have to endure years of noise and air pollution, what's the budget, and who's responsible to clean up our soil of diesel particulate pollution, to compensate us for the loss of our quiet enjoyment of our property, and for our depreciation in property values?

Sincerely,

Sarah Cortell
Real Estate Agent Chatsworth Manor Resident

565-1

565-2

565-3

565-1 DOE acknowledges your comment that no action need be taken but that if forced to choose an option, you would prefer the Conservation of Natural Resources Alternative. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

565-2 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

565-3 As discussed in Chapter 2, for the Final EIS DOE revised the EIS analysis to reflect a more realistic average of 16 heavy-duty truck round trips per day for soil removal activities, although on some days the number of dally truck shipments could increase to 32. DOE evaluated transport of waste from SSFL down Woolsey Canyon Road, then via multiple local roadways to local freeways. Shipments would occur during daylight hours. The EIS evaluates the potential impacts that could occur during shipment of waste and materials, including those from potential accidents, and found these potential impacts to be very small (also see the response to comment 162-6).

Considering all remediation activities at Area IV and the NBZ (i.e., soil remediation, building removal, and groundwater remediation), daily shipments attributable to DOE remediation activities would not exceed 32 and generally would be considerably less. However, NASA and Boeing could also be making shipments of waste, backfill, and equipment during some of the same years that DOE would be making shipments of waste, backfill, and equipment. As discussed in Chapter 2, Section 2.4.4, of this Final EIS, DOE, NASA, and Boeing have entered into a transportation agreement (Boeing 2015a) through which they would manage the daily number of trucks allowed on Woolsey Canyon Road to no more than 96. The potential cumulative impacts of site remediation by DOE, NASA, and Boeing are evaluated in Chapter 5 of the EIS, including the risks associated with transport of waste and material and the potential impacts on traffic in the SSFL area. DOE expects that daily heavy-duty truck shipments potentially as high as 96 per day from DOE, NASA, and Boeing would only occur for a few years.

As indicated in the summary of impacts in this EIS (e.g., Chapter 2, Table 2-9), truck traffic associated with cleanup activities would have some level of impact (noise, emissions) under any of the alternatives. Based on the analyses included in this EIS, DOE does not anticipate there would be any impacts that warrant compensation.

Commenter No. 566: Jessica Boen

Like many others, my family has suffered from cancer. We live in Simi Valley, What does the concentration of cancer have to be? The entire city? Please, We need FULL SSFL CLEANUP IMMEDIATELY!

Jessica Boen

Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 570: Margery Brown

All of the cleanup choices offered in the DOE EIS violate the AOC agreement to clean up to background, which is a legally binding document signed by DOE and NASA in 2010, It certainly appears that the DOE definitely intends to break this agreement which would leave anywhere between 34% to 99% of the radioactive and toxic chemical contamination in the soil to migrate to other communities. The AOC.s do not permit risk based assessments, and in this case, the cancer risk is assumed by the surrounding communities. There has been much too much deliberate frightening of people about all of the truck traffic that would be going through surrounding communities if the AOC agreement is carried out, but the DOE has NOT been willing to consider other alternative truck routes that would not go trough crowded communities. Also, those soil laden trucks have been going back and forth from the SSFL for years. The AOC's must be followed.

Margery Brown
West Hills Neighborhood Council

570-1

570-1 DOE acknowledges your concern about cleanup of SSFL in accordance with the 2010 AOC. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. The EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

570-2

570-2 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of the transportation topic and DOE's response.

570-1 cont'd

DOE's intent is not to generate opposition to the SSFL cleanup or to scare locals out of supporting cleanup, but it is true that the more soil that is removed to remediate the site, the larger the transportation effort (i.e., a larger number of truck trips) required. The analyses in this EIS were performed to evaluate the potential impacts associated with the various alternatives for cleanup of SSFL. Results of the analyses allow a comparison of potential impacts and the tradeoffs between the alternatives. In the case of soil remediation, leaving more soil, and consequently low concentrations of chemicals and/or radionuclides on site, reduces the number of truck trips from the site. Conversely, removing the soil with low concentrations of chemicals and/or radionuclides, results in more truck trips from the site. The EIS shows that the transportation risks are very small; Chapter 4, Section 4.8.1 and Appendix H of this Final provide details of the transportation risk analysis.

Commenter No. 571: Teresa Earnest

my ex husband has throat cancer, he was not a smoker or drinker, but he was a big water drinker. my neighbor died of a rare cancer in January. please clean up this mess.

Teresa Earnest

571-1 DOE refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

571-2 DOE acknowledges your concern about cleanup of SSFL. DOE’s purpose in preparing this Final is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 572: Laura

Please do your part and cleanup up all detectable contamination at SSFL. If SSFL contamination is left behind, it can continue to migrate offsite and put nearby communities at risk of cancer and other illnesses.

Laura

|| 572-1
|| 572-2

- 572-1 DOE acknowledges your preference for a cleanup of all detectable contamination at SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.
- 572-2 DOE acknowledges your concerns and refers you to Section 2.7, "Offsite Impacts," of this CRD regarding the potential for offsite migration of contaminants and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. All of the action alternatives evaluated in this EIS would result in cleanup of those areas of SSFL for which DOE is responsible, Area IV and the NBZ, that would be protective of human health and the environment.

Commenter No. 573: Mary Ann Seltzer

How many more people have to die before Boing cleans up the site. No one should be allowed on that property...Not now, Not ever. My daughters are still battling cancer that was caused by Rocketdyne. Years of pain and suffering, because of negligence and stupidity. How can these people sleep at night. When is this going to end? Promises that were never kept... We were lied to, years ago, and are still being lied to!! We must keep up the fight to put an end to this insanity. Even though it's too late for the many lives who were lost, and the many who are still battling cancer and other diseases caused by SSFL, we must continue this fight in their memory..7345K

Commenter No. 579: Jeanne Fjelstad

Radiation migrates. I lived at The Summit Mobilehome Park 1996-2002. My Mom lived at Riviera Mobile Estates on Eton Ave, as the crow flies from the lab. My Dad worked on the first shuttle and died in 1988. He said he wanted to retire early as many of his coworkers were dying. I have the same RARE blood cancer my Mom died of in 2007. We both ate food grown in ground on Eton and Woolsey Cyn. I have no cure. I ALSO had breast cancer in 2008. I have bought my grave at Eternal Valley already. How many more must die? My Mom and I two lived different places, I also lived at her home before and do now. So I am still contaminated and I went to The National Institute of Health in Bethesda Md. US GOV...for genetic testing. NOT genetic! Every time the wind blows and every time the water flows the radiation spreads. FULL CLEANUP!

Commenter No. 587: Kiryl Karpiuk

Ms. Stephie Jennings, NEPA Document Manager, SSFL Area IV EIS
US Dept. of Energy
4100 Guardian St., Suite 160
Simi Valley, CA 93063

Dear Ms. Jennings,

I believe that the current excuses put forth by the Department of Energy to not clean up the Santa Susana Field Lab to levels specified in the 2010 AOC are inexcusable. Any of the three proposed alternatives, whether they call for leaving 39%, 91% or even 99% of existing pollution, are in violation of the legally binding document signed by DOE and NASA in 2010. The communities affected by the site throughout decades of its operation and dormancy deserve to have the site cleaned to levels most protective of human health and the environment. The DOE's excuse for cleaning to a less protective standard is not valid, claiming that there would be more environmental impact cleaning up the contamination, than leaving it in place, as the amount of contaminants and radiation left behind would be nowhere near the protective level set by the EPA for plants and wildlife. Their claim of not being able to find a suitable replacement soil that would meet the AOC cleanup requirements to fill in the excavations also shows a willingness to ignore facts. In their own DEIS, the DOE admits that Gillibrand soil is the best option for replacement and backfill as it is practically harmless to human health, thus demonstrating their contradictory statements. In all instances the levels of chemicals and radionuclides in Gillibrand were below the AOC LUT values, with two minor exceptions that the DOE declared nonhazardous to human health and the environment. Also in the DEIS are claims that transportation of the amounts of contaminated soil from the site that would be necessary for cleanup to meet AOC levels would be more harmful to the nearby community than just leaving it in place. However, the DOE has greatly inflated the amount of truckloads necessary for soil transportation in order to frighten the community into stepping in line with their desire to avoid their cleanup duties. It is important to note that the DOE has refused to consider alternative transport routes that pass by no residences, and options such as rail lines located within a mile of the site or even conveyor systems to eliminate the need for trucking

587-1

587-2

587-3

587-4

587-5

587-1 DOE acknowledges your concern about cleanup of SSFL to levels specified in the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. The EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Regarding your comment about the community waiting for decades for cleanup of the contamination, please note, DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ.

587-2 DOE is committed to a cleanup of contamination in Area IV and the NBZ that meets the purpose and need to be protective of the environment and the health and safety of the public and workers, and has proposed alternatives to meet this commitment. Consistent with NEPA requirements, this Final EIS addresses the potential impacts that implementing each of the alternatives could have on several resource areas, including human health and safety, biological and cultural resources, ground and surface water resources, air quality, and traffic. Potential risks to biological resources and to public health and safety under all the proposed alternatives are presented in Chapter 4, Section 4.5; and Section 4.9 and Appendices G and K, of this EIS, respectively. In response to public comments on the Draft EIS, this Final EIS was revised to more

Commenter No. 587 (cont'd): Kiryl Karpiuk

altogether. The DOE has continued to focus on four transport options which involve a sixty mile drive to a train depot which does not yet exist. DOE has refused to research these possibilities claiming that doing so would result in significant delays to completion of the project. Seeing as how the site was meant to be clean by 2017 and work has yet to start, this no longer seems like a valid reason for leaving vast amounts of contamination in place. The community has been waiting for decades for this contamination to be cleaned up, while the polluters made sloppy attempts to get out of their responsibilities- we can afford to wait a little while longer for honest and thorough work to be done. While there are many other examples of excuses such as these, the bottom line is that the Department of Energy is attempting to weasel its way out of a binding legal contract. If we as private citizens attempted to do so, we would find ourselves facing unwinnable lawsuits. It is not like the DOE is trying to get out of its unfavorable two-year cell phone contract, it is trying to get out of a contract that ensures the safety and health of the countless people affected by the contamination at the SSFL, so then why is it not held to the same standard? I urge the DOE to open their ears to the overwhelming public and governmental condemnation, and to abandon the offensive cleanup alternatives proposed in the draft Environmental Impact Statement that violate the AOC.

Sincerely,

Kiryl Karpiuk

**587-5
cont'd**

587-3 DOE disagrees and notes that the statements are not contradictory. The 2010 AOC does not allow consideration of risk and requires all chemicals and radionuclides in backfill soil to be below their respective LUT values in order for the soil to be used in Area IV. DOE notes that it violates the 2010 AOC to determine that a backfill source is “close enough.” As stated in the AOC, all chemicals above the LUT values are exceedances and should be remediated. Refer to Section 2.3, “Suitable Backfill Soil,” of this CRD for discussion of the responsibilities and actions necessary to identify a backfill source, including interactions with DTSC.

**587-1
cont'd**

587-4 The volumes in the Draft EIS have a sound engineering basis. DOE used the GIS (geographic information system) database for Area IV to identify on a point-by-point basis, any sample location that had an exceedance of a LUT value (radionuclides published by DTSC on January 30, 2013 [DTSC 2013a] and chemicals on June 11, 2013 [DTSC 2013b]). The GIS system was then used to mark the locations of exceedances, map the extent of exceedance, develop areas and depth of exceedances, and then the calculation of the soil volume exceeding the LUT values. The volumes were independently reviewed by a separate team that validated the calculations.

Since the Draft EIS was prepared, DOE has independently checked the estimate of the soil volume associated with cleaning up to the 2010 AOC LUT values. Based on the characterization data, and recognizing the shallow soil depth over uneven bedrock across Area IV and the NBZ DOE is not as uncertain about the upper limit of the soil volume estimate as it was at the time the Draft EIS was prepared.

587-5 Please refer to Section 2.9, “Options for Transportation of Waste from SSFL,” of this CRD for a discussion of this topic and DOE’s response.

Commenter No. 588: Stephanie Jung

Ms. Stephe Jennings
NEPA Document Manager
SSFL Area IV EIS
US Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 93063

Dear Ms. Jennings,

I am worried about DOE's failure to comply with the AOC agreement that was signed in 2010. This lack of consideration is going to have a detrimental impact to the communities that directly surround the SSFL. The DEIS proposes four alternatives that leave either 39%, 91%, 99%, or 100% of the contamination which infringes on the agreement that states the DOE would clean up all of the contaminants that are on the SSFL. Furthermore, the DTSC is the only one with authority to decide how much of the contaminants need to be cleaned. The DOE has come up with constant excuses for their lack of ownership of their actions and the community will be the one who has to face the repercussions. The DEIS is proof of how irresponsible the DOE is, and that they are attempting to get away with an immense amount of damage that they have done to community. I am concerned about the DOE's DEIS because it does not state that they will follow up on their original AOC agreement.

Stephanie Jung

588-1

588-1 DOE acknowledges your preference for compliance with the 2010 AOC agreement. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for a discussion of this topic and DOE's response. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

588-2

588-1
cont'd

The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. The EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

588-2

DOE recognizes DTSC's authority over the cleanup at SSFL. DOE recognizes that DTSC needs to approve soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC and DOE-prepared RCRA closure plans for building demolition.

Commenter No. 589: Olivia Raine

A legally binding contract is legally binding, except to the government whenever it so chooses. The DOE has been ordered to hold itself accountable and clean up this site. Government accountability is so very low in this country, which is a serious shame when citizens' health is seriously at risk. Do your jobs, just like the rest of the country is ordered to do or be fired and replaced. You're the government, be accountable to your constituents and the land.

Olivia Raine

589-1

589-1

DOE acknowledges your concern about cleanup of the site in compliance with a legally binding contract. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 590: Christine Corr

PLEASE! Do not leave contaminants on-site! This site MUST be permanently cleaned up, 100%. PLEASE remediate the pollution this contamination has caused, and help mitigate future health issues for surrounding communities.

Thank you,
Christine Corr

|| 590-1
|| 590-2

590-1 DOE acknowledges your preference for 100 percent cleanup of the site. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

590-2 DOE acknowledges your concern and refers you to Section 2.7, “Offsite Impacts,” of this CRD for accurate information regarding offsite contamination.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

Commenter No. 591: Charlene Rothstein

After 20 years of involvement with the SSFL beginning with an HOA, the PTA and for the past 9 years with the West Hills Neighborhood Council Environment Committee, these are my conclusions: 1) Clean up should be health risk based with as much on site remediation as possible. 2) The number of trucks used to remove contaminated soil should be kept to the lowest possible number as well as those used to replace soil. The surrounding communities are keenly aware of the safety issues involved in moving trucks and soil through their neighborhoods. Some Neighborhood Councils have requested that NO trucks move through their communities. 3) A request should be made for a current area cancer study to be done by the CDC.

CHARLENE ROTHSTEIN

591-1

591-1 DOE acknowledges your support for site cleanup based on health risk. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

591-2

As discussed in Chapter 2, Section 2.3.2, of this Final EIS, one potentially effective form of onsite remediation would be to use monitored natural attenuation for management of certain low-concentration, petroleum-contaminated (TPH) soil. DOE has estimated that this onsite treatment method would reduce the amount of soil to be considered for removal at Area IV and the NBZ by about 620,000 cubic yards, with corresponding reductions in truck traffic and emissions of air pollutants. This or any other onsite treatment method would have to be approved by DTSC.

591-3

591-2 DOE acknowledges your concern about truck traffic in neighborhoods near SSFL. Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

591-3 DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

Commenter No. 592: William McNally and Barbara L Rain

We are writing to inform you that my wife, Barbara Lisa Rain, born December 1957 in Encino, CA resided at her family's single-family residence in Granada Hills (XXXXXXXXXXXXXXXX) from 1958-1976, approximately 4-5 miles north by northeast of the elevated Santa Susana Nuclear Laboratory Accident Site. At the time of the Accident, estimated to be June-July 1959, Barbara was an 18 month-old infant, probably outdoors and downwind from the nuclear reactor Site perched on a bluff overlooking the northwestern corner of the San Fernando Valley. Between 1970-71, Barbara's father, an MD internist, noticed she had a goiter and in fact her thyroid, which is naturally supposed to turn-on at puberty, did not function. Since 99% of thyroid failures have to do with exposure to toxic and radioactive substances it is safe to conclude that Barbara, as a 1 1/2 year old infant, perhaps during the event, was outside and directly exposed to the burst of radiation. Even if she were not directly exposed, the yard grass and pavement she daily played upon was. Everything in the area had been sprinkled lightly with cancer-causing radioactivity. Infants, we now know, are the most vulnerable to radioactive exposure. For the past 48 years Barbara has had to take thyroid medication to compensate for her non-functioning thyroid. Over the decades she has been exposed to the wide-ranging, always changing medical protocol for taking thyroid medication. From the 1970s through the 90s Barbara took 240 mg./day of natural thyroid. Since then, that dose has been reduced to 90 mg./day Over the years, there has been an on-going campaign to eliminate natural thyroid in favor of synthetic, a cheaper material. Currently she is bureaucratically fighting her medical provider, Kaiser, over what thyroid materials are approved and which are not, i.e. natural vs. synthetic. Over the years the medical community has utilized and denied the very same treatment protocol. In a certain sense Barbara knows more from her personal experience than a young medical resident. In short, the travail over not having a functioning thyroid and its impact on her health maintenance goes on every single day. This daily hassle of compensating for a non-functioning thyroid is not something we want anyone to experience. There should be no equivocating from the government regarding the removal of radioactive toxic materials, especially since this was in fact a government created and covered up problem, one the medical community struggles to get agreement over. Five years ago an activist concerned with the water runoff of the Santa Susana accident site into adjacent neighborhoods showed me a number of official studies done by the State and by the Feds over the radioactive toxicity (perchlorate, tritium) at the Site and its gravitational migration down into surrounding areas. There can be no moral slippage. The

592-1

592-1 DOE acknowledges your comment and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE (and its predecessor agency) has not kept the SRE accident secret. The accident was reported to local and National media in an August 29, 1959 news release (Atomic International 1959). The accident was also described in detail in a reactor safety textbook, "The Technology of Nuclear Reactor Safety" published in 1964 (Thompson and Beckerley 1964). These and other documents related to operation of SRE can be found at http://www.etec.energy.gov/Library/Historical_Docs.html.

592-2 DOE acknowledges your concerns about cleanup of a health hazard and government equivocating over removal of radioactive toxic materials. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for a discussion of this topic and DOE's response. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. The EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Regarding your comment about a government created and covered up problem that still exists, please note, DOE and its contractors assigned unique identification numbers to

592-2

592-3

Commenter No. 592 (cont'd): William McNally and Barbara L Rain

government (Department of Energy) and Boeing are obligated to clean up a health hazard -- if these studies are to be believed -- they created in a residential community that still exists. Emotionally, Barbara was furious that the 1959 nuclear accident was for thirty years kept a secret from those very citizens who were exposed to the dangerous radiation. This subterfuge was malice. Now you, Dept. of Energy, have the opportunity to make sure no one else loses their thyroid over government malfeasance. Thank you.

William McNally & Barbara L Rain
Los Angeles, CA

592-2

592-4

272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. DOE will complete cleanup of Area IV and the NBZ pursuant to published decisions in accordance with this Final EIS.

592-3 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

592-4 Chapter 3, Sections 3.9.5 and 3.9.6, of this Final EIS provide information about accidents at Area IV, including the 1959 SRE accident, which was the only accident that caused a measureable release of radioactive material. Section 3.9.6 explains that at the time of the accident it was estimated that the accident resulted in the release (over a 2-month period) of about 28 curies of radioactive noble gases such as krypton-85, in low, controlled concentrations that met Federal requirements. The release was estimated to result in a maximum radiation dose at the location of the nearest resident of 0.018 millirem. Using current risk factors, this dose would have resulted in a risk of a fatal cancer to an exposed individual of 1×10^{-8} (one chance in about 93 million). A 1999 study by ATSDR estimated a maximum dose to a potentially exposed individual of 0.005 millirem with an even smaller risk of a fatal cancer. Because of public concern about the accident, DOE hosted an informational workshop on August 29, 2009, with testimony from 3 independent experts (see http://www.etec.energy.gov/Community_Involvement/Public%20Meetings/SRE_Workshop.html). Two of these experts supported the estimate made at the time of the accident that releases at the time of the accident should have primarily involved noble gases, with only small releases of volatile fissions products such as iodine and cesium isotopes; one expert was skeptical of the estimates of large health effects being experienced by individuals and the population. The third expert concluded that available information was inadequate to resolve the fraction of the noble gases and fission products that may have been released. This expert did not quantify public risks from the accident but thought that the risk to the maximally exposed individual was smaller than the risk of cancer from other causes, but that the collective exposure could have resulted in some cancers in the population.

Commenter No. 592 (cont'd): William McNally and Barbara L Rain

DOE has not kept the SRE accident secret. The accident was reported to local and National media in an August 29, 1959 news release (Atoms International 1959). The accident was also described in detail in a reactor safety textbook, "The Technology of Nuclear Reactor Safety" published in 1964 (Thompson and Beckerley 1964). These and other documents related to operation of SRE can be found at http://www.etec.energy.gov/Library/Historical_Docs.html.

Commenter No. 593: Judy Mayer

You must fulfill your commitment to do the full cleanup! Toxic chemicals were used on the site, which have leached into the soil. IOIF1 The health of the residents of Simi Valley and surrounding areas depend on a proper cleanup.

Judy Mayer

|| 593-1

- 593-1 DOE acknowledges your preference for a full cleanup of SSFL. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. All of the action alternatives evaluated are protective of public health and safety and the environment.
- 593-2 Please see Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 594: Richard Mathews

On behalf of the North Valley Democratic Club and as its president, we ask that you try again on your SSFL Draft Environmental Impact Statement. You signed a contract, the Administrative Order on Consent (AOC), with the people of California. The cleanup promised in the contract is a debt that you owe us. It is unconstitutional under the Fourteenth Amendment to question a debt of the United States. That is what you have done with this DEIS. This is a violation of your oath of office. None of the proposed alternatives fully implement the AOC. Several explicitly and intentionally violate the agreement. This is unacceptable. It is illegal. DOE's draft EIS fails to acknowledge that the AOC is a legally binding agreement, which DOE cannot choose to ignore unilaterally. DOE as the polluter doesn't have the authority to decide how much of the mess that it made is going to get cleaned up. The decision rests with state Department of Toxic Substances Control. The three alternatives (other than the required baseline alternative) would respectively leave up to 39%, 91%, and 99% of the contamination on site, where it can continue to migrate and put nearby communities at risk. The AOC requires that all detectable contamination above background levels must be eliminated. It makes sane exemptions for protecting cultural artifacts and sensitive species, but it requires DOE to do as much cleanup as possible around those. Even your best alternative fails to do that. You agreed to cleanup to background levels, but now you propose using a dubious risk-based standard. Even if that were allowed, you fail to consider all of the risks from your pollution moving off of the site. Runoff from the site feeds the Calleguas Creek which is used to water the crops in Ventura County, making an agricultural rather than residential standard applicable. The residential standard does not consider the risks to wildlife in this open space. And you misuse the tables for even the residential standard. Instead of using the EIS process to debate WHETHER to follow the agreement, use it to decide HOW to fully implement it. We fully support considering alternatives to using trucks. We fully support considering alternative routes for trucks. We fully support considering alternatives on how to separate contaminated from uncontaminated material in order to reduce the amount of material that needs to be moved. We fully support considering alternatives for maximizing cleanup in areas where cultural artifacts or sensitive species make cleanup difficult. We fully support considering alternatives for how to restore the site to its natural state. The

594-5

594-6

594-7

594-8

594-1 DOE acknowledges your concern about a thorough cleanup in compliance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. The EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Regarding your comment about leaving the site as open space, Boeing is the landowner of Area IV and the NBZ, and intends to maintain its portion of SSFL as undeveloped open space, and to restrict future land use to prevent development for residential, agricultural, or commercial purposes (see Chapter 1, Section 1.5, of this Final EIS). A significant change in circumstances occurred after issuance of the Draft SSFL Area IV EIS. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site.

With respect to the timeliness of cleanup, please refer to Chapter 1, Section 1.3 of this EIS, which discusses the order issued by the U.S. District Court for the Northern District of California (Case No. 3:04-CV-04448-SC, May 2, 2007) that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision pursuant to NEPA. In accordance with CEQA and consistent with Section 4 of the 2010 AOC, DTSC is preparing an environmental impact report (EIR) that addresses cleanup of all of SSFL (including areas for which NASA and Boeing are responsible); the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). The

Commenter No. 594 (cont'd): Richard Mathews

AOC has strong support throughout our community. Public comment on the AOC ran 100 to 1 in favor. The Los Angeles City Council (mostly Democrats) has unanimously called for following the AOCs. So has the Simi Valley City Council (all Republicans). And the Ventura County Supervisors. And the Los Angeles County Supervisors (the site is on the border between the two counties). Cleanup of SSFL to background is the position of the California Democratic Party and of the six Democratic clubs surrounding the site based in Northridge, Simi Valley, Moorpark, Thousand Oaks, Topanga, and Encino. We want a cleanup NOW. We want a cleanup that is THOROUGH. We want to be left with open space we can be proud of—that is restored to the natural state in which you found it some 70 years ago.

Richard Mathews
North Valley Democratic Club

**594-1
cont'd**

completion of both the CEQA and NEPA processes must occur before DOE can complete the comprehensive cleanup of soils and groundwater in Area IV and the NBZ. DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition. In June 2017, DOE initiated communications with DTSC to discuss schedules and other appropriate matters that would facilitate cleanup activities (DOE 2017a).

594-2 DOE recognizes that the AOC is a legally binding agreement. NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. This Final EIS analyzes an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In response to public input since the 2010 AOC was signed, the EIS also analyzes alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ. For additional discussion of these topics please refer to CRD Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD. Additional information on alternatives analyzed is in Chapter 2 of this Final EIS.

594-3 Please see Section 2.7, “Offsite Impacts,” of this CRD for a discussion and DOE's response to concerns about offsite impacts.

594-4 Risks to wildlife, based on an ecological risk assessment, were added to Chapter 4, Section 4.5 of this Final EIS.

In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements)

Commenter No. 594 (cont'd): Richard Matthews

with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. The use of RBSLs that do not include the indirect garden pathway is appropriate for this land use.

In this Final EIS (see Chapter 2, Section 2.4) DOE has retained the Cleanup to Revised LUT Values Alternative, which uses chemical RBSLs based on an Onsite Suburban Residential Scenario without a garden pathway. The Final EIS also retains the Conservation of Natural Resources Alternative, but evaluates two scenarios. The Open Space Scenario is based on the future land use of Area IV and the NBZ as open space, consistent with Boeing's conservation easement and agreement (i.e., cleanup levels are based on exposure of an onsite recreational user as the receptor). The Onsite Suburban Residential Scenario is the scenario evaluated in the Draft EIS, that is, cleanup levels are based on a suburban residential scenario including only the direct pathways and without a garden (indirect) pathway. Based on the future use of SSFL as open space, this latter scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space.

In Chapter 4, Section 4.9 of this Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that local residents may get some portion of their food from a home garden.

- 594-5 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.
- 594-6 As part of the soil treatability studies, DOE did look at means of reducing soil volume. Measures considered included soil particle separation and soil washing. However, because any detectable concentrations in a treated soil would violate the LUT requirements, and soil washing would sterilize soil requiring adding soil amendments that would exceed LUT requirements, it would not be possible under the AOC to perform the reduction suggested in the comment.
- 594-7 DOE acknowledges your preference for alternatives that maximize cleanup in areas where cultural artifacts or sensitive species make cleanup difficult. Please refer to Sections 2.1, "Preferences for Cleanup," and 2.3, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD, which provides a discussion

Commenter No. 594 (cont'd): Richard Mathews

of these topics of interest and DOE's responses. All of the soil remediation action alternatives involve cleanup of chemicals and radionuclides that exceed risk-based standards within the biological and cultural exemption areas established in accordance with the 2010 AOC.

594-8 Please refer to Section 2.1, "Preferences for Cleanup," of this CRD, for further discussion of this topic.

Commenter No. 595: Anonymous

The DOE needs to comply with the AOCs which offer the public a truly protective cleanup. The issue of the truck routes has not been looked at adequately given there are alternatives including northern routes and covered conveyors which would eliminate the need for trucks to go near homes. The DOE does not have the authority to decide HOW much of the nuclear and chemical contamination to clean up. That is for the DTSC to decide. The DOE needs to find out HOW to clean up to the agreed up level not whether or not to do so. The fact that at the DOE public meeting on this topic that the DOE focused solely on wildlife and flowers and trucks instead of how much less dangerous it would be for the thousands of people living nearby is repulsive and shows that the DOE is using publicity stunts to try to get out of paying for something that will save lives. DO THE RIGHT THING PLEASE

595-1 DOE acknowledges your concern about compliance with the 2010 AOC. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Each alternative addresses the potential impacts that implementing the alternative could have on several resource areas, including human health and safety, biological and cultural resources, ground and surface water resources, air quality, and traffic. The EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

595-2 Please refer to Section 2.9, “Options for Transportation of Waste from SSFL,” of this CRD for a discussion of this topic and DOE’s response.

595-3 NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. This EIS analyzes an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In response to public input received, and consistent with its obligations under NEPA, DOE also analyzed alternatives that are based on risk to human health as well as the protection of natural resources. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ.

DOE will issue a Record(s) of Decision (ROD[s]) for this EIS no sooner than 30 days after the EPA Notice of Availability for this Final EIS is published in the *Federal Register*. The potential environmental impacts presented in this EIS, along with public

Commenter No. 595 (cont'd): Anonymous

input, cost, policy, and other factors, will be considered by decision-makers in selecting alternatives for soil remediation, building demolition, and groundwater remediation.

DOE recognizes that DTSC has authority over the cleanup decision. As discussed in Chapter 1, Section 1.9.2, of this Final EIS, DTSC is currently preparing a program environmental impact report (EIR) under CEQA that applies to cleanup of the entire SSFL; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DTSC will issue a Notice of Determination for the program EIR identifying the selected remedial actions. DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Commenter No. 596: William Preston Bowling

Dear U.S. DOE, Please clean up your responsible portions of the Santa Susana Field Laboratory including the Bowl in AREA I to the standards agreed to in the 2010 Administrative Orders on Consent.

William Preston Bowling
Aerospace Contamination Museum of Education

|| 596-1

596-1

DOE acknowledges your preference for cleanup of SSFL in accordance with the 2010 AOC. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. DOE is not, however, responsible for cleanup of Area I at SSFL. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 597: Anonymous

Nothing matters more than the lives of our children, our families. Please do the right thing. Save our health, save our lives. Please clean it all up.

|| 597-1

Anonymous

597-1 Thank you for your comment. It has been included in the Administrative Record for the EIS.

597-2 DOE acknowledges your preference for a full cleanup. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 598: Matthew E. Chin

The DOE needs to abide by the 2010 AOC they signed and clean up the site to those standards.

Matthew E Chin

598-1

DOE acknowledges your preference for cleanup of SSFL in accordance with the 2010 AOC. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 599: Gabe Sanchez

I consider the Department of Energy's recent draft Environmental Impact Statement (EIS) regarding the Santa Susana field laboratory contamination to be both controversial and deceitful. In particular, I have taken issue with the new proposed alternative cleanup solutions that have been offered by the Department of Energy (DOE) in the EIS. These alternative solutions are first off in violation of the Administrative Order on Consent (AOC) which both National Aeronautics and Space Administration (NASA) and DOE signed in 2010. The AOC states that both NASA and DOE are obligated to cleanup the contamination to background levels. Secondly, the alternative solutions proposed by the new EIS will leave behind anywhere from 39-99% of the contamination; the AOC bars any "leave in place" cleanup solutions. If DOE follows through with the EIS and leaves any contamination in the area, it still leaves the threat of the contamination moving off site and affecting other areas near by. Although I was raised in South Central Los Angeles, my family has been trekking up to the San Fernando Valley almost every weekend for their photography business. I would hate to see any of my family contract a radiation based cancer or illness. DOE claims the contamination in the area isn't that much of a concern because SSFL had the most advanced and safest technology. The contaminations we are dealing with today prove this to be false. SSFL had over 30,000 rocket tests conducted there, which resulted in the release of hazardous contaminants in the environment that we are now dealing with. Not only that, but an unprincipled sodium burn pit was also used in the area the DOE is tasked with cleaning up. The practice of burning sodium is no longer used for disposal because it leaves behind traces of PCBs, mercury, dioxins and radioactive contamination. This burning not only released contaminants into the soil, but also into the air of nearby cities. The laboratory kept spewing contaminants into the environment until 1989 when pressure was put on these companies by non profit groups to cease operations. That's decades of work done at SSFL, most to all of which produced hazardous contamination that has been proven time and time again to migrate off site by Boeing's monitoring reports of contamination levels in water run-off, where numerous exceedances of safe limits have been logged. According to Chapter 3 of the EIS, PCB's, PAHs, dioxins, and herbicides "often adhere to soil particles and can travel along drainage

599-2

599-3

599-2
cont'd

599-1 DOE acknowledges your concerns about a full cleanup to a background level of contamination in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Please also note that NASA was not a signatory to the 2010 AOC.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. The EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Regarding your concern about the timeliness of cleanup, please note that in prior cleanup actions DOE removed most of the buildings in Area IV as well as much of the soil contamination associated with past practices (see Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD). Please also refer to Chapter 1, Section 1.3 of this EIS, which discusses the order issued by the U.S. District Court for the Northern District of California (Case No. 3:04-CV-04448-SC, May 2, 2007) that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision pursuant to NEPA. In accordance with CEQA and consistent with Section 4 of the 2010 AOC, DTSC is preparing an environmental impact report (EIR) that addresses cleanup of all of SSFL (including areas for NASA and Boeing are responsible); the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). The completion of both the CEQA and NEPA processes must occur before DOE can complete the comprehensive cleanup of soils and groundwater in Area IV and the NBZ. DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by

Commenter No. 599 (cont'd): Gabe Sanchez

pathways as the sediment is carried in surface water” (3-32). Another concern from this EIS is the fact that the polluter themselves, DOE, are the ones deciding how much they are going to clean up. DOE does not have the authority to do this and must follow the standards set by the AOC. This decision lies with the Department of Toxic Substances Control, which sets the standards for the amount of contamination allowed under the AOC. The fact that these agencies have been purposely lying to the public for so long without consequence is unacceptable. There is no doubt that the lab’s radioactive contamination, from particles such as cesium-127 and plutonium-238, are causing cancer in the area. Patterns of rare cancers in the area suggest that the lab is the source of these cancer causing contaminants. A cleanup has been delayed for far too long. At this point, the community has the right to know how their community is going to be taken care of with full transparency. I find it deeply troubling that you generated and then proceeded to discontinue an email address specifically made for comments on the draft EIS, and only after the public began using it for its intended purpose. Seven years ago the communities affected by the Santa Susana incident were promised a full clean up, however, they have yet to see any real effort by the companies responsible. It is time to stop negotiating the facts and start cleaning up the mess that is causing multiple cases of rare cancer in the area. A full cleanup to background level of contamination should be executed as soon as possible.

Gabe Sanchez

the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition. In June of 2017, DOE initiated communications with DTSC to discuss schedules and other appropriate matters that would facilitate cleanup activities (DOE 2017a).

599-2 Please see Section 2.7, “Offsite Impacts,” of this CRD for a discussion and DOE’s response to concerns about offsite impacts.

599-3 DOE acknowledges your concerns and refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Much cleanup has previously been performed. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the action alternatives would be protective of the health and safety of the public and the environment.

599-4 NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. This EIS analyzes an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In response to public input received, and consistent

Commenter No. 599 (cont'd): Gabe Sanchez

with its obligations under NEPA, DOE also analyzed alternatives that are based on risk to human health as well as the protection of natural resources. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ.

DOE will issue a Record(s) of Decision (ROD[s]) for this EIS no sooner than 30 days after the EPA Notice of Availability for this Final EIS is published in the *Federal Register*. The potential environmental impacts presented in this EIS, along with public input, cost, policy, and other factors, will be considered by decision-makers in selecting alternatives for soil remediation, building demolition, and groundwater remediation.

DOE recognizes that DTSC has authority over the cleanup decision. As discussed in Chapter 1, Section 1.9.2, of this Final EIS, DTSC is currently preparing a program environmental impact report (EIR) under CEQA that applies to cleanup of the entire SSFL; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). The Area IV and NBZ site cleanup activities covered by this Final EIS would begin following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.599-5 As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act. Please see Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of this topic. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the

Commenter No. 599 (cont'd): Gabe Sanchez

potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

599-6 DOE apologizes for the confusion over the email address. The email address was previously created for scoping comments, not for comments on the Draft EIS. The email address was discontinued when DOE realized stakeholders had begun to use it for comments on the Draft EIS. In order to better track comments, DOE determined the website was the best method for electronic comments.

Commenter No. 600: Natalie Gates

As a student currently studying government, and committed to dedicating her life to public service, when a public agency fails to hear its constituents' calls, it undermines the principles of liberalism upon which the United States' state and federal governing system is founded. In 2010, the Department of Energy signed the Administrative Order on Consent (AOC) committing the department to cleaning up all detectable contamination at Santa Susana Field Laboratory by 2017. It is 2017 and nothing has been done. Rather than cleaning up the location, the DOE released a Draft Environmental Impact Statement that fails to acknowledge that the AOC is a legally binding agreement, which the DOE cannot choose to ignore unilaterally. As the polluter, the DOE does not have the authority to decide how much is to be cleaned up, the decision rests with DTSC. The draft proposes three alternative cleanup plans rather than the cleanup agreed upon in the 2010 AOC for Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory. These alternatives violate the previous commitments the DOE made in 2010, moreover, the three alternatives would leave 39%, 91% or up to 99% of the contamination on site. A study conducted by Dr. Hal Morgenstern from University of Michigan found within a 2 mile radius of the contamination site, the cancer risk increases 60%. In 2012, the EPA sampled the site and found through well and water runoff, chemicals such as TCE were 134 times higher than the Safe Water Drinking Act limits. There is mounting evidence of clusters of rare pediatric cancers within 20 miles of the contamination site. Contamination is transboundary: soil containing radionuclides travels due to wind, water carries pollutants to its destination. Contamination does not abide by fences and walls. Surrounding communities are at risk of contamination due to natural forces, and the ailments subjecting the people are preventable if the area is cleaned up as promised in 2010. There is not time to wait 70 years for a site to cleanse itself, people are dying and will continue to. Government agencies are meant to serve the people, and when the people are dying, it is way beyond the time one should have acted. Remember that these agencies serve at the pleasure of the people, remember that a legal agreement is a legal agreement, remember that a law is a law, these are undeniable facts. It is time make sure the job the DOE has legally obligated itself to do, is done. Justice must come for the people affected, and ramifications must be dealt for injustice. Out of all the comments on the AOC, only 1% opposed the cleanup standards being put into effect. The community spoke, and the stringent clean up is demanded. Do the RIGHT thing here, not the cheap and easy thing.

Natalie Gates

600-1 DOE refers you to Section 2, "Topics of Interest," of this CRD for responses to your comments. Section 2.1, "Preferences for Cleanup," of this CRD addresses commenters' stated or implied preferences for cleanup and/or a particular alternative. Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD responds to the assertion that none of the alternatives complies with the 2010 AOC and addresses comments about the quantities of soil exceeding 2010 AOC LUT values that would remain on site under each alternative. Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD indicates that in prior cleanup actions DOE has removed most of the buildings in Area IV as well as much of the soil contamination associated with past practices. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible.

With respect to the timeliness of additional cleanup, please refer to Chapter 1, Section 1.3 of this EIS, which discusses the order issued by the U.S. District Court for the Northern District of California that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision (ROD) pursuant to NEPA. Additionally, in accordance with CEQA and consistent with Section 4 of the 2010 AOC, DTSC is preparing an environmental impact report (EIR) that addresses cleanup of all of SSFL (including areas for which NASA and Boeing are responsible); the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]) The completion of both the CEQA and NEPA processes must occur before DOE can start the comprehensive cleanup of soils and groundwater in Area IV and the NBZ. DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition. In June 2017, DOE initiated communications with DTSC to discuss schedules and other appropriate matters that would facilitate cleanup activities (DOE 2017a).

600-2 NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable

Commenter No. 600 (cont'd): Natalie Gates

alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. This EIS analyzes an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In response to public input received, and consistent with its obligations under NEPA, DOE also analyzed alternatives that are based on risk to human health as well as the protection of natural resources. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ.

DOE will issue a ROD(s) for this EIS no sooner than 30 days after the EPA Notice of Availability for this Final EIS is published in the *Federal Register*. The potential environmental impacts presented in this EIS, along with public input, cost, policy, and other factors, will be considered by decision-makers in selecting alternatives for soil remediation, building demolition, and groundwater remediation.

DOE recognizes that DTSC has authority over the cleanup decision. As discussed in Chapter 1, Section 1.9.2, of this Final EIS, DTSC is currently preparing a program environmental impact report (EIR) under the California Environmental Quality Act that applies to cleanup of the entire SSFL; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). The Area IV and NBZ site cleanup activities covered by this Final EIS would begin following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC’s Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

600-3 DOE acknowledges your concerns and refers you to Section 2.1, “Preferences for Cleanup,” of this CRD regarding your support for cleanup per the 2010 AOC, Section 2.7, “Offsite Impacts,” of this CRD regarding your concern about the risks of contamination due to natural forces, and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL, including limitations of studies such as Dr. Morgenstern’s. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies

Commenter No. 600 (cont'd): Natalie Gates

that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Consistent with law as embodied in NEPA, DOE has prepared this EIS to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. NEPA strongly encourages agencies to evaluate alternatives and not limit their consideration to one pre-selected course of action. All of the action alternatives evaluated for cleanup of Area IV and the NBZ, including those that rely on monitored natural attenuation, are protective of the health and safety of the public and the environment.

- 600-4** Chapter 3, Section 3.4.3, of the Draft EIS discussed the presence of TCE in five areas of groundwater: the Former Sodium Disposal Facility, the Building 4100/Building 4056 landfill area, the radioactive Materials Handling Facility, the Hazardous Material Storage Area, and the Metals Clarifier area. DOE performed additional groundwater investigations and reported the results in the *Draft RCRA Facility Groundwater Remedial Investigation Report, Area IV, Santa Susana Field Laboratory, Ventura County, California* (CDM Smith 2018a). The text of this Final EIS has been updated with information from the remedial investigation, including the concentrations of TCE found in these groundwater plumes. As stated in Chapter 2, Section 2.6, of this Final EIS the 2007 Consent Order and RCRA requirements require the groundwater cleanup standards be risk-based, meaning the concentrations of any contaminants remaining in groundwater following remediation will pose an acceptable risk to future groundwater users.
- 600-5** Please see Section 2.7, “Offsite Impacts,” of this CRD for a discussion and DOE’s response to concerns about offsite impacts.

Commenter No. 601: Susan Stolla

If you refuse to thoroughly and definitively clean up this mess, you will have to live with what you have done to many people, and this contamination will remain to harm countless others. This contamination does not go away by itself. I see that our congressman knight wants to save some of the towers and other junk so that innocent people can come and view this part of history and share even more of the side effects of contamination. This effort to turn a toxic zone into a tourist haven and put a feather in his cap is bound to back fire. How you have managed to get away with refusing to clean it up, in spite of the documented proof of the harm it has done is beyond me. Please clean this mess up once and for all.

Susan Stolla

601-1

601-1

DOE acknowledges your concern about a thorough and definite cleanup of the site. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. Please also refer to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for a discussion of this topic and DOE’s response. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible (note that the towers referred to in the comment are not in Area IV or the NBZ). Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

Commenter No. 602: RL Miller

The only cleanup that is acceptable is a cleanup to background. The California Democratic Party and Ventura County Democratic Party both expect DOE to honor the AOCs and clean up in full, to background level, before deciding what to do with the test stands and the land.

RL Miller
California Democratic Party; Ventura County Democratic Party

602-1

602-1

DOE acknowledges your preference for cleaning the site to background in accordance with the AOC. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Please note that DOE is not responsible for the disposition of rocket engine test stands or any contamination resulting from activities that took place outside of Area IV or the NBZ. Regarding your comment about deciding what to do with the land, Boeing is the landowner of Area IV and the NBZ, and intends to maintain its portion of SSFL as undeveloped open space and prevent development for residential, agricultural, or commercial purposes (see Chapter 1, Section 1.5, of this EIS). In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site.

Commenter No. 603: Erin Reimer

I grew up in Santa Susana and lived there most of my life. Until I was a teenager, the sound of Rocketdyne was so commonplace that it was my first thought when hearing the rumble of an earthquake, and the sound was unforgettable even after moving away. It is incredible that such important testing for humanity's first forays into space were undergone so close to the Los Angeles metropolitan area, and even more incredible that the same land is an ancient Chumash astronomical observatory and sacred site. The cultural and natural history of the Santa Susana Field Lab and Burro Flats is irreplaceable. While waste was not properly handled at the site in the past, tearing down the test stands that play such a major role in history does not seem like the way to go. I stand with the honorable Reps. Steve Knight, R-Lancaster; Julia Brownley, D-Westlake Village; Adam Schiff, D-Burbank; Tony Cardenas, D- Panorama City; Brad Sherman, D-Sherman Oaks; and Ted Lieu, D-Manhattan Beach in pleading for the cultural history and natural resources to be preserved to the extent possible during this remediation. Even if the actual site of the field lab was cleaned of contaminants, what about the chemicals which have already contaminated the mountain itself? I hope that this EIS cleanup is not pretext for giving the "all-clear" for more residential and commercial development at or near the site. The Santa Susana mountains and Simi Hills are beautiful, but development has grown so rapidly just below the SSFL. Unfortunately how the waste was handled on top of the mountain has contaminated the groundwater, and allowing more development to occur downstream (Runkle Canyon, Bell Canyon, Andorra Estates) could be placing the health of thousands at risk. What of the findings of contamination at nearby Brandeis Bardin institute? Will cleanup occur there as well? The whole mountain and canyons below should be designated a monument to protect from further development. I will continue to follow the efforts closely, and I greatly appreciate all the work that NASA, Boeing, DOE, EPA, California Environmental Protection Agency, and other concerned citizens have taken for this historic venture.

Thank you,

Erin Reimer
Humboldt State University

603-1

603-1 DOE recognizes the breadth of resource values in Area IV and the NBZ and intends to protect human health without unduly damaging the environment. This is reflected in the range of alternatives DOE developed and analyzed, which allows a comparison of impacts among the various resource areas, including cultural resources. Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a discussion of the process that will be used to determine exemptions. Please also note that the test stands are not in Area IV or the NBZ, and thus are not part of the analysis presented in this Final EIS.

603-2

603-2

As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act. The environmental monitoring program for Area IV is extensive and addresses the potential for the spread of contamination from Area IV to offsite areas. The results of this monitoring program are provided in annual environmental monitoring reports (see http://www.etec.energy.gov/Environmental_and_Health/ASER.html). Information about this monitoring program can be found at the Energy Technology Engineering Center website (<http://etec.energy.gov>). Environmental contamination on and off the SSFL site has been remediated as the need was identified considering data obtained from this environmental program as well as other media sampling programs conducted by DTSC, EPA, and several other organizations. DOE expects that any contamination that may be discovered outside of SSFL, attributable to SSFL activities, and posing a hazard to the public or the environment would be remediated in accordance with State and Federal requirements.

Commenter No. 603 (cont'd): Erin Reimer

- 603-3 In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. There is no potential for the property to be redeveloped under these covenants.
- 603-4 Please see Section 2.7, “Offsite Impacts,” of this CRD for a discussion and DOE’s response to concerns about offsite impacts.

Commenter No. 604: Theodore Dent

In January, when I went from perfect health to Terminal Brain Cancer, Stage 4, the oncologist only asked if I had ever been exposed to radiation. Living in Chatsworth Lake Manor in the 1960s and 1970s was my only response. I think future generations need the best possible cleanup.

Theodore Dent

- 604-1 DOE refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.
- 604-2 DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 605: Jason C. Compton

Dear Ms. Jennings:

I am outraged by the DOE’s Draft Environmental Impact Statement (DEIS) for the Santa Susana Field Laboratory (SSFL) Area IV cleanup.

DOE’s DEIS makes it abundantly clear that DOE wants to break out of its commitment to clean up all of its contamination at SSFL. However, the Administrative Order on Consent (AOC) that DOE signed in 2010, commits the DOE to clean up all detectable contamination. We want 100% of the dangerous radionuclides and toxic chemicals on site cleaned up. We are tired of it migrating and putting nearby communities at risk. It is unacceptable and reprehensible!

DOE must abide by the 2010 AOC and reject all three of the cleanup alternatives proposed in the DEIS, as well as the “no action” alternative for soil remediation, all of which are prohibited under the AOC. Any “leave in place” cleanup methods, including natural attenuation and “no action” and should not be considered.

DOE also fails to acknowledge that the AOC is a legally binding agreement with the DTSC, and DTSC as the regulator makes the cleanup decisions, not DOE. The legal obligations in the AOC already require full cleanup, and even if it didn’t exist, the state toxics agency is the regulator who decides cleanup requirements for the toxic chemicals. That isn’t within the power of the polluter, DOE. DOE should withdraw the EIS, as it violates cleanup commitments and DOE has no legal authority to decide the cleanup in the first place.

If all of the contamination at SSFL is not cleaned up per the AOC cleanup agreement, people who live nearby and future visitors to the site will continue to be at increased risk of cancer and illnesses related to exposure to SSFL contaminants. I demand that you help protect our health and keep your cleanup commitment by ensuring that DOE’s final EIS fully comply with the AOC provisions and clean up ALL of the contamination.

I also demand that DOE initiate and utilize a site to rail transport plan for the clean up process and that they refrain from scaremongering local communities with talk and propaganda regarding a potential traffic

605-1

605-2

605-3

605-4

605-1 DOE acknowledges your concern about cleaning up all detectable contamination at SSFL in accordance with the 2010 AOC and using site to rail transport. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information, including the appropriate use of natural attenuation. Please also refer to Section 2.9, “Options for Transportation of Waste from SSFL,” of this CRD for a discussion of the consideration of transportation options.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. In addition to a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, this EIS also evaluates alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

605-2 NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. In addition, as discussed in Chapter 1, Section 1.3 of this EIS, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record(s) of Decision (ROD[s]) pursuant to NEPA. DOE recognizes that the 2010 AOC is a legally binding agreement with the DTSC and that DTSC has regulatory authority over aspects of DOE’s cleanup of Area IV and the NBZ.

Commenter No. 605 (cont'd): Jason C. Compton

traffic impact if trucks are used. Traffic should be the least of everyone's concerns!! Radionuclides and other contaminants are much deadlier and have made many community members ill, and some have died from their illnesses, including children. My own son had leukemia twice, before the age of 5, and two of our immediately adjacent neighbors, both in their early 30's at the time, were also fighting cancers (breast and thyroid). All three cancers are radiation related types. We demand 100% full clean up utilizing site to rail transport, in a timely manner! There's no room for nuclear waste in our communities!!!

Jason C. Compton

This EIS analyzes an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In response to public input received, and consistent with its obligations under NEPA, DOE also analyzed alternatives that are based on risk to human health as well as the protection of natural resources. This latter risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ.

DOE will issue a ROD(s) for this EIS no sooner than 30 days after the EPA Notice of Availability for this Final EIS is published in the *Federal Register*. The potential environmental impacts presented in this EIS, along with public input, cost, policy, and other factors, will be considered by decision-makers in selecting alternatives for soil remediation, building demolition, and groundwater remediation.

As discussed in Chapter 1, Section 1.9.2, of this Final EIS, DTSC is currently preparing a program impact report (EIR) under CEQA that applies to cleanup of the entire SSFL; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DTSC will issue a Notice of Determination for the program EIR identifying the selected remedial actions. DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues its Notice of Determination for the Program EIR, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

605-3 DOE acknowledges preference for cleanup in accordance with the 2010 AOC and refers you to Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Please refer to Section 2.7, "Offsite Impacts," of this CRD for accurate information on contamination in the environment around SSFL and to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and

Commenter No. 605 (cont'd): Jason C. Compton

workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

The purpose of this EIS is to evaluate alternatives for completion of cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. All of the action alternatives evaluated in this EIS would result in cleanup of Area IV and the NBZ that would be protective of the public health and safety and the environment.

605-4 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of the transportation topic and DOE's response.

The analyses in this Final EIS were performed to evaluate the potential impacts associated with the various alternatives for cleanup of SSFL. In accordance with NEPA, this EIS evaluates the potential impacts on a variety of resource areas, including traffic, human health, cultural and biological resources, socioeconomics, and environmental justice. Results of the analyses allow a comparison of potential impacts across all evaluated resource areas as well as the tradeoffs between the alternatives.

DOE's intent is not to generate opposition to the SSFL cleanup or to scare locals out of supporting cleanup, but it is true that the more soil that is removed to remediate the site, the larger the transportation effort (i.e., a larger number of truck trips) required. Leaving more soil, and consequently low concentrations of chemicals and/or radionuclides on site, reduces the number of truck trips from the site. Conversely, removing the soil with low concentrations of chemicals and/or radionuclides, results in more truck trips from the site. The EIS shows that the transportation risks are very small; Chapter 4, Section 4.8.1 and Appendix H of this EIS provide details of the transportation risk analysis.

Commenter No. 606: Maggie B. Compton

Dear Ms. Jennings:

I am outraged by the DOE's Draft Environmental Impact Statement (DEIS) for the Santa Susana Field Laboratory (SSFL) Area IV cleanup.

DOE's DEIS makes it abundantly clear that DOE wants to break out of its commitment to clean up all of its contamination at SSFL. **Commenter No. 609: Jay Coghlan, Executive Director,
Nuclear Watch New Mexico**

April 11, 2017

Ms. Stephanie Jennings
NEPA Document Manager
SSFL Area IV EIS
U.S. Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 93063

Re: Comments on the Department of Energy’s Draft Environmental Impact Statement (DEIS) for the Santa Susana Field Laboratory

Dear Ms. Jennings:

The long-delayed cleanup of the Santa Susana Field Laboratory (SSFL) is a familiar story to Nuclear Watch New Mexico. It goes like this: DOE operations release dangerous nuclear and chemical contamination into the environment, impacting both workers and neighboring communities. DOE minimizes the contamination and its impact on health, and drags its feet for decades on cleanup. DOE signs cleanup agreements that it does not keep, and DOE sites remain contaminated. Troubling issues regarding the SSFL cleanup were brought to our attention in August 2016, when we learned that while DOE broke its contract to fund the Community Involvement Fund of the New Mexico Community Foundation, it simultaneously funded a front group that lobbies against the SSFL cleanup. Funding from CIF was critical to several ANA groups, who were appalled by DOE’s conduct in the matter. Now more fully informed about the SSFL cleanup, we are pleased to submit comments on DOE’s DEIS for the site. SSFL was the site of nuclear activities that have left a legacy of contamination. SSFL once housed 10 nuclear reactors, one of which had a partial meltdown in 1959, and two others suffered accidents as well. A “Hot Lab” to cut up irradiated fuel from around the country was also sited at SSFL, as well as plutonium and uranium-carbide fuel fabrication facilities and a sodium burn pit used for open-air burning of contaminated reactor components. SSFL’s soil, groundwater, and surface water are contaminated, and this contamination has migrated off-site putting nearby communities at risk. Federal studies indicate elevated cancers among both workers and off-site populations near SSFL. In

609-1

609-2

609-3

609-4

609-1 While the comment is not on the scope or content of this Final EIS the following information is being provided.

DOE has funded a number of stakeholder groups, including Teens Against Toxins, the SSFL Advisory Panel, Physicians for Social Responsibility, the Rocketdyne Cleanup Coalition, Committee to Bridge the Gap and the SSFL CAG. The SSFL CAG is an independent group, created under the State of California Health and Safety Code, approved by the DTSC and formed under guidance from the Udall Foundation, an independent Federal agency focused on environmental stewardship. The SSFL CAG began operating in 2013.

DOE’s Office of Environmental Management started the Community Involvement Fund (CIF) to increase public involvement in the environmental management decision-making process and assist stakeholder groups with analyzing environmental management plans and proposals. The CIF operated from late 2010 until September 2015, and distributed a total of \$1.6 million through 46 grants to 23 recipients around the country, including groups involved in observing SSFL cleanup preparation. These included:

- \$46,800 in 2011 to the Committee to Bridge the Gap.
- \$55,000 in 2012 to the SSFL Advisory Panel, partnering with the Committee to Bridge the Gap. The SSFL Advisory Board is not related to the SSFL CAG.
- \$23,000 in 2013 to Physicians for Social Responsibility – Los Angeles, partnering with the Rocketdyne Cleanup Coalition, Teens Against Toxins and Committee to Bridge the Gap.
- \$20,000 in 2014 to Physicians for Social Responsibility – Los Angeles, partnering with Teens Against Toxins and the SSFL Work Group, which is not related to the SSFL CAG.

609-2 Chapter 3, Sections 3.9.5 and 3.9.6, of this EIS provide information about accidents at Area IV, including the 1959 SRE accident, which was the only accident that caused a measureable release of radioactive material. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE

**Commenter No. 609 (cont'd): Jay Coghlan, Executive Director,
Nuclear Watch New Mexico**

2010, DOE finally signed an Administrative Order on Consent (AOC) with the California Department of Toxic Substances Control to clean up its operational area at SSFL to background levels of contamination. In 2012, DOE issued a notice entitled, "Public Participation in the Development of Alternatives to be considered in the Santa Susana Field Laboratory Area IV Environmental Impact Statement." In it, DOE stated that it was committed to the AOC and that its EIS would be limited to an examination of alternate ways to achieve the AOC cleanup standard. In 2014, DOE stated that its DEIS would be completed later that year, and projected that it would meet the 2017 deadline stipulated in the AOC for the cleanup to be complete. Unfortunately, the cleanup has yet to begin. DOE's DEIS was just released at the beginning of this year, and not one of the four alternatives proposed in it comply with the AOC cleanup agreement. Despite the AOC barring leave in place options, DOE's first alternative proposes not cleaning up 480,000 cubic yards of contaminated soil, which DOE preemptively excludes citing potential exemptions that do not meet the narrow exemptions permitted in the AOC. The second alternative proposes to leave in place up to a million cubic yards of contaminated soil by using a suburban residential risk-based cleanup that omits the required backyard garden component of a residential cleanup level. The third alternative proposes to not clean up as much as 99% of the contaminated soil, allowing levels of radioactivity hundreds of thousands of times higher than the U.S. Environmental Protection Agency's preliminary remediation goals. The fourth alternative proposes no cleanup at all. DOE's DEIS also does not acknowledge that DOE does not have the authority to make the decisions about how much contamination gets cleaned up. For chemicals, under the Resource Conservation and Recovery Act, that decision is made by DOE's regulator, the DTSC. For radiological contaminants, DTSC is also the regulator as stipulated in the AOC. Nuclear Watch New Mexico recommends that DOE revise its EIS to be fully compliant with the AOC cleanup agreement that it signed, and that it proceed to do so without delay. Communities living near SSFL have waited too long for the promised cleanup to occur. Sincerely,

Jay Coghlan
Executive Director Nuclear Watch New Mexico

609-5

cont'd

and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. Therefore, Area IV and the NBZ are not highly contaminated.

609-3 Please refer to Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts. As described in Section 2.7, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

609-4 Please refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

609-5 DOE's understanding regarding the implementability of a cleanup in accordance with the 2010 AOC has evolved since the agreement was signed. As discussed in Chapter 2, Section 2.3.3.1 of this Final EIS, DOE determined that there were technical issues with implementing a cleanup according to the 2010 AOC. As a consequence, and in keeping with its responsibilities under NEPA, DOE developed two alternatives to the Cleanup to AOC LUT Values Alternative that meet the purpose and need of being protective of the health and safety of the public and the environment. These two risk-based alternatives, the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative, are presented in Chapter 2, Section 2.4 of this EIS. The No Action Alternative was included as required by NEPA regulations and provides a baseline against which other alternatives can be compared.

DOE disagrees with the assertion that none of the alternatives complies with the 2010 AOC. Refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a description of how the Cleanup to AOC LUT Values Alternative incorporates the technical elements of the 2010 AOC using the AOC LUT

**Commenter No. 609 (cont'd): Jay Coghlan, Executive Director,
Nuclear Watch New Mexico**

values as the basis for a cleanup to background or levels based on laboratory capabilities (AOC LUT values). This section explains how monitored natural attenuation and use of exemptions are in accordance with the AOC. Also refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD, which discusses the processes DOE is following to establish the exemptions. Section 2.2 of this CRD also acknowledges that the soil remediation action alternatives leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment. The No Action Alternative was included as required by NEPA regulations and provides a baseline against which other alternatives can be compared.

- 609-6 DOE recognizes DTSC's authority over the cleanup. Chapter 1, Sections 1.3 and 1.4 of the Draft and Final EISs include discussion that acknowledges that cleanup of the site is governed by the 2007 Compliance Order and the 2010 AOC. Section 1.9 identifies additional documents required by regulation or agreement that affect the cleanup of Area IV and the NBZ (e.g., CEQA Program Environmental Impact Report, Soils Remedial Action Implementation Plans, Resource Conservation and Recovery Act). In this Final EIS, DOE revised the text to more clearly indicate that DTSC has approval or other authority that dictates the actions to be taken for cleanup in Area IV and the NBZ.

Commenter No. 610: Sonia Schendel

Ms. Stephe Jennings
NEPA Document Manager
SSFL Area IV EIS
US Department of Energy
4100 Guardian St., Suite 160
Simi Valley, CA 93063

Dear Ms. Jennings,

I am outraged and disappointed in the Draft EIS for SSFL Area IV and the NBZ. DOE's DEIS breaks its legally binding 2010 AOC promise for a full clean up of the site. I am in full favor of the AOC, and its plan to do a full clean up is the only acceptable option. It is not morally sound or even legal for DOE to try and break its commitment of cleaning up all of the contamination. Every one of the clean up options in the DEIS violates the AOC, leaving in place anywhere from 39% to 100% of the contamination, when the AOC bars consideration of any leave in place alternatives. Any failure to do a full clean up, as promised, is unacceptable, posing continued risks to off site communities. Among its various excuses for not doing the cleanup, in all of the DEIS options DOE proposes to not clean up about 300,000 cubic yards of soil that they contaminated by claiming what they purport to be a biological exemption. But they are grossly misrepresenting this biological exemption, which is strictly limited in the AOC. In the 2010 AOC it was stated that the SSFL site must be cleaned up to local background contamination levels. It issued under Section 7(a)(2) of the Endangered Species Act a consultation with the USFWS over biological exemptions with narrow set limits, where in, the exemptions need to be completely unavoidable by any other means. Now years later, the DOE DEIS says on page 18, Chapter 2 of its report that "these areas [of proposed biological exemptions] would be protected under any of the soil remediation alternatives. DOE would not take action in any of these areas unless it is demonstrated that levels of chemical or radioactive constituents in the soil pose a risk to human health or the environment." First, DOE has no right to decide this for themselves, they need the US Fish and Wildlife Service (USFWS) to issue a formal Biological Opinion on what areas should be exempt from remediation. Second, the basis on which a Biological

610-1

610-2

610-1 DOE acknowledges your preference for a full cleanup of the site in compliance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Section 2.2 describes how the Cleanup to AOC LUT Values Alternative does incorporate the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background or levels based on laboratory capabilities (AOC LUT values) and acknowledges that the soil remediation action alternatives leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible.

610-2 Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a discussion of this topic and DOE's response. As noted in Section 2.4, the 2010 Biological Opinion has very limited applicability to the present project. The EPA action that was the subject of the 2010 Biological Opinion involved trimming or mowing of vegetation, leaving the soil seed bank intact and the potential for rapid recovery of the vegetation and habitat by re-sprouting or germination from the soil seed bank. In contrast, the soil remediation addressed in this EIS would require removal of vegetation and soils, including the seed bank, a profound and difficult-to-mitigate impact.

The occurrences of Braunton's milk vetch and Santa Susana tarplant shown in this EIS are based on biological surveys conducted through 2016, thus the results are different than the report produced for EPA.

Commenter No. 610 (cont'd): Sonia Schendel

Opinion is made is on the Endangered Species Act, which is a solely biocentric act; it doesn't have anything to do with human health in these respects (although it has been proven again and again that the current radioactive and chemical levels are in fact a huge risk to human health). Finally, the guidelines laid out under the Endangered Species Act and in the 2010 AOC don't say that DOE is to take 'no action' in these proposed biological exemption areas, it just means that under a USFWS Biological Opinion, if biological resources are identified, mitigation measures are to be taken. As stated in Chapter 2 of the DOE DEIS on page 22, the final exemption areas cannot be officially decided upon until the USFWS has issued a formal Biological Opinion, which they have not. There has been lots of talk and references to consultation with the U.S. Fish and Wildlife Services about forming an official Biological Opinion for SSFL (Appendix E, pp.18, DOE DEIS), but nothing official since the 2010 Biological Opinion over "surveys of SSFL Area IV and the NBZ for radiological contamination. The biological assessment and Biological Opinion identified nine plant species that are listed as endangered or threatened or rare." (Chapter 3 of the DOE DEIS pp.64-65) Of these nine plant species only two are actually found in Area IV and the NBZ. These are; Braunton's milk-vetch which is federally listed as endangered, and the Santa Susana tarplant, which is state listed as rare. This 2010 Biological Opinion for radiological survey sets helpful precedent in terms of the final Biological Opinion for the site. It concluded that for both Braunton's milk-vetch and the Santa Susana Tarplant all that was needed was for each individual to be tagged and avoided before brush clearing and other disturbances. It essentially gave the go ahead to do the survey and did not exempt the areas that were deemed critical or areas that carried either of the plants. In the DOE DEIS they claim that there are seven other (other than Braunton's milk-vetch and the Santa Susana Tarplant) plant species that they try to link to the area in a way that they think allows them to take no action on those areas. Of these seven plants, none of them have actually been observed on the site. They also list an additional five species which are neither federally listed as endangered nor threatened. In terms of animals, there are none that are both federally listed and have been found on the site. Of the seven animals mentioned on the DOE DEIS, five have a 'low' potential of occurrence and two are 'not expected' to occur on the site at all. (DOE DEIS Chapter 3 pp. 63-70) Braunton's

610-2
cont'd

610-3

610-2
cont'd

At the time the Draft EIS was issued, DOE had been involved in ongoing meetings with the USFWS and CDFW for several years (see Appendix E, Table E-4 of this EIS) and the Biological Assessment required as part of Section 7 consultation had not yet been submitted. Hence, there was no Biological Opinion from the USFWS at the time the Draft EIS was released. The USFWS has now issued a Biological Opinion (see Appendix J) for remediation of SSFL. This Final EIS reflects the results of the Biological Opinion on the exemptions areas in Area IV and the NBZ.

610-3 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts. DOE places a high priority on health and safety and remains committed to protecting the health and safety of current and future users of the site and of the residents in the surrounding communities. In response to comments, DOE has added a quantitative evaluation of worker, onsite individual, and offsite resident impacts for all alternatives. The results of the modeling are included in Chapter 4, Section 4.9 of this Final EIS.

Commenter No. 610 (cont'd): Sonia Schendel

milk-vetch is a short lived member of the pea family, it adorns purple flowers and has adapted to germinate after disturbances; either mechanical or from fire, this is because the subsequent dormancy lets the seeds live in soil seed banks for long periods. In other words they require a disturbance to fully thrive. “[Braunton’s milk-vetch] is (also) restricted to carbonate or calcareous soils” (“Recovery Plan For Six Plants from the Mountains Surrounding the los Angeles Basin” By US Fish and Wildlife in 1999). In 1987 a recovery plan was created that lays out the steps one would have to take for a recovery of the species. The basics of these steps are to create a reserve of 600 individual plants away from the site and maintain them, then, one could proceed to work on, or in this case clean up, the original site. DOE then goes on to say in Chapter 3 of the DOE DEIS on page 67 that because “the existing recovery plan for Braunton’s milk-vetch (USFWS 1999) does not include the population of the species at SSFL because it was not discovered on site until after the 2005 Topanga fire”, they do not have to follow the guidelines of the recovery plan, despite it being a perfectly viable option. There is a federally listed critical habitat for Braunton’s milk-vetch in the bottom left corner of Area IV, but again, the fact that there are endangered or rare species on the site does not mean that they have to leave the land completely alone and cannot clean it up at all, like they suggest, rather they are allotted a certain amount of ‘take’. Once species are identified they simply have to be more careful to make sure that what they are doing is in line with the USFWS Biological Opinion (which still does not exist) and the listed recovery plans. The Santa Susana Tarplant, a subshrub from the sunflower family, is not not federally listed, while it is state listed as rare in the California Endangered Species Act under the section of the ‘Native Plant Protection Act’. This Act follows similar rules to that of the Endangered Species Act, albeit much weaker than its federal counterpart. This is because the California Act was made in parallel to the federal Act. The broad outline of the California Act is that it prohibits the ‘take’ or harm of state listed endangered or rare species, but gives many take exemptions, as does the federal Endangered Species Act (CA FISH & G § 1904 - § 1907). According to the DOE, there are roughly 850 individuals of the Tarplant recorded in Area IV, which is 290 acres. (DOE DEIS Chapter 3. pp. 67 and Attachment A pp.5) However, when comparing the map from DOE’s DEIS in Chapter 3 pp. 66, and the map from the

**610-2

Commenter No. 610 (cont'd): Sonia Schendel

Quarterly Biological Monitoring Report #3, which was prepared for the EPA (report done by HydroGeoLogic Inc and Envicom Corporation), there are major discrepancies in the information provided. On the map produced by the DOE DEIS they are claiming many more occurrences of both Braunton's milk-vetch and the Santa Susana Tarplant than in the report produced for the EPA. DOE is trying to use the claim of conservation of natural resources as an excuse to break its obligations to clean up the toxic damage it did to those same resources. They are claiming to want to protect the environment and species by not cleaning up the contamination, when really all they are doing is hurting the ecosystem as a whole by proposing to leave these deadly chemicals and radiation in place. If they were concerned about the environment, they wouldn't have polluted it in the first place, and they wouldn't now be trying so hard to leave the contamination in place and cause more damage. Breaking the legally binding cleanup obligations set by the AOC would be an outrage, in terms of environmental wellbeing, species wellbeing, and the wellbeing of total human health.

U.S. Department of Energy NEPA Document Manager, SSFL Area IV
EIS Stephanie Jennings

Dear Ms. Jennings:

My daughter, son-in-law and three little grandchildren live in a community near to the SSFL.

If all of the contamination at SSFL is not cleaned up per the AOC cleanup agreement, people who live nearby and future visitors to the site will be at increased risk of cancer and illnesses related to exposure to SSFL contaminants. I respectfully request that you help protect the health of my family and keep your cleanup commitment by ensuring that DOE's final EIS fully comply with the AOC provisions and clean up ALL of the contamination.

Thank you!

Sincerely,

Claude Klein

611-1

611-1

DOE acknowledges your concern about cleanup of all contamination in compliance with the 2010 AOC. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Please also refer to Section 2.7, "Offsite Impacts," of this CRD and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for a discussion of offsite contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

To: Jennings, Stephanie

Subject: Comment on DOE's Draft EIS for SSFL

U.S. Department of Energy NEPA Document Manager, SSFL Area IV
EIS Stephanie Jennings

Dear Ms. Jennings:

I grew up down the mountain from SSFL, in Agoura. We had a natural stream that ran through our neighborhood. We'd play in in on the way home from school. No one cared about this then, but, it originated from the top of the mountainside, downstream from SSFL. Fast forward three decades . . . almost every classmate I have from my neighborhood is either affected with thyroid affliction, cancer, or has had a family member with cancer. My friend on the street behind me has inoperable brain tumors. My friend from two streets up lost her father to cancer, and her sister had a tumor behind her eye. My friend from two streets down has widespread growth on his thyroid, and his mama is deceased from cancer. My sister and I both are dealing with thyroid cancer, which is NOT genetic . . . my sister's more serious and rare. My friend from 3 streets up has a very severe Hashimoto's, as does her father . . . ALSO not genetic. My friend from 4 streets up has Grave's. She had to kill her thyroid with radiation. My troop leader from Oak Park (along the same stream) is dead from cancer. My grad school classmate, who lived up that hill is Oak Park is dead from cancer. The list goes on and on. It is frightening!

613-1

613-1

DOE acknowledges your comment and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 613 (cont'd): Joey Carnes

We have a pretty good idea of what might have caused it because the very chemicals that were leaked up in SSFL are known to cause thyroid disruption and our types of cancer.

613-1
cont'd

It is time to clean that mess up. Completely! Enough of us have suffered, already, and our kids don't deserve to suffer, too.

613-2

Please advocate for this site to be cleaned up fully! Our kids DRINK groundwater near this site. We need to do the right thing now.

Thank you so much for reading my plea. Please help our community.

Sincerely,

Joanna Carnes, MFT, LPCC

613-2 DOE acknowledges your preference for complete cleanup of the site. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for a discussion of this topic and DOE's response. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

With respect to your concern about groundwater near the site, please refer to Section 2.7, "Offsite Impacts," and Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for additional information. As discussed in these sections, Area IV is not currently spreading contamination to offsite areas, including offsite groundwater. Also, refer to Chapter 2, Figure 2-11 of this Final EIS. This figure shows that the groundwater plumes for which DOE is responsible do not exceed drinking water maximum contaminant levels outside Area IV and the NBZ.

To: Jennings, Stephanie

Subject: DOE Must Uphold AOC for SSFL - Comment on DEIS

U.S. Department of Energy NEPA Document Manager, SSFL Area IV
EIS Stephanie Jennings

Dear Ms. Jennings:

I live in the Susana Knolls, a community of approximately 500 homes located directly beneath the contaminated Santa Susana Field Laboratory (SSFL).

I am frustrated and exasperated by the Department of Energy's Draft Environmental Impact Statement (DEIS) for the SSFL cleanup. Every single one of the proposed cleanup alternatives violates the 2010 Administrative Order on Consent to clean up all detectable contamination. All three options are unacceptable. Leaving over 90%?? 80%?? Even over 30%??? Is this a joke?

And the idea that the DOE claims it does not get to decide how much contamination gets cleaned up is absurd on its face. The AOC makes it perfectly clear that the DOE is a regulated entity, with the Department of Toxic Substances Control (DTSC) having oversight. DTSC determines the cleanup, not DOE.

I can't believe that after 26 years of living in the Knolls that this is still being reworked, especially since it is being reworked in favor of allowing high degrees of contamination. The original agreement is what needs to be followed. None of the other three options is acceptable.

Sincerely,
Paige Moser

615-1

615-2

615-1
cont'd

- 615-1 DOE acknowledges your preference for cleanup in accordance with the 2010 AOC and refers you to Section 2.1, "Preferences for Cleanup," of this CRD for a discussion of commenters' preferences. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. This section discusses the alternative that incorporates the technical elements of the 2010 AOC, as well as the soil volumes that would be left on site under each alternative. None of the action alternatives leaves concentrations of chemicals or radionuclides that are dangerous for the intended use of the site as open space. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.
- 615-2 DOE recognizes DTSC's authority over the cleanup. Chapter 1, Sections 1.3 and 1.4 of the Draft and Final EISs include discussion that acknowledges that cleanup of the site is governed by the 2007 Compliance Order and the 2010 AOC. Section 1.9 identifies additional documents required by regulation or agreement that affect the cleanup of Area IV and the NBZ (e.g., CEQA Program Environmental Impact Report, Soils Remedial Action Implementation Plan, Resource Conservation and Recovery Act). In this Final EIS, DOE revised the text to more clearly indicate that DTSC has approval or other authority that dictates the actions to be taken for cleanup in Area IV and the NBZ.

Subject: Comment on DOE's Draft EIS for SSFL

U.S. Department of Energy NEPA Document Manager, SSFL Area IV
EIS Stephanie Jennings

DOE allowed Rocketdyne to test in a residential area. I am outraged you want to walk away from your folly . Clean it up now!

Sincerely,

Marvin Smith

|| **616-1**
|| **616-2**

- 616-1** Neither DOE nor its predecessor agency, the Atomic Energy Commission (AEC), was ever in a position of authority over Rocketdyne. DOE (or AEC) and Rocketdyne operated independently at SSFL. As described in Chapter 1, Section 1.3, of this EIS, Rockwell International's Rocketdyne Division began rocket engine testing in the Area I portion of SSFL in 1947, and in the mid-1950, the AEC funded nuclear research on a 90-acre parcel of land in what is now Area IV. Additional information can be found at DOE's Energy Technology Engineering Center website (see <http://www.etec.energy.gov/>).
- 616-2** DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing this EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Subject: Comment on DOE's Draft EIS for SSFL

U.S. Department of Energy NEPA Document Manager, SSFL Area IV
EIS Stephanie Jennings

Dear Ms. Jennings:

The DOE, Rockwell /Rocketdyne, etc. left an untold amount of dangerous contaminants behind.

THEY NEED TO CLEAN UP ALL OF IT.

NOW!

DOE must abide by the 2010 AOC and reject all three of the cleanup alternatives proposed in the DEIS, as well as the "no action" alternative for soil remediation, all of which are prohibited under the AOC.

If all of the contamination at SSFL is not cleaned up per the AOC cleanup agreement, people who live nearby and future visitors to the site will be at increased risk of cancer and illnesses related to exposure to SSFL contaminants. I demand that you help protect our health and keep your cleanup commitment by ensuring that DOE's final EIS fully comply with the AOC provisions and clean up ALL of the contamination.

Sincerely,

L. Lewis

617-1

617-2

617-1
cont'd

617-1 DOE acknowledges your preference for a full cleanup of the site in compliance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," of this CRD for a discussion of commenters' preferences.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. NEPA strongly encourages agencies to evaluate alternatives and not limit their consideration to one pre-selected course of action. In addition to a No Action Alternative (required by NEPA regulations), this EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS, which summarizes the public health studies that have been performed for the SSFL vicinity, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

617-2 DOE acknowledges your concerns and refers you to Section 2.1, "Preferences for Cleanup" of this CRD regarding your concern about cleanup per the 2010 AOC, and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have

Commenter No. 617 (cont'd): L. Lewis

examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

The purpose of this EIS is to evaluate alternatives for completion of cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. All of the action alternatives evaluated in this EIS would result in cleanup of Area IV and the NBZ that would be protective of the public health and safety and the environment.

To: Jennings, Stephanie

Subject: Comment on DOE's Draft EIS for SSFL

U.S. Department of Energy NEPA Document Manager, SSFL Area IV
EIS Stephanie Jennings

Dear Ms. Jennings:

DOE must abide by the 2010 AOC and reject all three of the cleanup alternatives proposed in the DEIS, as well as the "no action" alternative for soil remediation, all of which are prohibited under the AOC. Any "leave in place" cleanup methods, including natural attenuation and "no action" and should not be considered. AOC is a legally binding agreement with the DTSC, and DTSC as the regulator makes the cleanup decisions, not DOE.

The legal obligations in the AOC already require full cleanup, and even if it didn't exist, the state toxics agency is the regulator who decides cleanup requirements for the toxic chemicals. That isn't within the power of the polluter, DOE. DOE should withdraw the EIS, as it violates cleanup commitments and DOE has no legal authority to decide the cleanup in the first place.

I demand that you protect our health and keep your cleanup commitment by ensuring that DOE's final EIS fully complies with the AOC provisions and clean up ALL of the contamination.

Sincerely,

Timothy Wawrzeniak

619-1

619-2

619-1
cont'd

619-1 DOE acknowledges your preference for cleanup of all contamination in compliance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," of this CRD for a discussion of commenters' preferences.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. NEPA strongly encourages agencies to evaluate alternatives and not limit their consideration to one pre-selected course of action. In addition to a No Action Alternative (required by NEPA regulations), this EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD), as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

With respect to your comment about natural attenuation, as discussed in Section 2.2, onsite treatment is provided for in the 2010 AOC. DOE notes that the 620,000 cubic yards of soil for which monitored natural attenuation is proposed contain very low concentrations of hydrocarbons (TPH) that do not pose a threat to human health.

619-2 . NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. In addition, as discussed in Chapter 1, Section 1.3 of this EIS, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record(s) of Decision (ROD[s]) pursuant to NEPA. DOE recognizes that the 2010 AOC is a legally binding agreement with the DTSC and that DTSC has regulatory authority over aspects of DOE's cleanup of Area IV and the NBZ.

Commenter No. 619 (cont'd): Timothy Wawrzeniak

This EIS analyzes an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In response to public input received, and consistent with its obligations under NEPA, DOE also analyzed alternatives that are based on risk to human health as well as the protection of natural resources. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ.

DOE will issue a ROD(s) for this EIS no sooner than 30 days after the EPA Notice of Availability for this Final EIS is published in the *Federal Register*. The potential environmental impacts presented in this EIS, along with public input, cost, policy, and other factors, will be considered by decision-makers in selecting alternatives for soil remediation, building demolition, and groundwater remediation.

As discussed in Chapter 1, Section 1.9.2, of this Final EIS, DTSC is currently preparing a program environmental impact report (EIR) under CEQA that applies to cleanup of the entire SSFL; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DTSC will issue a Notice of Determination for the program EIR identifying the selected remedial actions. DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Commenter No. 620: Henning Cohrt

To: Stephanie Jennings

Subject: Comment on DOE's Draft BS for SSFL Cleanup

Date: Tuesday, April, 2017 5:00:37 PM

U.S. Department of Energy NEPA Document Manager, SSFL Area IV EIS

Stephanie Jennings

Regardless of whether a causal link between the contamination of the SSFL and various cancers in the surrounding areas can be proven, the fact that such severe contamination exists in close proximity to large residential areas shall be reason enough for the DOE to ensure a thorough cleanup.

The inactivity of the DOE and others with respect to addressing this issue will only make the problem worse, and a future solution more difficult.

Therefore, neither of the alternatives proposed in the Draft EIS are acceptable.

The DOE has the moral obligation to stand by its commitment made in 2010, at a minimum.

We are the tax payers, and we demand that the taxes we pay are used to protect us from avoidable threats to our health and life.

Sincerely,

Henning Cohrt

620-1

620-2

620-3

620-1 DOE acknowledges your concerns and refers you to Section 2.1, "Preferences for Cleanup" of this CRD regarding your concern about a thorough cleanup of SSFL and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

Also please see Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. Note that there is not severe contamination in Area IV. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

620-2 The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. In addition to a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. Therefore, DOE has included alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-

Commenter No. 620 (cont'd): Henning Cohrt

regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

620-3 Thank you for your comment. DOE's activities are approved and funded by congress as part of the Federal government budgeting process.

 * Ventura County Board of Supervisors, Los Angeles County Board of Supervisors, Los Angeles City Council pass resolutions critical of DOE's DEIS

A 13-year-long investigation of the Brandeis-Bardin Institute has revealed extensive radiation and chemical impacts across the 2,878 acre property in eastern Simi Valley, California. Multiple government and media tests and reports from 1993 through 2016 indicate that the site may have been contaminated by the bordering Santa Susana Field Laboratory (SSFL), commonly known as Rocketdyne.

621-2 DOE disagrees with the depiction of its actions and intent as presented in this comment. Consistent with DOE's Environmental Management mission of completing the safe cleanup of the environmental legacy of nuclear energy research, DOE remains committed to remediating those areas of SSFL for which it is responsible, Area IV and the NBZ. As new data became available, DOE has considered those data and adjusted its thinking and evaluations accordingly. For example, DOE's understanding regarding the implementability of a cleanup in accordance with the 2010 AOC has evolved since the agreement was signed. As discussed in Chapter 2, Section 2.3.3.1, of this EIS DOE determined that there were technical issues with implementing a cleanup according to the 2010 AOC. As a consequence, and in keeping with its responsibilities under NEPA, DOE developed two alternatives to the Cleanup to AOC LUT Values Alternative that meet the purpose and need of being protective of the health and safety of the public and the environment. These two risk-based alternatives, the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative, are presented in Chapter 2, Section 2.4 of this EIS.

Refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD. This section acknowledges that the soil remediation action alternatives leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

Refer also to Section 2.7, "Offsite Impacts," of this CRD and the referenced DTSC memorandum, *Review of Radiological and Chemical Data from Investigations Conducted at and near the Santa Susana Field Laboratory and the American Jewish University – Brandeis Bardin Campus*. Among the memorandum's conclusions is that, "levels of chemicals and radionuclides at Brandeis Bardin Campus are safe for human health, as determined using risk based screening levels derived using State and Federal standards and guidelines."

The comment misinterprets the meaning of the negative incremental risks presented in the Draft EIS. As explained in Chapter 4, Section 4.9.2, of the Draft, the negative results indicate that the concentrations from site-related activities are less than the variability in the background concentrations of those chemicals and radionuclides. In other words, the concentrations are so close to background that it is difficult to distinguish them from background. Key contributors to this for radioactive constituents

4/10/2017

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

The Brandeis Camp Institute began in 1947 on 2,200 acres in eastern Simi Valley and by 1953 Camp Alonim ("oak trees" in Hebrew) was established. The camp soon became a new paradigm in Jewish adult and youth retreats for "a non-denominational, Jewish experience brought to life through sports, the arts, nature, and learning in a safe and embracing community," according to its [website](#). In 2007, the 250-student Bel-Air based University of Judaism merged with the institute resulting in the American Jewish University (AJU) and its Brandeis-Bardin Campus.

Decades' worth of tests and analysis done by multiple government agencies, [EnviroReporter.com](#) and Brandeis-Bardin itself show what could reasonably be expected in a place downhill from one of the most radioactive and chemically contaminated sites in California. Brandeis-Bardin successfully sued Rocketdyne in the 1990s over contamination of its land, but now aggressively maintains that the lab, which has yet to begin an extensive cleanup, has not fouled its property.

266 acres were surveyed in nuclear Area IV for radiation and chemicals

Recent media coverage of Brandeis-Bardin's radiation and chemical issues, greeted with a howl of indignation by camp owner American Jewish University (AJU), has set the stage for this expose which fully documents contamination findings and impediments to full cleanup.

"Sludge from Rocketdyne"

Lab tested soil and water samples from Brandeis-Bardin show that elevated levels of radiation. Plutonium-239 (Pu-239/240) and Uranium-238 (U-238) were found in the Jewish camp at levels even higher than they are at SSFL's Area IV, according to soil tests from 2004 and water readings from 2005 that have been authenticated and verified by [EnviroReporter.com](#).

Area IV is the 280 acre nuclear research part of SSFL, much of it draining into Brandeis-Bardin. Operated for decades by the Atomic Energy Commission and then the Department of Energy (DOE), and owned by Boeing, it is the site of three partial nuclear meltdowns including the Sodium Reactor Experiment in 1959. Area IV is grossly polluted by radiation and chemicals.

2004 bubbling muck in Brandeis-Bardin

Gross beta radiation was double background in both the sampled Brandeis-Bardin dirt and water. Strontium-90 (Sr-90) and tritium (H-3) were also found at levels over twice their background, or normal levels of radiation. Photographs and video obtained and authenticated by [EnviroReporter.com](#) show the bubbling muck leaking from the same pipe each year from 2004 to 2007 and again in 2014 suggesting continuous release.

Tests were conducted for soil on December 30, 2004 and for water on November 23, 2005 from mud and a bubbling, chemical sheen-topped liquid at the [bottom of a ravine in the upper reaches of Meier Canyon](#) at the camp. Samples were subsequently sent for radiochemical analysis to STL Richland, a prominent Richland, Washington-based laboratory.

The 2004 STL Richland soil test results had to wait eight years before they could be compared to a reliable standard. The dirt's radionuclides were then compared to "Background Threshold Values" (BTVs) developed for Area IV by the U.S. Environmental Protection Agency (EPA) in 2012. The government's tests cost taxpayers \$41.5 million and found high radiation as reported in [Radiation Readings Soar at Rocketdyne](#).

The 2005 STL Richland water test readings were compared to the local and national averages. Both the soil and the water came from the same spot sitting over a thousand feet down a steep poison

are the naturally occurring radionuclides uranium and thorium. The analysis compensated for their presence by analyzing impacts with and without the uranium and thorium included. In this Final EIS, the analysis was updated and is presented in Chapter 4, Section 4.9.2.

621-3 Please refer to Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts. As described in Section 2.7, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

The scope of this EIS is limited to cleanup of DOE's portions of SSFL for which it is responsible, Area IV and the NBZ. DOE was not involved in rocket engine testing; contamination resulting from the testing is being addressed by NASA and Boeing. DOE's groundwater contamination remains within the boundaries of Area IV and the NBZ. Boeing and NASA cleanup activities are only considered as part of cumulative impacts (Chapter 5). Cleanup of the entire SSFL, including Boeing, NASA, and DOE activities, is being evaluated in the DTSC Program environmental impact report (EIR) for the SSFL, Ventura County, California (Draft EIR); the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]).

621-4 As indicated in Chapter 1 of this EIS, DOE acknowledges that past activities at SSFL resulted in chemical and radiological releases that impacted soils, buildings, and groundwater. Chapter 1, Section 1.3, contains a brief history of activities at SSFL and describes the radiological and chemical characterization studies performed for Area IV and the NBZ. Additional information about the activities of DOE and its predecessor agency, the Atomic Energy Commission, at Area IV at SSFL can be found at <http://www.etc.energy.gov/>. Chapter 3, Sections 3.9.5 and 3.9.6, of this EIS provide information about accidents at Area IV, including the 1959 SRE accident, which was the only accident that caused a measurable release of radioactive material. These sections also include information about health studies performed by independent organizations such as the Agency for Toxic Substances and Disease Registry (ATSDR),

Brandeis-Bardin's Toxic Denial - EnviroReporter.com

oak-choked canyon leading down from Area IV, it's referred to in one Brandeis-Bardin report as "Carpenter Area 1" suggesting people stayed at the site.

Area IV's former Sodium Disposal Facility (FSD) drains down Channel D into Meier Canyon where the toxins were detected. The FSD was used to dispose of barrels of radioactive sodium. Sodium reacts violently with air or water so workers would take lots on who would get to shoot the barrels with a rifle to make them explode outdoors. Debris was blown in all directions including down into Brandeis-Bardin according to an eyewitness account from a former Rocketdyne security guard recently recalled to EnviroReporter.com.

2009 Brandeis-Bardin water sampling

Gurgling goo was still flowing unimpeded in the exact same Meier Canyon location in 2014 when Simi Valley resident Brandon Manwell contacted EnviroReporter.com. Manwell had found the place hiking with friends. He videotaped and photographed it in April 2014 and the result is a YouTube video entitled [Sludge from Rocketdyne](#). The skateboarder first thought he was in the upper reaches of [Bunkie Canyon](#), one mountain ridge away to the west, where KB Home's controversial development called [Arroyo Vista at the Woodlands](#) is being built.

"Me and my friend found a few places just like this back in that canyon," Manwell wrote in an April 19, 2014 email to EnviroReporter.com. "We wouldn't have thought too much of it except for the fact that the water running out of this old pipe was iridescent, kind of like when water has oil in it, but it had a weird consistency when we touched it with a stick in the video. We weren't sure what to make of it to be honest, we thought we should go back and get samples."

The 2004 and 2005 STL Richland radiological testing isn't the only data available showing Brandeis-Bardin pollution detections. A DOE map showing chemical contamination reaching far into Brandeis-Bardin that is marked for possible remediation was shown at a public meeting April 22, 2014. That map listed offending chemicals on Brandeis-Bardin property which included dioxins, poly aromatic hydrocarbons (PAHs), phthalates and pesticides.

A 2015 Department of Toxic Substances Control (DTSC) version of the map shows that even more of Brandeis-Bardin is potentially contaminated. It was made public April 28, 2015 by DTSC, California's lead government agency on the cleanup of SSFL.

At the same meeting, DTSC officials straight-faced told the audience that SSFL pollutants were staying onsite, above and below ground. But the department later

621-5

and the conclusions from those studies. Section 3.9.6 explains that at the time of the accident it was estimated that the accident resulted in the release (over a 2-month period) of about 28 curies of radioactive noble gases such as krypton-85, in low, controlled concentrations that met Federal requirements. The release was estimated to result in a maximum radiation dose at the location of the nearest resident of 0.018 millirem. Using current risk factors, this dose would have resulted in a risk of a fatal cancer to an exposed individual of 1×10^{-8} (one chance in about 93 million). A 1999 study by ATSDR estimated a maximum dose to a potentially exposed individual of 0.005 millirem, less than one-third of the original estimate. This dose would result in a corresponding risk of fatal cancer of less than a third of that original estimate.

Because of public concern about the accident, DOE hosted an informational workshop on August 29, 2009, with testimony from 3 independent experts (see http://www.etc.energy.gov/Community_Involvement/Public%20Meetings/SRE_Workshop.html). Two of these experts supported the estimate made at the time of the accident. They stated that releases at the time of the accident should have primarily involved noble gases, with only small releases of volatile fissions products such as iodine and cesium isotopes. One of the two experts was skeptical of the estimates of large health affects being experienced by individuals and the population. The third expert concluded that available information was inadequate to resolve the fraction of the noble gases and fission products that may have been released. This expert did not quantify public risks from the accident but thought that the risk to the maximally exposed individual was smaller than the risk of cancer from other causes, but that the collective exposure could have resulted in some cancers in the population.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. DOE and others, including EPA, have conducted extensive studies to map the remaining chemicals and radioactivity. From these studies, it is known that chemical contamination at Area IV is more widespread than radiological contamination, and that contaminants are concentrated near certain

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

made public more information that confirms what the DOE and DTSC maps had already shown, this time with diagrams carefully plotting toxic trouble spots in the upper reaches of Brandeis-Bardin.

2015 DTSC map showing contaminants in Brandeis-Bardin drainage

DTSC sent to EnviroReporter.com December 3, 2015 a [Boeing report including maps of Brandeis-Bardin contamination](#) (pp. 55-57/138 PDF pages; 10.89 MB) down what is called "Channel D." This 2008 report explains that Boeing owns Area IV and the Northern Buffer Zone (NBZ), land transferred to Boeing in 1997 as part of the confidential settlement with Brandeis-Bardin over the camp's land allegedly being contaminated.

The maps show at least eight chemically-impacted places in Channel D on Brandeis-Bardin property that would be cleaned up applying the standard that the DOE and NASA have committed to with DTSC in 2010, normal background. Boeing's report suggests that's unreasonable and recommends a drastically smaller cleanup, which is shown on its own map as removing from remediation the eight chemical hot spots in Channel D on Brandeis-Bardin's property.

2016 DTSC Strontium-90 map using risk levels provided by Boeing instead of required background to declare Brandeis-Bardin clean

At an April 12, 2016 meeting, DTSC produced a [presentation](#) (pp. 28-30 PDF pages; 6.4 MB) stating that Brandeis-Bardin is safe. The presentation included maps showing both Sr-90 and Cesium-137 (Cs-137) migrating offsite into Brandeis, but declared the contamination posed no threat according to what it claimed was a residential Risk-Based Screening Level (RBSL.) Problem was that the standard of 3.85 picocuries per gram (pCi/g) for Sr-90 that it used, apparently provided to DTSC by Boeing, was hundreds of times less protective than the current EPA Residential Preliminary Remediation Goal of 0.00121 pCi/g. DTSC falsely declared almost all of the

Strontium-90 in Area IV to be to be less than a residential risk-based standard, when in fact they are almost all above it. DTSC also should not have applied any risk based standards to Area IV, since it is under the Administrative Order on Consent (AOC) to be cleaned up to background. (DTSC signed identical AOCs with the DOE and NASA in 2010 agreeing to remediate their areas of SSFL to background levels of radiation and chemicals under state authority.)

The maps strikingly, visually, and directly contradict recent statements by both AJU and DTSC. AJU has [linked](#) to just [one page](#) of that April 2016 presentation on its website, neglecting to include the maps that were in the very subsequent pages. Not to be outdone, in a [December 22, 2016 letter](#) to California Assemblymember Matt Dababneh, DTSC claimed that, "there was no migration of radiological contamination north of SSFL." This "nothing to see here, keep moving along" approach flies in the face of hard data, reports produced by DTSC itself, and established EPA regulations.

An [EnviroReporter.com analysis](#) of a huge June 30, 2015 Boeing report on seeps on SSFL and its surroundings, reveals 338 detections of toxic chemicals in Brandeis-Bardin water. Chemicals found included those the study termed "common laboratory contaminants[is]": Trichloroethylene, perchlorate, acetone, cis-1,2-DOE and carbon disulfide are a few of the toxins found in years of testing the Jewish camp's upper reaches which drain into the center of the property and beyond.

A November 2016 NASA groundwater report obtained by EnviroReporter.com also shows chemical contamination in a Brandeis-Bardin artesian well discharging water down a canyon, with toxic levels detected that exceed California Maximum Contamination Levels (MCLs) for drinking water. All water courses draining through Brandeis-Bardin, perennial and non-perennial, are considered "blue line streams" protected by the Clean Water Act. The MCL coverages in Brandeis-Bardin should, normally, be reported to the Los Angeles Regional Water Quality Control Board (LARWQCB). EnviroReporter.com has found no evidence that any such notification about Brandeis-Bardin's MCL exceedance were ever reported to the board.

facilities, rather than being evenly distributed across the site. DOE will complete contamination removal and site remediation based on the decisions made pursuant to this Final EIS and in accordance with all regulatory requirements. Therefore, SSFL Area IV and the NBZ are not "massively contaminated". Please refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for further discussion of past cleanup and the current status of Area IV.

The American Jewish University, Brandeis-Bardin Campus is located directly north of SSFL. The environmental monitoring program for Area IV is extensive and addresses the potential for the spread of contamination from Area IV to offsite areas, including that of the Brandeis-Bardin Campus. The results of this monitoring program are provided in annual environmental monitoring reports (see http://www.etc.energy.gov/Environmental_and_Health/ASER.html). Information about this monitoring program can be found at the Energy Technology Engineering Center website (<http://etc.energy.gov>). Studies, including those issued in 1992, 1994, and 1995, have addressed whether radiological and chemical contaminants were present on the properties north of SSFL (see http://www.etc.energy.gov/Environmental_and_Health/Brandeis_Bardin.html). These studies led to cleanup activities on part of the American Jewish University property, as well as Boeing purchases of the areas of the property with the highest levels of contamination. These areas were incorporated into the SSFL site as the NBZ (DTSC 2017a). In May 2017, DTSC published its review of chemical and radiological data from the investigations that had been performed to date. From its review, DTSC concluded that: (1) levels of radionuclides on the Brandeis-Bardin Campus appear to be within the natural background range; (2) levels of chemicals and radionuclides at the Brandeis Bardin Campus do not pose a threat to human health; (3) contamination at SSFL does not pose a threat to Brandeis Bardin Campus users; and (4) the Brandeis Bardin Campus is safe for use by campers, visitors, students, faculty, administrators, and staff (DTSC 2017a). Please refer to Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts. As described in Section 2.7, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

A DOE soil testing report published by the *Jewish Journal* December 7, 2016 shows high chemicals in Brandeis-Bardin dirt in drainages off of Area IV. AJU had sent the test results to the non-profit weekly newspaper after the publication inquired about the readings. "The sources of the chemicals are not known," the paper said. "Some may date to early agricultural operations on the land, which later housed the laboratory, the DOE information indicates."

EnviroReporter.com has also uncovered additional evidence of SSFL toxins impacting the Jewish camp including 1993 and 1995 Rocketdyne reports showing Sr-90 over background in 19 separate soil samples. Cesium-137 was found in a NASA drainage into the camp and radioactive cow flops in Area IV were so hot that they threatened to re-contaminate the FSDF after one of its remediations. Camp videos feature revelers playing traditional Jewish instruments dancing near the potentially hot heifers.

2014 DOE map shows pink "Preliminary Remediation Areas" stretching into Brandeis-Bardin

None of this should be unexpected. Brandeis-Bardin borders and is in the drainage of the former Sodium Reactor Experiment (SRE) which partially melted down and released hundreds of times more radiation outdoors than did Three Mile Island in 1979 from the unfortified building. The SRE site and its surroundings still have massively contaminated areas with radiation at thousands of times background.

Radiation in the Dirt

When first found in 2004 at the bottom of a ravine under Area IV, the suspect substance looked as if it had been coming out of the pipe and ground for years. Based on eyewitness observations, photographs, videotape, and Rocketdyne and Boeing reports, EnviroReporter.com estimates that the liquid leaking into Meier Canyon Creek and flowing through Brandeis-Bardin has likely been in existence for decades.

The sampling site sits about 1,200 feet downhill of the Radioactive Materials Handling Facility (RMHF), the former SNAP experimental space nuclear reactors and the FSDF. Small space reactors partially melted down in Area IV in 1964 and 1969 releasing radiation into the environment.

The entire 2,850-acre mountaintop lab drains 612 of its chemically and radioactively impacted acres into Brandeis-Bardin. The AJU property is the largest Jewish-owned institutionally owned property outside of Israel. Ironically, it borders the lab which was started to test V-2 rockets under the guidance of the former Waffen SS-Sturmbannführer (Major) and rocketeer, Wernher von Braun.

The flowing Brandeis-Bardin water seems to be connected to an artesian groundwater well or pipe running down the ravine from Area IV above, or both. The water makes it way past signs stating, "WARNING – DO NOT DRINK OR USE THIS WATER" and "NO HIKING BEYOND THIS POINT" into Meier Canyon Creek which flows intermittently through Brandeis-Bardin in rainy seasons or during significant precipitation events.

2004 Brandeis-Bardin oak with warning signs

Pu-239/240 was found considerably higher in the Brandeis-Bardin dirt tested than the highest sample analyzed in the EPA's 2011 radiation soil testing report

in Area IV. A potent radionuclide with a half-life of 24,110 years, Pu-239/240 was collected and tested in a 2004 Brandeis-Bardin soils report [17 PDF pages; 805 KB] completed in 2005 by STL Richland. Both soil samples had higher Pu-239/240 than found in Area IV soils.

EnviroReporter.com

4/10/2017

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

The peak 2004 Pu-239/240 sample exceeded its BTV by 55.2 percent. This extremely toxic, cancer-causing radioisotope produced during a nuclear reaction was precisely 21.6 percent higher than the "Maximum Value Detected" (MDV) for the radionuclide found in Area IV in the EPA's October 2011 [Final Radiological Background Study Report – SSFL](#) (PDF page 282/286; 16.5 MB).

Read more at [BRANDEIS-BARDIN'S TOXIC DENIAL INVESTIGATION](#)

Photos, videos, reports, figures, tests, data and special analysis of 2015 Boeing Report Brandeis-Bardin Seeps and 2016 DOE-AJU Summary Brandeis-Bardin Soils

Plutonium-239 is a nuclear reactor byproduct that has been called one of the most toxic substances on the planet due to its lethality and use in nuclear weapons. With a half-life of 24,000 years, it also hangs around for a very long time.

Rocketdyne and its successors have repeatedly denied the presence of Pu-239/240 on Brandeis-Bardin property, first in the 1995 report [Additional Soil and Water Sampling – The Brandeis-Bardin Institute and Santa Monica Conservancy](#) (S35 PDF pages; 11.9 MB). "Isotopic plutonium was not detected in any of the field samples collected during the study."

Uranium-238 in the mud was likewise found in the 2004 test at a higher level than any U-238 EPA detected in its extensive radioisotope survey. The sample was exactly 74.4 percent higher than the U-238 BTV reported in the EPA October 2011 Background study report. That amount was above the highest reading of U-238 in Area IV by 27.4 percent.

2004 Brandeis-Bardin at bottom of ravine leading up to Area IV

"The field lab sits at a higher elevation than the Brandeis-Bardin, any third-grader can tell you how the Plutonium 239/240 and Uranium 238 migrates offsite onto the camp," said William Preston Bowling, founder of the SSFL-themed [Aerospace Contamination Museum of Education](#), in a January 19 email to EnviroReporter.com. Bowling first came upon Brandeis-Bardin's warning signs in Meier Canyon in 2007 as well as the water dribbling into the creek, as evidenced by this article's cover photograph. "The sad thing is, the camp owners know about the contamination, even going as far as putting up signs – Do not drink or use water – they would rather put people at risk than upset their "Cash-Cow" aerospace neighbor."

The 2004 soil from Brandeis-Bardin showed substantially elevated beta radiation in both samples according to background numbers for California developed by the nuclear experts at U.C. Berkeley's Department of Nuclear Engineering. The highest gross beta soil sample reading was 2.18 times higher than background for this kind of ionization, the measurement of which is used to determine if man-made radionuclides are impacting a tested medium.

Alpha radiation in the camp's 2004 sludge also came in at over two times the median average according to a U.C. Berkeley nuclear expert's [range of gross alpha](#). Alpha radiation is between 20 to 1,000 times more dangerous to the human organism than other radiation due to its "relative biological effectiveness" in causing cell-death and cancer according to numerous sources.

These soil and water readings in 2004 and 2005 were done in just one spot. An entire area above the hot spot has never been tested. The 1995 Rocketdyne Brandeis-Bardin report included criticism from the camp's veteran environmental tester for not checking out the ravine leading down from Area IV above the gurgling goo. The report indicates that this area may have actually been a *campsite* at a later contamination testing site designated BB-03 at the bottom of the ravine below Rocketdyne.

Please see the response to comment 621-3. The determination of whether uranium-238 is from a natural source or man-made source requires comparison of the results with other uranium species and thorium. The ratios determine the origin of the uranium. The uranium and thorium species results were not provided for DOE comment. Regardless, the result was not duplicated in subsequent samples collected near its location and therefore cannot be used as evidence of uranium contamination.

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

Brandeis-Bardin sampling area in 2005

"Regarding the Campsite Area I drainage, please acknowledge the limitations of that work," radiation physicist Joel I. Cehn says in the report, critiquing its inadequacies. Cehn has been Brandeis-Bardin's an environmental contractor for decades. "There is a 1,200 ft. gap between the lowest soil sample at the top of the hill (BB-17) and the highest soil sample at the bottom (BB-20). This area was not explored. Thus, we cannot confirm that only one ravine is involved, nor how far down the hill the contamination extends. Recall that both tritium and Cesium-137 were detected at the bottom of BB-17. Samples further down the hill could not be collected due to steep terrain, resulting in this 1,200 ft. gap."

The 1995 report showed that tests at BB-03 in 1994 found both Cs-137 and Sr-90 that would be substantially over background values derived by the EPA in 2011 and published in 2012. A Cs-137 sample radiated 65.9 percent over its background. The tests provided to EnviroReporter.com a decade later showed it was still there lending credence to the likelihood that Cs-137 and Sr-90 may still plague the Campsite Area I site.

Radiation in the Water

The chemical sheen glossing the camp water was sampled and analyzed in 2005 from the same unmarked canyon as the 2004 soil test. The [2005 Brandeis-Bardin water report](#) [13 PDF pages; 355 KB], completed in 2006, found Sr-90 over double both the Los Angeles and national averages and Pu-239/240 at nearly half as high as the highest Pu-239/240 pulled and tested in Area IV groundwater by the EPA.

Tritium came in at double background according to H-3 levels cited in an April 21, 1996 Brandeis-Bardin crop testing report recently released by AJU in response to the KNBC I-Team investigation [LA's Nuclear Secret](#) which included Brandeis-Bardin's pollution issues. [The KNBC I-Team brought critical information first reported by this journalist in many cases to a much broader audience. KNBC also shook loose invaluable old reports from Brandeis-Bardin that EnviroReporter.com has used in this exposé.]

2014 Brandeis-Bardin gurgling goo – photo by Brandon Manwell

Beta radiation in the 2005 water was over double the national average in drinking water supplies derived by data provided by the National Research Council (US) Safe Drinking Water Committee. Beta radiation is often associated with man-made radionuclides like Cs-137 and Sr-90.

Brandeis-Bardin's water woes aren't limited to the 2005 report acquired by EnviroReporter.com. The story of the so-called Brandeis-Bardin "bathtub well" includes [DTSC exposing huge amounts of radiation in Brandeis-Bardin water in 2012](#) and then state agencies trying to disprove it in 2014 and beyond.

2011 map shows OS-10 Brandeis-Bardin well with high radiation close to camp center

The well is in one of the main canyons of the [Brandeis-Bardin's outer campus](#) and in the watershed that includes runoff from the SRE. Its official name is Offsite well 10 ([OS-10](#)), a well that filled a bathtub which watered animals and birds at Brandeis-Bardin.

A joint [DTSC/LARWQCB PowerPoint presentation May 21, 2014](#) [38 PDF pages; 3.44 MB] included a revision to the high alpha and beta radiation readings found in the bathtub well, perhaps because the high radiation

Commenter No. 621 (cont'd): Michael Collins
EnviroReporter.com

4/10/2017

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

caused a stir when *EnviroReporter.com* first reported on it in its May 23, 2012 exposé [Roulette](#).

"USEPA was granted access to an offsite well on the Brandeis-Bardin property," the article read. "There, at OS-10, the agency detected beta radiation in the well water at nearly three times its MCL for drinking water. Total adjusted gross alpha radiation activity was 8.61 times its MCL, which is even more troubling: alpha radiation is up to 60 to 1,000 times more dangerous than beta or gamma radiation because of the harm it causes upon ingestion or inhalation."

According to the government's revisionism in the presentation, the bathtub well was too turbid with suspended solids to give an accurate reading of the water. "The elevated levels of the suspended and total gross alpha and beta are attributed to the very high turbidity of the sample and is considered to be a result of naturally occurring radionuclide [sic]."

Yet it's clear, literally, from the photo of the bathtub well that the water isn't turbid enough not to be able to see down to the soil resting on the bottom. For professionals to draw a water sample with "very high turbidity" they would have had to stir up the water in the tub, which is unlikely that they would do.

2014 DTSC photo shows Brandeis-Bardin OS-10 well with running hose

But even more obviously, the photo shows clear water running out of a hose into the tub, keeping it filled and overflowing it. Any competent agency should know to take the sample from the hose, not the tub. Or both.

The last part of the sentence quoted preceding says the sample "is considered to be a result of naturally occurring radionuclide [sic]" which begs the question of why LARWQCB and DTSC didn't test the water with a gamma spectrometer to determine, not "consider", what is making the water so hot? By not determining the radionuclides causing the high readings, no fingers could be pointed at the most likely source radiating higher up in the Simi Hills. This unsound science also shortchanged anyone at Brandeis-Bardin who might have cared about watering their livestock with exceptionally radioactive water.

Plutonium Pipeline?

The conclusion that the bathtub well showed no man-made radiation was and is part of DTSC's mantra that no SSFL contaminants have gotten offsite. Straight faced at years of meetings, DTSC officials essentially maintain that chain-link fences somehow prevent the huge amounts of radiation and chemicals at SSFL from leaving their mountaintop compound.

Rocketdyne got into the act as well nearly twenty years before DTSC began its denial campaign. According to its McLaren/Hart report on Brandeis-Bardin for Rockwell International in 1995, a year before Boeing bought Rocketdyne, this higher than normal bathtub well radiation shouldn't be there at all.

"No radionuclides were detected above measure background in any of the human activity areas at either the Conservancy or Brandeis-Bardin," the report says. "Radionuclides were not detected in groundwater in the two private wells that were sampled."

2014 Brandeis-Bardin surface water - photo by Brandon Manwell

Somehow, this comprehensive report failed to include the gurgling goo's surface water even though it appears to come down from Area IV or from its groundwater which is topped with a chemical sheen as it continues on its way to Meier Canyon's creek. "Surface water data were not evaluated statistically because there was only one background sample from both rounds of sampling," was the befuddled excuse given for not testing the obvious.

EnviroReporter.com

4/10/2017 Brandeis-Bardin's Toxic Denial – EnviroReporter.com

Boeing weighed in on potential Brandeis-Bardin contamination with a July 29, 2008 paper entitled [Plutonium-238 at Brandeis-Bardin](#) [26 PDF pages; 4.65 MB]. "It should be noted from Appendix D that all samples were non-detect for plutonium-239 which is the plutonium isotope usually associated with nuclear reactor operation," the paper says.

Yet Plutonium-239/240 was detected in both Brandeis-Bardin soil and water in 2004 and 2005. Analysis of the scant original Brandeis-Bardin environmental documents AJU has released since the 2015 KNBC investigation began failed to reveal any testing for Pu-239/240 let alone detecting it.

It's not just Area IV that may be leaking radiation downhill into Brandeis-Bardin. Nor is it just radiation. William Preston Bowling joined in discovering black and grey blocks of lung-destroying asbestos in one of the main drainages into the camp in 2007 – blocks that stood taller than he did along with broken pipes with the toxic heavy metal antimony.

"The remediation began after the state's Department of Toxic Substances Control (DTSC) issued lab owners Boeing and the NASA an Imminent and Substantial Endangerment Order on Nov. 1 for the cleanup of asbestos-containing material strewn along the creek bed from 1965 to 1978 by lab workers working at the former NASA liquid oxygen plant (LOX) nearby," states the article [Cleaning Up Rocketdyne](#) in the November 21, 2007 *Ventura County Reporter*.

The area had approximately 500 cubic yards of the tainted soil trucked offsite to a licensed landfill. 8,000 cubic yards of soil polluted by PAHs were excavated as well from the adjacent former shooting range and along the Northern Drainage. The work required approximately 764 truckloads to get rid of the contaminated dirt and detritus. "The deadly debris stretches partway down the intermittent headwaters of the so-called Northern Drainage, which leads into the American Jewish University on Brandeis-Bardin's sprawling campus in Simi Valley below," the article written by this reporter said.

Contamination in drainage above Brandeis-Bardin dug out in 2007

And that wasn't all. Boeing was forced to remove contaminated soil in 2009 on the NASA part of the lab at Outfall 009 which leads down to the main eastern drainage into Brandeis-Bardin.

"The Boeing Company, on behalf of NASA, is currently preparing to excavate soil at Outfall 009," wrote Boeing's SSFL radiation manager Phil Rutherford to the chief of the Radiologic Health Branch of the California Department of Public Health September 11, 2009. "This soils is being removed in order to mitigate NYPDES [National Pollutant Discharge Elimination System] storm water runoff exceedances of dioxins and heavy metals." [sic]

The contaminants sloshing down into Brandeis-Bardin during infrequent rains also contained radioactive contamination that Boeing had to dig out of the NASA soil. A [NASA document](#) obtained by *EnviroReporter.com* shows that the radionuclide Cesium-137 was found in five areas in the heights above Brandeis-Bardin. The highest hot soil had Cs-137 at 3.4 times background, which was dug out and sent to the low-level radiation dump US Ecology in Grand View, Idaho in 2013.

A Troubled History

NASA owes its very genesis to Wernher von Braun who oversaw the Mercury and Gemini programs and developed the Saturn V rocket that took America to the moon. The secretive SSFL site was set up to test the V-2 war rockets that von Braun had developed for Nazi Germany in World War II.

"[A] deep depression separating a circular arrangement of hills became the site of Rocketdyne's first three test stands," says a 1987 Rockwell International booklet entitled [The Hill](#). "As direct copies of test stands that had been in use at the German WWII test facility at Penneunde, they were designed to hold not only the engine to be tested, but the entire vehicle as well."

4/10/2017

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

Wernher von Braun, who attained the rank of Major in the Waffen SS, following Reichsführer SS Heinrich Himmler to the rocketeer's initiation into the SS

These first rocket stands erected at the SSFL were built at the Bowli Test Facility, or "Bowl," as reported in the 2009 [EnviroReporter.com](#) article [Bowled Over](#). "Thanks to the Nazi designs brought to the U.S. after the war by SS officer and rocketeer Wernher von Braun, these three stands built in 1949 played a crucial role in America's burgeoning rocket program."

A chance encounter with a former Rocketdyne employee at a February 5, 2014 [SSFL Work Group](#) meeting revealed more about the lab's Nazi rockets origins. Taking a vape break during the meeting, a former worker of 30 years named Don told this reporter that von Braun's original rocket test stand was not built from scratch plans. "They took it apart in Europe and

shipped it over unassembled," he said. "It came in mahogany boxes with Nazi swastikas emblazoned on them."

"Von Braun's V-2 rockets slaughtered 7,250 military and civilian personnel in World War II, mostly in London and Antwerp, Belgium," reported [EnviroReporter.com](#) in the 2014 piece [High Stakes for Hot Property](#). "Production of his lethal rockets cost 20,000 Mittelbau-Dora concentration camp inmates their lives with 9,000 dying from exhaustion alone. About 350 of these Nazi slaves were hanged, including 200 for sabotage, with the remainder shot or dying from disease and starvation."

One French resistance fighter enslaved at von Braun's rocket works was [Guy Morand](#). In 1995 he testified that he was nearly executed by von Braun in 1944 after a supposed sabotage attempt. "Without even listening to my explanations, [von Braun] ordered the Meister to have me given 25 strokes... Then, judging that the strokes weren't sufficiently hard, he ordered I be flogged more vigorously... von Braun made me translate that I deserved much more, that in fact I deserved to be hanged... I would say his cruelty, of which I was personally a victim, are, I would say, an eloquent testimony to his Nazi fanaticism."

Instead of being tried for war crimes and shot, von Braun went on to become a legend in American rocketry despite his infamous Nazi past. He was one of over 100 German scientists captured by the U.S. at the end of World War II in "Operation Paperclip."

Von Braun worked closely with Nazis developing rocket designs later tested at SSFL

The morality over using suspected Nazi war criminals by the United States in an effort to best the Soviet Union did not end with America's rocketry program. A 600-page Justice Department report released in 2010 that was suppressed by the government for four years revealed that America served as a "safe haven" for nearly 10,000 Nazis after the war. Surpassing the Soviets in space clearly trumped any qualms about using a possible Nazi war criminal with concentration camp prisoners' blood on his hands.

Southern California's Nazi history doesn't end with the origins of the Santa Susana Field Laboratory. Less than 20 miles away is a Nazi lair that this reporter first wrote about for [Los Angeles](#) magazine in a 1996 article entitled [Murphy Ranch](#).

Yet for all this actual Nazi history in Southern California, there is nothing about either Wernher von Braun or SSFL or Murphy Ranch in any of the predominate Jewish institutions in Los Angeles dedicated to remembering the Holocaust. Nothing in Brandeis-Bardin's literature or online history mentions the Nazi-made rocket stand that loomed high in the Simi Hills above the Jewish camp for decades belching smoke and pollutants during test firing.

Rocket Smoke and Gunsmoke

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

Dr. Shlomo Bardin founded the Brandeis Camp Institute (BCI), naming it after Louis D. Brandeis, the first Jewish Supreme Court Justice who provided the vision and funds for the programmatic enterprise, according to the [BCI website](#). Bardin bought 2,200 acres of land in the hills above Simi Valley in 1947, a year before the U.S. government acquired 2,100 adjacent acres to secure secluded land for von Braun's rocket testing.

"In 1953, Dr. Bardin established Camp Alonim (Hebrew for 'oak trees') as a residential summer camp for children, ages 8 to 16," says BCI. "Camp Alonim provides a non-denominational, Jewish experience brought to life through sports, the arts, nature, and learning in a safe and embracing community."

One of the first signs of trouble at the camp came in 1957 when "discolored water" prompted Bardin to call the sheriff according to [documents obtained by KNBC's I-Team](#). Bardin's lawyer subsequently sent SSFL brass a letter saying the lab "caused and permitted great quantities of waste material to be carried down a stream running through Brandeis Camp" and that "this unlawful pollution of said stream endangers the camp water supply and the health of hundreds of children and adults who regularly use its facilities."

2006 Brandeis-Bardin olime 49 years after camp founder complained to Rocketdyne about "discolored water" in 1957

Rocketdyne replied that the water wouldn't kill people but it could destroy vegetation and make livestock sick. Bardin apparently "insisted that Rocketdyne stop the pollution" according to the KNBC report, but nothing seems to have been done according to the documents and eyewitness accounts.

Indeed, untold numbers of hikers and campers made the heights under the lab their world to explore. *EnviroReporter.com* has obtained an old map that shows campsites at the bottom of the hill in Meier Canyon. One of them, as noted earlier, appears adjacent to the area of the 2004 and 2005 tests that detected Plutonium 239/240.

Ralph Powell arrived in the Simi Hills in 1962 and went to work as a patrol officer in Area IV. The longtime Simi Valley resident recalled working in the nuclear zone at a [SSFL Work Group meeting September 24, 2015](#). His recollections included being engulfed in explosions from the FSDF, which drains into the same canyon Brandeis-Bardin where *EnviroReporter.com* found high plutonium and uranium with Area IV's atomic signature.

"A famous cowboy road his horse up to the property line and says 'I'd like to speak to a supervisor' and [the supervisor] says 'What's your problem, sir?'" Powell told the rapt Work Group audience of a story from 1962. "And he says I have 28 head of dead cattle down here that drank water out of this pond." So he assumed it was runoff from this disposal pit which it probably was."

Former SSFL security guard Ralph Powell speaking before a SSFL Work Group meeting September 24, 2015

Powell, who has suffered from extreme peripheral neuropathy, confirmed exclusively to *EnviroReporter.com* that the "famous cowboy" was indeed James Arness. Ten years later, Arness donated his land to Brandeis-Bardin. That included the working ranch and livestock.

"In 1972, the neighboring land owner, James Arness, star of TV's still wildly popular *Guns* donated his 950 acres, making the Brandeis-Bardin property 3,200 acres," according to AJU's Brandeis-Bardin-based [Camp Alonim website](#). "This is the second-largest piece of land held for Jewish communal purpose, second only to the State of Israel."

Brandeis-Bardin's Toxic Denial - EnviroReporter.com

The man known as Marshall Matt Dillon for 20 years on television originally bought the land in 1960. "[W]here I could raise my kids on a ranch with horses and farm animals, a place of beauty with a big sky," Arness wrote in his 2001 autobiography. Those farm animals included distinctive and tough white Charolais cattle. These cattle have roamed all through the Simi Hills as they graze for decades.

Actor James Arness as Marshall Matt Dillon in Gunslinger circa 1956

Over the years, cattle grazing in Area IV were becoming a problem for Rocketdyne. In a June 25, 1991 memo obtained by EnviroReporter.com, Rocketdyne honcho Steve Lafflam related that the cattle's droppings were so hot that they were interfering with restoration of the FSDF.

"The cattle were identified as a source of RA [radiation] contamination by the DOE Tiger Team," Lafflam wrote. "Too [sic] keep them we would have to start doing analysis on the animals. There is continually the evidence of "meadow muffins" in the "burn pit". The Burn pit will be cleaned up by 12/92 (State Order) and then we could go back to the lease if we wanted to."

The radioactive turds, surely dropped all over the place including Brandeis-Bardin where the Charolais cattle herd originated, came from the bovine eating hot vegetation and drinking hot water. Flora sucks up radioactive and chemical contamination in the soil which is eaten, in this case, by cattle which then spread it all over the place through their droppings. Radiation-tainted water would certainly have been accessible by these cattle.

White cattle graze in Area IV in 2007 - photo by William Preston Bowling

For the cow flops to be hotter than the burn pit indicates that the vegetation and water holes were highly radioactive. That Rocketdyne actually leased Area IV for the wandering cows' grazing indicates that the beef and milk from these cattle could have been contaminated and consumed by unsuspecting humans. Whether Lafflam or any Rocketdyne official ever informed Brandeis-Bardin of the radioactive meadow muffin herd is unknown.

Nor is it known if the producers, actors and crews of numerous films, TV shows and commercial productions filmed at BCI were ever told of the environmental situation that they faced working there. An educated guess would be they were not. Many productions have been made at the camp including *Jurassic Park*, *Star Trek VI*, *Melrose Place* and *Diagnosis Murder*.

Ranch Radiation

The distinctive white cows still roam the hills as the [AJU photo of white cattle](#) shows in its [The Land](#) web page. An August 2012 Camp Alonim video features two men lightheartedly blowing on instruments in front of a couple of the cows.

Brandeis-Bardin is a working ranch with youngsters riding horses, using mountain bikes and taking hikes. EnviroReporter.com can only confirm the presence of two or three warning signs nailed to one or two trees on the sprawling campus boasting "countless hiking trails" warning hikers of any contaminated water and none regarding potential dangers from dust inhalation and soil to skin contact. A 2007 photograph shows the signs nailed to an oak tree up Meier Canyon saying "WARNING DO NOT DRINK OR USE THIS WATER" and "NO HIKING BEYOND THIS POINT."

EnviroReporter.com

4/10/2017 Brandeis-Bardin's Toxic Denial – EnviroReporter.com

While most of Area IV drains through the Southern Buffer Zone and Bell Canyon into the Los Angeles River, significant parts of it drain into Brandeis-Bardin down into the Arroyo Simi and groundwater which is used as blended drinking well water in eastern Simi Valley mixed with imported supplies. This watershed includes the still radioactively contaminated site of the [SRE](#).

The SRE partially melted down in 1959 releasing [hundreds of times more radiation](#) than the structurally fortified Three Mile Island reactor did when it partially melted down in 1979. Additionally, the northern NASA sections of Area I and Area II drain into Brandeis-Bardin.

Two reports found elevated cancers and other risks within a few miles of Rocketdyne in 2006. "The new studies were commissioned in 2000 by the state Agency for Toxic Substances and Disease Registry, at a cost of \$700,000, after ATSDR had outraged the community by performing a month-long preliminary review the year before and declaring that SSFL chemicals and radiation were harmless to locals," this reporter wrote in a February 16, 2006 [Los Angeles ValleyBeat](#) article called [The Fallout](#).

Cesium-137 found at 183 times background at Sodium Reactor Experiment site overlooking and draining into Brandeis-Bardin

"The cancer results were nothing less than astonishing," the article reported. "Hispanics living within two miles of SSFL had 38 percent higher rates of all cancers than Hispanics (and non-Hispanic whites) living over five miles away from the lab and a 252-percent-higher ratio for chemosensitive cancers. Within the same distances and parameters, Hispanics living within two miles of SSFL had 189 percent higher rates of lung cancer, 271 percent more bladder cancer and 430 percent higher rates of melanomas."

The 2006 UCLA report, [Potential for Offsite Exposures Associated with Santa Susana Field Laboratory](#), showed offsite exposure data in almost every direction from SSFL in air, water and soil. Two radionuclides, Cesium-137 and Plutonium-238, stand out in the UCLA report as being present in above normal amounts in Brandeis-Bardin soil, readings even higher than in the already elevated 2004 Brandeis-Bardin soil tests.

As measured against the EPA's October 2011 [Final Radiological Background Study Report – Santa Susana Field Laboratory](#) (286 PDF pages – 22.0 MB), soil samples from Brandeis-Bardin were significantly higher than their now-established backgrounds in the 1995 McLaren/Hart report for "Campsite Area 1 (BB-03)." The 1994 samples and tests found Cesium-137 was 65.9 percent over its BTV, Strontium-90 registered 22.5 percent over Area IV background and Plutonium-238 was over 9.4 times normal.

Subsurface soil sampling for radiation in Area IV part of \$41.5 million study of contaminated site

According to [documentation obtained by EnviroReporter.com](#), the California Highway Patrol considers any material or situation over three times background to be the triggering level for a hazardous materials incident. The highest Pu-238 soil reading at Brandeis-Bardin was over 3 times CHP's HazMat trigger yet Boeing in 2008 explained away these worrisome readings saying a Rocketdyne test again in 1995 found, mysteriously, nothing. "The 1994 study results therefore do not confirm 1992 study results and plutonium-238 is therefore not a concern."

Perchlorate has been found in 18 wells in Simi Valley, as noted in this reporter's 2002 expose [Rocketdyne Ranch](#), which helped lead to the creation of the Upper Las Virgenes Open Space Preserve instead of a massive housing development due to groundwater perchlorate concerns. The

621-9

621-9 Please see the response to comment 621-3. Studies conducted by EPA and summarized by DTSC demonstrate that there is no radioactive Area IV contamination leaving Area IV. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act. The DTSC recently performed a review of the radiological and chemical data from investigations conducted at and near the SSFL and the American Jewish University - Brandeis-Bardin Campus and recorded their evaluation in a white paper dated May 2, 2017 (DTSC 2017a). The conclusions of the study are summarized in Section 2.7, "Offsite Impacts" of this CRD.

621-4 cont'd

621-10

621-10 DOE acknowledges your comment and refers you to Section 2.7, "Offsite Impacts," of this CRD for accurate information about contamination in the area around SSFL, including soil testing that has been done and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for discussion of illnesses in the vicinity of SSFL, including the studies referred to in the comment. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

621-3 cont'd

EnviroReporter.com

4/10/2017

Brandeis-Bardin's Toxic Denial - EnviroReporter.com

preserve, formerly known as Ahmanson Ranch, also borders Area IV and the Southern Buffer Zone on the other side of the lab from Brandeis-Bardin.

2004 Brandeis-Bardin pipe dribbling water

"The highest reading was 19.2 ppb [parts per billion], nearly ten times the new allowable limit of the powdery white substance in California drinking water," the *Ventura County Reporter* newspaper cover story read. "Perchlorate has been found in a former sodium burn pit at SSFL and was disposed of in the eastern part of the laboratory where munitions and propellant testing took place."

Perchlorate is considered a "precursor chemical" in groundwater meaning it moves faster from its source than other toxic contaminants. Brandeis-Bardin is much

closer to the source, SSFL being the most obvious candidate, than the 18 Simi Valley wells that have tested positive. In 2003's [The Sins of Rocketdyne](#), this reporter noted that Rocketdyne/Boeing official Steve Lafflam had claimed that the perchlorate in Simi Valley wells could have come from road flares or fireworks.

Actually, almost all of the perchlorate contamination nationwide comes from rocket fuel. The solid rocket fuel booster was used in massive quantities at SSFL. Boeing admits that more than a ton of perchlorate was burned in open pits at SSFL to dispose of it. Perchlorate has been found in about a quarter to a third of monitoring wells in Simi Valley, and the two biggest supply wells.

As *EnviroReporter.com* would later find out in the course of this long investigation, perchlorate has been detected dozens of times at Brandeis-Bardin. Indeed, it was just one toxin in a chemical kaleidoscope that would only be pieced together years later.

Chump Change

Whatever reservations Dr. Bardin had about "Rocketdyne pollution" fouling the camp's water in 1957 seemed to have evaporated by 1964 when the Brandeis Mutual Water Company was established. Perhaps James Arness didn't tell Bardin about his cattle dropping dead, possibly from drinking contaminated water in the early 1960s, when he donated the land to Bardin's Jewish institution a decade later.

By the mid-1990s, after around 15,000 alumni had stayed at the camp recreating in its intermittent streams and exploring its dusty trails, Brandeis-Bardin knew it had a serious problem. The *Los Angeles Times* broke the news with a December 15, 1995 story called [Institute Sues Rocketdyne Over Toxics](#). In the piece, institute lawyer Helen Zukin tries to walk a fine line on the use of groundwater on the property:

"They cannot and are not using the ground water," said Brandeis' lawyer, Helen E. Zukin, alleging that enough toxic solvent has leaked across the property line to render the ground water undrinkable. The institute, however, has never used the ground water, she said."

The institute seemed to have Rocketdyne dead to rights. "In or about August, 1991 defendants, and each of them, caused plaintiff's soil and groundwater to be tested in order to determine if plaintiff's property was also contaminated," the [lawsuit read](#) in documents unearthed by *KNBC*. "On or about September 3, 1991, initial results of said testing revealed that plaintiff's groundwater was contaminated. Before this date plaintiff did not know nor could have reasonably known of any potential contamination of plaintiff's property."

Once they 'did know,' Brandeis-Bardin claimed a galaxy of toxicants had trashed their land and water. "Defendants, and each of them, while owning and operating facility, allowed hazardous materials, including, but not limited to trichloroethylene; mercury; polychlorinated biphenyls; dichloroethylene; vinyl chloride; dioxin compounds; and radioactive cesium, and strontium, (hereinafter, "hazardous materials"), to be disposed of and released into the soil, air and groundwater. These hazardous

621-3
cont'd

Response side of this page intentionally left blank.

Commenter No. 621 (cont'd): Michael Collins EnviroReporter.com

4/10/2017

materials have subsequently seeped into, and come to be located in the soil and groundwater of the real property."

Yet even with its solid case against Rocketdyne, Brandeis-Bardin settled with new lab owner Boeing in 1997 for a net of around \$1,862,817.25 after selling its 180 acres of tainted land on SSFL's northern border with the camp, now known as SSFL's "Northern Buffer Zone." It is not known whether or not Brandeis-Bardin gave up any future right to sue over contamination, demand SSFL cease releases onto its property, or to force the polluter to clean up any contamination, past, present or future. It seems unlikely that Boeing would have made the deal if it would remain liable for new toxin finds such as the ones found in this investigation. Neither party has commented on the confidential settlement.

Brandeis-Bardin's Toxic Denial - EnviroReporter.com

2005 Meier Canyon in Brandeis-Bardin downhill from SSFL's Area IV

Read more at [BRANDEIS-BARDIN'S TOXIC DENIAL INVESTIGATION](#)

Photos, videos, reports, figures, tests, data and special analysis of 2015 Boeing Report Brandeis-Bardin Seeps and 2016 DOE-AJU Summary Brandeis-Bardin Soils

For years, this reporter and others in mainstream and alternative print media on the SSFL beat were under the impression that Brandeis-Bardin took Rocketdyne/Boeing for at least \$30 million. We were wrong. Not only did Brandeis-Bardin settle for chump change, it may have given away any say in further contamination of its land by SSFL. Today, the lab is years and hundreds of millions of dollars away from the only remediation that will prevent more pollution from continuing to plague downhill lands around the lab, a cleanup to background.

2005 Brandeis-Bardin warning sign with bullet holes rests on ground leaning against tree

This baffling settlement was followed by years of no warnings to camp visitors, employees or tenants of the potential dangers that caused Brandeis-Bardin to sue in the first place, other than those few signs in the far reaches of camp. While it may have settled for relatively few dollars, Brandeis-Bardin succeeded legally in its assertions because they were almost certainly true. Warning its visitors of the hazards would seem the logical thing to do in the wake of revelations of its own.

Instead, Brandeis-Bardin has endeavored to paint the place as radiation and chemical free from SSFL even though no major cleanup at SSFL has occurred. For that unlikely scenario to be true, contamination at the top of the hill would have had to somehow magically stayed in place. Newly reported test findings verified and confirmed by *EnviroReporter.com*, along with those by DOE, NASA and Boeing as detailed in this exposé, clearly indicate that is not the case.

Preemptive Strike

Brandeis-Bardin's efforts to declare its property clean included an unsolicited September 28, 2007 email from a camp director to *EnviroReporter.com*. Apparently, our reporting on [Bunkie Cannon](#) had hit a little too close to camp and prompted a series of "prebuttals" from Dr. Gabe Goldman, self-described "Director of Experiential Education" at Brandeis-Bardin.

"My name is Gabe Goldman and I was hired in 2005 by the Brandeis Bardin Institute in Simi Valley to start a new Jewish environmental education program." Goldman wrote to our general contact

EnviroReporter.com

4/10/2017

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

address. "As you know, our property lies directly beneath the cliffs of the former Rocketdyne disaster. Before moving here in 2005 from the East, I required that the Institute conduct a study of possible environmental pollution on the land. The Institute agreed and also showed me where it keeps the environmental testing records it has since the late 1980s when it began yearly testing."

"I came here and spent three days personally collecting samples of ground water, well water (we have a dozen capped wells), soil samples, fruit and plant samples and we even milked our cows – not something they are used to," Goldman continued. "We collected two dozen samples from all areas of our 3,000 acres... The tests included all the heavy metals, perchlorate and the other assortment of radioactive material and other pollutants so often found at government sites. The results that came back were clean. Anything that was an elevated level above normal background averages was still well beneath CA or national standards for concern. The milk tested better than the raw milk from Trader Joes [sic]"

Tons of toxic perchlorate were used during decades of over 30,000 SSFL rocket tests

What Goldman failed to mention was that in the May 15, 2006 memorandum from camp radiation physicist Joel I. Cehn to an unidentified, presumably Brandeis-Bardin, official was that perchlorate in any food substance at any level produced at the camp was cause for alarm. Perchlorate damages the human thyroid causing developmental damage especially in infants and children that will manifest oft-times in intelligence loss and impaired organ development. Pregnant women are especially vulnerable to perchlorate's toxic punch.

California's limit for perchlorate in drinking water is 6 parts per billion, or ppb. The memorandum, courtesy of a limited number of documents that AJU gave to the KNBC-Team, said that a whopping 14.9 ppb of perchlorate was in its 2004 milk, over double the state limit. The scant report doesn't say what the camp did with its milk.

April 2011 white cows in Runkle Canyon with Area IV in background – photo by William Preston Bowling

Goldman didn't mention the troubling Brandeis-Bardin milk perchlorate findings, only that they weren't as bad as Trader Joe's (actually the report says Vons). Nor did he cite Cehn's July 2007 "Summer Testing Report" that found 5.8 ppb in vegetation in the Gan area garden and 2.33 ppb in the Organic garden's vegetation. "The only significant finding this year is the perchlorate detected in milk and vegetation," Cehn wrote. "[Milk] result indicates that area cows are grazing on grass containing perchlorate."

Goldman's 2007 email to EnviroReporter.com continued:

"Runkle Canyon borders on the southwest side of our property and I've been reading your information about what you're finding there. I don't doubt what you're finding but wonder why we haven't found anything here."

Actually, as this article amply shows, plenty had been revealed about the radiation and chemicals in Brandeis-Bardin before Goldman's 2007 missive. His reasoning resembles some of the rhetoric years later that has been leveled against KNBC for its sin of even reporting about Brandeis-Bardin's radiation and chemical issues.

Nuclear Reactions

Unknown to EnviroReporter.com as it investigated, prepared and produced this investigation, KNBC – Channel 4's I-Team would come out with Brandeis-Bardin coverage that produced new information. Along with shaking loose radiation and chemical testing data, KNBC precipitated reactions from

Brandeis-Bardin's Toxic Denial - EnviroReporter.com

American Jewish University, former Brandeis-Bardin employees like Gabe Goldman, and individuals who attended Camp Alonim over the decades.

"I was a CIT, Counselor and riding instructor at Alonim 3 summers, 1969-71," commented Lisa Chait Appelbaum on the [Facebook group Camp Alonim of the 1970s \(and 60s\)](#) page November 11, 2015. "My memory is that at least once a week Rocketdyne would shoot off it's [sic] crazy jet fuel jets straight up into the air, right over camp. Between that and the Santa Su Field Lab, contamination of Alonim was probably astronomical. I am not saying I believe anyone at Brandeis was involved in a cover-up, but companies like Rocketdyne and SSFL are known for any and all attempts to keep what they've done to the environment and possibly humans under wraps."

Bowl Test Facility night tests of rocket engines on Werner von Braun's original test stand would light up the sky with the roar heard for miles

Ruminations, heartbreak and betrayal marked some of the comments. "The attacks on [KNBC's] Joel Grover a well respected journalist as well as former employees who are well respected members of our community are just so wrong," commented Leslie Sackheim the next day on the forum. "I had a beautiful niece who attended many retreats at Alonim during her childhood. We lost her a few years ago after a year long ugly battle with non-smokers lung cancer. She was in her twenties and was suppose[d] to be married the same month she passed. Watching her suffer was horrific and heartbreaking. I can't stop asking if her illness and time at Alonim were related?"

David Dassa, a forty-year self-described "role model to countless children and young adults who have spent time at Camp Alonim," shared with the forum an email he sent November 12, 2015 to Robert Wexler, president of AJU. Dassa had been interviewed by KNBC for its investigation and had been criticized for it by some in the Jewish community.

2006 Brandeis-Bardin water downhill from Area IV

"Without disclosing all reports to the public for testing that was performed (and continues to be performed) at Brandeis over the years, there is no transparency as to the safety of the Brandeis Bardin grounds," Dassa wrote in the email. "Parents are entitled to full disclosure so they can decide whether or not to send their children to the Institute. Neither Brandeis nor the AJU have provided parents with this choice - something that I find unconscionable and not within the context of Judaism as I know it."

Dassa was also amazed by the trove of previously secret documents detailing Brandeis-Bardin's financial settlement of the contamination of its land in the mid-1990s. "Now, as the confidential settlement agreement with respect to the lawsuit has been made public, I see that my worst fears have been confirmed," Dassa wrote to Wexler. "It is hard to fathom how, on the eve of trial for a matter of this magnitude (where who knows how many thousands of lives were and may continue to be put at risk), that Brandeis settled the case for a mere \$3.2M, with 35% of that amount paid to Helen Zukin and an outside law firm (noting that both Helen and the outside law firm each "kindly" donated \$35K of their fees back to the institute)."

Closing with an appeal to Jewish decency, Dassa spelled out what he felt needed to be done by AJU. "It is extremely unprofessional, divisive, and very sad that the AJU and you personally have chosen to discredit me and other leaders in the Jewish community," Dassa wrote. "This constitutes Lashon Hara [[evil tongue](#)], rather than Tikun Olam [[repair of the world](#)]. I believe that only with an apology and full disclosure by the AJU of any and all soil and ground reports, will Brandeis-Bardin be able to perhaps move forward."

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

Gabe Goldman exploded in indignation at the mere suggestion something could be amiss at Brandeis-Bardin claiming he knew the land better than anyone other than Arness' foreman who stayed on after he donated the ranch in order to keep running it. "The KNBC story on Camp Alonim / BBI is the crudest and ugliest example of "investigative reporting" that I've seen since reading about Israet," Goldman declared. "Additionally, testing of water and soil and plants on the BBI side under that range never showed any contamination, radiological or chemical. When KNBC says they uncovered a document, it's more bullcrapola – one of the former BBI Board or staff gave it to them."

One of the Brandeis-Bardin canyons leading down from the Northern Buffer Zone and Area IV above in 2006

American Jewish University wasn't done with KNBC either. "This latest story from KNBC continues to create gross misperceptions about the Brandeis-Bardin property and more than two decades of environmental test results that affirm the property is safe," said Wexler in a [Nov. 21, 2015 letter](#) to the "Alonim Family."

"Earlier this month, the DTSC confirmed the safety of the Brandeis site at a public workshop. And as recently as October 15, 2015, the DTSC wrote: "**Based on available data, there is no evidence of contamination from SSFL [the Santa Susana Field Laboratory] that poses an off-site threat to human health or the environment.**" This is very clear-no threat to human health or the environment extending beyond SSFL. This statement can only be understood to refer to the entire 2,700-acre Brandeis-Bardin property." [Wexler emphasis]

In another bullet point, Wexler wrote "In 1995, the EPA determined there were low levels of contamination in remote areas of what was then Brandeis-Bardin property, but declared: "...the theoretical cancer probability or risk to campers and camp counselors is **less than the EPAs.**" [Wexler emphasis]

In May 2016, AJU claimed that new "extensive" testing it commissioned proved that there was no "unacceptable" risk to public health on its property. But an [NBC4 investigation revealed numerous problems](#). Experts including Bob Alvarez, former senior adviser to the United States Secretary of Energy, and Dan Hirsch, director of the Program on Environmental and Nuclear Policy at UC Santa Cruz, criticized the study for taking too few samples.

The study took only 14 samples out of Brandeis' 2,878 acres. Even so, according to Hirsch, one of those 14 samples found Strontium-90 at two and half times local background. Critics of the study also noted that it did not test for many chemicals known to be on the SSFL property. AJU also claimed that the US EPA had found the site safe – claims denied by EPA when asked by the KNBC i-Team.

The lab that AJU chose to conduct the study, Tetra Tech, was recently fined \$7,000 by the Nuclear Regulatory Commission for deliberately falsifying soil samples from another former nuclear site in San Francisco. Even so, by simply agreeing to "Discuss the facts and lessons learned from this event with its employees who are engaged in licensed activities within 180 days, emphasizing the importance of not engaging in willful activities in violation of NRC's regulations," Tetra Tech avoided the fine.

This time, AJU lashed out at KNBC before the segment even aired, sending KNBC [a letter](#) stating that, "We remain concerned that the piece you plan on airing tonight might defame BBC by implying that wrongful conduct has been perpetrated by AJU or that the safety of our campers or visitors to our campus has in some manner been compromised."

"Common Laboratory Contaminant"

American Jewish University's blanket denials and anti-media attacks on KNBC don't appear to have taken into account all of the facts. In addition to the radiation found at Brandeis-Bardin that

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

EnviroReporter.com has exposed thus far in this investigation, there is even more recent data showing toxin-impacted dirt and water on the site.

Northern Seeps of Brandeis Bardin

Three months before Wexler's Alonim Family letter, DTSC released a massive 6,549-page report called [Report on Seeps Investigation SSFL Summary of Work Completed through IQ 2015](#) [6,549 PDF pages; 265 MB] and sent it to its, presumably, large e-list that includes EnviroReporter.com. AJU should have been on the list too as it allowed Boeing and its subcontractors on its property to take many tests through the years, the results of which are in this report.

Co-funded by Boeing, the DOE and NASA, the study looked at "165 verified seep locations at and surrounding SSFL," according to the report. "This area includes the Brandeis-Bardin Campus of the American Jewish University."

The breadth of toxins identified at Brandeis-Bardin was such that EnviroReporter.com created the page [2015 Boeing Report Brandeis-Bardin Seeps](#) to document them. This report alone reveals at least 338 detections of toxic chemicals found on Brandeis-Bardin property. Some of these detections were near where the camp has held outdoor activities according to Danielle D.'s flickr [Brandeis-Bardin photostream](#) from a survival camping class March 2, 2008, pictured in this article. Danielle Directo-Meston, aka Danielle D., did not respond to emailed requests for comment. Gabe Goldman surfaces in several of the photographs appearing to show the campers how to make a shelter out of hay.

The thick Boeing report is a toxic treasure trove. Hundreds of tests done on Brandeis-Bardin water at multiple sites reveal the presence of perchlorate, trichloroethylene (TCE), toluene, carbon disulfide, cis-1,2-DCE, methylene chloride, bromomethane, ethylbenzene and acetone.

"Acetone is a common laboratory contaminant, and was detected twice," the report said of the detections at seep S-19/FDP-207, a rare admission by Boeing that contaminants from SSFL were the source of the hits they were getting in Brandeis-Bardin. But even with this stating of what would seem obvious, the report later shows that acetone was actually detected eight times at S-19/FDP-207.

"Acetone is a manufactured chemical," says the [ATSDR](#) says of this volatile organic compound (VOC), "[A] colorless liquid with a distinct smell and taste. It evaporates easily, is flammable, and dissolves in water."

"Acetone is a common laboratory contaminant, and was detected twice," the report said of the detections at seep S-19/FDP-207, a rare admission by Boeing that contaminants from SSFL were the source of the hits they were getting in Brandeis-Bardin.

The chemical, which affects the hematological and neurological organ systems, was found in five different Brandeis-Bardin seeps 59 times. Boeing's report subcontractors seem to fail to notice the discrepancy in the number of actual positive contaminant identifications themselves.

The Boeing report continues to contradict itself repeatedly. While perchlorate was detected twice at S-19/FDP-207 and dozens of times at multiple water sources in Brandeis-Bardin, the study states "Perchlorate has not been detected at any SSFL seep, and no VOC has ever been confirmed to be present at any off-site seep location."

Likewise, other VOCs have been detected at different seeps hundreds of times on Brandeis-Bardin as the Boeing report shows in graphs, maps and data yet denies it in its explanation. Just seep S-19/FDP-207's chemical cocktail list shows that.

EnviroReporter.com

4/10/2017

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

Brandeis-Bardin seeps northwest of SSFL include S-19/FDP-207

Cis-1,2-DCE is also a VOC and was found nine times at S-19/FDP-207 from 2002 to 2009. The highly flammable, colorless liquid has a sharp, harsh smell and is used in the production of solvents and other chemical mixtures.

"Lower doses of cis-1,2-dichloroethene caused effects on the blood, such as decreased numbers of red blood cells, and also effects on the liver," says the [ATSDR](#).

"The long-term (365 days or longer) human health effects after exposure to low concentrations of 1,2-dichloroethene aren't known. One animal study suggested that an exposed fetus may not grow as quickly as one that hasn't been exposed."

Colorless and highly toxic carbon disulfide was also detected at S-19/FDP-207 eight times in seven years. "[C]arbon disulfide is extensively and rapidly absorbed via inhalation, oral, and dermal routes," says the [ATSDR](#). "[I]ts distribution is greatest in organs such as the brain and liver."

One experiment involving carbon disulfide involved dipping a human hand in it to see if it absorbed more of the toxin than a person was able to excrete through exhalation. "Rates of absorption of carbon disulfide," the experiment found, "were about 10 times higher than rates calculated from lung excretion of carbon disulfide."

That's not good considering the [Center for Disease Control](#) says carbon disulfide targets the "central nervous system, peripheral nervous system, cardiovascular system, eyes, kidneys, liver, skin, reproductive system" and causes the symptoms of "dizziness, headache, poor sleep, lassitude (weakness, exhaustion), anxiety, anorexia, weight loss; psychosis; polyneuropathy; Parkinson-like syndrome; ocular changes; coronary heart disease; gastritis; kidney, liver injury; eye, skin burns; dermatitis; reproductive effects."

Carbon disulfide has been found at multiple Brandeis-Bardin seeps according to Boeing's report. That would include seep S-25/OS-8 which is approximately 800 feet south, as the crow flies, and uphill from the camp Directo-Meston stayed at in 2008.

Indeed, carbon disulfide was detected 35 times at S-25/OS-8 during a series of samplings and lab tests from 1985 to 2010. The industrial solvent and paint stripper, [carcinogenic methylene chloride](#), was identified 51 times and acetone 36 times. The VOC toluene, used in making paints, paint thinners, lacquers and adhesives, was found 46 times.

Carbon disulfide was detected 35 times at S-25/OS-8, methylene chloride 51 times, acetone 36 times and dozens of detections of toluene, perchlorate & TCE.

"Toluene may affect the nervous system," according to the [ATSDR](#). "Low to moderate levels can cause tiredness, confusion, weakness, drunken-type actions, memory loss, nausea, and loss of appetite."

Perchlorate was found all nine times it was tested for at S-25/OS-8 for two years during 1989 to 1991. The report gives no explanation why perchlorate testing ended when it continued for the other toxins until 2010. Boeing also gives no explanation as to why it stopped testing for the other lab-associated chemicals at this Brandeis-Bardin seep so impacted by SSFL toxins like trichloroethylene (TCE) in 2010.

Carcinogenic rocket engine solvent TCE was detected 50 times at Brandeis-Bardin's seep S-25/OS-8 including the last time it was tested for September 15, 2010. "Trichloroethylene is used as a solvent for cleaning metal parts," says the [ATSDR](#). "It is expected to remain in groundwater for long time since it is not able to evaporate."

Section 3 – Public Comments and DOE Responses

Commenter No. 621 (cont'd): Michael Collins EnviroReporter.com

4/10/2017

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

TCE (trichloroethylene) tank in Area I of SSFL – Photo by William Preston Bowling

There's over 530,000 gallons of TCE in SSFLs groundwater. Von Braun's NASA conducted over 30,000 rocket engine tests over the decades at the lab. TCE was used to dissolve off carbon and other fining residues inside and outside the rocket engine. Until 1964, when it began to be recycled for economic reasons, NASA allowed TCE to sluice off into the soil after use. "More than 1.73 million gallons of TCE slopped onto Rocketdyme's ground," according to this reporter's 2003 expose [The Sins of Rocketdyme](#).

"If you live near such a facility or near a hazardous waste site containing trichloroethylene, you may also have higher exposure to this substance," ATSDR reports. "There is strong evidence that trichloroethylene can cause kidney cancer in people and some evidence for trichloroethylene-induced liver cancer and malignant lymphoma. Lifetime exposure to trichloroethylene resulted in increased liver cancer in mice and increased kidney cancer and testicular cancer in rats."

Those who hope cleanup of [SSFLs spreading TCE plumes](#) in the groundwater is possible soon shouldn't hold their breath. Before it was shut off in 2006, one water filtering system pumping at the lab managed to remove only 10 gallons of TCE per year. At that rate, it would take 53,000 years to remediate the water under the site.

By that time, the TCE plume may have moved under Brandeis-Bardin perhaps as far, and farther, than where the camp's religious, administrative and lodging buildings are located. As exposed in 2003's *Ventura County Reporter* article [Air Apparent](#), "TCE is 5 to 65 times more toxic than previously thought when inhaled." That does not portend well for any residents of some future development scheme over areas impacted by this deadly chemical. TCE vapors have concentrated in buildings, homes and schools across the United States in places where it has polluted the groundwater.

Too Many Crooks in the Kitchen?

Another way to get rid of the TCE is to claim it isn't there even when tests say that it is. This report is a case in point. When discussing seep OS-08 which tested positive for TCE fifty times, the report claims "TCE was not detected in the 48 other analyzed samples from this seep. These TCE detections are likely spurious."

"Likely spurious" is likely wishful thinking. Any report this long and detailed that shows the detections and then dismisses them with groundless and unexplained speculation is suspect in the extreme. It's also bad science.

Figure 12.08 Boeing Seeps Study Area

Boeing Seeps Study Area map excludes Meier Canyon to the northwest of the Northern Buffer Zone, the land Brandeis-Bardin Institute sold to Boeing as part of its contamination lawsuit confidential settlement.

The Boeing report does admit that the acetone found in seep S-19 was a common lab contaminant from SSFL. It's not the only time this admission is made.

"Methylene chloride is a common laboratory contaminant, and was detected once at a concentration equal to the PQL and just above the Cal MCL [Maximum Contaminant Level] for methylene chloride (5 µg/L)," the report says of a detection in Brandeis-Bardin seep S-29.

Since this toxin is regulated and exceeds its California MCL, it was a violation of the Clean Water Act as this is a 'blue line' stream course that supplies a drinking water source, in this case the utilized Simi Valley aquifer. *EnviroReporter.com* could find no evidence that this regulation violation was reported to the appropriate agency, in this case the LARWQCB.

Acetone and methylene chloride, each identified as a "common laboratory contaminant," were found in seep OS-08 before the report disclosed the readings of toluene which the Boeing report said "is a

EnviroReporter.com

4/10/2017

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

component of fuels, adhesives, and other prevalent products, and thus is a common field and laboratory contaminant.”[sic]

Along with acetone, another toxin was detected at seep S-17 as well. “Ethylbenzene was detected in one of five analyzed samples,” the report reads. “Ethylbenzene is a component of fuels, adhesives, inks, paints, and other prevalent products, and thus is a common field and laboratory contaminant.”[sic]

That was page 74 out of 6,549. On page 118, however, it shows that ethylbenzene was detected five times, not just once. Page 155’s map of S-17 shows it to be about 1,100 feet south and uphill of the camp Directo-Meston stayed at in 2008. Current satellite imagery of Brandeis-Bardin shows that the [group camp area and hillside amphitheater](#) are still there at the site.

Seep S-17 had detections of acetone and ethylbenzene. The report says “Ethyl benzene is a component of fuels, adhesives, inks, paints, and other prevalent products, and thus is a common field and laboratory contaminant.”

Seep S-9 is likewise identified by the report as being impacted by SSFL acetone and methylene chloride. “John Varble (Ranch Manager of BB) reports that the pool has been continuously [sic] for the last 30 years,” the study says.

Seep S-9 has been around and running for at least 30 years according to the late John Varble, ranch manager for Brandeis-Bardin ever since James Arness donated his land in 1972.

Far from the coherency that comes from a major multi-year study that reaches its conclusions after looking carefully at its own data, the Boeing report cooks up this interpretation: “Contaminants have not been detected at off-site seeps and this could be due to multiple reasons including that the contaminants are not at the seep, but also the contaminants may be at the seep but non-detect due to a) loss due to surface volatilization or b) VOC dilution with water sourced from local flow paths.”

The report *itself* shows the off-site detections of contaminants. There are hundreds of hits over a significant area. Also, if there is a loss “due to surface volatilization” or “VOC dilution with water sourced from local flow paths,” it means the toxins had to be there in the first place. It also means that toxins came from SSFL because they *aren't* from “water sourced from local flow paths.” This Boeing report confirms what cleanup activists have been saying for decades; lab pollutants are migrating off of the Santa Susana Field Laboratory.

“Fission Products” and “Reactor Control Rods”

Typically the most damning contamination findings come in dense scientific reports that require a keen eye to find data related to Brandeis-Bardin if, that is, it exists at all. Another such report arrived January 20, 2016. The [239 page study](#) [36.98 MB] for the Department of Energy was called “Department of Energy (DOE) RCRA Facility Investigation Groundwater Work Plan Portions of Area IV under DOE Responsibility.”

A trio of Brandeis-Bardin wells called RD-59A, RD-59B and RD-59C has yielded some shocking results with Area IV’s nuclear contamination fingerprints. “The cluster is located below the escarpment with groundwater flow from the mountain resulting in a generally upward gradient,” the report says. “The heads of B and C are above the ground surface and result in flowing artesian conditions.”

<http://www.enviroreporter.com/2017/04/brandeis-bardins-toxic-denial/all/1/>

22/40

621-6
cont'd

621-11

621-11 Please see the response to comment 621-3. Tritium at 110 picocuries per liter reflects the background concentration for tritium at the time the sample was collected. Tin-126 and cadmium-113 have not been consistently (2 or more times) detected in the RD-59 wells, and therefore, may be false positives. In addition, the detection of Tin-126 (0.74 picocuries per liter) was well below the maximum contaminant level of 293 picocuries per liter. Nonetheless, as the commenter noted, monitor wells RD-59A and RD-59B were recommended for sampling because these radionuclides were detected previously and are possibly site related. Tin-126 and cadmium-113 have not been detected in these wells in more recent sampling (Report on Annual Groundwater Monitoring, 2016, SSFL, Ventura County, California. Boeing, February 27, 2017).

Commenter No. 621 (cont'd): Michael Collins EnviroReporter.com

4/10/2017

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

Well RD59B in 2005 in Brandeis-Bardin had "Tin-126 is a fission product and is possibly site process related," according to the DOE report

They also result in some extraordinary readings. RD-59A, monitored from 1989 to 2011, had a high for radioactive tritium with a reading of 110 picocuries per liter (pCi/L). "No SSFL operations occurred off-site,"

read the report before making an incredible leap of logic. "Tritium detection frequency and activity confirm that there are no tritium off-site sources. No future action is required for off-site wells."

Later in the report, RD-59A is recorded as having a filtered reading of Cadmium-113m of 9,700 pCi/L. The well is subsequently recommended for future sampling because "Cadmium-113m neutron activation of Cadmium-112 used in reactor control rods – possibly site process related." [Report emphasis] Presumably, "site process related" means that it came from SSFL activities.

RD-59B also directly tied Area IV's radiation contamination spreading offsite in Brandeis-Bardin's groundwater. The well tested positive for radioactive Tin-126. The report advocated continued testing of this well too. "Tin-126 is a fission product and is possibly site process related." [Report emphasis]

November 9, 2015 DOE report shows Brandeis-Bardin radiation related to nuclear control rods and fission products

Nothing says radioactive contamination more than finding a "possibly site process related" isotope directly related to nuclear reactors downhill from Area IV of the Santa Susana Field Laboratory. Yet nothing is what AJU has had to say about it. Either Brandeis-Bardin representatives had no clue of the findings or they did know these astonishing results and chose not to share them.

Neither explanation can account for the institution's howling of certainty that its property has not been impacted by SSFL by one iota. The information kept on coming, courtesy of the department supposedly in charge of the Rocketdyne cleanup, a government agency also apparently blind to the data that the DOE created.

New Toxic Fluoride Levels in Brandeis-Bardin Groundwater

DTSC sent EnviroReporter.com an email "DTSC-SSFL Document Upload Notification: SSFL NASA Area I LOX and Area II Groundwater Monitoring Report Third Quarter 2016" with a link to [the report](#) [1,180 PDF pages; 17.3 MB] November 30, 2016. "Monitoring wells RD-68A and RD-68B and seep well SP-29B are the only wells located offsite that were sampled during the third quarter 2016," the report says of these wells which are on Brandeis-Bardin property. "Fluoride was detected above the SSFL comparison level of 0.8 mg/L [milligrams per liter] at RD-68B and SP-29B at concentrations of 0.97 mg/L and 4.8 mg/L, respectively."

While fluoride might seem an innocuous chemical added to drinking water to fight cavities, or a threat to "precious bodily fluids" as comically suggested in *Dr. Strangelove*, it is hazardous at high levels.

Artesian well SP-29B's 4.8 milligrams/liter of water more than doubles California's MCL for the chemical. A reading of 4.2 mg/L in the same well in the 1st Quarter shows that the toxic level of fluoride in Brandeis-Bardin water has increased.

November 2016 NASA report shows levels of fluoride in Brandeis-Bardin artesian well SP-29B that exceed California Maximum Contaminant Level for it in drinking water

"Samples collected from SP-29B were submitted for radionuclide analysis during third quarter 2016," the NASA report added. "Nine individual radionuclides were detected, for which there are screening criteria for only five of these analytes (gross alpha, gross beta, gross beta-decanted, uranium-233/234, and uranium-238)."

Actual levels of the radiation weren't provided. The report also didn't list exactly what the other four radionuclides were or their amounts either.

EnviroReporter.com

4/10/2017

Brandeis-Bardin's Toxic Denial - EnviroReporter.com

Fluoride might seem an odd chemical to find at such high levels in Brandeis-Bardin gurgling out of its artesian water. Yet according to an April 14, 1983 Rockwell International memo obtained by EnviroReporter.com entitled "LETF Fluoride Incident, 3 March through 31 March 1983," contaminated water from the Bowl Area [R-1] and Perimeter Pond reservoirs at SSFL was sprayed on the surrounding area dirt to bring down the levels of fluoride.

"I originally proposed this spray disposal system during the mid summer fluoride incident of June 1981 to evaporate the large volume of contaminated water at R-1," wrote C. E. Winzer in the "Internal Letter" to L. D. Schmeid. "[C]ontinued spraying with fluoride reduction due to salt formation afforded the most suitable treatment process. Run-off from this spray was monitored daily for magnitude and reduction."

According to the US National Council on Research, toxic concentrations of fluoride in drinking water can lead to weakened bones and cause hip and wrist fractures. In [Fluoride in Drinking Water: A Scientific Review of EPA's Standards \(2006\)](#), the council said fractures occur at fluoride levels of 1 to 4 mg/L. Brandeis-Bardin's artesian levels of fluoride were found in excess of this in samples pulled twice in 2016. The hazards of fluoride at high levels has been known for decades. Clinically-significant renal dysfunction is possible with fluoride drinking water levels of 1 ppm according to "Metabolism and renal effect of enflurane in man" in the *Journal Anesthesiology* in 1976.

1983 Rockwell memo detailing the spraying of fluoride on surrounding areas to bring down toxic levels in the Perimeter Pond reservoir

AJU Jolts Jewish Journal

New information was provided [December 7, 2016 by the Jewish Journal](#) when it published a piece saying that some of Brandeis-Bardin's soil was going to be remediated by the Department of Energy. The DOE had found toxins at levels above background on camp property and were considering removal of the dirty dirt according to the story.

Jewish Journal had learned of the plan from part of a DTSC draft environmental impact report on the upcoming remediation of Area IV given to it by Santa Monica-based Consumer Watchdog. Accompanying the news article was correspondence between AJU and the paper, as well as an undated DOE list of contaminants it found in Brandeis-Bardin.

AJU sent a [scathing letter](#) to the publication telling the reporter that she had no story. "We are concerned and surprised that the *Jewish Journal* refuses to accept the science-based verdict of DTSC, supported by reams of test results and careful analysis, and instead insists upon perpetuating a harmful and false impression about the safety of our property," wrote Rabbi Jay Strear from the office of AJU's senior vice president November 28, 2016. "In doing so, the *Jewish Journal* does a disservice to us and to our community."

"In short, the samples show a soil profile that is not meaningfully different from what you would find if you sampled the average American front lawn," Strear wrote. "Since DTSC has stated explicitly that there is no risk to human health in these sample results or in any other data collected from BBC to date, it is difficult for me to understand how an article about a project description included in a preliminary administrative draft EIR [Environmental Impact Report] would provide any meaningful information to your readership. On the contrary, it could well serve to give further unfounded cause for concern."

621-3
cont'd

621-12

621-12 Please see the response to comment 621-3. The commenter makes several inappropriate comparisons of low concentrations of chemicals in soils with industrial and other comparison standards that have been set for elevated concentrations of chemicals. The IDLH concentrations cited apply to industrial work place settings. The comparison for dieldrin is in reference to recently applied pesticides, not pesticides applied years ago. The appropriate comparison to evaluate soil risk is to risk-based screening levels (RBSL) that take into account how exposure may occur in the natural environment. RBSLs have been established for use at SSFL and have been approved for use by California DTSC. For example, the RBSL for bis (2-ethylhexyl) phthalate is 173,000 ppb while the concentration in the NBZ was 64 ppb. The RBSL for endosulfan I is 412,000 ppb and the concentration observed was 0.92 ppb. The RBSL for selenium is 380 ppm and the concentration observed was 1.04 ppm. None of the chemicals observed in the samples exceeded their respective RBSLs. As described in Section 2.5, "Toxicity of Soil Contaminants" of this CRD, exceeding a background value does not necessarily mean that the constituent is present at dangerous levels. Subsequent to issuance of DOE's Draft EIS, DTSC issued a report that included consideration of the 2016 sampling, and concluded that the chemicals and radionuclides do not pose a risk to users of the Brandeis-Bardin property.

Section 3 - Public Comments and DOE Responses

Brandeis-Bardin's Toxic Denial - EnviroReporter.com

Strear may have not known that the significance of the data he included with his missive to Jewish Journal. It had a [list of Brandeis-Bardin contaminants](#) found above Area IV background levels with their exact Brandeis-Bardin measurements. Assuming the veracity of the document, the DOE was likely investigating contamination pathways as part of its AOC-related investigation into the extent of its toxins in soil. DOE representatives have stated publicly that if Area IV contamination was found offsite, it would clean it up. It seems the draft EIR indicates it will do just that which would be good news if AJU welcomed it and the resultant cleanup. Plus, it would cost the camp nothing.

Read more at [BRANDEIS-BARDIN'S TOXIC DENIAL INVESTIGATION](#)

Photos, videos, reports, figures, tests, data and special analysis of 2015 Boeing Report Brandeis-Bardin Seeps and 2016 DOE-AJU Summary Brandeis-Bardin Soils

NASA has an identical AOC with DTSC. Both AOCs include soil and groundwater. Any contamination emanating from SSFL down drainages adjacent the site is supposed to be remediated as well hence why the DOE followed the contamination down into Brandeis-Bardin when it made its discoveries. All of the excess radiation and chemicals have to go if the cleanup is to be complete and leave such offsite locations safe for future generations.

Strear's DOE list of contaminants showed background threshold values multiple times their Area IV BTVs. The test results, called "Drainages from Area IV onto Brandeis Property Soil Data Summary Soil Samples Exceeding DTSC Look-Up Table Values," has written on it in red ink "none are SSFL related" with no explanation how that could be.

That the Jewish Journal would publish a summary that makes the unlikely assertion that none of the chemicals tested high are related to Area IV with no analysis would seem puzzling were it not for another strange turn of events when the article was published. The title of the piece, "Remote Brandeis-Bardin area may need cleanup," was amended within hours of going on the Jewish Journal website to "Remote Brandeis-Bardin area may need cleanup, no health threat seen." Then the headline went under a third revision with "Remote Brandeis-Bardin area may need cleanup, state officials see no health threat."

No explanation was given for the addition of "no health threat seen" and then that the state doesn't see one either. Yet it was, literally, correct. DTSC has always said there is no health threat so it doesn't see it. Jewish Journal didn't see a health threat either because it apparently didn't analyze DOE's numbers. If it had, it would have found what EnviroReporter.com did by simply cross-checking them with their publicly available BTVs.

Telling the Toxins

The DOE's sampling test results in Brandeis-Bardin are stunning. No less than 22 chemicals are higher than their SSFL background readings requiring a comprehensive EnviroReporter.com analysis of Brandeis-Bardin contamination found by DOE. That examination is called [2016 DOE-AJU Summary Brandeis-Bardin Soils](#).

Among the standouts, the heavy metal antimony registered three times its Area IV BTV in Brandeis-Bardin. Found in at least 403 of 1,416 of the EPA's National Priorities List of hazardous waste sites nationwide, antimony can be dangerous. "In long-term studies, animals that breathed very low levels of antimony had eye irritation, hair loss, lung damage, and heart problems," [according to ATSDR](#).

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

Brandeis-Bardin 3-2-08 Exploring in Brandeis-Bardin – Photo by Danielle D

Heavy metal molybdenum, "widely used to add strength and hardness and retard corrosion in metal alloys" according to the [Centers for Disease Control and Prevention](#) (CDC), registered 5.8 times its BTV.

Another heavy metal, selenium, came in at 1.8 times its Area IV background. The amount of selenium found in Brandeis-Bardin was between 11.6 to 20.8 times the Earth's average concentrations suggesting a man-made source.

"People may be exposed to higher-than-normal levels of selenium at hazardous waste sites by swallowing soil or water, or by breathing dust," says [ATSDR](#). "The way that selenium can enter the body from a particular site depends on such factors as whether vegetables are

grown in soil in which selenium from the site has been deposited, whether water at the site contains selenium and is able to flow into drinking water supplies, and whether selenium dust blows into the air."

Several PAHs were detected above their BTVs in Brandeis-Bardin drainages down into the camp as well. "People living near waste sites containing PAHs may be exposed through contact with contaminated air, water, and soil," reports [ATSDR](#). "Studies of people show that individuals exposed by breathing or skin contact for long periods to mixtures that contain PAHs and other compounds can also develop cancer."

The PAH naphthalene registered a substantial 5.4 times its SSFL BTV. "Naphthalene has caused cancer in animals," according to [ATSDR](#). "Naphthalene can become weakly attached to soil or pass through soil into underground water."

Another detected PAH, bis(2-Ethylhexyl)phthalate, is "Reasonably Anticipated to be a Human Carcinogen" by the [CDC](#). The Brandeis-Bardin sample was 58% higher than its BTV. The colorless liquid with nearly no odor is used in sheathing for wire and cable and to make plastics flexible.

Brandeis-Bardin 3-2-08 Danielle Directa-Motion by Brandeis-Bardin pond – Photo by Danielle D

The PAH fluorine was detected at 5.7 times its BTV. It is described by the [CDC](#) as a "Pale-yellow to greenish gas with a pungent, irritating odor," and is listed under "Immediately Dangerous to Life or Health Concentrations (IDLH)." Used as a chemical intermediate in a wide range of industrial uses, fluorine is sourced to formulate polyradicals for resins.

A wide range of herbicides and pesticides were used at Rocketdyne, many more than you would find on a typical lawn. That explains why the Area IV chemical background study identified so many and determined their BTVs. It might also explain how so much of these poisons ended up being detected by the short DOE report given by AJU to Jewish Journal then made public and analyzed by EnviroReporter.com. No less than a dozen of these substances exceeded their Area IV BTVs.

The insecticide Endosulfan I in Brandeis-Bardin measured a considerable 8.6 times its BTV. "How might I be exposed to endosulfan?" asks [ATSDR](#) in its [ToxFAQs for Endosulfan](#) page. "Touching contaminated soil or fruits or plants that have been sprayed with endosulfan will result in a small amount entering the body through the skin."

Dieldrin is an insecticide that was banned for all uses by the EPA in 1987 yet is still found in Brandeis-Bardin dirt tested by the DOE at 3.1 times its background threshold value. "[D]ieldrin build up in the body after years of exposure and can affect the nervous system," says [ATSDR](#). "In animals, oral exposure to lower levels for a long period also affected the liver and decreased their ability to

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

fight infections. We do not know whether aldrin or dieldrin affect the ability of people to fight disease.”

Brandeis-Bardin 3-2-08 Gabe Goldman is the man holding the hay bales – Photo by Daniela D.

The pesticide Gamma BHC, also known as Lindane, registered 4.7 times higher at Brandeis-Bardin than its Area IV BTV. “The substance can be absorbed into the body by inhalation through the skin and by ingestion,” according to CDC. “The substance may have effects on the liver. Tumours have been detected in experimental animals but may not be relevant to humans.”

What is relevant to humans, at least the ones visiting, working, camping and living at Brandeis-Bardin is that Rabbi Strear and American Jewish University had already claimed “that there is no risk to human health in these sample results or in any other data collected

from BBC to date.” Results from decades ago all the way through December 2016 from EPA, DOE, NASA and EnviroReporter.com may speak a very different story. Regardless of all these data showing toxic problems oozing from SSFL, the Obama Administration’s Department of Energy parting shot made clear in the first week of 2017 that it didn’t want any cleanup of Area IV at all.

Pollution Solution

DOE’s public policy line was different three years prior. “Let’s clean up to background,” said John Jones, federal project director for the DOE in Area IV, before a meeting of the SSFL Workgroup February 5, 2014. Jones told the audience that the agency was committed to the AOC it signed because, quoting another DOE official, “At the end of the day...it’s the right thing to do.”

Jones’ words were well received. Indeed over 3,700 public comments had been submitted in support of the AOC with only a handful opposed. Soon after, Jones wasn’t so vocal. KNBC’s Joel Grover filmed Jones refusing to speak with him at an SSFL-related meeting in 2015.

That silence ended January 6, 2017 with the DOE releasing its [Draft Environmental Impact Statement \(DEIS\)](#) which will determine what will actually happen with the cleanup of Area IV of SSFL and the Northern Buffer Zone. Three years overdue, there is no mention of Brandeis-Bardin contamination in all of the DEIS’s 27 reports totally 1,468 pages.

3-18-17 Department of Energy DEIS meeting in Simi Valley where majority of public commenters demanded DOE stick to its agreement and clean up SSFL to background levels of radiation and chemicals

There is analysis of three options for cleanup that drastically allow more radiation and chemicals than DOE’s AOC allows. The first option would leave up to 39 percent of dirty dirt in place, the second allowing 91 percent of the soil not cleaned up and the third possibility leaves up to an amazing 99 percent of the known contaminated land not remediated.

Community outrage was evident February 18 when the DOE held the first of two public meetings to take public comment. “You promised six years ago you would clean up the mess you made so that it would be like you never made it in the first place,” said Devyn Gortner of Teens Against Toxins at DOE’s meeting in Simi Valley. “The community has debunked every single one of your excuses as to why you cannot keep this promise.”

A little girl named Grace spoke at the Van Nuys meeting February 21, riveting the audience of around 100 people. “I had cancer,” Grace said referring to a rare form of the disease that her mother, [Melissa Bumstead](#), blamed on SSFL toxins. Bumstead’s [Pediatric Cancer Greater Los Angeles map](#) shows a sobering number of cases surrounding SSFL. “I want to help our city get all the love it needs by getting rid of all the chemicals and nuclear waste because we don’t want to have to do this

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

2-21-17 Little girl and cancer survivor Grace asks DOE to clean up SSFL at Van Nuys public meeting.

again. I don't want to live close to chemicals in the mountain."

"My daughter was diagnosed, recently, with leukemia, a rare form called APL, which the doctors said it was directly related to an environmental issue," said West Hills resident Mark Dow before the DOE panel in Simi Valley which included John Jones. A husband and father of two, Dow has lived about a mile from SSFL since 1996. "Our neighborhood has also had other cancers. We've had two children with brain cancer. We've had an adult die from brain cancer. We've also had two other cancers within our block. So when people say there is no direct correlation [to SSFL], I

have to object."

"We were there when the fires burned [2005] at that site and I could see the ashes coming into my yard and they looked extremely strange," Dow continued. "They weren't typical ashes and you could see it was muddy, gluey, particles coming into our neighborhood and it was appalling."

Though much fewer in number, people against full cleanup of SSFL spoke out too. One was Nancy Kidd, an archeologist who said at a DTSC meeting in 2013 that excavating "any dirt" at SSFL would result in Valley Fever region-wide. Kidd's choice of words and their emphasis, repeated here in their entirety, shocked some in the crowd who knew their Holocaust history.

"It's really heartbreaking to hear these stories and to hear these consternation over all of the years and people having so much invested in the sadness of some kinds of activities that occurred many many many years ago," Kidd said at an audience microphone. "I am with the Simi Valley Historical Society and, in November, we are actually hoping to celebrate Santa Susana Field Laboratory for the rocket engine testing not for your contamination issues. We are hoping that you can remember perhaps through the years and through the grief that the rocket engines that were born in flame and glory up there put our nation at the forefront of the space program and it was our proudest achievement in our history. We are hoping you can see that part of the Santa Susana Field Laboratory and join us. And we are sorry that it has been such a contentious issue for so very long and we hope too that all of this can find a final solution."

Nancy Kidd at 4-29-15 DTSC meeting.

The crowd gasped at the hopefully inadvertent use of a term more appropriate to a Nazi like SS-Sturmbannführer (Major) Wernher von Braun back when he was an Adolf Hitler favorite. As outrageous as Kidd may have sounded, DOE's conclusion that all this fuss about radiation and chemicals is specious may sound even worse. The department makes it abundantly clear that it doesn't think there is anything to worry about, sound science be damned.

"Because there is little difference between those risks, there would also be little difference between the risks following cleanup under any of the soil remediation alternatives—risks in all cases would be close to those from exposure to background soil," the DOE report reads suggesting there's no need for any cleanup at all.

If this unlikely scenario were true, why was \$41.5 million spent finding the radiation and chemical pollution in Area IV in the first place if the pollutant was only going to wave away any need for remediation? Has the U.S. taxpayer been deceived and defrauded for tens of millions of dollars in addition to the exposure of the public to DOE's poisons?

Not only does DOE boldly blind itself to all the foulness EPA found and figured the background levels for, it seems equally unable to comprehend that the department cannot unilaterally nix the cleanup.

621-14

621-2
cont'd

621-14 DOE places a high priority on health and safety and remains committed to protecting the health and safety of current and future users of the site and of the residents in the surrounding communities. In response to comments on the Draft EIS, the risk assessments have been revised for a better comparison of the site risks to background and expanded to include quantitative risks for both onsite and offsite exposures for all alternatives. In this Final EIS, DOE revised the Conservation of Natural Resources Alternative to include two scenarios. The first scenario reflects cleanup levels based on a suburban resident without a garden as was done in the Draft EIS. The second scenario establishes cleanup levels based primarily on a recreational user, with some constituents being further limited by ecological risk. In response to comments on the Draft EIS, DOE has added an offsite human health risk assessment by modeling of potential releases of wind-blown dust to an offsite suburban resident receptor during remediation for all alternatives. This analysis includes the indirect garden pathway, in recognition that local residents may get some portion of their food from a home garden. The results of the human health risk analysis are included in Chapter 4, Section 4.9, of this Final EIS. The results of the ecological risk assessment are included in Section 4.5.

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

2-21-17 Mark Dow at DOE Van Nuys meeting. "My daughter was diagnosed, recently, with leukemia, a rare form called APL, which the doctors said it was directly related to an environmental issue," Dow said. "Our neighborhood has also had other cancers. We've had two children with brain cancer. We've had an adult die from brain cancer."

The AOC it signed in 2010 to clean up to background radiation and chemicals is a legally binding document. The AOCs for both the DOE and NASA make it explicitly clear that DTSC will determine cleanup decisions for both chemicals and radiation in the SSFL cleanup.

While the DOE states at the beginning of the draft EIS report that "DOE has no preferred alternative at this time," it's clear that the department does have a preference, and that is doing as little cleanup as possible. "The negative incremental risks calculated for the No Action Alternative imply that the concentrations of chemical and radionuclides in soil from site-related activities are less than the variability of background concentrations of those chemicals and radionuclides. Therefore, the risk of cancer incidence or death from chemicals and/or radionuclides in Area IV and the NBZ are comparable to or less than the risk determined for background soils."

It goes without saying that if the DOE manages to get marching orders to do nothing in Area IV and the NBZ, nothing they will do. That leaves any possible contamination at Brandeis-Bardin, and its obvious source, left there forever. Nothing would please the polluters and their like-minded pals in the Trump Administration more.

The prospect of eternal pollution being the solution did not please the Ventura County Board of Supervisors in whose county the lab sits. At a March 7 meeting, the board made their unhappiness with the DOE clear with a 4-0 vote demanding adherence to the AOC. "Unfortunately, the EIS does not analyze cleaning the DOE site to the agreed upon stipulations in the 2010 Agreement on Consent," the board's letter to the DOE states. "Instead, hundreds of thousands of cubic yards of soil, some with known significant chemical and radiological contamination that would be covered by the AOC, are exempted from remediation."

"They have not done an analysis of cleaning up to background," Supervisor Linda Parks said of the DOE at the board meeting, "something that they have a legal binding agreement to do so. If you look at the document, they have excluded somewhere in the neighborhood of 300,000 cubic feet to half a million cubic feet of soil from even the consideration of remediation." Supervisor Steve Bennett concurred adding, "[I]t's backsliding after all of this work and all of these agreements ... is not appropriate or good government policy in terms of following through on commitments."

The Los Angeles City Council then voted to pressure the DOE to adhere to the AOC with a 12-1 vote March 8. A week later on March 14, Los Angeles County supervisors Sheila Kuehl and Kathryn Barger led a unanimous board vote demanding total cleanup of the old Atomics International site and SSFL. Kuehl, a longtime leader in the fight to clean up Rocketdyne, minced no words.

Los Angeles Supervisor Sheila Kuehl has long been a leader in the fight to fully clean up the Santa Susana Field Laboratory to background levels of toxins.

"This site has been a little unusual, actually, even compared to our other toxic sites in the county, because the federal government is so implicit in keeping this a dirty site and keeping it from being cleaned up, in not just dragging their heels, but in creating documents that lowball the danger, that lowball the health effects," Kuehl declared to a room packed with appreciative pro-cleanup supporters. "Well, I believe in a cancer cluster when I see one, and I know what's going on in these neighborhoods and what has been. If you see the film that was made about this site, and you see the workers given plastic aprons to go in and clean up a nuclear meltdown, or you see them shooting rifles at barrels of radioactive materials to set them on fire, and you watch this radiated material rising up into the air and spreading over miles of this area, and you think, well, you know, in

Brandeis-Bardin's Toxic Denial - EnviroReporter.com

the old days, they would claim, 'Oh we didn't know what we were doing, or we did and we didn't care.' But to say in the 21st Century 'we know and we don't care' is really inexcusable."

Toxic Test Stands

Then an anti-cleanup bolt out of the goo struck that would effectively relieve NASA of the majority its huge cleanup burden in its areas of responsibility at SSFL. Republican congressman Steve Knight (CA-25) sent a bipartisan letter to the acting head of NASA March 21 asking for the remaining rocket test stands at Rocketdyne not be demolished because of their "historical significance."

"We understand the need to complete the cleanup of toxic chemicals in the area from the many years of research and testing. However, the environmental protection mission and the preservation of such an important piece of our shared history are not mutually exclusive goals," Knight and his co-signers stated in the letter. "It would be a tragedy to lose these test stands and deny future generations the ability to connect with this history and humanity's ongoing search for a better understanding of our universe."

COCA Test Area in 2007 is in decrepit condition with lead paint covering the structure and massive amounts of TOE and perchlorate saturated into the dirt and groundwater around the stand which would remain if the decaying behemoth were "saved" resulting in no cleanup.

Nancy Kidd couldn't have put it better. But what could really be a tragedy is if the test stands remained because it is underneath and around them where the most contamination on NASA property remains unremediated. Two of the most important and prevalent chemicals of concern are perchlorate and TCE which, as this investigation shows, have migrated from NASA property into Brandeis-Bardin.

Despite highfalutin rhetoric to the contrary, leaving the test stands in place means leaving the pollution which would make any chance of eventually cleaning up Brandeis-Bardin virtually impossible. The proposal conveniently also leaves out how to pay for restoring the test stands which are covered in peeling lead paint, according to NASA, as well as how to secure and insure them since the public would presumably be in their proximity. Nowhere does Knight suggest where the substantial funds needed for what could be called [Glow in the Dark Park](#) would come from.

What is also left out of the anti-EPA arch conservative congressman's flowery pitch is any mention of the Nazi origins of SSFL or its impacts environmentally on the surrounding communities including the large Jewish camp downhill from contaminated NASA land and groundwater. This isn't surprising coming from Knight who is against federal regulation of greenhouse gas emissions and who voted with just two other California legislators to allow the display and sale of Confederate flag images in California state museums and gift shops in 2014.

What is surprising is that he got a handful of congress members who have previously supported the cleanup to co-sign [the letter](#). Most dismaying to cleanup advocates is Congresswoman Julia Brownley (CA-26) signing on to Knight's letter even though she has long advocated for the full cleanup of SSFL to background.

On a historic level, the dilapidated SSFL test sites do not rank with the many test stands at Cape Canaveral, Florida, where this reporter lived as a child growing up to love their grandeur and significance to space exploration. Indeed, the most historically noteworthy SSFL rocket test stands, the V-2 rocket ones brought to the new lab after World War II in Nazi swastika-embazoned boxes and reassembled, have already been removed.

Toxic Denial

A re-imagining of SSFL's toxic past and present took place March 29 at a meeting of the DOE-funded SSFL Community Advisory Group (CAG), a group exposed as a 'greenwashing' and 'astroturf' front in

3-1301

621-15

621-15 Thank you for your comment. The scope of this EIS is limited to cleanup of DOE's portions of SSFL for which it is responsible, Area IV and the NBZ. NASA cleanup activities are only considered as part of cumulative impacts (Chapter 5). Cleanup of the entire SSFL, including Boeing, NASA, and DOE activities, is being evaluated in the DTSC Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California (a draft of which was issued by DTSC in 2017 [DTSC 2017b]).

621-16 While the comment is not on the scope or content of this Final EIS the following information is being provided.

DOE has funded a number of stakeholder groups, including Teens Against Toxins, the SSFL Advisory Panel, Physicians for Social Responsibility, the Rocketdyne Cleanup Coalition, Committee to Bridge the Gap and the SSFL CAG. The SSFL CAG is an independent group, created under the State of California Health and Safety Code, approved by the DTSC and formed under guidance from the Udall Foundation, an independent Federal agency focused on environmental stewardship. The SSFL CAG began operating in 2013. DOE does not control information distributed by those it has funded, including not only the CAG, but also the SSFL Advisory Board, SSFL Work Group, Committee to Bridge the Gap, Physicians for Social Responsibility, Rocketdyne Cleanup Coalition, and Teens against Toxins. The CAG was not secretly funded; DOE posted notification of the grant in September 2015 on USASpending.gov, an official website disclosing grants, loans and other financial assistance awards. Information on the SSFL CAG grant can be found here: <http://go.usa.gov/xWppte>.

621-16

Section 3 - Public Comments and DOE Responses

Commenter No. 621 (cont'd): Michael Collins
EnviroReporter.com

4/10/2017

Brandeis-Bardin's Toxic Denial - EnviroReporter.com

2012 in [Greenwashing Rocketdyme](#). The sparsely attended meeting took place at the Shomrei Torah Synagogue in West Hills.

The DOE is actively working against its own AOC agreement to clean up Area IV and its environs to background as first revealed in [Dept. of Energy secretly funding front group to sabotage its own Santa Susana Field Lab cleanup](#) in September 2016. That front group is the CAG, a DTSD-approved attempted replacement of the [SSFL Work Group](#) against the majority of the extensive community's wishes.

One of the 18 people in the audience in a room seating over 150 was CAG Member Ross Berman, a former employee of SSFL contractors CH2M Hill and Tetra Tech, who was handing out packets of information. Another was William Preston Bowling who taped and took photographs of the public event that he shared with [EnviroReporter.com](#).

3-29-17 SSFL CAG at Shomrei Torah Synagogue

"Is that the rabbi [Rabbi Jay Streat] from Brandeis?" Bowling wrote in an e-mail to [EnviroReporter.com](#) during the event. "I say it is. Maybe he dropped off the Brandeis document or asked the CAG to pass it out."

The four pager purportedly from AJJU is called "Fact Sheet - Brandeis-Bardin and the Santa Susana Field Laboratory" and makes the strongest claims yet that there has been no impact at all to its property from SSFL. Some of the claims, however, don't seem rooted in the actual facts. This is ironic because in its zeal to discredit and intimidate TV reporter Joel Grover, AJJU tried to pull scientific rank on the longtime award-winning investigative journalist.

"Mr. Grover's so-called investigation is an undifferentiated 'the sky is falling' tale - the kind of spectacular story intended to draw attention with little attention to actual facts," wrote AJJU's communications and marketing VP Joanna Gerber May 4, 2016. "The complex nature of the scientific findings appears to have eluded your writers and your editors."

Perhaps it has eluded AJJU that its "fact sheet" handed out at the CAG meeting made claims that are not supported by the facts. In fact, the evidence comes from the fact sheet itself.

"Environmental conditions on the Brandeis Bardin Campus have been studied extensively since 1991 by federal and state environmental agencies, as well as independent third-party engineers," the AJJU fact sheet states. "During that time, hundreds of soil, sediment, surface water, groundwater, and vegetation samples taken from the BBC have been analyzed. In 2016, an additional test - known as a gamma survey-was conducted on the main camp area and in the southern ravines. At no point in time have these tests shown any evidence of contaminant migration from SSFL."

SSFL Area IV Outfall 6 diamo over rocks into Brandeis-Bardin

This exposé has shown hundreds of detections of "contaminant migration" from the former Rocketdyne facility as confirmed by Boeing, Rockwell International, DOE, NASA and [EnviroReporter.com](#). These are evidence of SSFL contaminants just as the polluter itself admitted repeatedly, then denied, in its massive 2015 seeps report.

Yet AJJU's fact sheet claims that from 1991 on, there has been no evidence that SSFL goo got onto its property. If this AJJU statement were true, wouldn't it mean that the action Brandeis-Bardin brought against

Brandeis-Bardin's Toxic Denial - EnviroReporter.com

Rockwell in 1995 and settled with Boeing in 1997 confidentially for \$3.2 million shouldn't have happened? If there was no contamination, why did Brandeis-Bardin sue over it? Why did Boeing pay Brandeis-Bardin millions to settle?

AJU has made no typo here as this claim is repeated. "In 1991, a rigorous testing program began at BBI to determine whether contamination at the SSFL had migrated to the BBI property," says the fact sheet. "The results of those tests consistently show no migration from SSFL to the Brandeis Bardin property."

The claim is repeated yet again this time citing AJU's Tetra Tech report. "Tetra Tech found no evidence of contaminant migration from the SSFL," reads the AJU fact sheet. Indeed, AJU's shaky claims flow into leaky descriptions of how there is no way SSFL's toxins can even get to Brandeis-Bardin property.

"Since 2010, storm water runoff from SSFL is primarily diverted away from Brandeis Bardin," the paper claims. "Storm water diversions have been constructed on the SSFL to prevent the flow of runoff from the SSFL on or toward the BBC."

"It's not diverted away, yet in places they [Boeing and/or its subcontractors] have created bioswales to hold storm water runoff in place from Area I in the northern drainage, and there are some BMP [Best Management Practice] work before and after the outfalls in Area IV that connect to AJU," said Bowling in an email after the CAG meeting. "The camp has been dealing with Rocket-Goo since the 1940s as per the letters produced in the NBC expose."

[Satellite imagery from 2017](#) shows that Area IV outfalls for surface runoff, like [outfalls 5 & 6 in 2008](#), are still in operation. Boeing's 2015 seeps report has a map of them on page 95 of its massive report. These SSFL outfalls above Brandeis-Bardin slow the effluent's flow during rain events, allowing it to soak in onsite and churning the water to encourage VOC evaporation. What soaks in makes its way into the groundwater which then squirts out in seeps below as a Boeing illustration in the report shows.

SSFL Area IV Outfall 5 bottom of drain into Brandeis-Bardin

But that's about it even though AJU claims otherwise. "What is released onto BBC is first processed to drinking water standards."

If the water flowing off of Area IV met drinking water standards, why would AJU feel compelled to have maintained signs in Meier Canyon that said "WARNING DO NOT DRINK OR USE THIS WATER"? And why would AJU's fact sheet make the conclusion that "Decades of testing have shown no evidence of contaminant migration from SSFL to BBC" when even Boeing says as much in its seeps report?

John Luker 2-18-17 DOE DEIS meeting Semi Valley

The facts continued their holiday at the SSFL CAG meeting. "I mean what could possibly mitigate removing something that's on the National Register, like a sacred cave or a test stand that got us to the moon?" anti-cleanup CAG member [John Luker](#) asked the small crowd knowing full well that the sacred Chumash cave won't be touched in any cleanup scenario. "How do you mitigate the removal of those things? That question has remained unanswered for twelve years."

That's because the question hasn't been asked because it is senseless and Luker knows it. The former Venice Beach juggler has repeatedly tossed out these cock-and-bull stories since he first started collaborating on the scheme to greenwash SSFL with former Los Angeles Times reporter and Boeing hired gun Gary Polakovic as exposed in [Boeing's Meltdown Makeover](#) in 2012.

Brandeis-Bardin's Toxic Denial - EnviroReporter.com

Bonnie Klea, long reknowned as [The Atomic Avenger](#), knows Luker quite well. Klea, recently [profiled by the Los Angeles Daily News](#), has been on the receiving end of his belittling remarks for years. Recently, she was named the 2017 Pioneer Woman of the Year by Los Angeles Councilmember Mitchell Englander for "her exceptional work advocating for those affected by the Santa Susana Field Lab during the partial meltdown of a sodium reactor occurred in 1959 at the site." [sic]

"We have a cancer cluster of little kids," Klea said during the CAG meeting after yet another presentation claiming no one has been effected by SSFL poisons. "We are on the second cancer cluster. The first one was in 2006. Those babies were born with retinoblastoma. Now we have 70 little children surrounding Santa Susana and they have extremely rare cancers. Maybe there's one in a million in America and we have more than one. Seventy kids."

Councilmember Mitchell Englander awards Bonnie Klea Pioneer Woman of the Year 2017 for her SSFL work

"If there was the remotest chance that there actually is cancer, somebody's got to start doing some soil testing because the contamination is not at SSFL," Luker said without the slightest trace of irony. "So we have to start looking at, maybe, school yards, public parks where we could do the testing and sampling and see if there's anything there."

Look anywhere but where there is dirt so hot that it is over a [thousand times background](#). DOE's Area IV sitting high above the Jewish camp. That kind of nonsense might work for people new to the issue but it doesn't fly with folks who've fought for full cleanup of the hot zone for decades.

Now or Never Again

Talking with a DOE official at the February 18 EIS meeting in Simi Valley, this reporter asked that if Area IV contaminants were found in Brandeis-Bardin above background, would DOE remove them per the AOC. DOE's project manager for Area IV, John Wondollock, said yes "in terms of anything that migrated from [Area IV]" before a DOE person intervened and offered an on the spot interview with DOE's John Jones.

DOE's John Jones 2-18-17 at Simi Valley DEIS public meeting during exclusive EnviroReporter.com interview.

"What we have discovered in the drainages are extremely low levels of pesticides and herbicides that are in the drainages leaving Area IV into Brandeis," Jones told EnviroReporter.com in a room adjacent DOE's public display describing the DEIS. "They are in no way near a threat to human health and, at this point, our range for what we have for the volume does not include going to Brandeis because at this stage this an informational document. This is not a decisional document so it would be inappropriate to say 'we're going to go here and do this' when we first have to talk to the private owners as well as we have to develop our final EIS and our record of decision is a decision document."

SSFL's DTSC project manager Mark Malnowski has repeatedly stated that if any contamination was found in Brandeis-Bardin related to Rocketdyne, DTSC would ensure that the responsible parties would be obliged to clean it up to background. In this case, NASA and the DOE would be those parties. These assurances were made last year in DTSC's April 12, 2016 presentation, and again in its December 22, 2016 letter to state Assemblymember Matt Dababneh (D-Van Nuys), where DTSC director Barbara Lee wrote, "I would like to emphasize that, if contaminants were detected at concentrations that posed an imminent threat to human health or the environment at Brandeis-Bardin Campus, DTSC would have issued an order for an immediate cleanup."

Brandeis-Bardin's Toxic Denial - EnviroReporter.com

Considering that there has been no comprehensive examination until this expose of what the contamination and remediation challenges are, the public now has the knowledge to determine what it wants done at SSFL and Brandeis-Bardin. The public can [comment on DOE's Draft EIS](#) by April 13, 2017.

"These environmental outrages shouldn't be allowed," says Bowling. "Now that the red hot spotlight of truth backed by proof is shining on Brandeis-Bardin, it's time for action. The place has to be cleaned up to background levels of radiation and chemicals just like SSFL must be according to law."

William Preston Bowling, right, praising SSFL takes outside lab gates with Michael "Mikey" Rincon August 6, 2016.

While the sordid history of this place suggests that the worst will indeed continue to pass, the information unearthed here, in over thirteen years of digging, will nevertheless warn the unwary of what secrets lie in and around the Santa Susana Field Laboratory. People that make the Simi Hills their playground, destination or home deserve to know what risks await.

Putting the best possible spin on it, perhaps the good folks at Brandeis-Bardin Institute were simply unaware of the extent to which the toxic SSFL run-off could pollute their land. But now, Collins has documented it. BBI cannot blow this off, the health of way too many people is at stake.

Dale

April 7, 2017 at 11:46 pm | Edit

A very complete and worrying description of contamination problems associated with SSFL and nearby lands. I would be concerned about residents and visitors who unknowingly come into contact with the airborne and waterborne effluent leaching from the hills and watersheds surrounding SSFL. Although the story mentions some warning signs on the Brandeis-Bardin property, I wonder if publicly accessible hiking trails in the area are similarly marked. And, of course, one wonders just how far the contaminants could migrate from the SSFL property. The very long half-life radionuclides could seep into groundwater supplies if given enough time. I lived within earshot of the SSFL Saturn IVB engine tests of the 1960s. But at the time, I had no idea of the trouble that would develop years later due to the research activities at SSFL. I hope that articles like this one will stir action within the community and from local governments to bring closure to the SSFL cleanup project. Thank you, Michael Collins, for writing this important investigative article.

To Michael Collins: I am beyond impressed with your very clear organization and explanation of many years of test results relating to the Brandeis-Bardin Institute's property, and the implication that the parties involved don't want to admit the degree of contamination that the tests show. To the community of "Rocketdyne clean up activists" and visitor/camper/employees at Brandeis-Bardin Institute who may react to this EnviroReporter report with a question or a plea to the current decision makers for Brandeis-Bardin Institute "Why don't you do something to make the clean-up of

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

toxic and radioactive contamination happen" I hope to provide an answer as to why they most likely won't.

The reason "they won't do something" is in large part because the Board of Directors of American Jewish University, as the parent non-profit company to the non-profit owner of the Brandeis-Bardin property, are bound to a 1997 "Settlement and Release Agreement" between Boeing North America and Brandeis-Bardin Institute.

In essence, back in 1997 Brandeis-Bardin Institute's decision makers decided release all of their past and future claims against Rocketdyne/Boeing and to put their faith in Federal, California and regional toxics regulatory agencies to "do the right thing" and decide upon the details of further clean-up of hazardous substances and radioactive substances on, under and near the Brandeis-Bardin Institute's property.

Assuming that back in 1997 the Brandeis-Bardin Institute's decision makers expectation was that the government agencies WOULD require additional soil and ground water clean-up by Boeing on and around Brandeis-Bardin Institute's land, the sad fact is that 20 years later little has been done in terms of remediation improving the conditions of the Brandeis-Bardin Institute's land or the Boeing land directly upstream from it or adjacent to it.

Assuming that back in 1997 the Brandeis-Bardin Institute's decision makers expectation was that the government agencies WOULD require additional soil and ground water clean-up, the Settlement and Release Agreement they entered into with Boeing prevents Brandeis-Bardin Institute or its successor land owner from prosecuting any lawsuits NOW to try to force any such remediation.

One might say that given the wording of the Settlement and Release Agreement entered into by Brandeis-Bardin Institute in 1997, they shot themselves in the foot.

Back in 2015, when NBC Los Angeles was running its investigative news stories about Rocketdyne related contamination of Brandeis-Bardin Institute, NBC LA posted documents on its website which it believed supported its investigative news stories. The posted documents directly relate to the anguish exhibited today by "clean up Rocketdyne" activists and former Brandeis-Bardin Institute campers from around the state who are dismayed by the California Department of Toxic Substances Control and multiple Federal agencies desires to not order much if any remediation of radioactive and toxic substances on, under and near the Santa Susana Field Lab or Brandeis-Bardin Institute.

Among those documents posted online by NBC LA in 2015 was a letter dated October 23, 1997 from the late Judge Joseph A. Wapner to Brandeis-Bardin Institute's lawyer Barry I. Goldman, enclosing the Settlement and Release Agreement with Boeing North America signed by Judge Wapner in his capacity as President of the Brandeis-Bardin Institute ("BBI"). In the letter Judge Wapner wrote to Mr. Goldman "Enclosed please find the original Settlement and Release Agreement signed by me as President of the Brandeis-Bardin Institute. I certainly hope this matter will be concluded soon. I know that you are doing everything in your power toward that end for which I sincerely thank you."

The copy of that letter obtained by NBC LA showed a "cc" to Dr. Alvin Mars, the then Executive Vice President of Brandeis-Bardin Institute. In the style of secretaries in the 1990's the "cc" to Dr. Alvin Mars had a little check mark next to it on the letter posted online by NBC LA, showing that the particular copy of the letter was the copy physically sent to Dr. Mars by Judge Wapner's secretary.

As a result one can conclude the copy of the letter and its attachment obtained by NBC LA has an appearance of authenticity because it likely came from (1) Dr. Mar's file on the Rocketdyne/Boeing litigation, (2) a file maintained at the offices of Brandeis-Bardin Institute or (3) a file maintained by a person or entity who was authorized to receive a copy under that Settlement and Release Agreement's terms.

To my knowledge, no copy of the "counterpart" of that Settlement and Release Agreement signed by Boeing North America ("BNA") as corporate successor-by-merger to Rocketdyne, Inc. has been published by any media source.

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

From the text of that Settlement and Release Agreement attached to the letter described above it is fairly clear that neither Brandeis-Bardin Institute nor Boeing North America intended the text of that Settlement and Release Agreement be made public. All that Brandeis-Bardin Institute and Boeing North America intended the public see would be a one page "Dismissal With Prejudice" of the U.S. District Court case captioned The Brandeis-Bardin Institute v. Rocketdyne, Inc, et al, Case No. CV-95-8316 ABC (RMCx) signed by Brandeis-Bardin Institute's lawyer. That practice of filing a one page dismissal of a lawsuit with the U.S. District Court without court-filing of the parties' actual Settlement and Release Agreement is and has been very common for decades.

However, given the veneer of authentication of the version of the 1997 Settlement and Release Agreement signed by Brandeis-Bardin Institute in the late Judge Wagner's letter described above, it is worth looking at the text of that Settlement and Release Agreement to understand the rights (or lack thereof) of Brandeis-Bardin Institute and the American Jewish University subsidiary which owns the Brandeis-Bardin Institute land today.

As a result readers should direct their attention to the that 1997 Settlement and Release Agreement, quoted below, and showing that Brandeis-Bardin Institute gave Boeing North America the customary ironclad release of known and unknown claims arising out of known and unknown facts related to the general subject of the lawsuit. In that Settlement and Release Agreement text "BBI" means Brandeis-Bardin Institute and its subsidiaries, and its successor entities and their subsidiaries and "BNA" means Boeing North America and its predecessor owners of the Santa Susana Field Lab, as well as their subsidiaries and successors in ownership or operation of the Field Lab.

The only comfort the release paragraphs in that Settlement and Release Agreement provide is that Brandeis-Bardin Institute did not purport to release claims held by "other people" who attended events at the property or who camped or ate food grown at the property.

That Settlement and Release Agreement does not describe, in any detail, the hazardous or radioactive substances found or alleged to be found, or not found, on any part of Brandeis-Bardin Institute's property, including the part deeded over to a Boeing North America subsidiary in early 1998 as part of the implementation of the settlement.

Settlement and Release Agreement Section III Paragraph 1 provides: "General Release. BBI hereby releases and forever discharges BNA of and from any and all claims of any kind or nature, under any theory, whether legal, equitable or other, under the law, either common, constitutional, statutory, regulatory or other, of any jurisdiction, foreign or domestic, whether such claims are known or unknown, suspected or unsuspected [sic], including claims that BBI has brought or could have brought, which now exist or in the future may exist, arising out of or in any way related to events or matters referred to or which could have been referred to directly or indirectly in the Action [the Federal court case], including but not limited to, claims relating to hazardous substances at or emanating from the BBI site and the Field Lab."

Settlement and Release Agreement Section III Paragraph 2 provides: "Waiver Under California Civil Code 1542. It is understood that 1542 of the Civil Code of California provides as follows: "A GENERAL RELEASE DOES NOT EXTEND TO CLAIMS THE CREDITOR DOES NOT KNOW OR SUSPECT TO EXIST IN HIS FAVOR AT THE TIME OF EXECUTING THE RELEASE, WHICH IF KNOWN BY HIM MUST HAVE MATERIALLY AFFECTED HIS SETTLEMENT WITH THE DEBTOR." BBI expressly waives and releases any right or benefit which it has or may have under 1542 of the Civil Code of the State of California, to the extent it may waive all such rights and benefits pertaining to the matters released herein. In connection with such waiver and relinquishment, BBI acknowledges that it is aware that it may hereafter discover claims presently unknown or unsuspected, or facts in addition to or different from those which it now has or believes to be true, with respect to matters released herein. Nevertheless it is the intention of BBI, through this Agreement, and with the advice of counsel, fully, finally and forever to settle and release all such matters, and all claims relevant thereto, which do now exist, may exist or heretofore have existed between BBI and BNA. In furtherance of such intention, the release herein given shall be and remain in effect as a full and

EnviroReporter.com

4/10/2017

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

complete release of such matters notwithstanding the discovery or existence of any such additional different claims or facts relative thereto."

The 1997 Release and Settlement Agreement DOE contain "custom drafted promises" between Brandeis-Bardin Institute and Boeing North America concerning remediation and non-remediation of hazardous substances found on the Brandeis-Bardin Institute property after the settlement went into effect. Those custom drafted provisions are found at Article III, Section 7 (page 8) of that Settlement and Release Agreement. Those paragraphs generally leave decision making about remediation to "regulatory agencies", cutting Brandeis-Bardin Institute out of the decision-making process:

Settlement and Release Agreement Section III Paragraph 7a: "Remediation of Hazardous Substances a. BNA shall continue to investigate and remediate under the direction of regulatory agencies the hazardous substances emanating from the Field Lab. BBI shall fully cooperate with BNA, giving BNA access to the BBI Site, in connection with BNA's investigation and remediation under the direction of the regulatory agencies of hazardous substances on the BBI Site emanating from the Field Lab. The scope of BNA's investigation and remediation of hazardous substances shall be determined by the regulatory agencies, and not by BBI. BNA shall be responsible for remediation of the Parcels required by the regulatory agencies..."

To the public that Section III, Paragraph 7a is the most important provision in the Settlement and Release Agreement. In layman's language, Brandeis-Bardin Institute promised not to demand any clean-up of hazardous substances (by definition in the Agreement including radioactive substances) on the Field Lab or on Brandeis-Bardin Institute's remaining property other than clean-up required by "regulatory agencies" which by definition in Article I, Section 3 did NOT include Ventura County or any city.

As a result of that Settlement Agreement's text at Section III Paragraph 7a, if the regulatory agencies do not require remediation to background level, Brandeis-Bardin Institute is stuck with that decision as to its own property and as to the Field Lab property adjoining it. If the regulatory agencies only require 39% of the hazardous or radioactive substances, Brandeis Bardin Institute is stuck with that decision. The only power Brandeis-Bardin Institute still has, under that Settlement Agreement, is to do its own elective remediation of its own property after the regulatory agencies have relieved Boeing North America and its affiliates from any further remediation obligation.

Settlement and Release Agreement Section III Paragraph 7b provides: "b. Before selling, leasing, or otherwise conveying an interest in the BBI Site or any part thereof, BBI (i) shall provide a copy of this Agreement and make full disclosure of BBI's obligation to cooperate fully with BNA, including giving BNA access to the BBI Site, in connection with BNA's investigation and remediation under the direction of the regulatory agencies of hazardous substances on the BBI Site emanating from the Field Lab, (ii) shall obtain the written covenant from all persons acquiring an interest in the BBI Site or any part thereof in the form attached hereto as Exhibit C, and (iii) shall forward such covenant to BNA within five (5) days."

In effect, Exhibit C was to be a binding admission by Brandeis-Bardin Institute as to the implied risks presented by its real estate being located adjacent to the Santa Susana Field Lab.

Unfortunately, the version of the Release and Settlement Agreement which Judge Warner signed as President of Brandeis-Bardin Institute, and which NBC LA posted online, did not have Exhibit "C" attached. That is not unusual. Officers of corporations typically leave it to their company's lawyers to approve the wording of exhibits and attach them to the "official" copies of settlement agreements. No other copies of the final version of Exhibit "C", approved by the lawyers for Brandeis-Bardin Institute and Boeing North America, has surfaced in the press.

If Brandeis-Bardin Institute actually fulfilled its contractual promise to Boeing North America in that Settlement and Release Agreement's Section III, Paragraph 7b quoted above, language mirroring the missing Exhibit "C" should have been signed by the lender under any deeds of trust recorded with

Section 3 – Public Comments and DOE Responses

Commenter No. 621 (cont'd): Michael Collins
EnviroReporter.com

4/10/2017

Brandeis-Bardin's Toxic Denial – EnviroReporter.com

the approval of Brandeis-Bardin Institute in connection with its borrowing against the BBI Site prior to or after American Jewish University's acquisition of control of BBI. A document mirroring the text of Exhibit "C" should have been signed by any recipient/grantee of easements over the BBI Site, such as those which the BBI Site property owner granted to neighboring residential real estate developers, utility companies or the City of Simi Valley. The text of Exhibit "C" should have been included in one of the documents under which the BBI Site was deeded to a subsidiary of American Jewish University.

Brandeis-Bardin Institute's "admission" in Exhibit "C", or in documents quoting Exhibit "C" would be of great interest to any individual claiming that they or American Jewish University had a moral, ethical or legal obligation to disclose hazardous substances health risks associated with humans physically being on the BBI Site for any extended period of time. Documents with the Exhibit "C" wording may or may not have been filed with the Ventura County Recorder, because that Settlement and Release Agreement does not require that such a recording be made. As far as I know, no member of the press has publicized Exhibit "C" or a similar document pertaining to the parts of the BBI Site which Brandeis-Bardin Institute, American Jewish University, or their land-owning subsidiary which was recorded in those Ventura County Official Records in 1998 or later.

Other the requirement that Brandeis-Bardin Institute make an Exhibit "C" written disclosure to any legal person obtaining an interest in the BBI Site, the Release and Settlement Agreement between Brandeis-Bardin Institute and Boeing North America contains a broad non-disclosure agreement about that Settlement Agreement binding on Brandeis-Bardin Institute and, through a provision not quoted below, its subsidiaries, affiliates and successors:

Settlement and Release Agreement page 13, Article III, Section 18: "Non-Disclosure. The parties agree not to disclose in any way the terms or conditions of this Agreement to any person other than their counsel, auditors, insurance carriers, lenders, officers and directors, each of whom shall be informed of, and bound by, the confidentiality terms of this Agreement, except in response to a lawful subpoena or other lawful process or as may be required by an independent auditor, or as part of an effort to enforce the terms of this Agreement. In the event that a party believes that disclosure is otherwise required by law or is necessary to enforce this Agreement, it shall give prompt written notice via overnight delivery to the other parties to this Agreement prior to disclosing such information....Said notice shall set forth all of the information which the party to this Agreement proposes to disclose, the statute or other legal authority purportedly requiring disclosure, and the circumstances pursuant to which disclosure is to be made. If the party providing notice to the other party receives no notice within ten (10) days that the other party intends to seek to prevent disclosure, it may produce this Agreement...."

Since the counterpart of that Settlement and Release Agreement signed by Boeing North America has not publicly surfaced, and since the content of Exhibit "C" has not become public, one cannot say with 100% certainty that the Settlement and Release Agreement signed by the late Judge Wapner in October 1997 and posted online by NBC LA is the final version of the document. At the very least litigation and toxics lawyers would say that the document's content looks like one which would have met with the approval of Boeing's lawyers in 1997 as being a "customary" form of settlement agreement relating to hazardous materials contaminated properties in California.

The text of that Settlement and Release Agreement does NOT bluntly require that Brandeis-Bardin Institute (or its successor land owners) not make public comment about hazardous substances or radioactive substances found on, under or near the Brandeis-Bardin Institute at any point in time before or after the settlement. The text of that Settlement and Release Agreement does NOT bluntly forbid Brandeis-Bardin Institute from "warning" people participating in activities on its property, camping or living there, about the past or current status of hazards on the Brandeis-Bardin Institute property (the "BBI Site" referred to in the Settlement Agreement) or the Santa Susana Field Lab/Rocketdyne property.

Brandeis-Bardis Toxic Denial - EnviroReporter.com

However, on a purely investment-minded level there was and still is little benefit to the owners of the Brandeis-Bardin Institute land in Simi Valley to bezzrich the physical condition of their property or property owned by others next door, because Brandeis-Bardin Institute has a history of selling a part of its property for office/warehouse land development and it is conceivable that in the future the American Jewish University could decide to have its subsidiary which owns the Brandeis-Bardin Institute land sell parts of its remaining land for residential development. In that sense, it is in AJU's economic interest that the Federal, California and regional agencies involved in investigating the history of Rockeddyne aka Santa Susana Field lab find that no further clean-up or protective land use regulations are required.

Commenter No. 622: Anonymous

I implore the U.S. Department of Energy "DOE" to fully cleanup the SSFL site contamination as the DOE agreed to, and signed, in the 2010 Administrative Order on Consent "AOC". It is not all right for the DOE to renege on the AOC agreement by changing the terms and compromising the health and well-being of residents, and may I say many future generations, in all nearby communities. The site must be cleaned up fully and completely to remove all detectable contamination!

The 4 EIS proposals presented by the DOE are NOT in compliance with the 2010 signed AOC. To leave ANY of the detectable contamination in place allows for the contamination to adversely affect and impact communities that are nearby.

In 1994 when my husband and I married, we moved into our home on Appleton Road in Simi Valley. We are in close proximity to the SSFL when the wind radius is taken into account, and we live just down the street from Runkle Canyon. We have 2 sons. Three years ago one son was diagnosed with a chronic thyroid condition at the age of 15. I am extremely worried about him. There are contaminants at the site that are known to cause thyroid health issues. When the rocket engines were being tested, we would hear the extremely loud rumble of the rocket engines, and at those times, our windows would rattle and shake.

The name "Simi" means windy, and Simi Valley is a windy city. Hazardous contaminants at the SSFL can easily blow in the wind in any direction. Hazardous contaminants can easily run downhill from the SSFL when it rains. To leave any detectable contaminants at the SSFL would absolutely be the wrong action to take.

There are some who want to preserve, in place, the rocket engine test stands and the Chumash Indian paintings that are on the grounds of the SSFL. I am not one of them. If that is done, the DOE would not be removing the detectable contaminants under and around those test stands and the Indian paintings. That is not acceptable! People presently living, and future generations to come, are immeasurably more valuable than the rocket engine test stands and the Chumash paintings. Make replica stands and put those replicas somewhere else to be viewed. Have a government photographer photograph the Chumash paintings to preserve what those paintings look like before they are removed from the site. I recognize that the rocket engine test stands and the Chumash paintings are a part of history. I surely hope though that the DOE does not take the position that the rocket engine test stands and Chumash paintings are more important and valuable than human lives!!

The DOE needs to concentrate on how it is going to completely cleanup the detectable contaminants at the SSFL rather than on how much of the site's contaminants it is going to cleanup or whether it will do any cleanup!

The DOE must abide by the AOC to cleanup ALL detectable contamination. It is the U.S. Federal government's duty to protect its citizens. It is the U.S. federal government that was involved with the SSFL nuclear site as well as the testing of the rocket engines. With the nuclear meltdown of many years ago, it is the U.S. federal government DOE that has the responsibility to clean it up. It has been way too many years already that residents in the surrounding communities have been exposed to the hazardous contaminants. Cleanup should have been done long ago. It still needs to be done!

To those in the DOE who have decision power regarding the cleanup of the SSFL site, I ask "If you lived close by the SSFL site, would you want yourself and your family and generations that follow to be continually exposed to hazardous contaminants that can cause horrific health conditions?"

622-1

622-2

622-3

622-4

622-1
cont'd

622-2
cont'd

622-1 DOE acknowledges your concern about full cleanup of the contamination at SSFL in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. NEPA strongly encourages agencies to evaluate alternatives and not limit their consideration to one pre-selected course of action. In addition to a No Action Alternative in accordance with the requirements of NEPA, this EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities (see Section 2.2), as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

With respect to your concern about residents in the surrounding communities being exposed for years to hazardous contaminants, please refer to Section 2.7, "Offsite Impacts," and Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for additional information. As discussed in these sections, Area IV is not currently spreading contamination to offsite areas, including offsite groundwater, and each of the alternatives evaluated in this EIS is protective of public health and safety and the environment, both on and off the SSFL site.

Commenter No. 622 (cont'd): Anonymous

To do nothing in the way of cleanup or only partially cleanup the SSFL site is absolutely NOT acceptable. All detectable contamination must be removed as per the 2010 AOC which was agreed to and signed by the U.S. Department of Energy!!

|| 622-1
cont'd

- 622-2 DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," of this CRD for accurate information about contamination in the area around SSFL, including soil testing that has been done and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.
- 622-3 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.
- 622-4 Please note that DOE has no jurisdiction regarding protection of the rocket engine test stands, or the Burro Flats Painted Cave because these resources are not located in DOE administered portions of Area IV or the NBZ. DOE proposes to protect human health without unduly damaging the environment, as reflected in the range of alternatives DOE developed and analyzed, allowing a comparison of impacts among the various resource areas, including cultural resources. Also, please see Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a discussion of the process that will be used to determine exemptions.

Commenter No. 623: Southern California
Federation of Scientists

Dear Ms. Jennings

The Southern California Federation of Scientists attempted to transmit via the DOE SSFL EIS website our comments and exhibits, but there were numerous problems with your website. We kept getting an error message, saying "We're sorry but we have encountered an error processing your request. If the error persists, please contact Site Support." See the screen shot attached of one of the error messages.

We are therefore sending to you the comments and exhibits in the enclosed CD.

623-1

623-1

DOE apologizes for any difficulties you may have had submitting comments through the website. Site support was available to assist with any difficulties as you indicated in your comment. In response to comments about the website, early during the public comment period DOE expanded the capacity of the website to accept longer comments and added the ability to upload entire documents. In addition, multiple means were provided for public comment. Members of the public were invited to attend the public hearings in Simi Valley on February 18, 2017 and Van Nuys on February 21, 2017 to make comments orally or submit paper copies. DOE also accepted comments by U.S. mail.

Federation of Scientists**

Comments of
The Southern California Federation of Scientists
on the
Draft Environmental Impact Statement
for Remediation of Area IV and the Northern Buffer Zone
of the Santa Susana Field Laboratory
April 13, 2017

Introduction

The Southern California Federation of Scientists (SCFS) was founded after the Second World War by former Manhattan Project scientists. It is dedicated to providing scientific assistance on important public problems. In that vein, SCFS has been involved for nearly forty years in efforts to get the contaminated Santa Susana Field Laboratory cleaned up.

SCFS has carefully reviewed the draft Environmental Impact Statement (EIS) issued by the Department of Energy (DOE) for cleanup of the contamination of its parts of SSFL. We reluctantly conclude that it is not a scientifically defensible document. It appears to be more a polemical effort to justify breaking cleanup commitments DOE made. This is part of a long pattern by DOE of contaminating its sites nationwide through poor environmental practices, then resisting cleanup obligations, eventually being forced to enter into legally binding cleanup agreements with states, and then breaking them. We find this very disturbing from a public health and environmental protection standpoint.

An EIS is supposed to be a neutral, fact-driven effort to scientifically assess impacts and ways to mitigate impacts to inform decision-makers as they make decisions within their discretion. This EIS does not meet those requirements. Rather, it appears filled with erroneous and misleading assertions that do not bear scrutiny.

In 2010 DOE proposed and then signed a legally binding agreement (an Agreement on Consent, or AOC) with California to clean up all the contamination at SSFL to background. In 2012 DOE committed that any EIS it might produce would be AOC-compliant, with all alternatives addressing how to achieve the required cleanup, not whether to do so (with the exception of the standard "No Action" alternative). With this EIS, DOE has broken both the 2010 and 2012 commitments.

All alternatives in the EIS violate the AOC ban on consideration of "leave in place alternatives." One would leave in place about half a million cubic yards of contaminated soil; alternatives two and three would leave 90% or more.

The City of Los Angeles, the Natural Resources Defense Council, and the Committee to Bridge the Gap have submitted detailed comments. We share their concerns and join the comments they have made. While some duplication is inevitable, we will here expand on

623-2

623-3

623-2 Please see Chapter 2, Section 2.3.3 of this Final EIS for a detailed discussion of the regulatory and science-based reasoning for looking at alternatives other than compliance with the 2010 AOC, as required by NEPA. Contrary to the commenter's assertion that DOE knew of all the issues when it signed the 2010 AOC, in actuality most of the information on the conditions at the site were not known in detail and the technical issues of implementing the AOC had not been identified. And the statement that "Nothing has occurred since the AOC that provides justification" for DOE's assessment of the implementability of the AOC is not correct. Since the signing of the AOC a lot more information is now available that was not available at that time. Since the 2010 AOC was signed. For Example, EPA completed the radiological characterization of Area IV and the NBZ; DOE completed the chemical characterization of Area IV and the NBZ; radiological and chemical background study reports were completed; and DTSC issued LUT values for chemicals and radionuclides. This wealth of later-acquired information has informed DOE's decision-making during the NEPA process. Chapter 2, Section 2.3, of this EIS outlines several issues associated with the implementability of the 2010 AOC.

623-3 Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent" of this CRD for a discussion of this topic. Subsequent to 2012, as new data became available, DOE considered those data and adjusted its thinking and evaluations accordingly. For example, DOE's knowledge regarding the nature and extent of soil contaminants, and the impact that the cleanup in accordance with the 2010 AOC LUT values would have without environmental benefit, has evolved since the agreement was signed. As contemplated by the AOC, DOE was required to undertake an environmental review, which is this NEPA process. As required by NEPA, DOE has objectively evaluated reasonable alternatives to achieve the goal of site remediation. One of the alternatives evaluated addressed the technical elements of the 2010 AOC (Cleanup to AOC LUT Values). In keeping with its responsibilities under NEPA, DOE also developed two alternatives to the Cleanup to AOC LUT Values Alternative that meet the purpose and need of being protective of the health and safety of the public and the environment.

Regarding the statement that the AOC has a ban on consideration of "leave in place alternatives", Section 2.6 of the AOC recognizes the potential for on-site and in situ treatment of soils. Monitored natural attenuation (MNA) is an in situ treatment option. MNA does not "leave in place" contamination but rather recognizes the destruction of contamination via natural processes and is well-accepted in the environmental field.

Commenter No. 623 (cont'd): Southern California
Federation of Scientists

some of those issues and focus on additional matters. We do need to reinforce some key points as well.

The EIS's History of the Site Understates the Extensive Environmental Problems

A good measure of whether DOE has understood that it must start conducting itself in a neutral scientific manner is whether it can candidly admit its failures in terms of poor environmental and safety practices and potential impacts on its workers and the neighboring public. Unfortunately, the EIS sections dealing with these matters are more spin than accurate description of these failings. The accident descriptions improperly minimize their seriousness. The discussion of the credible years-long studies (government funded, yet performed at arms-length) of increased cancers among the exposed workers and the people living nearby is cavalier. Furthermore, the various state- and federally-funded studies by the SSFL Oversight Panel are nowhere mentioned. We attach several of the key ones.

For the EIS to be credible, DOE needs to admit its failings. The EIS fails to do this.

Purpose and Need Statements are Wrong

The 2012 DOE promise was that the EIS purpose and need were to carry out the 2007 Consent Order for cleanup of groundwater and the 2010 AOC for cleanup of soil to background. DOE has now violated that commitment and its purpose and need no longer say so. Instead, the EIS proposes alternatives all of which violate the AOC. This must be remedied.

The EIS Deals With Matters Far Outside DOE's Discretion

Under NEPA, an EIS is conducted for *discretionary* federal agency actions. The original purpose and need commitments for the EIS were within DOE's discretion – examining alternative ways of achieving the cleanup to background required by the AOC (e.g., active in situ treatment, different transport options). However, the EIS as issued is now almost entirely about matters that are outside DOE's discretion. DOE is legally bound by the AOC. The AOC specifies that DTSC has the regulatory authority over the chemical and radioactive cleanup. And even were there no AOC, the cleanup of the chemicals, which DOE says represents the great majority of the contamination, is solely in DTSC's authority under the Resource Conservation and Recovery Act (RCRA). DOE has no power to choose how much contamination it will clean up. It cannot in fact perform an EIS and issue a Record of Decision based thereon about how much cleanup it will do. It is the polluter and the polluter does not get to choose how much of its pollution it cleans up. The EIS is thus an affront to the authority of the regulator and is about matters DOE does not have authority over.

623-4

623-5

623-6

623-4 DOE's current focus is to complete the cleanup of the remaining contamination in those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. To that end, the current condition of Area IV and NBZ, not the past incidences within Area IV, is relevant. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. Also see Section 2.8, "Cancers and Other Illnesses Near SSFL," of this CRD for additional discussion of cancer within the population near SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

623-5 DOE notes that it does include reference to a SSFL Advisory (Oversight) Panel report (Report of the SSFL Advisory Panel) in Chapter 3, Section 3.9.5 of this EIS. Other topical reports (like those provided by the commenter relating to groundwater) were reviewed in preparing this Final EIS and incorporated as appropriate.

623-6 The specific wording of DOE's purpose and need has been refined since it was first stated in the 2007 Advance Notice of Intent, but the overall message expressed by the statement has remained consistent – DOE needs to remediate those portions of SSFL for which it is responsible in a manner that is protective of the environment and the health and safety of the public and workers. The change noted by the commenter in the statement does not change DOE's responsibility for complying with agreements, as well as with other requirements such as regulations and orders. Please see Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of how DOE's alternatives relate to the 2010 AOC. DOE's knowledge regarding the nature and extent of soil contaminants, and the impact that the cleanup in accordance with the 2010 AOC LUT values would have without environmental benefit, has evolved since 2012. As discussed in Chapter 2, Section 2.3.3.1 of this Final EIS, DOE determined that there were technical issues with implementing a cleanup

Commenter No. 623 (cont'd): Southern California Federation of Scientists

The Alternatives All Violate the AOC, as Well as the 1995 EPA-DOE Joint Policy and DTSC Standard Cleanup Requirements

The AOC requires cleanup to background. Alternative 1 estimates more than 1.4 million cubic yards of soil have been contaminated above the levels promised in the AOC to be cleaned up. Yet DOE proposes to not clean up about half a million cubic yards, 34-39% of the total, just leaving it in place despite the prohibition on doing so in the AOC. None of the reasons given by DOE meet the strict, narrow requirements for exceptions in the AOC. They would leave large amounts of contaminated soil not cleaned up, often in areas of the greatest pollution impacts. This is untenable.

Alternative 2 would replace the AOC's Look-Up Table (LUT) cleanup values with new values created by DOE. These are often hundreds or thousands of times higher than the promised cleanup levels, and would leave vast amounts of contamination not cleaned up. DOE disingenuously asserts these LUT values are based on risk based screening levels (RBSLs) for suburban residential exposures from the DTSC-approved Standardized Risk Assessment Methodology (SRAM). Perhaps DOE presumed no one would check to see if that were true. The SRAM is, after all, a very long document, more than a thousand pages. But on page 1071 and following in the pdf, the RBSLs are given. And the SRAM-based suburban residential RBSLs, with the required garden component, are orders of magnitude lower (more protective) than the ones put forward by DOE in the EIS. The risks of leaving that much contamination in place are thus hundreds and thousands of times higher than DOE claims in the EIS.

Almost the entire premise of the EIS is that there is no risk to not cleaning up SSFL, and so the only impacts to consider are the impacts from cleaning up (e.g., truck traffic). But that is completely incorrect. By using the wrong risk based screening levels, the entire claim of limited risk in the EIS is consequently wrong as well. The cost-benefit analysis, which is similarly based on erroneous risk figures, becomes useless in addition.

Alternative 3 would not only use cleanup standards for chemicals that are orders of magnitude weaker than the required AOC LUT values and the true residential RBSLs, but weaken things even further by using astronomically high cleanup levels for radionuclides, and on top of that, averaging contamination across wide areas. High contamination levels would not get cleaned up, based on the claim that contamination levels acres away are lower. This violates basic scientific and public health principles, EPA guidance, and the AOC.

The proposed radionuclide cleanup levels for radionuclides are extremely high, and grossly non-protective. We attach here tables comparing DOE's Alternative 3 radionuclide cleanup levels with the promised levels, and with EPA's Preliminary Remediation Goals (PRGs) for the scenario DOE claims to be using, suburban residential exposures. We also include tables showing the actual radiation dose estimates for those concentrations DOE proposes, and the cancer risk estimates, from EPA's Dose Compliance Calculator and the PRG calculator.

623-7

623-6

according to the 2010 AOC. As a consequence, and in keeping with its responsibilities under NEPA, DOE developed two alternatives to the Cleanup to AOC LUT Values Alternative that meet the purpose and need of being protective of the environment and the health and safety of the public and workers. These two risk-based alternatives, the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative, are presented in Chapter 2, Section 2.4 of this EIS. As noted in Chapter 2, Section 2.2.1 of this EIS, DOE has indicated that changes to the AOC may be required. Sections 6.0 and 8.0 of the AOC allows DOE and DTSC to agree upon changes to the AOC to better meet cleanup objectives. DOE would engage DTSC in discussions about such changes in order to implement any soil remediation alternative.

623-8

Section 6.1 of the AOC recognizes the legal requirement of DOE to prepare the EIS. DOE must meet the requirements of NEPA, compliance is not discretionary. Also, Section 6.2 of the AOC recognizes that DOE is to perform an environmental review that could lead to a change to the AOC. NEPA is the correct legal process to perform that review. NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs that analyze the potential environmental impacts of the Proposed Action and reasonable alternatives that meet the agency's purpose and need. DOE has a legal obligation in this EIS to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. In addition, as discussed in Chapter 1, Section 1.3 of this EIS, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision(s) (ROD[s]) pursuant to NEPA. DOE recognizes that the 2010 AOC is a legally binding agreement with the DTSC and that DTSC has regulatory authority over aspects of DOE's cleanup of Area IV and the NBZ. In accordance with the 2010 AOC, Section 7.11, "Compliance with Applicable Laws and Regulations," all actions taken by DOE pursuant to the order will be undertaken in accordance with applicable local, State, and Federal laws and regulations. This clause recognizes that DOE must comply with NEPA as do Sections 6.1 and 6.2 of the AOC. Section 6.1 acknowledges DOE's obligation to prepare an EIS and ROD pursuant to a court order. Section 6.2 recognizes the need to complete an environmental review that meets the requirements of the court order.

623-9

The EIS itself is not a decision document, it only analyzes potential impacts of the proposed action and alternatives that meet the agency's purpose and need. This EIS

Commenter No. 623 (cont'd): Southern California
Federation of Scientists

The numbers are disturbing. DOE's proposed cleanup standards for some key radionuclides are hundreds of thousands of times higher than the EPA PRGs for suburban residential exposures. They produce risks hundreds of thousands of times higher than the one in a million (10^{-6}) excess cancer risk DOE claims its alternative proposals would meet. Some of those risks are as high as every third person getting a cancer they would not otherwise have gotten had they not been exposed. The radiation doses estimated by the EPA dose calculator for those concentrations are the equivalent of thousands of chest X-rays a year, year after, from conception until death. (As shown in material attached, a chest X-ray is about 2 millirem, or 0.02 mSv. The dose from the proposed cleanup levels for a true suburban residential exposure according to EPA's dose calculator would be thousands of millirem per year for a number of the radionuclides.)

The entire basis of DOE's claim that it can walk away from cleaning up the contamination is predicated on cleanup standards so high, so non-protective, that they would be automatically dismissed if they were candidly disclosed in the EIS. But of course they are not. Only people deeply versed in the field would understand that a proposed cleanup standard of 1200 picocuries of strontium-90 per gram of soil, as put forward by DOE, is immense, and that the EPA PRG by contrast is 0.00361 pCi/g—more than 300,000 times more protective than DOE's proposed standard.

At the core of DOE's sleight of hand is its claim that it would clean up to suburban residential standards based on the SRAM and EPA's PRGs, when in fact it has left out the key component required by both: the backyard garden. By leaving it out, they propose cleanup standards orders of magnitude weaker than normally required. There is no logical basis for this action, and DOE buries the omission in a couple of footnotes and then repeatedly in the EIS claims it is proposing cleanup to suburban residential standards, without disclosing that it is not really doing so.

One can understand that if a Responsible Party hopes to get out of obligations that it might try such tactics, but they are distressing from a governmental agency, particularly when people's lives are at stake. Whatever the end uses of SSFL—and that use remains uncertain and EPA and DTSC procedures require cleanup to the uses allowed by local zoning and General Plan designations, which here allow residences with gardens as well as allow agriculture—people live near SSFL, and they have backyard gardens, and there is also agriculture. They must be protected.

One of the main deficiencies in the EIS is that there is no analysis of offsite impacts to the public from not cleaning up the contamination. The only impacts analyzed are of impacts from cleaning up (e.g., trucks).

Alternative 3 is called "Conservation of Natural Resources." This is remarkable, in that conserving the natural resources is the opposite of what this alternative would accomplish. After polluting those natural resources for decades, DOE now tries to use them as an excuse to not remediate the pollution of those very ecological features. The DTSC-approved SRAM established ecological risk based screening levels (Eco RBSLs), to protect ecological receptors. The EIS fails to disclose those Eco RBSLs, or to compare the cleanup levels it

623-9
cont'd

623-10

623-11

623-12

analyzes an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In response to public input received, and consistent with its obligations under NEPA, DOE also analyzed alternatives that are based on risk to human health as well as the protection of natural resources. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ.

DOE will issue a ROD(s) for this EIS no sooner than 30 days after the EPA Notice of Availability for this Final EIS is published in the Federal Register. The potential environmental impacts presented in this EIS, along with public input, cost, policy, and other factors, will be considered by DOE decision-makers in selecting alternatives for soil remediation, building demolition, and groundwater remediation.

As discussed in Chapter 1, Section 1.9.2, of this Final EIS, DTSC is currently preparing a program environmental impact report (Program EIR) under CEQA that applies to cleanup of the entire SSFL; the Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DTSC is expected to issue a Notice of Determination for the Program EIR identifying their selected remedial actions. Once this is done DOE and DTSC would conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination. This process does not result in DOE getting to "choose how much of its pollution it cleans up," but rather results in DTSC and DOE making informed decisions.

623-7 The AOC allows for in situ treatment, and this treatment option is only addressed for soil containing low concentrations of TPH and that contain no other contaminants. The exemption (exception) process presented in the Draft EIS was developed during a series of meetings attended by US Fish and Wildlife Service, California Department of Fish and Wildlife, and California DTSC personnel. Both USFWS and CDFW issued letters concurring with the process. The Draft EIS presented the outcome of those meetings. The comment is in error with the statement that the AOC has "strict and narrow requirements for exceptions". The AOC has no stated "strict and narrow requirements" for biological and cultural exceptions, except the overall requirement that DOE and DTSC comply with all Federal, State, and local laws and regulations in conducting cleanup. (One category of exceptions, unforeseen circumstances, does have

Commenter No. 623 (cont'd): Southern California Federation of Scientists

proposes to those values. If it did so, it would have to disclose that the contamination levels it proposes to leave in place, in violation of the AOC, are orders of magnitude higher than the EcoRBSLs. In other words, the alternative that DOE, in an Orwellian fashion, claims is to protect natural resources would in fact continue to expose ecological receptors to toxic materials hundreds of times higher than the levels determined to put them at risk.

The EIS is Largely a Polemic Attacking the Agreement DOE Proposed and Signed

An additional indication of DOE's efforts to use the EIS as a polemic to support breaking its legally binding commitments rather than a scientific document to inform decision-makers how to protect the environment and public is that the arguments given as to why the AOC should be broken are trivial, erroneous, and/or misleading. We discuss these in significant detail in the attachment. Suffice it to say that none of the claims is meritorious. Nothing new has occurred since the AOC that provides the justification. The assertions do not bear scrutiny.

Inflation of Soil Volume Estimates, Truck Impacts

As part of the polemical attack on the AOC it signed, DOE has markedly inflated its estimates of soil volumes that would need to be transported. SCFS has criticized these unscientific assumptions in our scoping comments, attached hereto. Virtually all of the problems we identified remain (with the possible exception of the fluffing issue). For example, if a soil sample near the surface was found to be contaminated, DOE often assumed all soil down to bedrock would have to be removed, even if there was no evidence of the entire soil column being contaminated. Similarly, if a soil sample at one location showed contamination, DOE would often assume all soil laterally from that location would have to be removed, all the way to where the soil ended at a bedrock outcropping. Through such clearly unsupported assumptions, almost all designed to greatly increase the soil estimates, DOE essentially colored in all of Area IV as needing cleanup.

If indeed DOE contaminated all of Area IV, then its environmental mismanagement was even greater than previously realized and the need for the promised full cleanup is even greater than before. DOE can't have it both ways - claiming far more contamination than previously disclosed while arguing for far less cleanup than it promised.

Failure to Examine Reasonable Transport Alternatives

DOE refuses to consider any options to minimize impacts of transport. There are roads leaving from Area IV going north that could readily be upgraded and allow trucks to travel passing far fewer homes, if any, compared to the routes DOE puts forward. And the option of using a covered conveyor system of the sort frequently used in mining and similar operations is not examined at all. It could cut the cleanup time down to a year or so. Similarly, DOE considers only trucking the waste 60 miles to a yet-to-be-opened train location 60 miles away, while refusing to consider using the rail line that is a mile or so from SSFL. Rail could greatly reduce a whole range of impacts, including greenhouse gas emissions and trucks through neighborhoods, while also saving a good deal of money. It

623-12
cont'd

623-2
cont'd

623-13

623-14

a limit of 5% of the total soil cleanup volume. In this EIS, DOE has not used this category to identify areas in which the exemption process would be applied.) Please refer to Sections 2.2, "Compliance with the 2010 Administrative Order on Consent," and 2.4, "Applications of Exemptions Under the 2010 Administrative Order on Consent," of this CRD for additional information.

The 2010 AOC identifies three of exceptions. The first two (ones that DOE has applied in the identification of areas in which the exception process would be applied) are the exemptions for protection of biological and cultural resources. This exemption is based on the Biological Opinion provided by USFWS (see Appendix J), consultation with CDFW, and an agreement with the State Historic Preservation Officer. The 2010 AOC has no limitations on what these three entities determine should be protected. The volumes in this EIS are based on consultation with the three entities. The third exemption is for "unforeseen circumstances." DOE has not identified any locations meeting the "unforeseen" definition and did not use this exemption in the EIS. As discussed in Chapter 2, Section 2.3.2, of this Final EIS, soils within the boundary of an exemption area that have higher concentrations of chemicals or radionuclides (above human health or environmental Risk Based Safety Levels [RBSLs]); that is, those that pose a risk to human health or to plants and animals, would be subject to focused removal actions.

623-8 The statement that the Revised AOC LUT alternative includes "values created by DOE" is not correct. In the Draft EIS, DOE incorporated RBSLs values from the SRAM for the suburban resident (without garden) exposure scenario. The RBSLs were developed under DTSC oversight and approved by DTSC for use at SSFL. The assertion that the SRAM requires a "garden component" is incorrect. The SRAM includes RBSLs for multiple scenarios including the suburban resident, with and without the garden pathway. A garden pathway was not used in the RBSLs for the EIS, as residential development with garden was not a future land use for the SSFL property when the Draft EIS was developed, and it is now prohibited. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. Therefore, the use of the selected RBSLs in this EIS is consistent with the future land use as open space.

Commenter No. 623 (cont'd): Southern California
Federation of Scientists

6

appears DOE is doing everything it can to argue why it shouldn't meet the obligations it made in the AOC for a full cleanup, instead of doing a scientific EIS that tries to identify ways to mitigate impacts to the extent possible.

623-14
cont'd

Offsite Contamination

Last year, DOE informed DTSC that it had found contamination that had migrated off SSFL and onto the neighboring Brandeis Bardin Institute, a children's camp abutting SSFL, at levels exceeding the AOC LUT values. It estimated under the AOC, DOE would have to clean up as much as 1 acre because of the contamination. A copy of the DTSC administrative draft EIR chapter with this revelation is attached. However, there is no mention of this in the DOE EIS. The AOC requires following plumes offsite if they exist and remediating them. This should be explicated in the EIS.

623-11
cont'd

Groundwater Contamination

The 2010 AOC and the 2007 Consent Order require cleanup of groundwater. Instead, the EIS contemplates not cleaning it up, just leaving it in its contaminated state and hoping some of the contaminants eventually attenuate. This violates the Orders and protection of public health and the environment.

623-15

The EIS didn't include groundwater as part of the risk assessment, asserting that wells produce only 0.5 to 1 gallon per hour, too little for domestic consumption. Yet the report they cite doesn't support that claim, instead giving well production rates as high as 4.35 million gallons per year, clearly enough for domestic use. Indeed, supply wells at the site produced water for extensive site use, including drinking water, until contamination in the wells was finally recognized and their onsite use discontinued.

623-9

There is no risk assessment for the water, whether drunk, used for agriculture, backyard garden, or other uses, and no assessment if the plume migrates further offsite. The groundwater clearly can be used, and in fact is a beneficial water source, and refusal to clean it up would violate the Orders and the requirement to protect such sources.

623-16

It is not clear tritium levels are indeed diminishing, rather than sources with higher concentrations leaching more tritium in. Well RD 90, for example, is essentially unchanged from 2010-2014, at 2 x MCL; CDM Smith 2015 PDF p. 59. The California Department of Health Services did a study some years ago noting that tritium levels were not degrading and in some cases going up. There is no basis for asserting that in 12 years it will be at the MCL.

623-17

And other contaminants clearly can continue to migrate and contaminate groundwater and surface water. Surface water discharges continue to violate the site's NPDES discharge permit. And as Dr. Tabidian's study demonstrates, other contaminants like perchlorate appear to have migrated from SSFL into Simi Valley, contaminating groundwater and a significant fraction of wells there.

623-18

623-10

In the Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that local residents may get some portion of their food from a home garden.

The EIS does not state "that there is no risk to not cleaning up SSFL". The existing risk posed by soil in Area IV is presented in Chapter 4, Section 4.9.2.1, of the Final EIS and the manner in which that risk is reduced is presented in Appendices G and K. As stated above, the correct RBSLs were used to assess the risk and the Cost Benefit Analysis provides a depiction of the risk reduction by alternative.

The commenter is also wrong in the assessment of Alternative 3 "violates basic scientific and public health principles" and "EPA guidance". Alternative 3 is based on EPA guidance and follows the processes EPA uses nationwide and DTSC for sites throughout California. The Conservation of Natural Resources (the commenters Alternative 3) would first remove soil with elevated concentrations of radionuclides and chemicals and then assess remaining risk to verify a cleanup to risk-based standards. In no instance would "high contamination levels" not be cleaned up. Averaging of data is not performed "across wide areas" (DOE used 2.5 acre lots for the analysis) and high concentrations at one location are not averaged with data "acres away".

The radionuclide cleanup levels are consistent with the future land use. DOE does not propose in the Final EIS radionuclide cleanup standards based on dose. DOE instead has conducted a risk-assessment based approach for soil remediation. DOE notes that the methodology used in the cleanup evaluation for the Conservation of Natural Resources Alternative in the final EIS results in dose estimates that are in a range that is consistent with the CERCLA target risk range. Please see the response to comments 623-99 relative to applicable pathways, 623-110 relative to EPA CERCLA requirements, and 623-55 relative to risk limits. The exposure pathways assumed to be applicable in the draft were clearly delineated in both the text discussion and footnotes of tables in Chapter 4, Section 4.9 of the draft EIS and in the text discussion and footnotes of Appendix G along with the rationale for selection. The use of the term Suburban Residential was used to be consistent with the SRAM which separately used the term and provided separate RBSLs for both the direct pathways and the garden pathway.

The basis for cleanup of a contaminated site is not always based on "local zoning and General Plan designations", as both are subject to change. EPA guidance for conducting a risk assessment and soil cleanup does not state that risk should be based solely on zoning rules. EPA's Risk Assessment Guidance for Superfund, Part A (EPA 1989) states that in identifying future land use one should "determine possible alternate

No Analysis of Remedy for the Sodium Burnpit and the Landfill

For decades, DOE illegally burned radioactively and chemically contaminated waste in the sodium burnpit. This caused extensive contamination of soil, bedrock, surface water and groundwater.

Twenty years ago, an "interim measure" was conducted to remove some of the contaminated soil. Other soil was placed on top of it thereafter as a "temporary cap" until a permanent remedy was carried out. A study by Dr. William Bianchi (attached) demonstrated that moisture readily could penetrate that temporary soil layer.

Nowhere in the EIS is there an analysis of a final remedy for the remaining contamination in the sodium burnpit.

Similarly, the Area IV landfill contains contaminants buried therein. It was long promised that the landfill would exhumed and the contaminants removed. Again, there is no analysis in the EIS of the landfill and its remediation.

Improper Comparison to Other Sites

In support of its effort to break its SSFL cleanup commitments, DOE points to two other sites, that it claims have less protective cleanup standards. This, of course, is not much of an argument; another site doing a poor job of cleanup does not justify DOE doing the same or breaking the AOC it signed. But it cherry-picked those two sites, leaving out others that are being cleaned up to background or to true unrestricted residential standards. And even with those two, it misrepresents the situation. Hunters Point is a very controversial site, with substantial concern because it failed to follow EPA guidance in setting cleanup standards and then employed Tetra Tech which was found to have fabricated soil measurements. But Hunters Point doesn't really support DOE's argument; radioactivity there, for example, is being cleaned up to EPA PRGs for suburban residential use with a garden (albeit outdated PRGs), levels far, far lower than the radioactivity cleanup levels DOE is proposing for SSFL in its Alternative 3. Furthermore, the other site to which DOE points, McClellan Air Force Base is being restricted to industrial uses and the cleanup standards set accordingly. So comparing DOE's proposed supposed residential standards at SSFL to restricted industrial standards at McClellan is an apples and oranges problem. Even so, many of the cleanup standards at McClellan, including those DOE chose not to disclose, are comparable to the LUT values and more protective than what DOE proposes for SSFL.

Conclusion

Dr. Steven Chu, the Nobel Prize winning physicist then serving as Secretary of Energy, and Dr. Inez Triay, then the Assistant Secretary for Environmental Management, proposed to the State of California that DOE commit to cleaning SSFL to background. DOE then signed a legally binding agreement with California to do precisely that.

623-19

623-20

623-21

future land uses based on available information and professional judgment." In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. Consequently, residences with gardens or agriculture are not reasonable future land uses and open space (i.e., consideration of a recreational user) is the appropriate future scenario for performing a risk assessment.

In the Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that offsite local residents may get some portion of their food from a home garden.

623-11 In the Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that offsite local residents may get some portion of their food from a home garden. DOE had made DTSC aware of sample results much earlier than last year. AOC LUT values are not risk based, exceeding a LUT value does not pose a risk for most chemicals. DTSC concluded in its review of the data that "While the sediment sample results are above LUT values, they do not pose a threat to human health or the environment." The low concentrations of contaminants in this sediment do not pose a risk to users of the Brandeis property.

Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

623-12 The "Conservation of Natural Resources" alternative conserves the natural resources by removing soil contamination that would exceed human health and ecological standards, thereby protecting resources from contamination. It conserves the resources by not impacting land that exhibits low concentrations of contaminants that do not pose a risk. This Final EIS (Section 4.5.1.4) was revised to incorporate soil cleanup based on ecological risk considerations into the Conservation of Natural Resources Alternative. DOE used a risk-based approach in which soil is removed where it represents a risk to human health or ecological resources as determined by the application of risk assessments utilizing both human health RBSLs and ecological risk-based levels (as defined in the SRAM [MWH 2014]). In some locations within Area IV, the results of the human health and ecological risk assessments determined that soil cleanup levels would be primarily based on ecological considerations.

Doctors Chu and Triay are no longer at DOE. Those who are now are trying to breach the agreement and commitments made. There is no scientific basis to do so. Indeed, virtually all the new acts DOE says have since then been revealed—particularly that there is much more contamination at SSFL than previously believed—support more rather than less cleanup.

An EIS is to be a neutral, scientific document. This EIS sadly does not meet those standards. Instead it appears a political document, trying to provide cover for efforts to break solemn cleanup promises.

At the core of the EIS is the erroneous assertion that there is no risk, to public health or ecological receptors, of leaving the contamination not cleaned up, whereas there is inconvenience and cost to clean up as promised. However, the claims about risk are based on misrepresenting the risk based screening levels for human health, and by failing to even use risk based screening levels for ecological receptors. They are also based on improperly averaging and numerous other errors.

DOE has a long history of cutting environmental corners. That is what led to the contamination of SSFL and so much of the rest of the DOE national nuclear complex. A few years ago, DOE promised to change course, at least with regards SSFL, and committed to a full cleanup, in a legally binding agreement. Efforts to renege on those commitments must be reversed.

DOE has no authority to decide to not do the promised cleanup. The entire premise of the EIS, that the decision DOE is to make is how much of its pollution to remediate, is wrong. That power does not rest with DOE. The decisions that DOE purports in the EIS to be preparing to make are not in its discretion.

SCFS strongly opposes the EIS and all efforts by DOE to violate the AOC and its commitments to a full cleanup.

Our detailed comments, tied to specific parts of the EIS, are attached, as are supporting documents.

- The Final EIS includes within the Conservation of Natural Resources – Open Space Scenario, an assessment of ecological risks, which includes ecological RBLSs.
- 623-13 The volumes in the Draft EIS have a sound engineering basis. DOE used the GIS (geographic information system) database for Area IV to identify on a point-by-point basis, any sample location that had an exceedance of a LUT value (radionuclides published by DTSC on January 30, 2013 [DTSC 2013a] and chemicals on June 11, 2013 [DTSC 2013b]). The GIS system was then used to mark the locations of exceedances, map the extent of exceedance, develop areas and depth of exceedances, and then the calculation of the soil volume exceeding the LUT values. The depth of soil to be removed was determined by the deepest sample exceeding a LUT value or depth to bedrock (if all samples to bedrock exceeded LUT value) while the lateral extent of the soil to be removed around each sample was based on several factors as identified in Appendix D.
- Since the Draft EIS was prepared, DOE has independently recalculated the estimate of the soil volume associated with cleaning up to the 2010 AOC LUT values. Based on the characterization data and recognizing the shallow soil depth over uneven bedrock across Area IV and the NBZ, DOE is not as uncertain about the upper limit of the soil volume estimate as it was at the time the Draft EIS was prepared. DOE's intent is not to alarm people, but it is true that the more soil removed from a remediation site, the larger the transportation effort (i.e., a larger number of truck trips) that would be required. DOE has not "contaminated all of Area IV" as the commenter alleges. Much of the observed "contamination" is TPH above 5 parts per million. DTSC has recognized based on the results of the soil treatability study that this is most likely naturally occurring organic matter, not TPH.
- 623-14 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response. Since the publication of the Draft EIS, DTSC has published, in September of 2017, the Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California (DTSC 2017b), which includes a draft transportation study. The transportation related conclusions of the EIR are summarized in Chapter 2, Section 2.2.4, of this EIS. Both this EIS and the DTSC's Program EIR address the alternatives suggested by the commenter. As noted in Chapter 2, Section 2.2.4, of this EIS, the Transportation Feasibility Analysis (App J of the DTSC Program EIR) concluded that transporting soil by truck using the Woolsey Canyon Road was the most technically feasible and least environmentally impactful option for the transport of soil from SSFL and backfill to SSFL.

Detailed Comments by Southern California Federation of Scientists

Chapter 1

1.0 This section misstates the NEPA requirements

NEPA applies only to *discretionary* agency actions. DOE has no discretion over how much of the contamination in Area IV and the NBZ it must clean up. That is dictated by the AOC and by DTSC. The entire purpose of the EIS is erroneous and outside of NEPA.

DOE says the EIS is designed to provide information to DOE decision makers as to what cleanup they will choose to conduct, but DOE personnel have no power to decide how much cleanup they will do.

This section admits that the majority of the contamination is from chemicals. However, DOE has zero authority to decide how much of the chemical contamination to clean up. Under RCRA, DOE is merely a regulated entity, subject to the regulation of EPA, or in the case of a state such as California where that authority has been delegated. RCRA contains a waiver of sovereign immunity by federal agencies such as DOE. In short, even in the absence of an AOC, DOE has no discretion as to how much of its chemical contamination to clean up; that rests solely with its regulator, DTSC.

However, there is a legally binding AOC, which mandates how much of the chemical and radioactive contamination must be cleaned up (all, with very narrow exceptions) and prohibits certain alternatives (i.e., no leave in place alternatives shall be considered). Again, DOE has no discretion, about either the radioactivity or chemicals. The AOC binds DOE to its terms and to DTSC as the regulator.

The only aspect of the cleanup about which DOE might have some discretion is *how* to achieve the required cleanup to background, not *whether* to comply with the AOC and DTSC's RCRA direction. It might also have some discretion about transportation alternatives (routes, conveyances). This is what DOE promised in 2012 would be the scope – not whether to clean up to background, as required, but how. However, the very purpose of the EIS as put forward by DOE now violates that promise, violates the AOC, violates RCRA, and is at variance with NEPA.

In summary, the EIS addresses almost entirely matters that are not in DOE's discretion in the first place, at variance with NEPA's fundamental purpose, and violates the AOC and past DOE promises.

The section also ignores the central cleanup requirement, the AOC

Strikingly, DOE fails to mention the AOC, which is the binding requirement for the cleanup. It mentions NEPA and DOE implementing regulations and the District Court decision, but what controls the cleanup is the AOC. This silence, except for a few tiny references buried elsewhere

623-15 The commenter is in error with the statement that the “EIS contemplates not cleaning” up groundwater. As described in Chapter 2, Section 2.6.3 of the Draft EIS, DOE assessed active groundwater remedies, including pump and treat, soil vapor extraction, and removal of the strontium-90 source. Further DOE evaluated monitored natural attenuation for locations with low concentrations of contaminants that have a history demonstrating decreasing concentrations over time (e.g., the Metals Clarifier TCE plume and the tritium plume).

These alternative remedies are fully within the purview of the 2007 Consent Order. As noted in Chapter 2, Section 2.6, of this EIS the groundwater cleanup standards are risk-based, meaning the concentrations of any contaminants remaining in groundwater following remediation will pose an acceptable risk to future groundwater users. Also, note that DTSC, in its Program EIR, considered monitored natural attenuation for some groundwater plumes.

At this time, DOE is using promulgated maximum contaminant levels (MCLs) as the cleanup goals for groundwater.

623-16 A groundwater risk assessment was not performed at DTSC's request because at the time of publication of the Final EIS, the scenarios under which exposure could occur were still under development. As long as impacted groundwater remains within the boundaries of SSFL, and computer models show that to be the case, there is no potential for exposure to groundwater on site. (The open space use of SSFL guaranteed by the two Grant Deeds of Conservation Easement and Agreements (conservation easements) prohibit any receptor/activity that would use groundwater on site.) Without a receptor, there cannot be a risk.

DOE recognizes that there have been times in the past that some wells have been more productive than others. However, those times coincide with wet rainfall periods. During the more recent drought years, wells that had once been productive, were either dry or produced much less water. Wells that once produced 200 gallons per day, now produce 20 gallons. And it is much easier today to pump wells dry. In order to supply water for domestic purposes the wells must provide a reliable water supply during all rainfall conditions. Such is not possible with Area IV of SSFL.

623-17 DOE has performed additional groundwater investigations and reported the results in the Draft RCRA Facility Groundwater Remedial Investigation Report, Area IV, Santa Susana Field Laboratory, Ventura County, California (CDM Smith 2018a). Chapter 3, Section 3.4 of this Final EIS was updated with information from the draft groundwater

623-6

623-23

Commenter No. 623 (cont'd): Southern California Federation of Scientists

in the EIS (which generally do not acknowledge that DOE cannot change the AOC absent approval from its regulator, DTSC), pervades the EIS and is a fundamental flaw.

Essentially, the EIS pretends that DOE has the discretion to choose any level of cleanup it wishes, and ignores both the legally binding nature of the AOC and the fact of DTSC authority.

The EIS assertion that contaminants are concentrated near certain facilities undercuts DOE's improper use of averaging

This section also makes the assertion that contaminants "are concentrated near certain facilities, rather than being evenly distributed across the site." This statement undermines DOE's efforts to average contaminants and purported risk over large areas, as much as 100 acres.

At the same time, the statement seems to contradict DOE maps in the EIS. It claims essentially all of Area IV and the NBZ is contaminated, part of what appears an effort by DOE to inflate the soil volume and truck estimates to create an argument for not cleaning up all the contamination, as promised in the AOC.

1.1 The Purpose and Need for Agency Action Statement is Inaccurate and Improper

In its 2012 scoping statement DOE expressly stated

*What is DOE's "purpose and need" for action?
DOE needs to complete cleanup of Area IV and the Northern Buffer Zone in compliance with regulations, orders and agreements, including the 2007 Consent Order (groundwater) and the 2010 Administrative Order on Consent (soil).*

But now in its EIS, DOE has dropped the last phrase, indicating, as is indeed the case, that it intends to breach the AOC.

The second sentence in the EIS purpose and need section mentions in passing "orders and agreements" but does not directly cite the Administrative Order on Consent.

The third sentence claims that the purpose and need is "to clean up the affected environment in Area IV and the NBZ in a manner that is protective of the environment and the health and safety of the public and workers." (emphasis added). But that is not the purpose and need for agency action. It is to comply with the requirements of the AOC and the directives of its regulator, DTSC, which are to clean up to background. The AOC bars a supposed risk-based cleanup. DOE acknowledged all this in its 2012 scoping document, but now breaches it.

p. 1-3 The EIS asserts even though no NEPA review was conducted for any of the prior decommissioning and related activities, this was legal, pursuant to categorical exemptions. This

**623-23
cont'd**

623-24

623-25

623-26

remedial investigation report, including information on the magnitude and extent of the existing groundwater contamination plumes in Area IV and the NBZ. The report is included as a reference for this Final EIS and is available for review on DOE's website.

The commenter is incorrect in its statement that tritium concentrations 2010-2014 are essentially unchanged. As described in Section 3.4.3.6, of this Final EIS, and provided in the table below, the tritium concentrations in groundwater are decreasing. DOE is also not aware of a California of Health Services study that concluded tritium concentrations were not decreasing.

Well	2010	2014	2016	2018
RD-90	41,000	40,000	37,200	31,600
RD-95	59,700	28,000	27,400	31,000

623-18 There have been no violations of stormwater limits from the Area IV outfalls in recent years. (Although there have been two exceedances for iron and one for toxicity from an outfall shared between multiple areas, including Area IV.) Perchlorate is found at concentrations near its MCL at the Former Sodium Disposal facility and off-site wells do not show its presence. Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

623-19 The Former Sodium Disposal Facility was operated in compliance with the rules of its day. When the rules under RCRA changed, the operation was shifted to the Hazardous Waste Management Facility. The prior removal actions at the facility have addressed all surficial contamination. There is no "extensive contamination" today. What remains today are solvent wastes that lay at the bedrock interface below ground surface. In Section 4.4 of the EIS, DOE assesses pump and treat, enhance pump and treat, and soil vapor extraction as potential remedies for the Former Sodium Disposal Facility. The Building 56 landfill was primarily used for the placement of bedrock excavated to create a basement for a proposed building. It was used secondarily for the placement of drums and building materials. All waste materials have been removed from the landfill site. DOE is not aware of any promises made specific to the landfill that the "landfill would be exhumed and the contaminants removed." DOE proposes to address all contaminated areas in Area IV, including the landfill, per the issues each area presents to human health and the environment.

623-20 When asked by the community to provide examples of facility cleanups in California similar to SSFL, DTSC presented both of these facilities as examples to the community. It was on this basis that DOE selected McClellan AFB and Hunters Point as

Commenter No. 623 (cont'd): Southern California
Federation of Scientists

3

is false. These activities required NEPA review and did not get it. Artificial segmentation is illegal under NEPA.

The EIS very misleading states that operating research reactors and conducting nuclear research resulted in *some localized* [emphasis added] releases of chemicals and radionuclides to the soil, bedrock, and groundwater.” This is indicative of a fundamental failure in the EIS – the inability to be honest about the contamination DOE created. The statement is directly contradicted by the EIS itself, which asserts that almost the entirety of Area IV is contaminated.¹ (The LUT values are set at levels that are above background, i.e., anything above them is higher than would have been there had DOE not contaminated the site.) Additionally, DOE claims it contaminated 1,413,000 cubic yards of soil (p. 2-20), a very large amount. DOE can’t have it both ways. If there are only “some localized releases,” then cleanup is a modest undertaking. If on the other hand it contaminated almost all of Area IV and vast volumes of soil, as it also asserts, then the releases are not “some localized” releases.

This points to a central failure of the EIS—it is more a piece of propaganda to try to buttress DOE’s efforts to break the AOC and its commitments to a full cleanup than it is an honest and accurate environmental assessment. On the one hand, DOE wants to claim there is very little contamination; on the other hand, it inflates the level of contamination to argue that cleaning it all up would require large numbers of truck trips, etc. An EIS is supposed to be an honest environmental assessment – a work of science. It is not supposed to be a piece of PR. That is what this EIR appears to be.

p. 1-4 inaccurately describes the origins and contents of the EA and the subsequent lawsuit that found DOE had violated NEPA. Concerned that DOE was conducting all of its closure operations at SSFL with zero NEPA coverage, then-Senator Barbara Boxer repeatedly complained that this violated the law. NGOs made similar complaints, and filed FOIA requests that resulted in the disclosure that DOE was essentially naked in terms of NEPA coverage. Given those external criticisms, DOE decided to perform some NEPA review – an Environmental Assessment, a lesser level of analysis – and issued the EA.

The EA proposed to leave behind, not cleaned up, 98 or 99% of the radioactive contamination DOE estimated at the site. US EPA and numerous others heavily criticized it. The City of Los Angeles, the Natural Resources Defense Council, and the Committee to Bridge the Gap filed suit, which was successful. The judge issued a stinging rebuke of DOE. None of this is disclosed in the EIS. The EIS should be rewritten to accurately describe this history.

The Conti Order was issued in 2007. A decade has passed without DOE preparing the EIS. DOE simply dragged its feet. This should be disclosed in the EIS finally issued.

The statements about the 2007 Consent Order are misleading. Groundwater is not to be cleaned up to risk assessment levels but to Maximum Contaminant Levels (MCLs) from the Safe Drinking Water Act. Furthermore, DOE’s characterization of cleaning up to risk assessment

¹ See, e.g., Figure 2-1, Extent of Radiological and Chemical Constituents Above AOC Look-up Table Values.”

623-26

623-27

623-28

623-29

comparative sites. Table D-6 provides a comparative table of soil cleanup values for SSFL RBSLs, Hunters Point, and McClellan AFB vs. AOC LUT values. While the selected remedy at McClellan was to an industrial/commercial standard, the McClellan ROD provided evaluation of both industrial/commercial and residential cleanup levels. The values cited in Table D-6 are for unrestricted use based on a residential exposure scenario that included an ingestion of homegrown produce pathway. The Hunters Point values are also for a residential exposure scenario including ingestion of homegrown produce.

623-21 DOE is committed to a safe and effective cleanup of Area IV and the NBZ. Regarding the new information about contamination at SSFL (Area IV), the characterization efforts of EPA and DOE revealed that the site was not extensively radioactively contaminated as many believed, but concentrations of chemicals exceeding the AOC LUT (background) values are more widespread. If human health risk is considered and RBSL values are employed as cleanup criteria, the areas (and soil volumes) needing to be remediated are much smaller than that needing cleanup using the AOC LUT values as cleanup criteria. This is shown in Chapter 2, Figures 2-3, 2-5, 2-6, and 2-7 and Table 2-5 of this Final EIS.

DOE disagrees that all of the alternatives violate the AOC and basic principles of environmental remediation. Refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD, which describes how the Cleanup to AOC LUT Values Alternative incorporates the technical elements of the 2010 AOC, using the AOC LUT values as the basis for a cleanup to background or levels based on laboratory capabilities (AOC LUT values). This section also discusses the two alternatives that take into account future land use and human health and ecological risks based on use the application of risk-based screening levels.

623-22 The commenter is mistaken. Nowhere in the EIS does DOE assert “that there is no risk, to public health or ecological receptors”. The EIS concludes otherwise. The EIS identifies locations across Area IV that need to be cleaned up due to predicted risk to human health. The exemption process presented in the EIS identifies locations that need to be cleaned up to protect ecological receptors. The ecological risk process is described further in Section 4.5 of this Final EIS, and the Biological Assessment. The commenter is again wrong in how DOE conducted the risk analysis. The risk analysis was performed per EPA guidance in which averaging is the normal practice [*Supplemental Guidance to Risk Assessment Guidance for Superfund: Calculating the Concentration Term*. Publication 9285.7-081 (EPA 1992)] Please see the response to comment 623-103.

Commenter No. 623 (cont'd): Southern California Federation of Scientists

levels leaves out the fundamental requirement—which is that DTSC and EPA require those risk levels to be based on the land uses allowed under local zoning and general plan designations, which for SSFL are agriculture and also residential (with garden). Even were there no 2010 AOC, DOE is violating the 2007 Consent Order by attempting to claim it is doing risk assessment levels when the risk based levels it purports are orders of magnitude higher than the true risk levels allowed for SSFL land use.

The box on p. 1-4 further misstates the 2007 Consent Order. It states that the 2007 Consent Order requires cleanup to a future residential land use. This is false. There is no such statement in the Consent Order. It merely requires cleanup pursuant to DTSC’s procedures, which in fact defers to local zoning and general plan designations, which as indicated above, includes agricultural uses, the most protective of cleanup standards. DOE tries to get around this by saying that other plausible receptors were also identified, though the example it gives is of a lesser receptor, recreational, not the one that requires the actual major cleanup, agricultural. The statement is very misleading. Nowhere in the Consent Order does it say clean up to residential standards. And even if it did, DTSC’s risk assessment methodology (which covers agricultural as well), includes the backyard garden component of the residential scenario, which DOE refuses to include in the EIS, thus violating the 2007 Order, even if one accepted as true DOE’s claim that the Order is based on the residential scenario.

P. 1-5 misrepresents by not explaining why the state did not support listing on the NPL. It was because the state had concluded under its own procedures a cleanup that was as protective or more protective than EPA would impose under CERCLA would be required. It wasn’t, as implied in the paragraph, that the state didn’t think the site was that badly contaminated as to qualify for Superfund, the most contaminated sites in the country. To the contrary, the EIS should disclose what the Superfund listing recommendation meant – it meant EPA had concluded there was significant evidence that this is one of the most polluted sites in the nation and that it should be on the National Priority List, i.e., a top priority for thorough cleanup.

p 1-6 makes it sound as though just two radionuclides were found, with a couple of exceptions. The EIS should list all the radionuclides found above background.

The box on p. 1-6 once again tries to spin data rather than present them candidly. First of all, the EIS misleads by saying both man-made and naturally occurring radionuclides were detected, implying that the latter were found at naturally occurring levels. However, what EPA found was that uranium, thorium, radium, and numerous others which do occur in nature but also were used at SSFL for nuclear purposes were found at levels exceeding what is found in background. In other words, there was contamination from these materials. Indeed, DOE operated, for example, a uranium fuel fabrication facility, used thorium for reactor fuels, and possessed significant amounts of radium at SSFL, which apparently resulted in contamination by these materials. DOE should not try to mislead the public – or a court that may have to review the adequacy of its NEPA compliance – by referring to materials as “naturally occurring” when they can occur in nature but are at SSFL, not through nature, but by contamination caused by decades of DOE’s poor environmental practices. DOE compounds this misrepresentation by then only citing the EPA statistics about man-made radionuclides that have contaminated SSFL at levels above background, leaving out its figures for radionuclides such as the thoriums, uraniums, etc.

623-29 cont'd

623-30

623-31

623-23 DOE disagrees that this Final EIS does not adequately address the 2010 AOC. Chapter 1, Section 1.3, of this EIS provides a history of the site, and with the information in Section 1.4 includes a discussion of the actions, activities, and regulatory requirements that have led to or guided DOE’s cleanup to date and preparation of this EIS. The 2010 AOC and the activities it outlines for soil remediation are mentioned prominently in that discussion, including in the text box dedicated to the 2010 AOC to which this comment refers. Furthermore, Chapter 2, Section 2.3.2 of the Final EIS describes the Cleanup to AOC LUT Values Alternative, which incorporates the technical elements of the 2010 AOC, using the AOC LUT values as the basis for a cleanup to background or levels based on laboratory capabilities (AOC LUT values). Again, as contemplated by the AOC, DOE has conducted this NEPA evaluation for site remediation. As required by NEPA, DOE objectively considered various reasonable alternatives to achieve the remediation goal. One of those alternatives addressed the technical elements of the 2010 AOC while other alternatives were evaluated that, would leave Area IV and the NBZ in a state that was protective of human health and the environment.

DOE also notes in Section 2.2.1 of the Final EIS, Section 8.0 of the AOC allows DOE and DTSC to agree upon changes to the requirements of the AOC to better meet cleanup objectives. DOE would engage DTSC in discussions about such changes in order to implement any soil remediation alternative. Those changes would be accomplished in accordance with Section 8.0 of the AOC, which acknowledges that the Order may be modified by mutual agreement of the parties.

623-24 The commenter’s statement that contaminants “are concentrated near certain facilities” is a correct one. This was also a EPA conclusion for the radionuclide distribution. Figure 2-5 of the Draft EIS illustrates this. The commenter’s statement that DOE “efforts to average contaminants and purported risk over large areas” is incorrect. To perform the risk assessment, DOE used 10,000 square meter or 2.5 acres, not 100 acres as the commenter states, as the exposure area. In conducting a cleanup under a standard risk assessment as DOE would when implementing a risk-based cleanup, locations with higher concentrations are located first and targeted for cleanup. Averaging of remaining soil is then performed to assess the post cleanup risk. The map produced by DOE illustrated where any chemical may exceed a LUT value; however, exceeding a LUT value is not necessarily evidence of contamination nor is it an indication of risk posed to an onsite or adjacent land user. Please see Section 2.5, “Toxicity of Soil Contaminants,” of this CRD for additional information on this topic.

623-25 Please see the response to comment 623-5.

5

EPA says directly (see Fact Sheet it issued when releasing its report):

Of the [3735] samples a total of 500 samples contained concentrations of radioactive materials exceeding background levels. Many samples contained concentrations of two or more radionuclides that exceed background. Both man-made and naturally occurring radionuclides were detected. Man-made radionuclides were detected in 423 of the 500 samples, with naturally occurring radionuclides detected in 105 of the 500 samples; some samples had both man-made and naturally occurring radionuclides.

DOE should quote this, in its entirety, and should include the table from p. 3 of EPA's fact sheet showing the exceedances.

The running problem with the EIS being more spin than science is found in the statement, "man-made radionuclides were not detected above background levels in more than 88% of the total number of samples." As indicated above, that leaves out the uranium, thorium, etc. But the focus on the samples that weren't contaminated is indicative of the underlying problem with the EIS—constant efforts at minimizing the recognition of the environmental harm DOE has done with decades of accidents, spills, and releases, while trying to inflate the supposed impacts of remediating the toxic mess DOE made. Would the reader feel reassured by a doctor who said, "88% of your body doesn't have any cancer?"

A more accurate statement would be "Every seventh soil sample taken by EPA found radiological contamination. And the great majority of soil samples found chemical contamination."

Footnote 6 on p. 1-7 misrepresents the AOC. EPA made a controversial recommendation, but that doesn't change the AOC, which is explicit: the LUT values are to be based on the values found and the detection limits employed in the EPA background study (for radiation) and DTSC background study (for chemicals). There have been attempts to weaken those requirements by saying one should ignore the detection limits from the background studies and instead use far weaker detection limits that multiple laboratories (rather than the best labs available) can routinely employ (rather than what they can achieve if asked to do as well as possible).

The box on p. 1-7 misrepresents the AOC. First of all, it must be said that relegating the AOC to this single page or two is part and parcel of DOE's efforts to push the AOC far to the margin of the cleanup process. The entire cleanup is governed by the AOC. DOE can't violate it. But it constantly tries to make it seem as though the AOC barely exists. The EIS should begin with the AOC; make clear all its key components, without spin; identify that it is legally binding and that DTSC by terms of the AOC is in charge; and then restrict the EIS to how to carry it out, as previously promised.

Nowhere is it stated that the AOC is a legally binding set of obligations; that DTSC co-signed it; that DTSC is established as the party that regulates DOE in the cleanup and must approve all DOE proposals, all of which must comply with the AOC. These deficiencies are stark and must be remedied.

623-32

623-23
cont'd

623-26 Your comment has been included in the Administrative Record for the EIS. It is DOE's position that the appropriate level of NEPA review was conducted for prior decommissioning activities. As stated in Chapter 1, Section 1.3, "As appropriate, these activities were covered by categorical exclusions in accordance with DOE's "NEPA Implementing Regulations" (10 CFR Part 1021, Appendix B to Subpart D)." Categorical exclusions are a form of NEPA review.

623-27 The EIS does not assert that "almost the entirety of Area IV is contaminated". The EIS presents areas and volumes exceeding the current LUT values. However, exceeding a LUT value is not necessarily an indication of contamination. For example, soil treatability studies show that up to 500 ppm of soil with TPH as the only contaminant. The treatability study show that TPH results could contain naturally occurring organic matter. An issue that DTSC is in agreement with. Exceeding the 5 ppm TPH LUT value is not an indication of contamination. The statements that contaminants are generally located within a limited area of Area IV and that application of the LUT values would result in removal of the quantity of soils identified are not in conflict.

623-28 DOE believes that Chapter 1, Section 1.3 of this EIS accurately and adequately describes the events preceding and effectuating preparation of this EIS. This information, along with the remainder of Chapter 1, provides the context necessary for the public and decision-makers to understand the purpose and need for DOE's Proposed Action and alternatives for remediation of those portions of SSFL for which it is responsible. DOE's current focus is to complete the cleanup of the remaining contamination in those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. To that end, the current condition of Area IV and NBZ, not the past incidences within Area IV, is relevant.

623-29 The text box on page 1-4 of the Draft EIS stated that residential and other plausible land use scenarios will be considered. For groundwater remediation, Chapter 2, Section 2.6 of this Final EIS describes how DOE would clean up groundwater in accordance with the requirements of the 2007 CO and that technologies are being identified and evaluated through the applicable RCRA process. Maximum contaminant levels (MCLs) from the Safe Drinking Water Act that are used as a basis for groundwater protection. Most MCLs are based on risk to a drinking water user.

However, DOE respectfully disagrees with the concept that the future land use must be considered suburban residential with garden or agricultural. At the time the Draft EIS was issued, the landowner, Boeing, had committed to maintaining the land it owns at SSFL, which includes Area IV and the NBZ, as open space. That commitment

Commenter No. 623 (cont'd): Southern California Federation of Scientists

The statement that EPA is responsible for establishing the LUT values is not quite correct. See p. 2 of Attachment B of AOC. "US EPA, in the course of conducting its radioactive contaminant background study, will determine local background levels and detection limits." EPA did this in its Background Study. It set Background Threshold Values (BTVs) which represented the higher of the detection limits it established in that study and the background values it could measure. The AOC says that those values from the background study shall become the LUT values. The EIS does not state this correctly.

623-32 cont'd

The box states that "chemicals and radionuclides in the backfill soil must meet the same LUT vales." DOE knows this is not true. If there is any difficulty finding such soil (e.g., there is some soil that might very marginally exceed LUT values for a couple of constituents, like the Gillibrand soil), DOE and DTSC are to consult and DTSC is to choose the best available soil. Indeed, DOE, recognizing this, has written to DTSC to do precisely that. This is another example of trying to make it seem as though the AOC can't be met, when it can. The false statement needs to be corrected.

623-33

The box also includes the following: "No 'leave in place' alternative (onsite burial or landfill) is allowed." Once again, DOE misrepresents the AOC it signed; and in an EIS has an obligation to accurately present the facts. The prohibition of consideration of "leave in place" alternatives is actually a separate prohibition from the ban on consideration of onsite burial or landfilling, as seen in the quote below from the AOC:

Cleanup to local background means removal of soils contaminated above local background levels
No "leave in place" alternatives will be considered
No on-site burial or landfilling of contaminated soil will be considered

623-34

One can understand why DOE would wish to misrepresent this AOC requirement, because the bulk of the EIS is filled with DOE's intention to leave in place hundreds of thousands of cubic yards of contaminated soil, in violation of this AOC provision. Note that it bars not just leaving any contaminated soil in place, but even consideration of such an alternative. Yet all alternatives in the EIS consider leaving in place vast amounts of the soil not cleaned up.

623-3 cont'd

p. 1-8 in passing mentions that many of the chemical contaminants in soil were due to "burning of wastes" but does not disclose the true nature of this – the illegal burning of radioactive and toxic wastes in open-air burnpits for years, resulting in widespread aerial deposition over not just SSFL but outlying areas as well. There should be full disclosure of this, as without its recognition, the problem of the widespread contamination cannot be understood and addressed.

623-35

The assertion that the soil sampling by DTSC and EPA was used to estimate 1,413,000 cubic meters of contaminated soil creates a misimpression that DTSC and EPA made the estimate and that the estimate has any validity. In fact, DOE and its contractors performed the estimate, and it is wildly inflated. As SCFS indicated in its scoping comments on the EIS, numerous errors to inflate the numbers were made. If there is a surface sample that is contaminated, DOE assumed

623-13 cont'd

was put into effect via two Grant Deeds of Conservation Easement and Agreements (conservation easements), legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site.

623-30 SSFL Area IV is not "one of the most polluted sites in the nation." Soil cleanup actions have occurred throughout the history of operations in Area IV. Chapter 3, Section 3.2.5.3, of the EIS provides several examples of the prior cleanups. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV;" of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ.

EPA and DTSC decided not to list SSFL on the National Priorities List but instead to have State regulations govern the cleanup standards and process. Subsequently, the 2010 AOC (with respect to soil) and the 2007 Consent Order (with respect to groundwater) defined the parameters for the cleanup. DOE is committed to a remediation of the SSFL Area IV and the NBZ to levels that will provide for protection of public health and the environment.

623-31 DOE believes that the information in Chapter 1, Section 1.4 of this EIS, including the text box, presents an accurate summary of the cited EPA data (EPA 2012; HGL 2012b). This section states that "Cesium 137 and strontium 90 were the two site-related radionuclides most frequently observed in EPA's samples." The text does not imply that these were the only two radionuclides observed. More detailed data are presented and used in Chapters 3 and 4 of this EIS and their supporting appendices.

The EPA in its final report of soil radionuclide sampling in Area IV of SSFL (HGL 2012b) indicated that the uranium and thorium decay series radionuclides that were above the radiological trigger level (RTL) were mostly from naturally occurring radioactive material (NORM) origin and not related to site contamination. The report stated:

"For Round 1 sample results, only four NORM RTL exceedances warranted collection of step-out samples during Round 2. Several instances were identified where NORM RTL exceedances were associated with collocated site-related radionuclides. In these instances, Round 2 step-out samples were collected and analyzed to characterize potential site-related contamination." and: "The evaluation of NORM RTL exceedances produced few results considered potentially site related,"

Commenter No. 623 (cont'd): Southern California
Federation of Scientists

7

contamination all the way to bedrock even if there were no data that was the case. If a particular sample was contaminated, DOE presumed contamination laterally all the way to bedrock outcroppings, even if there were no data to support that. This is unscientific and appears designed to buttress efforts to scare the public about trucks rather than to try to reasonably evaluate environmental impacts.

p. 1-8 regarding future of Area IV is false and misleading. Boeing does not decide the future land use of those areas, and for purposes of determining cleanup levels, a Responsible Parties' desires about future land use are irrelevant in terms of EPA or DTSC cleanup practice, which rely heavily instead of local government's land use designations. The County of Los Angeles and a number of other entities have major roles. As DTSC made clear in its 2010 Response to Comments on the Agreement in Principle, DTSC relies on local zoning and general plan designations, which allows in the SSFL case agricultural use, which requires the strictest cleanup standard.

Responsible Parties do not get to dictate cleanup levels for pollution on their land by declaring they will restrict its future use. If that were the case, then they could pollute at will and never have to remediate; all they would have to do is say they'll put a fence around it or otherwise restrict it. EPA guidance (see, e.g. Land Use in the CERCLA Process), does not identify a Responsible Party's desires or supposed intentions for future land use as even one of the factors to consider in determining prospective future land use for cleanup standard determinations. Again, if it were up to the polluter, its pollution would never get cleaned up; they would just restrict the land and walk away, which is not allowed.

The statement that Boeing has indicated that it is "committed to cleanup to a standard that is equivalent to a suburban residential standard" is false. The referenced document in fact shows that Boeing is pushing for cleanup to a standard that it is orders of magnitude less protective than a suburban residential standard. It does this, as does DOE throughout the EIS, by leaving out the required backyard garden component of the suburban residential standard.

Once again, it is not the polluter that picks the cleanup standard for its pollution; it is DTSC, the regulator. Throughout the EIS, DOE misleadingly suggests that the polluters (Boeing or DOE) get to decide how much of the contamination they created they must clean up. The polluter does not get to decide. The regulator – DTSC – decides. This is a fundamental flaw of the EIS.

p. 1-9 It would appear from 40 CFR 1508.5, quoted in the box on this page, that DOE has violated the applicable regulations by naming the Santa Ynez Band of Chumash Indians as a cooperating agency. **Those regulations, as DOE acknowledges by the direct quote on this page from them, only allows naming an Indian Tribe as a cooperating agency "when the effects are on a reservation."**

The reservation of the 154-member Santa Ynez Band of Chumash Indians is located north of Santa Barbara, *more than a hundred miles from SSFL*. The effects being considered in the EIS are in no fashion on the Santa Ynez reservation. The Cooperating Agency status is thus illegal and should be withdrawn.

623-13
cont'd

623-36

623-37

EPA did not provide a list of samples that exceeded the RTL for the uranium and thorium decay series radionuclides that were or were not considered site related and did not include any results for them in their list of Radiological Areas of Interest. Therefore, an evaluation was performed in 2015 to identify which samples that exceed the LUT values for the uranium and thorium decay series radionuclides appear to be NORM origin and which appear to be site related. A Technical Memorandum Evaluation of Naturally Occurring Uranium and Thorium Decay Chain Radionuclides in Santa Susana Field Laboratory Area IV Soils (Rucker 2015) was issued in August 2015 and was used in developing the Site Remedial Action Plan. This reference has been cited and referenced in Chapter 3, Affected Environment, in this Final EIS. The evaluation determined that no Th-232 results exceeded its LUT value. Of the 13 sample locations that exceeded the LUT values for uranium 234, uranium 238, or both, 4 were determined to be from NORM origin and 9 were determined in the evaluation to be from site processes based on their ratios with long-ingrowth daughters and/or ratios of the uranium isotopes. Seven of the nine locations whose concentrations were determined to be from site processes were from Subarea 7; one was from Subarea 6 and one was from the Northern Buffer Zone. The results for all but one of the locations were from surface soil. The one exception was from a sample taken from the 1 to 2.3 foot depth.

As discussed in Appendix G of the Draft EIS, natural uranium and thorium decay chain radionuclides contribute a major portion of the impacts to human health that could be experienced by an onsite suburban resident or recreational user. The variability in natural background from location to location is significant as evidenced by site uranium and thorium impacts being less than those from background and masking the incremental impacts from site-related radionuclides when viewing the total radiological impacts. The evaluation of uranium and thorium origin mentioned in the previous paragraph was performed after the risk assessment was performed for the Draft EIS. Therefore, impacts were shown in Appendix G and Chapter 4, Section 4.9, of the Draft EIS, with and without all uranium and thorium decay chain radionuclides. For the final EIS, Uranium was included in the statistical evaluation for identification of Contaminants of Concern (COCs) by subarea by comparison to background levels and frequency of detection in the Radionuclide Data Assessment Report (Leidos 2018a). The three subareas where uranium was identified in the report above a being process related had UCL95 values less than the UCL95 value for uranium in background soil and was therefore eliminated as a COC. In this Final EIS, by not including uranium in the risk impact assessment, introducing a net negative impact from uranium has been avoided.

**Commenter No. 623 (cont'd): Southern California
Federation of Scientists**

8

Great concern has been expressed, by the public as well as by the Los Angeles and Ventura governments, about potential motivation for the involvement by the Santa Ynez Band, which operates a large casino operation. Were they to be able to obtain SSFL land and build casinos on it, they could be extraordinarily lucrative, as the current casino is far from the LA metropolitan area. The potential for a conflict of interest – helping the RPs avoid cleanup expenses in hopes perhaps of obtaining part or all of the SSFL land – would undercut key aspects of NEPA. Those conflicts need to be disclosed in the EIS. Furthermore, the potential environmental impacts of this cooperation between the Santa Ynez Band and the Responsible Parties that could result in a casino with all that goes with it needs to be analyzed. (A Boeing statement in a letter of what it claims to intend to do with the land has no binding effect, of course.)

We also note that the EIS cites to several documents by a lobbyist and lawyer for the Santa Ynez Band, Mr. Cohen, but when one goes to the cited reference, one gets a notice that DOE is withholding the record, citing attorney-client privilege. Mr. Cohen represents the tribal casino and related interests; he does not represent DOE. DOE cannot make a claim of attorney-client privilege for a communication from Mr. Cohen. This creates a further impression of possible secret collusion; in any case, documents cited in an EIS must be available for public scrutiny.

Section 1.6, “Decisions to be Supported,” is fundamentally wrong, and the error is the key error in the EIS. It states that the “potential environmental impacts presented in this EIS, along with public input, cost, policy and other factors, will be considered by **DOE decision-makers in selecting alternatives for soil remediation, building demolition, and groundwater remediation for implementation.**” DOE officials do not get to select alternatives for cleaning up the contamination DOE created in soil, buildings, and/or groundwater. DOE signed an AOC, which mandates what that cleanup is to be. It has no power to ignore the AOC. And DTSC is the regulator, and enforcer. Furthermore, even in the absence of the AOC, DOE has zero authority over how much chemical contamination to clean up; that is solely DTSC power, delegated to it under RCRA, with which DOE must comply. The fundamental basis of the EIS is erroneous.

[Again, the EIS misstates the 2007 Consent Order, which does not require a risk-based cleanup approach; groundwater is to be cleaned up to MCLs. Only where MCLs don't exist for particular contaminants will risk-based cleanup levels be developed.]

Section 1.8.1 erroneously lists the 2003 EA as a related NEPA document. It was struck down by the court in 2007.

§1.8.2 is a direct affront to DTSC and misrepresents who controls the cleanup decisions. DTSC's EIR is given a mere 3 sentences, listed as a “related CEQA document.” In fact, the EIS is irrelevant, as DOE does not have the authority to make the cleanup decisions evaluated in the EIS. DTSC controls – both through the AOC and even in its absence, through its RCRA authority.

§1.8.3 More particularly, this section says DOE “may” prepare multiple SRAIPs, including separate ones for chemicals they claim will naturally degrade. No it may not. This violates the AOC, which requires no “leave in place” alternatives. DOE also says it may do separate SRAIPs

623-41

623-32 Footnote 6 in Chapter 1 of the Draft EIS (footnote 13 of the Final EIS) factually represents information included in the Final Technical Memorandum, Look-Up Table Recommendations, Santa Susana Field Laboratory Area IV Radiological Study (HGL 2012c), quoting the relevant passages from the source document. EPA was providing the technical expertise for which it was engaged and identifying potential issues with the implementation of the 2010 AOC.

Regarding the statement about EPA establishing LUT values, in this Final EIS, the text box in Chapter 1 regarding the 2010 AOC was revised to more accurately reflect the language from the 2010 AOC regarding establishment of the LUT values.

623-33 As described in the 2010 AOC, chemicals and radionuclides in the backfill soil must meet concentration limits established in the LUTs. DTSC does have the authority to change the backfill concentration limits. DOE has initiated consultation with DTSC on this subject, as is required by the 2010 AOC. The responsibility for identifying backfill ultimately lies with DTSC per the 2010 AOC, which states: “If an onsite or offsite source of backfill soils that achieves all LUT values cannot be reasonably found, then DTSC, DOE and EPA shall enter a consultation process and DTSC shall determine the best available source of backfill.” Therefore, any discussion of 2010 AOC implementation issues must include this concern. Please refer to Section 2.4, “Suitable Backfill Soil” of this CRD for further discussion of this topic.

623-34 DOE revised the text box to reflect the two separate statements as indicated in response to this comment. However, it should be noted that the 2010 AOC does state that cleanup to background levels does include in situ and other onsite treatment of soils that is able to achieve cleanup standards.

623-35 No burning of wastes in open pits occurred in Area IV. Please see Section 2.7, “Offsite Impacts,” of this CRD for a discussion and DOE's response to concerns about offsite impacts.

623-36 Boeing as the property owner has the right to determine what the future use of its land will be. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site and, consistent with EPA guidance, firmly establishes the basis for the use of risk assessment cleanup levels based on the determination of the future use of the land as open space.

**Commenter No. 623 (cont'd): Southern California
Federation of Scientists**

9

for those chemicals it claims are the greatest risk and another for those it asserts are of lesser risk, even though over the LUT values. All of this is indication of DOE's intent to break the AOC, which requires cleanup of all the soils, and very quickly – a six year time period was established in the AOC.

Moreover, DOE indicates that the key documents such as SRAIPs about actual cleanup are being hidden from the NEPA process. DOE says it plans to not even release the first plan until after DTSC issues the Final EIR. This is bait-and-switch, keeping from the public during the NEPA – and CEQA – process the key aspects that should be reviewed. Over and over again, DOE does this; trying to hide the core of its proposals from review. There is no excuse for this. The contamination has existed for seventy years at the site. The order by Judge Conti was a decade ago. The AOC was signed seven years ago. Hiding the key plans is unacceptable.

p. 1-16 to 1-19 DOE dramatically misrepresents the public comments received during the scoping process. The majority of those who presented testimony at the scoping hearings and the majority of those who submitted written comments strongly condemned any effort by DOE to break the commitments it had made—that the scope of the EIS would be limited to ways to carry out the AOC, not whether to do so. The majority over and over again said that no alternatives, with the exception of the required No Action alternative, should be included in the EIS—as EPA had promised in 2012. That is nowhere acknowledged. Instead, DOE—always with a heavy thumb on the scale of what is supposed to be a neutral, accurate process—tries to pretend this overwhelming insistence on the EIS scope being consistent with the AOC doesn't exist. It gives far more space to the small minority (often tied to DOE and other Responsible Parties in ways DOE does not disclose) that is helping provide cover for DOE to break its commitments. Disclose in the EIS how many commenters during the formal scoping process in 2014 at the hearings supported an AOC-compliant scope and how many written comments took the same position. Because DOE wants to break its commitment, it mischaracterizes the scoping comments received. This is not acceptable.²

Chapter 2

p. 1 asserts that the proposed action is to implement the AOC. This is false. None of the alternatives implements the AOC. The AOC bars consideration of "leave in place" alternatives. All four alternatives leave in place vast quantities of contaminated soil. The first alternative leaves in place on the order of half a million cubic yards. None of that meets the strict exceptions in the AOC.

The consideration of not cleaning up the groundwater but leaving the contaminants to supposedly naturally attenuate over long periods of time also violates the 2007 Consent Order. Once again, DOE is trying to get out of its cleanup obligations.

² DOE itself pushed the AOC supporters into one group at the workshop and spread those aligned with DOE's efforts to break the AOC into three others, in an effort to be able to claim three groups proposed alternatives to the AOC.

623-41

623-42

623-43

623-3
cont'd

- 623-37 The regulations stated in 40 CFR 1508.5 do not limit cooperating agencies to tribes where reservations would be impacted; rather cooperating agency status is required when Native American reservations are impacted. CEQ guidance encourages agencies to engage tribal agencies as a cooperating agency. Specifically the guidance says "As soon as practicable, but no later than the scoping process, Federal agency officials should identify State, tribal and local government agencies which have jurisdiction by law and or special expertise with respect to reasonable alternatives or significant environmental, social or economic impacts associated with a proposed action that requires the preparation of an environmental impact statement." Further CEQ states: "...cooperator status for appropriate non-Federal agencies should be routinely solicited)." In this case, the Santa Ynez Band of the Chumash Indians' interest in the site as a sacred site and traditional cultural property qualifies it as a cooperating agency.
- 623-38 DOE is not the owner of the land in Area IV and the NBZ; its purpose in preparing this Final EIS is to clean up the land so it can be returned to the land owner, Boeing. Boeing has formalized its previously stated intent by entering into a conservation easement and agreement that legally restricts future use of SSFL to open space, preventing any type of a development on Area IV, including a casino (Ventura County 2017a, 2017b). According to the provisions of the conservation easements these restrictions would apply to any future owner of the site. Accordingly, DOE is not aware of any conflict of interest with respect to the Santa Ynez Band tribe and the responsible parties
- 623-39 The original letter included in the reference Chumash 2014 from Marzulla Law to Sam Cohen was marked as attorney-client privileged information. It was proper that DOE respect that declaration. The nature of the letter was that the Santa Ynez Band of Chumash Indians requested that this EIS include a rigorous evaluation of reasonable alternatives.
- 623-40 The 2003 EA is part of the history of NEPA documentation related to the DOE cleanup of Area IV; as such it is considered to be related NEPA documentation.
- 623-41 The AOC allows for onsite treatment of soil (Section 2.6 of the 2010 AOC). Natural attenuation of low concentrations of TPH s in soil is an applicable onsite treatment method. DOE does not consider Monitored Natural Attenuation a 'leave in place' treatment methodology. There is nothing in the AOC that would prevent multiple SRAIPs and phasing soil cleanup, with targeting of radionuclides and high concentrations of chemicals first making the most sense.

Commenter No. 623 (cont'd): Southern California Federation of Scientists

p. 2-1 lists the EA and FONSI as official documents affecting the EIS; no, they were struck down by the court.

623-40 cont'd

2-2 The discussion of why DOE is trying to breach the AOC and its 2012 commitments about the EIS scope is disingenuous. No genuine scientific issues have arisen. And the public comments received during the formal scoping process were overwhelmingly in favor of living up to those commitments. All that has changed is that DOE now wants to break the promises it made.

623-44

The statement made here, and throughout the EIS, that its Alternatives 2 and 3 are risk-based are false. DOE is using risk based screening levels hundreds, thousands, and tens of thousands of times higher than the true risk based screening levels even for residential use, the scenario it claims to be using. Additionally, the assertion that risk-based levels for radionuclides are expressed as radiation dose is false. EPA's CERCLA program has long insisted that radionuclide concentrations be set based on risk, not dose. (See, e.g., EPA Q&A on Radiation Risk Assessment in CERCLA.) And indeed, the risks associated with the concentrations of radionuclides DOE is proposing as cleanup standards are staggering – risks in the 10¹ and 10² levels (as much as several hundred thousands times higher risk than the one-in-a-million risk goal for DTSC and EPA and which DOE claims falsely in the EIS to be meeting). See the risk estimates from DOE's Preliminary Remediation Goal calculator for radionuclides, attached as an exhibit.

623-9 cont'd

The entire key to the EIS is its efforts to bury the AOC, hide it, make it go away. That is true in all this discussion.

p. 2-4 contains the key revelation, that all alternatives considered in the EIS would breach the AOC. That is true. The first one, although entitled cleaning up to AOC LUT values, exempts nearly 40% of the soil from that requirement, in violation of the AOC. All others violate it even more. None, with the exception of the No Action Alternative, is supposed to.

623-3 cont'd

p. 2-5 misrepresents the workshop. As indicated above, as part of DOE's efforts to give itself cover for breaking the AOC, it itself assigned people to the four groups, so as to claim there were four approaches, only one of which was meet the legal obligations of the AOC. And DOE does not disclose its ties, and that of its longstanding contractor Boeing, to some of those people. Furthermore, the other three groups were not formally recommending breach of the AOC; they recommended carrying it out in a way that emphasized certain values.

623-45

What is key about the misrepresentation of the workshop is the failure of DOE to quote or even acknowledge its own fact sheet distributed at the workshop, which clearly stated that the scope of the EIS would be limited to alternative ways to carry out the AOC. All of the suggestions given were in that context, as set by DOE itself. It should quote the Fact Sheet extensively in the EIS; it doesn't do so because it doesn't want to acknowledge it is breaking those commitments.

It is false to claim that all the groups at the workshop agreed on cleaning up to open space requirements. There was strenuous insistence on cleaning it up so that it was safe for all uses allowed under Ventura County zoning and general plan designations. And the great majority of

623-42 DTSC is currently preparing a program environmental impact report (Program EIR) under CEQA that applies to cleanup of the entire SSFL; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the 2010 AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition. These plans may provide more detail, as is appropriate for an implementation plan, but the planned cleanup would be encompassed in the alternatives presented and evaluated in this Final EIS.

As noted above DOE and DTSC need to conform the decisions in the DOE EIS ROD(s) and the TRSC's Program EIR Notice of Determination. This step would finalize the decisions regarding soil and groundwater cleanup. Since the SRAIP will detail the technical and operational plans for soil remediation within Area IV and the NBZ, the final versions cannot be developed until after this step is completed. DOE notes that DTSC states in the Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California, Appendix A, "Program Management Plan," that the "Draft SRAIPs will be made available for public comment."

623-43 DOE does not believe it misrepresented or mischaracterized the scoping comments received. DOE refers the commenter to the CEQ statement that commenting is not a form of voting (CEQ 2007). Similarly, the number of comments received stating a preference for including or excluding material from this Final EIS does not dictate the scope of DOE's analysis. Rather, as indicated above, under NEPA DOE has an obligation to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action.

The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, DTSC at DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ. An extensive discussion of legal requirements to analyze a full range of alternatives is included in Chapter 2, Section 2.3.3, of this EIS.

Commenter No. 623 (cont'd): Southern California
Federation of Scientists

11

commenters during the formal scoping insisted on living up to the commitment to clean it up to background. DOE is playing very loose with the process, mischaracterizing the informal workshops, and ignoring the formal scoping process, where insistence on living up to the AOC promises far outweighed any other view.

623-45
cont'd

The discussion of "green cleanup" is very misleading. What DOE is proposing is the exact opposite of green cleanup. It proposes to leave the contamination not cleaned up – the antithesis of green.

623-46

2-10 The excuses why DOE breached the AOC requirement for cleanup by 2017 are unpersuasive. Indeed, the promised cleanup hasn't even begun. DOE just dragged its feet, as a way of breaking its obligations.

623-44
cont'd

2-11 DOE simply dismisses out of hand looking at reasonable transportation alternatives, like using and upgrading the roads out of Area IV headed north, or a covered conveyor, or the nearby train routes. Once again, DOE creates a straw man; since it sat on its hands so no cleanup began by 2017, it refuses to come up with reasonable transportation alternatives because that might take a bit of time. It should have begun years ago, and should have included the transportation alternatives in this EIS which was years in the making, and can still carry out most of the alternatives in a very short time, saving money and reducing impacts.

623-14
cont'd

2-13 in a parenthetical aside, DOE merely says the garden component of the suburban residential scenario "was not evaluated." No reason is given. Elsewhere, completely arbitrary reasons are given. If one is to assume a residential exposure, the garden is part of it. We are trying to protect people not just on site, but also offsite; they have gardens. DOE is completely capricious about saying they will clean up to residential standards but then excluding from those standards the required garden component. The real reason that DOE has done this in the EIS is that most of the time it says it is cleaning up to suburban residential standards, when in fact it isn't. There is one footnote and this parenthetical comment, but the rest of the time the omission is not disclosed. Leaving out the garden results in cleanup standards orders of magnitude higher than true suburban residential standards, and thus very little cleanup of the contamination.

623-8
cont'd

2-17 to 18 Leaving contaminants in place is barred by the AOC. Natural attenuation is thus barred. The time estimates given in the EIS are on the one hand very long – 70 years – and on the other the true time periods are far longer, according to the very studies cited. Indeed, those studies indicate no evidence of any attenuation under actual conditions at the site.

623-47

2-18 The claimed biological exemption violates the actual provision of the AOC, which is limited to a finding of illegality by US Fish and Wildlife Service in a Section 7 Biological Opinion, with no reasonable alternatives or mitigations. There is no such Biological Opinion.

623-48

The exemption the EIS characterizes as for cultural features is also far more narrow – it is limited to Native American artifacts that are officially recognized. The EIS admits there are none. Furthermore, the exception requires DTSC approval, no alternatives available (like working around the artifact or removing it and later replacing it), and still requires cleanup as close to background as possible.

623-44 Please refer to the response to comment 623-3.

623-45 Chapter 2, Section 2.2.2 of this EIS, is intended to provide background on a number of factors that influenced the development of alternatives presented in this EIS. DOE respectfully disagrees with the characterization of its intentions related to the workshops and that the workshops are misrepresented. DOE properly has considered changing conditions and input from stakeholders in developing the alternatives evaluated in this EIS. As discussed in Chapter 2, Section 2.3.3.1 of this EIS, there are real technical issues with implementing the technical elements of the 2010 AOC such as, complying with the LUT values per the requirements in the AOC. There has also been a lot of new site contamination characterization information that has become available since the 2010 AOC was signed (see the response to comment 623-2). While there were many stakeholders that advocated for strict implementation of the 2010 AOC, during the workshop and the scoping period for this EIS, there were also stakeholders who were in favor of cleaning up the site, but requested that decisions be based on risk to future users as opposed to cleanup to background. DOE considered all of these factors in developing the alternatives included in this EIS.

623-46 "Green Cleanup" has a specific meaning for remediation. The green cleanup process implements green and sustainable remediation and innovative technology practices throughout the remediation process. Green cleanup practices minimize energy use (maximizing renewable energy); minimize air pollutants and greenhouse gas emissions; minimize water use and impacts on water resources; reduce, reuse, and recycle materials and waste; and protect land and ecosystems. DOE is committed to using green cleanup processes to the extent feasible in all aspects of remediation, for additional information refer to Chapter 2, Section 2.2.2, and Chapter 7, Resource Commitments, of this EIS.

None of DOE's action alternatives for soil remediation proposes leaving contamination not cleaned up. This EIS analyzes an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. It also analyzes alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of Area IV and the NBZ.

Commenter No. 623 (cont'd): Southern California Federation of Scientists

And the 5% exemption for unanticipated problems clearly isn't applicable—DOE is anticipating it will claim the exception, thus violating it. The matters it anticipates do not apply, like desiring not to clean up below 5 feet.

Figure 2-2 shows that many of the areas DOE wishes to exempt from cleanup are right where the contamination is, such as the burn pit, the SRE area, etc. This is demonstrated by the fact that the proposed areas to leave in place represent up to 40% of the overall contamination. This violates the AOC and is unacceptable.

§2.2.3 is a direct attack on the AOC that DOE signed, is without scientific basis, and contains numerous misrepresentations. It claims that "technical aspects of implementing the 'cleanup to background' approach described in the 2010 AOC...*compelled* DOE to look at other soil cleanup alternatives. . ." (emphasis added). This, of course, is untrue. Virtually all of the issues DOE now raises are not new; it knew of all them when it signed the AOC. Moreover, it was DOE that proposed the cleanup to background. It now is merely coming up with empty excuses for breaking the promises it made and the agreement it itself had proposed.

DOE claims that a cleanup to background is lower than what is typically used as a standard for soil cleanup. However, cleanups to background are in fact frequent. DTSC (see attached Brausch declaration) gave numerous examples in California where this is done:

- 9. DTSC has cleaned up contaminants at other sites to background levels in situations where, as with the Santa Susana Field Laboratory, the calculated risk levels are below the local background concentrations for contaminants. Examples of sites where DTSC has used this same approach include, but are not limited to, Midway Village in Daly City, California; Eskimo Radiator in Los Angeles, California; Western Lead Products Corporation in City of Commerce, California; and Ace Trailer Park in Downey, California.

And as DTSC said in its 2010 Response to Comments on the Agreement in Principle, its standard practice when it uses a risk-based approach is to clean up to local land use designations, and for SSFL, that is agricultural, which DTSC said equals a cleanup to background. It made that statement based on analysis of risk-based cleanup levels and how they compare to local background.

DOE's EIS supports these false statements with more misrepresentations. It states (p. 2-24) that the risk-based standard from the SRAM for mercury is 16.8 parts per million, while the AOC LUT value is 0.13 parts per million. But that is false. The SRAM-based suburban residential risk-based level (which includes a garden) for mercury is in fact 0.0504. (see the 2nd highlighted column on pdf page 1071 of the SRAM). The true risk-based value (Risk Based Screening Level, or RBSL) is 333 times lower than what DOE claims.

623-48
cont'd

623-2
cont'd

623-20
cont'd

623-10
cont'd

623-49

623-47 The AOC allows for onsite treatment, which natural attenuation will accomplish. Natural attenuation is only being considered for "low concentrations" of TPH chemicals and would be used only after DTSC approves its use. (Simple polycyclic aromatic hydrocarbons may be amenable to natural attenuation and would be evaluated on a location-by-location basis during development of soil remediation plans.) See Chapter 2, Section 2.3.2 of this Final EIS for additional information. The referenced studies also addressed much higher concentrations of chemicals.

623-48 Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a discussion of this topic and DOE's response. The Office of Historic Preservation supports DOE's preference to avoid disturbance at archaeological sites or to risk disturbance to unknown sites if there is no direct threat. Through formal and informal consultation with the State Historic Preservation Officer, the federally recognized Santa Ynez Band of Chumash Indians, and non-federally recognized tribes, DOE has also identified areas in which it proposes to apply the exemption process for protection of cultural resources. This process is described in this Final EIS Chapter 2, Section 2.3. The application of cultural resource exemptions requires the approval of the DTSC.

Specifically, the proposed exemption areas on the necessarily small-scale maps included in the Draft EIS do include areas such as the Sodium Reactor Experiment that have levels of soil constituents that would be remediated. Their inclusion in the mapped areas is because of the immediate proximity to habitat that supports endangered species. The delineation of exemption areas would be refined as planning and consultation proceed and in any event, thorough evaluation of contamination and focused removal actions would be conducted to remove levels that pose a risk to human health or the environment. The 5 percent exemption noted in the comment is for unforeseen circumstances and would be invoked, subject to DTSC approval, as remediation planning and implementation proceed.

At the time the Draft EIS was issued, DOE had been involved in ongoing meetings with the USFWS, CDFW, and DTSC for several years (see Appendix E, Table E-4 of this EIS) and the Biological Assessment required as part of Section 7 consultation had not yet been submitted. Hence, there was no Biological Opinion from the USFWS at the time the Draft EIS was released. However, both USFWS and CDFW provided letters stating concurrence with the exemption process. The USFWS has now issued a Biological Opinion (see Appendix J) for remediation of SSFL. This Final EIS reflects the results of the Biological Opinion on the exemptions areas in Area IV and the NBZ.

**Commenter No. 623 (cont'd): Southern California
Federation of Scientists**

13

Similarly, the EIS claims that the risk-based standard from the SRAM for silver is 230 ppm, but the LUT is 0.2. However, in fact, the SRAM-based RBSL for suburban residential exposures is 1.81, 127 times lower than DOE claims.

The EIS claims the SRAM-based residential RBSL for Aroclor 1254 is 232 parts per billion, compared to the LUT of 17 ppb. But in fact, the SRAM-based residential RBSL is 0.486 (one needs to convert from mg/kg to ppb). The risk from the LUT value is in fact 35 times higher than the risk-based concentration. What DOE claims is the risk based value from the SRAM is in fact 477 times higher (less protective) than the true value.

What DOE does – and does not disclose – is improperly use one column from the DTSC-approved SRAM for residential that is hundreds of times more lax than the second column, which is supposed to be used. One is supposed to consider both aspects of the suburban residential scenario, getting some soil on your hand, for example, as well as getting some of the contamination in you by eating an apple or tomato that you grew in the backyard. The latter is generally the dominant risk component, and DOE just ignored it. It claimed to use the DTSC-approved SRAM-based suburban residential risk based screening levels, but didn't. It used levels hundreds or thousands of times more lax.

The DTSC-approved SRAM, beginning at pdf p. 1071, shows two components of the suburban residential exposure scenario. The first salmon-highlighted column is for the exposures such as getting some of the soil on one's skin; the second highlighted column is for exposures from the residential backyard garden. DOE misleadingly states that it is using the SRAM-based suburban residential RBSLs, but in fact those SRAM-based suburban residential RBSLs are dominated by the second highlighted column, which is directly labeled SRAM-based suburban residential RBSL with garden.

DOE misrepresents the situation with radionuclides even further. It refers to the cleanup levels Boeing proposed in 1999, which were extremely high and non-protective. The cleanup level for Cs-137 Boeing wanted back then was 9.3 picocuries per gram (pCi/g). But the current EPA Preliminary Remediation Goal (PRG) for Cs-137 for a suburban residential scenario using EPA's default assumptions is actually 0.0302 pCi/g – 300 times lower. The LUT value of 0.225 pCi/g thus is above, rather than below DOE claims that a suburban residential land use scenario consistent with the SRAM corresponds to 10.3 pCi/g. But the EPA suburban residential PRG is, as shown above, hundreds of times lower than that. DOE just misrepresents what is a residential cleanup standard, and is proposing to leave behind hundreds of times higher concentrations than appropriate, either in terms of compliance with the AOC or from a true risk standpoint. And note that agricultural scenario, which is what should be used for a risk-based cleanup because that is what the land is zoned for and there are nearby agricultural uses, would produce even lower acceptable cleanup concentrations.

The claim made by DOE that the LUT values are unnecessary from a risk standpoint is thus false. It is based on misrepresenting the risk screening levels. The LUT values are quite consistent with risk-based levels. And the levels DOE proposes would produce risks far higher than acceptable or what it claims.

**623-49
cont'd**

623-50

623-49 The mercury RBSL of 16.8 ppm for the Suburban Resident without garden is correct. The background concentration for mercury is 0.13 parts per million. The commenter's discussion regarding the Suburban Resident RBSL with garden is moot as one cannot clean up to below background.

623-50 DOE is applying a risk assessment approach that produces results consistent with the CERCLA target risk range to identify where radionuclides are to be cleaned up. DOE is not using a specific soil standard so the discussion on prior cleanup levels is not relevant.

Commenter No. 623 (cont'd): Southern California Federation of Scientists

There is thus no risk basis for breaking the AOC. Furthermore, nothing that DOE purports about risk is new – it knew all that when it agreed to clean up to background. Indeed, it was DOE that proposed the cleanup to background.

DOE also attacks the AOC it signed because it is based on a “not to exceed” basis, what for some reason it now calls in the EIS a “point-by-point” process. “Not to exceed” means that no sample shall exceed background, i.e., be contaminated; if it is, DOE is to clean it up. The AOC expressly requires such a cleanup and bars averaging, where one might refuse to clean up contamination in one place because levels a few acres away are lower. If your child is playing in your backyard or in a picnic area somewhere, you don’t want him or her to be exposed to elevated contamination just because levels a half mile away are not as bad. DOE signed the agreement, well aware it was promising to not average. Now it is trying to renege on that commitment.

DOE entered into a Joint Policy with EPA in 1995 pledging to follow EPA Superfund guidance in cleanup of all DOE sites, whether or not on the NPL. EPA guidance is that one is not to average, and instead is to use a “not to exceed” approach, whenever exposure can’t be guaranteed to be random. It expressly identifies residential exposures as non-random, for which averaging should not be employed. DOE is trying to get out of its Joint Policy as well as the AOC. Someone should not be exposed to elevated levels of radioactivity or other contaminants at one location because someone somewhere else is exposed to lower levels.

DOE admits on p 2-25 that cleaning up on a not-to exceed-basis does occur at numerous sites. It then tries to claim that because SSFL is so badly contaminated, with so many toxic chemicals and radionuclides, a lesser cleanup should be allowed. This is illogical. If the situation is worse, and there are many more dangerous materials, one wants more protection, not less.

DOE proposes instead what it calls risk-assessment-based cleanup. DOE does not define what it means by this term—and should far more precisely in the EIS—but it appears to be including three separate mechanisms for dramatically weakening the cleanup from what was promised. First of all, it is using the wrong risk based screening level (RBSL). As shown above, it should use agricultural RBSLs, because that is what the site is zoned for, the General Plan allows, and there are agricultural activities close by. Additionally, it is using purported suburban residential RBSLs that are orders of magnitude less protective than the true suburban residential RBSLs, by leaving out the required garden exposure. Secondly, it appears to breach the requirement for a “not to exceed” cleanup, instead averaging contaminants over wide areas, so that soil elevated over the already very weak RBSLs they propose would still not get cleaned up. Third, because there are so many contaminants with which they have polluted SSFL, even if a grossly weak RBSL were exceeded, even with averaging, they don’t want to clean it up, but rather do a supposed risk-assessment procedure that would allow them to avoid cleanup. This procedure is not defined – and must be – but the little hints in the EIS suggest that it involves adding all contaminants together and allowing risks as much as three hundred times higher than the risk they claim they would be meeting for an individual contaminant.

When there are multiple contaminants and risk-based levels are established, the required procedure is a “sum of the fractions” approach. In other words, if contaminant A has a risk-

623-50

623-51

623-52

- 623-51 The comment contains many inaccuracies. DOE’s criticism of the AOC was not based on “not to exceed” language, it was based on DTSC selecting LUT values so low that the soil results could not be distinguished from background. Risk assessments are based on land use considerations, with some based on residential lot size. Risk assessments are not based on larger areas, as the commenter implies. EPA does area average its residential risk assessments. EPA guidance: Supplemental Guidance to Risk Assessment Guidance for Superfund: Calculating the Concentration Term. Publication 9285.7-081 [EPA 1992]), states the basis for risk determination assumes a random exposure over an exposure area. The exposure area is an assumed location where exposure to the chemical in soil may occur. Risk from exposure to a chemical is then related to the arithmetic mean concentration of that chemical averaged over the entire exposure area, regardless of the current or future land use type. Because the true arithmetic mean concentration cannot be calculated with 100 percent certainty from a limited number of measurements, the EPA recommends that the upper 95th percentile confidence limit of the arithmetic mean at each exposure point be used when calculating exposure and risk at that location (EPA Office of Solid Waste and Emergency Response.) This is also consistent with DTSC Human and Ecological Risk Office guidance that states: “In cases where there is adequate characterization, the 95 percent upper confidence limit (UCL) of the arithmetic mean may be used for the exposure point concentration.” Finally, nowhere in the Draft EIS does DOE claim that “SSFL is so badly contaminated” or use such an argument for a reduced cleanup. The extensive soil sampling performed by EPA and DOE and the review of those data by EPA and DTSC show that radioactive contamination is restricted to about 12 locations (and the majority of those were located within 5 areas of Area IV), and chemical contamination is associated with former operational areas.
- 623-52 Chapter 4, Section 4.9.1, of the Final EIS describe the basis for the risk assessment process used by DOE. The risk assessments are based on EPA and DTSC guidance, and the SRAM. Please see the response to comments 623-99 and 623-103. Contaminant impacts were evaluated in Chapter 4, Section 4.9, of this EIS, as the sum of multiple individual contaminants. The RBSLs were only used for scaling factors to determine the individual risks and then risks were summed. Cleanup under the Cleanup to Revised LUT Values Alternative and the Conservation of Natural Resources Alternative would be performed using “the sum of fractions” approach to achieve the target risk/dose based limits proposed. The approach used in this EIS is presented in Appendices G and K.

Commenter No. 623 (cont'd): Southern California
Federation of Scientists

15

based cleanup level of X, and contaminant B has a risk-based cleanup level of Y, and both are present, one isn't allowed to avoid cleanup if contaminants A and B are each at, say, 95% of their limits. Instead, one takes the fraction of the limit for each, adds them together, and cleans up if collectively they exceed a ratio of 1.

Because DOE has contaminated SSFL so badly, with so many pollutants, it appears to be suggesting avoiding cleanup obligations by not just breaking the AOC, not just using the wrong RBSL, not just averaging, but by allowing contaminants to nonetheless remain not cleaned up, by some undefined risk assessment process. It will use RBSLs, it proposes, not to actual do cleanup, but to "make cleanup decisions," and appears to contemplate allowing collective average risks to go as high as several hundred times the one in a million risk level it had promised and is the standard risk goal. When one adds in the problem of using the wrong RBSL and of averaging, this approach could leave contaminant levels thousands and tens of thousands and even hundreds of thousands of times higher than if the normal risk goals were used and used appropriately.

This needs to be candidly disclosed, rather than hidden, in the EIS. Is DOE proposing that remaining risks would exceed the one in a million risk goal? Is it, at least for Alternative 3, not even using the RBSLs as cleanup levels but, in addition to exceeding them by averaging, also exceeding them by a risk assessment process that allows risks orders of magnitude higher than 10^{-6} ? Does it propose to not follow the sum of the fractions rule for Alternatives 2 and/or 3?

DOE argues on p 2-25 that it should be allowed to break the AOC because there are too many contaminants with which it has polluted SSFL. This is illogical. The fact that it contaminates the site with so many chemicals argues for stricter standards, not weaker ones.

DOE cherry picks two examples of other cleanups that it asserts have weaker cleanup standards than DOE agreed to at SSFL. But even if true, there are many other cleanups that are stronger, and in any case, DOE agreed to cleanup to background at SSFL, and the fact that some other sites are controversially using weaker standards was known when DOE signed the AOC. It provides no basis for breaking it.

DOE asserts that the "AOC LUT values do not account for the natural occurrence of many constituents in the soil, meaning that they could lead to decisions to remove soil that has not been contaminated by Area IV soil." This is false. The LUT values are based on background—the natural occurrence of the constituents. Furthermore, the statistical test used to establish background, USL, is the least protective of human health by far of statistical tests and errs exceedingly heavily on not removing soil that has not been contaminated. Its bias is very strongly to avoiding cleaning something up that is not contaminated, when arguably the bias should be to avoid not cleaning up something that is contaminated.

The imprecise language employed in the EIS, saying that point-by-point exceedances of its proposed revised LUT values, in Alternative 2, will trigger "cleanup decisions," rather than trigger cleanup, is troubling. In Alternative 3, DOE seems to imply that even when averaged over wide areas, averaged exceedances of its proposed revised LUT values will not necessarily trigger cleanup, but only "cleanup decisions." And in the purported risk assessment and cost-

623-53

623-54

623-55

Please see Chapter 4, Section 4.9, for a summary of the risks associated with each of the action alternatives. In view of the rate of cancer in the general population (nearly 1 out to 2 in a lifetime), EPA CERCLA guidance has established that risks of getting cancer less than 1 in 1,000,000 are insignificant and that risks in the range of 1 in 10,000 to 1 in 1,000,000 may be acceptable when all impacts of remediation options are evaluated. Therefore, risks in that range are typically evaluated for acceptability during evaluation of alternatives and selection of a remedy for remediation.

623-53 Background soil concentrations are not an absolute value but reflect a range of possible values. This means there is a potential for naturally occurring concentrations of a constituents to be above a value that does not properly consider the possible range of values. Selection of the value needs to consider the natural variability. DOE's assertion is based on the fact that 42 percent of the chemicals analyzed by DTSC for the identified background sites exceeded their AOC LUT value in at least one sample and at about 25 percent of the background points at which samples were taken at least one chemical exceeded its AOC LUT value. This means that the LUT values did not adequately consider the natural variability of constituents in soil.

623-54 Please see the response to comment 623-51. A cleanup decision would lead to cleanup. The language reflects the need to evaluate to determine if the cleanup level has been achieved.

623-55 As discussed in Chapter 4, Section 4.9 of the Draft EIS, The risk values are compared to an EPA defined acceptable risk range of 1 in 1,000,000 to 1 in 10,000. Any risks lower than this range are by default acceptable. Any risks higher than this range are by default usually unacceptable. Risks within the range are subject to a cost-benefit evaluation. So the upper threshold for potentially acceptable risk is 1 in 10,000. In response to comments, DOE has added a quantitative evaluation of onsite impacts for all soil remediation alternatives. The results of the modeling are included in Chapter 4, Section 4.9 of this Final EIS.

**Commenter No. 623 (cont'd): Southern California
Federation of Scientists**

16

benefit analysis in the appendices, it appears DOE is proposing risks far in excess of the 10⁻⁶ level the EIS repeatedly asserts as the cleanup level for its Alternatives 2 and 3.

We oppose DOE breaching its commitments to cleanup to background and its proposals to instead use what it claims are suburban residential RBSLs. Furthermore, the claimed proposed revised LUT values, asserted to be based on residential RBSLs, are not the actual suburban residential RBSLs, but orders of magnitude higher. We oppose this as well.

We oppose DOE using its revised LUT values as merely levels that trigger “cleanup decisions” rather than cleanup itself.

We oppose DOE employing some undefined “risk assessment process” for cleanup, rather than actually cleaning up to cleanup levels.

We oppose allowing multiple contaminants to allow greater risk above background than the limits for individual contaminants allow, i.e., failing to employ the sum of the fractions rule.

We oppose averaging, which would allow concentrations of pollutants in one location far in excess of cleanup levels, by averaging with other locations elsewhere that are cleaner. Exposures are not random, and people thus could be exposed at excessive levels. EPA guidance is to use the “not-to-exceed” approach of cleaning up everything over the cleanup level rather than averaging³ elevated areas with lower areas for residential cleanup standards, as DOE is using, or any other where the exposure cannot be guaranteed to be random. Averaging violates the AOC; averaging is at variance with EPA guidance⁴, which DOE is bound to follow pursuant to the 1995 DOE-EPA Joint Policy. And averaging violates both fundamental scientific and public health principles. Cleanup aims to protect the person who might reasonably be expected to get the maximum exposure. Allowing some people to get excessive exposures because other people would get lower exposures is impermissible. DOE must live up to its commitments in the AOC to not average.

At the end of the day, DOE must live up to the commitments made in the AOC. All of its alternatives violate the AOC, violate basic principles of environmental remediation, and would pose great and unacceptable risks to public health and the environment.

DOE then goes on to argue that there is a high level of uncertainty in cleanup decisions under the AOC. Again, this is scientifically false, and does not represent anything new that DOE didn't know when it signed the AOC.

³ see Radiation Risk Assessment at CERCLA Sites: Q&A, OSWER 9285.6-20, June 13, 2014

⁴ DOE in the EIS conveniently ignores the recent EPA guidance, the Q&A mentioned above, and instead references a 25-year-old guidance document that nowhere says that one should average, but merely shows how to do it if one is going to average. As indicated in the Q&A, averaging may be appropriate in limited circumstances, but not when one is presuming residential exposures or others that can't be guaranteed to be random.

623-56

623-56 DOE acknowledges the authority of the DTSC to set the LUT values per the 2010 AOC. The statement that there was nothing new that DOE “didn't know when it signed the AOC” what the soil cleanup levels would be, is inaccurate. The AOC was signed in December 2010. DTSC published the LUT values in June 2013. DOE could not assess the impact of the values on soil cleanup decision until after June 2013.

The LUT values were adjusted based on EPA's recommended uncertainty process. As described in Chapter 2, Section 2.3.3.1 of the EIS, EPA provided guidance and recommendations on how the AOC LUT values for radionuclides should be developed (HGL 2012c). EPA states that, “BTVs [Background Threshold Values] alone are neither appropriate nor recommended for use as the LUT values.” EPA also stated that their field action levels (FALs), which they renamed “radiological trigger levels” (RTLs) after adding uncertainty factors to the FALs, should not be used for radionuclide LUT values. EPA stated that the RTLs were developed for EPA's radiological investigation of Area IV and, “UEPA does not [EPA emphasis] recommend the use of those [RTLs] for future phases of the project,” (i.e., cleanup). EPA recommends consideration of uncertainty in the decision-making process. EPA states, “For any given sample, a laboratory result that is equal to the BTV represents a range of possible true values for that sample; some of which are less than the BTV and some of which are greater than the BTV. Whether that result represents a true sample value that actually exceeds the BTV is purely a matter of chance; a decision that the BTV has been exceeded would be incorrect 50 percent of the time,” (meaning a 50 percent false positive rate or that one-half the time, DOE could be remediating clean soil). EPA further states, “[e]stablishing a decision criterion, without considering the impact [of uncertainty], would

Commenter No. 623 (cont'd): Southern California
Federation of Scientists

17

This section misstates the primary statistical issue of uncertainty. DOE argues that there needs to be certainty that every soil sample to be cleaned up is indeed contaminated. However, there are two aspects to uncertainty – (1) the probability that one might clean up some dirt whose measurements show it to be above background when in fact it is not, and (2) the probability that some dirt that measurements report it to be at or below background when it is in fact contaminated. In other words, what is an acceptable level of cleaning up a bit of dirt that doesn't need cleaning up versus what is acceptable to erroneously not clean up when it needed to be. These are typical Type I and Type II statistical error issues. DOE is only concerned with the first type of uncertainty and completely ignores the second. It is the risk of not cleaning up something that needs to be cleaned up that should dominate.

The chance of a sample being erroneously reported as above background when it is in fact not has been reduced to a vanishingly small probability by the statistical test EPA and DTSC used to establish background. Called the Upper Simultaneous Limit (USL), it is a very rarely employed technique that is the least conservative in terms of protecting public health and avoiding the failure to clean up something that is indeed contaminated, and the most conservative in terms of avoiding cleaning up something that might in fact not be contaminated. In other words, it is very heavily weighted to protecting DOE's bottom line as opposed to protecting the public that could be harmed by DOE's contamination. See EIS reference URS 2012, which expressly states that the USL was chosen as the technique that would reduce to an absolute minimum the problem of false positives (avoiding cleaning up something that didn't need to be); this of course increased the problem of false negatives, the risk of not cleaning up something that needs to be.

The EIS does not mention or acknowledge this. Instead, it creates the spurious argument that with so many contaminants, there is a chance that occasionally a contaminant will be reported above background when it is not. But because the background values were so heavily inflated in the first place, the chances of this occurring are very small. And the AOC is based on a recognition that cleaning some small amounts of soil that may not have needed to be cleaned up is an acceptable trade-off given the significant amounts of soil that won't be cleaned up but should have been.

It is important to recognize that the soil sampling is just that – sampling – and that measurements of much of the hundreds of acres involved have not been made and won't be. Thus large amounts of soil that may be contaminated will not be cleaned up because no measurements were made in the first place.

The arguments about detection levels also are without merit. The LUT values were set based on background and detection limits. To say they are set at the "lower limits" of detection limits for some constituents is misleading – they were set within the detection limits. And the example given for strontium-90 is also misleading; the detection limits EPA employed for the background measurements for many of the samples were much lower than the LUT values.

The LUT values are based on background and detection limits. They are based on what can readily be detected. They are not set at levels that can't be detected.

623-56
cont'd

623-57

623-56
cont'd

result in a potential situation in which the release of uncontaminated background-level material would not be assured, but would instead be randomly determined, similar to a coin toss." EPA goes on to caution DTSC's selection of AOC LUT values: "While DTSC may select LUT values that are equal to cleanup levels, it is EPA's understanding that the extraordinarily high decision error rate for laboratory results at or near those cleanup levels [that is, background] is believed to be unacceptable." EPA states that it "recommends an adjustment to the BTVs and minimum detectable concentrations to include appropriate consideration [for uncertainty] to ensure an acceptably low decision error rate of approximately 5 percent" (HGL 2012c). The FALs used by EPA in presenting potential radionuclide contamination did not include an uncertainty factor and, thus per EPA, should not be used to determine the presence of radionuclide contamination.

The issue of decision rate error for radionuclides also applies to chemicals. The 2010 AOC (DTSC 2010) (paragraph 1.8.3.1) specifies that the detection limits for the chemical AOC LUT values should be based on the "lowest concentrations at which an analyte can be confidently detected in a sample and its concentration can be reported with a reasonable degree of accuracy and precision." During the development of the chemical AOC LUT values, DTSC chemists were critical of the process. In a memorandum to DTSC management, the chemists stated, "[t]he Environmental Chemistry Laboratory does not recommend the process outlined in the current Draft Technical Memorandum to serve as the foundation for site characterizations and for the development of the [method reporting limit] lookup table values" (DTSC 2012a).

See response 623-59, for a discussion of the impacts of leaving soil where samples had values slightly above the AOC LUT values.

623-57 DOE disagrees with the commenter. Over 10,000 soil samples for chemicals and 3,000 samples for radionuclides have been collected. Area IV and the NBZ comprise about 472 acres. That is about 27 samples per acre. Area IV is adequately characterized and the locations with contamination well defined.

Commenter No. 623 (cont'd): Southern California Federation of Scientists

Furthermore, it is not up to DOE to determine the LUT values or detection limits; DTSC has that authority under the AOC. It has set the LUT values; DOE had a right to comment when those were proposed, years ago; it is untimely to try to raise the matter now. But in any case, it is not within DOE's purview; it is DTSC's.

The assertion that DOE might clean up some soil where contamination doesn't exist is not supported by the DOE statement that the LUT values are based on the lower limits of detection limits for some constituents. And again, the key issue isn't whether some soil may occasionally get cleaned up when it may not have been above background; that is the small price presumed to be paid for dealing with the Type II error, that much soil that is contaminated wouldn't get cleaned up.

p. 2-25 – 26 discussion of EPA's recommendation is inaccurate. The AOC says that the values EPA determined for background and for detection limits during its background study are to be the LUT values. EPA recommendations for something different do not override the AOC. But in any case, DTSC has taken the EPA recommendations and created LUT values accordingly, using not the detection limit from the background study but more lax detection limits.

The assertion in the EIS that DTSC has set a 5% acceptable error rate misstates what was done. Because the background value was already greatly inflated by the use of the USL, a 95% confidence in a measured value does not mean that 5% of the time one would clean up something that doesn't need to be. And once again DOE completely ignores the false negative problem, that a significant percent of the time a measurement would indicate the sample was below background when it was in fact contaminated.

Furthermore, DTSC set not an overall 5% acceptable error rate, as suggested by DOE in the EIS, but set a "decision error rate of 5% for the measurement uncertainty at the BTV or MRL." EIS reference DTSC 2012, emphasis added. And that is for measurement of each contaminant. DOE tries to shoehorn that into a requirement of an overall cumulative error rate. DTSC set the LUT values based on detection limits that could have a 5% error rate.

The claim of compounding errors was raised during the EPA radiation survey by someone allied with efforts to break the AOC. EPA strongly refuted the argument and in fact, when the sampling was completed, concluded that the problem had not occurred, just as they had said it wouldn't. Despite measuring for more than a hundred radionuclides, the findings of contamination were reliable, as expected, limited to and focused on the key radionuclides of concern. This DOE argument now is a straw man.

Appendix J states:

In order to make cleanup decisions that involve remediation of only contaminated soils that exceed cleanup standards (e.g., no unnecessary remediation of clean soil), the remediation manager would require having high confidence in the conclusion that contaminants are present at concentrations that exceed the cleanup standard. In making cleanup decisions, two types of decision errors are possible:

A false negative decision error would occur if a remediation manager decides site

623-56
cont'd

623-58

623-58 DOE disagrees with the commenter. The text in Chapter 2, Section 2.3.3, of the Draft EIS, accurately presents quotations made by EPA and its recommendations to DTSC on deriving the radionuclide LUT values.

623-59

623-59 DOE disagrees with the commenter. DTSC did not "inflate" the background concentration; they used a concentration within the upper range of values as determined in accordance with statistical procedures also used by EPA. Background is a range of values, not an absolute value. Any concentration within that range is a true background value. Normally, decision criteria are established at a point where there is a 95 percent chance of the correct decision being made. The recommendation made by EPA on decision error was to consider uncertainty factors in the selection of the background values that would minimize the potential for removing non-contaminated soils.

Regarding the commenters concern that DOE is ignoring the false negative problem, DOE recognizes that false negative samples could occur. However, any sample subject to a false negative would indicate a sample with a contaminant concentration near background levels, i.e., near the AOC LUT value. As discussed in several locations within these comment responses and in the Final EIS, a value exceeding a LUT value is not necessarily indicative of contamination and that sample value would be below any of the risk-based standards used in this EIS to determine potential impacts to human health or the environment.

Commenter No. 623 (cont'd): Southern California
Federation of Scientists

19

exposures are not of health concern, when in fact they are of concern.

A false positive decision error would occur if a remediation manager decides site
exposures are above a level of concern, when in fact they are not.

*Remediation managers are most concerned about guarding against the occurrence of
false negative decision errors, since an error of this type may leave human and
ecological receptors exposed to unacceptable levels of contamination. However,
remediation managers are also concerned with the probability of making false positive
decision errors. Although this type of decision error does not result in unacceptable
exposures, it may result in unnecessary expenditure of resources (i.e., remediation of
soils that are not actually contaminated). For the purposes of the Area IV/NBZ, the goal
is to limit the false positive decision error rate to 5% or
less (DTSC 2013). (lined and italicized emphases added)*

Note the extraordinary statements here. While acknowledging that there are two types of error—false negatives and false positives—and that remediation managers should be most concerned about the former, where something that needs to get cleaned up doesn't in fact get cleaned up, DOE here proposes only to be concerned about false positives, cleaning up something that arguably didn't have to, i.e., "unnecessary expenditure of resources." This entire analysis is based on saving DOE money, at the expense of increasing the percentage of time people are exposed to contaminants that should have been cleaned up but weren't.

As indicated above, the claimed DTSC reference is incorrect. All DTSC said is that it was setting detection limits high enough that measurement uncertainty would not exceed 5% for each constituent. It did not say it was limiting cumulative false positive measurements to 5%. But more importantly, it chose to use the USL statistical approach to background, which inflated the results compared to any other possible statistical method considered, so as to reduce false positives to the maximum extent possible.

The appendix analysis erroneously claims there is no false negative positive. But background is not a single number; it is a statistical estimate of the upper limit of a range of background values. Comparing a range of field measurements with an upper limit of background is apples and oranges. Furthermore, there are false negative measurements, of course. If the true concentration in a sample is x, the LUT value, a measurement that is reported as 1.05 times x is a false positive reading; but a measurement reported as 0.95 x is a false negative.

DOE at minimum should do a careful analysis of how large the false negative problem would be—how much soil above background would not get cleaned up given the cumulative measurement error and the inflation of background by use of the USL.

Assume there is a distribution from x to 50x ppm of a particular contaminant in background, with a fairly even distribution throughout that range, and the USL is set close to 50x. And assume that measurements at SSFL of that contaminant in a particular area are also from x to 50x ppm, but that they are congregated around 45-50 ppm. Under the LUT, there would be no cleanup, even though clearly there is contamination above background – the mean and median values at SSFL considerably exceed the mean and median values of background. This is a false negative problem built into the LUTs that the EIS does not even mention. Additionally, the

623-59
cont'd

Response side of this page intentionally left blank.

Commenter No. 623 (cont'd): Southern California Federation of Scientists

allowable 5% false positive error rate for measurement uncertainty for each constituent does not take into account the potential for a significant false negative measurement error rate, where the measurement purports to show the sample is below the LUT value when in fact it is above it. As one more sign of the imbalance in the EIS, its use as a tool for rationalizing breaking the AOC instead of being a neutral scientific document, the EIS only discusses false positive issues and not false negative ones.

p. 2-27 misrepresents even DOE's own analysis of background, by asserting that 42% of chemicals exceeded their respective AOC LUT values in at least one sample in the background study. A lay reader would think that 42% of the background area was above the LUT values. This is misleading. It is unclear what analysis DOE is referring to in this section; no citation is given. The full analysis should be provided for review. (It does not appear to be the discussion in appendix J, which doesn't support the claims made in this section of Chapter 2.)

The actual analysis in appendix J doesn't appear to even be based on the actual USL values for background, which, as indicated above, are strongly skewed to limit false positives.

In any case, none of this is within DOE's purview, and none of it is based on new information, post-AOC. DTSC decides the LUT values, not DOE. DOE proposed cleanup to background, with lookup table values specifying what background is and based on detection limits. There is no basis provided for violating what it signed.

Furthermore, DTSC held a public comment period on the draft background study that was used to establish the LUT values:

The California Department of Toxic Substances Control (DTSC) held a public-comment period from August 2 through September 4, 2012, on the Study's Draft Report for SSFL, dated July 2012. Over the course of that period, DTSC received comments from two (2) community members (an individual plus an advocacy group representative). DTSC prepared responses to the two sets of comments listed below in Sections A and B. In reviewing the submitted comments, DTSC determined that they did not require that the Study's Report be revised.

As seen, DOE did not even submit comments. Nearly five years later, in its EIS, DOE raises issues it should have raised back then and failed to. Similarly, DTSC established the LUT values years ago; if DOE had concerns, it should have raised those with its regulator long ago. But as made clear repeatedly, it is DTSC that is to establish background, LUT's, acceptable error rates for measurements, etc., not DOE. None of this material by DOE is relevant to an EIS, since these decisions are not DOE's to make.

The TPH argument on p. 2-27 is without merit. DTSC determined years ago the LUT value for total petroleum hydrocarbons (TPHs). DOE, far after the fact, says it doesn't like the value. It sat on its hands for years about this matter, but again, it is not its to decide; DTSC establishes the LUT values.

623-59
cont'd

623-60

623-61

623-62

623-60 Information was added to Appendix D of this Final EIS that identifies the background sample locations and chemicals that exceed the LUT values. At these two background sites, samples from 54 of the 208 locations sampled (about 25 percent of the sample locations) contained at least one chemical in a concentration exceeding its AOC LUT value.

The analysis of impacts in Appendices G and K for the Cleanup to AOC LUT Values Alternative is based using the established LUT values.

623-61 DOE's understanding of the implementability of cleanup in accordance with the 2010 AOC has evolved since 2012. As discussed in Chapter 2, Section 2.3.3.1 of this Final EIS, DOE determined that there were technical issues with implementing a cleanup according to the 2010 AOC. As a consequence, and in keeping with its responsibilities under NEPA, DOE developed two alternatives to the Cleanup to AOC LUT Values Alternative that meet the purpose and need of being protective of the environment and the health and safety of the public and workers. These two risk-based alternatives, the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative, are presented in Chapter 2, Section 2.4 of this EIS. Refer to Section 2.1, "Preferences for Cleanup," of this CRD, for a description of why DOE considered alternatives to the Cleanup to AOC LUT Values Alternative.

623-62 DTSC did not sample the background location for TPH and therefore had no basis for the 5 ppm LUT for TPH. DTSC recognized this issue when it published its chemical LUT values and included the following footnote for TPH: "(3) For locations where TPH is the sole contaminant, a cleanup strategy will be considered based on the findings of the soil treatability study." The treatability studies have been completed and DOE has discussed the value of adjusting the TPH LUT value accordingly with DTSC. DOE does note that the soil treatability studies determined that between 300 and 500 parts per million of TPH-like chemicals observed in Area IV soil samples have a natural origin. When the AOC was signed, DTSC had not conducted a background study, picked LUT values, nor disclosed to DOE its intent on the values it did ultimately did select.

The statement that "there is nothing about TPHs that DOE couldn't have known when it signed the AOC" is false. DOE signed the AOC in December 2010, DTSC completed its soil background study (leaving out TPH) in December 2012, the soil chemical LUT values were not published until June 2013, and the soil treatability studies tied to the TPH issue were completed in 2014.

Commenter No. 623 (cont'd): Southern California
Federation of Scientists

21

DOE argues that two labs can't readily detect below 100 ppm. No evidence is provided that other labs are incapable of detecting below those levels. DTSC apparently identified labs that could and set the LUT value accordingly. It is up to DTSC.

Additionally, DOE argues that the LUT value was set without consideration of its natural presence. That isn't really true; DTSC set the LUTs based on detection limit and background values, whichever were greater. DOE argues, citing Nelson 205d, that organic molecules in soil could be getting reported as TPH. But Nelson actually reported that only 5-8% of the value of the TPH was due to naturally occurring material. 92-95% of the measured value thus is true TPH. The argument fails.

As repeatedly stated here, this is not DOE's call. DTSC sets the detection limits and background values, and from there the LUTs. If DOE has a technical issue with that, it should have raised it years ago with DTSC when the LUT values were established.

But even were there a genuine issue with the TPHs, and that appears questionable, it does not in any way provide a basis for breaking the legally mandated requirements of the AOC. DOE estimates that no more than 150,000 cubic yards of soil are contaminated with TPHs and/or PAHs and nothing else. It does not discriminate what fraction of that 150,000 cubic yards is exclusively TPHs, nor what fraction of that is TPH at levels it believes cannot be detected or is due to naturally occurring material. At best, this represents a small fraction of the total cleanup required under the AOC and in no way challenges the AOC itself.

Finally, there is nothing about TPHs that DOE couldn't have known when it signed the AOC.

Next DOE claims, p. 2-27 to 2-28, that there have been changes in site knowledge since the signing of the AOC. This is unconvincing.

First of all, DOE says that the EPA radiological study showed that approximately 70% of soil samples with radioactive contamination are within five radiological areas of interest. That provides no basis for questioning the agreement DOE signed – if anything, that should make cleanup easier.

It says there was a belief that there was widespread radioactive contamination at SSFL. And indeed, that has turned out to be true. Contamination was found, in addition to in those five areas of interest, throughout much of Area IV. It was found not just near nuclear buildings, but in areas where no nuclear activity occurred, showing that there were airborne releases and deposition (e.g., from nuclear fires at the hot lab, illegal burning at the burn pit, releases from reactor accidents like the partial meltdown) that transported the contamination from the source of the release to areas distant from it. So what we have learned is just what was expected; about 2/3 of the contamination is located near where the releases occurred, and the remaining 1/3 substantial distances away.

So there is nothing new; and to the extent DOE argues something is new (70% located in five areas of interest), that strengthens the case for the AOC, not weakens it. Indeed, DOE says of the five areas where the radioactivity is particularly bad "each of these areas were known to be

623-62
cont'd

623-63

623-63

The few locations where EPA found elevated concentrations of radionuclides were mostly locations that were subject to prior cleanup actions, and were known. EPA made it clear in its study conclusions that exceedance of a background threshold value, in itself, does not indicate the presence of radionuclide contamination. Most of EPA's results were small exceedances of the threshold values (EPA's Field Action Levels).

Commenter No. 623 (cont'd): Southern California Federation of Scientists

impacted by radionuclides prior to EPA's study...." So why is this matter even included in the section on "changes in site knowledge since the signing of the 2010 AOC?" DOE knew these areas were contaminated when it signed the AOC, and the fact that there is contamination elsewhere just reinforces the need for cleanup.

623-63 cont'd

DOE argues that those five areas had been subject to prior cleanup to an approximate 9.2 pico/gram standard. It is not clear to what this is referring, as there are a number of different radionuclides present, each of which has a different cleanup level proposed in the 1999/2000 Boeing document referenced. The document to which this sentence did propose 9.2 picocuries per gram for Cs-137; but for other radionuclides, different standards were proposed.

However, these were proposed remediation standards; the sites in question were not actually cleaned up. DOE issued an EA proposing to use those standards, which would have left 99% of the contamination not cleaned up, and the court struck down the proposal.

In any case, it is clear from the EPA survey that contamination in excess of 9.2 picocuries per gram remains at SSFL. The EPA fact sheet summarizing their findings shows Cs-137 at 192 picocuries per gram, for example.

623-64

More importantly, those proposed cleanup levels were orders of magnitude higher (less protective) than EPA's preliminary remediation goals (PRGs) for radionuclides. The EPA PRG for suburban residential exposure for Cs-137, for example, is 0.0303 pCi/g, three hundred times lower (more protective). For Sr-90, the PRG is 0.00361 pCi/g, compared to what Boeing proposed in the late 1990s of 36, about 10,000 times higher. For plutonium-239, Boeing proposed 33.9 pCi/g; today's EPA PRG is 0.00615 pCi/g, 5500 times lower.

623-64 In the Draft and Final EIS, DOE is not proposing a risk-based soil standard for radionuclides but instead will perform cleanup based on a using EPA CERCLA risk assessment principles. The comparison of the prior soil standard was only to illustrate that for the most part, prior soil cleanups met the standard. As stated in Chapter 2, Section 2.3.3.1, of this Final EIS, only about 12 percent of the samples collected and analyzed by EPA reported radionuclides above the EPA's FALS, and the majority of those were located within 5 areas of Area IV. DOE concludes based on these findings that radioactive contamination of Area IV is not widespread.

So, it is not clear that it is true that all the areas where EPA identified contamination had been "subject to prior soil removal actions by DOE to an approximate 9.2 picocurie per gram cleanup standard." DOE proposed to do cleanup and use that standard for cesium-137 and similarly extremely high (lax) standards for radionuclides, but the proposal was stopped by the court. And EPA found contamination present now at levels in excess of even those very lax proposed standards.

623-65

Again, DOE claims that "only" about 12 percent of the samples exhibited radionuclide concentrations showing contamination. (The actual figure is 13%; see EPA Fact Sheet; 500 of 3735 samples had radionuclides above background, or 13.3%.) Roughly every seventh sample was contaminated. That is not something DOE should be boasting about.

623-65 The text of this EIS has been revised to accurately state the percent of samples exhibiting radionuclide concentrations exceeding threshold values. DOE notes that in its concluding guidance, EPA stated that exceeding a threshold level is not an indication of radionuclide contamination.

623-66

It goes on to say that cesium-137 and strontium-90 were the primary radionuclides found, "consistent with site knowledge prior to the EPA study." Again, why this is in a section on "changes in site knowledge since the signing of the 2010 AOC" is puzzling – DOE is saying that this is not a change. And of course, cesium and strontium are precisely what one would primarily expect—they are primary fission products, with long half lives. And the fact that they are primary radionuclides found contaminating SSFL is not a reassuring fact. They are extremely biologically dangerous. Cesium-137 is a powerful gamma emitter; strontium-90 concentrates in bone and can cause bone cancer and leukemia; they are very bad actors from a

623-66 The EPA radionuclide study was completed in 2014 confirming site information available when the AOC was signed in 2010. While finding the radionuclides that were found was not surprising, the extent of the contamination was not as extensive as generally perceived by the public. The SSFL, including Area IV, is fenced and is not accessible for the routine grazing of cattle.

Commenter No. 623 (cont'd): Southern California
Federation of Scientists

23

health standpoint, and persistent in the environment, with an ability to concentrate from soil into vegetation and into humans. The presence of cows grazing on Area IV and nearby is especially troubling, because of the capacity of strontium-90 in particular to concentrate in grass, then in the cow, then in the milk, then in the body of the child or adult drinking the milk. It was strontium-90 bioaccumulation in children during the atmospheric fallout period that in part led to the partial test ban in the early 1960s.

DOE concludes this paragraph with another misleading statement: "As a result, the EPA findings disproved the general belief that Area IV is highly contaminated by radionuclides throughout." Does this mean it is highly contaminated in many places, but not everywhere in Area IV? Or is DOE trying to say that there is contamination in many parts of SSFL, but not all? Or that the contamination is not "highly contaminated?"

A couple of key facts about radiation are important here. High levels of contamination can produce acute radiation syndrome, the kind of extreme prompt health effects seen right after the atomic bombings of Hiroshima and Nagasaki where people got such large doses that they died within days. No one is talking about radiation levels like that at SSFL, or any other contaminated site in the U.S. That is simply a red herring.

What one worries about from radioactive contamination at DOE and similar sites are latent effects – increased incidence of solid cancers, leukemias, genetic effects, heart disease, etc. – that have a latency period of years before evidencing themselves. It has long been established that there is no safe level of radiation exposure – all doses increase the risk of these latent effects, with the greater dose producing the greater increase in risk.

One aims to limit that increased risk to one in a million (10^{-6}) – see, e.g., EPA CERCLA guidance. DOE claims in the EIS that that is the risk it is proposing for its Alternatives 2 and 3. But the radioactive contamination levels EPA found remaining at SSFL far exceed those risk levels. The 196 pCi/g of Cs-137 found, for example, is 6500 times higher than a one in a million risk level, according to the EPA PRG calculator for residential uses. The strontium-90 found at 21.3 pCi/g at SSFL carries with it a risk 6000 times higher than the 10^{-6} goal for suburban residential exposure. For agricultural exposures the risks can be even greater. These are not trivial concentrations, as DOE would appear to imply.

So, the first paragraph of the section on changes in site knowledge since the AOC was signed identifies no changes whatsoever.

The remaining two short paragraphs that try to make the case for new knowledge that would support breaking the AOC fail to provide any such support. DOE states, "What was not clearly known at the time of the signing of the 2010 AOC was the extent of soil contamination by chemicals." First of all, DOE should have known; it contaminated the soil with those chemicals. But secondly, the discovery that there was much more contamination than DOE had presumed before argues for more cleanup, not less. The new information is that there is much more contamination than DOE thought before. That logically can only support more cleanup, not the abandonment of existing cleanup obligations and leaving in place vast quantities of contaminated soil.

623-66
cont'd

623-67

623-68

623-69

623-67 The statement in the Draft EIS was attempting to convey that EPA's data show that radionuclide contamination is restricted to a few locations in Area IV and is therefore not widespread. The text of this Final EIS was revised to clarify that the extensive soil sampling performed by EPA and DOE and the review of those data by EPA and DTSC show that radioactive contamination is restricted to about 12 locations (and the majority of those were located within 5 areas of Area IV). Please see Section 2.10, "Public Perceptions About Waste and Contamination in Area IV," for additional information.

623-68 In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. Neither an agricultural scenario, nor a residential scenarios that include consuming products grown in a backyard garden, are appropriate for property that would be restricted to an open space land use.

The locations with the higher levels radionuclide contamination would be targeted for cleanup under all three action alternatives. In this Final EIS, under the Cleanup to AOC LUT Values Alternative and the Cleanup to Revised LUT Values Alternative, radionuclides would be cleaned up to LUT levels. Under the Conservation of Natural Resource Alternative, radionuclides are analyzed for cleanup commensurate under two scenarios: 1) a recreational user consistent with the designation of the property as open space (the Open Space Scenario), and 2) residential (without garden) land use scenarios (the Suburban Resident Scenario). The Open Space Open exposure scenario evaluated by DOE is appropriate for the future open space use for SSFL, while the Suburban Resident Scenario provides a conservative analysis for comparison.

623-69 These comments have been addressed in the responses to previous comments. Please see the responses to comments 623-20, -56, -59, -62, -63 and -66.

**Commenter No. 623 (cont'd): Southern California
Federation of Scientists**

24

The argument DOE makes is that it wants to break the AOC because (1) AOC values are supposedly low, (2) purported false positive issues, and (3) the claim that TPH readings were in fact in part due to other organic molecules. We have shown above how each of these claims is wrong and do not in any way justify breaking the cleanup commitments. AOC values are not low—they are comparable to or exceed true risk based screening levels for suburban residential exposures, let alone agricultural. The false positive issue is incorrectly presented; it posed no problem when more than a hundred radionuclides were analyzed for, and can only increase somewhat the total soil cleanup required, whereas the false negative issue, ignored by DOE, works in the precise opposite direction and results in failing to clean up much that is contaminated. Furthermore, the USL statistical choice for background had inflated background so as to narrowly limit false positives while significantly increasing the chance for false negatives. And the TPH matter is wrong; DOE's own Nelson study indicates naturally occurring material represents only 5-8% of the TPH; and even were there a TPH issue, it results in only a fraction of the 150,000 cubic yards DOE says are contaminated with TPH and/or PAHs alone, with 90% of the soil DOE now estimates being contaminated having other contaminants that would necessitate cleanup. These are all straw men.

The entire premise of the EIS—with all alternatives breaching the legally binding AOC—has to rest on some new information that DOE did not have or could not have had when it proposed and signed an agreement to cleanup to background. It rests instead on a few sentences on p. 2-28, none of which provides such a basis.

Essentially DOE now says it had no idea how badly it had contaminated SSFL, and because the contamination is far greater than it had realized, it should be allowed to clean up much less. This of course makes no logical, scientific, or public health sense.

Finally, DOE argues that it would be difficult to get offsite fill that meets the LUT for all constituents. That argument is unavailing. First of all, only two constituents of Gillibrand fill are reported as possibly exceeding the LUT value, and both just barely. The LUT value for one is 3.9 and the value reported is 4; but it is tagged "J", for measurement is just an estimated value for which there is not confidence. The second one (measured at 1.09) is similarly close to the LUT value (0.86) but also reported as an estimated value. For all practical purposes, they are at the LUT value and, given that neither is a value that is better than an estimate, neither therefore demonstrates it is above the LUT value. Were this a measurement at SSFL, DOE would have replicated the measurement and if it came back lower, thrown out the higher value. Now, when it is to its advantage, it does the opposite.

(A third measurement is highlighted, again tagged "J" and the estimated value is not much different than the LUT; but the MDL is higher than the LUT value, so there is no confidence that the estimated value is in fact above the LUT.) Additionally, DOE itself says there is no health risk from those minor exceedances.

But the key is that even if it were true that the Gillibrand soil slightly exceeds the LUT value for a couple of constituents—which is not demonstrated—that doesn't make the AOC in need of abrogation. The AOC has provisions, which, in fact, DOE has recently invoked, that if

623-69
cont'd

623-70

623-70 DOE notes the 2010 AOC does not allow to determine that a backfill source that is "close enough." Therefore, the two LUT values exceeded by the Gillibrand soil make it unacceptable as backfill according requirements of the 2010 AOC. As stated in the AOC, all chemicals above the LUT values are exceedances and should be remediated. Refer to Section 2.3, "Suitable Backfill Soil," of this CRD for discussion of the responsibilities and actions necessary to identify a backfill source. As stated in this EIS, DTSC does have the authority to change this requirement. DOE has initiated consultation with DTSC on this subject, as is required by the 2010 AOC. The responsibility for identifying backfill ultimately lies with DTSC per the 2010 AOC, which states: "If an onsite or offsite source of backfill soils that achieves all LUT values cannot be reasonably found, then DTSC, DOE and EPA shall enter a consultation process and DTSC shall determine the best available source of backfill." It should also be noted that DOE evaluated the sites DTSC identified as clean background sites. The background sites should be reasonable candidate locations for backfill as they have similar lithology and chemical makeup as Area IV and have not been affected by SSFL operations. But the soil cannot be used as backfill because 42 percent of the chemicals analyzed by DTSC for the identified background sites exceeded their AOC LUT value in at least one sample and at about 25 percent of the background points at which samples were taken at least one chemical exceeded its AOC LUT value.

Commenter No. 623 (cont'd): Southern California
Federation of Scientists

25

replacement soil exceeds LUT values in any way, DOE and DTSC shall confer and DTSC shall decide which is the best replacement soil under the circumstances. So the Gillibrand soil can readily be used, without any challenge to the AOC; the AOC contemplated this issue and allows it.

Thus, none of the arguments in §2.3.3.1 is scientifically valid. None of the arguments represents something new that DOE couldn't have known when it signed the AOC. All that has changed is that DOE wants to break its commitment.

We discuss the four alternatives in our summary statement, and the issues with those alternatives are well dealt with in the comments by the City of Los Angeles, NRDC and CBG, in which we join, so we will not detail the problems here.

appendix B

B.1 Land Use

The DEIS says that the proposed activities could cause potential impacts "if they displace or cause a change in land use that conflicts with an applicable land use plan, policy, or regulation of Ventura and/or Los Angeles County, including general plans, any specific or area plans, and zoning ordinances..." This is true, and all 3 options considered would do so, but none of those impacts is admitted or analyzed.

The Ventura County zoning and general plan for the SSFL land allows, according to the County, "allow for a wide array of both residential and agricultural land uses."⁵ Those residential uses allow for vegetable gardens, fruit trees, etc. The agricultural uses include "a wide range of crops and fruit-bearing trees" and a "wide range of animals, including cattle (ranching), horse ranches, etc."⁶ Indeed, SSFL, before Rocketdyne, was a working farm/ranch, the Silvernale Ranch, and cows from neighboring agricultural areas still graze at and near the contaminated site.

The longstanding position of DTSC and EPA is to rely heavily on local zoning and general plan designations for determining the cleanup level required for a contaminated site. Nowhere in the DEIS, however, is there any analysis of the agricultural exposure pathway, which generally produces far higher estimated risks and concomitantly far lower and more protective cleanup standards than those on which the DEIS is based.

Similarly, nowhere in the DEIS is there an analysis of suburban residential use with garden, a scenario also allowed under the zoning and general plan. So despite the assertion in B.1.2. that a key impact driver is the zoning and general plan allowable land uses, what DOE now proposes

⁵ Letter, Kim Prillhart, Director, Ventura County Planning Department, to Mark Malinowski, DTSC, July 20, 2015.

623-71

623-71

Please refer to the response to comments 623-10 and 623-36. Text of this Final EIS was revised to identify open space as the future land use consistent with the Boeing conservation easements (Ventura County 2017a, 2017b).

Commenter No. 623 (cont'd): Southern California Federation of Scientists

would result in leaving contamination levels that would interfere with most of the uses allowed by the zoning and general plan.

Boeing assertions about its intentions regarding the future use of land are irrelevant to this determination, as responsible parties do not get to determine the cleanup level of contamination on their land by preemptively restricting the future use.

B.1.3.1. The DEIS correctly notes that Area IV is zoned agricultural, but fails to disclose either that this allows residences nor that the "Open Space" designation for the NBZ is a zoning designation that allows agricultural uses. Similarly, the DEIS does not disclose that the "open space" general plan designation allows a wide range of residential and agricultural uses.⁷

B.2 Soils

This section fails to analyze the effect of the contamination on the soils, including those offsite subject to migration of onsite contaminants.

B.3. Surface Water Resources

Following the same pattern throughout the EIS, it only examines the negative impacts from cleanup, failing to examine the negative impacts of the contamination and those impacts were DOE to fail to clean up all the contamination, so that surface water would continue to be contaminated and migrate offsite, carrying contaminants into other water bodies. There have been approximately 200 exceedances of pollution limits and benchmarks in recent years, and over a million dollars in fines, due to contamination leaving the site in surface water at elevated levels.

B.4. Groundwater

The same fundamental problem applies here; impacts of cleanup on groundwater are identified as impact drivers, not the contamination of groundwater itself and the impact of failing to clean it up. Groundwater contamination plumes have already migrated offsite.

This section contemplates not cleaning up the groundwater, but rather walking away from the contamination, in part claiming natural attenuation. It focuses on tritium, but there are numerous other contaminants in the groundwater and walking away from the contamination rather than cleaning it up is no solution and violates the AOC and 2007 Consent Order.

Indeed, migration of contaminants from SSFL appears to have already affected the Aroyo Simi and has infiltrated into and contaminated significant groundwater sources in Simi Valley.⁸

⁷ id.

⁸ See Ali Tabidian, Ph.D. *Land-use conversion and its potential impact on stream/aquifer hydraulics and perchlorate distribution in Simi Valley, California*, October 2006, prepared for the SSFL Advisory Panel, established and funded by the State Legislature to oversee studies of health impacts from SSFL.

623-71
cont'd

623-72

623-73

623-74

623-72 Please see Appendix B, Section B.9, for a discussion of the impacts from contaminants. Also, please refer to the Topics of Interest, "Public Perceptions about Waste and Contamination in Area IV" (Section 2.10 of this CRD) and "Offsite Impacts" (Section 2.7 of this CRD) for discussions of these topics and DOE's responses.

623-73 All of the soil remediation action alternatives addressed in this EIS would involve removal of contaminated soil and are protective of the health and safety of the public and the environment. Exceeding a LUT value for any chemical or radionuclide does not mean that contamination is present nor is it an indication of risk posed to onsite or adjacent land users. This includes potential runoff following soil remediation. In addition, the LARWQCB has made it clear during several community meetings that exceedance of a LARWQCB NPDES permit stormwater benchmark does not mean that the chemical exceeded a risk-based standard. The benchmarks have been set below risk-based standards. Regardless, there have been a limited number of exceedances of stormwater benchmarks in recent years with the reduction due to extensive upgrades of stormwater measures implemented by Boeing. As noted in Chapter 3, Section 3.3.1, there were multiple exceedances of regulatory limits in the years immediately following the 2005 wildfire. These exceedances have diminished over time, with exceedances only for iron in 2011 and 2012. There were no exceedances for outfalls receiving discharges solely from Area IV in 2013, 2014, 2015, 2016, or 2017. This Final EIS includes additional discussion on risk remaining following soil removal.

623-74 The statement that groundwater plumes have already migrated offsite is incorrect. The Area IV monitoring well network sample results demonstrate the plumes remain within Area IV and the NBZ. Perchlorate has not migrated beyond the boundaries of Area IV. There is no evidence of any Area IV groundwater contaminants resulting in "significant" groundwater contamination in Simi Valley. Appendix B, Section B.4, of this EIS, describes the methodologies used to evaluate the impacts on groundwater resources from implementing the alternatives. The impact drivers, in this case, would be the elements of the alternatives. Section B.4 has been revised to state that the length of time required to achieve cleanup goals under the monitored natural attenuation is an impact driver. As described in Chapter 2, Section 2.6.3 of this EIS, several active groundwater remediation measures (including pump and treat, soil vapor extraction, and source removal) are considered as part of the Groundwater Treatment Alternative. In addition, this EIS does not just focus on tritium; it assesses measures for solvents and strontium-90. As described in Chapter 3, Section 3.4.3, of this Final EIS, the monitoring well network established for Area IV and the NBZ demonstrates that the contaminants are primarily shallow (less than 100 feet below ground surface), have not moved downward through bedrock fractures more than 200 feet, and have not moved

Commenter No. 623 (cont'd): Southern California
Federation of Scientists

B.5 Biological Resources

One again, the only “impact drivers” identified are those that support an argument for not cleaning up. No analysis of the impact from the contamination from not cleaning up much of it. No comparison is provided to the ecological RBSLs, which are in fact orders of magnitude lower than the cleanup levels proposed by DOE and thus the proposed actions would impact the biological resources by continued exposure to the contamination.

Whereas at least the human health impact section (discussed below) mentions as a potential impact “chemical and radioactive constituents in the soil could pose a threat” to future people on site, the biological features section does not even consider that the contamination on site could pose a risk to the biological features.

It is an extraordinary omission for DOE to not include the ecological RBSLs as thresholds for evaluating impacts for biological features. It creates the impression that the exclusion was because the ecological RBSLs are so much lower than the cleanup standards DOE is now proposing that it is clear the proposal to not clean up much of the contamination would far exceed the thresholds for injury to biological features from that pollution. This is a critical deficiency.

B.9 Human Health

B.9.2. claims impact to be assessed is to a future onsite suburban resident, failing to disclose they are not examining a suburban resident exposure scenario, but one hundreds or thousands of times less, by leaving out the backyard garden. Similarly, no impact on agriculture, for which the site is zoned, is considered.

Additionally, the DEIS only examines human health impacts *onsite*. One of the critical drivers of impacts, and concern, is the potential offsite impacts. Whether people ever again live on or run agricultural operations on the property, they do so nearby. Use of RBSLs that are orders of magnitude more lax than those that include a garden or address agricultural exposure pathways can result in people offsite engaged in those activities being exposed to unacceptable risks, even assuming some dilution of concentrations. And contaminants can actually concentrate offsite, as seen in the perchlorate contamination at Dayton Canyon.

Moreover, the impact evaluation only considers impacts from contaminated soil, not contaminated groundwater, surface water, or air. Elsewhere in the EIS it is argued that the risk from the polluted groundwater will not be considered because purportedly the flow rate out of wells onsite is too low for domestic use. However, as indicated elsewhere herein, the actual source cited provides no support for that claim and to the contrary shows high flow rates from some wells. Groundwater was used at SSFL for decades in large quantities for many uses, including drinking. Indeed, contamination led to the loss of the potable use of that critical

623-75

623-76

623-77

623-78

laterally off of DOE-administered areas of Area IV and the NBZ. Please refer to “Offsite Impacts” (Section 2.7 of this CRD) for a discussion of this topic and DOE’s response. There is no known contamination in Arroyo Simi associated with activities in Area IV. The referenced paper (Tabidian 2006) was reviewed and was found to pertain to perchlorate, a rocket engine ignitor. Perchlorate was not used in Area IV and the NBZ.”

623-75 The EIS was revised to reflect cleanup levels for the Conservation of Natural Resources Alternative that are based on human risk as well as ecological risk. Inclusion of this analysis more quantitatively addresses ecological risk receptors under the alternatives.

623-76 In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. They permanently bind the property, regardless of who owns the land. North American Land Trust will monitor and enforce the easement. The use of RBSLs that do not include the indirect garden pathway is appropriate for this future land use.

In this Final EIS (see Chapter 2, Section 2.4), DOE has retained the Cleanup to Revised LUT Values Alternative, which uses chemical RBSLs based on an Onsite Suburban Residential Scenario without a garden pathway. The Final EIS also retains the Conservation of Natural Resources Alternative, but evaluates two scenarios. The Open Space Scenario is based on the future land use of Area IV and the NBZ as open space, consistent with Boeing’s conservation easement and agreement (i.e., cleanup levels are based on exposure of an onsite recreational user as the receptor). The Onsite Suburban Resident Scenario is the scenario evaluated in the Draft EIS, that is, cleanup levels are based on a suburban residential scenario without a garden pathway. This latter scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space. Also see Section 2.1, “Preferences for Cleanup” of this CRD for a discussion of commenters’ preferences for alternatives or cleanup levels.

623-77 Please see Section 2.7, “Offsite Impacts,” of this CRD for a discussion and DOE’s response to concerns about offsite impacts.

In Chapter 4, Section 4.9 of this Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that local offsite residents may get some portion of their food from a home garden.

Commenter No. 623 (cont'd): Southern California Federation of Scientists

resource. And Brandeis Bardin Institute, the camp abutting SSFL, sued Boeing alleging in part that BBI had to give up its use of groundwater for human use because of SSFL contamination.⁹

B.9.3.2

Again, over and over again, the DEIS falsely states that its alternatives involve cleanup to the risk-based values for a suburban resident from the SRAM. However, the SRAM specifies SRAM-based RBSLs for a suburban resident with a garden that are orders of magnitude more protective than the values DOE actually used. Additionally, this assumes for all alternatives that radionuclide concentrations would be reduced to AOC LUT values or DOE's proposed RBSLs. In truth, under all alternatives, hundreds of thousands of cubic yards of contaminated soil wouldn't get cleaned up at all, based on improper claims of exemptions.

B.9.4 Evaluation of Impacts

DOE evaluates the health impacts through two measures, both of which are inappropriate and misleadingly described.

Firstly, DOE Order 458.1 does not apply. The AOC is the true governing document. And even if it was not, the 1995 Joint Policy with EPA applies, which requires the use of EPA guidance. That guidance bars the use of dose, unless there is an ARAR deemed protective by EPA, and the dose limits in Order 458.1 exceed the threshold for an acceptable ARAR. The entire purpose of the DOE-EPA Joint Policy was that DOE Orders such as 458.1 cannot be used for cleanup of DOE sites, whether or not on the NPL, only EPA CERCLA guidance.

Additionally, the DEIS misrepresents DOE Order 458.1 as setting a limit of 10 millirem per year to the maximally exposed member of the public from DOE activities. In fact, Order 458.1 sets a limit ten times that. See section 4.b.(1)(a) "public dose limit." In apparent recognition of the misleading nature of the statement, DOE says the DOE standards "invoke the NESHAPS limit of 10 millirem per year." NESHAPS (National Emissions Standard for Hazardous Air Pollutants) are, as the name states, restricted to air pollutants. Whereas a 10 millirem limit for air pollutants might be an ARAR, the rest of Order 458.1, governing soil and other media and allowing doses of 100 millirem. That is far outside the acceptable dose for an ARAR, and EPA does not allow the use of DOE Order 458.1 for cleanup of sites pursuant to its CERCLA guidance¹⁰, and DOE is required to use standards at least as protective as EPA's CERCLA guidance for cleanup of its sites.

Again, because DOE, for every citation it gives, provides no page #, we cannot readily determine where in Order 458.1 it claims is the basis for this assertion. The only references we can see to NESHAPS are requiring analyses of exposures to air pollutants so as to demonstrate compliance with EPA's NESHAP rules at 40 CFR Part 61. Again, that is limited to air pollution, not soil contamination or that of other environmental media. Order 458.1 allows 100 millirem for those

⁹ Third Amended Complaint for Damages to Real Property and Declaratory Relief, June 7, 1996

¹⁰ See EPA Q&A document

623-78 cont'd

623-76 cont'd

623-79

623-80

623-78 The statement that the EIS "only considers impacts from contaminated soil, not groundwater, surface water, and air" is incorrect. Sections 3.4 and 4.4 address groundwater, Sections 3.3 and 4.3 surface water, and Sections 3.6 and 4.6 air quality. Additional discussion of human health risks is included in Section 4.9. Groundwater contaminants have not moved beyond Area IV and the NBZ and there are no on-site receptors for groundwater to conduct a risk assessment. Nevertheless, Section 4.4.3 provides descriptions of the active remediation measures being considered by DOE to reduce Area IV groundwater contaminant levels to drinking water standards. Please see the response to comments 623-76 and 623-77. Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

623-79 Please see the response to comment 623-110. Please see Section 2.6, "Comparison of Radiation Doses," of this CRD for a discussion and DOE's response to concerns regarding the use of DOE Order 458.1 and a 25 millirem criteria. DOE is required to comply with DOE Order 458.1 along with any other ARARs or agreements. DOE chose to identify the 25 millirem per year in its risk-based alternative for clean in this EIS, consistent with the upper limit for dose-based release criteria under DOE requirements (DOE Order 458.1). The 25 millirem in a year exposure limit would represent a maximum possible dose. It did not take into account the Department's requirement to apply ALARA. DOE does not propose in the Final EIS radionuclide cleanup standards based on dose. DOE instead has conducted a risk-assessment based approach for soil remediation. DOE notes that the methodology used in the cleanup evaluation for the Conservation of Natural Resources Alternative in the final EIS results in doses that are well below the 25 millirem per year upper limit and are in a range that is consistent with the CERCLA target risk range.

623-80 In the context of Appendix B, Section B.9.4 of the Draft EIS, the bulleted items are a listing of all relevant thresholds for comparison. The reference to a 10 millirem per year limit is in the context on NESHAPS requirements for air emissions. Because air emissions are possible and have been considered, this is a relevant ARAR. The 25 millirem per year is the dose limit for clearance of property from DOE Order 458.1 (Section K). DOE Order 458.1 also includes a requirement that DOE consider as low as reasonably achievable (ALARA) when determining cleanup levels. Applying ALARA principles is intended to maximize the total benefits of the radiation protection provisions of a DOE activity. Please also see the response to comment 623-79 for further discussion of the dose limit.

Commenter No. 623 (cont'd): Southern California
Federation of Scientists

29

exposures—the equivalent of a chest X-ray a week, for decades, which EPA says is non-protective.

Order 458.1, at Section e.1(b) would appear to require inclusion of dose from food and water, which DOE refuses to do in the DEIS. It appears to rely on 458.1 when it wants to and ignore it other components of it in its own risk assessment.

The second criterion DOE puts forward to evaluate impacts is whether its estimated lifetime cancer risk is between 1×10^{-6} to 1×10^{-4} . This misstates the requirements, by incorrectly suggesting that anything below 1×10^{-4} is presumptively safe and acceptable. However, the contrary is true. Under CERCLA (and similarly with RCRA), one aims for a 1×10^{-6} cancer incidence risk. That is risk on which Preliminary Remediation Goals and RBSLs are based. If a Responsible Party believes it cannot readily meet that risk level, it can propose falling back on higher risk, if it can demonstrate that it meets the nine balancing and other criteria, and its regulator approves based on that showing, and then only falls back as far as absolutely necessary, getting as close to 10^{-6} as possible.

DOE has said its 2nd and 3rd options would clean up to a 10^{-6} cancer risk, and that is what should be demonstrated in the impact analysis. And since DOE's claim is based on leaving out the agricultural scenario entirely, and leaving out the primary risk contributor to the suburban residential scenario, the garden, it is clear that the actual risk from its options far exceeds 10^{-6} , and indeed, far exceeds even the extreme upper limit of the acceptable risk range, which one can only be allowed to approach under a showing of exceptional circumstances. Under the AOC, no risk assessment was to be done; it is to be a cleanup to background. If DOE ignores that and still does an impact analysis, it should be demonstrating that the cleanup will result in a less than 10^{-6} risk for a suburban resident with a garden and for the standard EPA assumptions for agricultural use. Furthermore, this must be based on the actual measured concentrations of contaminants, not a fictional number in which the real value is dramatically reduced by averaging over a wide area.

B.10.3.2

The DEIS asserts that disposal of waste would be done pursuant to a twenty-year-old DOE 1997 ROD and Programmatic EIS for dealing with waste generally. That is not correct. Waste disposal from SSFL is governed by the AOC, which expressly dictates that any waste – including from structures, debris, and other anthropogenic materials – with radioactivity above background must be disposed of in a licensed low level radioactive waste (LLRW) site or an authorized federal low level radioactive waste site.¹¹

For some reason, the DEIS does not use the legal term LLRW, which is also used in the AOC, but instead refers to "LLW." This should be clarified, as it appears to suggest an attempt to avoid the requirement of the AOC that all waste above background go to an LLRW site.

The definition given in Table B-2 does not include the definition/requirements from the AOC and should.

¹¹ AOC §1.8.1, 1.8.4, and p. 3, Appendix B

623-80
cont'd

623-81

623-82

623-83

623-84

623-81 DOE Order 458.1, Section 4.e.1 (b) requires modeling of likely exposure pathways and food is only listed as an example. Please see the response to comment 623-99 for a discussion of likely pathways.

623-82 Please see the response to comments 623-99 relative to applicable pathways, 623-103 relative to averaging, 623-110 relative to EPA CERCLA requirements, and 623-55 relative to risk limits.

623-83 The AOC does not govern the disposal of wastes generated during building demolition or soil excavation. Disposal of wastes is governed by existing Federal and State laws, rules, and regulations. The AOC states that all actions taken by DOE and DTSC must be in compliance with Federal and State laws and regulations. The cited ROD reflects DOE's decision based on the analysis in the cited EIS to establish regional LLW disposal at two DOE sites, including the Nevada National Security Site, and to not preclude DOE's use of commercial disposal facilities consistent with DOE order and policy. DOE's decision in that ROD is applicable independent of the 2010 AOC. As discussed in the response to comment 623-85, each DOE building in Area IV will be surveyed in accordance with an approved survey plan to determine the disposition of building materials during and after demolition. The radionuclide and chemical content on and within buildings or structures will be determined in accordance with decisions made pursuant to this Final EIS, regulatory requirements, and approved procedures. The approved plans and procedures will describe the activities that DOE will perform to sample and characterize DOE's remaining buildings to determine whether they are contaminated with radiological or chemical contaminants, and to determine appropriate handling methods for managing and disposing of demolition debris. This information was included in Appendix D, Section D.1, of this Final EIS.

623-84 While used in the AOC, the term LLRW (low-level radioactive waste) is not defined in the AOC. LLW (low level waste) is an abbreviation and is a term commonly used in a variety of NEPA documents rather than LLRW; both terms describe the same material. Appendix B, Table B-2, provides a definition of LLW for purposes of this EIS, and this definition is derived from Federal law (i.e., the Low-Level Radioactive Waste Policy Act of 1980 [Public Law 96-573] and its 1985 amendments [Public Law 99-240]). A statement was added to Chapter 4, Section 4.10, of this Final EIS that all wastes generated from the activities evaluated in this Final EIS will be disposed of in facilities that are licensed or permitted to accept the wastes.

Commenter No. 623 (cont'd): Southern California Federation of Scientists

Furthermore, the description of typical waste streams is deeply problematic. It describes LLW as, for example, "debris from removal of Area IV buildings with a radioactive history that is managed as LLW." This is circular – all debris with radiological history is LLW. LLW is any material above background, as set forth in the AOD. Secondly, this implies that the determination of whether something is potentially LLW is based on whether the building has a known radioactive history. This is unacceptable. The knowledge of what went on at SSFL over 70 years is extremely dubious. The fact that DOE today claims it has no memory of radioactive activity in a particular building is in no way dispositive. Time and time again we have seen situations where buildings assumed to not have had nuclear activity did in fact. Additionally, since the buildings where such activity did occur often had accidents that resulted in releases to the environment, contaminating soil at substantial distances, one must assume all buildings are potentially contaminated. They need to be thoroughly measured. There is no indication that that even surveys have been or will be done.

Additionally, there is no discussion of how background will be determined for buildings. Will one use other buildings at SSFL, which, rather than being background can in fact be contaminated themselves?

At the heart of the concern is that the AOC requires everything, including building debris, over background to go to a LLRW site, and the EIS seems to sidestep the issue, suggesting that it may intend to breach this requirement of the AOC as well. Elsewhere in the EIS, as discussed later herein, DOE says it relies on 25 millirem per year above background and Reg. Guide 1.86 contamination levels above background to determine whether to release a building. If that is the intent, it should be directly declared; and it would directly violate the AOC, and be non-protective of public health.

B.11.3 Cultural Features

DOE once again appears to try to expand the criteria for exemption in the AOC which is limited to Native American artifacts that are officially recognized.

B.14 Sensitive-aged populations

Because of the failure of the DEIS to address impacts on offsite populations from the SSFL contamination, it also fails to analyze the impacts of sensitive-aged populations, and other sensitive groups. For example, the DEIS assumes exposures for 30 years, 6 of which are as a child; but it does not use the greater cancer risk that a child has compared to an adult, or for that matter, the greater risk to females, in assessing risk.

Appendix C

DOE committed in 2012 that the purpose and need for the EIS would be to carry out the cleanup requirements for groundwater found in the 2007 Consent Order and for soil in the 2010 AOC. It committed that the scope of the EIS would be limited to how to clean up the soil to background, not whether to.

623-85

623-86

623-83 cont'd

623-85 cont'd

623-87

623-88

623-89

623-85 The statement about "debris from removal of Area IV buildings with a radioactive history" refers to the description of typical waste streams in Appendix B, Table B-2 of this EIS. The intent is to distinguish between waste from a building with a radioactive history that must be managed as radioactive waste and waste that need not be so managed. It is not clear that all debris from such a building would be considered radioactive waste. Given this, for purposes of EIS analysis, only projections were made of the various types of wastes that would be generated from building demolition. These projections were made considering the history of each building – e.g., whether the building had a history of radioactive operations. (For purpose of analysis, all waste from a building with a radioactive history was assumed to be LLW or MLLW.)

In preparation for demolition activities, surveys of building structural materials for the presence of radioactivity would be conducted.

Irrespective of the past history of these buildings, DOE proposes to survey each DOE building in Area IV in accordance with an approved survey plan to determine the disposition of building materials during and after demolition. The radionuclide and chemical content on and within buildings or structures will be determined in accordance with survey plans and procedures made pursuant to this Final EIS, regulatory requirements, and approved procedures. (Waste determined to be LLW from the buildings within RMHF and Building 4024 would be managed and disposed of off site as radioactive waste. In this EIS, waste determined to be LLW from other buildings that have a radioactive history was also assumed to be disposed of as radioactive. While waste only from Buildings 4038, 4057, 4462, and 4463 is not assumed to be radioactive, these buildings would be surveyed for the presence of radioactive material and waste material disposed of appropriately after demolition.). The approved plans and procedures will describe the activities that DOE will perform to sample and characterize DOE's remaining buildings to determine whether they are contaminated with radiological or chemical contaminants, and to determine appropriate handling methods for managing and disposing of demolition debris. This information was included in Appendix D, Section D.1, of this Final EIS. With respect to buildings, Footnote 1 of Appendix D of the Draft EIS. refers to a 25-millirem criterion. Footnote 1 of Appendix D has been deleted from the Final EIS. Also deleted in the Final EIS are any references to Regulatory Guide 1.86.

With regard to the commenter's statement that "LLW is any material above background, as set forth in the AOC." The AOC did not make that statement. Rather it identifies a requirement that soils contaminated above local background be disposed of at a licensed LLRW disposal site. DOE notes that in its concluding guidance,

Commenter No. 623 (cont'd): Southern California
Federation of Scientists

31

During the public scoping process, at the hearings and in the written comment period, the great majority of commenters insisted that DOE live up to these pledges. Rather than acknowledge this, however, DOE instead creates the false impression that the public asked DOE to break the AOC and its EIS promises and by doing an EIS that violates the AOC. The great majority of the public loudly said no to this. DOE in Appendix C buries this fact, consolidating as single entries similar comments from large numbers of people insisting DOE comply with its promises. At the same time, DOE decided to count as numerous individual entries the multiple submissions of a small number of individuals, often associated with the polluters of SSFL, urging DOE to break the 2010 and 2007 commitments.

Appendix D

D.1 asserts that some of the 18 remaining DOE buildings were “not impacted by site radiological operations” but there is no proof provided for that statement. Since there is widespread contamination of soil in Area IV, demonstrating that contamination did not remain inside buildings, and much of the release was airborne with subsequent deposition on surfaces, there is no basis for asserting any building was not impacted by site radiological operations. No data are provided showing thorough measurements of those buildings to determine they are contaminant-free; relying on “process knowledge” (what they think went on in the buildings over many decades is inadequate, as time and again one has found activities occurred that one didn’t have records of years later, or people may have tracked contamination in, etc.

Footnote 1 asserts some buildings were “free released,” and cites as the standard for that contamination levels producing 25 millirem per year or the levels found in Regulatory Guide 1.86. Both of these standards violate the AOC and also the 1995 Joint Policy with EPA requiring cleanup of DOE sites meet EPA CERCLA guidance. As discussed elsewhere herein, EPA has long declared 25 millirem/year to be “non-protective” and cannot be used pursuant to its CERCLA guidance.

Regulatory Guide 1.86 was issued in 1974 by the Atomic Energy Commission, which no longer even exists. It was not intended as a risk-based standard for cleaning up contaminated buildings, but instead was based solely on what hand-held radiation detection equipment in the 1960s could readily detect. EPA CERCLA guidance bars RG 1.86s use, absent exceptional showings that have not occurred here (i.e., DOE must request of EPA that it be allowed to be used, demonstrating some overriding need to do so and that it would be protective within EPA’s standards, and the EPA Region must request concurrence from EPA HQ).¹²

EPA guidance is to use its PRG calculators (Q&A Q16)—not 25 mrem/year or Reg Guide 1.86. EPA guidance is to use risk, not dose. (Q33) Dose can only be used in very limited circumstances, when there is an ARAR (a formal “applicable or relevant and appropriate requirement”), but only when the ARAR is 12 millirem/year or less. There is no ARAR of 12 mrem/year or less besides Maine’s state standard. DOE’s 25 millirem/year standard is thus not an ARAR and cannot be used.

¹² See EPA “Radiation Risk Assessment at CERCLA Sites: Q&A,” OSWER 9285.6-20, Q10.36.

623-89
cont'd

623-90

623-91

EPA stated that exceeding a threshold level is not an indication of radionuclide contamination. Therefore, soil exhibiting radioactivity levels above a LUT value may not be contaminated soil.

- 623-86 “Background” is not applicable to building material. DOE proposes to remove 100 percent of the building structure and dispose of the debris in accordance with the waste characterization determined through surveys and sampling.
- 623-87 Please refer to Section 2.4, “Application of Exemptions under the 2010 Administrative Order on Consent,” of this CRD for a discussion of the process that will be used to determine exemptions.
- 623-88 This Final EIS addresses the impacts on offsite populations from the releases of radioactive and chemical contaminants into the air that could occur during site remediation activities. The analysis follows a standard risk assessment methodology that includes risk factors that account for gender and various ages, (see Chapter 4, Section 4.9.1.1 of this EIS). The human health analysis determined that for any alternative or combination of action alternatives, the incidence of cancer or a cancer fatality to a member of the public following Area IV and NBZ remediation would be very low and dominated by impacts from background levels of chemical and radioactive constituents. Because of this there would be no disproportionately high or adverse impacts on any individual group, including sensitive aged populations (children and the elderly) and females.
- 623-89 The specific wording of DOE’s purpose and need has been refined since it was first stated in the 2007 Advance Notice of Intent, but the overall message expressed by the statement has remained consistent. Thus, DOE needs to remediate those portions of SSFL for which it is responsible in a manner that is protective of the environment and the health and safety of the public and workers. See the response to comment 623-45. All comments are treated equally; DOE evaluated a broad range of reasonable alternatives that meet the purpose and need based on input from stakeholders (see Chapter 2, Sections 2.3 and 2.4 of this EIS). Including alternatives in addition to a cleanup to AOC values allows for a fair and reasonable comparison of potential impacts and is required by NEPA. Please refer to “Compliance with the 2010 Administrative Order on Consent” (Section 2.2 of this CRD) for a discussion of this topic and DOE’s response.
- 623-90 The EPA Final Historical Site Assessment, Santa Susana Field Laboratory Site, Area IV Radiological Study, Ventura, California (HGL 2012a) provides insight into which

Commenter No. 623 (cont'd): Southern California Federation of Scientists

The AOC covers all structures, debris, and anthropogenic materials and requires their cleanup to background

623-92

D.2 says they used a Hazard Quotient of 1 on p. D-11 and D-12. Why is it not a Hazard Index (HI)? And why does Appendix G use 0.1? G-47 uses 0.1, but for HI.

623-93

p. D-8 they exclude ethanol and methanol and nitrate and sodium (that is intriguing, given the extensive use of sodium coolants for the reactors), by footnote, because it is supposedly a naturally occurring, low-toxicity chemical. unclear whether it is excluded from being given a RBSL and would therefore use the LUT, or is excluded from cleanup

623-94

Table D-3 comparisons of LUT values to supposed RBSLs is not only completely wrong but also misleading. The comparison makes it appear one would be cleaning up contaminants that have no risk under the AOC, but this is only because they are using RBSLs that are a thousand times higher than the actual ones.

623-95

Footnote 5 says that where TPH is the sole constituent, "a cleanup strategy will be considered based on the findings of a soil treatability study, and the soil will be cleaned to the 5 milligrams per kilogram LUT value." This is very strange, as it suggests that TPH would not be left in place for attenuation, which seems contradictory to earlier statements about attenuation for soils that have either TPH or PAH or both, but nothing else. Perhaps this is just dishonest and they don't mean soil treatment, but rather mean to not treat it at all and just leave it there for supposed attenuation.

623-96

The bottom of p. D-11 is very puzzling. DOE only proposed revised LUT values for constituents that exceeded the AOC LUT in more than 2.5% of the soil samples and which exceeded the RBSL in at least one of those samples. The implication is that they intend not to clean up any contamination, even when found, if found in less than 2.5% of samples and when what is found is not above the RBSLs. There is also a footnote about an accepted false positive error rate, which really needs to be explained. Are they trying to claim a 5% error rate and therefore not clean up real hits?

623-97

p. D-12 mentions for selenium alone an exceedance of risk-based ecological screening level, about the only reference we have seen for the eco RBSLs; see no examination of eco RBSLs in the EIS. key

623-98

p. D-13 is extremely misleading about Hunters Point and McClellan. Page 4 of McClellan ROD says the cleanup was based on industrial/commercial – they lied saying it was for residential. and p. 5 says relies on engineered and institutional controls. Again, DOE lied, saying for unrestricted residential. almost all the decisions are to rely on restricted land use. see Table 1-2

623-99

Footnote c is false. It claims RBSL is based on suburban residential scenario established for SSFL, 24 hours a day, 350 days a year, which is absolutely not true.

buildings were not impacted by site radiological operations. While such process knowledge is a common indicator of potential contamination, as stated in response 623-85, irrespective of each building's radioactive history and past surveys DOE will conduct thorough radiation surveys and sampling for each remaining building consistent with current industry practice prior to demolition and determining the final disposition of building debris.

623-91 Appendix D, Table D-1 of this EIS lists the radiological status of those buildings for which DOE is responsible in one of three categories: those identified as "not contaminated with radioactive material" do not have a history of any radioactive contamination; those identified as "contaminated with radioactive material" have known radioactive contamination and are managed accordingly; and those identified as "not considered a radioactively contaminated structure" are buildings which have previously been decontaminated and are currently used without radiological controls. The discussion in Appendix D, Section D.1 and footnote 1 was modified to reflect that the structures that were free released were released in accordance with the DOE requirements in effect at the time. However, DOE will conduct thorough radiation surveys and sampling consistent with current industry practice prior to demolition and determining the final disposition of building debris.

DOE is required to comply with DOE Order 458.1 along with any other ARARs or agreements. DOE chose to identify the 25 millirem per year in its risk-based alternative for clean in this EIS, consistent with the upper limit for dose-based release criteria under DOE requirements (DOE Order 458.1). The 25 millirem in a year exposure limit would represent a maximum possible dose. It did not take into account the Department's requirement to apply ALARA. DOE does not propose in the Final EIS radionuclide cleanup standards based on dose. DOE instead has conducted a risk-assessment based approach for soil remediation. DOE notes that the Conservation of Natural Resources Alternative (both scenarios) analysis in this Final EIS results in radiological risks in the 10⁻⁵ range; this would correspond to a dose much lower than 25 millirem per year.

623-92 This EIS evaluates separate sets of alternatives for soil remediation and for building demolition. The Proposed Action for building demotion is to remove all 18 buildings owned by DOE in Area IV. Please see Chapter 2, Section 2.5.2 and Figure 2-10 of this Final EIS for a discussion of the Building Removal Alternative and a diagram showing the buildings that DOE would remove. After a building or structure is removed it could no longer contribute to any contamination at SSFL. Any contamination remaining in the soils at SSFL after building removal would be cleaned up as part of DOE's soil remediation efforts.

Commenter No. 623 (cont'd): Southern California
Federation of Scientists

33

McClellan p 37-8 says when they analyzed residential, they included garden, which DOE doesn't and which contradicts DOE. It then analyzes industrial/commercial with restrictions, which doesn't apply to SSFL.

DOE cherry picks the McClellan remediation values from McClellan table 2-3. For example, DOE claims for SSFL a RBSL of 7290 for 1-Methylnaphthalene, but doesn't compare this to McClellan's figure of 0.73 in its Table D-5. McClellan's value is even lower than the 2.5 AOC LUT.

Even its own table shows COCs cleanup levels at McClellan far lower than DOE's RBSL (130 vs 3040, copper; mercury ten times lower, etc.) Vanadium at Hunters Point is lower than even SSFLs LUT value.

Appendix G
G.2

This section states that the EIS analysis didn't include exposures to contaminated groundwater in the assessment because of supposed low pump rates at existing wells of purportedly 0.5 to 1 gallon per hour, which it says is insufficient for household use. The EIS cites to a CDM Smith 2015 report of 241 pages; like all citations in the EIS, no page numbers are given, frustrating the ability to confirm the accuracy of the purported fact. We don't know where in the report the purported fact comes from, and indeed cannot find that assertion in the report.

The data we do find in the report, however, directly contradict the EIS assertion. Page. 8-8 indicates RD-21 pumped 173 gallons per day. RD54B did the same (p. 89 pdf). PDF p. 99 says RD33b produced 2 gallons/minute. PDF p. 140 says RD-63 produced 3.9 million gallons from periodic use between 1994-2005. PDF p. 146 says well WS-07 produced up to 4.35 million gallons annually. SSFL used site water for site supply purposes for decades.

Thus, they left out of the residential scenario any exposure to the contaminated groundwater, a major pathway.

It is asserted that Area IV and the NBZ are within a "secured perimeter fence that limits access to the soil sources." That doesn't appear to be correct; cows, for example, have been found grazing on the site of the former sodium burn pit and on other nearby land. Even if it were presently the case, there is no guarantee a fence would be there indefinitely.

G.2.1 states that rather than use the actual measurements of contamination, some of which are quite high, they instead "generate[d] soil concentrations of chemicals and radionuclides that are representative of the central tendency in the area IV and NBZ and background data sets. . . . The term 'central tendency' describes values are most typically found in the overall distribution of values (it may be represented by an average such as a median or mean) as opposed to upper-boundary values that might represent the extremes of the distribution. DOE claims that, "For purposes of analysis in this environmental impact statement (EIS), central tendency is represented by the median or mean (arithmetic)." In other words, the didn't compare the actual

623-99
cont'd

623-100

623-101

623-102

623-103

623-93 A Hazard Quotient (HQ) is the ratio of the potential exposure to a substance and the level at which no adverse effects are expected for that substance. The Hazard Index (HI) is the sum of hazard quotients for substances that affect the same target organ or organ system. Because different pollutants (air toxics) can cause similar adverse health effects, combining hazard quotients associated with different substances is often appropriate. A 0.1 HQ is used as the screening level for individual substances for inclusion in the HI calculation. A limit of 1 is used for the HI threshold, but is also used as the HQ basis for the individual substance RBSLs, as defined in Appendix D.

623-94 Due to low toxicity, RBSLs were not established for ethanol, methanol, nitrate, or sodium in the Final Standardized Risk Assessment Methodology Revision 2 Addendum, Santa Susana Field Laboratory, Ventura County, California (SRAM) (MWH 2014). While this does not impact the Cleanup to AOC LUT Values Alternative, these chemicals were not included in the RBSL lists for the Cleanup to Revised LUT Values or Conservation of Natural Resources Alternatives. Only 15 of 5,748 soil samples exceeded background for sodium. Thus sodium is not a significant contaminant for Area IV and the NBZ.

623-95 As described in the response to comment 623-8, in the Draft EIS, the appropriate risk scenario RBSLs were taken from the SRAM for the suburban resident (without garden) exposure scenario. In Appendix D, Table D-3 of this Final EIS, RBSLs for a recreational user exposure scenario (open space land use) were added to the Conservation of Natural Resources Alternative, the Open Space Scenario. This is consistent with the future use of the site as open space. Boeing entered into a land use covenant that restricts future use of the property it owns at SSFL to open space (Ventura County 2017a, 2017b); this includes Area IV and the NBZ. Neither an agricultural scenario, nor a residential scenarios that include consuming products grown in a backyard garden, are appropriate for property that would be restricted to an open space land use

623-96 The first part of the footnote comes directly from the DTSC publication of the LUT Values, June 2014 ("a cleanup strategy will be considered based on the findings of the soil treatability study"). DOE is awaiting DTSC's determination on this matter. The second part of the footnote ("and the soil will be cleaned to the 5 milligrams per kilogram LUT value") is in error and has been deleted in the Final EIS. The treatability study concluded that TPH could not be measured reliably at 5 milligrams per kilogram. The decision for the appropriate means to treat soil contaminated by TPH would be based on the efficiency and capability of various treatment options, including monitored natural attenuation, to treat TPH contaminated soil. DOE does note that the soil treatability studies determined that between 300 and 500 parts per million of TPH-like chemicals observed in Area IV soil samples have a natural origin.

Section 3 – Public Comments and DOE Responses

Commenter No. 623 (cont'd): Southern California Federation of Scientists

measured values of contaminants to the Lookup Table values or what they claim are Risk Based Screening levels, but instead only compared far lower values that represent the average.

But the statement that they compared the average contamination level against the average background value is completely false. G.2.2.2 states that for on-site data, they used the average spread over a wide area (as much as 110 acres). But for the background data, they didn't use the average, they used the 95th upper confidence level. In other words, they measured apples to compare to oranges. Rather than comparing the average contamination level against average background, they compared average contamination level against the upper statistical limit of background. That is how they can claim, over and over again, that the levels of contaminants at Area IV are always *below* background, something that isn't possible. "Background" is what would be there if the polluters of SSFL hadn't contaminated it. SSFL can't be cleaner than background. And this remarkable claim by DOE is based purely on improperly using averaging for the contamination, and at the same time not averaging for background.

The EIS decision to use the median for radionuclides and the mean for chemicals is seemingly arbitrary. The EIS says this was done because the radionuclide sampling was conducted in a biased rather than random manner (i.e., they chose where to sample based on their judgment it was a good place to find contamination if it were there). But much of the chemical sampling was simply co-located with the radioactive sampling, so it was equally biased; Furthermore, a significant portion of the radionuclide and co-located samples weren't biased. Averaging is bad enough, but the use of the median instead of the mean is particularly egregious, because very high readings are simply ignored.

The claim that there is very little difference between the median and mean, and between the mean and the UCL95 is unsupported and unlikely to be correct. The UCL95 is the very upper end of what you would expect a reading to be, whereas the mean is the average of all the readings, almost always a lesser value and frequently very much less.

G.2.2.1 states, as the EIS does over and over again, that it is evaluating the residential scenario; but as has been shown here, that isn't true. It is using a residential exposure one hundredths or one thousandths of the true residential exposure as required in the SRAM and by EPA, by leaving out the primary, required residential exposure pathway.

Evidence was found to suggest DOE removed the ECO RBSLs (ecological risk based screening levels) from CDM 2017. On pdf p51 of CDM 2017 (which is referenced in the DEIS), ECO RBSL was left defined in a footnote, but does not actually appear in the chart. Was it taken out of chart, but the footnote not removed? The values would have been 1000s of times lower than the purported residential RBSLs they now include. Were these values removed intentionally? The ECO RBSLs would have shown that DOE had to clean up pretty much consistent with AOC LUT values, which are close to the ECO RBSLs. Were they removed from the chart because it would force DOE to do a full cleanup, but the footnote was forgotten? DOE should disclose whether it removed the ECO RBSLs and comparisons from prior drafts.

G.3.1. DOE states that, "Because significant uncertainty accompanies any projection of future site uses, the exposure assessment was based on assumptions that were likely to overestimate

623-103
cont'd

623-104

623-105

623-106

623-97 The normal practice for identifying chemicals of concern is to use a 5 percent detection frequency as a criterion. For the identification of chemicals of concern for Area IV, DOE used 2.5 percent. The 2.5 percent is not an indicator of what would be cleaned up. Any location with an elevated concentration of any chemical will be targeted for cleanup.

623-98 In this Final EIS (see Chapter 2, Section 2.4), DOE has retained the Cleanup to Revised LUT Values Alternative, which uses chemical RBSLs based on a suburban residential scenario without a garden pathway. The Final EIS also retains the Conservation of Natural Resources Alternative, but evaluates two scenarios. The Open Space Scenario is based on the future land use of Area IV and the NBZ as open space, consistent with Boeing's conservation easements (i.e., cleanup levels are based on exposure of an onsite recreational user as the receptor). The Suburban Resident Scenario is the scenario evaluated in the Draft EIS, that is, cleanup levels are based on a suburban residential scenario without a garden pathway. This latter scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space. The Conservation of Natural Resources Alternative includes consideration of ecological risks in determining cleanup levels.

In Chapter 4, Section 4.9 of this Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that local offsite residents may get some portion of their food from a home garden.

623-99 Appendix D, Table D-6, of this EIS provides a comparative table of soil cleanup values for SSFL RBSLs, Hunters Point, and McClellan AFB vs. AOC LUT values. While the selected remedy at McClellan was to an industrial/commercial standard, the McClellan ROD provided evaluation of both industrial/commercial and residential cleanup levels. The values cited in Table D-6 are for unrestricted use based on a residential exposure scenario that included an ingestion of homegrown produce pathway. The Hunters Point values are also for a residential exposure scenario, including ingestion of homegrown produce.

In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or

Commenter No. 623 (cont'd): Southern California
Federation of Scientists

35

impacts to receptors in order to be protective of human health.” As they noted, Boeing’s stated intent to maintain its portion of SSFL as undeveloped open space cannot be relied upon over time, so instead “a person was assumed to build a house on site in an area where the soil contains chemical and radioactive constituents (i.e., exposure of a hypothetical future onsite resident).” However, not only is that statement misleading, but that is exactly what they didn’t do. DOE assumed the hypothetical onsite resident had no garden and assumed the house wasn’t where the main contamination was, but instead averaged their contamination with lower areas as large as 100 acres. DOE says one can’t presume institutional controls work, and therefore assume current conditions. But in the next paragraph, the DEIS says it examines for future conditions, with the assumptions of effective 100 years of institutional control, during which the radioactive materials would decay. This is unsupported and contradicted by the prior statements.

Further, neither DOE nor Boeing get to decide that cleanup levels can be weakened based on a claim that Boeing will put in place institutional controls; under EPA guidance the future use is based largely on current zoning and general plan designations, and is not allowed to be decided by a Responsible Party.

G.3.2.1.

This states that the suburban resident scenario is based on the SRAM; but the SRAM includes exposure via a backyard garden. The EIS here, as in many places throughout the document, says they are applying the suburban residential scenario, but they are not. They are using standards 1000 times weaker than the actual scenario, by excluding the primary, indirect exposure pathway. The rationale given here is completely arbitrary, contradictory, and unsupported: (1) the claim that “exposure point concentration calculations in plants are associated with significant uncertainty” and (2) “future use of the property as residential development is expected to be restricted by the landowner” (citing a Boeing letter).

EPA calculates as its default for radioactive exposures, based on extensive research about uptake in plants, exposure from the garden and requires its inclusion in the backyard garden scenario unless there is some extraordinary site-specific reason why particular vegetables or fruits can’t grow at that specific location. The SRAM similarly includes RBSLs for the suburban backyard garden, including for chemicals. And both have RBSLs or PRGs for agricultural exposure. The fact that there are uncertainties – which in fact are fairly limited, because of the extensive tracer work done regarding plant uptake – is no excuse to not consider it. Indeed, the uncertainties mean the actual risk could be far higher than assumed by the EPA PRGs and DTSC RBSLs. Leaving the indirect pathway out entirely is nonsensical; at minimum, to deal with the uncertainties, one might need to use even higher estimates of exposures from the pathways.

The result of leaving out the garden, in violation of DTSC and EPA guidance, in a hundred or thousand-fold increase in the cleanup standards, under the guise that one is still considering the suburban resident. In fact, if the correct EPA and SRAM-based values were used for the suburban resident, the cleanup levels would be orders of magnitude lower, and a cleanup very comparable to the AOC would be required. The AOC bars risk-based approaches and requires cleanup to background. But as DTSC wrote in its response to comments on the Agreement in Principle that was incorporated into the AOC, and which DOE approved, cleanup to current land

623-106
cont'd

623-36
cont'd

623-107

uses of the site. A garden pathway was not used in the RBSLs for onsite receptors in this EIS as residential development with a garden is not a future land use for the SSFL property.

In this Final EIS (see Chapter 2, Section 2.4), DOE has retained the Cleanup to Revised LUT Values Alternative, which uses chemical RBSLs based on an Onsite Suburban Residential Scenario without a garden pathway. The Final EIS also retains the Conservation of Natural Resources Alternative, but evaluates two scenarios. The Open Space Scenario is based on the future land use of Area IV and the NBZ as open space, consistent with Boeing’s conservation easement and agreement (i.e., cleanup levels are based on exposure of an onsite recreational user as the receptor). The Onsite Suburban Residential Scenario is the scenario evaluated in the Draft EIS, that is, cleanup levels are based on a suburban residential scenario without a garden pathway. This latter scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space.

In Chapter 4, Section 4.9 of this Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that local residents may get some portion of their food from a home garden.

623-100 See the response to comment 623-99. It was DTSC that identified McClellan and Hunter’s Point as being comparable cleanup sites to SSFL. The differences between the values used at McClellan and the SSFL RBSL values that DOE used for this EIS are attributable to the garden pathway not being included in the SSFL RBSL values. A footnote to this effect has been added to Table D-6. The SSFL RBSL values come directly from the SRAM values for a Suburban Resident. The SRAM separated the Suburban Resident Garden Pathway RBSLs from the RBSLs for the direct pathways due to large uncertainty in the plant uptake factors.

623-101 The Draft EIS analysis didn’t include exposures to contaminated groundwater because there is not a sustainable water supply in Area IV and NBZ sufficient for prolonged household use, particularly by multiple households. Although it is recognized that some wells can produce groundwater in some years, continued pumping will eventually lower the water table to where production no longer is possible. Water supply well WS-07 is located at the boundary of Areas IV and III. The 700-ft deep well was part of a network of 17 water supply wells at SSFL, and the only supply well located in Area IV. The lack of other water supply wells in Area IV is an indication that the bedrock aquifer in Area IV cannot sustain a continuous water supply. Water production from the

Section 3 – Public Comments and DOE Responses

Commenter No. 623 (cont'd): Southern California Federation of Scientists

use designations would result in cleanup comparable to the AOC. A comparison of the correct RBSLs for suburban residential, using EPA and DTSC's approved suburban residential inputs, which include the garden, against the LUT values and the measured concentrations onsite, shows that a cleanup very similar to the AOC requirements would occur even if a true "risk-based" cleanup were employed, using the real suburban residential risk based standards. The DOE is quietly removing the key component of those standards, the child eating an apple from a backyard tree, or lettuce or tomatoes growing in the contaminated soil.

The second rationale provided by DOE for excluding the required garden component of the suburban residential standard is equally flimsy. DOE argues that future land use is "expected" to be restricted by Boeing. But here DOE has just fallen all over itself. Just a few paragraphs earlier it has admitted that such an expectation cannot be relied upon and therefore DOE will presume there is no restriction against residential use. How it can presume residential use, because one cannot rely on Boeing's supposed intent to restrict future use, but then presume we can trust the resident will be barred from having a fruit tree or tomato plant, is impossible to reconcile. DTSC has informed Boeing that the garden must be included in the residential scenario. DOE is violating all this, as its key way of trying to walk away from the obligation to clean up its contamination.

And it is critical to remember that a main purpose of analyzing whether it is safe for someone to live on the site is as a way of determining the degree of risk for people living nearby. If it is safe for SSFL to be used for unrestricted use, then people offsite are safe as well.

But if you aren't assessing for unrestricted use onsite, the contamination migration means there is no way of demonstrating safety for people living nearby, with gardens, or people consuming milk or beef or other farm products grown close to the site.

Here DOE concedes the SRAM includes the suburban residential garden scenario, and that DOE didn't. Elsewhere in the EIS DOE however claims it used the SRAM suburban residential exposure assumptions. Not disclosing there are key components of the scenario omitted is misleading and unethical.

G.3.2.2.

Here DOE goes so far as to claim that the suburban residential RBSLs "were based on a standard set of exposure pathways." This is false. As mentioned before, the standard, default exposure pathways for suburban residential are dominated by the backyard garden, which DOE leaves out, producing RBSLs thousands of times higher than would be the case if they indeed based them on the standard exposure pathways.

G.4.2 This claims the radioactive RBSLs came from the EPA PRGs, "consistent with the SRAM exposure scenarios" but both parts of this claim are false. The EPA PRGs for suburban residential exposure are hundreds and thousands of times lower than the values DOE used, and the SRAM exposure scenarios include the garden, which DOE quietly excluded.

623-108

623-107 cont'd

623-109

623-110

SSFL water-supply wells peaked between 1957 and 1964. However, sustained pumping through this time resulted in lowering the groundwater level as much as 500 feet in the most heavily pumped area (north-central SSFL). Water levels in WS-07 were lowered 200 feet during the 4 years that it was pumping 8 gallons per minute. Water production was discontinued in all but 5 wells by the early 1960s due to insufficient yield (MWH 2009). In 1964 SSFL began importing water from the Calleguas Water District. WS-07 is currently proposed for abandonment as it is not a reliable source of water.

Sustained pumping of the wells cited in the comment would similarly be expected to draw water levels down in Area IV to the point that a reliable supply would not be available. In addition RD-21 and RD-54B produced less than the projected needs of a single 3-person household (about 540 gallons per day based on the U.S. Geological Survey estimation that the average water use in California is 181 gallons per day).

623-102 Please see the response to comment 623-99. With regards to the fence the commenter is correct and the reference to a fence has been removed. The conservation easements, prohibiting residential, agricultural, or commercial development or uses of the site and North American Land Trust will monitor and enforce the easement.

623-103 DOE agreed in the 2010 AOC to cleanup at SSFL on a point-by-point basis based on an LUT value. However, when a risk assessment is performed, EPA Risk Assessment Guidance (EPA 1989) prescribes the use of an upper confidence limit (UCL) on the arithmetic average (UCL95) and only suggests the use of a maximum value as a screening tool. Therefore, DOE has appropriately used a UCL95 (or a median when warranted) as the exposure point concentration for calculating risk and toxicity impacts. The commenter has confused the UCL95, which stands for the upper 95 percent confidence limit on the arithmetic mean of the population, with a UTL, which is the upper tolerance limit on the distribution of the population based on the distribution of the sample values. For example, a UTL95/95 is an individual concentration that bounds at least 95 percent of the population distribution with 95 percent confidence. The UCL95 bounds the arithmetic mean of a population with 95 percent confidence. For a large number of samples the UCL95 is nearly always smaller than the UTL95/95 and much closer to the mean (the larger the sample the smaller the uncertainty). The statement that there is very little difference between the median and mean, and between the mean and the UCL95 was based on comparison of actual calculated values for radionuclides. The use of the median was considered by DOE to be more statistically robust due to the biased nature of the sampling. Additional exposure point concentration data has been developed since publication of the draft EIS for chemicals

Commenter No. 623 (cont'd): Southern California
Federation of Scientists

37

DOE chose to evaluate the external exposure pathway for radionuclides in soil via its own RESRAD code rather than the EPA PRG calculator, even though external exposure from radionuclides in soil is part of the EPA PRGs. EPA guidance generally bars the use of the generally less protective RESRAD and requires the use of the PRGs, and under the 1995 Joint Policy, DOE is required to follow the EPA guidance. One is not supposed to use dose but rather morbidity risk (cancer incidence). If there is some genuine reason to not do this (and there isn't), one is supposed to use EPA's Dose Conversion Calculator, not RESRAD.

G.4.3.

p. G-17, future conditions are defined as institutional controls, working for 100 years and then estimating risks after 100 years of decay – this is inappropriate.

p. G-21 estimates onsite risks as 1.6×10^{-4} , which they claim is largely background; but under EPA rules, if total risk with background is high, you clean up to background, so the total risk is as close to the risk range as possible.

Table G-42, p G-93 is missing numerous values for the last two columns for many of the radionuclides detected by EPA as above Background Threshold Values, which would be required to be cleaned up under the AOC. DOE can't have it both ways – claiming to clean up to residential standards, but then in fact not doing so.

623-110
cont'd

623-111

623-112

623-113

is now available and the appropriate UCL95 or median values have been used in this Final EIS. It should be noted that not only does the biased sampling tend to bias the site average high, but the fact that the site results were truncated on the lower end at the detection limit for chemicals and at the FAL for radionuclides results in an additional high bias for the site data. This bias has been removed in this Final EIS by use of all the data, including that developed since the publication of the draft EIS, in performing statistical calculations.

623-104 The statement that the SRAM and EPA require a “true residential exposure” is incorrect. Both the SRAM and EPA allow for exposure assessments based on a most likely future scenario. Because Suburban Resident with garden is not a likely future scenario. It is not used here. Please see the response to comment 623-99.

623-105 DOE performed two types of risk assessments. For human health DOE employed the standard risk assessment process used by EPA nationwide and at DTSC sites in California. The process involved establishing exposure areas, analyzing the data within the exposure area, and using the analyzed data to predict the risk to human health. This is what is described in CDM Smith 2018d. The process for ecological receptors differed from the human health analysis. Because some ecological receptors will only occupy a portion of a 10,000 square meter plot, DOE reviewed the data on a point-by-point basis to see where elevated concentrations of contaminants exist, and compared the results with their respective RBSLs. Locations exceeding ecological RBSLs were targeted for cleanup. The ecological risk process is described further in Section 4.5 of this Final EIS, and in the Biological Assessment.

623-106 Please see the response to comments 623-99 and 623-103.

623-107 Please see the response to comment 623-99. The uncertainties in the plant uptake factors have already been taken into consideration in the RBSL and EPA Preliminary Remediation Goal values making them biased high to be conservative. In addition the SRAM dictates fruit and vegetable consumption rates that are biased high and are higher than those recommended by the EPA and included in EPA's Regional Screening Levels and Preliminary Remediation Goal guidance. These conservatisms result in the high risk values for background for this pathway calculated using the SRAM RBSLs for the garden pathway and why the SRAM suggests the risks for this pathway be evaluated separately from the direct pathway risks.

623-108 Please see Section 2.7, “Offsite Impacts,” of this CRD for a discussion and DOE's response to concerns about offsite impacts.

Commenter No. 623 (cont'd): Southern California
Federation of Scientists

623-109 Please see the response to comment 623-99.

623-110 Please see the response to comment 623-99 for a discussion of applicable pathways. The 1995 DOE-EPA Joint Policy creates a framework for the conduct of decommissioning of DOE facilities and provides guidance to EPA Regions and DOE Operations Offices on the use of CERCLA response authority to decommission such facilities. However, it only ensures compliance with CERCLA requirements for remedy selection at National Priorities List facilities. Since SSFL is not on the National Priorities List, CERCLA requirements for the selection of a remedy do not apply to it. However, note that this EIS does include an alternative/scenario consistent with the approach and process used by EPA in CERCLA cleanups. The radiological RBSLs used as risk slope factors for the No Action Alternative were obtained from the EPA online source for Preliminary Remediation Goals (EPA 2015) and included the direct external exposure from radionuclides in soil. The risk from the external exposure pathway due to submergence in airborne radioactive material from suspended soil for radionuclides was evaluated using default RESRAD parameters because the external dose pathway from submergence in airborne radioactive material from soil was not addressed in the SRAM RBSLs or in the EPA Preliminary Remediation Goal calculator. EPA does not bar the use of RESRAD. It is only stated in the Radiation Risk Assessment at CERCLA Sites: Q & A document that the EPA Preliminary Remediation Goal calculators are “recommended by EPA for Superfund remedial radiation risk assessments.” The RESRAD code calculates both radiological dose and risk, whereas the Preliminary Remediation Goal calculator calculates only risk. For dose calculations, the EPA uses another tool—the Dose Compliance Concentration Calculator (ANL 2015). A document that compares RESRAD with the EPA CERCLA tools, Preliminary Remediation Goal and Dose Compliance Concentration calculators, makes the following observations: “Unlike RESRAD, which uses the same models and parameters for both dose and risk calculations, the EPA uses two different Calculators—Dose Compliance Concentration and Preliminary Remediation Goal—which use different models and parameters to calculate dose and risk. The Preliminary Remediation Goal Calculator does not handle radiological decay and ingrowth properly. The ingrowth of longer-lived progenies is ignored, and some short-lived progenies are not accounted for or not accurately accounted for. Furthermore, the Preliminary Remediation Goal Calculator is not designed for realistic or site-specific analysis because many models (e.g., fish, produce, and special radionuclides) and parameters (e.g., Kds, MLF) used are not realistic” (ANL/EVS/TM--15-1).

Commenter No. 623 (cont'd): Southern California
Federation of Scientists

623-111 Please see the response to comments 623-99 and 623-102.

623-112 The information presented in the draft EIS implies that the site risk from chemicals is not significantly different from the background risk. However, the site risk was calculated without elimination of contaminants of potential concern that are in the background range before calculating the risk. This has been revised in this Final EIS to obtain a different comparison to background based only on the site COCs in background. As shown in Chapter 4, Table 4-63, the No Action Alternative residential risk from exposure to chemical contaminants of concern at background levels is 5.6×10^{-7} and the onsite residential risk from onsite chemicals ranges from 2×10^{-6} to 3×10^{-4} .

EPA rules do not dictate cleanup to background when the background risk is high. EPA CERCLA background guidance (EPA 2002) states “Where background concentrations are high relative to the concentrations of released hazardous substances, pollutants, and contaminants, a comparison of site and background concentrations may help risk managers make decisions concerning appropriate remedial actions. The contribution of background concentrations to risks associated with CERCLA releases may be important for refining specific cleanup levels for contaminants of concern that warrant remedial action.” Also, please see the response to comment 623-110.

623-113 The last two columns of Table G-42 contain the values calculated by RESRAD. As noted in the footnote, the risk from the radionuclides that are missing in the columns is evaluated and included the risk for their decay parents because they are in activity equilibrium with their parents. Therefore, separate RBSLs for them are not available from RESRAD and listing them in the table would not be appropriate.

Also see the response to comment 623-99 for a discussion of applicable pathways.

Re: San Fernando Valley Audubon Society Supplemental Comments on the Draft Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory (Draft SSFL Area IV EIS) (DOE/EIS-0402)

Dear Ms. Jennings:

INTRODUCTION AND BACKGROUND

The purpose of this letter is to provide supplemental comments on behalf of the San Fernando Valley Audubon Society (SFVAS) regarding the U. S. Department of Energy Draft Environmental Impact Statement (DEIS) on the Remediation of Santa Susana Field Laboratory (SSFL) Area IV and the Northern Buffer Zone. SFVAS previously submitted comments regarding the DEIS on April 13, 2017. However, new information has become available since that time that may alter the DOE's decision on what remediation standard is to be enforced regarding the remediation of soil and surficial media currently addressed in the Administrative Order on Consent for Remedial Action (AOC). SFVAS believes the new information is crucial to determining how DOE should proceed.

NEW INFORMATION

During the month of May, 2017, SFVAS received notice that The Boeing Company, which owns Area IV and the Northern Buffer Zone, entered into a Grant Deed of Conservation Easement and Agreement (the Easement), with the North American Land Trust for the administration of an easement encompassing all of the property owned by the company at SSFL. The Easement stipulates, among other things, that the property is to be maintained in perpetuity as open space for the benefit of wildlife and to further other conservation values (Easement, Part 1), and that no commercial, industrial, residential, or agricultural activities are to be located there (Easement, Part 4). A publicly accessible web page <http://www.boeing.com/features/2017/04/santa-susana-open-space-habitat-04-17.page>

624-1

624-1 Your comments were considered in preparing this *Final SSFL Area IV EIS*.

624-2

624-2 DOE acknowledges SFVAS' support for remediation of the Boeing property to an open space standard consistent with plans for its future use as mandated by two Grant Deeds of Conservation Easement and Agreements (conservation easements) the Boeing Company entered into with Ventura County (Ventura County 2017a, 2017b). Please refer to Section 2.1, "Preference for Cleanup," of this CRD for further discussion of this topic.

Commenter No. 624 (cont'd): Mark B. Osokow,
San Fernando Valley Audubon Society

generally describes the terms of the Easement.

SFVAS RESPONSE

In light of the new information, SFVAS re-considered its previous position supporting remediation of soil and surficial media covered by the AOC for Area 4 and the Northern Buffer Zone to a suburban residential standard, as the original comments state. As a result, the SFVAS Board of Directors passed a resolution essentially stating that SFVAS supports remediation of the Boeing property to an open space standard consistent with plans for its future use as mandated by the Easement. A copy of the resolution is appended to this letter and is self-explanatory. This letter, with appendix, is to be considered as an integral part of the SFVAS comments on the DOE remediation undertaking.

CONCLUSION

Based on the foregoing, SFVAS urges DOE to adopt a remediation standard consistent with the planned ultimate use of SSFL Area 4 and the Northern Buffer Zone as open space wildlife habitat, while preserving or enhancing other conservation values, as described in the Easement.

Sincerely,

Mark B. Osokow
San Fernando Valley Audubon Society,

In this Final EIS, DOE has retained the Cleanup to Revised LUT Values Alternative and the Conservation of Natural Resources Alternative, but evaluates two scenarios under the Conservation of Natural Resources Alternative. One scenario is based on a future land use of Area IV and the NBZ as open space, consistent with Boeing's conservation easement and agreement (i.e., evaluates a recreational user as the onsite receptor). The other scenario is the scenario evaluated in the Draft EIS, that is, a suburban residential scenario without a garden pathway. This scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space. Ecological risk is also considered in determining cleanup levels.

ADDENDUM

RELEASE TO PRESS AND THE PUBLIC

June 25, 2017

RESOLUTION TO SUPPORT REMEDIATION OF SANTA SUSANA FIELD
LABORATORY TO OPEN SPACE STANDARD

WHEREAS, based on information available at the time, in March, 2015 the San Fernando Audubon Society Board of Directors (the Board) unanimously passed a Resolution supporting remediation of the Santa Susana Field Laboratory (SSFL) a to risk-based suburban residential standard (text of resolution attached below); and

WHEREAS The Boeing Company (Boeing) owns approximately 2,400 acres of the 2,850 acre site; and

WHEREAS, at the time the resolution was promulgated, the Board was aware that Boeing had previously pledged publicly on numerous occasions to preserve their property at SSFL as open space; and

WHEREAS Boeing recently entered into an agreement with the North American Land Trust (the Trust) to have the Trust administer and enforce a Conservation Easement (the Easement) governing future uses of the Boeing-owned portions of the site as open space; and

WHEREAS the Easement is a legally enforceable document; and

WHEREAS the Easement assures that future use of the property will be limited to that of open space intended to conserve natural, historical, and cultural resources; and

WHEREAS the Easement prohibits commercial, residential, and agricultural use of the site in perpetuity; therefore, it is

RESOLVED that the San Fernando Valley Audubon Society hereby supports remediation of the SSFL to an open space standard consistent with future use of the site; and it is further hereby

RESOLVED that the previous resolution supporting remediation of SSFL to the suburban residential standard is hereby updated and superseded.

PASSED UNANIMOUSLY BY SAN FERNANDO VALLEY AUDUBON SOCIETY
BOARD OF DIRECTORS ON JUNE 26, 2017.

ATTACHMENT

AD HOC SHORT TITLE (by Mark Osokow): Resolution supporting a clean-up of Santa Susana Field Laboratory to risk-based suburban residential standard.

"SFVAS supports remediation of contamination at SSFL only to the standard for suburban residential areas. SFVAS opposes the unprecedented proposal to require remediation to background level, which would devastate outstanding wildlife habitat, extremely significant historical structures from the USA Space Age, and create significant health and safety impacts on communities near routes that trucks hauling soils offsite would pass. Background remediation would destroy Native American cultural sites, which remediation to the suburban residential standard would not."

PASSED UNANIMOUSLY BY SAN FERNANDO VALLEY AUDUBON SOCIETY
BOARD OF DIRECTORS ON MARCH 26, 2015.

Response side of this page intentionally left blank.

Commenter No. 625: Gary Kozlowski

Just now saw this website(aug.22,2017). My wife died from cancer in 1995. We moved to 6621 charing st. Simi valley ca. 93063 in 1989. She was diagnosed with lung cancer in 1992. We lived withen 2 miles of the Santa Susana site then owned and operated by Rocketdyne. My wife and mother of two died in 1995 from the cancer that came from nowhere. She never drank alcohol nor smoked cigarett. I can only believe that living where we did contributed to her cancer. It is very sad to see how little caring goes into the health and well being of people verses the progress the private companies that contract with the government that is supposed to protect and serve its citizens. That move to Santa Susana cost her life and destroyed mine and my sons. Shame on all those responsible for polluting that part of Simi Valley and West Hills. The people who made these outrageous decisions to pollute then cover up the mess need to be shamed for their actions and the government cover up speaks volumes to the citizens moving forward. This should never have happened in the way it did.

Regards to all the other people who suffered like we did. I will never forget this even though I have forgiven those pitiful souls who made all those bad decisions.

625-1

625-1 Your comments were considered in preparing this Final SSFL Area IV EIS. As described in Section 2.7, “Offsite Impacts” of this CRD, there is no evidence of major amounts of contamination leaving SSFL. The commenter is referred to EPA’s soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC’s review of the data (included as part of DTSC’s broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an offsite investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

625-2**625-1
cont’d**

Please refer to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD, for a discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of the EIS which summarizes several public health studies for the SSFL, in addition to a number of health studies for workers at SSFL as well as cancer mortality and incidence rates for the United States, California, and Los Angeles and Ventura Counties.

625-2

DOE conducted historic operations under the laws and regulations applicable at the time. There was no pollution cover up by DOE. In addition, DOE has performed much cleanup in Area IV. As described in Section 2.10, “Public Perceptions about Waste and Contamination in Area IV” of this CRD, over the operation history of the site, there have been 272 numbered structures in Area IV. As the missions for the buildings ended, they were decontaminated and removed. Today only 22 structures, 18 DOE-owned and 4 Boeing-owned, remain. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). DOE has also removed much of the contamination within the remaining buildings, soil, and bedrock that resulted from nuclear research activities. Therefore, SSFL Area IV and the NBZ do not contain large amounts of toxic contamination.

In reply, refer to SHEA-115696

Ms. Stephanie Jennings
NEPA Document Manager
SSFL Area IV EIS
U.S. Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 93063

Dear Ms. Jennings:

On April 12, 2017, The Boeing Company ("Boeing") submitted comments on the Draft Environmental Impact Statement ("Draft EIS") for the Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory ("SSFL") prepared by the U.S. Department of Energy ("DOE") pursuant to the National Environmental Policy Act ("NEPA"). The purpose of this letter is to provide DOE with additional information for consideration relating to events that have occurred since the close of the comment period on the Draft EIS, so that the information can be taken into account by DOE in preparation of the EIS. Boeing understands that the comment period on the Draft EIS has closed, but respectfully requests that DOE include this additional information in the record and consider these new circumstances as it continues to prepare the EIS.

Recording of Conservation Easement over Area IV and the Northern Buffer Zone

In our April 12 comments, we informed DOE of Boeing's plans to permanently preserve the property it owns at SSFL, including Area IV and the Northern Buffer Zone, as open space. As you are aware, on April 24, 2017, Boeing recorded a Conservation Easement in the Official Records of Ventura County in favor of North American Land Trust, covering nearly 2,400 acres of the SSFL, including Area IV and the Northern Buffer Zone ("the Property"). A copy of the Conservation Easement is enclosed for the record.

The Conservation Easement expressly prohibits the Property from ever being developed or used for residential, commercial, industrial or agricultural purposes. The Conservation Easement is perpetual in duration, meaning these uses and developments are and forever will be prohibited on the Property. The Conservation Easement unequivocally ensures, as a matter of law, that the Property will be preserved as open space habitat, protecting the unique and valuable natural and cultural resources that are present. On April 27, 2017, we notified DTSC that, as a matter of law, the State must recognize the restrictions that the Conservation Easement places on future use of the Property, and that the only legally feasible and reasonably foreseeable land use scenario for the Property is recreational. Boeing remains committed to completing a cleanup that is fully protective of human health and environment, consistent with the land's

626-1

626-1 Your comments have been considered in preparing the *Final SSFL Area IV EIS*.

626-2 DOE is aware of the two Grant Deeds of Conservation Easement and Agreements (conservation easements) the Boeing Company entered into with Ventura County (Ventura County 2017a, 2017b) and has updated the final EIS analysis to include consideration of a future open space land use for all Boeing property at SSFL.

In this Final EIS, DOE has retained the Cleanup to Revised LUT Values Alternative and the Conservation of Natural Resources Alternative, but evaluates two options under the Conservation of Natural Resources Alternative. One option is based on a future land use of Area IV and the NBZ as open space, consistent with Boeing's conservation easement and agreement (i.e., evaluates a recreational user as the onsite receptor). The other option is the scenario evaluated in the Draft EIS, that is, a suburban residential scenario without a garden pathway. This scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space. Ecological risk is also considered in determining cleanup levels.

626-2

**Commenter No. 626 (cont'd) : Steven L. Shestak,
Director, Environment, Health & Safety, Boeing**

June 6, 2017
SHEA-115696
Page 2

future use as open space habitat; our cleanup will be safe for people who use SSFL for recreational purposes, the wildlife that live at there, and the neighboring communities.

Inclusion of a Risk Based Alternative Based on Recreational Land Use

With the recording of the Conservation Easement, there is no question that recreation is the only legally permissible future use of Area IV and the Northern Buffer Zone. DOE's stated reason in its Draft EIS for not examining an alternative based on a recreational user scenario was to be "consistent with Boeing's basis for analysis." As noted above, Boeing's proposed remediation activities will ensure protection of recreational and ecological receptors, consistent with the land's future use as open space habitat. On May 24, 2017, we provided DTSC with updated information on Boeing's proposed project activities for inclusion in the Project Description for the Program Environmental Impact Report ("Program EIR") being prepared by DTSC for remediation activities at the SSFL. We notified DTSC that following the recording of the Conservation Easement, in order to comply with CEQA, Boeing's proposed soil remediation activities should not be based on residential land use scenarios, and that information previously provided to DTSC regarding such soil remediation activities should not be used in the Program EIR as part of the Project Description or for any other purpose.

Not including an alternative that evaluates the only legally permissible future land use would appear to be inconsistent with both U.S. Environmental Protection Agency (EPA) and DTSC guidance for remediation activities based on risks to human health and the environment. Thus, Boeing again urges DOE to include a risk-based alternative for the remediation of Area IV and the Northern Buffer Zone that considers protection of the recreational user and ecological receptors.

Preservation and Protection of the Property's Conservation Values

The Conservation Easement identifies as its primary purpose the preservation and protection of the six "Conservation Values" that the Property possesses. Conservation Easement, Section II.1. These Conservation Values consist of and are prioritized as follows:

- (1) Habitat Values, as the Property provides high quality natural, restored or enhanced habitat for a large number of species, including rare, threatened and endangered species under State and federal law;
- (2) Open Space Values, as the Property links vital habitat corridors described as critical connectivity habitat;
- (3) Cultural Resources Values, as the Property is important to the Chumash, Tatavian and Tongva Tribes;
- (4) Scenic Values, given the unique natural scenic beauty of the Property, with significant, virtually untouched areas, and its visibility from nearby parks, reserves and natural areas and various developments;
- (5) Historic Resources Values, reflecting the role of the Property in supporting numerous defense and space programs; and
- (6) Education, Scientific, and Recreation Values, in light of the opportunities the Property has provided to various organizations and members of the public to research and observe of sensitive ecological habitats and wildlife populations.

626-2
cont'd

626-3

626-2
cont'd

626-4

626-3 Thank you for your comment. It has been included in the Administrative Record for the SSFL Area IV EIS. Although the comment/statement is not on the scope or content of this SSFL Area IV EIS, note that as indicated in response to comment 146-1, the Final EIS includes an alternative that includes an option based on a future land use of Area IV and the NBZ as open space, consistent with Boeing's conservation easement and agreement. DTSC issued the *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* was issued by DTSC in September 2017 (DTSC 2017a).

626-4 The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. This EIS evaluates impacts on biological resources (including habitat and habitat corridors, and threatened and endangered species), cultural resources (including Native American and historic resources), and land resources (including aesthetics and visual quality, and recreation). All of the cleanup alternatives evaluated in this EIS would remediate Area IV and the NBZ so these areas would be safe for future use as open space.

If implemented, regardless of the cleanup alternative, DOE would use measures that would protect and minimize impacts to biological and cultural resources, including the use of exemption areas. The purpose of exemption areas is to minimize impacts to important biological and cultural resources. Therefore, if there were no chemicals or radioactive constituents within these areas that posed a risk to human health or the environment, the areas would not be disturbed. However, if levels of constituents in these areas pose a risk to human health and the environment, as determined using risk-based screening levels (RBSLs), DOE would remove the contamination through carefully planned, focused removals that would minimize impacts.

Please refer to Section 2.4 "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a discussion of the process followed for employing exemptions.

The process and controls that will be used to minimize impacts to federally protected threatened and endangered species are described in the U.S. Fish and Wildlife Biological Opinion (see Appendix J).

Likewise the process and controls that will be used to minimize impacts to cultural resources will be described in the Section 106-compliant Programmatic Agreement. (This document is being prepared in conjunction with the SHPO and involved Native American groups.)

Commenter No. 626 (cont'd) : Steven L. Shestak,
Director, Environment, Health & Safety, Boeing

June 6, 2017
SHEA-115696
Page 3

Conservation Easement, Section I.C.

The Conservation Easement also provides that the remediation activities conducted on the Property, including activities performed by DOE, are important to the advancement and protection of, and therefore consistent with, these Conservation Values. It further provides that such remediation activities can be performed in a manner that will further the long-term preservation of the Conservation Values at the Property. Conservation Easement, Section II.1. Thus, DOE should consider which of, and how, the cleanup alternatives that are evaluated in the EIS will assure that these Conservation Values are protected and preserved to the fullest extent. The Conservation Values set forth in the Conservation Easement are especially important with regard to the protection of biological, cultural and land resources and the discussion of aesthetics, visual quality and recreation.

Cumulative Impacts Analysis

Boeing's April 12 comments included an attachment that provided data regarding Boeing's estimates for its remediation project to support DOE's cumulative impacts analysis. With the Conservation Easement restricting the future use of the Property as protected open space habitat, we have revised the information provided in this attachment. Enclosed is revised Attachment C, Revised Data for Cumulative Impacts Analysis of SSFL Remediation for DOE EIS – Boeing Remediation Project Estimates, May 2017. This document should be utilized in considering Boeing's comments on the EIS instead of the Attachment C previously appended to Boeing's April 12 comments.

Again, Boeing appreciates the opportunity to submit these additional comments to DOE. Should you have any questions regarding our comments or wish to discuss them, please contact Art Lenox of my staff at (818) 466-8795.

Sincerely,

Steven L. Shestak

626-5

626-5 The soils volumes and other cumulative impacts information presented in Chapter 5, Table 5-1, of the Draft EIS were up-to-date at the time the Draft EIS was prepared (see references to NASA 2015b and Boeing 2015d). Since the Draft EIS was released in January 2017, revised information has become available. Therefore, this Final EIS includes updated NASA and Boeing values (including information provided in Attachment C to this comment letter) in Table 5-1 to reflect the latest information.

Commenter No. 626 (cont'd) : Steven L. Shestag,
Director, Environment, Health & Safety, Boeing

This comment document included as an attachment, the "Grant Deed of Conservation Easement and Agreement" between The Boeing Company and North American Land Trust. It is not considered a comment on the EIS so is not presented here to conserve space. A copy is included the Administrative Record.

Response side of this page intentionally left blank.

Commenter No. 626 (cont'd) : Steven L. Shestak,
Director, Environment, Health & Safety, Boeing

Attachment C - revised
Data for Cumulative Impacts Analysis of SSFL Remediation for DOE EIS –
Boeing Remediation Project Estimates, May 2017

	Boeing
Land disturbed (acres)	
- Area Disturbed for Soil Removal	17
- Area Disturbed for Building Removal	3
Employment (persons)	
- Onsite Employees	100
- Truck Drivers - Truck drivers for occasional deliveries or pickups are not included in long-term employment	Assume 16 to 32 truck drivers when 96 truck trips are split between NASA, Boeing and DOE.
Resources used	
- Backfill for Soil Excavation (cubic yards)	50,000 (a)
- Backfill for Building and Bedrock Removal (cubic yards)	1,300
Resources used	
- Water (gallons/day)	20,000 (c)
Waste generated (cubic yards)	
- Soil Excavation	150,000 (b)
- Building Removal	112,000 (d)
- Bedrock Excavation	None expected
Truck trips	
- Soil Disposal	9,800 (e)
- Bedrock Disposal	None expected
- Backfill Delivery	3,300 (f)
- Demolition Debris	1,000 (g)
- Other deliveries	400
Totals	14,500

Boeing = The Boeing Company;

- (a) Estimates assume that approximately 33% of excavated soil volume will be needed as backfill obtained from other sources to supplement surrounding soils used as backfill to restore the soil remediation area.
- (b) Estimated in situ soil excavation volume for cleanup to protect future recreational and ecological receptors for DOE EIS planning.
- (c) Water use estimated based on generalized data regarding water use for prior soil removal activities at SSFL and comparable information for other MWH/Stantec soil remediation projects.
- (d) Building debris cubic yard volume based on 1.5 cy per ton to maintain consistency with soil volume estimates. Actual debris volume will be dependent on type of material.
- (e) Estimates assume 1.5 cy per ton of soil, and 23 tons per truck average.
- (f) Trucking estimates for backfill delivery provided for conservative planning estimates. To minimize truck trips, Boeing plans to use the trucks that bring clean backfill to the site from offsite sources for subsequent off-haul of contaminated soil. Also, Boeing may use onsite sources of backfill. In both of these cases, the truck trips estimated here would be minimized or eliminated.
- (g) Trucking estimate for building debris removal based on an average truck volume of 17 cy based on prior Boeing demolition projects.

Campaign A

U.S. Department of Energy NEPA Document Manager, SSFL Area IV EIS
Stephanie Jennings
stephanie.jennings@emcbc.doe.gov

Dear Ms. Jennings:

I am outraged by the DOE's Draft Environmental Impact Statement (DEIS) for the Santa Susana Field Laboratory (SSFL) Area IV cleanup.

DOE's DEIS makes it abundantly clear that DOE wants to break out of its commitment to clean up all of its contamination at SSFL. Instead, DOE proposes leaving between 39% and 99% of the dangerous radionuclides and toxic chemicals on site, not cleaned up, where they will continue to migrate and put nearby communities at risk. That is unacceptable!

DOE must abide by the 2010 AOC and reject all three of the cleanup alternatives proposed in the DEIS, as well as the "no action" alternative for soil remediation, all of which are prohibited under the AOC. Any "leave in place" cleanup methods, including natural attenuation and "no action" and should not be considered.

DOE also fails to acknowledge that the AOC is a legally binding agreement with the DTSC, and DTSC as the regulator makes the cleanup decisions, not DOE. The legal obligations in the AOC already require full cleanup, and even if it didn't exist, the state toxics agency is the regulator who decides cleanup requirements for the toxic chemicals. That isn't within the power of the polluter, DOE. DOE should withdraw the EIS, as it violates cleanup commitments and DOE has no legal authority to decide the cleanup in the first place.

If all of the contamination at SSFL is not cleaned up per the AOC cleanup agreement, people who live nearby- including myself and young family- and future visitors to the site will be at increased risk of cancer and illnesses related to exposure to SSFL contaminants. I demand that you help protect our health and keep your cleanup commitment by ensuring that DOE's final EIS fully comply with the AOC provisions and clean up ALL of the contamination.

A-1

A-2

A-3

A-1
cont'd

A-1 DOE has not announced that it intends to break the 2010 AOC. NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action.

This EIS analyzed an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). In response to public input since the 2010 AOC was signed, this EIS also analyzed alternatives that determine cleanup levels by considering risk to human health and the protection of natural resources. This latter approach is consistent with that used by DOE throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

As discussed in Section 2.2 of this CRD, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

With respect to your comment about natural attenuation, as discussed in Section 2.2, of this CRD, onsite treatment is provided for in the 2010 AOC. DOE notes that the 620,000 cubic yards of soil for which monitored natural attenuation is proposed contain very low concentrations of hydrocarbons (TPH) that do not pose a threat to human health. See Chapter 2, Section 2.3.2 of this Final EIS for additional information.

A-2 NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. In addition, as discussed in Chapter 1, Section 1.3 of this EIS, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision pursuant

Campaign A (cont'd)

to NEPA. DOE recognizes that the 2010 AOC is a legally binding agreement with the DTSC and that DTSC has regulatory authority over aspects of DOE's cleanup of Area IV and the NBZ.

This EIS analyzes an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In response to public input received, and consistent with its obligations under NEPA, DOE also analyzed alternatives that are based on risk to human health as well as the protection of natural resources. This latter approach, use of a risk assessment, is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ.

DOE will issue a ROD(s) for this EIS no sooner than 30 days after the EPA Notice of Availability for this Final EIS is published in the *Federal Register*. The potential environmental impacts presented in this EIS, along with public input, cost, policy, and other factors, will be considered by decision-makers in selecting alternatives for soil remediation, building demolition, and groundwater remediation.

As discussed in Chapter 1, Section 1.9.2, of this Final EIS, DTSC is currently preparing a program environmental impact report (EIR) under CEQA that applies to cleanup of the entire SSFL; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

A-3 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

DOE remains committed to protecting the health and safety of current and future users of the site and of residents in the surrounding communities. This Final EIS

Campaign A (cont'd)

evaluates the human health risk for each of the remediation alternatives. Each of the three soil remediation action alternatives analyzed in this EIS would leave Area IV and the NBZ safe for their designated future use as open space; offsite residents would also be protected. The reader is referred to the summary of impacts presented in Chapter 2, Section 2.8 and to Chapter 4, Section 4.9, "Human Health," of this EIS. Exceeding an AOC LUT value does not necessarily mean that the constituent is present at dangerous levels. For further discussion of this topic, refer to Section 2.5, "Toxicity of Soil Contaminants" of this CRD.

Also please see Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of the EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ.

...I truly hope you are reading the messages being sent to you. Already the child of a friend has had to undergo cancer treatments at age 5. Why is she finding out that so many of her little friends in the cancer ward in Children's Hospital in Los Angeles live within in a five mile radius of her home, which also happen to be within a five-mile radius of Santa Susana Field Laboratory (SSFL) Area IV? I AM outraged by the DOE's Draft Environmental Impact Statement (DEIS) for the Santa Susana Field Laboratory (SSFL) Area IV cleanup. I don't want to see or hear of any other childhood cancer patients linked to this area because nothing has been done to clean up the contaminants.

FOLLOW THROUGH ON YOUR PROMISE....

Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

A3-1 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of the transportation topic and DOE's response.

In accordance with NEPA, this Final EIS evaluates the potential impacts on a variety of resource areas, including traffic, human health, cultural and biological resources, socioeconomics, and environmental justice. Results of the analyses allow a comparison of potential impacts across all evaluated resource areas as well as the tradeoffs between the alternatives.

DOE's intent is not to generate opposition to the SSFL cleanup or to alarm locals out of supporting cleanup, but it is a true that the more soil that is removed to clean up the site, the larger the transportation effort (i.e., a larger number of truck trips) that would be required. In the case of soil remediation, leaving more soil, and consequently low concentrations of chemicals and/or radionuclides on site, reduces the number of truck trips from the site. Conversely, removing the soil with low concentrations of chemicals and/or radionuclides, results in more truck trips from the site. The EIS shows that the transportation risks are very small; Chapter 4, Section 4.8.1 and Appendix H of this EIS provide details of the transportation risk analysis.

A3-2 DOE acknowledges your concerns and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. This EIS describes the potential impacts that implementing each alternative could have on the evaluated resource areas, including human health and traffic.

Individuals submitting "Campaign A" with additional comments

...When my family moved to the area 3 years ago, we had not idea about the past activity at the SSFL. When we began renting a house in Woodland Hills, there was no mention of the dangers near us. My husband and I have 2 young daughters. They attend school in West Hills, very close to the SSFL site. We go to church in West Hills, very near the SSFL site. We were considering moving to West Hills, or buying a house in Woodland Hills, but now have second thoughts having done research into the past of the SSFL and inquiring about the dangers that are still present at the site. Since we have moved, we have become friends with many families that have children diagnosed with very rare cancers, associated with some of the toxins known to remain at the contaminated SSFL site. We absolutely do not want to put our young daughters at risk by buying property anywhere near the SSFL site. If news continues to get out regarding what remains at the site, and the potential health risks these contaminates pose to the community (and it will), I fear that the surrounding areas will suffer a great deal- the housing market, jobs, vitality in general will decline until the site is cleaned up 100%. I want to believe we all wish our children grow up to be critical thinkers, people who are truthful, and do good for others. Isn't that what makes a strong society? Isn't that what leaders are supposed to do? My husband and I urge you to please do the right thing in this situation. The contaminates are there, and people are getting hurt and dying because of it. What if you or one of your loved ones was living nearby and got sick or died? Please take action and clean up the site 100% before that happens (anything less than 100% cleaned up will continue to cause problems such as we see now). The clean up process will by no means be easy. That is understood, and to be expected. But it is also absolutely crucial for the health and well-being of thousands upon thousands of residents near the SSFL site, and undeniably the RIGHT thing to do. Please think about the long term gain for all those counting on the right outcome in this situation. The clean up has to happen. Please clean up the SSFL site 100%....

Jeff and Sabrina Flagg

...Peoples families, their children, their parents can be seriously affected by the toxic waste these polluters have left behind. How would they feel if it was their own families that had to live nearby? It makes me sick to think that anyone could care more about saving money, then innocent people's lives and well being....

...Anyone that agrees to any of these three ridiculous excuses of a solution, is just as guilty as they are. Why should children and mothers and fathers etc have to suffer with possible deadly sicknesses, because of the mistakes of people who seem to think they are above the law. Why would these people even think for a second that anything but 100% cleanup is acceptable....

Jessica Seifert

...I am frightened by the DOE's Draft Environmental Impact Statement (DEIS) for the Santa Susana Field Laboratory (SSFL) Area IV cleanup. As a resident of a neighboring city, I am scared for my family and friends in this area....

Joyce Ezaki

... I worked their for the government when the agreement was made so why does ANYONE THINK THEY CAN CHANGE IT., NO NO NO!...

...I am the mother of a child with cancer so rare that there are less than 74 cases every year in America. Her cancer required 10x the normal dose of chemotherapy and she became addicted to morphine at four years old to treat the pain caused by the treatment meant to save her life. There are forty-six other children we've found so far that have rare childhood cancers surrounding the SSFL. We've discovered that West Hills is far above the national averages for pediatric Ewings Sarcoma and pediatric Optic Pathway Hypothalamic Glioma.

Childhood cancer is rare...but how many "coincidences" will it take to convince the Department of Energy that a pediatric cancer cluster exists in West Hills and the surrounding areas? It is unacceptable to treat my family this way. We have suffered through my daughter's cancer, which may have been avoidable if you had kept the promise to finish the cleanup by 2017.

I am deeply disappointed in the sloppy DEIS proposed methods. I know that DOE hires some of the most brilliant scientists and dedicated workers, but your DEIS proposes the most archaic and dangerous cleanup options possible- how can you list driving 60 miles through residential streets as a viable option when there are two service roads available? Why have you not offered more advanced methods to stop dust or the release of contamination? Why have you allowed my community to be afraid of the cleanup instead of educating them about the safe processes you will be required to follow? It is unacceptable to treat my community this way- we deserve a SAFE, complete cleanup.

...Shame on you all!
I've lost 2 family members, and 2 neighbors to cancer,
We have fought, for years that you would do the honorable thing.
Apparently, no one cares, about our health, or our list ones.
Too bad that you haven't experienced, such losses. Perhaps, then you'd do something?
Nothing but, half truths from DOE.

Patricia Olsen

A18-1

Of course, if the DOE group would consent to all the removed contamination be dumped in their back yards that would be OK from what DOE says about how little contamination there is at SSFL. Its just a little is a LIE!

Rand & Shirley Malmin

A19-1

...I can't believe that the people can't force the government to carry out the terms of it's contract to clean up this horrible toxic waste site. At his inauguration ceremony President Trump said that we, the people, are now in charge. And we, the people, DEMAND that the US Government respect and honor the agreement it made to get the toxic waste out of the Santa Susana Field Laboratory site NOW!!! The "People" will not tolerate the existence of this toxic dump any longer!...

Robert Heron

A20-1

...We have a lot to be proud of here in Ventura county. For the most part it is a beautiful healthy place to live. Our farmers produce 2 billion dollars of delicious food annually. We are third in the state for oil production. A magazine chose us as the best place to live.

We don't want to be known for having a cancer cluster or hot spot making our neighbors sick for the next millennium, for seven generations.

After World War 2, scientists worked to beat the swords of war into tools for peace. They tamed the atom to produce power. They developed rockets that would eventually take us to the moon, and put up satellites that help us connect by cell phone.

Mistakes were made. A nuclear reactor went critical. Dangerous radioactive waste was burned in open air. Chemical waste was dried out in open pits to dry out or absorb into the soil or blow on the wind. We now know better than to do these practices. EPA has regulations to control waste disposal.

We have the opportunity to clean up the mess so that it does not continue to make our children sick. You hold the public trust in your hands. We ask you to clean up the mess made by our parent's generation.

We want specifically the standards appropriate for a residential community. The dust blows from SSFL to neighboring homes. The soil runs downstream by other homes. There is no safe level of radiation.

You want this area cleaned to the highest standards for your legacy for your great grand children....

||| A26-1

A8-3 DOE acknowledges your concern about a 100 percent, timely cleanup of the site using site to rail transport. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. Please also refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of the transportation topic and DOE's response.

A9-1 DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

A10-1 Please refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

A10-2 DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV

...P.S: My life with Liberal Klans in Oregon!!

Arab/Muslim Americans are treated less than animals! We are called Sand N...

We are being prosecuted in a daily basis! High tech lynching, institutionally racism! Especially for Arab women!!

Oregon former late A.G. Dave Frohnmayer had my SS# blocked & prevented me from getting employed, made me homeless and jobless!

He was the one who started & initiated the fraud of taking over our homes!!

His bank robber Rep. Bob Ackerman, Doug McCool and Margaret Hallock hired Scarlet Lee/Barnhart Associates, forged my family's signature, gave our fully paid Condo to the thief Broker Bob Ogle. And his mom Karen Ogle " who was working in the USA Consulate in Jeddah, Saudi Arabia 1997-1999 & administered the power of attorney to have my sister signed it and add her son to the deed.", without my signature!!

Bob Ackerman had never responded to the Summon from the Court, and the sheriff never served him or arrested him either!!

ThIs is what kind of criminal government we have in Oregon!!

I ran five times for public offices! Voter Fraud & Sediton by Lane County government to protect & cover up for the two criminals Frohnmayer & Ackerman!! Oregon government is complicit with their crimes!!

Nadia Sindi

...As a health professional, an epidemiologist, the first recipient of "Peace Award" from the American Public Health Association, (APHA), a Human Right activist, and as a mother, I am I am disturbed, and outraged by the DOE's Draft Environmental Impact Statement (DEIS) for the Santa Susana Field Laboratory (SSFL) Area IV cleanup.

The cancer causing effects of radioactives, and other atomic waste materials, has been known for decades now, and is well documented. Far too many people including children, have already been exposed in the SSFL areas, in the last few decades. According to different reports, many residents in that area has become ill, by many unknown illness, including cancer. Therefore, as a health expert, I urge you and demand that you fully comply with the AOC provisions, and clean up all the contamination, not only a portion! - keep your cleanup commitment by ensuring that DOE's final EIS fully comply with the AOC provision.

Please help protect health of many people, including our children!

Do the right things, and protect innocent people, and the next generation residing there, and also the visitors!

Dr. Farideh kioumehr

A28-1 cont'd

are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. Furthermore, Area IV and the NBZ have been extensively characterized for radiological and chemical contamination. These soil investigations have shown that much of the remaining chemical and radionuclide contamination at Area IV is concentrated near certain facilities. Additional chemical and radionuclide contamination is dispersed throughout Area IV and the NBZ in much smaller concentrations than those in the localized areas. As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

DOE acknowledges your preference for 100 percent cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for a discussion of this topic and DOE's response. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. NEPA strongly encourages agencies to evaluate alternatives and not limit their consideration to one pre-selected course of action. In addition to a No Action Alternative in accordance with the requirements of NEPA, this Final EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil

Section 3 – Public Comments and DOE Responses

Campaign A (cont'd)Individuals submitting "Campaign A" with additional comments

cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

- A11-1** DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ.

- A11-2** As a Federal agency, DOE is required to evaluate and justify major expenditures of Federal dollars. Because the AOC cleanup is not the normal way DOE, EPA, or

Campaign A (cont'd)

Individuals submitting "Campaign A" with additional comments

California DTSC perform soil cleanups, DOE evaluated the costs and benefits of the AOC cleanup versus what is normally done (that is, a cleanup that is based on risk and future land use). That analysis demonstrated that the AOC cleanup would be much more expensive and with minimal additional protection of public health and the environment.

A11-3 Please refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for a discussion of this topic and DOE's response. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE acknowledges your preference for a full cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. In addition to a No Action Alternative in accordance with the requirements of NEPA, this EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

A12-1 DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter

The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007).

Campaign A (cont'd)

Individuals submitting "Campaign A" with additional comments

Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ.

As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record of Decision pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

- A16-1** DOE agrees with placing a high priority on health and safety and remains committed to protecting the health and safety of current and future users of the site and of the residents in the surrounding communities. Please see Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for a discussion and DOE's response on the topic of cancers and other illnesses near SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.
- A16-2** This EIS identifies and evaluates a reasonable range of alternatives that are appropriate for effecting cleanup of Area IV and the NBZ. Work would be performed in a manner that is protective of worker and public health and safety and the environment.
- A16-3** Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

Campaign A (cont'd)
Individuals submitting "Campaign A" with additional comments

- A16-4** Methods for dust and contamination control are described primarily in Appendix D, Section D.6, and Chapter 4, Sections 4.3, 4.6 and 4.9. Measures to minimize impacts and mitigation measures are described in Chapter 6. The measures described in this EIS range from measures required by regulation to more innovative best management practices.
- A16-5** DOE has attempted to engage and educate the public through stakeholder outreach workshops and public meetings such as the SRE Workshop, Groundwater University and the Community-Developed Alternative Workshop Series, the Site Treatability Group, and the Soil Characterization Tech Stakeholder Group. This Final EIS is also a way to educate the public on the technical and environmental issues of the cleanup.
- A16-6** DOE acknowledges your desire for a safe, complete cleanup of the site. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.
- A17-1** DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ.
- DOE remains committed to protecting the health and safety of current and future users of the site and of residents in the surrounding communities. This Final EIS evaluates the human health risk for each of the remediation alternatives. Each of the three soil remediation action alternatives analyzed in this EIS would leave Area IV and the NBZ safe for their designated future use as open space; offsite residents would also be protected. The reader is referred to the summary of impacts presented in Chapter 2, Section 2.8 and to Chapter 4, Section 4.9, "Human Health," of this EIS. Exceeding an AOC LUT value does not necessarily mean that the constituent is present at dangerous levels. For further discussion of this topic, refer to Section 2.5, "Toxicity of Soil Contaminants" of this CRD.
- Also please see Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of the EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Campaign A (cont'd)

Individuals submitting "Campaign A" with additional comments

A18-1 DOE acknowledges your concerns and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. Campaign A (cont'd)**Individuals submitting "Campaign A" with additional comments**

- A19-1** DOE agrees with placing a high priority on health and safety and remains committed to protecting the health and safety of current and future users of the site and of the residents in the surrounding communities. Please see Section 2.7, "Offsite Impacts," and Section 2.8 "Cancer and Other Illnesses Near SSFL," of this CRD for discussions about offsite impacts. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. Also refer to Section 2.5, "Toxicity of Soil Contaminants," and Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for information relevant to residual contamination remaining in Area IV.
- A20-1** DOE acknowledges your concern about DOE honoring its agreement to get toxic waste out of the SSFL site. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.
- A21-1** DOE acknowledges your concerns and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.
- A21-2** As indicated in Chapter 1 of this Final EIS, DOE acknowledges that past activities at SSFL resulted in chemical and radiological releases that impacted soils, buildings, and groundwater; and intends to complete remediation of SSFL Area IV and the NBZ in compliance with applicable requirements (including regulations, orders, and agreements) for cleanup of radioactive and hazardous substances. Chapter 1, Section 1.3, contains a brief history of activities at SSFL, including previous cleanup efforts. Additional information about the activities of DOE and its predecessor agency, the Atomic Energy Commission, at Area IV at SSFL can be found at <http://www.etec.energy.gov/>. Chapter 3, Sections 3.9.5 and 3.9.6, of this EIS contain information about accidents at Area IV, including the 1959 SRE accident, which was the only accident that caused a measureable release of radioactive material. At the time of the accident it was estimated

Campaign A (cont'd)

Individuals submitting "Campaign A" with additional comments

that the accident resulted in the release (over a 2-month period) of about 28 curies of radioactive noble gases such as krypton-85, in low, controlled concentrations that met Federal requirements. Additional information about the 1959 SRE accident can be found at http://www.etec.energy.gov/Operations/Major_Operations/SRE_Accident.html. With respect to the statements regarding burning radioactive and chemical waste in open pits, the Former Sodium Disposal Facility was used from 1956 to 1978 to clean alkali metals (sodium and potassium/sodium mixtures) from metallic components and other materials, and also received chemical waste and radionuclides. The facility was remediated during the 1990s and released for unrestricted use (i.e., declared clean) in 1998 by the California Department of Health Services (now California Department of Public Health). Additional information can be found at http://www.etec.energy.gov/Operations/Support_Ops/FSDF.html.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. In addition, please see Section 2.7, "Offsite Impacts," of this CRD for a discussion of this topic and DOE's response. Wastes generated under the activities evaluated in this EIS will be managed in accordance with applicable State and Federal regulations. Generation and management of radioactive and other wastes resulting from the activities evaluated in this Final EIS are addressed in Chapter 4, Section 4.10, of this EIS. This Final EIS is being prepared in accordance with NEPA to evaluate alternatives for completing the remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. The EIS will inform Federal decisions about remediation of contaminated soil and groundwater, building demolition, restoration of the impacted environment, and disposal of chemical and radioactive waste.

- A21-3** Thank you for your comment. It has been included in the Administrative Record for the EIS.
- A21-4** DOE acknowledges your preference for the residential standards. Since release of the Draft EIS, Boeing entered into a land use covenant that restricts future use of the

Campaign A (cont'd)Individuals submitting "Campaign A" with additional comments

property it owns at SSFL to open space (Ventura County 2017a, 2017b); this includes Area IV and the NBZ. A residential scenarios that includes consuming products grown in a backyard garden, is not appropriate for property that would be restricted to an open space land use. In this Final EIS, DOE retained the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative. Each of these alternatives retains an analysis that reflects cleanup levels based a suburban resident without a garden as was done in the Draft EIS. The Conservation of Natural Resources Alternative now includes a second scenario which establishes cleanup levels based primarily on a recreational user, with some constituents being further limited by ecological risk.

A21-5 As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act. DOE remains committed to protecting the health and safety of current and future users of the site and of residents in the surrounding communities. This Final EIS evaluates the human health risk for each of the remediation alternatives. Each of the three soil remediation action alternatives analyzed in this EIS would leave Area IV and the NBZ safe for their designated future use as open space; offsite residents would also be protected. The reader is referred to the summary of impacts presented in Chapter 2, Section 2.8 and to Chapter 4, Section 4.9, "Human Health," of this EIS.

Also please see Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of the EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

A22-1 DOE acknowledges your concerns and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the

Campaign A (cont'd)
Individuals submitting "Campaign A" with additional comments

A24-1 DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

DOE remains committed to protecting the health and safety of current and future users of the site and of residents in the surrounding communities. This Final EIS evaluates the human health risk for each of the remediation alternatives. Each of the three soil remediation action alternatives analyzed in this EIS would leave Area IV and the NBZ safe for their designated future use as open space; offsite residents would also be protected. The reader is referred to the summary of impacts presented in Chapter 2, Section 2.8 and to Chapter 4, Section 4.9, "Human Health," of this EIS. For further discussion of this topic, refer to Section 2.5, "Toxicity of Soil Contaminants" of this CRD.

Please refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE also refers you to Chapter 3, Section 3.9.5, of the EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

A28-2 DOE acknowledges your preference for a cleanup of all contamination in full compliance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," of this CRD regarding commenters' preferences. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Campaign B

I am writing to comment on DOE's Draft Environmental Impact Statement (DEIS) for the Santa Susana Field Laboratory (SSFL) Area IV cleanup.

As you know, SSFL was the site of nuclear and rocket engine tests that went on for decades, leaving a legacy of contamination with dangerous radionuclides and toxic chemicals. These contaminants migrate from the site and put nearby communities at risk of cancer and other illnesses. Federal studies indicate higher rates of certain cancers for both workers at the site as well as in the offsite population. It is therefore imperative that the site be fully cleaned up, as DOE committed to do in 2010 when it signed the Administrative Order on Consent (AOC) to clean up to background levels of contamination.

Unfortunately, all of the cleanup options presented in DOE's DEIS violate the AOC cleanup agreement, leaving between 34% - 94% of the site not cleaned up! The AOC requires that all detectable contamination be cleaned up, and it expressly bars any "leave in place" options. DOE claims that its weaker cleanup options are sufficiently protective of public health, but they are not - indeed, DOE's second and third options manipulate longstanding EPA protective standards and guidelines. Furthermore, the National Academy of Sciences and all federal agencies state that there is no safe level of radiation exposure.

DOE failed to consider routes for the transportation of contaminated soil that avoid neighborhoods. DOE failed to consider, for example, alternative truck routes as well as the railroad station less than a quarter mile north of the site that is able to ship out contaminated soil. The station is accessible by routes that do not pass by any residences. Instead it only considered trucking the waste to a railroad line 60 miles away.

DOE must comply with the AOC and reject all of the cleanup alternatives proposed in the DEIS, as well as the "no action" alternative for soil remediation. DOE also must recognize that regarding SSFL, it does not have the authority to decide what the cleanup will be. Under both the Resource Conservation and Recovery Act (RCRA) and the AOC, it is the California Department of Toxic Substances Control that makes the cleanup decisions, not DOE.

SSFL has been left contaminated for far too long. It's high time for DOE to fulfill its cleanup obligations, honor the AOC that it signed, and help ensure that current and future generations are not at risk from SSFL contamination.

B-1 DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

Please refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

B-2 DOE does not agree with the claim that all of the cleanup options presented in the Draft EIS violate the 2010 AOC. NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action.

This Final EIS analyzed an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) In response to public input since the 2010 AOC was signed, this EIS also analyzed alternatives that determine

Campaign B (cont'd)

cleanup levels by considering risk to human health and the protection of natural resources. This latter approach is consistent with that used by DOE throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

As discussed in Section 2.2 of this CRD, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. The use of RBSLS that do not include the indirect garden pathway is appropriate for this future land use.

- B-3** Please refer to Section 2.9, “Options for Transportation of Waste from SSFL,” of this CRD for a discussion of this topic and DOE’s response.
- B-4** NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. In addition, as discussed in Chapter 1, Section 1.3 of this EIS, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision (ROD) pursuant to NEPA. DOE recognizes that the 2010 AOC is a legally binding agreement with the DTSC and that DTSC has regulatory authority over aspects of DOE’s cleanup of Area IV and the NBZ.

This EIS analyzes an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In response to public input received, and

Campaign B (cont'd)

consistent with its obligations under NEPA, DOE also analyzed alternatives that are based on risk to human health as well as the protection of natural resources. This latter approach, use of a risk assessment, is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ.

DOE will issue a ROD(s) for this EIS no sooner than 30 days after the EPA Notice of Availability for this Final EIS is published in the *Federal Register*. The potential environmental impacts presented in this EIS, along with public input, cost, policy, and other factors, will be considered by decision-makers in selecting alternatives for soil remediation, building demolition, and groundwater remediation.

As discussed in Chapter 1, Section 1.9.2, of this Final EIS, DTSC is currently preparing a program environmental impact report (EIR) under CEQA that applies to cleanup of the entire SSFL; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

DOE acknowledges your concerns and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

Campaign C

U.S. Department of Energy NEPA Document Manager, SSFL Area IV EIS
Stephanie Jennings
stephanie.jennings@emcbc.doe.gov

Dear Ms. Jennings:

I live in the Susana Knolls, a community of approximately 500 homes located directly beneath the contaminated Santa Susana Field Laboratory (SSFL). Those of us who live so close to SSFL are particularly vulnerable to SSFL's nuclear and chemical toxins that migrates offsite, especially during wind or rain events, which have been frequent this year. Many of us have creeks running through our properties, and have long been concerned with the hundreds of surface water violations for contamination migrating from SSFL reported by the Water Board. We are also aware of the numerous federal studies indicating higher rates of certain cancers associated with proximity to SSFL.

C-1

I was therefore exceedingly alarmed by the Department of Energy Draft Environmental Impact Statement (DEIS) for the SSFL cleanup. Every single one of DOE's proposed cleanup alternatives violates the commitment it made in 2010 when it signed the Administrative Order on Consent to clean up all detectable contamination. The first option DOE proposed leaves 34% of the contamination not cleaned up, the second leaves 86% not cleaned up, and the third leaves up to 94% not cleaned up. That is unconscionable!

DOE's DEIS also makes numerous mentions of "natural attenuation" meaning that in some 70 years the contamination will go away on its own. That will do nothing to protect me and my neighbors, who will continue to be exposed to hazardous contamination for decades. Leaving contamination on site, not remediated, also violates the AOC which prohibits "leave in place" options. DOE must uphold its 2010 AOC cleanup commitment and reject all of the cleanup alternatives proposed in the DEIS. The EIS should be focused exclusively on how DOE will cleanup to background per the AOC, not propose alternatives to it.

Finally, DOE's DEIS also refuses to properly acknowledge that it does not get to decide how much contamination gets cleaned up. The AOC makes it perfectly clear that the DOE is a regulated entity with the Department of Toxic Substances Control (DTSC) having oversight. DTSC determines the cleanup, not DOE.

In 2014 DOE SSFL Project Manager John Jones told the SSFL Work Group that DOE signed the AOC because the AOC was "the right thing to do." Please don't now do the wrong thing by violating the AOC. DOE must fully live up to the obligations it assumed in the AOC and under the law to completely clean up the pollution it created so close to our homes and families. There must be no consideration whatsoever of options that violate the cleanup agreement.

- C-1 DOE disagrees with the implication that Area IV and the NBZ are highly contaminated and that substantial contamination is migrating offsite. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.
- C-2 DOE acknowledges your concerns and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.
- C-3 NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action.

This EIS analyzed an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). In response to public input since the 2010 AOC was signed, this EIS also analyzed alternatives that determine cleanup

Campaign C (cont'd)

levels by considering risk to human health and the protection of natural resources. This latter approach is consistent with that used by DOE throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

As discussed in Section 2.2 of this CRD, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

- C-4 Monitored natural attenuation would only be applied to soil containing low concentrations of TPH that do not pose a risk to human health and the environment. See Chapter 2, Section 2.3.2 of this Final EIS for additional information. (Simple polycyclic aromatic hydrocarbons may be amenable to natural attenuation and would be evaluated on a location-by-location basis during development of soil remediation plans.)The monitoring aspect of the remedy would be performed to verify that the contaminants would remain in place; that is, within the boundaries of SSFL. The treatment of soil in this fashion would not put the public using the site, or living near the site, at risk.
- C-5 NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. In addition, as discussed in Chapter 1, Section 1.3 of this EIS, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision (ROD) pursuant to NEPA. DOE recognizes that the 2010 AOC is a legally binding agreement with the DTSC and that DTSC has regulatory authority over aspects of DOE’s cleanup of Area IV and the NBZ.

This EIS analyzes an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In response to public input received, and consistent with its obligations under NEPA, DOE also analyzed alternatives that are

Campaign C (cont'd)

based on risk to human health as well as the protection of natural resources. This latter approach, use of a risk assessment, is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ.

DOE will issue a ROD(s) for this EIS no sooner than 30 days after the EPA Notice of Availability for this Final EIS is published in the *Federal Register*. The potential environmental impacts presented in this EIS, along with public input, cost, policy, and other factors, will be considered by decision-makers in selecting alternatives for soil remediation, building demolition, and groundwater remediation.

As discussed in Chapter 1, Section 1.9.2, of this Final EIS, DTSC is currently preparing a program environmental impact report (EIR) under CEQA that applies to cleanup of the entire SSFL; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.
- C4-1** DOE acknowledges your concerns and refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Campaign D

I am contacting you to notify you that I would like for you to clean up the contamination spill at Santa Susana! Why hasn't this been done? It was supposed to be done years ago! Many are getting sick from the contamination! Please clean that area up fast!

||| D-1
||| D-2

D-1 DOE acknowledges your concern about cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

With respect to the timeliness of DOE’s completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record of Decision pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

D-2 DOE disagrees with the implication that Area IV and the NBZ are highly contaminated and that substantial contamination is migrating offsite. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. As described in Section 2.7, “Offsite Impacts” of this CRD, there is no

Campaign D (cont'd)

evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act. Also, see Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of concerns about illness in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Petition 1

No Breaking of SSFL Cleanup Commitments!

TO: Elected Officials representing communities near the Santa Susana Field Laboratory

We are deeply disturbed to learn of efforts to breach the commitments made in 2010 for a full cleanup of all the nuclear and chemical contamination at the Santa Susana Field Laboratory. Some of the parties responsible for the contamination are pushing to not have to clean up the great majority of the contaminated soil. This is unacceptable. It would leave all who live in the area around the polluted lab at risk from radioactivity and other toxic materials migrating off the hill. We ask that you take strong immediate actions to assure that this doesn't happen. Please take effective steps to make sure that the Department of Toxic Substances Control, the Department of Energy, NASA and Boeing comply with the 2010 requirements to fully clean up all of the contamination at the site.

Sincerely,

P1-1 DOE acknowledges your support for the Cleanup to AOC LUT Values Alternative. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. Please note that DOE is only responsible for cleanup of Area IV and the NBZ at SSFL; cleanup of other areas of SSFL is the responsibility of NASA and Boeing. NASA and Boeing activities at SSFL are considered as a part of cumulative impacts (Chapter 5) but otherwise are outside the scope of this EIS. Also, please refer to the Topic of Interest "Compliance with the 2010 Administrative Order on Consent" (Section 2.2 of the CRD) for a discussion on this topic and DOE's response.

NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

P1-2 DOE disagrees with the implication that Area IV and the NBZ are highly contaminated and that substantial contamination is migrating offsite. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith

Section 3 - Public Comments and DOE Responses

Petition 1 (cont'd)

2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.)

DOE remains committed to protecting the health and safety of current and future users of the site and of residents in the surrounding communities. This Final EIS evaluates the human health risk for each of the remediation alternatives. Each of the three soil remediation action alternatives analyzed in this EIS would leave Area IV and the NBZ safe for their designated future use as open space; offsite residents would also be protected. The reader is referred to the summary of impacts presented in Chapter 2, Section 2.8 and to Chapter 4, Section 4.9, "Human Health," of this Final EIS. Exceeding an AOC LUT value does not necessarily mean that the constituent is present at dangerous levels. For further discussion of this topic, refer to Section 2.5, "Toxicity of Soil Contaminants" of this CRD.

Also please see Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of the EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Petition 2

Don't let DOE break its SSFL cleanup commitments!

The Department of Energy recently released a Draft Environmental Impact Statement (DEIS) that proposes three alternative cleanup plans for its operational area of SSFL. The three alternatives would respectively leave up to 39%, 91% or up to 99% of the contamination on site, where it can continue to migrate and put nearby communities at risk. All of the alternatives violate the Administrative Order on Consent (AOC) that DOE signed in 2010, which committed them to clean up all detectable contamination. DOE's DEIS also fails to acknowledge that as the polluter, it doesn't have the authority to decide how much of the mess that it made is going to get cleaned up. That decision rests with the California Department of Toxic Substances Control, not DOE. (Click [here](#) to learn more about DOE's attempt to break out of its cleanup commitments.)

Take action today! Demand that the Department of Energy uphold its promise of a full cleanup of SSFL. Below is a sample comment - we recommend personalizing it if you can. Please also share widely with your friends and neighbors!

Stephanie Jennings
U.S. Department of Energy

Comment on DOE's Draft EIS for SSFL

Dear Ms. Jennings:

I am outraged by the DOE's Draft Environmental Impact Statement (DEIS) for the Santa Susana Field Laboratory (SSFL) Area IV cleanup.

DOE's DEIS makes it abundantly clear that DOE wants to break out of its commitment to clean up all of its contamination at SSFL. Instead, DOE proposes leaving between 39% and 99% of the dangerous radionuclides and toxic chemicals on site, not cleaned up, where they will continue to migrate and put nearby communities at risk. That is unacceptable!

P2-1

P2-2

P2-1
cont'd

P2-1 DOE does not agree with the claim that all of the cleanup options presented in the Draft EIS violate the 2010 AOC. NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action.

This EIS analyzed an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). In response to public input since the 2010 AOC was signed, this EIS also analyzed alternatives that determine cleanup levels by considering risk to human health and the protection of natural resources. This latter approach is consistent with that used by DOE throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

As discussed in Section 2.2 of this CRD, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

P2-2 NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. In

Petition 2 (cont'd)

DOE must abide by the 2010 AOC and reject all three of the cleanup alternatives proposed in the DEIS, as well as the "no action" alternative for soil remediation, all of which are prohibited under the AOC. Any "leave in place" cleanup methods, including natural attenuation and "no action" and should not be considered.

P2-1
cont'd

DOE also fails to acknowledge that the AOC is a legally binding agreement with the DTSC, and DTSC as the regulator makes the cleanup decisions, not DOE. The legal obligations in the AOC already require full cleanup, and even if it didn't exist, the state toxics agency is the regulator who decides cleanup requirements for the toxic chemicals. That isn't within the power of the polluter, DOE. DOE should withdraw the EIS, as it violates cleanup commitments and DOE has no legal authority to decide the cleanup in the first place.

P2-2
cont'd

If all of the contamination at SSFL is not cleaned up per the AOC cleanup agreement, people who live nearby and future visitors to the site will be at increased risk of cancer and illnesses related to exposure to SSFL contaminants. I demand that you help protect our health and keep your cleanup commitment by ensuring that DOE's final EIS fully comply with the AOC provisions and clean up ALL of the contamination.

P2-3
P2-1
cont'd

Sincerely,

PAGE 1

addition, as discussed in Chapter 1, Section 1.3 of this EIS, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision (ROD) pursuant to NEPA. DOE recognizes that the 2010 AOC is a legally binding agreement with the DTSC and that DTSC has regulatory authority over aspects of DOE's cleanup of Area IV and the NBZ.

This EIS analyzes an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In response to public input received, and consistent with its obligations under NEPA, DOE also analyzed alternatives that are based on risk to human health as well as the protection of natural resources. This latter approach, use of a risk assessment, is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ.

DOE will issue a ROD(s) for this EIS no sooner than 30 days after the EPA Notice of Availability for this Final EIS is published in the *Federal Register*. The potential environmental impacts presented in this EIS, along with public input, cost, policy, and other factors, will be considered by decision-makers in selecting alternatives for soil remediation, building demolition, and groundwater remediation.

As discussed in Chapter 1, Section 1.9.2, of this Final EIS, DTSC is currently preparing a program environmental impact report (EIR) under CEQA that applies to cleanup of the entire SSFL; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

P2-3 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

Petition 2 (cont'd)

DOE remains committed to protecting the health and safety of current and future users of the site and of residents in the surrounding communities. This Final EIS evaluates the human health risk for each of the remediation alternatives. Each of the three soil remediation action alternatives analyzed in this EIS would leave Area IV and the NBZ safe for their designated future use as open space; offsite residents would also be protected. The reader is referred to the summary of impacts presented in Chapter 2, Section 2.8 and to Chapter 4, Section 4.9, "Human Health," of this Final EIS. Exceeding an AOC LUT value does not necessarily mean that the constituent is present at dangerous levels. For further discussion of this topic, refer to Section 2.5, "Toxicity of Soil Contaminants" of this CRD.

Also please see Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of the EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Final Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 Friday, February 17, 2017, Simi Valley, CA, 10:31 a.m.
2 * * * * *
3 MS. LOWE: Okay. Good morning, everyone. Thank
4 you so much for coming. I believe I know everyone. But
5 my name is Wendy Lowe, and I'd like to welcome you to
6 this hearing, which is being hosted by the Department of
7 Energy -- U.S. Department of Energy. DOE has prepared a
8 Draft Environment Impact Statement, or EIS, to evaluate
9 the potential environmental impacts associated with
10 cleanup of Area IV and the Northern Buffer Zone at the
11 Santa Susana Field Laboratory. And, the goal of this
12 hearing is to provide you with the opportunity to submit
13 your comments on the draft document for consideration by
14 DOE as the Department finalizes the Environmental Impact
15 Statement.
16 Today is Friday, February 17th, 2017, and this
17 meeting is being convened at 4100 Guardian Street in
18 Simi Valley, California, and the time is now 10:31.
19 I would like to point out a few housekeeping
20 items before we get started. This is the only door into
21 the room, and the restrooms are located to the right as
22 you leave this room. And, if there's an emergency and
23 we need to exit the building, you'd go left to go
24 immediately outside of the building. We do have water
25 if you would like water here.

Response side of this page intentionally left blank.

3-1445

Section 3 – Public Comments and DOE Responses

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 Feel free to leave the hearing room at any
2 time, but we'd request that if you do so, that you do it
3 in a way that minimizes distraction.

4 Please silence your cell phones and refrain
5 from any conversations in this room.

6 And, before we begin, I would like to
7 introduce John Jones and Stephe Jennings from the U.S.
8 Department of Energy. They will provide an overview
9 presentation about the Draft Environmental Impact
10 Statement. Copies of the slides that John and Stephe
11 will be using for their presentation will be available
12 on the EIS website after next Tuesday. And, if you
13 prefer, hard copies are available at the registration
14 table. After John and Stephe's presentation, I will
15 review the ground rules for this hearing and we can
16 begin taking your comments. John Jones is the director
17 at the U.S. Department of Energy's Energy Technology
18 Engineering Center, and he's been in that position since
19 2011, and he has the overall responsibility of
20 completing remediation at the site.

21 MR. JONES: Thank you, Wendy, and good morning. My
22 name is John Jones, and, as Wendy stated, I am the
23 director for the U.S. Department of Energy's Energy
24 Technology Engineering Center or ETEC. On behalf of
25 DOE, I would like to welcome you to the public hearing.

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 As Wendy mentioned, our purpose this evening is to
2 gather your input into the Department's recently
3 released EIS for Area IV and the Northern Buffer Zone of
4 the Santa Susana Field Lab. We will give you more
5 background about the Draft EIS and a brief history of
6 operations at the site in a moment.

7 I would like to introduce my colleague Stephanie
8 Jennings, who is the deputy director at our site and
9 will serve as the official hearing officer for this
10 afternoon -- this morning. In addition, we thank
11 everybody for attending the meeting, and we are here to
12 make sure everybody feels comfortable and safe to
13 provide their comments.

14 A brief history on the site. After World War
15 II, the U.S. Government was interested in developing the
16 peaceful purposes for atomic energy. In 1953, the
17 government approved a nuclear research and development
18 center in Area IV of the Santa Susana Field Lab that
19 would eventually be known as ETEC. During its
20 operation, the center housed and tested a number of
21 small research reactors. Researchers also explored best
22 practices in nuclear waste management and the use of
23 liquid metals as a coolant for nuclear energy.

24 The research at this site was critical in
25 developing our modern nuclear energy program that today

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 helps power everything from our space program to
2 electricity generation from commercial nuclear reactors.
3 This research resulted in localized releases of
4 chemicals and radionuclides to the soil, bedrock, and
5 groundwater. The Draft EIS lays out a range of
6 alternatives to address the contamination that remains
7 at Area IV and the Northern Buffer Zone.

8 I want to speak briefly about our path so far.
9 In 2003, DOE released an Environmental Assessment for
10 Area IV and the Northern Buffer Zone following an
11 internal review of remediation needs at the site. After
12 a court challenge to this assessment, in 2007 a federal
13 judge ordered DOE to complete an Environmental Impact
14 Statement per the National Environmental Policy Act,
15 NEPA. The order enjoined DOE from relinquishing control
16 over any portion of Area IV until DOE had completed an
17 Environmental Impact Statement and issued a Record of
18 Decision as required by NEPA. Based on that finding,
19 the court chose not to address the plaintiff's
20 Comprehensive Environmental Response, Compensation,
21 Liability Act, CERCLA, and the Endangered Species Act
22 claims, ESA. As a result of this order, DOE began the
23 EIS process, including extensive research, planning and
24 public involvement.

25 DOE initiated a significant characterization

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 effort with multiple agencies, including California
2 Department of Toxic Substance Control, or DTSC, and
3 universities as well. DOE provided 41 million in
4 funding to the Environmental Protection Agency to
5 perform a thorough radiological study of the site. The
6 EPA concluded this was one of the most comprehensive
7 technical evaluation studies for low-level radiological
8 contamination the agency had ever conducted. This
9 study, along with the chemical studies performed by DOE
10 with DTSC, included more than 10,000 soil samples as
11 well as installation of additional groundwater sampling
12 wells and analysis of groundwater sampling results. The
13 Draft EIS is the culmination of careful study by
14 environmental and technical experts.

15 This process made a significant effort to be
16 transparent and involved many partners, including the
17 community, in the important studies that were completed.
18 Community involvement programs have included a workshop
19 about the accident that occurred in 1959 at the Sodium
20 Reactor Experiment, Groundwater University workshops,
21 the Soil Treatability Investigation Group, and the
22 Community Workshops to Develop Alternatives.

23 Now I would like to ask Stephanie Jennings, the
24 hearing officer for this meeting, to discuss the NEPA
25 involvement process, and to provide more information

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 about the Draft. Stephanie.

2 MS. JENNINGS: Thank you. Thanks, John, and good

3 morning everyone again. The National Environmental

4 Policy Act, often called NEPA, is a law that designates

5 a process that federal agencies must follow to consider

6 the environmental effects of a project. In our case,

7 the project involves the remediation of Area IV and the

8 Northern Buffer Zone. Under NEPA, federal agencies are

9 required to assess and disclose environmental effects of

10 a range of reasonable alternatives and present them to

11 the public in a Draft Environmental Impact Statement.

12 The analysis of alternatives in the Draft EIS is at the

13 heart of the federal environmental review process,

14 enabling the public to better understand the complexity

15 and trade-offs that will be involved in cleaning up the

16 site.

17 The process began with a Notice of Intent to

18 Prepare the EIS followed by an initial scoping and

19 comment period. Since that time, DOE has extensively

20 studied and analyzed the site, resulting in the Draft

21 EIS, which was published on January 13th. There is a

22 60-day comment period for public input which will end on

23 March 14. At the end of the public comment period, DOE

24 will review all public comments, make changes as

25 appropriate and publish a Final EIS. Following the

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 Final EIS, DOE will issue a Record of Decision for
2 cleanup of the site.

3 The Draft EIS analyzes the environmental
4 impacts of the Administrative Order on Consent or AOC
5 agreement and other alternatives that consider risk to
6 human health, and the protection of natural resources to
7 determine cleanup levels. This approach is consistent
8 with cleanup actions at other DOE sites and is in
9 compliance with federal law. The comparative analysis
10 of these alternatives allows stakeholders to understand
11 the balance and trade-offs associated with the various
12 options for site cleanup.

13 DOE remains committed to a site cleanup that
14 is protective of the public and the environment. The
15 Purpose and Need Statement you see on the screen here is
16 also in the Draft EIS and represents a summary of why
17 we're undertaking this process. In the Draft EIS, Area
18 IV references the traditional area of operations, and
19 the Northern Buffer Zone, well, which includes 182 acres
20 immediately adjacent to Area IV.

21 As I mentioned, NEPA states we must examine a
22 range of reasonable alternative approaches to
23 remediating the site. In developing this range, we
24 considered input received at public scoping meetings and
25 concepts developed by participants in the community

Response side of this page intentionally left blank.

3-1451

Section 3 – Public Comments and DOE Responses

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 developed alternative workshops. As required by NEPA,
 2 each alternative was considered thoroughly and potential
 3 environmental impacts from each alternative were
 4 analyzed

5 I want to briefly explore the alternatives in
 6 the Draft EIS starting with the soil remediation
 7 alternatives. You will note on this summary slide that
 8 there are four alternatives, beginning with No Action,
 9 which is a required -- which is required as a baseline.

10 Beginning on the right, you'll see first an
 11 alternative we labeled the Cleanup to AOC Look-Up Table
 12 Values, which adheres to the levels in the agreement
 13 signed in 2010 by DOE. Under this alternative, DOE
 14 would remediate soil in Area IV and the Northern Buffer
 15 Zone to meet chemical and radionuclide cleanup look-up
 16 table values established in accordance with the 2010
 17 Administrative Order on Consent. DOE would start at one
 18 side of the site and proceed across Area IV and the
 19 Northern Buffer Zone, removing soil at any location that
 20 exceeds a look-up table value. An estimated 933,000
 21 cubic yards of soil would be removed from the site,
 22 assuming that the proposed cultural and biological
 23 exemptions are approved by US Fish and Wildlife Service,
 24 California Department of Fish and Wildlife, the State
 25 Historic Preservation Office, and ultimately, DTSC. The

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 planning estimate for soil removal and backfill is
2 approximately 115,000 truck trips over at least a
3 10-year period.

4 Second is the Cleanup to Revised Look-Up Table
5 Values. Under this alternative, a revised set of look-
6 up table values would be established for chemicals.
7 Cleanup levels for radionuclides would remain the same
8 as those under the Cleanup to Administrative Order on
9 Consent Look-Up Table Values Alternative. This revised
10 look-up table would evaluate a reduced list of
11 chemicals. These are chemicals believed to cause a
12 concern for human health at the site based on the
13 extensive site studies that John mentioned previously.
14 If the soil in a particular area exceeded the revised
15 look-up table value for any chemical or the AOC Look-Up
16 Table Value for a radionuclide, the soil would be
17 removed. Approximately 192,000 cubic yards of soil
18 would be removed under this alternative. The planning
19 estimate for soil removal and backfill is approximately
20 23,800 truck trips over a two and a half year period.
21 Like the AOC alternative, biological and cultural
22 resources would be protected, while also protecting the
23 public and the environment.

24 Third is the Conservation of Natural
25 Resources. This approaches cleanup using a risk-based

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 analysis which is consistent with DOE cleanup sites, as
2 well as Superfund cleanup sites across the country. DOE
3 would clean up soil to a level that would protect human
4 health by removing soil with concentrations of chemicals
5 or radionuclides that exceed criteria established using
6 a risk assessment process. Concentrations of
7 contamination would be averaged over a defined risk
8 assessment unit in accordance with standard practice for
9 cleanups across the country. This alternative would
10 reduce risk to the public and the environment, yet
11 conserve natural resources by disturbing less land than
12 the other alternatives, thereby reducing the potential
13 of impacting visual, biological, cultural, and water
14 resources. An estimated 148,000 cubic yards of soil
15 would be removed from the site within a two-year time
16 frame. The planning estimate for soil removal and
17 backfill is approximately 18,400 truck loads. Like the
18 first two alternatives, biological and cultural
19 resources would be protected, while also protecting the
20 public and the environment.

21 I'd like to talk in more detail about the
22 difference between alternatives in terms of soil volumes
23 proposed for removal. As I mentioned on the last slide,
24 the Conservation of Natural Resources alternative
25 approaches cleanup using a risk-based analysis. A

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 document called the "Standardized Risk Assessment
2 Methodology" was approved by DTSC to serve as the
3 technical basis for conducting human health and
4 ecological risk assessments for cleanup on other
5 contaminated land at the Santa Susana Field Laboratory.
6 This methodology establishes a cleanup threshold for
7 cancer causing chemicals based on ensuring that
8 remaining contaminant concentrations result in less than
9 one additional cancer case per one million people. It
10 also establishes a cleanup for non-cancer causing
11 chemicals based on a level that is considered non-toxic.
12 More information on this can be found in Appendix J of
13 the Draft EIS.

14 Under the Administrative Order on Consent
15 Cleanup, soil represented by all colors of trucks as
16 depicted on this slide would be removed. The Draft EIS
17 analyzes -- analysis uses the most currently approved
18 version of the Standardized Risk Assessment Methodology,
19 to assess the soil condition on the DOE controlled
20 portion of the property. This partial red truck --
21 thank you -- this partial red truck represents the soil
22 that exceeds the Administrative Order on Consent Look-
23 Up Table Values for radionuclides only. The yellow or
24 orange trucks represent soil that would be removed
25 because chemicals exceed a risk threshold using the

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 methodology described in the Standardized Risk
 2 Assessment Methodology. As you can see, these soils are
 3 removed under all three action alternatives. This
 4 removal would reduce the risk to human health from any
 5 remaining soil contamination to less than one cancer
 6 incidence per one million people. It also ensures that
 7 remaining chemical levels were not toxic in accordance
 8 with the methodology.

9 The blue trucks represent the volume of soil
 10 that would be removed using revised look-up table values
 11 for chemicals as described in the previous slide and AOC
 12 Look-Up Table Values for radionuclides. The green
 13 trucks represent 741,000 cubic yards of soil that would
 14 be removed because they exceed the Administrative Order
 15 on Consent Look-Up Table Values for chemicals alone.

16 The largest reduction in risk to a future
 17 on-site user comes from removal of the soil represented
 18 by the red and yellow/orange trucks. There would be an
 19 additional reduction in risk from the removal of soil
 20 represented by the blue trucks. There is a much smaller
 21 .3 percent reduction in risk from the removal of the
 22 soil represented by the green trucks. All of these soil
 23 removals have potential associated impacts relative to
 24 dust, and vehicle emissions, truck traffic, road
 25 deterioration, vehicle accidents, facilities and worker

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 injuries, as well as potential impacts to cultural and
2 ecological resources that increase proportionately to
3 the amount of soil removed.

4 For a more detailed discussion of this
5 information, you can refer to Chapter 4 and Appendix J
6 of the Draft EIS.

7 This slide shows the alternatives for
8 groundwater remediation. Through extensive
9 characterization efforts, we are confident that
10 groundwater contamination remains on site for DOE's
11 responsibilities. However, we know that it is important
12 to develop a plan to address groundwater contamination.
13 The Draft EIS analyzes a no action alternative, as
14 required. It also analyzes active treatment
15 technologies and monitored natural attenuation, which
16 means natural processes that decay and degrade materials
17 over time.

18 Finally, this slide outlines the building
19 remediation options. As we mentioned earlier, only 18
20 buildings remain on the site. The Draft EIS proposes
21 only two alternatives relative to these buildings: a
22 baseline no action alternative, similar to what we've
23 described above, or complete removal of the remaining
24 structures.

25 Collectively, the Draft EIS analyzes the

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 environmental and community impact of remediation
 2 options, including preservation of historic and cultural
 3 resources, wildlife conservation, impact on roads and
 4 local communities, and length of cleanup, among many
 5 other factors. Every DOE Environmental Impact Statement
 6 must consider the resource areas listed on this slide.
 7 As with any project of this size, there are complex
 8 factors that go into the decision-making process. The
 9 final decision will have to balance many factors.

10 With that overview of the Draft EIS, I want to
 11 briefly recap next steps. The 60-day public comment
 12 period started on January 13, which means interested
 13 parties have until March 14 to provide comments. This
 14 can be done at hearings like this or through our website
 15 at www.SSFLAreaIVEIS.com. Public input is an important
 16 part of shaping the Final EIS and eventually the path
 17 forward.

18 Once the Final EIS is complete, DOE will
 19 publicly release all of the comments that we received
 20 and our responses to those comments. We also will
 21 publish a notice of the EIS's completion in the Federal
 22 Register. The final step will be to publish a Record of
 23 Decision no sooner than 30 days after the Final EIS is
 24 made publicly available.

25 With that, I would like to turn the podium

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 over to Wendy so she can hear -- we can hear your
2 comments.

3 MS. LOWE: Thanks, John and Stephe.

4 As the moderator, it's my job to make
5 sure that everyone who wants to speak is provided a
6 respectful opportunity to do so. So, please understand
7 that DOE will not be responding directly to any comments
8 during the rest of this meeting; however, your comments
9 will be considered in the finalization of the
10 Environmental Impact Statement. All comments will be
11 given equal consideration whether they're submitted
12 orally or in writing. I think most of you had the
13 opportunity to attend the open house which preceded this
14 meeting, and if you did that, I want -- I want you to be
15 aware that any discussions that you had at the posters
16 were not recorded and will not be included in the formal
17 record of this meeting. If you said something in the
18 open house that you want DOE to consider when they're
19 finalizing the Environmental Impact Statement, please
20 restate your thoughts early -- the thoughts that you
21 expressed earlier either at the -- well, when you
22 provide your comments today or in writing.

23 I'd like to emphasize that providing oral
24 comments is only one of the ways that you can submit
25 your comments during the public comment period. If you

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 prepared written comments that you would like to submit
2 for the record today, you're welcome to leave those with
3 us before you leave. There's also a public comment form
4 that's available at the public comment table, and you
5 can fill out that form and leave it before you leave
6 today. There's also information at the registration
7 table about how you can submit your comments later in
8 writing. So, all comments that are received during the
9 public comment period, which will end on March 14, 2017,
10 will be given equal consideration.

11 All comments received during the public
12 comment period will be included in the Final
13 Environmental Impact Statement. If you are not already
14 on the mailing list, you can have the opportunity to
15 sign up to be on the mailing list at the registration
16 table. And those folks that are on the mailing list
17 will be notified when the final EIS is published.

18 Let's see. Phillip Orr, who is sitting here,
19 is our court reporter, and it's his job to provide a
20 complete and accurate transcription of this hearing.
21 I've asked him to let us know you if he's having trouble
22 hearing or understanding you. If people on this side of
23 the room want to make comments, we'd like to ask you to
24 go to the back side of the room when making your
25 comments so that he can have some visual contact so he

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 can see you while you're making your comments. So, if
2 you'd like to make a comment, we'd like you to begin by
3 stating your name and the name of any organization that
4 you're representing in an official capacity today.

5 And one final request I'd like to make of you:

6 I know some of you have strong opinions about the
7 cleanup effort -- cleanup program at Santa Susana Field
8 Laboratory. The point of a public comment hearing is to
9 provide you with the opportunity to provide your
10 thoughts to the Department of Energy about the Draft
11 Environmental Impact Statement. We're grateful that you
12 have taken time out of your busy schedules and driven
13 through the rain to attend this public meeting and for
14 your ongoing interest in the cleanup of Santa Susana
15 Field Lab.

16 Regardless of your position, I would
17 appreciate your help in making sure that everyone who
18 speaks today is treated with respect, as I know you will
19 appreciate when it's your turn to speak.

20 So, it is my understanding that only one of
21 you have actually signed up to speak, but we are
22 prepared to take comments from anyone who would like to
23 provide comments today.

24 So, Mr. Stickel, I understand you registered
25 to speak. Would you like to go first?

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 MR. STICKEL: Yeah. I'm the only one?

2 MS. LOWE: I'm not sure you're the only one, but I

3 want to check -- check the box on the card. So, we're

4 going to move the chair over here so that --

5 MR. STICKEL: That's the hot seat, huh?

6 MS. LOWE: Yeah. You can stand or sit. It's up to

7 you. So, let the record reflect this is Gary Stickel.

8 MR. STICKEL: Yeah. I represent the Gabrieleno

9 Band of Mission Indians Kizh Nation, spelled K-i-z-h.

10 And, I'm a little bit at a loss for words because you

11 went into a little more detail than, you know, I can

12 comment on. But, I guess I just want to reaffirm what

13 you already know and heard a lot, you know, that the

14 Santa Susana Field Laboratory area is considered very

15 sacred to the Kizh, and not only the most prominent side

16 of Burro Flats, but there's other -- many other sites

17 that I think everybody here will agree that is sacred.

18 This is sacred landscape. It has to be viewed that way.

19 So, it's not just an individual little dot on a map, but

20 it's -- it's sacred area.

21 And, you know, I do -- I do appreciate the

22 government outreach to Native American people and

23 participation has been deeply appreciated. And, you

24 know, we want to continue with the process, and I

25 haven't fully reviewed the EIS, you know, but I will be

800-1

800-1

DOE recognizes and takes seriously the sacred status of SSFL, as discussed in Chapter 3, Section 3.11.2.3.4 and elsewhere throughout Section 3.11, and also as reflected in the effects analysis in Chapter 4, specifically under each alternative in Section 4.11.

800-2

800-2

Thank you for comment; outreach to Native Americans is an important part of DOE's EIS process.

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 taking a hard copy home today. I understand it's a
2 possibility and I'd like to do that and allow myself
3 some time to go over this. I missed the last meeting,
4 and I'm sorry about that. I had a major conflict, but,
5 you know, I was sick with pneumonia. That's my excuse.
6 So, but, anyway, that's -- that's basically all I have
7 to say right now. Thank you.

8 MS. LOWE: Well, thank you, Mr. Strickel, and
9 please take advantage of the 60-day comment period.

10 MR. STICKEL: Right.

11 MS. LOWE: Thank you. Patrick? This is Patrick
12 Tumamait.

13 THE REPORTER: Patrick.

14 MR. TUMAMAIT: Good morning. My name is Patrick
15 Tumamait. I represent the Barbareno Ventureno Band of
16 Mission Indians. Just -- just a few things. And, I've
17 kind of learned a little bit more about what's going on
18 here. But, in the past, it's been brought up that we
19 would like to see some type of overlay in our
20 circumstances of the contaminated areas that are going
21 to be removed versus the archaeological sites that have
22 been discovered here on the site. So, I'm requesting
23 that today is to have some kind of overlay of a mapping
24 situation where we can kind of see exactly where the
25 most effective areas are going to be when it concerns

801-1

801-1 Archaeological location information is maintained as confidential in order to protect the integrity of archaeological sites, and is not available to the public. This information has been presented to the Native American consulting parties (e.g, the Santa Susana Field Laboratory Sacred Sites Council (SSFL Sacred Sites Council), an organization of Native Americans with historical ties to SSFL land). These consulting parties were required to sign a non-disclosure agreement with DOE before being given access to this information.

In accordance with the NHPA, Section 106 Programmatic Agreement (being developed in consultation with the SHPO and other consulting parties, including the federally recognized Santa Ynez Band of Chumash Indians and non-federally recognized tribes, and DTSC), DOE will share additional information as cleanup plans are developed. The Soil Remedial Action Implementation Plans will identify specific areas and methods of remediation. This information will be shared with the Native American consulting parties, giving them an opportunity to see exactly where cleanup will occur in relationship to identified traditional cultural resources.

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 the archaeological sites.

2 Also, too, in your -- in your -- four group

3 levels of cleanup, you know, I kind of feel and think

4 that the general publics are going to want to go with

5 the most effective, you know, removal tier on site, and

6 I can see where there's, you know, other determinations

7 that they -- you may not have to go to the lowest.

8 But, I asked also in the past that, is there

9 going to be testing during the removal to see just how

10 much contamination exists during that excavation work?

11 I mean, is there going to be soil samples taken out of

12 the material that's being excavated as they go so to

13 determine whether there's anything left behind or if

14 there needs to be more or so on and so forth? So, are

15 you going to have other environmental companies out

16 there, you know, testing for soil samples?

17 Also, too, usually in a lot of construction

18 sites, you know, the bill -- and I've seen it where

19 companies will start at one -- at one end of the

20 project; before they finish, they'll move on to another.

21 Well, I hope in this circumstance that they start in one

22 area, complete it, and then move on to the next.

23 Because with the animal situation, you're going to be

24 displacing a lot of the animals, and in that one

25 particular area, where they're going to end up going is

|| 801-1
cont'd

|| 801-2

|| 801-3

|| 801-4

801-2 Please refer to Section 2.1, "Preferences for Cleanup," of this CRD, for a description of the alternatives evaluated in this EIS.

801-3 Testing of remaining soil after contaminated soil has been removed will be performed to confirm that cleanup standards have been met. The process for soil testing will be described in the Soil Remedial Action Implementation Plans.

801-4 DOE acknowledges your concern for wildlife. A biologist will be on staff during the remediation to ensure minimal wildlife disturbance. The potential impacts on biological resources during Area IV and NBZ remediation are evaluated in Chapter 4, Section 4.5 of this EIS; cumulative impacts on biological resources by the combined remediation activities by DOE, NASA, and Boeing are evaluated in Chapter 5, Section 5.5.5.

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 to where there's no noises, no equipment, there's
2 nothing going -- no action going on. But if the
3 contractor decides to move on or things change within
4 the project, then they start affecting another area,
5 then you've got this whole layout of equipment then
6 that's going to affect the migration for the habitat --
7 (Interruption and noise in adjacent room)
8 MR. TUMAMAIT: -- or the habitat of the -- of the
9 animals in a larger portion of the project. So, what I
10 would like to see, if it gets started in one particular
11 area, that it gets completed and -- and so on before
12 they move on to another area. That way it gets --
13 (Interruption and noise in adjacent room)
14 MR. TUMAMAIT: -- the animals -- so on -- because
15 they're going to -- because they're going to end up
16 going to wherever's safe, and, you know, by that time,
17 you know, hopefully they'll -- because they're --
18 they're going to return. They're going to be -- going
19 to return.
20 Also, too, the -- the idea of the trucking and
21 the costs and the construction companies are going to be
22 involved with this, you know, there's going to be a big
23 cost effect on, you know, the company that you're going
24 to hire because not everything is -- not everything goes
25 well on the ground with companies that have equipment.

801-4
cont'd

801-5

801-5 Your concern for safety and costs during remediation activities is noted. DOE will put protocols in effect to ensure safety and appropriate maintenance of equipment. DOE is committed to using green cleanup processes to the extent feasible in all aspects of remediation (see Chapter 2, Section 2.2.2, and Chapter 7 of this EIS). Many of these principles are and will continue to be incorporated into the remediation work at SSFL to ensure safety and efficiency while minimizing impacts to the environment.

3-1465

Section 3 - Public Comments and DOE Responses

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 A lot of times there's people who are sick or people
 2 that are -- equipment that's breaking down and so on, so
 3 that's going to prolong the costs, and it's going to get
 4 even greater at that time. So, hopefully you're going
 5 to take that into consideration when you do hire these
 6 companies, that they -- all of their equipment is, you
 7 know, inspected, their -- their drivers are -- you know,
 8 are approved drivers, so on and so forth. So, hopefully
 9 that alleviates some of that. That's all.

10 MS. LOWE: Thank you, Mr. Tumamait. Would other
 11 folks like to make comments on the record?

12 MR. COHEN: They would might say where to read.

13 MS. LOWE: Okay. This is Sam Cohen.

14 THE REPORTER: Sam Cohen?

15 MS. LOWE: Uh-huh.

16 MR. COHEN: Good morning. My name is Sam Cohen.
 17 I'm the government affairs legal officer for the Santa
 18 Ynez Band of the Chumash Indians. I have two verbal
 19 comments today and will be providing additional comments
 20 in writing before the end of the comment period. And, I
 21 may, if I have the time and the interest, go to some
 22 other public meetings, if I am brave.

23 So, two major comments for this morning: The
 24 first one is there are major areas, starting on Figure
 25 S-5 on Page S-22 of combined proposed biological and

801-5
cont'd

802-1

802-1 Because of the sensitive and confidential nature of archaeological site location information, DOE will not provide this data in this Final EIS. However, it was made available to members of the Sacred Sites Council who signed a non-disclosure agreement and attended a tour designed specifically to address this concern. Qualified members of the public and non-tribal consulting parties may obtain this information at the South Central Coastal Information Center of the California Historical Resources Information System. DOE's definition of cultural resources considered for exemptions under the AOC is discussed Chapter 4, Section 4.11.

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 cultural exemption areas. This shows up in three maps.
2 The second one is Figure S-7 on Page S-35. And, I
3 skipped over a third map, which is Figure S-6 on Page
4 S-32, all of which are in the Summary volume of the
5 Draft EIS. So, for the purposes of the Native American
6 participants, and the Santa Ynez Band of Chumash Indians
7 specifically, we would like a separation of the cultural
8 exemption areas from the biological exemption areas and
9 a more detailed explanation of both the cultural areas
10 and the biological areas.

11 The second item which we'd like to address is
12 wildlife corridors that surround the entire Santa Susana
13 Field Laboratory site and permeate the individual areas
14 within the Santa Ynez Band -- sorry -- within the Santa
15 Susana Field Lab site, including Area IV, which is the
16 area being analyzed by the DOE Draft Environmental
17 Impact Statement. There's been a lot of work on
18 wildlife corridors and how many animals, including
19 mountain lions, pass through this area on a regular
20 basis, and I think that needs to be added to the stuff.

21 Thank you very much.

22 MS. LOWE: Thank you, Mr. Cohen. Are there
23 additional folks that would be interested in commenting
24 today? Okay.

25 On behalf of the US Department of Energy, I

802-1
cont'd

802-2

802-2

Additional information about the wildlife corridors in relation to Area IV and the NBZ has been added to Chapter 3, Section 3.5 of this EIS.

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

1 want to thank you very much for your time and attention.
 2 Let the record reflect that it is now 11:02 a.m., and
 3 all individuals who are interested in speaking have been
 4 provided an opportunity to do that. The project team
 5 looks forward to working with you throughout this
 6 process. I would like to remind you that you can submit
 7 comments in writing between now and March 14th, 2017.
 8 Thank you so much for coming today.
 9 (Whereupon, the Tribal Hearing adjourned
 10 at 11:02 a.m.)

Comments from the Simi Valley, California Tribal Meeting (February 17, 2017)

REPORTER'S CERTIFICATION

I, PHILLIP DEAN ORR, C.S.R. No. 7656, Certified
Shorthand Reporter, certify:

That the foregoing proceedings were taken
before me at the time and place therein set forth.

That the proceedings were recorded stenographically
by me and were thereafter transcribed;

That the foregoing is a true and correct transcript
of my shorthand notes so taken.

I further certify that I am not a relative or
employee of any of the parties, nor financially
interested in the action.

I declare under the penalty of perjury under
the laws of the State of California that the
foregoing is true and correct.

Dated this 5th day of March, 2017.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 Saturday, February 18, 2017, Simi Valley, CA, 9:30 a.m.

2 * * * * *

3 MS. LOWE: So, good morning everyone.

4 MR. UNIDENTIFIED: Morning.

5 MS. LOWE: And, thank you so much for coming today.

6 My name is Wendy Lowe, and I'd like to welcome you to

7 this public hearing, which is hosted by the U.S.

8 Department of Energy. DOE has prepared a Draft

9 Environmental Impact Statement, or EIS, to evaluate the

10 potential environmental impacts associated with cleanup

11 of Area IV and the Northern Buffer Zone at the Santa

12 Susana Field Laboratory. The goal of this public

13 hearing is to provide you, as members of the public,

14 with an opportunity to provide your comments on the

15 draft document for consideration by the Department of

16 Energy as the Department finalizes the Environmental

17 Impact Statement.

18 Today is Saturday, February 18, 2017, and this

19 meeting is being convened in the Valley Ballroom at the

20 Grand Vista Hotel, located at 999 Enchanted Way in Simi

21 Valley, California, and the time is now 9:31.

22 I would like to point out a few housekeeping

23 items before we get started. The restrooms are located

24 at these doors. Take a left, take a right, and then

25 they're on the right. And, we have water available at a

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 water station on -- back along this wall. The exists in
2 the event of an emergency, there's one exit that goes
3 through the kitchen that way. I would recommend these
4 three exists and then out the same way that you came in.
5 Feel free to leave this hearing room at any
6 time, but we'd ask that if you do so, you do it in a way
7 that minimizes distraction. Please silence your cell
8 phones and refrain from any conversations in this room.
9 Before we begin, I would like to introduce
10 John Jones and Stephe Jennings from the U.S. Department
11 of Energy. They will provide an overview presentation
12 about the Draft EIS. Copies of the slides that John and
13 Stephe use for their presentation will be available on
14 line after Tuesday. And, there are hard copies
15 available in the back of the room. After their
16 presentation, I will review the ground rules for this
17 hearing and begin taking your comments.
18 Speaking first will be John Jones. He's been
19 the Director of the U.S. Department of Energy's Energy
20 Technology Engineering Center since 2011, and he has the
21 overall responsibility for completing remediation at the
22 site.
23 MR. JONES: Thank you, Wendy. Thank you, Wendy,
24 and good morning. My name is John Jones, and as Wendy
25 stated, I am the Director for the U.S. Department of

Response side of this page intentionally left blank.

3-1473

Section 3 - Public Comments and DOE Responses

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 Energy's Energy Technology Engineering Center or ETEC.
 2 On behalf of DOE, I would like to welcome you to this
 3 public hearing. As Wendy mentioned, our purpose this
 4 morning is to gather your input on the Department's
 5 recently released Draft Environmental Impact Statement
 6 for Area IV and the Northern Buffer Zone. We would like
 7 to give you more background about the Draft EIS and a
 8 brief history of operations at the site in a moment.

9 I would like to first introduce my colleague
 10 Stephie Jennings, who is the deputy director at our site
 11 and will serve as the official hearing officer for this
 12 morning's hearing. In addition, I would like to thank
 13 Simi Valley's funds. Thank you for attending this
 14 meeting. They're here to insure that everybody is
 15 comfortable and safe to provide your comments, and we
 16 appreciate you here.

17 A little history on the site. After World War
 18 II, the U.S. Government was interested in developing
 19 peaceful purposes for atomic energy. In 1953, the
 20 government approved a nuclear research and development
 21 center in Area IV of the Santa Susana Field Lab,
 22 eventually being known as ETEC. During its operation
 23 years, the center housed and tested a number of small
 24 research reactors. Research also explored best
 25 practices in nuclear waste management and the use of

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 liquid metals as a coolant for nuclear energy.
2 The research at this site was critical in
3 developing our modern nuclear energy program that today
4 helps power everything from the space program to
5 electricity generation from commercial nuclear reactors.
6 This research resulted in localized releases of
7 chemicals and radionuclides to the soil, bedrock, and
8 groundwater. The Draft EIS lays out a range of
9 alternatives to address contaminations that remain at
10 Area IV and the Northern Buffer Zone.
11 I want to speak briefly about our path so far.
12 In 2003, DOE released an environmental assessment for
13 Area IV and the Northern Buffer Zone following an
14 internal review of remediation needs at the site. After
15 a court challenged this assessment, in 2007 a federal
16 judge ordered DOE to complete an Environmental Impact
17 Statement per the National Environmental Policy Act,
18 NEPA. The order enjoined DOE from relinquishing control
19 of any portion of Area IV until DOE had completed an
20 Environmental Impact Statement and issued a Record of
21 Decision as required by NEPA. Based on that finding,
22 the court chose not to address the plaintiff's claims
23 related to the Comprehensive Environmental Response,
24 Compensation, and Liability Act, CERCLA, and the
25 Endangered Species Act, ESA. As a result of this order,

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 DOE began the EIS process including extensive research,
 2 planning and public involvement. DOE initiated a
 3 significant characterization effort from multiple
 4 agencies, including California Department of Toxic
 5 Substances Control, or DTSC, and the universities as
 6 well. DOE provided \$41.5 million in funding to the
 7 Environmental Protection Agency to perform a thorough
 8 radiological study of the site. The EPA concluded this
 9 was one of the most comprehensive technical evaluations
 10 for low-level radiological contamination the agency had
 11 ever conducted. This study, along with the chemical
 12 studies performed by DOE and DTS -- with DTSC oversight,
 13 included more than 10,000 samples, as well as the
 14 installation of additional groundwater sampling wells
 15 and analysis for groundwater sampling results. The
 16 Draft EIS is the culmination of a careful study by
 17 environmental and technical experts.

18 Throughout this process, DOE has made a
 19 significant effort to be transparent and involve many
 20 partners, including the community in the important
 21 studies that were completed. Community involvement
 22 programs have included a workshop about the accident
 23 that occurred in 1959 at the Sodium Reactor Experiment,
 24 Groundwater University workshops, the Soil Treatability
 25 Investigative Group, and Community Workshops to Develop

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 Alternatives.

2 Now I would like to ask Stepheie Jennings, the
3 hearing officer for this meeting, to discuss the NEPA
4 public involvement process, and provide more information
5 about the Draft EIS. Stepheie.

6 MS. JENNINGS: Much shorter. Thanks, John, and
7 good morning everyone. The National Environmental
8 Policy Act, often called NEPA, is a law that designates
9 a process that federal agencies must follow to consider
10 the environmental effects of a project. In our case,
11 the project involves remediation of Area IV and the
12 Northern Buffer Zone. Under NEPA, federal agencies are
13 required to assess and disclose environmental effects of
14 a reasonable range of alternatives and present them to
15 the public in a Draft Environmental Impact Statement.
16 The analysis of alternatives in the Draft EIS is the
17 heart of the federal environmental review process,
18 enabling the public to better understand the complexity
19 and trade-offs that will be involved in cleaning up the
20 site.

21 The process began with a Notice of Intent to
22 Prepare the Environmental Impact Statement followed by
23 initial scoping and public comment period. Since that
24 time, DOE has extensively studied and analyzed the site,
25 resulting in the Draft EIS, which was published on

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 January 13th, 2017. There is a 60-day public comment
 2 period which will end on March 14th, 2017. At the end
 3 of the public comment period, DOE will review all public
 4 comments, make changes as appropriate, and published a
 5 Final Environmental Impact Statement. Following the
 6 Final Environmental Impact Statement, DOE will issue a
 7 Record of Decision for cleanup at the site.

8 The Draft EIS analyzes the environmental
 9 consequences of the Administrative Order on Consent or
 10 AOC agreement and other alternatives that consider risk
 11 to human health, and the protection of natural resources
 12 to determine cleanup levels. This approach is
 13 consistent with cleanup actions at other DOE sites and
 14 is in compliance with federal law. The comparative
 15 analysis of these alternatives allows stakeholders to
 16 understand the balance and trade-offs associated with
 17 the various options for site cleanup.

18 DOE remains committed to a site cleanup that
 19 is protective of the public and the environment. The
 20 Purpose and Need Statement you see on this screen is
 21 also in the EIS and represents a summary of why we're
 22 undertaking this process. In the Draft EIS, Area IV
 23 references the traditional area of operations, and the
 24 Northern Buffer Zone which includes 182 acres
 25 immediately adjacent to Area IV.

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 would be removed from the site, assuming that the
2 proposed cultural and biological exemptions are approved
3 by US Fish and Wildlife, California Department of Fish
4 and Wildlife, the State Historic Preservation Office,
5 and ultimately, DTSC. The planning estimate for soil
6 removal and backfill is approximately 115,000 truck
7 trips over at least a 10-year period.

8 Second is the Cleanup to Revised Look-Up Table
9 Values. Under this alternative, a revised set of look-
10 up table values would be established for chemicals.
11 Cleanup levels for radionuclides would remain the same
12 as those under the Cleanup to AOC Look-Up Table Values
13 Alternative. This Revised Look-Up Table would evaluate
14 a reduced list of chemicals. These are chemicals
15 believed to cause a concern for human health at the site
16 based on the extensive site studies that John mentioned
17 previously. If the soil in a particular area exceeded
18 the Revised Look-Up Table Value for any chemical or the
19 AOC Look-Up Table Value for a radionuclide, the soil
20 would be removed. Approximately 192,000 cubic yards of
21 soil would be removed under this alternative. The
22 planning estimate for soil removal and backfill is
23 approximately 23,800 truck trips over a two and a half
24 year period. Like the AOC alternative, biological and
25 cultural resources would be protected while still

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 planning estimate for soil removal and backfill is
 2 approximately 115,000 truck trips over at least a
 3 10-year period.

4 Second is the Cleanup to Revised Look-Up Table
 5 Values. Under this alternative, a revised set of look-
 6 up table values would be established for chemicals.
 7 Cleanup levels for radionuclides would remain the same
 8 as those under the Cleanup to Administrative Order on
 9 Consent Look-Up Table Values Alternative. This revised
 10 look-up table would evaluate a reduced list of
 11 chemicals. These are chemicals believed to cause a
 12 concern for human health at the site based on the
 13 extensive site studies that John mentioned previously.
 14 If the soil in a particular area exceeded the revised
 15 look-up table value for any chemical or the AOC Look-Up
 16 Table Value for a radionuclide, the soil would be
 17 removed. Approximately 192,000 cubic yards of soil
 18 would be removed under this alternative. The planning
 19 estimate for soil removal and backfill is approximately
 20 23,800 truck trips over a two and a half year period.
 21 Like the AOC alternative, biological and cultural
 22 resources would be protected, while also protecting the
 23 public and the environment.

24 Third is the Conservation of Natural
 25 Resources. This approaches cleanup using a risk-based

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 protecting the public and the environment.
2 Third is the Conservation of Natural
3 Resources. This approach -- this approaches cleanup
4 using a risk-based analysis which is consistent with DOE
5 sites, as well as Superfund sites across the country.
6 DOE would clean up soil to a level that would protect
7 human health by removing soil with concentrations of
8 chemicals or radionuclides that exceed criteria
9 established using a risk assessment process.
10 Concentrations of contamination would be averaged over a
11 defined risk assessment unit in accordance with standard
12 practice for cleanups across the country. This
13 alternative would reduce risk to the public and the
14 environment, yet conserve natural resources by
15 disturbing less land than the other alternatives,
16 thereby reducing the potential of impacting visual,
17 cultural, and biological, and water resources. An
18 estimated 148,000 cubic yards of soil would be removed
19 from the site within a two-year time frame. The
20 planning estimate for soil removal and backfill is
21 approximately 18,400 truck loads. Like the first two
22 alternatives, biological and cultural resources would be
23 protected, while also protecting the public and the
24 environment.
25 I'd like to talk in more detail about the

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 difference between alternatives in terms of soil volumes
 2 proposed for removal. As I mentioned on the last slide,
 3 the Conservation of Natural Resources alternative
 4 approaches cleanup using a risk-based analysis. A
 5 document called the "Standardized Risk Assessment
 6 Methodology" was approved by DTSC to serve as the
 7 technical basis for conducting human health and
 8 ecological risk assessments for cleanup on other
 9 contaminated land at the Santa Susana Field Laboratory.
 10 This methodology establishes a cleanup threshold for
 11 cancer causing chemicals based on ensuring that
 12 remaining contaminant concentrations result in less than
 13 one additional cancer case per 1,000,000 people. It
 14 also establishes a cleanup for non-cancer causing
 15 chemicals based on a level that is considered non-toxic.
 16 More information on this can be found in Appendix J of
 17 the Draft Environmental Impact Statement.

18 Under the Administrative Order on Consent Cleanup,
 19 soil represented by all colors of trucks as depicted on
 20 this slide would be removed. The Draft Environmental
 21 Impact Statement uses the most currently approved
 22 version of the Standardized Risk Assessment Methodology
 23 to assess the soil conditions on the DOE controlled
 24 portion of the property: This partial red truck
 25 represents the soil that exceeds the Administrative

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 Order on Consent Look-Up Table Values for radionuclides
2 only. The yellow or orange trucks represent soil that
3 would be removed because chemicals exceed a risk
4 threshold using the methodology described in the
5 Standardized Risk Assessment Methodology. As you can
6 see, these soils are removed under all three action
7 alternatives. This removal would reduce the risk to
8 human health from any remaining soil contamination to
9 less than one cancer incidence per 1,000,000 people. It
10 also ensures that remaining chemical levels were not
11 toxic in accordance with the methodology.

12 The blue trucks represent the volume of soil
13 that would be removed using Revised Look-Up Table Values
14 for chemicals as described in the previous slide, an
15 Administrative Order on Consent Look-Up Table Values for
16 radionuclides. The green trucks represent 741,000 cubic
17 yards of soil that would be removed because they exceed
18 the AOC Look-Up Table Values for chemicals alone.

19 The largest reduction in risk to a future
20 on-site user comes from removal of the soil represented
21 by the red and yellow/orange trucks. There would be an
22 additional reduction in risk from removal of the soil
23 represented by the blue trucks. There is a much smaller
24 .3 percent reduction in risk from removal of the soil
25 represented by the green trucks. All of these soil

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 removals have potential associated impacts relative to
 2 dust and vehicle emissions, truck traffic, road
 3 deterioration, vehicle accidents, fatalities and worker
 4 injury, as well as potential impacts to cultural and
 5 ecological resources that increase proportionately to
 6 the amount of soil removed.

7 For a more detail discussion of this
 8 information, you can refer to Chapter 4 and Appendix J
 9 in the Draft EIS.

10 This slide shows the alternatives for
 11 groundwater remediation. Through extensive
 12 characterization efforts, we are confident that
 13 groundwater contamination remains on site for DOE's
 14 responsibilities. However, we know that it is important
 15 to develop a plan to address groundwater contamination.
 16 The Draft EIS analyzes a no action alternative, as
 17 required. It also analyzes active treatment
 18 technologies and monitored natural attenuation, which
 19 means natural processes that decay and degrade over
 20 time.

21 Finally, this slide outlines the building
 22 remediation options. As we mentioned earlier, only 18
 23 buildings remain on the site. The Draft EIS proposes
 24 only two alternatives relative to these buildings: a
 25 baseline no action alternative, similar to what we've

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 described above, or a complete removal of the remaining
2 building structures.

3 Collectively, the Draft EIS analyzes the
4 environmental and community impact of remediation
5 options, including preservation of historic and cultural
6 resources, wildlife conservation, impact on roads and
7 local communities, and length of cleanup, among many
8 other things. Every DOE Environmental Impact Statement
9 must consider the resource areas listed on this slide.
10 As with any project of this size, there are complex
11 factors that go into the decision-making process. The
12 final decision will have to balance many factors.

13 With that overview of the Draft Environmental
14 Impact Statement, I want to briefly recap next steps.
15 The 60-day public comment period started on January 13,
16 2017, which means interested parties have until March
17 14, 2017 to provide comments. This can be done at
18 hearings like this one or through our website at
19 www.SSFLAreaIVEIS.com. Public input is an important
20 part of shaping the Final EIS and eventually the path
21 forward.

22 Once the Final EIS is complete, DOE will
23 publicly release all of the comments that were received
24 and our responses to those comments. We also will
25 publish a notice of the EIS's completion in the Federal

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 Register. The final step will be to publish a Record of
 2 Decision no sooner than 30 days after the Final EIS is
 3 made publicly available.

4 With that, I would like to turn the microphone
 5 back over to Wendy so we can hear your comments.

6 Thanks.

7 MS. LOWE: Thank you, John and Stephe.

8 As the moderator, it's my job to make sure
 9 that this meeting is conducted in a respectful manner
 10 and that as many people as possible have a fair
 11 opportunity to provide oral comments.

12 Please understand the DOE will not be
 13 responding directly to your comments during the rest of
 14 this meeting; however, your comments will be considered
 15 in the finalization of the Environmental Impact
 16 Statement. All comments will be given equal
 17 consideration, regardless of whether they are submitted
 18 orally or in writing.

19 Some of you may have had the opportunity to
 20 attend the open house which began at 9:00 a.m. this
 21 morning. If you didn't, I wanted to make sure that you
 22 know that the information provided in the open house
 23 will be posted on the EIS website, and hand-out copies
 24 of the posters in the open house will remain available
 25 until the meeting ends today. If you did attend the

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 open house, it is important for you to understand that
2 any conversations you had in that area will not -- were
3 not recorded and will not be included in the formal --
4 as formal comments. If you said something in the open
5 house that you want DOE to consider while finalizing the
6 EIS, please restate your thoughts either from a
7 microphone today or in writing.

8 I'd like to emphasize that providing oral
9 comments from the podium is only one of the ways that
10 you can submit comments during the public comment
11 period.

12 There is also a public comment form that looks
13 like this, and it's available on these two back tables
14 here, and you're welcome to fill one of those out. You
15 can leave comment forms and other written comments with
16 the staff at the registration table or at the comment
17 table today. (Indicating)

18 For information on how to submit written
19 comments after today's meeting that -- the information
20 about how to do that is available at the registration
21 table. All comments received during the public comment
22 period, again which will end on March 14, 2017, will be
23 given equal consideration.

24 All comments received during the public
25 comment period will be included in the Final

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 Environmental Impact Statement. If you are not already
 2 on the mailing list, you can sign up to be added to that
 3 list at the registration table. Those people who are on
 4 the mailing list will be notified when the Final EIS is
 5 published.

6 If you're interested in providing comments
 7 today, you have to sign up to do that at the
 8 registration table, and there's a card that looks like
 9 this. And, if you indicate on that card that you would
 10 like to make comments today, they're bringing their
 11 cards -- those cards up to me. (Indicating)

12 Phillip Orr, who is sitting here at the front
 13 of the room, is our court reporter this evening -- or
 14 this morning, how about. It's Mr. Orr's job to provide
 15 a complete and accurate transcription of this hearing,
 16 and I've asked him to let me know if he is having
 17 trouble hearing or understanding you.

18 I would point out that there may be people in
 19 the room that are recording this meeting. Because this
 20 is a public meeting, there's nothing we can do to
 21 prevent that. But, we did want you to know that the
 22 only recording DOE is making is the transcription that's
 23 being prepared by the court reporter.

24 Now I will go over the ground rules for
 25 today's meeting:

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 To allow sufficient time for every -- to allow
2 time for everyone to speak, oral comments will be
3 limited to three minutes per speaker. All comments
4 provided by -- will be provided by individuals and no
5 one will be allowed to share their time with another
6 person. Each person will be allowed to speak only once.

7 We recognize that three minutes is a brief
8 amount of time, and strongly encourage folks to provide
9 more detailed comments in writing to ensure that all of
10 your thoughts, concerns, and suggestions can be fully
11 captured in the record.

12 I will hold up signs that look like this for
13 30 seconds, and this for time to stop to let you know
14 how -- how you are doing on your time. (Indicating)
15 If you are still speaking at the end of the three
16 minutes, I will ask you to conclude your remarks and
17 I'll call the next speaker to begin. Please understand
18 that if I do cut you off, it's because it's my job to
19 make sure that everyone who wants to speak today has an
20 opportunity to do that.

21 I will be calling on people in the same order
22 in which they signed up, and we will accommodate as many
23 people as we can until 12:00 noon, which is the time
24 that was advertised for this public hearing to end. I
25 will try to call two or three people at a time so you

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 will have some warning when it's your turn to speak. We
 2 have two microphones. There's one over here and there's
 3 one in the middle of the room. So, when I call on your
 4 name, make your way forward to whichever microphone is
 5 your preference. When I call your name, please step
 6 forward to the microphone and speak clearly and directly
 7 into the microphone. Begin by stating your name and the
 8 name of any organization that you may be representing in
 9 an official capacity today. Your three minutes will
 10 begin at that time.

11 One final request that I would make of you
 12 today: I know some of you have strong opinions about
 13 the cleanup at Santa Susana Field Laboratory. The point
 14 of a public comment period meeting is to give you an
 15 opportunity to share your thoughts with DOE about the
 16 Draft Environmental Impact Statement. We are grateful
 17 that you have taken time out of your busy lives to
 18 attend this public meeting and for your ongoing interest
 19 in the cleanup at Santa Susana Field Lab.

20 Regardless of your position, I would be
 21 grateful for your help in making sure that everyone who
 22 speaks today is treated with respect, as I know you will
 23 appreciate it when it is your turn to speak.

24 Interruptions and outbursts will slow things down, and
 25 I will control the hearing process to make certain that

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 everyone who wants to provide their comments is able to
2 do that in a respectful setting. Profanity and yelling
3 will not be tolerated.

4 Obviously, any interruptions will slow the
5 process and ultimately limit the number of people that
6 will be allowed to speak.

7 So, with that, I will begin taking comments.

8 So, the first person registered is Ron Ziman,
9 and Ron will be followed by Tenna Takata, and then
10 Melissa Bumstead.

11 MR. ZIMAN: My name is Dr. Ronald Ziman. I am a --
12 the co-chairman of the CAG. However, I'm speaking as an
13 individual, but the opinions I have are not necessarily
14 those of the CAGs. And, I am also a resident of Bell
15 Canyon and stakeholder. Bell Canyon, for those of you
16 who are not aware, is directly adjacent to SSFL. It is
17 downstream. It has 90 percent of the runoff -- water
18 runoff from SSFL.

19 I feel that the Environmental Impact Report
20 has to take into account protection for the public, the
21 environment, and the taxpayer. I'm grateful to see that
22 there were risks discussed as required by state and
23 federal law in the Environmental Impact Statement,
24 because risk is really the issue related to the cleanup,
25 those presented from the site itself and those that are

900-1

900-1

Onsite disposal options were eliminated from analysis in this EIS because the 2010 AOC does not allow onsite burial or landfilling (excavating and burying) of contaminated debris or soil. Boeing owns the land in Area IV and the NBZ. DOE's intent is to complete its cleanup responsibilities, then relinquish the land to Boeing's control. DOE does not want any enduring responsibility for a landfill created on site.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 presented by the cleanup actions and how they will
 2 effect the surrounding communities. In that regard, I
 3 feel that, as is standard throughout the nation, onsite
 4 disposal should be considered within the alternatives to
 5 reduce the amount of soil that requires removal from the
 6 site.

7 There should also be consideration of
 8 alternative cleanup methods, again to reduce soil that
 9 has to leave the site via trucks to minimize those risks
 10 to the community, including such things as diesel
 11 pollution, which has been associated with increased
 12 incidences of stroke, heart disease, dementia, and
 13 cancer, to name a few. There are, of course, other
 14 risks associated with truck traffic beyond the diesel
 15 pollution itself.

16 Biological, cultural and historic resources
 17 should be preserved to the greatest degree as possible
 18 and should receive a high priority. Obviously, human
 19 health is the major priority, but preservation of these
 20 other resources, I believe, is critical for multiple
 21 reasons, including maintaining wildlife linkages.

22 Area averaging, which is standard in my
 23 opinion, should be applied rather than the
 24 point-by-point contamination assessment to, again, be
 25 consistent with whether it's national standards and also

900-1
cont'd

900-2

900-3

900-4

- 900-2 Please refer to Section 2.1, "Preferences for Cleanup," of this CRD, for a description of why DOE considered alternatives to the Cleanup to AOC LUT Values Alternative. The alternative cleanup methods would reduce the volumes of soil that must leave SSFL. The impacts from truck traffic for the various alternatives are summarized in Chapter 2, Table 2-9, of this EIS and described in more detail in Chapter 4, primarily in Sections 4.6 (Air Quality and Climate Change), 4.7 (Noise), 4.8 (Transportation and Traffic), 4.13 (Environmental Justice), and 4.14 (Sensitive-aged Populations).
- 900-3 DOE has presented measures that would avoid, minimize, rectify, reduce, eliminate, or compensate for potential adverse impacts on the environment. Minimization measures are inclusive of methods, procedures and protocols, design features, and best management practices aimed at reducing the environmental impact of project activities. This EIS includes a range of minimization measures, including those that reduce the environmental footprint; improve safety, efficiency, and sustainability; and are incorporated as part of the alternatives' design. Additional information on wildlife linkages is included in this Final EIS.
- 900-4 While the Cleanup to AOC LUT Values Alternative and the Cleanup to Revised LUT Values Alternative would apply cleanup criteria on a point-by-point basis, the Conservation of Natural Resources Alternative would apply a traditional risk-assessment approach to making cleanup decisions, including using area averaging to determine concentrations and developing risk and dose criteria. Prior to area averaging, "hot spots" with higher concentrations are identified and targeted for cleanup. Area averaging is then applied to the remaining soil to determine whether additional soil cleanup is needed.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 to reduce unnecessary removal of soils that don't --
2 that -- that are not required with regards to risk
3 assessment. The --
4 No backfill has been identified. This is
5 indicated in the report, and the fact of the matter is,
6 if we applied the same standards to the State of
7 California in general that are being applied to SSFL, I
8 think that it would require removal of most of the soil
9 from California and elsewhere and --
10 (Clock timer ringing)
11 MR. ZIMAN: -- this is -- shows how this overly
12 strict cleanup requirement really doesn't make any
13 sense.
14 MS. LOWE: Thank you, Mr. Ziman.
15 MR. ZIMAN: Thank you.
16 MS. LOWE: Teena Takata will be followed by Melissa
17 Bumstead, and then Alec Uzemeck.
18 MS. TAKATA: Good morning. I'm Tenna Takata. I
19 have lived in the west part of Chatsworth for the last
20 30 years. I'm the president of the Santa Susana
21 Mountain Park Association, and have been involved with
22 the neighborhood council for the last 10 years in
23 Chatsworth.
24 Thank you very much to the -- to the DOE for
25 providing an EIS with an extensive analysis of possible

900-2
cont'd

900-5

900-5

DOE did explore locations for backfill, including those DTSC used as clean sites to establish background. One would consider the background sites to be "reasonable" locations as they have "similar lithology and chemical makeup" as Area IV. But the soil cannot be used as backfill because 42 percent of the chemicals analyzed by DTSC for the identified background sites exceeded their AOC LUT value in at least one sample and at about 25 percent of the background points at which samples were taken at least one chemical exceeded its AOC LUT value.

900-6

900-6

DOE acknowledges your concern about application of an overly strict cleanup requirement. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 alternatives. I can't tell you how much that is
 2 appreciated, that you have actually looked at the
 3 alternatives that could occur.

4 I especially appreciate in that document the
 5 consideration and analysis of the difficulty of
 6 replacing the soils. Given that the long-term use of
 7 the property is anticipated to be open space under all
 8 commitments made by the owner of the land, which
 9 presently is Boeing, removal of soils with inadequate
 10 replacement creates a poor effect from both wildlife and
 11 plant habitat, as well as long-term aesthetic views that
 12 will be permanently affected by the cleanup. Various
 13 community impacts are greatly increased as the number of
 14 truck trips increase.

15 Given that all the alternatives provide a
 16 cleanup that is protective of human health, and the
 17 variation, cancer risk is similar for all methods. The
 18 smart answer for wildlife and neighboring communities is
 19 to reduce the impacts from the cleanup as much as
 20 possible; therefore, the Conservation of Natural
 21 Resources approach is the best alternative in my view.

22 And, my comments are mine, and our
 23 organizations will separately submit comment and their
 24 letters as time goes on.

25 Thank you.

901-1

901-1 Please refer to Section 2.3, "Suitable Backfill Soil," of this CRD, for further discussion of this topic.

901-2

901-2 DOE acknowledges your support for the Conservation of Natural Resources Alternative. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 MS. LOWE: Thank you. Melissa Bumstead will be
2 followed by Alex Uzemeck, and then Paul Poirier. I hope
3 I'm saying that properly.
4 MS. BUMSTEAD: I'm Melissa Bumstead. I'm a mom. I
5 live in West Hills. And, I'd like to --
6 MS. LOWE: Can you get closer to the microphone?
7 Can you? Thank you.
8 MS. BUMSTEAD: Thank you. This is my daughter
9 Grace. She was diagnosed with cancer three years ago
10 with an incredibly rare form of leukemia. I'd like to
11 introduce you to Hazel. She's from Simi Valley. She is
12 in Children's Hospital today, receiving chemotherapy to
13 save her life. She was diagnosed with neuroblastoma in
14 2013. This is Sofia. She's from Bell Canyon. She was
15 diagnosed with neuroblastoma in 2011, as she died a year
16 and a half after her treatment. This is Ballie.
17 She's from Chatsworth. She was also diagnosed with
18 neuroblastoma in 2014. She died at two years old. It's
19 hard for me because these are all the children that
20 we've mapped. These are children that I know personally
21 who have childhood cancer in our local area.(Indicating)
22 I appreciate that so much research has been
23 done. My problem is with the methodology itself. I
24 have spoken with Dr. Hal Morgenstern, who is one of the
25 primary epidemiologists who put together the report, and

902-1

902-1

Thank you for your comment. It has been included in the Administrative Record for the EIS.

902-2

902-2

DOE acknowledges your comment and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 only a two-mile radius on adult cancer was researched.
 2 However, according to the National Cancer Institute,
 3 many studies have shown that exposure to Ion-19
 4 radiation could cause damage to the DNA, which could
 5 lead to the development of childhood leukemia and
 6 possibly other cancers, and I have -- I tried to get --
 7 I tried to get more information out of Dr. Morgenstern,
 8 to ask him, "Are -- are we safe in our community? Is
 9 this really a threat? Or am I overreacting?" He
 10 couldn't give me that answer. He was very nice but very
 11 firm, but he did not have the data available to assess
 12 any risks to children outside of that two-mile radius,
 13 and there's a -- there's a lot of complicating reasons
 14 for that, so I'm going to have to get you with the way
 15 the HIPAA laws are attributed, but he cannot compare our
 16 area to other local areas to see if we are above the
 17 national average. However, I would like to say that I'm
 18 not -- not -- I had 10 cases of childhood cancer that I
 19 think by the most compelling to say that more research
 20 needs to be done before we can move on to say that it is
 21 safe enough to limit the cleanup.

22 Neuroblastoma, those three cases that I just
 23 showed you, all those children live within a five-mile
 24 radius of the Santa Susana site. There are only 700
 25 cases nationally. So, if you put that over the

902-2
cont'd

902-1
cont'd

Counties. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

DOE's purpose in preparing this EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. DOE believes that all of the action alternatives evaluated in this EIS would result in cleanup of those areas of SSFL for which DOE is responsible, Area IV and the NBZ, that would be protective of human health and the environment.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 three-year range that those children were diagnosed,
2 there's only 2000 cases out of 73,000,000 children in
3 the United States who would get that disease. We have
4 three of them right here.
5 Brain tumors, there are only 5,000 cases of
6 pediatric brain tumors, and over two years, we had
7 Daniel pass away last year at DITG, inoperable,
8 untreatable brain cancers in the valley. Three years
9 ago we had Dillon with optic nerve glioma from West
10 Hills. We had Tyler from 2015, medulloblastoma brain
11 cancer from West Hills. Wendy, 2015, brain tumor,
12 Chatsworth. Right there we have four out of 5,000 cases
13 living very close. We have earliest tumors -
14 (Clock timer ringing)
15 MS. BUMSTEAD: -- known in 200 cases of that
16 nationally that --
17 (Clock timer ringing)
18 MS. LOWE: Ms. Bumstead, I'm sorry. You've run out
19 of time. Thank you so much.
20 MS. BUMSTEAD: I wish to leave you my map. Thank
21 you.
22 MS. LOWE: We appreciate you. (Clock timer ringing)
23 Okay. Stop. I'm sorry. Okay. Alec Uzemeck will be
24 followed by Paul Porier, and then Robert Dodge.
25 MR. UZEMECK: My name is Alec Uzemeck, and I'm a co

3-1497

Section 3 - Public Comments and DOE Responses

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 chair of the SSFL Community Advisory Group, and I'm a
 2 member of the West Hills Neighborhood Council, but this
 3 morning I'm representing my own opinions.

4 I strongly support the Conservation of Natural
 5 Resources. This is a very good alternative that
 6 satisfies a number of laws and regulations. The fact
 7 that it's risk-based satisfies the National Contingency
 8 Plan and the California Health Act. The fact that it
 9 has alternative analysis satisfies NEPA. And the fact
 10 that it would use area averaging, it complies with U.S.
 11 EPA guidelines, and all of this was done in -- within
 12 the AOC framework. I congratulate you for that.

13 But it is clear that the present AOC as
 14 written doesn't satisfy any of those acts or regulations
 15 or procedures or in generally used processes, so it does
 16 need to be rewritten to accommodate this alternative.
 17 What we're concerned about as a committee -- community
 18 is that we have the lowest truck traffic going through
 19 the neighborhood in order to control traffic and
 20 pollution, and so this alternative fits that same --
 21 that desire.

22 We do need air sampling, but the air sampling
 23 that's called out in the EIS is more from the point of
 24 view of DOE, and I -- I would like to see air sampling
 25 that considers the health of individuals in the

903-1

903-1 DOE acknowledges your support for the Conservation of Natural Resources Alternative. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

903-2

As described in Chapter 3, Section 3.9.2 of the Draft EIS, DOE collects air samples and monitors ambient radiation at locations in and around Area IV and the NBZ. Air samplers run continuously and the filters are collected weekly for analysis. Offsite ambient radiation dosimeters are located at the SSFL Main Gate and at background locations in West Hills and West Lake Village. The ambient radiation dosimeters are collected for analysis quarterly. The results of the monitoring can be found in the Annual Site Environmental Reports, which can be found on the Energy Technology Engineering Center website.

With regard to non-radiological air monitoring DOE, NASA, and Boeing each implemented their respective baseline air monitoring programs in early 2018 for their areas of responsibility at SSFL. For DOE the program includes a meteorological station within Area IV and four air monitors along the perimeter of Area IV (as described in NASA/Boeing/DOE 2017). The perimeter stations include two along the north border near the SRE and RMHF, one along the western border, and one along the southern border. DOE is operating the system to establish a pre-remediation baseline. The system will continue to operate during remediation activities to monitor any potential air pollutant releases of concern. If the air monitoring network indicates any elevated levels of air pollution, onsite staff would take action to mitigate the releases to acceptable levels. A description of the DOE air monitoring system was added to Chapter 3, Section 3.6.1 of this Final EIS.

903-2

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 community and perhaps some ongoing evaluation of any
2 peaks and types of illnesses.
3 That ends my comments. Thank you.
4 MS. LOWE: Thank you. Next is Paul Poirier,
5 followed by Robert Dodge, and then Kristi Storey, I
6 believe.
7 MR. POIRIER: Hi. Paul Poirier. I'm going to be
8 speaking to you on two -- representing two facts: One
9 is I'm the past president and current vice president of
10 Advocacy for the Central Coast Rebuilding Council, which
11 is a chapter of the U.S. Rebuilding Council, and that
12 organization is supporting compliance with the
13 Administrative Order on Consent of 2010 with the DOE,
14 just the bigger version to clean up. And, the reason
15 is, we feel that all of the short-term costs will be
16 more expensive, the long-term costs will be less
17 expensive. Much like fighting climate change and things
18 like that, right now it's containable. We can do that.
19 I think that if we take care of it now, we'll be taking
20 care of it forever. If we don't, we may have ongoing
21 problems and ongoing expenses that we'll have to deal
22 with as it migrates off the site.
23 A couple of comments regarding the study: You
24 could use reclaimed water for dust control as opposed to
25 potable water as a way to reduce the environmental

903-2
cont'd

904-1

904-2

- 904-1 DOE acknowledges your support for compliance with the AOC. DOE's purpose in preparing this Final EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. Please also refer to Sections 2.7, "Offsite Impacts," and 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of the EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. Please also see Appendix K, Cost-Benefit Analysis of the Soil Remedial Alternatives, of this EIS.
- 904-2 DOE agrees that use of reclaimed water would be desirable for dust control. Chapter 7, Table 7-1, of this EIS, summarizes the applicability of greener cleanup using best management practices in DOE's remediation activities. In this table DOE addresses the potential for use of reclaimed water for such activities as dust control or wash water. Sources of water could include captured stormwater runoff or treated extracted groundwater. The use of captured stormwater runoff, however, would require coordination with the landowner (Boeing), and the use of treated extracted groundwater (a minor potential source of reclaimed water). That source would require approval by the State of California. DOE is not considering construction of a parallel reclaimed water distribution system for site reclamation activities because such a distribution system would need to pass through urbanized areas and then up the steep slope to SSFL, and it would potentially result in additional environmental impacts.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 impacts of the water, if need.

2 Also, regarding the CO2 generation, you can

3 include some kind of a solar array to offset the CO2

4 that will be generated by electricity, to offset the

5 land CO2 that all the additional truck trips will take

6 as well.

7 Now, speaking on behalf of a former resident

8 of the area that currently live in Santa Barbara,

9 California, but I spent the first 18 years of my life

10 living near the corner of Topanga and Vanowen, and then

11 later near Fallbrook and Roscoe, kind of in the fallout

12 area of the Santa Susana Lab. And, I would say

13 definitely going to school, there were a lot of kids

14 that had leukemia and exotic forms of cancer, even

15 though we were outside of the two-mile radius, going to

16 Our Lady of the Valley School and high school at

17 Chaminade High School, used to runaround the reservoir

18 all the time, running 10 miles to practice for cross

19 country.

20 And, right now, being 56, you know, people

21 from the graduating class of 1979 to 1980 who grew up in

22 that area now no longer live in the area. But, it seems

23 like every year one or two of them is dying of some form

24 of cancer, and it's kind of alarming. You know, people,

25 when I was a kid, dying of leukemia in grade school, and

904-2
cont'd

904-3

904-3

Thank you for your comment. While DOE does not propose any solar electrical generation as part of the proposed cleanup activities, they will consider opportunities in the future for onsite renewable energy generation and solar power for remote sensing instrumentation. DOE also will consider such opportunities in the scopes of work of contractors who bid on the proposed cleanup activities. For example, DOE could give preference to bids that demonstrate inclusion of renewable energy generation into the proposed remediation work.

904-4

904-4

DOE acknowledges your comment and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 now a lot of people, let's say, two a year are passing
2 away locally. So maybe there's a way to reach out to
3 the local schools and the alumni associations and find
4 out who used to live in the area for an extended period
5 of time and who has passed away. Because there -- I can
6 go through a list of people who died of breast cancer,
7 the star football captain in the 1979 class of Chaminade
8 who just passed away two years ago, another buddy of
9 mine who served in the Marine Corp., he just passed away
10 last year. My high school girlfriend passed away last
11 year. I was married to her. I have a wife of my own
12 now. But, people are currently fighting breast cancer,
13 many women now, and it's -- it's alarming, and we -- we
14 just think that if you don't clean this site up as clean
15 as you can make it now, the price will be passed on from
16 the federal government to the individual people who have
17 to use their money to pay for the medical expenses to
18 treat the cancers and other things that they're going to
19 get, and it's a -- a fair way of spending the money now.

20 Granted, as a kid, we loved to look up and see
21 the rockets going off and smoke coming off the top of
22 the mountain when they had a missile test and feel the
23 ground shake. But, you know, really, you should clean
24 up the mess that -- that got us to the moon and gave us
25 military superiority. It's just all part of the

904-4
cont'd

904-1
cont'd

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 expense, and just passing it off to people's medical
 2 expenses, we don't think is right.

3 So, thank you very much. (Clock timer ringing)

4 MR. LOWE: Thank you, Mr. Poirier. Robert Dodge
 5 will be followed by Kristin Storey, and then Bonnie
 6 Klea.

7 MR. DODGE: My name is Robert Dodge. I'm a family
 8 physician practicing in Ventura. I'm also the president
 9 of Physicians for Social Responsibility Los Angeles.
 10 Thank you for having us here today.

11 I'm going to be reading an op ed that was
 12 published in this week's Star that I wrote:

13 "Our region has just been hit by two
 14 significant events that affect the health of our
 15 community.

16 While we have long awaited some relief for our
 17 drought, torrential rainstorms inundated the Santa
 18 Susana Field Lab, one of the most polluted places in our
 19 state. Runoff from far lesser storms in recent years
 20 has resulted in more than 200 instances in which highly
 21 toxic and radioactive contaminants migrated off site at
 22 levels in excess of state pollution limits, and one can
 23 only imagine the effect these recent large storms have
 24 had.

25 Around the same time, the Department of Energy

904-1
cont'd

905-1

905-2

905-1 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

905-2 Please see Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. In addition to a No Action Alternative in accordance with the requirements of NEPA, of this Final EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors (refer also to Section 2.5, "Toxicity of Soil Contaminants," of this CRD). Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

With respect to your concern about people in neighboring communities being at perpetual risk from migrating radioactivity and toxic chemicals, please refer to Section 2.7, "Offsite Impacts," and Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for additional information. As discussed in these sections, Area IV is not currently spreading contamination to offsite areas, including offsite groundwater, and each of the alternatives evaluated in this EIS is protective of public health and safety and the environment both on and off the SSFL site.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 broke its solemn cleanup commitments and announced it
2 would leave as much as 99 percent of the soil
3 contaminated at the field lab site not cleaned up.
4 Unless people rise up and our elected officials act
5 strongly to enforce the promises, people in the
6 neighboring communities will be at the perpetual risk
7 from migrating radioactivity and toxic chemicals.

8 The field lab housed 10 nuclear reactors, of
9 which at least four suffered accidents, including a
10 partial nuclear meltdown in 1959. There was a factory
11 for fabricating reactor fuel rods out of plutonium,
12 which is perhaps the most deadly substance on our
13 planet. In a 'Hot Lab' there, highly irradiated nuclear
14 fuel rods shipped in from around the nation were cut
15 apart, releasing several radioactive impact fires.

16 It illegally burned radioactive and chemically
17 hazardous wastes in the open air pit, by shooting
18 barrels of waste with rifles to ignite them, with the
19 toxic plumes blown over surrounding communities. It
20 conducted tens of thousands of rocket tests, many using
21 very dangerous fuels, and then flushed out the engines
22 with a million gallons of toxic solvents that were
23 allowed to simply percolate into the soil and
24 groundwater.

25 The result of this shameful violation of basic

905-2
cont'd

905-3

905-4

905-3 This EIS is being prepared to evaluate alternatives for completing the remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Chapter 1, Section 1.3, of this EIS provides a history of the SSFL site that summarizes DOE's past activities in Area IV, including previous cleanup efforts. Additional information can be obtained from the DOE Energy Technology Engineering Center website (see <http://www.etec.energy.gov/>). Chapter 3, Sections 3.9.5 and 3.9.6, of this EIS provide information about accidents at Area IV, including the 1959 SRE accident, which was the only accident that caused a measurable release of radioactive material. Section 3.9.6 explains that at the time of the accident it was estimated that the accident resulted in the release over a 2-month period) of about 28 curies of radioactive noble gases such as krypton-85, in low, controlled concentrations that met Federal requirements. The release was estimated to result in a maximum radiation dose at the location of the nearest resident of 0.018 millirem. Using current risk factors, this dose would have resulted in a risk of a fatal cancer to an exposed individual of 1×10^{-8} (one chance in about 93 million). A 1999 study by ATSDR estimated a maximum dose to a potentially exposed individual of 0.005 millirem with an even smaller risk of a fatal cancer.

Because of public concern about the SRE accident, DOE hosted an informational workshop on August 29, 2009, with testimony from three independent experts (see http://www.etec.energy.gov/Community_Involvement/Public%20Meetings/SRE_Workshop.html). Two of these experts supported the estimate made at the time of the accident. They stated that releases at the time of the accident should have primarily involved noble gases, with only small releases of volatile fissions products such as iodine and cesium isotopes. One of the experts was skeptical of the estimates of large health effects being experienced by individuals and the population. The third expert concluded that available information was inadequate to resolve the fraction of the noble gases and fission products that may have been released. This expert did not quantify public risks from the accident but thought that the risk to the maximally exposed individual was smaller than the risk of cancer from other causes, but that the collective exposure could have resulted in some cancers in the population.

With respect to the statements regarding burning radioactive and chemical waste in an open air pit, the Former Sodium Disposal Facility was used from 1956 to 1978 to clean alkali metals (sodium and potassium/sodium mixtures) from metallic components and other materials, and also received chemical waste and radionuclides. The facility was remediated during the 1990s and released for unrestricted use (i.e., declared clean) in 1998 by the California Department of Health Services (now California Department of Public Health). Additional information can be found at <http://www.etec.energy>.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 environment protections produced widespread
 2 contamination of groundwater, surface water and soil
 3 with strontium-90, cesium-137, plutonium-239,
 4 perchlorate, PCBs, dioxins, heavy metals, volatile
 5 organic compounds and more. And because the site sits
 6 in the hills overlooking more than 500,000 people within
 7 10 miles, the contamination wants to flow off site to
 8 places and people below.

9 The site has been fined more than \$1,000,000
 10 in recent years for allowing pollutants to migrate off
 11 the property at levels deemed unsafe for people or for
 12 the environment. And as long as the site doesn't get
 13 cleaned up, that will continue."

14 We'll have Kristin Storey continue.

15 MS. LOWE: Kristin Storey will be followed by
 16 Bonnie Klea, will be followed by Shel Plotkin.

17 MS. STOREY: My name is Kristin Jensen Storey. I'm
 18 an educator and resident of Ventura County.

19 "These awful materials cause cancers,
 20 including leukemia, genetic defects, neurological and
 21 developmental disorders and other health problems. A
 22 federally funded study by Dr. Hal Morgenstern of the
 23 University of Michigan found a greater than 60 percent
 24 increase in key cancers in people living near the site
 25 compared with people living farther away. Another

905-4

906-1

906-2

gov/Operations/Support_Ops/FSDF.html. Rocket engine testing was a completely separate activity from the nuclear research DOE and its predecessor agencies conducted in Area IV; and was conducted in locations other than and physically separated from Area IV, by entities other than DOE. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. In addition, please see Section 2.7, "Offsite Impacts," of this CRD for a discussion of this topic and DOE's response. DOE will complete contamination removal and site remediation based on the decisions made pursuant to this Final EIS and in compliance with regulatory requirements, including regulations, orders, and agreements.

905-4 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts. As described in Section 2.7, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

906-1 DOE acknowledges your comment and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for discussion of illnesses in the vicinity of SSFL, including author-acknowledged limitations of past studies. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 government-funded study by a team from UCLA led by
2 Dr. Yoram Cohen concluded that numerous pollutants from
3 the site had migrated off site at levels in excess of
4 EPA levels of concern.
5 For these reasons, the community was joyous in
6 2010 when the Department of Energy and NASA signed a
7 legally binding agreement -- legally binding agreements
8 with the California Department of Toxic Substances
9 Control requiring all contamination that could be
10 detected in the soil to be cleaned up by 2017.
11 It is now 2017 and the cleanup hasn't even
12 begun. And the DOE just issued a Draft Environmental
13 Impact Statement breaking the 2010 cleanup agreement and
14 saying it will only consider three options, none of
15 which comply with its past commitments.
16 One would leave 39 percent of the
17 contamination in place. A second would leave 91
18 percent. And the third would walk away from a
19 staggering 99 percent of the contaminated soil, just
20 leaving it in place. The 2010 agreement barred any
21 consideration of leave-in-place alternatives.
22 The DOE has essentially thumbed its nose at
23 California. Even if the cleanup agreement didn't exist,
24 the decision on how much toxic pollution to clean up
25 doesn't rest with the polluter, but with the state

906-2
cont'd

906-3

906-4

906-2 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts. As described in Section 2.7, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

Dr. Cohen's report merely determined areas of potential exposure concern due to data limitations and expressed data needs and future monitoring need.

906-3 Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for a discussion of this topic and DOE's response. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

As discussed in Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD, in prior cleanup actions DOE has removed most of the buildings in Area IV as well as much of the soil contamination associated with past practices. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. In addition to a No Action Alternative (required by NEPA), this EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. As discussed in Section 2.2, the alternatives

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 regulator. The DOE can't decide to just walk away from
 2 most of the contamination.

3 But the state has been remarkably silent so
 4 far in response to this assault on its authority.
 5 Indeed, it has in its own actions undercut the cleanup
 6 agreement it signed. Toxic Substances Control is years
 7 late on its own environment impact report and has been
 8 busy undermining the cleanup in other ways as well.

9 In 2010, we were promised that, with a couple
 10 of narrow exceptions, all of the soil contamination that
 11 could be detected would be cleaned up. Now it appears
 12 likely that close to none will be, and the people in the
 13 area will continue to be the people with children who
 14 will continue to be at perpetual risk from migrating
 15 radioactive and toxic contamination unless they speak
 16 out now, loud and clear, and their elected
 17 representatives do the same."

18 I'm a teacher for a reason. I'm a mother.
 19 This isn't right. Thank you.

20 MS. LOWE: Thank you, Ms. Storey. Bonnie Klea will
 21 be next, followed by Shel Plotkin, and then Denise
 22 Duffield:

23 MS. KLEA: My name is Bonnie Klea. I'm a resident
 24 of West Hills. I worked up at Santa Susana in my young
 25 years, and I developed bladder cancer 20 years after I

906-4
cont'd

906-5

906-3
cont'd

907-1

evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors (refer also to Section 2.5, "Toxicity of Soil Contaminants," of this CRD). Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

With respect to the timeliness of additional cleanup, please refer to Chapter 1, Section 1.3 of this EIS, which discusses the order issued by the U.S. District Court for the Northern District of California (Case No. 3:04-CV-04448-SC, May 2, 2007) that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision (ROD) pursuant to NEPA. In accordance with CEQA and consistent with Section 4 of the 2010 AOC, DTSC is preparing an environmental impact report (EIR) that addresses cleanup of all of SSFL (including areas for which NASA and Boeing are responsible); the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition. DOE initiated communications with DTSC to discuss schedules and other appropriate matters that would facilitate cleanup activities (DOE 2017a).

906-4 DOE recognizes DTSC's authority over the cleanup. Chapter 1, Sections 1.3 and 1.4 of the Draft and Final EISs include discussion that acknowledges that cleanup of the site is governed by the 2007 Compliance Order and the 2010 AOC.

NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action.

This EIS analyzes an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In response to public input received, and

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 left. I got involved with a work group, started saving
2 their handouts. I had boxes of data. Then I started
3 getting phone calls from all the other workers. They
4 all had cancer, the same kind of cancer I had.
5 And, by 2000, the federal government took
6 responsibility for 350 companies in America that exposed
7 their workers to radionuclides and chemicals without
8 their permission, and then when they filed a lawsuit,
9 they sent federal lawyers in to help.
10 So, by 2006, I looked at the records. Only
11 two workers had been paid out of the thousands who were
12 trying to get compensated. And, there was one last
13 resort where you could file a special exposure covert
14 proposition, and I did that, and last Christmas we got
15 compensated for years up through 1988. So, all the
16 workers from Downey, Canoga, Desoto, and Santa Susana
17 who worked in the nuclear area will be compensated.
18 And, my only enemy was Boeing, the Boeing
19 Company. There was men on my work group, conversations
20 that came to the meetings I had with the federal
21 government. They wrote letters. They were the only
22 enemy that did not want -- want their workers to be
23 compensated.
24 And I've seen the toll in my neighborhood. My
25 community was built in 1959. On my street of 15 houses,

907-1
cont'd

907-2

907-1
cont'd

consistent with its obligations under NEPA, DOE also analyzed alternatives that are based on risk to human health as well as the protection of natural resources. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ.

DOE will issue a ROD(s) for this EIS no sooner than 30 days after the EPA Notice of Availability for this Final EIS is published in the *Federal Register*. The potential environmental impacts presented in this EIS, along with public input, cost, policy, and other factors, will be considered by decision-makers in selecting alternatives for soil remediation, building demolition, and groundwater remediation.

As discussed in Chapter 1, Section 1.9.2, of this Final EIS, DTSC is currently preparing a program environmental impact report (EIR) under CEQA that applies to cleanup of the entire SSFL; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

906-5 Thank you for your comment. The *Draft Program Environmental Impact Report for the SSFL, Ventura County, California* was issued by DTSC in September 2017 (DTSC 2017b). Because the comment/statement is not on the scope or content of this Final EIS, no further response is provided. It has been included in the Administrative Record for the EIS.

907-1 DOE refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 there were -- there were one or two cancers in every
 2 single house from the 1959 houses. I -- this is now the
 3 second mother -- young mother I've seen come forward
 4 with children who are all sick.

5 And, of course, we have the National Academy
 6 of Science, who studied Japan, and they found that women
 7 and children were 50 percent more at risk for cancer
 8 than the men.

9 And, I say, clean it up, clean it up, all of
 10 it, all that you can. And, it's not up to DOE and the
 11 neighborhood to make comments and pick out our -- our
 12 cleanup. It's up to the State of California and the
 13 EPA, DTSC from the state.

14 Anyway, thank you.

15 MS. LOWE: Thank you for coming. Shel Plotkin will
 16 be followed by Dennis -- excuse me -- Denise Duffield
 17 and Dawn Kowalski.

18 MR. PLOTKIN: I'm Sheldon Plotkin. I'm appearing
 19 here on behalf of Southern California Federation of
 20 Scientists, which has been involved for nearly 40 years
 21 trying to get the Department of Energy to take
 22 responsibility for the contamination that it created at
 23 Santa Susana and clean it up.

24 And, I'm deeply concerned the DOE is once
 25 again demonstrated that its word cannot be trusted and

907-1
cont'd

907-3

907-4

907-5

908-1

907-2 Thank you for your comment. Because the comment/statement is not on the scope or content of this EIS, no response is provided. It has been included in the Administrative Record for the EIS.

907-3 This Final EIS addresses the impacts on offsite populations from the releases of radioactive and chemical contaminants into the air that could occur during site remediation activities. The analysis follows a standard risk assessment methodology that includes risk factors that account for gender and various ages.

907-4 DOE acknowledges your concern about cleanup of all of the site contamination. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

907-5 DOE recognizes DTSC's authority over the cleanup. Chapter 1, Sections 1.3 and 1.4 of the Draft and Final EISs include discussion that acknowledges that cleanup of the site is governed by the 2007 Compliance Order and the 2010 AOC.

NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action.

This EIS analyzes an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In response to public input received, and consistent with its obligations under NEPA, DOE also analyzed alternatives that are based on risk to human health as well as the protection of natural resources. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ.

DOE will issue a Record(s) of Decision (ROD[s]) for this EIS no sooner than 30 days after the EPA Notice of Availability for this Final EIS is published in the *Federal Register*. The potential environmental impacts presented in this EIS, along with public

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 that it has now broken the legally binding cleanup
2 agreement it signed in 2010. DOE and its predecessor
3 agency, the Atomic Energy Commission, historically acted
4 as if they were above the environmental laws of the
5 country and that applied to everyone else. They
6 consistently broke fundamental rules about protecting
7 the environment and ending up polluting the soil, water,
8 and the air at sources of nuclear facility -- at scores
9 of nuclear facilities around the country.
10 Santa Susana elementary safety rules were
11 ignored. Four different reactors suffered accidents.
12 In 1959, one reactor released radioactivity. A few
13 months later, a different reactor suffered a partial
14 meltdown in which a third of the fuel experienced
15 melting. Essential safety rules were simply ignored.
16 In that case, after an accident, which power ran out of
17 control exponentially and they could barely shut down
18 the -- the reactor, they inexplicably started it up
19 again a couple of hours later without having been able
20 to identify the cause of the problem. They ran -- they
21 ran it for another 10 days or so in the face of clear
22 evidence of a failing reactor, with radiation readings
23 so high that they were off scale, in other words,
24 radiation levels higher than the monitors could record.
25 Radioactive material was intentionally release -- was

|| 908-1
cont'd

|| 908-2

|| 908-3

input, cost, policy, and other factors, will be considered by decision-makers in selecting alternatives for soil remediation, building demolition, and groundwater remediation.

As discussed in Chapter 1, Section 1.9.2, of this Final EIS, DTSC is currently preparing a program environmental impact report (EIR) under CEQA that applies to cleanup of the entire SSFL; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DTSC will issue a Notice of Determination for the program EIR identifying the selected remedial actions. Soil cleanup would begin after DOE and DTSC conform the decisions included in the DOE ROD(s) and DTSC Notice of Determination and, in accordance with DTSC's regulatory authority as provided in the AOC, and DTSC approves the DOE-prepared soils remediation action implementation plan.

908-1 DOE acknowledges your concern that DOE has broken the 2010 AOC agreement. The purpose of this EIS is to evaluate alternatives in accordance with the requirements of NEPA for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

908-2 DOE conducted historic operations under the laws and regulations applicable at the time. DOE's Office of Environmental Management has been charged with the responsibility of cleaning up 107 sites across the country. To date, the Office of Environmental Management has made substantial progress in nearly every area of nuclear waste cleanup and completed cleanup at 91 of these sites. Additional information can be found at <https://energy.gov/em/office-environmental-management>.

908-3 As indicated in Chapter 1 of this EIS, DOE acknowledges that past activities at SSFL resulted in chemical and radiological releases that impacted soils, buildings, and groundwater. Chapter 1, Section 1.3, contains a brief history of activities at SSFL and describes the radiological and chemical characterization studies performed for Area IV and the NBZ. Additional information about the activities of DOE and its predecessor agency, the Atomic Energy Commission, at Area IV at SSFL can be found at <http://www.etec.energy.gov/>. Chapter 3, Sections 3.9.5 and 3.9.6, of this EIS contain information about accidents at Area IV, including the 1959 SRE accident, which was the only accident that caused a measureable release of radioactive material. At the time of the accident it was estimated that the accident resulted in the release (over a 2-month

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 intentionally released into the environment for weeks,
 2 and then true to pattern, they lied about the accident
 3 and tried to cover it up.

4 In 1964, another reactor had a very similar
 5 accident, and they pushed it up, running it for a year
 6 in the face of clear evidence that the fuel was failing.
 7 80 percent of the fuel was damaged.

8 A few years later, sloppy safety practices
 9 lead to another accident, where again they kept running
 10 it for many months, the failing of fuel, leading to a
 11 third of the core being damaged.

12 There were radioactive fires in the Hot Lab,
 13 where highly irradiated nuclear fuel was disassembled.
 14 And, for decades, they were illegally burning --
 15 (Time clock ringing)

16 MR. PLOTKIN: -- radioactive and toxic chemical
 17 waste in open burn pits with the --

18 MS. LOWE: That's the clock, and I need you to
 19 conclude your remarks.

20 MR. PLOTKIN: Okay.

21 MS. LOWE: Thank you very much. I'm sorry.

22 MR. PLOTKIN: Thank you.

23 MS. LOWE: Denise Duffield will be followed by
 24 Duane Kowalski and then Mark Osokow:

25 MS. DUFFIELD: Denise Duffield. I'm the associate

908-3
cont'd

period) of about 28 curies of radioactive noble gases such as krypton-85, in low, controlled concentrations that met Federal requirements. Additional information about the 1959 SRE accident can be found at http://www.etec.energy.gov/Operations/Major_Operations/SRE_Accident.html. With respect to the statements regarding burning radioactive and chemical waste in open pits, the Former Sodium Disposal Facility was used from 1956 to 1978 to clean alkali metals (sodium and potassium/sodium mixtures) from metallic components and other materials, and also received chemical waste and radionuclides. The facility was remediated during the 1990s and released for unrestricted use (i.e., declared clean) in 1998 by the California Department of Health Services (now California Department of Public Health). Additional information can be found at http://www.etec.energy.gov/Operations/Support_Ops/FSDF.html. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. In addition, please see Section 2.7, "Offsite Impacts," of this CRD for a discussion of this topic and DOE's response. This Final EIS is being prepared in accordance with NEPA to evaluate alternatives for completing the remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. The EIS will inform DOE decisions about remediation of contaminated soil and groundwater, building demolition, restoration of the impacted environment, and disposal of chemical and radioactive waste.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 director of Physicians for Social Responsibility Los
2 Angeles. I also serve as a coordinator of the SSFL
3 Work Group. Physicians for Social Responsibility, I'm
4 working for over 30 years for the SSFL cleanup.

5 We thought we finally had a cleanup in 2010
6 when DOE signed the AOC to clean up to background levels
7 the contamination, but the ink was barely dry before DOE
8 started trying to break out.

9 In 2014, just after telling the SSFL Work
10 Group meeting that DOE was committed to upholding the
11 AOC, DOE issued a Public Scoping Comment to the EIS
12 that violated the AOC by considering onsite disposal of
13 contaminants. DOE told us then that the Draft EIS would
14 be done by 2014, finalized in 2015, and cleanup done in
15 2017.

16 The DOE delayed publishing the EIS until now,
17 when it knew several key elected officials who supported
18 the AOC would no longer be in office.

19 It's not nearly a surprise to us then that
20 this EIS violates the AOC with all four alternatives,
21 leading to dangerous nuclear and contamination on site.

22 What is surprising is the length that DOE has
23 gone to to avoid cleaning up SSFL. Last year, we
24 discovered that DOE was secretly funding a group the
25 SSFL had to help it break out of the AOC. The group has

909-1

909-2

909-1
cont'd

909-3

909-1 DOE acknowledges your concern about cleanup to background levels in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. In addition to a No Action Alternative, in accordance with the requirements of NEPA (Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. This EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

With respect to the suggestion to discard this EIS and merely follow the AOC, please refer to Chapter 1, Section 1.3 of this EIS, which discusses the order issued by the U.S. District Court for the Northern District of California (Case No. 3:04-CV-04448-SC, May 2, 2007) that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision pursuant to NEPA. In accordance with CEQA and consistent with Section 4 of the 2010 AOC, DTSC is preparing an environmental impact report (EIR) that addresses cleanup of all of SSFL (including areas for which NASA and Boeing are responsible); the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017]). The completion of both the CEQA and NEPA processes must occur before DOE can complete the comprehensive cleanup of soils and groundwater in Area IV and the NBZ. DOE initiated communications with DTSC to discuss schedules and other appropriate matters that would facilitate cleanup activities (DOE 2017a).

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 several ties to responsive parties, including some
 2 that's still consultant to the DOE, and you've heard
 3 from some of those good people already.

4 According to the minutes of the group, DOE
 5 asked to get in touch anonymous because, according to
 6 the chair, it did not want to get a call from Senator
 7 Barbara Boxer.

8 DOE will not release the grant application,
 9 the contracts or the terms, so all we know is that DOE
 10 is paying this fee, \$33,000 a year, with our money to
 11 fight the cleanup, and we don't have access to any of
 12 the documentation.

13 At the same time, DOE reneged on a commitment
 14 to independently administer a community fund, causing
 15 over a dozen community groups near DOE sites throughout
 16 the country to lose funding, including the SSFL Work
 17 Group.

18 Then for the -- for this DIS, DOE's targeted
 19 the members who want the cleanup from participating by
 20 refusing to provide an email address for comments. And
 21 once we discovered the correct email address, which we
 22 used for the public scoping, DOE disabled the email.

23 DOE's DIS has missing documents, which now
 24 there's no way to easily get those documents.

25 DOE has also refused to allow community groups

909-3

909-4

909-5

909-6

909-2 Thank you for your comment. It has been included in the Administrative Record for the EIS.

909-3 While the comment is not on the scope or content of this Final EIS the following information is being provided.

DOE has funded a number of stakeholder groups, including Teens Against Toxins, the SSFL Advisory Panel, Physicians for Social Responsibility, the Rocketdyne Cleanup Coalition, Committee to Bridge the Gap, and the SSFL CAG. The SSFL CAG is an independent group, created under the State of California Health and Safety Code, approved by the DTSC and formed under guidance from the Udall Foundation, an independent Federal agency focused on environmental stewardship. The SSFL CAG began operating in 2013. The grant to the CAG was funded through local project funds in an effort to support community engagement. DOE posted notification of the grant in September 2015 on USASpending.gov, an official website disclosing grants, loans and other financial assistance awards. Information on the SSFL CAG grant can be found here: <http://go.usa.gov/xWpte>.

DOE's Office of Environmental Management started the Community Involvement Fund (CIF) to increase public involvement in the environmental management decision-making process and assist stakeholder groups with analyzing environmental management plans and proposals. The CIF operated from late 2010 until September 2015, and distributed a total of \$1.6 million through 46 grants to 23 recipients around the country, including groups involved in observing SSFL cleanup preparation. These included:

- \$46,800 in 2011 to the Committee to Bridge the Gap.
- \$55,000 in 2012 to the SSFL Advisory Panel, partnering with the Committee to Bridge the Gap. The SSFL Advisory Board is not related to the SSFL CAG.
- \$23,000 in 2013 to Physicians for Social Responsibility – Los Angeles, partnering with the Rocketdyne Cleanup Coalition, Teens Against Toxins and Committee to Bridge the Gap.
- \$20,000 in 2014 to Physicians for Social Responsibility – Los Angeles, partnering with Teens Against Toxins and the SSFL Work Group, which is not related to the SSFL CAG.

909-4 DOE provided a means of submitting comments electronically through a comment portal on the SSFL Area IV EIS website. DOE also allowed comments through regular

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 to present any slides at this meeting with no good
2 rationale except trying to prevent the public from
3 hearing half more about how the DOE's breaking its
4 cleanup obligations.

5 This EIS is atrocious. All of the terms break
6 the AOCs and risk public health. For DOE to try to show
7 this comment in -- in terms of trucks instead of
8 contamination is absurd. When you see this many trucks,
9 you think this much contamination. That's how it should
10 be regarded. (Indicating)

11 This document should be tossed and DOE should
12 just follow the AOCs. Thank you.

13 MS. LOWE: Thank you, Ms. Duffield. Dawn Kowalski,
14 who will be followed by Mark Osokow, and then John
15 Luker.

16 MS. KOWALSKI: Hi. Good morning. When we started
17 off on this journey, almost 28 years ago, 28 in May, we
18 started meeting in homes with the department, four of
19 us. Look at the room now. I mean, it's still very
20 small considering how many people are affected by this
21 horrendous site.

22 Really, you know, you can look at how many
23 truck levels that you want. But whatever pollution is
24 left out there is potentially harmful to everybody in
25 this room and everybody in the Valley, half the San

909-6
cont'd

909-1
cont'd

910-1

- U.S. mail; orally during the public hearings, or privately with a court reporter prior to the public hearings; and by bringing a hard copy of comments to the public hearings for submittal. DOE apologizes for the confusion over the email address. The email address was previously created for scoping comments, not for comments on the Draft EIS. The email address was discontinued when DOE realized stakeholders had begun to use it for comments on the Draft EIS. In order to better track comments, DOE determined the website was the best method for electronic comments.
- 909-5 For those references that were not appropriate to post on the SSFL Area IV EIS website (e.g., sensitive cultural resource information, copyrighted information) there was a note with contact information so a person interested in these documents could contact and coordinate with DOE to review them. On the SSFL Area IV EIS website, the note initially providing an email address was changed to provide a U.S. mail address and a phone number for questions regarding sensitive references. DOE recognizes that obtaining these references was more difficult than downloading the majority of the references, but DOE is legally required to protect copyrighted materials, sensitive cultural resource information, and any materials protected by client-attorney privilege. DOE notes that it received no inquiries requesting coordination so that the documents could be reviewed.
- 909-6 The purpose of the public hearings was to allow stakeholders the opportunity to make comments on the Draft EIS. PowerPoint presentations were not allowed during the oral comment periods at the public hearings in order to give all commenters equal time. Commenters could submit PowerPoint presentations by uploading to the comment website, posting through U.S. mail, or delivering a hard copy at the public hearings.
- 910-1 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 Fernando Valley, the Conejo Valley.

2 I'm a cancer survivor. I don't blame it on

3 anything. This is the land of the jewel for me. But I

4 listen to the mom who has to cradle her baby with

5 cancer, and I can't really think of anything more

6 horrific. I think of the retinoblastoma moms, the Milan

7 family, who came to the meetings before Boeing paid them

8 off. And, I think there were nine cases and there were

9 only 250 nationwide, nine cases around the site. Those

10 moms carried their babies for nine months, and when they

11 were born -- and it was a neutro -- then what did they

12 think when they were saying -- when they were holding

13 their baby? They wanted that baby to look at their

14 faces, look at the world, see what they could see in the

15 few months before those eyes were removed. Because

16 retinoblastoma is a cancer of the eyes.

17 I don't think that you can put a number on

18 truck loads when you're talking about cancer. I

19 remember when the oncologist told me that "You have

20 breast cancer," and I didn't know that it feels like a

21 truck hitting me.

22 And you know how many people -- I've heard

23 John Luker say, you know, we don't have cancer. You are

24 so lucky that you never had it as well, believe me,

25 because suddenly your world spins before you. You look

910-2 Please see Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of the EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 at your children in a different way. You look at your
2 husband in a different way.
3 But to have take one last -- when you're a mom
4 and to have to look at your child and to know that your
5 child is facing the biggest challenges in life and
6 you've only had precious little time with them, I cannot
7 even imagine what it is.
8 But I think everyone in this room has to think
9 long and hard and clearly about what -- what legacy they
10 want to leave on this site.
11 Thank you.
12 MS. LOWE: Thank you, Dawn. Mark Osokow will be
13 followed by John Luker, and then Marie Mason.
14 MR. OSOKOW: Good morning. My name is Mark Osokow,
15 and I represent the San Fernando Valley Audubon Society.
16 I'm going to be speaking on my own behalf, however.
17 The -- what you just heard from a lot of
18 people that had experienced cancer is -- is very
19 touching. I've had my own experiences with cancer. My
20 family's been riddled with cancer since I was a child.
21 My mother died from cancer. My uncle died from cancer.
22 My girlfriend of 33 years died from the effects of
23 cancer essentially. So, this is something that I can --
24 I can relate to very, very closely.
25 However, you know, there are millions and

|| 911-1 911-1 Thank you for your comment. It has been included in the Administrative Record for the EIS.

3-1515

Section 3 - Public Comments and DOE Responses

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 millions and millions of people in this country who have
 2 had experiences with cancer, have died from cancer.
 3 It's one of the main causes of death in the country.
 4 Most of the people who die from cancer, probably the
 5 overwhelming majority of people have no association with
 6 the Santa Susana Field Laboratory whatsoever.

7 I think the issue with cancer has to do more
 8 with actually finding out the causes and -- of cancer
 9 and the appropriate treatments of cancer, and barking up
 10 the wrong tree is not going to help that. And, I think
 11 that all this attention given to Santa Susana Field
 12 Laboratory with respect to cancer is just that, it's
 13 really barking up the wrong tree.

14 I support the cleanup to the Conservation of
 15 Natural Resources standard. And, although the San
 16 Fernando Valley Audubon Society has not come out
 17 officially for that yet, I expect it will do so. And I
 18 think that the issues of preserving the natural or
 19 cultural resources and historical resources at Santa
 20 Susana are -- are critical to our wildlife and -- in the
 21 area. And we're seeing a lot of developments in areas
 22 around that park area that is just chewing up our
 23 countryside and obliterating all chances for wildlife to
 24 persist in the area.

25 I've done studies at Santa Susana Field

DOE acknowledges your support for the Conservation of Natural Resources Alternative. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. Please also refer to Chapter 4, Sections 4.5 and 4.11, respectively, for analyses of the potential impacts of these EIS alternatives on biological and cultural resources.

911-3

911-3

Thank you for your comment. It has been included in the Administrative Record for the EIS.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 Laboratory since 2011, and have found no impact on the
2 wildlife there whatsoever, and I'll be submitting some
3 extensive comments to refute a lot of the claims. I
4 think that there's exaggerated claims that have been
5 made by people speaking here today in support of the
6 Administrative Order on Consent and the Look-Up Table
7 Values. So, we'll see how this goes.

8 I commend the Department of Energy for this
9 EIS. I think they've done a very good job overall.
10 Although, I have to admit, I haven't read the entire
11 thing from cover to cover. But I think that the
12 introductory documents and other documents that I have
13 read indicate that a sincere effort was made to cover
14 all the issues, and they've done what is necessary to
15 comply with NEPA to the letter, and I greatly appreciate
16 that.

17 So, thank you very much.

18 MS. LOWE: Thank you, Mark. The next speaker will
19 be John Luker, followed by Marie Mason, and then Greg
20 Williams.

21 MR. LUKER: Hi, everybody. My name is John Luker,
22 and apparently I'm evil. A lot of people hold that
23 opinion.

24 I work for four different environmental groups
25 in this area, most notably the Santa Susana Mountain

911-3
cont'd

911-4 911-4 Thank you for your comment. It has been included in the Administrative Record for the EIS.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 Park Association. I'm employed by the State of
 2 California in the Resources Department. What I do is
 3 rehabilitate native -- native environments, so I do know
 4 what I'm talking about on some of this stuff.

5 I'd like to come out really quickly and say,
 6 yes, I support the Conservation of Natural Resources
 7 alternative; and, also at the groundwater remediation,
 8 the treatment and monitored natural attenuation. I
 9 think if you can pump it out, you should pump it out.

10 I'd also like to speak to some of the people
 11 who are in the audience, mothers with children and
 12 cancer and teachers. I want you to do what -- what --
 13 was just said, think and think hard. The pollution that
 14 gave your babies cancer did not come from SSFL. It came
 15 from your neighborhood. Look at your back yard, look at
 16 your schools, look at your parks. That is where the
 17 contamination is.

18 If you say this place contaminated an area 10
 19 miles in diameter, then your area is contaminated. Have
 20 any of you had sampling and testing done in your
 21 neighborhoods? If you're a teacher, have sampling done
 22 in your school. They'll do it. They want to get out of
 23 this. They want to prove that there's nothing down
 24 there. Go -- go look at your homes. See if the
 25 Environmental Protection Agency will come and take

912-1

912-1 DOE acknowledges your support for the Conservation of Natural Resources Alternative for soil remediation and a combination of the Groundwater Monitored Natural Attenuation and Groundwater Treatment Alternatives for groundwater remediation. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

912-2

912-2 Thank you for your comment. It has been included in the Administrative Record for the EIS.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 samples at your house and tell you what's in your back
2 yard. Look under your sink. Look in your -- in your
3 pantry. Look in your garage. What causes cancer in
4 there? 30 percent of people in this room will get
5 cancer and die from it. That is a statistic. Yes, a
6 neighborhood built in 1959, every single house had
7 cancer in it because of that statistic, and that's what
8 you have to think about. Instead of spending billions
9 of dollars cleaning this place up, maybe you should look
10 into your neighborhoods and clean up your neighborhoods,
11 because that's where your babies are getting cancer
12 from.

13 And, it disgust me there are groups that are
14 using this to make money and that's tough. Follow the
15 money, look around the room, figure out how many people
16 are making a living off of this. It's really sad.

17 In any case, that's what I'm doing. I'm
18 trying to preserve habitat, preserve natural resources.
19 It occurs to me that none of the RODs or DTSC has had a
20 meeting that specifically addresses resource management,
21 resource preservation and resource -- resource
22 restoration. I do not see anything in the EIS that says
23 much about a mitigation. Ask yourself, will this turn
24 this place back to its natural state? What will it take
25 to turn this place back in its -- into its natural

912-4 DOE has been consulting with Federal and State agencies since 2009 and further information is provided in Appendix E of the EIS. Also, Chapter 6 of the EIS "Measures to Minimize Impacts and Mitigation Measures" presents measures that would avoid, minimize, rectify, reduce, eliminate, or compensate for potential adverse impacts on the environment. Minimization measures are inclusive of methods, procedures and protocols, design features, and best management practices aimed at reducing the environmental impact of project activities. This EIS includes a range of minimization measures, including those that reduce the environmental footprint; improve safety, efficiency, and sustainability; and are incorporated as part of the alternatives' design.

912-4

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 state?

2 And, I would like to think you very much.

3 And, in you can make it to the SSMP meeting this

4 Monday --

5 (Clock timer ringing)

6 MR. LUKER: -- we'll be talking about the history

7 of Burro Flats.

8 MS. LOWE: Okay. Marie Mason. Marie will be

9 followed by Maria Caine and then Sonia Schendel.

10 MS. MASON: I'm Marie Mason, and I live in Knolls

11 right below this facility. All of you have known me.

12 I laid in my bed last night, listening to the

13 two creeks that run through my yard, just roaring

14 through my yard, knowing I was coming to this meeting

15 today.

16 MS. LOWE: Can you just hang on. There's a lot of

17 conversations in the room, and I would like to please

18 limit that so we can focus our attention on Ms. Mason.

19 You have it.

20 MS. MASON: And, although it's just been stated

21 that perhaps my yard's contaminated, hard to get

22 contaminated. I live right below the site.

23 And, John, you made a commitment to us. I've

24 heard you say it over and over you were following the

25 AOCs. This report doesn't follow the AOCs. And, if you

913-1 DOE acknowledges your concern about the “need to clean up this mess” and following the provisions in the 2010 AOC. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 look at all the trucks that are going to come down,
2 maybe because they're all full of -- going to be full
3 dirt that needs to get off that mountain. I know you
4 all live in Simi. But, it helps if all the billions --
5 we have spent billions of dollars. I ain't making any
6 money off of this. Let me tell you, I probably spent 27
7 years of my life putting money into doing this. I
8 haven't made a dime out of this. I've lost my property
9 values. I live below it. I have phone calls constantly
10 from people that want to move into our neighborhood but
11 they're scared and I -- I can't give them an answer.
12 I think we need to follow the AOCs. I think
13 Ventura County -- I don't even see anything -- and I
14 have to be honest, I didn't read every page of your
15 report yet, but I didn't -- Ventura County, you're
16 supposed to follow what -- what is already zoned, and
17 you're not -- there's no talk about that. We act like
18 we're just going to leave it all there and Ventura
19 County zoning laws don't have any impact. They do have
20 impact.
21 This needs to be cleaned up. We've wasted
22 billions and billions of dollars doing this. We spent
23 \$42,000,000 on the study that we were all part of, and
24 -- and we know where the stuff is. So, why are we
25 playing around and playing games with this? This is

913-1

913-3

913-3

Zoning rules are subject to change. EPA's Risk Assessment Guidance for Superfund, Part A (EPA 1989) states that in identifying future land use one should "determine possible alternate future land uses based on available information and professional judgment." In the Draft EIS, DOE reflected Boeing's stated intent that the future land use of its land at SSFL (including Area IV and the NBZ) would be open space. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. When cleaned up, the future use of the site will be that of open space. All of DOE's soil remediation action alternatives would ensure Area IV and the NBZ are safe for that use.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 ridiculous. We need to clean up this mess. I'd like to
 2 have a job. I'd like for the end of my life to be
 3 knowing that one thing was done and it was over. But my
 4 grandchildren that could never play in my creeks if they
 5 were running through my yard, and my girls loved to play
 6 in the creeks. I think that we're kind of exposing
 7 children if they ran through the creeks. I've never let
 8 my grandsons play in the creeks. I'd say, "No. Sorry.
 9 You can't even go down there yet." Maybe there's
 10 nothing there, but maybe there is.

11 And since -- and I just want to announce that
 12 the Santa Susana Work Group, which you wanted to so --
 13 help wanted to shut us down, we're not being shut down.
 14 We are a voice and we are not going to end our voice
 15 ever if it's to my last breath. We have our next
 16 meeting on March 8th, and maybe you can come and hear
 17 the other side of the story.

18 MS. LOWE: Thank you, Marie. Okay. Maria Caine
 19 will be followed by Sonia Schendel and then Mark
 20 Ruhland.

21 MS. CAINE: Hi. I'm Maria Caine. I'm here today
 22 to express my immense anger and great disappointment in
 23 the Department of Energy.

24 The DOE's Draft EIS breaks the promises made
 25 by the DOE back in 2010 when they signed the

913-1
cont'd

913-4 913-4

DOE acknowledges your concerns and refers you to Section 2.7, "Offsite Impacts," of the CRD regarding offsite contamination and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

914-1

DOE acknowledges your concern about cleanup of soil contamination in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

914-1

As discussed in Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD, in prior cleanup actions DOE has removed most of the buildings in Area IV as well as much of the soil contamination associated with past practices. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. In addition to a No Action Alternative in accordance with the requirements of NEPA, this Final EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 Administrative Order on Consent. The AOC called for a
2 full cleanup of the site, to be completed in 2017, and
3 here we are, February of the completion year with
4 cleanup not even begun.

5 The Draft EIS proposes four alternatives, all
6 of which violate the AOC. Option one would leave in --
7 in place 39 percent of the contamination. Option two
8 would leave in place 91 percent. Option three would
9 leave in place 99. And, option four would leave 100.

10 DOE raises several unsubstantiated issues and
11 at the top of the Administrative Order on Consent: The
12 first is that it supposedly is too difficult to find
13 soil fill that does not exceed the AOC Look-Up Table
14 Values. However, the Draft EIS that shows that
15 Gillibrand fill meets all requirements with the minor
16 exception of two constituents. The DOE accepts that
17 these are not a risk for human health and the
18 environment. Furthermore, the AOC states that the
19 source of backfill soil cannot meet all the AOC Look-Up
20 Table Values. The Department of Toxic Substances
21 Control and DOE will discuss it, and the DTSC would
22 determine the best available fill, which would appear to
23 be Gillibrand. There's -- they're forming no issue with
24 finding a suitable fill under the AOC, and the DOE's
25 argument is a non-issue.

914-1
cont'd

914-2

914-2

background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors (refer also to Section 2.5, "Toxicity of Soil Contaminants," of this CRD). Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

With respect to the timeliness of additional cleanup, please refer to Chapter 1, Section 1.3 of this EIS, which discusses the order issued by the U.S. District Court for the Northern District of California (Case No. 3:04-CV-04448-SC, May 2, 2007) that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision pursuant to NEPA. In accordance with CEQA and consistent with Section 4 of the 2010 AOC, DTSC is preparing an environmental impact report (EIR) that addresses cleanup of all of SSFL (including areas for which NASA and Boeing are responsible); the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition. DOE initiated communications with DTSC to discuss schedules and other appropriate matters that would facilitate cleanup activities (DOE 2017a).

The 2010 AOC does not allow consideration of risk and requires all chemicals and radionuclides in backfill soil to be below their respective LUT values in order for the soil to be used in Area IV. DOE notes that it violates the 2010 AOC to determine that a backfill source is "close enough." As stated in the AOC, all chemicals above the LUT values are exceedances and should be remediated. Refer to Section 2.3, "Suitable Backfill Soil," of this CRD for discussion of the responsibilities and actions necessary to identify a backfill source, including interactions with DTSC.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 In regards to transportation, the DOE has also
 2 heavy inflated soil volume estimates, and in doing so,
 3 overestimated the number of truck trips to scare the
 4 local community into supporting DOE's efforts to avoid
 5 cleanup of its contamination field. DOE has had at
 6 least 15 years since it first did its environmental
 7 assessment to adjust for a way of avoiding truck and
 8 pass our neighborhoods if it wished to. There are
 9 numerous routes that would pass new homes. The DOE has
 10 not considered these.

11 There are methods of conveyance besides
 12 trucks, such as conveyer systems to a nearby rail line.
 13 The DOE refused to consider it. There are rail lines
 14 within a mile or so of the site that could be reached
 15 without passing a single home. The DOE refuses to
 16 consider it. The only rail option they considered is to
 17 truck the material 60 miles to Puente Hills to a rail
 18 depot that isn't even open yet.

19 They claim that there is no risk in leaving
 20 all that contaminated -- contamination not cleaned up,
 21 but this is completely false. DOE has misrepresented by
 22 orders 9 to 2, the federal standards. The heinous
 23 contamination not cleaned up would pose great risk to
 24 all who live nearby.

25 In 2010, the DOE signed the AOC. They

914-3

914-3 The volumes in the Draft EIS have a sound engineering basis. DOE used the geographic information system (GIS) database for Area IV to identify on a point-by-point basis, any sample location that had an exceedance of a LUT value (radionuclides published by DTSC on January 30, 2013 [DTSC 2013a] and chemicals on June 11, 2013 [DTSC 2013b]). The GIS system was then used to mark the locations of exceedances, map the extent of exceedance, develop areas and depth of exceedances, and then calculate the soil volume exceeding the LUT values.

914-4

Since the Draft EIS was prepared, DOE has independently recalculated the estimate of the soil volume associated with cleaning up to the 2010 AOC LUT values. Based on the characterization data, and recognizing the shallow soil depth over uneven bedrock across Area IV and the NBZ, DOE is not as uncertain about the upper limit of the soil volume estimate as it was at the time the Draft EIS was prepared. DOE's intent is not to alarm people, but it is true that the more soil removed from a cleanup site, the larger the transportation effort (i.e., a larger number of truck trips) that would be required.

914-4

Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

914-5

In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. The use of RBSLS that do not include the indirect garden pathway is appropriate for this future land use.

914-5

In this Final EIS (see Chapter 2, Section 2.4), DOE has retained the Cleanup to Revised LUT Values Alternative, which uses chemical RBSLS based on an Onsite Suburban Residential Scenario without a garden pathway. The Final EIS also retains the Conservation of Natural Resources Alternative, but evaluates two scenarios. The Open Space Scenario is based on the future land use of Area IV and the NBZ as open space, consistent with Boeing's conservation easement and agreement (i.e., cleanup levels are based on exposure of an onsite recreational user as the receptor). The Onsite Suburban

914-1 cont'd

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 committed to a full cleanup of their contamination at
2 SSFL. In 2012, DOE promised the EIS would only consider
3 alternatives of how to much -- how to clean up, not how
4 much to clean up. DOE has an obligation how the
5 contaminated SSFL through its failure to follow proper
6 environmental procedures to clean up the site fully as
7 required by the AOC, to do so by the promised deadline,
8 and to attempt to mitigate impasse, such as trucks, by a
9 careful development of alternative transportation
10 options.

11 Thank you.

12 MS. LOWE: Thank you. Sonia Schendel. I'm
13 probably saying that wrong. Followed by Matt Ruhland
14 and then Devyn Gortner.

15 MS. SCHENDEL: Hi. My name is Sonia Schendel, and
16 I'm deeply upset by DOE's DEIS which breaks its legally
17 binding 2010 AOC promise for a full cleanup of the site.

18 Every one of the cleanup options violates the
19 D -- or every one of the cleanup options in the DEIS
20 violates the AOC, leaving in place from 39 percent to
21 100 percent of the contamination when AO -- when AOC
22 barred consideration for any leave-in-place
23 alternative. And if they're to do a full cleanup as
24 promised is unacceptable, posing continued risks to
25 off-set communities. The heavy rains we just

914-1
cont'd

915-1

Resident Scenario is the scenario evaluated in the Draft EIS, that is, cleanup levels are based on a suburban residential scenario without a garden pathway. This latter scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space.

In Chapter 4, Section 4.9 of this Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that local residents may get some portion of their food from a home garden.

915-1 DOE acknowledges your concern about a full cleanup of the site in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. In addition to a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, this EIS also evaluates alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 experienced remind us all of the pollution on top the
 2 hill and will continue to until there's a full cleanup.

3 Among its various excuses for not doing the
 4 cleanup, in all of the DEIS options, DOE proposes to not
 5 clean up about thirty -- 300 -- sorry -- 300,000 cubic
 6 yards of soil that they contaminated by claiming what
 7 they purport to be a biological exemption, but they are
 8 grossly misrepresenting this biological exemption, which
 9 is strictly limited in the AOC and for which they do
 10 not qualify.

11 In the 2010 AOC, it was stated that the entire
 12 site must be cleaned up to local background levels. It
 13 allowed a very narrow exemption to be considered only to
 14 the extent that the US Fish and Wildlife Service -- and
 15 I quote -- "issues a Biological Opinion with a
 16 determination that implementation of the cleanup action
 17 would violate Section 7(a)(2) or Section 9 of the ESA,
 18 and no reasonable" or "prudent measures or responsible
 19 and prudent alternatives exist that would allow the use
 20 of" the -- "the specified cleanup standards in that
 21 portion of the site." There have, however, been no such
 22 biological opinion from the US Fish and Wildlife
 23 Service, so the exemption's not valid.

24 Indeed, the US Fish and Wildlife Service did
 25 issue a biological exemption several years ago to the

915-1
cont'd

915-2

915-2

Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a discussion of this topic and DOE's response. As noted in Section 2.4 of this CRD, the 2010 Biological Opinion has very limited applicability to the present project. The EPA action that was the subject of the 2010 Biological Opinion involved trimming or mowing of vegetation, leaving the soil seed bank intact and the potential for rapid recovery of the vegetation and habitat by re-sprouting or germination from the soil seed bank. In contrast, the soil remediation addressed in this EIS would require removal of vegetation and soils, including the seed bank, a profound and difficult-to-mitigate impact.

At the time the Draft EIS was issued, DOE had been involved in ongoing meetings with the USFWS and CDFW for several years (see Appendix E, Table E-4 of this EIS) and the Biological Assessment required as part of Section 7 consultation had not yet been submitted. Hence, there was no Biological Opinion from the USFWS at the time the Draft EIS was released. The USFWS has now issued a Biological Opinion (see Appendix J) for remediation of SSFL. This Final EIS reflects the results of the Biological Opinion on the exemptions areas in Area IV and the NBZ.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 EPA for its preparatory work for the cleanup, which led
2 to -- involved cutting down much of the vegetation
3 so that -- so a radiation survey could be done. It
4 concluded no problem, mitigation measures could be done
5 and that, indeed, the cleanup of the contamination was
6 critical for protecting biological resources.

7 In the DOE DEIS, however, it says that they
8 are not going to clean up any -- anything in any of the
9 subsequent bio -- biological exemption As. DOE has no
10 right to declare these areas or decide for themselves
11 how to handle them. Furthermore, the guideline says
12 that as biological resources are identified, mitigation
13 measures are to be taken, not that DOE can avoid cleanup
14 altogether.

15 DOE would rather shamelessly time to use the
16 claim of Conservation of Natural Resources as an excuse
17 to break its obligations to clean up the toxic damage it
18 did to those resources. They are claiming to want to
19 protect the environment and species by not cleaning up
20 the contamination, when really all they are doing is
21 hurting the ecosystem as a whole by proposing to leave
22 these deadly chemicals underneath and in place.

23 If they were concerned about the environment,
24 they wouldn't have polluted it in the first place.

Section 3 - Public Comments and DOE Responses

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 (Clock timer ringing)

2 MS. SCHENDEL: -- binding cleanup obligation within

3 our reach in terms of environmental --

4 (Clock timer ringing)

5 MS. SCHENDEL: -- and physical (Inaudible) --

6 (Clock timer ringing)

7 MS. SCHENDEL: -- and all we have undoubtedly

8 helped.

9 MS. LOWE: Thank you. Matt Ruhland will be

10 followed by Devyn Gortner and then Isaac Levy.

11 MR. RUHLAND: Hello. My name is Matt Ruhland. I

12 grew up in Thousand Oaks, and I'm outraged.

13 In 2010, the DOE solemnly entered into an

14 agreement with the state regulatory agency, the DTSC,

15 whereby the site would be cleaned up to background, in

16 other words, remove all the dissectible contamination

17 and return to the condition it was before DOE

18 contaminated it.

19 After two rounds of opportunity for public

20 comment, in which more than 3,000 comments were

21 received, all -- all of which but a handful were

22 strongly in favor of the DTSC, and DOE issued an AOC in

23 the summer of 2010.

24 There are several key components to the AOC:

25 One is legally binding. The DOC (sic) cannot be allowed

915-1
cont'd

916-1

916-2

916-1 NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. In this EIS, DOE does not propose breaking the 2010 AOC signed with its regulator, DTSC. As stated in Chapter 2, Section 2.2.1 of this Final EIS, in order for the implementation of any alternative to be consistent with the 2010 AOC, changes to the AOC would be required. Section 8.0 of the AOC allows DOE and DTSC to agree upon changes to the AOC to better meet cleanup objectives. DOE expects that it will need to engage DTSC in discussions about such changes in order to implement any soil remediation alternative. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

916-2 None of the alternatives evaluated in this EIS proposes to not comply with the 2010 AOC. As indicated in Chapter 2, Section 2.2.1, of this Final EIS, DOE believes that in order for the implementation of any alternative to be consistent with the 2010 AOC, changes to the AOC would be required. Section 8.0 of the AOC allows DOE and DTSC to agree upon changes to the AOC to better meet cleanup objectives. DOE expects that it will need to engage DTSC in discussions about such changes in order to implement any soil remediation alternative. This EIS evaluates alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 to choose to comply with any part of it -- to not comply
2 with any part of it. Two, enough of soil shopping to
3 background. And, critically, three, leave -- no
4 leave-in-place alternatives will be considered.
5 In 2012, DOE issued a Notice of Public
6 Participation in the Development of Alternatives to be
7 Considered in the Santa Susana Field Laboratory at Area
8 IV Environmental Impact Statement. In this statement,
9 DOE acknowledged that, one, DTSC was the regulator and
10 had the regulatory authority over the cleanup. Two, the
11 DOE was obligated to carry out the AOC requirements to
12 clean up to background. And, three, that the EIS would
13 be limited to alternative ways to achieve that same
14 restricted cleanup standards.
15 A few weeks ago, DOE issued a Draft EIS. In
16 the Draft EIS, DOE broke its commitments in the AOC and
17 its past promises about entry through the EIS. It was
18 promised in the community that -- that any EIS would be
19 limited to different technologies to live up to its
20 restricted AOC obligations to clean up all of the
21 contamination, not whether or not to do so.
22 Every option the E -- that the EIS puts
23 forward would leave in place large amounts of
24 contamination despite the -- the explicit prohibition
25 against that in the AOC. Option one would leave in

|| 916-2

cont'd

Response side of this page intentionally left blank.

3-1529

Section 3 - Public Comments and DOE Responses

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 place 39 percent of the contamination. Option two would
 2 leave in place 91 percent of the contamination. Option
 3 three would leave in place 99 percent of the
 4 contamination. And, option four, would leave 100
 5 percent.

6 The DOE has lacked integrity and transparency
 7 when engaging with the public. Not only is it limiting
 8 the size of comments and files that's been submitted
 9 through their website, we are only allowed 180 seconds
 10 to speak at these meetings. Even yesterday, the DOE
 11 prohibited public testify -- public testimony today from
 12 presenting slides on the information we wanted to
 13 highlight in the Draft EIS, just as they did this
 14 morning. No where on the public hearing announcements
 15 that's prohibited members of the public from presenting
 16 slides. They're refusing to give people the same
 17 opportunity that the government has. The public has
 18 asked numerous times for email comments be accepted --

19 (Time clock ringing)

20 MR. RUHLAND: -- as is the most practical -- and
 21 practical way of meeting --

22 (Time clock ringing)

23 MR. RUHLAND: -- and so, I am done?

24 (Time clock ringing)

25 MS. LOWE: Thank you, Matt. I know. Let me see.

916-1
cont'd

916-3 916-3

Thank you for the feedback on the Draft EIS. Considering public comments on the Draft EIS is an important step in this Final EIS process. DOE's time limit on oral comments at the public meetings was set to allow all stakeholders equal time to present their comments. The intent was not to quell public comment; multiple means of submitting comments were available. These methods included the website, U.S. mail, providing oral comments during the public meetings or to the court reporter before the public hearings commenced, and providing a written transcript at the public hearings. In response to comments about the website, early during the public comment period DOE expanded the capacity of the website to accept longer comments and added the ability to upload entire documents. Regardless of the submission method, DOE considered all comments equally when developing this Final EIS. The purpose of the public hearings was to allow stakeholders to make comments on the Draft EIS. PowerPoint presentations were not allowed during the oral comment periods at the public hearings in order to give all commenters equal time; however PowerPoint presentations could be submitted by providing a printout of the presentation at the public hearing or by U.S. mail, or by uploading the presentation on the comment website.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 Devyn Gortner, Isaac Levy, and then Martha Waite. That
2 wasn't very special what I just said. I'm sorry. I
3 meant to say thank you, and I -- I forgot to notice
4 that, so I apologize for that. Okay. You should be
5 Devyn.

6 MS. GORTNER: My name is Devyn Gortner. I grew up
7 in Oak Park, less than five miles from the site. I have
8 been coming to these meetings now for -- or meetings
9 such as this for the last 10 years, and I'm really sick
10 of having to do this, and sick of the polluters trying
11 to weasel out of their commitments to protect us.

12 One of the DOE's proposals for all of the
13 cleanup options in the DEIS is to leave 150,000 cubic
14 yards of contaminated soil in place to supposedly
15 naturally attenuate. However, this is prohibited by the
16 AOC. DOE itself estimates that it could take 70 years
17 for the total petroleum hydrocarbons, or TPHs, to
18 attenuate to required levels. This is outrageous.

19 DOE wants to leave the hazardous materials, which has
20 already been contaminating Santa Susana for 70 years, in
21 place for another 70 years, so that the nearby
22 communities will have faced 140 years of migration and
23 exposure. There are very few, if any, people in this
24 room who will be alive for another 70 years, sorry to
25 say. That means for all of our life times, this toxic

|| 916-2
cont'd

917-1

917-1 The 2010 AOC allows for onsite treatment of soils and natural attenuation was included as a treatment option at the suggestion of DTSC staff. The Draft EIS states that natural attenuation would be applied to soil with "low concentrations" of TPH's where they are the only chemical exceeding comparison criteria. Based on soil treatability studies, it appears that monitored natural attenuation will be able to degrade TPH concentrations in these soils to below their AOC LUT values within 70 years. See Chapter 2, Section 2.3.2 of this Final EIS for additional information. Soils with higher concentrations of TPH would be removed, as they would take longer than 70 years to attenuate.

3-1531

Section 3 - Public Comments and DOE Responses

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 stew that the DOE created will be in the midst of our
 2 communities, so every time it rains, as it has been
 3 doing profusely for the last couple of days, it will
 4 migrate down to expose the people and the environment.
 5 But, it gets worse. This 70-year estimate,
 6 which is just one of the many that's been talked about
 7 for the TPHs to supposedly attenuate, it turns out to be
 8 false. The DOE's cites a Particular Report as the basis
 9 for that conclusion, but, in fact, it is simply citing
 10 to another report which doesn't actually conclude that
 11 the hazardous stuff will degrade in 70 years. In fact,
 12 it says it will take much longer, because the easiest
 13 stuff to degrade did so already, and what is now left
 14 degrades very slowly, if at all. It's not a linear
 15 process. In fact, the study measured that the --
 16 sorry -- degradation rate -- natural attenuation rate
 17 given for the conditions at the site, when they tested
 18 it, they found no natural attenuation at all. So, once
 19 again, the DOE misrepresented the facts as a way of
 20 trying to get out of the cleanup agreements. But,
 21 whether it's 70 years that the DOE wants to leave the
 22 TPHs in place or far longer, it's unacceptable.
 23 And let us keep in mind that the majority of
 24 the contamination that the DOE now proposes to walk away
 25 from, it admits there's no basic -- there is basically

917-1
cont'd

917-2

917-2 As described in Section 2.10, "Public Perceptions about Waste and Contamination in Area IV" of this CRD, Area IV and the NBZ are not "heavily contaminated." The Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative would remove the contamination that would be a risk to human health and the environment. What would be left under the two alternatives, are low concentrations of chemicals that do not pose a risk to human health and the environment. As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 no attenuation at all, and that it will be there for
2 practically, you know, for eternity, capable of
3 migrating off the site and affecting the community.

4 The DOE contaminated the site by grossly,
5 irresponsible environmental practices. It solemnly
6 signed a legally binding agreement to clean it all up,
7 and now they're breaking its promises. It's as simple
8 as that, and it's totally unacceptable.

9 You are playing with my health. You are
10 playing with my life. You're playing with my family's
11 health. You are playing with my community's health.
12 And my community doesn't care about trucks driving by
13 the neighborhood. You know, we care about getting that
14 contamination out of there. So, DOE, please, live up to
15 your commitments. Clean up all the contamination and
16 stop the risk in the nearby community with your toxic
17 pollution and toxic actions.

18 Thank you.

19 MS. LOWE: Thank you, Ms. Gortner. Isaac Levy will
20 be followed by Martha Waite and then Ms. Kidd.

21 MR. LEVY: I'm Isaac Levy. I've been a resident of
22 Simi Valley for 28 years.

23 I've been coming to this meeting now for over
24 three years. I tell you, prior times, when you guys
25 celebrated in 2010, when the AOCs were signed, in fact,

917-2
cont'd

917-3

917-3 DOE acknowledges your preference of cleanup of all the contamination and refers you to Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

917-4

With respect to your concern about risk in the neighborhood community, please refer to Section 2.7, "Offsite Impacts," and Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for additional information. As discussed in these sections, Area IV is not currently spreading contamination to offsite areas, including offsite groundwater, and each of the alternatives evaluated in this EIS is protective of public health and safety and the environment, both on and off the SSFL site.

917-4

917-4 DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

918-1

918-1 DOE acknowledges your concern about compliance with the 2010 AOC. The purpose of this EIS is to evaluate alternatives in accordance with the requirements of NEPA for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 I look back at it. I think it was monumental. But, it
 2 seems like for the last three years, all we're doing is
 3 going backwards. Every time I come to this meeting,
 4 meetings like this, I see the charts, I see the -- the
 5 bows of the trucks. It's a combination of how many
 6 trucks, how much dirt you're removing, and then how long
 7 it's going to take, and the inconsistencies are
 8 tremendous.

9 At the beginning of the meeting, I saw one of
 10 your charts, and it said -- it talked about a study,
 11 March 2003, a U.S. Department of Energy. At that point,
 12 you said it was going to take 404,850 cubic meters.
 13 That's what would have to be removed. I call your
 14 attention that to your technical memorandum, September
 15 2013, that said there were going to be up to, not
 16 400,000, not 800,000, then you talked about there would
 17 be a million six. But then you put in a little
 18 disclaimer, it said, well, it could be plus 50, minus
 19 30. You put -- you put in a Report of Memorandum that
 20 varies of 80 percent. Then you go to March 2014. Then
 21 incorporated in a NASA report was, you said, hey, it's
 22 850,000 cubic yards, it's 53,125 trucks, and at 213 per
 23 day, it would be -- you removed in one year. I didn't
 24 write the reports. That was written by you.

25 Now, come to the meeting today. Again, I call

918-1
cont'd

918-2 918-2

EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

DOE's estimate of the contaminated soil volume has changed as more information has become available. Estimates prior to 2013 did not have the specific LUT values as a basis. Estimates subsequent to 2014 had the benefit of the characterization data from the extensive sampling performed by EPA and DOE. The volumes in the Draft EIS have a sound engineering basis. DOE used the geographic information system (GIS) database for Area IV to identify on a point-by-point basis, any sample location that had an exceedance of a LUT value (radionuclides published by DTSC on January 30, 2013 [DTSC 2013a] and chemicals on June 11, 2013 [DTSC 2013b]). The GIS system was then used to mark the locations of exceedances, map the extent of exceedance, develop areas and depth of exceedances, and then the calculation of the soil volume exceeding the LUT values.

Since the Draft EIS was prepared, DOE has independently checked the estimate of the soil volume associated with cleaning up to the 2010 AOC LUT values. Based on the characterization data, and recognizing the shallow soil depth over uneven bedrock across Area IV and the NBZ DOE is not as uncertain about the upper limit of the soil volume estimate as it was at the time the Draft EIS was prepared.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 it the bow of the trucks or whatever. We've gone from
2 one year removal. Now you're saying it's 10 years
3 removal.
4 All this started actually -- I started looking
5 into this when I attended a meeting that was held on
6 Monday -- excuse me -- that was held in Simi Valley
7 August 7th, 2014. Two and a half years ago there was a
8 Transportation Option Study. I was told at that point
9 in time within one year you'd come up with the amount of
10 trucks that it would take, the right volume and the time
11 table. Well, the bottom line is -- actually, prior to
12 that meeting, on Monday, July 14th, ThyssenKrupp
13 Industrial submitted three different plans, and the
14 number of trucks is zero. They looked at conveyor A and
15 B was presented in that meeting, conveyor A and B, which
16 isn't even mentioned in your report. ThyssenKrupp, if
17 you haven't heard of them, they're a company with
18 150,000 employees, world renowned, and -- and a revenue
19 of over \$40,000,000,000. That report, which talked
20 about tower-to-tower fill site and road site conveyors,
21 which would be 100 percent safe because it's a sealed
22 conveyor, is missing.
23 The other thing I ask is, is this about
24 cleanup or is it about money? You know, 2014 report, I
25 looked at this --

918-2
cont'd

918-3

918-3 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

918-4

918-4 Any cleanup performed by DOE in Area IV and the NBZ would remove soil contamination to levels that would be protective of human health and the environment, leaving the site safe for use as open space. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. As a Federal agency, DOE is required to evaluate and justify major expenditures of Federal dollars. Because the AOC cleanup is not the normal way DOE, EPA, or California DTSC perform soil cleanups, DOE evaluated the costs and benefits of the AOC cleanup versus what is normally done (that is, a cleanup that is based on risk and future land use). That analysis demonstrated that the AOC cleanup would be much more expensive and with minimal additional protection of public health and the environment.

918-4

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 (Time clock ringing)

2 MR. LEVY: -- and it's above maybe 400 million

3 dollars at full cleanup or 25 million at partial. Are

4 you putting the money --

5 (Time clock ringing)

6 MS. LOWE: Thank you, Mr. Levy.

7 MR. LEVY: -- atop the lives of other people?

8 MS. LOWE: Martha Waite will be followed by Nancy

9 Kidd, will be followed by Daniel Hirsh. Is Martha Waite

10 present? I'll try her again later. Nancy Kidd will be

11 followed by Daniel Hirsh and then Margery Brown.

12 MS. KIDD: Good morning. How is everybody feeling?

13 MR. UNIDENTIFIED: Terrible.

14 MS. KIDD: Pretty depressed. Sorry about that.

15 This has been a very contentious issue, and it has been

16 very sad for many other people and the stories that we

17 have heard today.

18 MS. LOWE: Ms. Waite, could you remember to state

19 your name for the record, please?

20 MS KIDD: I'm sorry. I'm Nancy Kidd.

21 MS. LOWE: I'm sorry. Okay. I had Martha. But

22 I'm glad -- glad you clarified it. Okay. Go ahead.

23 MS. KIDD: And it's -- it's really heartbreaking to

24 hear these stories and to hear these consternation over

25 all of these years and people having so much invested in

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 the sadness of some kinds of activities that occurred
2 many, many years ago.

3 I am with the Simi Valley Historical Society,
4 and in November we are actually hoping to celebrate
5 Santa Susana Field Laboratory for the rocket engine
6 testing, not for your contamination issues. We are
7 hoping that you can remember perhaps through the years
8 and through the grief that the rocket engines that were
9 born in flame and glory up there put our nation at the
10 forefront of the space program, and it was our proudest
11 achievements in our history. We are hoping that you can
12 see that part of the Santa Susana Field Laboratory and
13 join us. And, we are sorry that it has been such a
14 contentious issue for so very long, and we hope, too,
15 that all of this can find a final solution.

16 MS. LOWE: Thank you. Daniel Hirsch will be
17 followed by Margery Brown and then Elena Semper.

18 MR. HIRSCH: My name is Daniel Hirsch. I'm the
19 director of the Program on Environmental and Nuclear
20 Policy -- it's in Santa Cruz -- and the president of the
21 committee Bridge the Gap. I have less than 180 seconds
22 to try to rebut a half hour presentation filled with
23 falsehoods by the Department of Energy, knowing lies.

24 You said that the first option complies with
25 the AOC, yet you -- it actually leaves in place 39

919-1

919-1

Thank you for your comment. Because the comment/statement is not on the scope or content of this EIS, no response is provided. It has been included in the Administrative Record for the EIS.

920-1

920-1

Option 1 referred to by the commenter is the Cleanup to AOC LUT Alternative. The description and analysis of this alternative in the EIS incorporates all technical elements of the AOC. The commenter is referred to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of how the Cleanup to AOC LUT Values Alternative incorporates the technical elements of the 2010 AOC,

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 percent of the contamination when the AOC bars
 2 leave-in-place alternatives. Every way it's actually
 3 claimed in there is, in fact, contradicted by the AOC.
 4 You have no biological opinion by Fish and Wildlife.
 5 You have no recognized Native American artifacts and the
 6 attenuation is barred.

7 The next option violates not just the AOC, but
 8 the 1995 Joint Policy with the U.S. Environmental
 9 Protection Agency the DOE entered solemnly into, which
 10 doesn't seem to bother the DOE to enter into agreements
 11 you break, which promised that all DOE sites would be
 12 cleaned up consistent with EPA CERCLA guidance. EPA
 13 CERCLA guidance bars averaging for residential scenario.
 14 It bars it for any scenario where there is non-granted
 15 use. EPA guidance further bars the exclusion of the
 16 backyard garden which is for residential. You folks
 17 claimed that you were complying with the Standardized
 18 Risk Assessment Methodology by DTSC, which actually
 19 includes the backyard garden, and the DTSC policy that
 20 you have to do things based on current zoning, which
 21 Ventura has already identified the use and -- and allows
 22 the provision in garden. By doing so, you lied to this
 23 community to tell them that there was essentially no
 24 risk in leaving 99 percent of the contamination buried,
 25 said it's a one-in-a-million risk. But, to do that, you

920-1
cont'd

920-2

using the AOC LUT values as the basis for a cleanup to background or levels based on laboratory capabilities.

The commenter is inaccurate his statement that “the attenuation is barred.” Natural attenuation was included as a treatment option in the EIS at the suggestion of DTSC staff. Section 2.6 of the AOC anticipates the potential for in situ treatment, which includes natural attenuation.

At the time the Draft EIS was issued, there was not a biological opinion for the project from the U.S. Fish and Wildlife Service. The Biological Opinion by the USFWS was released in August 2018 and was used in part in establishing the exemption process described in the Draft and Final EIS documents. The AOC exemptions are based first and foremost on DOE’s compliance with Federal, State, and local laws. The AOC does not affect compliance with laws. Per the AOC, exemptions are based on consultation with USFWS and determination of Native American artifacts formally recognized as cultural resources. Concerning the Native American artifacts exemption in the AOC, the particular application and scope of the phrase “Native American artifacts that are formally recognized as Cultural Resources” will be determined in cooperation with DTSC and in consultation with the California SHPO, Santa Ynez Band of Chumash Indians, other tribes, and other consulting parties in the Section 106 process. The exemption process described in the Draft EIS was based on several years of meetings attended by USFWS, CDFW, and DTSC staff. Those meetings are documented in Appendix E of the EIS. CDFW provided a letter accepting the exemption process (CDFW 2016) and the process is addressed in USFWS’ Biological Opinion (see Appendix J). DOE’s use of the cultural resource exemption is based on site surveys and discussions with the State Historic Preservation Officer and staff, as well as Native Americans. Please refer to Section 2.4, “Application of Exemptions under the 2010 Administrative Order on Consent,” of this CRD which discusses the process DOE followed for implementing the regulatory requirements for protection of biological and cultural resources. For this Final EIS, USFWS has issued a Biological Opinion (see Appendix J) and DOE is developing a National Historic Preservation Act (NHPA) Programmatic Agreement for protection of cultural resources in consultation with the California Office of Historic Preservation, the federally recognized Santa Ynez Band of Chumash Indians, and non-federally recognized tribes.

920-2 DOE is assuming that the “next option” referred to in the comment is the Cleanup to Revised LUT Values Alternative. Under this alternative, DOE would replace the LUT values for chemicals with risk-based screening levels for soil and use the AOC LUT values for radionuclides. Providing cleanup alternatives in the EIS does not “violate” the

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 purposely used the risk-based screen level that is a
2 thousand times higher than the EPA standard or the
3 standard in the DTSC SRAM. You knowingly lied to tell
4 people that the only call-up is trucks, which is what
5 you've been trying to scare people about so that they
6 won't -- they'll back you in your efforts to break up
7 with the cleanup.

8 Your third option says you will use 25
9 millirem a year. People don't know what that is. That
10 means you would be forcing people to get the equivalent
11 of a chest X-ray every month from the moment of
12 conception to the moment of proof. You said that's
13 consistent with the EPA's guidance. EPA bars the use of
14 25 milirems, says it's non-protective. And, because
15 you're averaging and because you are also not including
16 a full suburban residential scenario, it's actually the
17 equivalent of 100 chest X-rays a month, you're third
18 option.

19 And I want everyone in this audience to think
20 twice about getting one chest X-ray. To think about the
21 morality of demanding that people get exposed to the
22 equivalent of 100 a month because the Department
23 contaminated the site by breaking the law, and now
24 you're breaking this commitment to clean it up.

25 So, the fundamental point is this, one last

920-2
cont'd

920-3

920-4

AOC. The AOC contemplates that the NEPA process may have to be followed. Once DOE engaged in the NEPA process, it is required of DOE to evaluate "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. The 1995 DOE-EPA Joint Policy mentioned by the commenter created a framework for the conduct of decommissioning of DOE facilities and provided guidance to EPA Regions and DOE Operations Offices on the discretionary use of CERCLA response authority to decommission such facilities. The policy is no longer in effect. DOE notes that SSFL Area IV and the NBZ are not on EPA's National Priorities List and do not have to be cleaned up under the CERCLA law. However, DOE did follow USEPA guidance used for CERCLA sites in conducting risk assessments for the Conservation of Natural Resource scenarios. Use of risk-based soil screening levels derived using EPA risk assessment principles would also be consistent with CERCLA, and would not "violate it."

The commenter is inaccurate when he states that EPA CERCLA guidance "bars" averaging for a residential scenario. EPA CERCLA Risk Assessment Guidance (EPA 1989) prescribes the use of an upper confidence limit (UCL) on the arithmetic average (UCL95), meaning soil averaging is the norm; it is not barred as the commenter suggests. Regarding the commenter's statement that EPA guidance "bars the exclusion of the backyard garden which is for residential," EPA guidance requires an assessment of the most likely future land use in establishing the risk assessment basis. Because residential redevelopment with garden is not a future land use for SSFL, that scenario was not included in the EIS. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site, and firmly establishes the basis for establishing cleanup levels based on use of the land as open space. The soil screening levels used in the EIS were taken directly from the DTSC approved SRAM and reflect the residential scenario without garden. The screening levels are not 1,000 times higher than any equivalent EPA standard or the SRAM.

This EIS provides estimates of the number of trucks required to transport soil from SSFL based on the estimated volume of soil under each alternative. The volumes have been independently verified and confirmed for use by DTSC in its Draft EIR (DTSC 2017b).

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 thing: You don't even have the right to do this EIS.
 2 The Department of Toxic Substance Control is your
 3 regulator. Under Rick Brausch, the polluter doesn't
 4 get --
 5 (Time clock ringing)
 6 MR. HIRSCH: -- to pick out how much contamination
 7 it's going to clean up. You can't break the AOC.
 8 (Time clock ringing)
 9 MS. LOWE: Thank you, Mr. Hirsch.
 10 MR. HIRSCH: You don't have that regulation. And
 11 you can't break Rick Brausch. And, it is a shameful
 12 thing to break your promises and to put people's lives
 13 at risk.
 14 MS. LOWE: Thank you --
 15 MR. HIRSCH: I don't know --
 16 MS. LOWE: -- Mr. Hirsch.
 17 MR. HIRSCH: -- how you can sleep.
 18 MS. LOWE: Margery Brown will be followed by Elena
 19 Semper, and then Christina Walsh. Do we need that -- to
 20 adjust that for you?
 21 MS. BROWN: No. My name is Margery Brown and --
 22 MS. LOWE: Thank you for helping her.
 23 MS. BROWN: -- I have been working on the cleanup
 24 of -- for 10 years now. I am on the board of the West
 25 Hills Neighborhood Council, have been on the Environment

920-4
cont'd

920-3 The third option referred to by the commenter is the Conservation of Resources Alternative. This alternative is based on a risk-based soil cleanup process like that followed by EPA at CERCLA sites nationwide and DTSC-regulated sites throughout California.

DOE chose to identify the 25 millirem per year in its risk-based alternative for cleanup in this EIS, consistent with the upper limit for dose-based release criteria under DOE requirements (DOE Order 458.1). DOE notes that the Conservation of Natural Resources Alternative (both scenarios) analysis in this Final EIS results in radiological risks in the 10⁻⁵ range; this would correspond to a dose much lower than 25 millirem per year.

920-4 The commenter is inaccurate in his statement that DOE "does not have the right to do this EIS." Section 7.11 of the AOC states that "All actions taken pursuant to this Order by DOE shall be undertaken in accordance with applicable local, State, and Federal laws and regulations." NEPA is a Federal law that requires Federal agencies to consider the impact of major Federal actions that could significantly affect the quality of the human environment. For those major actions, NEPA requires Federal agencies to prepare a detailed statement (an EIS) that analyzes the potential environmental impacts of the Proposed Action and "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. In addition, as discussed in Chapter 1, Section 1.3 of this EIS, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision pursuant to NEPA. The obligation for DOE to prepare the EIS pursuant to the court's order is referenced in Section 6.1 of the AOC. Section 6.2 recognizes the need to complete an environmental review that meets the requirements of the court order. DOE recognizes that the 2010 AOC is a legally binding agreement with the DTSC and that DTSC has regulatory authority over aspects of DOE's cleanup of Area IV and the NBZ, including soils and the RCRA-regulated buildings.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 Committee for 10 years re the cleanup, and my friends
2 at -- at the -- on the board tell me that every once in
3 a while I turn back into a probation officer. Well, I
4 can't help it. I was one for 45 years, spending great
5 amounts of energy and time working with kids to get them
6 to stop trying to manipulate the system and to take
7 responsibility for what they do, to be accountable.
8 And, when adults, and particularly government adults,
9 are exhibiting the same kind of manipulative behavior,
10 it really appalls me, so I turn back into a DPO once in
11 a while, and you'll have to forgive me. I don't mean to
12 scold you, but I have seen very upsetting attempts to
13 break the AOCs all over the place.

14 Not one of the four suggestions that you have
15 made in your EIS is acceptable, and all of them violate
16 the AOCs, which shouldn't have been provision for
17 risk-based analysis. And the talk is constantly about
18 risks-based this and risk-based that. Hey, you signed a
19 legal agreement. I expect you to uphold it. That
20 agreement provides for taking care of nature, for
21 taking care of indian caves and paintings, all of the
22 things that those who are concerned about the
23 environment care about.

24 There is a vision that I have of all those
25 trucks that were running up and down Woolsey Canyon when

921-1

921-2

921-1 DOE acknowledges your preference for compliance with the 2010 AOC and refers you to Section 2.1, "Preferences for Cleanup," of this CRD for a discussion of commenters' preferences.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. NEPA strongly encourages agencies to evaluate alternatives and not limit their consideration to one pre-selected course of action. In addition to a No Action Alternative (required by NEPA regulations), this Final EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

921-2 DOE's intent is not to alarm people, but it is true that the more soil removed from a cleanup site, the larger the transportation effort (i.e., a larger number of truck trips) that would be required. DOE would ensure that waste materials transported from the site by truck were well contained to prevent the spread of contamination and particulates. The analyses in this EIS were performed to evaluate the potential impacts associated with the various alternatives for cleanup of Area IV and the NBZ. Results of the analyses allow a comparison of potential impacts and tradeoffs between the alternatives. In the case of soil remediation and using the Conservation of Resources Alternative as an example, leaving more soil, and consequently low concentrations of chemicals and/

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 the place was open, and when you were making your huge
 2 nuclear mess and chemical mess, there were trucks then.
 3 I am getting very tired people trying to scare some of
 4 us about the vision of all these trucks running around,
 5 spreading contamination and particulates and all of this
 6 stuff that will cause cancer, and now we have dementia.
 7 It's not going to happen. There's a railway that's a
 8 block away. Please consider some other alternatives,
 9 and please carry out the AOCs which you've signed.
 10 Thank you.
 11 MS. LOWE: Thank you. Elena Semper will be
 12 followed by Christina Walsh and then Kamara Sams.
 13 MS. SEMPER: My name is Elena Semper. I'm a
 14 Certified Conduct Reality Project Leader. I'm on the
 15 Porter Ranch Neighborhood Council -- thank you -- the
 16 Porter Ranch Neighborhood Council Sustainability
 17 Committee. I'm speaking on behalf of myself.
 18 I grew up in the Valley. I'm aware of my
 19 playground, being in a contaminated, toxic wasteland.
 20 Our roots are strong and unpredictable and we're atop a
 21 serious earthquake fault, making partial remediation
 22 unacceptable. Alternative solutions and alternative
 23 facts just don't make sense. I urge the Department of
 24 Energy to pull its part, AOC.
 25 Thank you.

921-2

922-2

or radionuclides on site, reduces the number of truck trips from the site and associated transportation risk and air quality impacts. But, the potential impacts to a site user following cleanup would be highest for this alternative. Conversely, removing the soil with low concentrations of chemicals and/or radionuclides, as would be the case for the Cleanup to AOC LUT Values Alternative, would result in more truck trips from the site and increases the transportation risk and air quality impacts. But the potential impacts to a site user following cleanup would be lowest. Although the cleanup levels under the three soil remediation action alternatives and scenarios are different, Area IV and the NBZ would be cleaned up to a level that is protective of the public and environment regardless of the alternative (see Chapter 4, Section 4.9).

Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

Earthquakes are a hazard in California; however, as stated in Chapter 3, Section 3.2.1.3 of the Draft EIS, Geologic Faults, "None of the faults in Area IV have been classified as "active" faults by the California Geological Survey (Jennings and Bryant 2010). Active faults are those that have had movement within the last 11,700 years. Area IV and the NBZ are, however, susceptible to earthquakes due to movement along distant faults. Some slopes in the valleys in the NBZ and the north-facing slope of the hill in the southernmost part of Area IV have been identified as Earthquake-Induced Landslide Zones (California Department of Conservation 1998). This designation is based on topography, geologic materials and structure, geotechnical data, rock strength data, and estimates of earthquake-related shaking." Stability of the remediated

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 MS. LOWE: Thank you. Christina Walsh will be
2 followed by Kamara Sams and then Brant Armbruster.
3 MS. WALSH: Hi. My name is Christina Walsh. I
4 live in West Hills. I've been involved in this for a
5 very, very, very long time, and I can't believe we're
6 still trying to consider what we should do. You know,
7 it's like Groundhog Day nightmare.
8 I do believe that the AOCs, the one -- and we
9 should be kind of -- it's sort of weird. We're sort of
10 in this place where we're pretending that there isn't a
11 brand new administration, a new world ahead of us when
12 it comes to the environment, and I think we should pay
13 attention there is legislation on the table to remove
14 the EPA by 2018, so let's give a little perspective.
15 And the AOC is, I believe, the only place
16 where the federal government, the federal entities, the
17 responsible parties voluntarily agree to do what is
18 asked to be regulated by the State of California. So,
19 when we try to bash away the agreement, the one and only
20 thing that is holding it together, I am concerned about
21 that.
22 I'm also concerned when I see a republished
23 chart that's distributed to the public by the CAG that
24 shows the alternatives but they're all marked AOC except
25 for no action. So, that really, really, really is

923-1

923-1

Thank you for your comment. Because the comment/statement is not on the scope or content of this EIS, no response is provided. It has been included in the Administrative Record for the EIS.

923-2

923-2

DOE acknowledges your concern about compliance with the 2010 AOC. The purpose of this EIS is to evaluate alternatives in accordance with the requirements of NEPA for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

923-3

923-3

DOE does not control information distributed by those it has funded, including not only the CAG, but also the SSFL Advisory Board, SSFL Work Group, Committee to Bridge the Gap, Physicians for Social Responsibility, Rocketdyne Cleanup Coalition, and Teens against Toxins.

contamination areas will be taken into consideration in the excavation and grading plans. The risk from accidents caused by earthquakes is addressed qualitatively in Chapter 4, Section 4.9.2. Please see Section 2.1, "Preferences for Cleanup," of this CRD for a discussion of commenters' preferences regarding cleanup.

922-3

DOE acknowledges your concern about compliance with the 2010 AOC. The purpose of this EIS is to evaluate alternatives in accordance with the requirements of NEPA for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 disinformation. That isn't alternative facts. That is
 2 fraudulent, false activities that -- that harm the --
 3 the community. This is supposed to be the opportunity
 4 to be able to shape what this cleanup looks like. So,
 5 we don't do crazy. You know, we don't want crazy
 6 either. But it seems that we're always pushing against
 7 nothing, so we have to push hard, and we've been pushing
 8 for a long time.

9 The cleanup options, when I look at those
 10 alternatives that you showed, the ones, the really big
 11 number of trucks, and the really big number of soil, of
 12 years, all of that, it also shows that on that
 13 alternative, you require that you remove all the roads
 14 and everything, but you don't in the other ones. So, I
 15 do agree with the people that have said that there's a
 16 false exaggeration of how many trucks that there might
 17 be instead of a real effort to try to deal with near
 18 background. It is not a one-page, one-word agreement.
 19 This is background. It is a 45-page document with lots
 20 of addendums that show how we have to adhere to those
 21 exceptions, and I expect you to adhere to the
 22 exceptions. They are important. They are the way to
 23 make this reasonable and safe. Both can be -- excuse
 24 me. I'm sorry about that. Too close.

25 I also want to clarify a few things, and I

923-3
cont'd

923-4

923-4 Within Area IV, about 10,000 feet (less than 2 miles) of paved road remains. As stated in the Draft EIS, DOE does not plan to remove any road. An exception may be made for roads where soil contamination has been shown to extend below a road. Inclusion of the roadways on the figure was not intended to imply that they would be removed; the figures have been revised in this Final EIS.

923-5

923-5 Please refer to "Application of Exemptions under the 2010 Administrative Order on Consent" (Section 2.4 of this CRD) for a discussion of this topic and DOE's response.

923-6

Please see Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of the EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

923-6

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 appreciate the -- the -- the woman who came forward with
2 all those pictures of those children. That's something
3 that we need to remember. We need to remember what has
4 happened here and we need to not -- you know, and
5 CAGnians, I've seen the CAG leadership say to Bonnie
6 Klea, "Bring those cancer victims to me, show them to us
7 as if they are false, as if we are making up children."
8 I think we know that that is not the case, and it is not
9 appropriate to do so. I founded the CAGs, so here I am.
10 The fact is, that I was pushed out because --
11 (Timer clock ringing)
12 MS. WALSH: -- it was not allowed for me to make a
13 presentation that countered the
14 radiation-is-good-for-you presentation --
15 (Time clock ringing)
16 MS. WALSH: -- and concerns because that was narrow
17 dated. Thank you --
18 MS. LOWE: Time --
19 MS. WALSH: -- very much.
20 MS. LOWE: -- clock. Kamara Sams will be followed
21 by Brant Armbruster and then Alex Kim.
22 MS. SAMS: Hi. I'm Kamara Sams and I'm with the
23 Boeing Company.
24 Thank you for this opportunity to provide
25 comments on the Draft EIS. Boeing's the owner of Area

923-6
cont'd

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 IV and the Northern Buffer Zone, the property that is
 2 primarily under evaluation in the Draft EIS. We look
 3 forward to working -- to continuing to work
 4 cooperatively with DOE and NASA as field activities at
 5 Santa Susana are implemented.

6 Boeing will be submitting written comments on
 7 the Draft EIS, but we wanted to take this opportunity to
 8 express our support of your agency's approach to its
 9 analysis under NEPA in preparing the Draft EIS.

10 NEPA requires a statement of the purpose and
 11 need for the proposed action, and DOE properly concluded
 12 that it is to remediate its portion of the site to
 13 protect both human health and the environment. The
 14 applicable federal and state statutes mandate this
 15 purpose. NEPA also requires the coordination -- the
 16 consideration of alternatives that will achieve the same
 17 purpose of reducing risk but will cause fewer or less
 18 serious environmental impacts. We support DOE's
 19 decision to evaluate alternatives to an AOC Look-Up
 20 Table Values cleanup.

21 We appreciate DOE's acknowledgment in the
 22 Draft EIS that Boeing, as the property owner, will
 23 permanently preserve the land as open space; there will
 24 never be homes, gardens or any agricultural use. The
 25 Draft EIS demonstrates that the AOC Look-Up Table Values

- 924-1 924-1 Thank you for your comment. It has been included in the Administrative Record for the EIS.
- 924-2 924-2 Thank you for your comment. It has been included in the Administrative Record for the EIS.
- 924-3 924-3 Thank you for your input. DOE's intent is to provide a range of alternatives to allow for a comparison of impacts among different approaches to the cleanup.
- 924-4 924-4 In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. This Final EIS was revised to incorporate the conservation easements, its restriction measures, and soil cleanup scenarios consistent with future use as open space (e.g., exposure to a recreational user).

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 cleanup alternative is at odds with the future use of
2 the -- of the property as open space because it would
3 profoundly disturb natural resources, ecosystems,
4 wildlife habitat and wildlife corridors, resulting in
5 decades-long or permanent damage to these irreplaceable
6 environmental resources. The Look-Up Tables Values
7 cleanup would also impose on the community a decade of
8 unnecessary truck traffic, with increased emissions and
9 traffic accident risk.

10 Boeing supports a reasonable cleanup of the
11 site that fully protects people, wildlife, habitat and
12 cultural resources. As the property owner, Boeing is
13 pleased that your Draft EIS acknowledges that
14 alternative approaches to remediating Area IV and the
15 Northern Buffer Zone will be protective of human health,
16 shorten the cleanup schedule, reduce impacts to adjacent
17 communities, and limit damage to Santa Susana's unique
18 biological and cultural resources that are worthy of
19 protection.

20 Thank you.

21 MS. LOWE: Thank you. Brant Armbruster will be
22 followed by Alex Kim and then Carla Bellinger. Is Brant
23 Armbruster present? Okay. Alex Kim? Are you Alex?
24 No. Sorry. Okay. Carla Bellinger? Carla will be
25 followed by Anthony Zepeda and then I will recall Greg

924-4
cont'd

924-5

924-6

924-5 DOE needs to complete remediation of SSFL Area IV and the NBZ to comply with applicable requirements for cleanup of radiological and hazardous substances. DOE needs to remove the remaining DOE structures in Area IV of SSFL and clean up the affected environment in Area IV and the NBZ in a manner that is protective of the environment and the health and safety of the public and workers. The EIS considers alternatives for accomplishing these tasks, and each alternative addresses the potential impacts that implementing the alternative could have on several resource areas, including human health and safety, biological and cultural resources, ground and surface water resources, air quality, and transportation and traffic. After publication of this Final EIS, DOE's decision will be issued in a Record of Decision published in the *Federal Register*. This decision will reflect the consideration and balancing of the potential impacts on all evaluated resource areas.

Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

924-6 DOE acknowledges your support for alternative approaches to remediating Area IV and the NBZ that protect human health, biological, and cultural resources while reducing impacts to adjacent communities. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

Section 3 - Public Comments and DOE Responses

3-1547

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 Williams.

2 MS. BELLINGER: I'm Carla Bellinger, and I

3 organized the Public Land Alliance Network, which is

4 simply a way for all the environmental groups to meet

5 quarterly and work out solutions to save our open space

6 and parkland in our community.

7 I just want to do a side bar here. I grew up

8 in -- I mean -- excuse me -- my children grew up in

9 either -- with -- in the area that is now under

10 development of about 460 homes in what is called "Runkle

11 Canyon." This development was approved after much

12 testing by DTSC for this development. I lived there

13 back in the late '70s. None of my children nor I have

14 cancer.

15 I am sympathetic to just the horrendous,

16 horrible effects of cancer on so many lives. But I do

17 not believe that you can always just play to the Santa

18 Susana Field Lab.

19 I also lived on the other side on Woolsey

20 Canyon for 12 years. That area was very much tested for

21 any contamination during a period of time when the park

22 I lived in was being considered for sale.

23 So, I think we need to be responsible and

24 reasonable. And, I very much appreciate the work that

25 DOE and Boeing has done to the areas on an ongoing

925-1

925-1

Thank you for your comment. It has been included in the Administrative Record for the EIS.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 cleanup process that Boeing's doing in -- in
2 consideration of protecting our natural resources.
3 I think it's time for a new vision. I have
4 seen a program about 10 parks that are unusual, and one
5 of them is called the "Glass Works Park" in Seattle.
6 This park was once highly, highly toxic, considered a
7 toxic wasteland, and it had been originally a burn dump
8 site for Seattleites, and then it became an industrial
9 gasification plant that polluted for over 50 years in
10 the air, in the water, and in the soil. Luckily, they
11 had a visionary, Richard Haag, an architectural
12 landscape person that saw the way to redeem this area,
13 clean it up, much as what Boeing has been undergoing of
14 recent years, and converting it to a wonderful parkland
15 and preserving the gasification towers and boiler house
16 in part of the park. I think we need to do that, and I
17 support and recommend the conservation of our natural
18 resources.
19 Thank you.
20 MS. LOWE: Thank you. Anthony Zepeda, followed by
21 Greg Williams.
22 MR. ZEPEDA: Good morning. I'm a resident of
23 Calabasas, Anthony Zepeda.
24 I have four general points to make: The first
25 one is, is that there's a May 2012 DOE document that was

- 925-2 925-2 Thank you for your comment. It has been included in the Administrative Record for the EIS.
- 925-3 925-3 DOE acknowledges your support for approaches to remediating Area IV and the NBZ that conserve natural resources. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.
- 926-1 926-1 DOE acknowledges your concern about compliance with the 2010 AOC. Please see Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

Section 3 - Public Comments and DOE Responses

3-1549

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 referenced in an earlier public comment called "Public
 2 Participation in the Development of Alternatives to be
 3 Considered in SSFL Area IV EIS." In that document,
 4 which is a document generated by DOE, it says that DO --
 5 that the -- that the AOC dictates -- well, first of all,
 6 it says that the DOE is committed to full compliance
 7 with both the 2007 and 2010 orders, the 2010 order being
 8 the AOC. It says, however, neither order dictates how
 9 DOE should accomplish the cleanup standards. So, DOE
 10 has committed to the AOC. It's signed it, and then it's
 11 also followed through in writing by saying that it would
 12 comply with it. I mean, the only caveat is how it will
 13 comply, not whether it would comply.

14 None of the four options, again, found in the
 15 Draft EIS would comply with the AOC. The Council of
 16 Environmental Quality has stated that there's no need to
 17 consider options that would violate the AOC. That's the
 18 Federal Council Environmental Quality. There's been no
 19 identification of any regulatory or statutory basis for
 20 violating the AOC, and there's been no authorization by
 21 Congress to do so. DOE essentially says the -- the
 22 AOC -- and this is in the Draft EOS -- EIS -- would take
 23 too long to comply with, would be too expensive and
 24 difficult, but no where does it say it would be
 25 impossible.

926-1
cont'd

926-2 926-2

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. NEPA strongly encourages agencies to evaluate alternatives and not limit their consideration to one pre-selected course of action. In addition to a No Action Alternative in accordance with the requirements of NEPA, this Final EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. Recognizing that Section 8.0 of the AOC provides that the AOC may be modified by mutual agreement of the parties, DOE took the appropriate path of evaluating reasonable alternatives that identify different cleanup levels.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 The second point is truck routes. There is a
2 nearby rail station that would create a truck route that
3 would avoid houses, but for some reason that wasn't
4 considered in the Draft EIS, and there's no explanation
5 for why that wasn't considered.

6 Third, the Draft EIS in Appendix F, Page 16,
7 says that Area IV and the Northern Buffer Zone have
8 cultural resources, but all cultural resources
9 identified in the appendix state that they were
10 unevaluated by the National Register of Historic Places
11 or the California Register Eligibility, which means
12 nobody has identified these as cultural resources. This
13 is just a claim based on no -- no evidence or no
14 designation by a government agency.

15 The fourth point is that DOE in the Draft EIS
16 claims that a large portion of Area IV is culturally or
17 biological exempt. That ties into my third point, which
18 the cultural resources have been unevaluated. But
19 Appendix 13 also identifies sources that are not
20 provided by DOE in -- in the Draft EIS, and, therefore,
21 it's impossible for the public to comment.

22 (Clock timer ringing)

23 MR. ZEPEDA: These are 13 different sources.

24 MS. LOWE: Thank you, Mr. Zepeda. Greg Williams.

25 MR. WILLIAMS: I'd like to comment later in my --on

926-3

926-3 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

926-4

926-4 The designation of "Unevaluated" in Appendix F was employed because at the time the Draft EIS was published, the State Historic Preservation Officer in the Office of Historic Preservation had not completed their evaluation of DOE's eligibility determinations for any of the documented archaeological sites. These eligibility designations have been updated in this Final EIS. DOE, as the Federal agency responsible for complying with Section 106 of the National Historic Preservation Act (NHPA), considers some of these sites to be eligible for listing on the National Register of Historic Places (NRHP), which confers the same status (i.e., eligible sites are protected) as actual listing on the NRHP (36 CFR 800.16(l)(2)). Determinations of eligibility are based on evidence collected during archaeological survey, and through laboratory analyses of artifacts or other evidence. These analyses have been completed by archaeological professionals (defined as meeting the Secretary of the Interior's Professional Qualifications Standards for Archeology and Historic Preservation (36 CFR 61)). Some of the sites may also be eligible for protection under NHPA (even if not listed on the NRHP) because of their status contributing to an extensive traditional cultural property or historic district (please refer to Chapter 3, Section 3.11.2.3.4). Final decisions on exemptions for cultural resources will be made in consultation with DTSC, the Office of Historic Preservation and consulting parties. Please see Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent" of this CRD, which describes the process that will be used to determine exemptions. DOE is not trying to exempt areas from cleanup that are not eligible for such exemptions. Not all cultural resource-related sources cited in this EIS are available through the EIS website. Some of these contain confidential site information that may not be released to the general public. Qualified members of the public may obtain this information at the South Central Coastal Information Center of the California Historical Resources Information System.

926-4

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 this.

2 MS. LOWE: Okay. Michael Rincon, followed by

3 Leanna Brand, followed by Stephanie McIntyre.

4 MR. RINCON: Name's Mike. Good afternoon,

5 everyone. My name is Mike Rincon. I have a state

6 agency in Santa Cruz and a local from the area.

7 I'm also deeply upset that DOE has broken its

8 legally binding obligations for a full cleanup of SSFL

9 and now wants to leave in place, not clean up, vast

10 amounts of contamination it created over the decades of

11 an environmentally irresponsible practices at SSFL. It

12 appears that DOE's environmentally irresponsibility

13 continues.

14 At the heart of DOE's Draft EIS is a

15 breathtakingly false claim that leaving the radioactive

16 and toxic chemical contamination would produce no risk.

17 It makes that claim in an extraordinarily dishonest

18 assertion that it would clean the site up to risk-based

19 screening levels for suburban residential use and that

20 the risk would be one in a million or 10 time minus six.

21 And you've heard today the bald-faced lie the

22 DOE's options two and three are following the DTSC

23 approved Standardized Risk Assessment Methodology or

24 SRAM, but it turns out that all this is completely

25 false. A tiny footnote on Page S-31, number 22 of the

927-1

927-1 Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information related to your comment, including a discussion of how the Cleanup to AOC LUT Values Alternative incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background or levels based on laboratory capabilities (AOC LUT values).

927-2

927-2 In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. The use of RBSLS that do not include the indirect garden pathway is appropriate for this future land use.

In this Final EIS (see Chapter 2, Section 2.4), DOE has retained the Cleanup to Revised LUT Values Alternative, which uses chemical RBSLS based on an Onsite Suburban Residential Scenario without a garden pathway. The Final EIS also retains the Conservation of Natural Resources Alternative, but evaluates two scenarios. The Open Space Scenario is based on the future land use of Area IV and the NBZ as open space, consistent with Boeing's conservation easement and agreement (i.e., cleanup levels are based on exposure of an onsite recreational user as the receptor). The Onsite Suburban Residential Scenario is the scenario evaluated in the Draft EIS, that is, cleanup levels are based on a suburban residential scenario without a garden pathway. This latter scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space.

In Chapter 4, Section 4.9 of this Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that local residents may get some portion of their food from a home garden.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 DE -- the DEIS Summary indicate the DOE is not, in fact,
2 using a suburban residential risk-based cleanup levels
3 from the SRAM but has left out the major required
4 exposure pathways and in the end using values that are a
5 thousand -- sorry -- that are a thousand times higher
6 than the standard suburban residential goals. In other
7 words, the levels of the contaminants DOE proposes to
8 leave are higher -- a thousand times higher than would
9 be the case were they to use a correct suburban
10 residential risk-based screen levels.

11 They only consider -- sorry -- they only
12 conservative -- consider the trivial portion of that
13 risk, gainsly -- gainful underhand and leaving out the
14 required main risk they are taking, and how it won't
15 work to me, and I'm throwing it in your back yard, and
16 where the contaminate gets into their body and stays
17 there for a long, long time, damaging genetic material
18 of cells and producing cancers.

19 To show how false DOE claims I've noticed are,
20 one need really look at the detailed risk assessments
21 prepared by Boeing for contaminated portions of Area
22 III, which is about DOE's Area IV. One facility which
23 actually lies in part of the area, the end part in Area
24 IV is assimilated by Boeing to produce three times 10ths
25 of a million with one access cancer risk, in other

927-2
cont'd

927-3 927-3

The risks calculated by Boeing for Area III that resulted in high rates of cancer incidence were for the garden pathway for the Suburban Resident. As indicated in the Draft EIS and the SRAM (MWH 2014), the conservative treatment of the calculation of the risks (including the treatment of uncertainties) from the indirect pathway result in high risk values for this pathway. A garden pathway was not used in the RBSLs for the EIS, as residential development with garden is not a future land use for the SSFL property. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 words, three out of ten people would get cancer from the
 2 -- from the contamination.

3 Another area nearby has an astonishing 9.6
 4 10ths, 10 to the negative one, which is about 96 out of
 5 a hundred people will get cancer from the contamination.
 6 That is a million times higher than the risk -- sorry --
 7 that is a million times higher risk than the nonsense
 8 risk assessment DOE is putting forth. Even after
 9 cleaning up to the same standards DOE is now proposing,
 10 which violates the AOC, Boeing estimates would remain
 11 3,000 times higher than the -- than the one-in-a-million
 12 risk level that DOE claims, and that is far outside of
 13 the EPA/DTSC acceptable risk frame.

14 (Clock timer ringing)

15 MS. LOWE: Thank you, Mr. Rincon.

16 MR. RINCON: Thank you.

17 MS. LOWE: Did I pronounce that right? Rincon?

18 MR. RINCON: Rincon.

19 MS. LOWE: Okay. Thank you. Okay. Leanna Brand
 20 will be followed by Stephanie McIntyre, and then I will
 21 recall Martha Waite.

22 MS. BRAND: I don't have much to say except for my
 23 name is Leanna Brand, and I live here in Simi Valley for
 24 the last 20 years, and the political climate right now
 25 is making me very afraid that things are not going to

927-3

easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. The use of RBSLs that do not include the indirect garden pathway is appropriate for this future land use.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 get done.

2 I am for as much cleanup as they have agreed

3 to do in the most severe sense. And I don't really care

4 if you have to rebuild the roads to do it. I think you

5 should do it.

6 So, I'm concerned because of the regulations,

7 the Executive in Need of Scrutiny Act, which has just

8 been passed by Congress, and our Simi Valley

9 congressman, who was a co-sponsor to the bill and who

10 took campaign contributions from Boeing, I'm very

11 concerned that things are going to be let to go. If the

12 regulations, the Need of Scrutiny Act, passes the senate

13 and it's signed by the -- by the president, what it

14 means is any regulations that were set forth for

15 something this large, if they sit on congress's desk for

16 70 days without their looking at it, those regulations

17 become null and void. So, I think we should be very,

18 very concerned about this happening and this happening

19 right away.

20 Thank you very much.

21 MS. LOWE: Thank you. Stephanie McIntyre, and then

22 Martha Waite, and then I will recall Yvonne Brockwell.

23 MS. MCINTYRE: Hi. I'm Stephanie McIntyre. I'm a

24 resident of Simi Valley just for a year and a half.

25 But I was 10 years old and living in Canoga

- 928-1 928-1 DOE acknowledges your concern about a severe cleanup of the site. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.
- Please also refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of the transportation topic and DOE's response.
- 928-2 928-2 Thank you for your comment. Because the comment/statement is not on the scope or content of this EIS, no response is provided. It has been included in the Administrative Record for the EIS.
- 929-1 929-1 Thank you for your comment. It has been included in the Administrative Record for the EIS.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 Park when the nuclear meltdown occurred. I have
 2 relapsing-remitting multiple sclerosis. My best friend
 3 from that time period, who also played in the dirt and
 4 the gutters and everything with me, has lupas. There
 5 were numerous people who have since died of cancers,
 6 various kinds, lupas ones or brain cancers, from the
 7 same neighborhood.

8 The cleanup is not optional. The idea that
 9 it's not contaminating the groundwater or not spreading
 10 through the rest of our neighborhoods, I won't grow food
 11 in my ground here. I did when I lived far enough away
 12 near Burbank have a beautiful vegetable garden that I'm
 13 afraid to grow in Simi Valley. I have some container
 14 plants that don't come near what I used to enjoy
 15 picking.

16 But, this is not a joke, and it's -- it's
 17 impacting everyone in this valley and much of the San
 18 Fernando Valley, and I really want to see the cleanup
 19 happen. And, I really appreciate the people who came
 20 with all the specific data.

21 Thank you very much. Thank you.

22 MS. LOWE: Thank you. Martha Waite. Has Martha
 23 left? Yvonne Brockwell. Yvonne will be followed by a
 24 recall for a Brant Armbruster.

25 MS. BROCKWELL: Hi. Good afternoon. My name is

929-1
cont'd

929-2
929-3

929-2
cont'd

929-2 DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing this EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

929-3 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 Yvonne Brockwell. I'm a resident of Thousand Oaks,
2 lived nearby in 1975 and played in the streams all of my
3 life and continue to play in the streams, as I
4 participate in the Assistance Science Program doing
5 streamline samplings in Malibu Creek water shed for the
6 past five years.

7 First of all, I'd like to say thank you to all
8 the watchdogs and activists in the room, and I look
9 forward to joining you in March and learning more.

10 I didn't even intend to speak today. I have a
11 vocal cord injury from surgeries to remove my thyroid
12 due to thyroid cancer. But after hearing from the woman
13 with the Historical Society, I composed this poem that I
14 wrote after attending a session a couple of years ago
15 that it was learned by the Ventura County epidemeologist
16 while we were reviewing the State of California Breast
17 Cancer Cluster Maps, so I hope you can -- maybe it gets
18 to you very quickly:

19 Cancer Forester. Affluent or effluent,
20 there's nothing in the room. Overlay some maps, you'll
21 see how we brought our doom. A great big tear of cancer
22 drops from every single seam. Where our weapons were
23 engineered and falsified with schemes of a race to
24 space, where manmade gods held the sons and crossed
25 the project with pride. We all cashed in, now, didn't

930-1

930-1 Thank you for your comment. It has been included in the Administrative Record for the EIS.

Section 3 - Public Comments and DOE Responses

3-1557

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 we, all innocence cast aside. What were we protecting
 2 when we lined our streams with filth, radionuclides,
 3 perchlorates, defy all the mother's milk. It's murder
 4 on the right, death be left the left, disease-me-unders.
 5 It doesn't take science. And there's no comfort in the
 6 birthing breast. We need this bed and we lie in it,
 7 every follicle and screening. Let her into your life
 8 and the pail is a dream. Who holds her head and her
 9 expensive wig as she vomits in. This toilet that we
 10 made of life now comes crashing in. Welcome to the
 11 backdoor payment floor.

12 Thank you.

13 MS. LOWE: Okay. Brant Armbruster. Alex Kim.
 14 Call Martha Waite one more time. Brant Armbruster.
 15 Alex Kim. Greg Williams, there is no more names in
 16 front of you.

17 MR. WILLIAMS: Well, I'll do it right quick.

18 MS. LOWE: I'm sorry?

19 MR. WILLIAMS: Well, my name is Greg Williams, and
 20 I had no intention of speaking here today. I just came
 21 here. I didn't want to be denied the opportunity to
 22 speak.

23 I think that it's wrong that we find ourselves
 24 in this position today. Rocketdyne had received federal
 25 moneys to, you know, do great things for our nation, and

930-1
cont'd

Response side of this page intentionally left blank.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 it seems that the DOE has got -- is using government
2 money. I think that -- that the DOE should be
3 responsible to clean up their mess here in our cities
4 locally. I think it's wrong for them to try to, you
5 know, deny a hundred percent cleanup or their
6 contractual obligations to the parties due to them in
7 2010. Our -- our communities have been torn apart by
8 lots and lots of various cancers and clusters that's
9 been enumerated here today.

10 I think that we should -- it's just deplorable
11 to think that Donald Trump is going to try to, you know,
12 eliminate -- he's got some kind of a crony in there
13 that's going to try to eliminate the EPA and diminish
14 the effect that -- the federal responsibility for these
15 cleanups. It's -- it's criminal. And, you know, we, as
16 people in Simi Valley and other communities around the
17 Valley, should, you know, rally around this and rise up,
18 and, you know, force the government to own up to their
19 own errors and clean up this mess for everyone's sake.

20 Thank you.

21 MS. UNIDENTIFIED: Very good.

22 MS. LOWE: Thank you. I have no more names on the
23 list. This hearing was scheduled to go until noon. We
24 will take a recess until someone else signs up. I will
25 close the meeting at noon if no one else has registered

931-1

931-1 DOE acknowledges your concern about a 100 percent cleanup of the site in accordance with the 2010 AOC. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

931-2

931-2 DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

931-3

931-3 Thank you for your comment. Because the comment/statement is not on the scope or content of this EIS, no response is provided. It has been included in the Administrative Record for the EIS.

Comments from the Simi Valley, California Public Hearing (February 18, 2017)

1 to speak.

2 (Recess Taken)

3 MS. LOWE: Let me have your attention, please. I'm

4 going to call the three people that I called already

5 that have not come taken the opportunity. Martha Waite.

6 Brant Armbruster. Alex Kim. Okay.

7 On behalf of the U.S. Department of Energy,

8 I'd like to thank you very much for your time and

9 attention today. Let the record reflect that it is now

10 11:58 a.m. All registered speakers have been called

11 upon to speak. The project team looks forward to

12 working with you throughout the process. We will now

13 adjourn this meeting.

14 Thank you so much for coming today.

15 (Whereupon, the Public Hearing adjourned

16 at 11:58 a.m.)

REPORTER'S CERTIFICATION

I, PHILLIP DEAN ORR, C.S.R. No. 7656, Certified
Shorthand Reporter, certify:

That the foregoing proceedings were taken
before me at the time and place therein set forth,
at which time the witness was put under oath by me;

That the testimony of the witness and all
objections made at the time of the examination were
recorded stenographically by me and were thereafter
transcribed;

That the foregoing is a true and correct transcript
of my shorthand notes so taken.

I further certify that I am not a relative or
employee of any attorney or of any of the parties, nor
financially interested in the action.

I declare under the penalty of perjury under
the laws of the State of California that the
foregoing is true and correct.

Dated this 22nd day of February, 2017.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 * * * * *

2 THE REPORTER: Go ahead. We're on the record.

3 MS. McFADDEN: Hi. My name is Rita McFadden.

4 We've lived in the Knolls area of Simi Valley for about

5 12 years, and I have a son who just turned 18, and he

6 was diagnosed with T-cell ALL cancer on August 23rd this

7 year and -- last year -- sorry -- 2016, and he is

8 struggling for his life right now, going through

9 chemotherapy. Today, we found out that he's going to

10 have radiation therapy in the next month. We're all

11 scared. He's had setbacks. We found out when we

12 checked him into the emergency room when he was -- the

13 day that he was set to get treatment, that a lot of kids

14 in Simi Valley were diagnosed with cancer because of the

15 meltdown and because of the toxins that were still --

16 that were never cleaned up from the site -- the field

17 site. It scares me to think that that's still going on,

18 that so many other families are going to have to endure

19 all that we've had to endure in seeing our son spend his

20 senior year of high school in the hospital hooked up

21 to -- and hooked up to chemo poisons, having blood

22 transfusions, platelet transfusions. It's been six

23 months of hell for him and our family. So, I hope they

24 clean it up.

25 THE REPORTER: Is that all you want to say, ma'am?

1000-1

1000-1 DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ.

1000-2

1000-2 DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing this EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 MS. McFADDEN: Yeah, that's it. Want to say
2 anything?
3 MR. McFADDEN: No.
4 (Whereupon, at 6:08 p.m., Ms. McFadden's
5 comment concluded, and there were no other comments in
6 the Open House.)
7 * * * * *
8 (Whereupon, at 6:31 p.m., the following Public
9 Hearing was held:)
10 MS. LOWE: Thank you so much for coming tonight.
11 My name is Wendy Lowe, and I'd like to welcome you to
12 this public hearing, which is being hosted by the U.S.
13 Department of Energy. DOE has prepared a Draft
14 Environmental Impact Statement, or EIS, to evaluate the
15 potential environmental impacts associated with cleanup
16 of Area IV and the Northern Buffer Zone at the Santa
17 Susana Field Laboratory. The goal of this public
18 hearing is to provide you, as members of the public,
19 with an opportunity to provide your comments on the
20 draft document for consideration by the Department of
21 Energy as the Department finalizes the Environmental
22 Impact Statement.
23 This public hearing is being held on Tuesday,
24 February 21, 2017 in the Gulfstream Ballroom of the
25 Airtel Plaza Hotel, located at 72777 Valjean Avenue in

Response side of this page intentionally left blank.

3-1565

Section 3 - Public Comments and DOE Responses

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 Van Nuys, California. The time is now 6:31 p.m.
 2 I would like to point out a few housekeeping
 3 items before we get started. The restrooms are located
 4 through these doors, take a left, and as you walk
 5 towards the door to go outside, they're on your right.
 6 There's water available back here at the -- right at the
 7 edge of where the chairs are. The exits in the event of
 8 an emergency are located over here, go out, go either
 9 direction to get out of the buildings. And I also want
 10 to let you know that, although you took a ticket when
 11 you got into the parking lot, the arms will be up
 12 starting at 7:00 o'clock, so there will be no charge for
 13 parking. Feel free to leave this hearing at any time,
 14 but we request that you do so in a way that minimizes
 15 distraction. Please silence your mobile phones and
 16 refrain from any conversations in this room. Even back
 17 in the open-house area, folks, please keep your
 18 conversations to a minimum. (Indicating)
 19 Before we begin, I would like to introduce John
 20 Jones and Stephe Jennings from the U.S. Department of
 21 Energy. They will provide an overview presentation
 22 about the Draft EIS. Copies of the slides that John and
 23 Stephe will use for their presentation will be
 24 available on line after Tuesday. Hard copies are also
 25 available on the table immediately in coming into the

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 room to the right, so if you want hard copies of the
2 slides, that's where you can get them. After they're
3 presentation, I will review the ground rules for this
4 hearing and begin taking your comments.

5 John Jones has been the director of the U.S.
6 Department of Energy's Energy Technology Engineering
7 Center since 2011 and he has the overall responsibility
8 for completing the remediation at the site.

9 MR. JONES: Thank you, Wendy, and good evening. My
10 name is John Jones, and as Wendy stated, I am the
11 director of the Energy Technology Engineering Center or
12 ETEC. On behalf of DOE, we would like to welcome you to
13 this public hearing. As Wendy mentioned, our purpose is
14 to gather your input to the Department's recently
15 released Draft Environmental Impact Statement for Area
16 IV and the Northern Buffer Zone of the Santa Susana
17 Field Lab. We will give you more background about the
18 Draft EIS and a brief history of operations at the site
19 in a moment.

20 I would like to first introduce my colleague
21 Stephie Jennings, who is the deputy director at our site
22 and will serve as the official hearing officer for this
23 evening's hearing. In addition, I would like to thank
24 the officers from the L.A. Police Department. Thank you
25 for attending today's meeting. They are here to ensure

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 that everyone feels comfortable and safe to provide your
 2 comments.

3 A little history on the site. After World War II
 4 the U.S. was interested in developing peaceful purposes
 5 for atomic energy. In 1953, the government approved a
 6 nuclear research and development center in Area IV of
 7 the Santa Susana Field Lab that would eventually be
 8 known as ETEC. During its operation years, the center
 9 housed and tested a number of small research reactors.
 10 Researchers also explored best practices in nuclear
 11 waste management and the use of liquid metals as a
 12 coolant for nuclear energy.

13 The research at this site was critical in
 14 developing our modern nuclear energy program that today
 15 helps power everything from our space program to
 16 electricity generation from the commercial nuclear
 17 reactors. This research resulted in localized releases
 18 of chemicals and radionuclides to the soil, bedrock and
 19 groundwater. The Draft EIS lays out a range of
 20 alternatives to address the contamination that remains
 21 in Area IV and the Northern Buffer Zone.

22 I want to speak with you briefly about our
 23 path so far. In 2003, DOE released an Environmental
 24 Assessment for Area IV and the Northern Buffer Zone
 25 following an internal review of remediation needs at the

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 site. After a court challenge to this assessment, in
2 2007 a federal judge ordered DOE to complete an
3 Environmental Impact Statement per the National
4 Environmental Policy Act, NEPA. This order enjoined DOE
5 from relinquishing control over any portion of Area IV
6 until DOE had completed an Environmental Impact
7 Statement and issued a Record of Decision as required by
8 NEPA. Based on that finding, the court chose not to
9 address the plaintiff's claims related to the
10 Comprehensive Environmental Response, Compensation, and
11 Liability Act, CERCLA, and the Endangered Species Act,
12 ESA. As a result of this order, DOE began the EIS,
13 including extensive research, planning and public
14 involvement. DOE initiated a significant
15 characterization effort with multiple agencies,
16 including California Department of Toxic Substances
17 Control, or DTSC, and universities as well. DOE
18 provided \$41.5 million in funding to the Environmental
19 Protection Agency to perform a thorough radiological
20 study of the site. The EPA concluded this was one of
21 the most comprehensive technical evaluation studies of
22 low-level radiological contamination the agency had ever
23 conducted. This study, along with the chemical soil
24 studies performed by DOE with DTSC oversight, included
25 more than 10,000 samples, as well as installation of

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 additional groundwater sampling wells and analysis of
 2 groundwater sampling results. The Draft EIS is the
 3 culmination of careful study by environmental and
 4 technical experts.

5 Throughout this process, DOE has made a significant
 6 effort to be transparent and involve many partners,
 7 including the community, in the important studies that
 8 were completed. Community involvement programs have
 9 included a work shop about the accident that occurred in
 10 1959 at the Sodium Reactor Experiment, Groundwater
 11 University workshops, the Soil Treatability
 12 Investigation Group, and the Community Workshops to
 13 Develop Alternatives.

14 I would like now to ask Stephe Jennings, the
 15 hearing officer for this meeting, to discuss the NEPA
 16 involvement process, and provide more information about
 17 the Draft EIS. Stephe.

18 MS. JENNINGS: Thanks, John, and good evening
 19 everyone. The National Environmental Policy Act, often
 20 called NEPA, is a law that designates a process that
 21 federal agencies must follow to consider the
 22 environmental effects of a project. In our case, the
 23 project involves remediation of Area IV and the Northern
 24 Buffer Zone. Under NEPA, federal agencies are required
 25 to assess and disclose environmental effects of a range

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 of reasonable alternatives and present them to the
2 public in a Draft Environmental Impact Statement. The
3 analysis of alternatives in the Draft EIS is at the
4 heart of the federal environmental review process,
5 enabling the public to better understand the complexity
6 and trade-offs that will be involved in cleaning up the
7 site.

8 The process began with a Notice of Intent to
9 Prepare the EIS followed by an initial scoping period --
10 scoping and comment period. Since that time, DOE has
11 extensively studied and analyzed the site, resulting in
12 the Draft EIS, which was published on January 13, 2017.
13 There will be a 60-day public comment period, which will
14 end on March 14, 2017. At the end of the public comment
15 period, DOE will review all public comments, make
16 changes as appropriate, and publish a Final
17 Environmental Impact Statement. Following the Final
18 EIS, DOE will issue a Record of Decision for cleanup of
19 the site.

20 The Draft EIS analyzes the environmental
21 impacts of the Administrative Order on Consent or AOC
22 agreement and other alternatives that consider risk to
23 human health, and the protection of natural resources to
24 determine cleanup levels. This approach is consistent
25 with cleanup actions at other DOE sites and is in

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 compliance with federal law. The comparative analysis
 2 of these alternatives allows stakeholders to understand
 3 the balance and trade-offs associated with the various
 4 options for site cleanup.

5 DOE remains committed to a site cleanup that
 6 is protective of the public and the environment. The
 7 Purpose and Need Statement you see on the screen here is
 8 also in the Draft EIS and represents a summary of why
 9 we're undertaking this process. In the Draft EIS, Area
 10 IV references the traditional area of operations and the
 11 Northern Buffer Zone, which includes 182 acres
 12 immediately adjacent to Area IV.

13 As I made mention, NEPA states that we must
 14 examine a range of reasonable alternative approaches to
 15 remediating the site. In developing this range, we
 16 considered input we received at public scoping meetings
 17 and concepts developed by participants in the community
 18 developed alternative workshops. As required by NEPA,
 19 each alternative was considered thoroughly and potential
 20 environmental impacts from each alternative were
 21 analyzed.

22 I want to briefly explore the alternatives in
 23 the Draft Environmental Impact Statement, starting with
 24 the soil remediation alternatives. You will note on
 25 this summary slide that there are four alternatives,

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 beginning with the No Action, which is required as a
2 baseline.

3 Beginning on the right, you'll see first an
4 alternative we labeled "Cleanup to AOC Look-Up Table
5 Values," which adheres to the levels in the agreement
6 signed in 2010 by DOE. Under this alternative, DOE
7 would remediate soil in Area IV and the Northern Buffer
8 Zone to meet the chemical and radionuclide clean-up
9 look-up table values established in accordance with the
10 2010 AOC. DOE would start at one side of the site and
11 proceed across Area IV and the Northern Buffer Zone,
12 removing soil at any location that exceeds a look-up
13 table value. An estimated 933,000 cubic yards of soil
14 would be removed from the site, assuming that the
15 proposed cultural and biological exemptions are approved
16 by US Fish and Wildlife Service, California Department
17 of Fish and Wildlife, the State Historic Preservation
18 Office, and ultimately, DTSC. The planning estimate for
19 soil removal and backfill is approximately 115,000 truck
20 trips over at least a 10-year period.

21 Second is the Cleanup to Revised Look-Up Table
22 Values. Under this alternative, a revised set of look-
23 up table values would be established for chemicals.
24 Cleanup levels for radionuclides would remain the same
25 as those under the Cleanup to AOC Look-Up Table Values

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 alternative. This Revised Look-Up Table would evaluate
 2 a reduced list of chemicals. These are chemicals
 3 believed to cause a concern for human health at the site
 4 based on the extensive site studies John mentioned
 5 previously. If the soil in a particular area exceeded
 6 the Revised Look-Up Table Value for any chemical or the
 7 AOC -- AOC Look-Up Table Value for a radionuclide, the
 8 soil would be removed. Approximately 192,000 cubic
 9 yards of soil would be removed under this alternative.
 10 The planning estimate for soil removal and backfill is
 11 approximately 23,800 truck trips over a two and a half
 12 year period. Like the AOC alternative, biological and
 13 cultural resources would be protected, while also
 14 protecting the public and the environment.

15 Third is the Conservation of Natural
 16 Resources. This approaches cleanup using a risk-based
 17 analysis which is consistent with DOE cleanup sites, as
 18 well as Superfund cleanup sites across the country. DOE
 19 would clean up soil to a level that would protect human
 20 health by removing soil with concentrations of chemicals
 21 or radionuclide that exceed criteria established using a
 22 risk assessment process. Concentrations of
 23 contamination would be averaged over a defined risk
 24 assessment unit in accordance with standard practice for
 25 cleanups across the country. This alternative would

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 reduce risk to the public and the environment, yet
2 conserve natural resources by disturbing less land than
3 the other alternatives, thereby reducing the potential
4 of impacting visual, biological, cultural, and water
5 resources. An estimated 148,000 cubic yards of soil
6 would be removed from the site within a two-year time
7 frame. The planning estimate for soil removal and
8 backfill is approximately 18,400 truck loads. Like the
9 first two alternatives, biological and cultural
10 resources would be protected, while also protecting the
11 public and the environment.

12 I would like to talk in more detail about the
13 difference between alternatives in terms of soil volumes
14 proposed for removal. As I mentioned on the last slide,
15 the Conservation of Natural Resources alternative
16 approaches cleanup using a risk-based analysis. A
17 document called the "Standardized Risk Assessment
18 Methodology" was approved by DTSC to serve as the
19 technical basis for conducting human health and
20 ecological risk assessments for cleanup on other
21 contaminated land at the Santa Susana Field Laboratory.
22 This methodology establishes a cleanup threshold for
23 cancer causing chemicals based on ensuring that
24 remaining contaminant concentrations result in less than
25 one additional cancer case per 1,000,000 people. It

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 also establishes a cleanup for non-cancer causing
 2 chemicals based on a level that is considered non-toxic.
 3 More information on this can be found in Appendix J of
 4 the Draft Environmental Impact Statement.

5 Under the Administrative Order on Consent
 6 Cleanup, soil represented by all colors of trucks as
 7 depicted on this slide would be removed. The Draft
 8 Environmental Impact Statement uses the most currently
 9 approved version of the Standardized Risk Assessment
 10 Methodology to assess the soil conditions on the
 11 DOE-controlled portion of the property. The -- this
 12 partial red truck represents the soil that exceeds AOC
 13 Look-Up Table Values for radionuclides only. The yellow
 14 or orange trucks represent soil that would be removed
 15 because chemicals exceed a risk threshold using the
 16 methodology described in the Standardized Risk
 17 Assessment Methodology. As you can see, these soils are
 18 removed under all three action alternatives. This
 19 removal would reduce the risk to human health from any
 20 remaining soil contamination to less than one cancer
 21 incident per 1,000,000 people. It also ensures that
 22 remaining chemicals were not toxic in accordance to the
 23 methodology.

24 The blue trucks represent the volume of soil
 25 that would be removed using the revised look-up table

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 values for chemicals as described in the previous slide
2 in the Administrative Order on Consent look-up table
3 values for radionuclides. The green trucks represent
4 741,000 cubic yards of soil that would be removed
5 because they exceed the Administrative Order on Consent
6 look-up table values for chemicals alone.

7 The largest reduction in risk to a future
8 on-site user comes from the removal of the soil
9 represented the by the red and yellow/orange trucks.
10 There would be an additional reduction in risk from
11 removal of the soil represented by the blue trucks.
12 There is a much smaller .3 percent reduction in risk
13 from removal of the soil represented by the green
14 trucks. All of these soil removals have potential
15 associated impacts relative to dust and vehicle
16 emissions, truck traffic, road deterioration, vehicle
17 accidents, fatalities and worker injury, as well as
18 potential impacts to cultural and ecological resources
19 that increase proportionately to the amount of soil
20 removed.

21 For a more detailed discussion of this
22 information, you can refer to Chapter 4 and Appendix J
23 of the Draft EIS.

24 This slide shows the alternatives for
25 groundwater remediation. Through extensive

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 characterization, we are confident that groundwater
 2 contamination remains on site for DOE's responsibility.
 3 However, we know that it is important to develop a plan
 4 to address groundwater contamination. The Draft EIS
 5 analyzes a no action alternative, as required. It also
 6 analyzes active treatment technologies and monitored
 7 natural attenuation, which means natural processes that
 8 decay and degrade materials over time.

9 Finally, this slide outlines the building
 10 remediation options. As we mentioned earlier, only 18
 11 buildings remain on the site. The Draft EIS proposes
 12 only two alternatives relative to these buildings: a
 13 baseline no action alternative, similar to what we've
 14 described above, or complete removal of the remaining
 15 structures.

16 Collectively, the Draft EIS analyzes the
 17 environmental and community impact of remediation
 18 options including preservation of historical and
 19 cultural resources, wildlife conservation, impact on
 20 roads and local communities, and length of cleanup,
 21 among many other factors. Every DOE EIS must consider
 22 the resource areas listed on this slide. As with any
 23 project of this size, there are complex factors that go
 24 into the decision-making process. The final decision
 25 will have to balance many factors.

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 With that overview of the Draft EIS, I want to
2 briefly recap next steps. The 60-day public comment
3 period started on January 13th, which means interested
4 parties have until March 14 to provide comments. This
5 can be done at this hearing tonight or on our website,
6 www.SSFLAreaIVEIS.com. Public input is an important
7 part of shaping the Final EIS and eventually the path
8 forward.

9 Once the Final EIS is complete, DOE will
10 publicly release all of the comments that were received
11 and our responses to those comments. We also will
12 publish a notice of the EIS's completion in the Federal
13 Register. The final step will be to publish a Record of
14 Decision no sooner than 30 days after the Final EIS is
15 made publicly available. With that, I would like to
16 turn the microphone back over to Wendy so we can hear
17 your comments. Thank you.

18 MS. LOWE: Thank you, John and Stephe. As the
19 moderator, it's my job to make sure that this meeting is
20 conducted in a respectful manner and that as many people
21 as possible have a fair opportunity to provide oral
22 comments.

23 Please understand that DOE will not be
24 responding directly to any comments during the rest of
25 this meeting; however, your comments will be considered

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 in the finalization of the Environmental Impact
 2 Statement. All comments will be given equal
 3 consideration, regardless of whether they are submitted
 4 orally or in writing.

5 Some of you may have had the opportunity to
 6 attend the open house which was in the back of the room
 7 and started at 6:00 p.m. this evening. If you did not
 8 do that, please be aware that the information that was
 9 provided will also be posted on the EIS website, and
 10 there are hand-out copies of all of the posters in the
 11 back of the room. They'll be available until this
 12 meeting ends tonight. If you did attend the open house,
 13 it's important for you to understand that any
 14 conversations that you had in the open house area were
 15 not recorded and will not be included as formal comments
 16 unless you spoke with the court reporter. I believe
 17 there was one person that talked to the court reporter.
 18 All your comments were not recorded. If you said
 19 something in the open house that you want DOE to
 20 consider while finalizing the Environmental Impact
 21 Statement, please restate your thoughts either from the
 22 podium tonight or in writing.

23 I'd like to emphasize that oral comments from
 24 the podium is only one way that you can provide comments
 25 during the public comment period. If you have prepared

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 written comments that you would like to submit for the
2 record, you are welcome to leave those with us tonight.
3 There is also a public comment form that looks like
4 this. It's available at the back of the room at a
5 public comment area. So, if you would like to fill that
6 out and leave it, that's fine. You can either leave it
7 on the comment tables or at the registration table.

8 Let's see. The information on how to submit
9 written comments after tonight's meeting is available.
10 It's on a handout. It's a "Making your voices heard"
11 how-to comment. If you pick that up, it's got all the
12 information that you need for submitting a comment later
13 after tonight.

14 All comments that are received during the
15 public comment period, which will end on March 14th,
16 2017, will be given equal consideration. And all
17 comments that are received during the public comment
18 period will be included in the Final Environmental
19 Impact Statement. If you are not already on the mailing
20 list, you can sign up for that mailing list at the
21 registration table. And everyone that's on the mailing
22 list will be notified when the Final Environmental
23 Impact Statement is published.

24 If you are interested in providing comments
25 tonight, you must sign up to do so at the registration

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 table, and there's a card that looks like this, and
 2 there's a little box at the bottom you can check if
 3 you're interested in providing comments. So, if you
 4 haven't signed up yet, you're welcome to go back to the
 5 registration table and sign up to speak.

6 Phillip Orr, up here in the front of the room,
 7 is our court reporter this evening, and it's Mr. Orr's
 8 job to provide a complete and accurate transcription of
 9 this hearing. I've asked him to let know if he is
 10 having trouble hearing or understanding you.

11 I would point out that there maybe people
 12 recording this meeting. Because it's a public meeting,
 13 we are not able to prevent that. We did want you to
 14 know that the only recording the DOE is making is the
 15 transcription that is being prepared by the court
 16 reporter.

17 Now I will go over the ground rules for this
 18 meeting:

19 To allow sufficient time for everyone to
 20 speak, oral comments will be limited to three minutes
 21 per speaker. All comments will be provided by
 22 individuals and no one will be allowed to share their
 23 time with other people. Each person will be allowed to
 24 speak only once.

25 We recognize that three minutes is a brief

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 amount of time, and we strongly encourage people to
2 provide more detailed comments in writing to ensure that
3 all of your thoughts, concerns, and suggestions can be
4 fully captured in the record.

5 I will hold up signs to let you know how
6 you're doing on your time. I have a 30-second warning
7 and then I have a "Stop." So, I'll hold these up to
8 give you an indication on how you're doing on time. If
9 you're speaking after your three minutes or if you're
10 still speaking after your three minutes are up, I will
11 ask you to conclude your remarks and then I will call
12 the next speaker to begin. Please understand that if I
13 do have to cut you off, it's only because it's my job to
14 make sure that everyone who wants to speak tonight has
15 a fair opportunity to do so.

16 I did want to let you know that we have a
17 couple of children that are going to be making comments
18 tonight, and I'm going to call them first. Otherwise,
19 I'll be calling on people in the same order in which
20 they signed up. We are scheduled. The announced time
21 of this meeting to end was 9:00 o'clock. We presently
22 have -- it depends how, you know, people go. But right
23 now we're scheduled to run out of time about 9:00. We
24 have confirmed that the DOE officials are willing to
25 stay late, so if we have additional people that still

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 want to speak after 9:00 o'clock, we will go long, but
 2 we will conclude as soon as we call everyone that wants
 3 to speak once. I'm also going to take a break at 8:00
 4 o'clock to allow the front of the room to run to the
 5 restroom.

6 So, I'll be calling several people at a time
 7 to let you know when your turn is coming up. We have
 8 just one microphone tonight. It's in the middle of the
 9 room. So, when you know your turn is coming up, you
 10 might start making your way towards the microphone so
 11 that we can keep moving along efficiently.

12 When I call your name, please step forward to
 13 the microphone and speak clearly and directly into the
 14 microphone. Begin by stating your name and the name of
 15 any organization that you might be representing in an
 16 official capacity tonight. Your three minutes will
 17 begin at that point.

18 One final request that I would like to make of
 19 you tonight: I know some of you have strong opinions
 20 about the cleanup program at Santa Susana Field
 21 Laboratory. The point of a public comment meeting is to
 22 give each of you an opportunity to provide your comments
 23 to the Department of Energy about the Draft
 24 Environmental Impact Statement.

25 We're grateful to you for taking the time out

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 of your busy schedules to attend this public meeting and
2 for your ongoing interest in the cleanup at Santa Susana
3 Field Laboratory.

4 Regardless of your position, I will would be
5 grateful for your help in making sure that everyone who
6 speaks tonight is treated with respect, as I know you
7 will appreciate when it is your turn to speak.

8 Profanity and shouting will not be tolerated.
9 Interruptions and outbursts will slow things down, and I
10 will control the hearing process to make certain that
11 everyone who wants to provide comments is able to share
12 their comments in a respectful setting. Obviously, any
13 interruptions slow the process and will limit the number
14 of people that will be allowed to speak.

15 So, with that, we will begin taking comments.

16 MS. UNIDENTIFIED: Question. Excuse me. I have a
17 question. What about people who have difficulty getting
18 up to speak into the mic? Is there a way for someone to
19 bring the mic to them?

20 MS. LOWE: We prefer that they make their way to
21 the mic. Mike can take -- can we take it out of the
22 stand? Can that be done? We'll -- we'll work with you.
23 Okay. We'll make it work. Okay?

24 Okay. So, Melissa Bumstead and Grace Bumstead
25 are going to go first, and they will be followed by Ryan

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 Compton and Maggie Compton.
 2 MS. BUMSTEAD: Hi. My name is Melissa Bumstead. I
 3 live in West Hills. My daughter was diagnosed with a
 4 rare form of leukemia in 2014. These are my children.
 5 I brought a map tonight -- I brought a map tonight of
 6 all the pediatric cancer cases that I personally know
 7 of, because the California Cancer Registration does not
 8 police statistics about pediatric cancer care; however,
 9 I'm well aware that this map cannot definitively prove
 10 that we have a pediatric cancer cluster. I'm more than
 11 aware that this map can't give me the answer that I'm
 12 looking for to know if our environment is safe.
 13 (Indicating)
 14 THE REPORTER: Higher.
 15 MS. LOWE: Please slow down just a bit for the
 16 court reporter.
 17 MS. BUMSTEAD: Sorry.
 18 THE REPORTER: Go ahead.
 19 MS. BUMSTEAD: We'll do. So what this map does
 20 show me, is that we need more answers before we assume
 21 that the Santa Susana Field Lab is safe. Children's
 22 bodies are much more sensitive and they react
 23 differently to substances and chemicals than adults.
 24 Their bodies are different, and that's why the studies
 25 done on adult cancers around the site are not

1001-1

1001-1

DOE acknowledges your concerns and refers you to Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD regarding your concern about a complete cleanup. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Also please see, Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. One of these studies, by the University of Southern California Cancer Surveillance Program, reviewed the incidence of retinoblastoma in children in Los Angeles and Ventura Counties (CSP 2007). The study authors concluded that the incidence of retinoblastoma among children under age 5 residing in the area around SSFL between 1988 and 2005 was slightly, although statistically not significantly, higher than expected based on incidence statewide. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

1001-1
cont'd

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 sufficient. To date, there's not been a study of
2 childhood cancer in our community. My map shows that
3 over 35 children who live within 20 miles of the site
4 who have been diagnosed within the last five years.
5 There are 14 children diagnosed before 2010. Just
6 today, I was alerted to four more children in our area
7 with cancer, and I feel strongly there are more,
8 especially with the Spanish speaking population. Many
9 of the cancers on the map are extremely rare, less than
10 one in a million in my daughter's case. I wish more
11 studies on children had been done before the DOE
12 responds to the discussion, but without that knowledge
13 at hand, I ask that the Department of Energy to fill
14 its promise to a complete cleanup so that parents like
15 myself won't need to worry that we're inadvertently
16 exposing our children to toxins and radiation. I'm
17 afraid that the Santa Susana Field Lab is responsible
18 for our children's cancer, and I cannot bear to attend
19 another child's funeral. Please keep your promises.
20 Please clean up 100 percent of the Santa Susana Field
21 Lab.
22 Thank you.
23 MS. LOWE: Thank you, Ms. Bumstead. And this is
24 Grace? Hi, Grace.
25 GRACE BUMSTEAD: Sit right there. There. My name

1001-1
cont'd

1001-2

1001-2 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Section 2.2, specifically addresses cleanup in accordance with the 2010 AOC.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 is -- my name is Grace. I live -- I live in West Hills.
 2 I am seven years old. Okay. I have cancer. I want to
 3 help our city get all that we need by getting rid of all
 4 the chemicals and the nuclear waste because we don't
 5 won't to have to do this again. I don't want to live
 6 close to chemicals in the mountain -- mountains. I want
 7 to be as safe as anyone that is safe. I want to help
 8 other people to be safe. I don't want to get cancer
 9 again because cancer was very -- a very scary thing when
 10 I was in the -- the hospital, and I was -- had to get GI
 11 tubes and pokes, and 10 times or more than that, and it
 12 wasn't very fun. And you don't want cancer either. So
 13 we want to get all the load that we can get. Please
 14 clean up this chemicals in the mountains.

15 MS. LOWE: Thank you, Grace, very much. Okay.
 16 Ryan Compton and Maggie Compton, and they will be
 17 followed by Paul Poirier.

18 MS. COMPTON: Hi. My name is Maggie Compton, and
 19 this is my son Ryan. Ryan is also a pediatric cancer
 20 survivor. Ryan is a two-time pediatric cancer survivor.
 21 He had leukemia XY. And, lots of scientists,
 22 angiologists say they're all about radionuclides,
 23 groundwater contamination, nuclear meltdowns, you name
 24 it.

25 I am surprised that when I moved to Simi in

1002-1

1002-1 DOE acknowledges your concern and preference for cleanup of SSFL. Please refer to Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Also please see, Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. Each of the action alternatives evaluated for cleanup of Area IV and the NBZ is protective of the environment and the health and safety of the public.

1002-2

1002-2 DOE acknowledges your concern about cleanup of chemicals in the mountains. It is DOE's mission to remediate sites to ensure that they are protective of human health and the environment. DOE's purpose in preparing this EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

1003-1

1003-1 DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," of this CRD for a discussion of contamination in the area around SSFL and to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of causes and incidences of cancer and cancer clusters. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

1003-2

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 2008, I never heard about a nuclear meltdown because it
2 was just not wanting to be publicized. I -- I'm really
3 shocked, disgusted, dismayed. I can go on and on of
4 what's going when we bought our house in Simi.
5 Ryan has been cancer free now for six years.
6 He had a half a bone marrow transplant. He had to have
7 his life-time maximum dose of radiation over the course
8 of four days to prepare for him for the bone marrow
9 transplant to get rid of all the leukemia, which kept
10 coming back, and he became basically resistant to any
11 one of chemotherapy. He was sick from the time he was
12 22 months old until the time he was spotted to have. He
13 has pervasive learning disabilities.
14 He's going to speak, but I'm going to help him
15 because he's not as eloquent as Grace. He cannot read
16 like Grace, although he is probably twice as old as she
17 is.
18 Don't smile at me. I -- I don't want you to
19 smile at me. This is not a happy topic for me at all.
20 I doubt that you live in Simi Valley. I'm sure you guys
21 live in Colorado or Washington DC or somewhere where DOE
22 headquarters is located. There is -- know the DOE. I
23 used to work for scientists -- a group of scientists,
24 engineers that were all CalTech graduates. My ex-boss,
25 Lon Bell, was actually the keynote speaker at the

1003-2
cont'd

1003-2 DOE acknowledges your concern. Chapter 3, Sections 3.9.5 and 3.9.6, of this EIS contain a description of the 1959 SRE accident and the levels of radiation that were believed to have been released. Additional information can be found at http://www.etec.energy.gov/Operations/Major_Operations/SRE_Accident.html. DOE has not kept the SRE accident secret. The accident was reported to local and National media in an August 29, 1959 news release (Atomics International 1959). The accident was also described in detail in a reactor safety textbook, "The Technology of Nuclear Reactor Safety" published in 1964 (Thompson and Beckerley 1964). These and other documents related to operation of SRE can be found at http://www.etec.energy.gov/Library/Historical_Docs.html. Because of public concern about the SRE accident, DOE hosted an informational workshop on August 29, 2009, with testimony from three independent experts (see http://www.etec.energy.gov/Community_Involvement/Public%20Meetings/SRE_Workshop.html).

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. DOE will complete contamination removal and site remediation based on the decisions made pursuant to this Final EIS and in accordance with all regulatory requirements.

1003-3 There has been a lot of cleanup performed in Area IV. As discussed in Chapter 1, Section 1.3, of this Final EIS, DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). Most of these structures have been removed. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 conference of thermoelectrics every year in San Diego
 2 and other places.

3 So, unfortunately, I have really lost any
 4 sense of trust in what you say. I'm not interested in
 5 all this stuff that you basically try to explain to
 6 everyone because of the fact that, you know, the nuclear
 7 meltdown happened 58 years ago, I believe, in 1959, and
 8 they still haven't cleaned it up. We're still talking
 9 about it. I know there's a lot of older people here
 10 that have been coming here ever since the late '80s
 11 asking you to clean it up. You said that you were
 12 committed, that the DOE is committed to cleaning up.
 13 How long is it going to take you? 100 years? 58 years
 14 is too long. It's 58 years too long.

15 There's a map of cancer cluster in Simi
 16 Valley, in Moorpark, West Hills, all the surrounding
 17 areas. As you know -- I'm sure you're a scientist -- we
 18 have at least -- everything basically goes now, you
 19 know -- you know, you're testing these sites, but I'm
 20 not even comfortable --

The purpose of this EIS is to evaluate alternatives for completing remediation at those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," of this CRD which addresses steps that must be completed before cleanup can resume. Briefly, DOE must complete an EIS (this EIS) and issue a Record of Decision pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 not -- okay.
2 (Clock timer ringing)
3 MS. COMPTON: This is my son, so he was sick for --
4 MS. LOWE: Ms. Compton, your time is up. Would you
5 like to let your -- have a seat, please?
6 MS. COMPTON: Yes. I want you to see what he went
7 through. I'm ashamed from one scientist to another that
8 you are not taking responsibility for your agency on
9 what they've done to the community here. And, with
10 that, I turn this over to my son. (Indicating)
11 MS. LOWE: Ryan, will you introduce yourself,
12 please?
13 RYAN COMPTON: My name is Ryan.
14 MS. COMPTON: How old are you?
15 RYAN COMPTON: I'm 11 years old.
16 MS. COMPTON: Were you sick when you were little?
17 RYAN COMPTON: Yes.
18 MS. COMPTON: What happened? Tell him and her.
19 They need to know. What happened to you when you were
20 little?
21 RYAN COMPTON: Uh --
22 MS. COMPTON: Say it. What did you have?
23 RYAN COMPTON: Leukemia.
24 MS. COMPTON: How many times?
25 RYAN COMPTON: Two times.

DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. DOE's purpose in preparing this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 MS. COMPTON: Is it hard for you to read? Can you
 2 read like Grace?
 3 RYAN COMPTON: Uh, no.
 4 MS. COMPTON: "No" why? Because it's hard; right?
 5 RYAN COMPTON: Yes.
 6 MS. COMPTON: What do you want our government
 7 scientists -- what do you want our government scientists
 8 to do? Do you want them to protect us or to hurt us?
 9 RYAN COMPTON: Protect us.
 10 MS. COMPTON: So, what would you like to ask them
 11 to do with all the pollution that they left behind in
 12 Simi Valley? Ask -- tell them, too. Look at them.
 13 Sweetheart, what would -- look at them. What would you
 14 like to ask them to do?
 15 RYAN COMPTON: Please clean it up.
 16 MS. COMPTON: Why? Tell him. Look at him and look
 17 at her. Ask them again. Look at them in their eyes,
 18 sweetheart.

1 of the Central Coast Green Building Council, which is
 2 the local chapter of the U.S. Green Building Council,
 3 representing Santa Barbara, San Luis and Ventura
 4 Counties.

5 One of the basic philosophies of the U.S. --
 6 MS. LOWE: And, back up. Could everybody please
 7 minimize the distractions in the back of the room? This
 8 gentleman has the floor. Try it.

9 MR. POIRIER: Thank you. So, one of the basic
 10 philosophies of the USBC is a balance of the health of
 11 the environment, of the people in the communities, and
 12 of the economy. And, our philosophy is that one of us
 13 don't have to thrive at the expense of the other. So,
 14 we're promoting green building, and we believe that will
 15 have a robust economy, and that people will be healthier
 16 if we're able to get all those things going.

17 We realize that some of the federal things
 18 happened at the Santa Susana Field Laboratory, things
 19 that you can be proud of, great knowledge and great
 20 scientific work produced at the laboratory, namely the
 21 U.S. flying to the moon. We expect the DOE to clean up
 22 the site so that we can be -- it can be celebrated by
 23 the communities, a monument to American ingenuity. Also
 24 I feel that in the past, the economy and striving to get
 25 to the moon may be took priority over the environment or

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 over the community, and risks were taken at the expense
2 of the community.

3 None of us -- many of my compadres -- I grew
4 up in what they call now West Hills, we used to not go
5 far to get to Chatsworth, lived there for 18 years.
6 Many of my friends have died of cancer. Six guys -- I
7 went to high school, when I graduated, high school class
8 of maybe 110 -- died in the last few years. As a kid,
9 many, many children that had known me from school had
10 leukemia when I was in grade school as well. I went to
11 the Valley Church in Topanga and Sherman Way. So, I
12 feel that maybe errand on the side of the environment
13 and the community is appropriate at this time. You may
14 say that the minimal cleanup in place of the toxins that
15 are there is adequate. But for us, we've paid the
16 price, and I'm -- I'm happy to pay the price, fighting
17 cancer, because we had to do those experiments to get
18 nuclear power to go to the moon. That's part of being
19 an American and being patriotic about what's going on.
20 But now we know better. Back in 1959, they didn't know
21 what would happen with those things. But we do know how
22 to clean it up, and now it's just a matter of money.
23 So, now it's really -- the economy's pointing to -- to
24 us back here. How much money was spent by Rocketdyne,
25 by the DOE or by NASA to do the experiments on the top

1005-2

1005-2 DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

1005-3

1005-3 This Final EIS evaluates alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It presents the potential near-term and long-term impacts so that the public and decision-makers can evaluate the tradeoffs between a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities and alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment. Refer also to Sections 2.7, "Offsite Impacts," and 2.8, "Cancer and Other Illnesses Near SSFL," for information on the potential impacts in the vicinity of SSFL.

1005-4

1005-4 As a Federal agency, DOE is required to evaluate and justify major expenditures of Federal dollars. Because the AOC cleanup is not the normal way DOE, EPA, or California DTSC performs soil cleanups, DOE evaluated the costs and benefits of

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 of that mountain? And, how much are we talking about
 2 doing a full cleanup to the benefit of the community and
 3 the benefit of the environment with the long-term
 4 effects of the cleanup benefiting the environment and
 5 the community? But maybe the short-term benefits are
 6 little inconveniences, some additional truck trips or
 7 maybe it's disturbance of some cultural resources. I
 8 think that the short-term impacts of full cleanup are
 9 far less than the long-term impacts on the community
 10 to --

11 (Clock timer ringing)

12 MR. POIRIER: -- take care of the people that are
 13 getting sick and getting cancer. So, the USGBC is
 14 supporting the whole cleanup of the site.

15 MS. LOWE: Thank you, Mr. Poirier. The next
 16 speaker will be Denise Duffield. Denise will be
 17 followed by Sheldon Plotkin and then Jose Quiroga.

18 MS. DUFFIELD: I've been waiting so I know my
 19 time's -- and the timers starts with my comment.

20 MS. LOWE: Okay. When you're ready.

21 MS. DUFFIELD: My name is Denise Duffield. I'm the
 22 associate director for Physicians for Social
 23 Responsibility Los Angeles, and I also serve as the
 24 coordinator of the SSFL Work Group. PSRA will be
 25 submitting technical comments in writing.

1005-4

1005-3
cont'd

the AOC cleanup versus what is normally done (that is, a cleanup that is based on risk and future land use). That analysis demonstrated that the AOC cleanup would be much more expense and with minimal additional protection of public health and the environment. This EIS presents a comparative analysis of these alternatives and the impacts across various resource areas to allow people to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ. Each of the alternatives would be protective of the public and the environment.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 I was shocked this Saturday listening to John
2 Jones' comments in the Ventura County -- County Star
3 saying that DOE is upholding the AOC cleanup agreements,
4 that all of its counter alternatives are protective of
5 public health because "That's what we do." No, that's
6 not what you do.
7
8 What the DOE does is produce unnecessary and
9 dangerous nuclear weapons, create hazardous radioactive
10 and chemical contamination, make promises to clean it
11 up, and then break those promises, all across the
12 country, from Lawrence Livermore, to Rocky Flats, to
13 New Mexico, to Hanford, to Idaho, to Savannah River, to
14 Oak Ridge. What DOE does is to create a legacy of toxic
15 waste and contamination that impacts communities and
16 vital ecosystems, and what DOE's -- DOE's Office of
17 Environmental Management does is anything it can do to
18 avoid cleaning it up. No, DOE is not upholding the SSFL
19 cleanup agreement. Every single one of the alternatives
20 leaves contamination on site, which is prohibited in the
21 AOC. No, none of DOE alternatives are protective of
22 public health. DOE has manipulated the standards to be
23 thousands of times higher than what the EPA would allow.
24 No, DOE's not required by NEPA to look-it-up options in
25 an AOC. No, DOE's not fit to decide to clean up. That
decision's made by California's DTSC. No, DOE cannot

1006-1

1006-2

1006-3

1006-4

1006-5

1006-6

1006-1 The mission of DOE is to ensure America's security and prosperity by addressing its energy, environmental, and nuclear challenges through transformative science and technology solutions. Additional information can be found at <https://energy.gov/>. As the largest environmental cleanup program in the world, DOE's Office of Environmental Management has been charged with the responsibility of cleaning up 107 sites across the country. To date, the Office of Environmental Management has made substantial progress in nearly every area of nuclear waste cleanup and completed cleanup at 91 of these sites. Additional information can be found at <https://energy.gov/em/office-environmental-management>.

1006-2 The Cleanup to AOC LUT Values Alternative complies with the 2010 AOC. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD. However, NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. To meet this obligation, this EIS evaluates alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ, in a manner consistent, using risk assessment techniques, with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

1006-3 DOE did not 'manipulate the standards to be thousands of times higher than what the EPA would allow.' The EPA allows for assessments that use the projected end use of the property to determine the factors used in a risk analysis. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. The use of RBSLS that do not include the indirect garden pathway is appropriate for this future land use.

In this Final EIS (see Chapter 2, Section 2.4), DOE has retained the Cleanup to Revised LUT Values Alternative, which uses chemical RBSLS based on an Onsite Suburban Residential Scenario without a garden pathway. The Final EIS also retains the Conservation of Natural Resources Alternative, but evaluates two scenarios. The Open

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 exempt soil based on natural attenuation or biological
 2 exemption -- exemptions that are misrepresented. No,
 3 DOE does not get to frame the entire cleanup in terms of
 4 trucks versus contamination, especially when DOE refused
 5 to look at other routes and transportation methods.

6 The DOE will go to any length to avoid the
 7 cleanup, including secretly funding a front group that
 8 are opposing the cleanup. \$34,100.00 a year is all we
 9 know because DOE will not release the grant contractor
 10 and details. I'm sure we'll be hearing from some of
 11 these people today. You'll know who they are. DOE must
 12 stop funding people's health and clean up SSFL as
 13 promised and comply with the AOC to the letter.

14 Because DOE is not leveling with the public, I
 15 prepared a handout with just some of the information the
 16 public needs to know. Some people will hand that out
 17 right now. I encourage everyone to attend the March 8th
 18 meeting of the SSFL Group -- Work Group, and I would
 19 also add that please listen to the speakers. You don't
 20 need to read the handout now. I think it's important to
 21 hear what everybody has to say.

22 Thank you.

23 MS. LOWE: Thank you, Ms. Duffield. So, the next
 24 speaker will be Sheldon Plotkin, followed by Jose
 25 Quiroga, and by Betsey Landis.

1006-6
cont'd

1006-7

1006-8

1006-2
cont'd

Space Scenario is based on the future land use of Area IV and the NBZ as open space, consistent with Boeing's conservation easement and agreement (i.e., cleanup levels are based on exposure of an onsite recreational user as the receptor). The Onsite Suburban Resident Scenario is the scenario evaluated in the Draft EIS, that is, cleanup levels are based on a suburban residential scenario without a garden pathway. This latter scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space.

In Chapter 4, Section 4.9 of this Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that local residents may get some portion of their food from a home garden.

1006-4 DOE respectively disagrees.

1006-5 DOE recognizes DTSC's authority over the cleanup at SSFL. DOE recognizes that DTSC needs to approve soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC and DOE-prepared RCRA closure plans for building demolition.

1006-6 Please refer to "Application of Exemptions under the 2010 Administrative Order on Consent" (Section 2.4 of this CRD) regarding application of the 2010 for a discussion of this topic and DOE's response with regard to biological exemptions.

1006-7 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of transportation issues and DOE's response.

In accordance with NEPA, this Final EIS evaluates the potential impacts on a variety of resource areas, including traffic, human health, cultural and biological resources, socioeconomics, and environmental justice. Results of the analyses allow a comparison of potential impacts across all evaluated resource areas as well as the tradeoffs between the alternatives. The intent was not to frame the cleanup in terms of trucks versus contamination. But, it is true that the more soil that is removed from the cleanup site, the more transportation will be required. Leaving more soil, and consequently low concentrations of chemicals and/or radionuclides on site, reduces the number of truck trips necessary from the site. Conversely, removing the soil with low concentrations of chemicals or radionuclides, requires more truck trips from the site. The EIS shows that the transportation risks are very small; Chapter 4, Section 4.8.1 and Appendix H of this EIS provide details of the transportation risk analysis.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 MR. PLOTKIN: Okay. I'm Sheldon C Plotkin. I'm
2 appearing here on behalf of Southern California
3 Federation of Scientists, which has been involved for
4 nearly 40 years trying to get the DOE to take
5 responsibility for the contamination they created at
6 Santa Susana and clean it up.

7 I'm deeply concerned the DOE has now broken a
8 legally binding cleanup agreement it signed in 2010, and
9 is proposing leaving between 39 and 99 percent of the
10 contamination not cleaned up. DOE and its predecessor,
11 the Atomic Energy Commission, historically acted as if
12 they were above the environmental laws of the country
13 that apply to everyone else. They consistently broke
14 fundamental rules about protecting the environment,
15 ending up polluting soil, water, and air at scores of
16 nuclear facilities around the country.

17 Santa Susana elementary safety rules were
18 ignored. Four different reactors suffered accidents.
19 In 1959, one reactor released radioactivity.

20 A few months later, a different reactor
21 suffered a partial meltdown in which a third of the fuel
22 experienced melting. In that case, after an accident
23 which power ran out, the control exponentially -- they
24 could barely shut the reactor down, and they
25 inexplicably started it up again a couple of hours later

1007-1

1007-2

1007-3

1006-8 While the comment is not on the scope or content of this Final EIS, the following information is provided:

DOE has funded a number of stakeholder groups, including Teens Against Toxins, the SSFL Advisory Panel, Physicians for Social Responsibility, the Rocketdyne Cleanup Coalition, Committee to Bridge the Gap and the SSFL CAG. The SSFL CAG is an independent group, created under the State of California Health and Safety Code, approved by the DTSC and formed under guidance from the Udall Foundation, an independent Federal agency focused on environmental stewardship. The SSFL CAG began operating in 2013. The grant to the CAG was funded through local project funds in an effort to support community engagement. DOE posted notification of the grant in September 2015 on USASpending.gov, an official website disclosing grants, loans and other financial assistance awards.

1007-1 DOE has not announced that it intends to break the 2010 AOC. NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

1007-2 DOE conducted historic operations under the laws and regulations applicable at the time. DOE's Office of Environmental Management has been charged with the responsibility of cleaning up 107 sites across the country. To date, the Office of Environmental Management has made substantial progress in nearly every area of nuclear waste cleanup and completed cleanup at 91 of these sites. Additional information can be found at <https://energy.gov/em/office-environmental-management>.

1007-3 As indicated in Chapter 1 of this EIS, DOE acknowledges that past activities at SSFL resulted in chemical and radiological releases that impacted soils, buildings,

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 without having been able to identify the cause of the
 2 problem. They ran it for another 10 days or so in the
 3 face of clear evidence of a failing reactor with
 4 radiation radiating higher than the monitors -- where
 5 were I -- monitors could record. Radioactive material
 6 was intentionally released into the environment for
 7 weeks, and then they lied about the accident and tried
 8 to cover it up.

9 Two other reactors had similar accidents.
 10 There were radioactive fires in the Hot Lab, which
 11 highly irradiated -- in which highly irradiated nuclear
 12 fuel was disassembled.

13 For decades they illegally burned radioactive
 14 and toxic chemical waste in open burn pits with the
 15 contamination released into the air over Simi Valley and
 16 polluted water -- and polluted water was dumped over the
 17 hillside to -- to a children's camp.

18 Finally, in 2010, DOE signed a legally binding
 19 agreement with California for a full cleanup, and now
 20 DOE has announced that it intends to break the agreement
 21 and leave dangerous contaminations on site when it will
 22 continue to migrate to off-site communities. This is
 23 unacceptable. DOE must live up to its cleanup
 24 obligations, carry out the cleanup agreement to the
 25 letter --

1007-3
cont'd

1007-1
cont'd

and groundwater. Chapter 3, Sections 3.9.5 and 3.9.6, of this Final EIS contain information about accidents at Area IV, including the 1959 SRE accident, which was the only accident that caused a measureable release of radioactive material. At the time of the accident it was estimated that the accident resulted in the release (over a 2-month period) of about 28 curies of radioactive noble gases such as krypton-85, in low, controlled concentrations that met Federal requirements. Additional information about the 1959 SRE accident can be found at http://www.etec.energy.gov/Operations/Major_Operations/SRE_Accident.html. DOE has not kept the SRE accident secret. The accident was reported to local and National media in an August 29, 1959 news release (Atomics International 1959). The accident was also described in detail in a reactor safety textbook, "The Technology of Nuclear Reactor Safety" published in 1964 (Thompson and Beckerley 1964). These and other documents related to operation of SRE can be found at http://www.etec.energy.gov/Library/Historical_Docs.html. Because of public concern about the SRE accident, DOE hosted an informational workshop on August 29, 2009, with testimony from three independent experts (see http://www.etec.energy.gov/Community_Involvement/Public%20Meetings/SRE_Workshop.html). With respect to the statements regarding burning radioactive and chemical waste in open pits, the Former Sodium Disposal Facility was used from 1956 to 1978 to clean alkali metals (sodium and potassium/sodium mixtures) from metallic components and other materials, and also received chemical waste and radionuclides. The facility was remediated during the 1990s and released for unrestricted use (i.e., declared clean) in 1998 by the California Department of Health Services (now California Department of Public Health). Additional information can be found at http://www.etec.energy.gov/Operations/Support_Ops/FSDF.html.

With respect to the statements regarding polluted water being dumped over a hillside, studies have addressed whether radiological and chemical contaminants were present on the properties north of SSFL, including studies issued in 1992, 1994, and 1995 (see http://www.etec.energy.gov/Environmental_and_Health/Brandeis_Bardin.html). These studies led to cleanup activities on part of the American Jewish University Brandeis Bardin property, as well as the Boeing purchases of the areas of the property with the highest levels of contamination. These areas were incorporated into the SSFL site as the NBZ (DTSC 2017a). In May 2017, DTSC published its review of chemical and radiological data from the investigations that had been performed to date. From its review, DTSC concluded that: (1) levels of radionuclides on the Brandeis Bardin Campus appear to be within the natural background range; (2) levels of chemicals and radionuclides at the Brandeis Bardin Campus do not pose a threat to human health; (3)

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 (Clock timer ringing)
2 MR. PLOTKIN: -- with no more games, no more false
3 statements, no more breach of public trust.
4 Thank you.
5 MS. LOWE: Thank you, Mr. Plotkin. Okay. Jose
6 Quiroga, followed by Betsey Landis, and then Alec
7 Uzemeck.
8 MR. QUIROGA: Hi. I am Jose Quiroga. I -- I come
9 here to this meeting for all sorts of reasons. The most
10 important thing is, because I live here in San
11 Fernando --
12 THE REPORTER: Okay. We're fine.
13 MS. LOWE: Yeah?
14 MR. QUIROGA: -- that it goes to the -- the
15 contamination. Second, I'm on the board of Physicians
16 for Social Responsibility, of which I've been fighting
17 for (Inaudible) --
18 THE REPORTER: (Shakes head)
19 MS. LOWE: Can you just slow down just a little bit
20 to help the court reporter?
21 THE REPORTER: Sorry. Sorry.
22 MS. LOWE: He's having trouble hearing you, so --
23 MR. QUIROGA: Huh?
24 MS. LOWE: The court reporter's having trouble
25 hearing you, so slow down just a little bit and -- and

1007-1
cont'd

contamination at SSFL does not pose a threat to Brandeis Bardin Campus users; and (4) the Brandeis Bardin Campus is safe for use by campers, visitors, students, faculty, administrators, and staff (DTSC 2017a). In addition, please see Section 2.7, "Offsite Impacts," of this CRD for a discussion of this topic and DOE's response. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ.

Section 3 - Public Comments and DOE Responses

3-1603

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 you could speak --

2 MR. QUIROGA: Yeah.

3 MS. LOWE: -- towards the --

4 MR. QUIROGA: Okay. My name is Jose Quiroga. I'm

5 coming here for the reason, and the basic part is

6 because I'm living here in San Fernando Valley. I live

7 below -- estate close to the site of contamination.

8 Second, I am a member of Physicians for Social

9 Responsibility, and this is one of the organizations

10 that's been fighting for -- now for at least -- for many

11 years. And, the important thing I said in the

12 introduction, that the contamination -- the

13 contamination of -- of -- is -- the environmental

14 impact, and I'm feeling that the radionuclides

15 disappears, this cesium, strontium, plutonium, DU, and,

16 on the chemical part, we have the very contaminating,

17 the cyanide, the tetrachloride, evaporite, hydrazine,

18 and helimantodiad (ph). The combination of these two

19 help to --

20 THE REPORTER: I'm sorry. I'm sorry.

21 MR. QUIROGA: -- produce a contamination value of

22 the most higher of contamination, that it's going to the

23 liver about 11 or 55 years, and it's going to produce

24 cancer. And, basically the reasons that brought cancer

25 that is produced is a cancer that's basically a cancer

1008-1 **1008-1** DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. Section 2.8, discusses the UCLA study referred to by the commenter and notes some of the limitations the study authors identified. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 of the liver and of the bone, travel then, could be
2 cancer in the blood, is going to be contaminating
3 children. We can have cancers in other parts of the
4 body.
5 And, then basically, this is a study that's
6 been done at UCLA, where I was a member there of the
7 department, the disease are many, so there we started
8 the main prevention. Then from the people who were
9 working for -- in this place or people who live in the
10 neighborhood have a high proportion of cancer compared
11 with the general population, and then there is -- for
12 simple here, in the nation, that we have a -- a scale of
13 being highly contaminated in -- in the population to
14 produce cancer. We have a new study that -- that show
15 that the cancer is higher than on this -- in adult
16 population of people --
17 THE REPORTER: I'm sorry. I -- I --
18 MR. QUIROGA: -- who worked there --
19 MS. LOWE: We have --
20 MR. QUIROGA: -- and then now in children. But,
21 basically, all of the seas that aren't clean for human
22 beings, and they're being to go the disease, because we
23 contaminated the agent. And, the reason that there are
24 agencies that are responsible for that, and this is the
25 Department of Energy, and they're the primary agency

1008-1
cont'd

1008-2 1008-2

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities (remediation to background levels),

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 either responsible for these (Inaudible) who are getting
 2 -- for cancer in the population that's close to work
 3 there, and then they have the responsibility to clean
 4 this, and their responsibility has to be to clean at
 5 background there, and there has to be responsibility
 6 cleaning there. And the reason, the most important
 7 thing, and there is no way that you can have a lazy feel
 8 for not to do that --
 9 (Clock timer ringing)
 10 MR. QUIROGA: -- is the responsibility of the state
 11 and has to do that.
 12 Thank you.
 13 MS. LOWE: Thank you. Okay. Betsey Landis will be
 14 followed by Alex Uzemeck, will be followed by Richard
 15 Mathews.
 16 MS. LANDIS: My name is Betsey Landis. I'm here
 17 representing the California Native Plant Society, and
 18 I'm -- I would like to look forward, not backwards. I'm
 19 about healing here, so keep a healthy earth makes
 20 everyone else healthier around it.
 21 So, I have some comments that I would like to
 22 say about your DEIS. I think you have the right idea of
 23 taking it over here and there and trying to get an
 24 overall plan that will clean up the earth and allow it
 25 to heal, and it is healing now, and it's just kind of

1008-2
cont'd

1009-1

as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). This latter approach, use of a risk assessment, is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

Also please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts in the vicinity of SSFL.

1009-1 DOE acknowledges your concern about remediating SSFL in a manner that would minimize damage to the surrounding area. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 slow, and not cause so much damage to the surrounding
2 area.

3 For instance, Woolsey Canyon Road is not
4 anywhere near able to handle all of those heavy trucks,
5 and if they go off the road, where do they land? They
6 land in a natural canyon, so you will have another
7 source of contamination that you'll have to clean up.

8 So, I would prefer that you do -- do
9 point-to-point on some of the radioactives, areas
10 that are -- need to be cleaned up and do deep cleaning.

11 I would prefer that you go with natural attenuation
12 where possible, because it seems to be -- because you
13 are monitoring things, it seems to be proceeding the way
14 it should. And, if you're monitoring low vegetation, I
15 would prefer that you remove all the non-native
16 vegetation. They're invasive plants that are pushing
17 out the deep-rooted plants that are actually cleaning
18 the earth. You need all those plants. They are working
19 hard on cleaning the earth for you.

20 And, you must preserve the rare plants you
21 have. You don't have that many rare plants, but you do
22 have some of the Santa Susana tarplant, and you also
23 have the Astragalus brauntonii, which I have studied for
24 years. You have the lovely population and the
25 Asteraceae, the Southern Buffer. You also have a couple

1009-1
cont'd

1009-2

1009-3

1009-4

1009-5

- 1009-2 DOE acknowledges that the potential for an accident increases as the volume of traffic increases. The truck shipments evaluated in the EIS are estimates based on the evaluated truck-loading configurations and the expected levels of cleanup. DOE agrees that there are some risks associated with the transport of the contaminated soils. However, the risks, as documented in Appendix H, Section H.8, and Chapter 4, Section 4.8.1, of this EIS, are very small. It should be noted that the radioactive contamination level in the soil to be transported is itself very low. Some soil to be shipped would likely have radioactive contamination levels below detection limits. Nevertheless, at least some contamination would exist in the transported soil. It should also be noted that the radioactive contaminants are bonded within the soil matrix and, in the event of an accident, soil would not easily become airborne and be carried over a long distance. If an accident were to occur, the expected releases would be local and manageable. Also see the response to comment 162-6. Appendix H, Section H.13, of this EIS evaluates the conditions and suitability of the roads that are considered for transporting various materials from and to the site. These evaluations are summarized in Chapter 4, Section 4.8.2. These roads are built to the standard for heavy-duty trucks and are adequate for the vehicles that would be used during the cleanup activities, although some repairs to some roads may be required over the duration of site remediation operations. The operations at the site, including management oversight, the expected traffic volumes, and the consequential traffic speeds, would result in traffic flow conditions with minimum potential for accidents. Section H.13 also provides details on the potential impacts of increased traffic on the roads in the vicinity of SSFL (including potential pavement damage) as well as on the roads near the evaluated disposal and recycle facilities.
- 1009-3 Thank you for your comment. It has been included in the Administrative Record for the EIS.
- 1009-4 In Chapter 6, Table 6-1, measure 5-9 identifies a Weed/Invasive Plant Species Management Plan will be implemented to eradicate noxious and invasive species as they appear on sites using State and/or federally approved methodologies. The Weed Management Plan will include strategies and measures to minimize the potential for invasive plant species (i.e., weeds) or soil pathogens to become established in disturbed areas and spread into restoration areas or natural areas. Weeds generally include those species listed by the California Invasive Plant Council and any species that can invade natural or restoration areas and replace or preclude the establishment of native or other more desirable species). All off-road earthmoving equipment such as excavators

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 of plants that for some reason or other, either the
 2 entire land or somebody's close, besides you grow in the
 3 middle of all the buildings, and I am recommending here
 4 for the record that all you do is, if a stroll-back
 5 will produce seeds, take the seeds and take them up to
 6 the main population that's on the hill.

7 The other thing is that I was asked to tell
 8 you that -- that California has now decided that green
 9 waste is not disposable, and they're getting regulations
 10 on how you can handle it, and their choices are chopping
 11 and grinding or mulching or composting, and I would
 12 suggest --

13 (Clock timer ringing)

14 MS. LANDIS: -- that you chip and grind everything
 15 that you -- in the way of green waste or wood waste that
 16 you take off the site.

17 MS. LOWE: Thank you, Ms. Landis.

18 MS. LANDIS: Uh-huh.

19 MS. LOWE: Alec Uzemeck will be followed by Richard
 20 Mathews and then Arline Mathews.

21 MR. UZEMECK: My name is Alec Uzemeck. I am the co
 22 chair of the SSFL Community Advisory Group, the CAG, and
 23 I'm also a member of West Hills Neighborhood Council.
 24 I'm here representing myself this evening.

25 I support a cleanup of the SSFL. More

1009-5
cont'd

1009-5 Thank you for your comment. It has been included in the Administrative Record for the EIS.

1009-6

1009-6 DOE is aware of the Mandatory Commercial Organics Recycling (MORE) law that was signed into law by Governor Brown on September 28, 2014 (Assembly Bill Number 1826). A summary of this law was added to Chapter 8, Laws, Regulations, and Other Requirements, of this Final EIS. A statement was added to Chapter 4, Section 4.10, Waste Management, of this Final EIS that all wastes generated under the activities evaluated in this EIS would be managed in accordance with State and Federal requirements that are applicable to each type of waste.

1010-1

1010-1 DOE acknowledges your support for the Conservation of Natural Resources Alternative. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 specifically, I support the Conservation of the Natural
2 Resources, and I believe that the AOC has to be changed
3 as is -- is in its present form. The AOC is a contract
4 between two parties, and if the two parties agree, the
5 contract can be changed at any time for any reason.
6 This particular cleanup that we're talking
7 about satisfies the National Contingency Plan, it
8 satisfies the California Health Act, NEPA, and USEPA
9 guidelines, and I'm sure that it would satisfy CEQA.
10 AOC does none of that. If you read the AOC,
11 it speaks to 132 chemicals. It doesn't discuss human
12 health, toxicity, or any other threats to human health.
13 It is just a list of chemicals that somebody has put
14 together and not rated by toxicity, but to have these
15 extraordinary cleanup levels, the AOC needs to be
16 changed.
17 Another thing, I believe that DOE says that
18 they're going to clean up the toxic materials at the
19 site, so they have this issue of remaining materials,
20 which I assume are not toxic, so these percentages
21 they're describing, chemicals that are not toxic or
22 harmful because the toxic ones have disappeared. So, as
23 you walk through the percentage, 99 percent says you're
24 doing a great job of separating those things that are
25 toxic from the ones that are not toxic, reducing

1010-2 DOE agrees with the commenter that the 2010 AOC can be changed. Section 8.0 of the AOC states that the "Order may be modified by mutual agreement of the parties." Note that the AOC itself does not address a specific number of chemicals. DTSC published LUTs identifying cleanup levels as provided for in the Agreement in Principal that is part of the AOC.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 excavation, reducing truck -- trucks that will go
 2 through their neighborhood, along with the pollution.
 3 So, please revise the AOC.
 4 Thank you.
 5 MS. LOWE: Thank you, Mr. Uzemeck. Next is Richard
 6 Mathews, who will be followed by Arline Mathews, who
 7 will be followed by Bill Mathews.
 8 MR. MATHEWS: I'm Richard Mathews. My background
 9 includes being a physics major at CalTech, where I
 10 handled radioactive materials, including some of the
 11 same radionuclides found at the site, and I think that
 12 gives me a fairly good understanding of what is safe and
 13 what is not.
 14 I am here on the behalf of the California
 15 Democratic Party, the Los Angeles County Democratic
 16 Party, and the North Valley Democratic Club, which have
 17 all passed resolutions calling for cleanup to background
 18 and following the AOCs. We also want to remind you, the
 19 Los Angeles City Council, the Simi Valley City Council,
 20 and the Tarrant County Supervisors have all voted, I
 21 think all unanimously, for cleanup to background. And,
 22 I point out that this includes organizations that are
 23 both delegated by Democrats and by Republicans. This is
 24 a bipartisan issue.
 25 I ask and we ask that you follow the contract

1010-1
cont'd

1010-2
cont'd

1011-1

1011-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," of this CRD.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup levels (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). This latter approach, use of a risk assessment, is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

Also refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD. This section discusses that under all of the alternatives considered by DOE, locations with concentrations of chemical or radioactive constituents that pose a threat to human health would be cleaned up; this includes locations within exemption areas.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 that was entered by the AOCs. Do not be modifying the
2 contract. In order to modify the contract, it's
3 required to give consideration. And what consideration
4 would be given to the people of California, the people
5 of this area to protect us in order to change this
6 contract? Please follow the letter and spirit of the
7 AOCs, and that includes providing for groundwater
8 treatment to reduce the TCEs and PCEs.

9 We do recognize the critical habitat must be
10 protected, and that is in accordance with the AOCs, but
11 that isn't where the majority of the pollution is. In
12 the areas that are more heavily polluted, it is
13 necessary to go and do a good thorough cleanup to
14 background levels.

15 Restore the site to its natural site. Make
16 the people of California, the people of these valleys
17 whole by giving us open space that we can be proud of.

18 Thank you very much.

19 MS. LOWE: Thank you, Mr. Mathews. The next
20 speaker will be Arline Mathews. Arline will be followed
21 by Bill Mathews, and then Cindy Gortner.

22 MS. MATHEWS: Ladies and gentlemen, respectfully --

23 MS. LOWE: Ms. Mathews started your introduction --
24 introduce your --

25 MS. MATHEWS: I'm sorry. You can't hear me?

1011-1
cont'd

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 MS. LOWE: Well, no. I need you to introduce
 2 yourself. I'm sorry.
 3 MS. MATHEWS: Arline Mathews.
 4 MS. LOWE: Thank you.
 5 MS. MATHEWS: I'm a solar advocate, political
 6 activist for many years.
 7 MS. LOWE: Thank you.
 8 MS. MATHEWS: Respectfully, I want to say that we
 9 have every right to be made whole again, to have a
 10 cleanup to background. If there was an automobile
 11 accident, a judge would say, "But the victim has a right
 12 to be made whole." And we have been victim of a federal
 13 government that says they were going to defend us. It's
 14 not defense when -- when our people have been made to
 15 suffer and die. My son Bobby died of glioblastoma,
 16 which killed all of the firemen at the Santa Susana
 17 Field Lab, the same rare ailment nobody like everly --
 18 ever had cancer before, never, but Bobby died of
 19 glioblastoma.
 20 So, you propose -- the federal government
 21 proposes to ignore the Consent decree that they signed.
 22 That should have been the end of it. And to reduce the
 23 amount of damaged soil by nine times, so in round
 24 numbers, reduce it from 900,000 to a hundred thousand
 25 cubic yards, to reduce it from 70,000 truck loads to

1012-1

1012-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

1012-2

1012-2 DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL, as well as a discussion of the studies of University of Michigan (Morgenstern) study and the UCLA (Cohen) study. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

1012-1 cont'd

Whereas the incidences from the past described in the comment may or may not be accurate, they are not relevant to the current effort. DOE's current focus is to complete the cleanup of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 only 14,000 truck loads. You have a duty to obey a
2 court order that you signed, and we have a right to be
3 made whole.

4 And I have a few more things to add. Let me
5 talk about the Environmental Impact Report, and that's
6 terribly important. You don't include the lives that
7 have died that are gone forever and those that continue
8 to die and suffer and the valleys that suffer with the
9 deaths of relatives.

10 Dr. Morgenstern at the University of Illinois
11 did a preliminary study and said that if it was left
12 intact, that what would happen is the people would
13 continue to suffer or die in our community. No study
14 has been made about the increased amount. But Dr. Cohen
15 at UCLA agreed with Dr. Morgenstern of the University of
16 Illinois, and said that leaving it in place all these
17 years continues to hurt our people. So, I have to end,
18 I'm sorry to say.

19 (Clock timer ringing)

20 MS. MATHEWS: But, let me just say this: You
21 signed a Consent decree, it has to be made done, and we
22 have to be made whole.

23 (Clock timer ringing)

24 MS. MATHEWS: That means clean up to background,
25 nothing less than background.

1012-2
cont'd

1012-1

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 MS. LOWE: Thank you, Ms. Mathews. Bill Mathews
 2 will be followed by Cindy Gortner, will be followed by
 3 Mark Osokow.
 4 MR. MATHEWS: Well, I don't have any prepared
 5 remarks, but -- so this will be real short.
 6 MS. LOWE: Start with your name.
 7 MR. MATHEWS: I'm Bill Mathews.
 8 MS. LOWE: Thank you.
 9 MR. MATHEWS: I -- Arline is my mother. Robert
 10 Mathews was my brother. We lost him 20 years ago, I'm
 11 sure again through your -- the situation.
 12 I haven't been in touch with this because I
 13 live in Albuquerque, New Mexico. Over there, you
 14 probably know we have Kirtland Air Force Base, we have
 15 Sandia National Labs, and upstream, up the Rio Grande,
 16 we have Llano, Los Alamos National Labs. New Mexico's a
 17 very contaminated place. We also have high instances of
 18 cancer, dating all the way back to the first explosion
 19 of the atomic bomb in 1945. And I'm very quieted,
 20 mostly expecting families that have been ignored in the
 21 decades since are still clamoring this injustice. And,
 22 I, as an Albuquerque resident -- resident, realize that
 23 we have a plume of underground jet fuel from Kirtland
 24 Air Force Base coming towards my house, which is only
 25 five miles from the airport. And, we live -- we live in

1013-1

1013-1 Thank you for your comment. It has been included in the Administrative Record for this EIS.

1013-2

1013-2 Kirtland Air Force Base is operated by the U.S. Air Force. DOE is not responsible for U.S. Department of Defense activities at Kirtland Air Force Base. DOE has prepared sitewide EISs (SWEISs) for Los Alamos National Laboratory (DOE 2008) and Sandia National Laboratories (DOE 1999). These SWEISs evaluate the impacts of continued operation of these facilities. DOE also prepares Annual Site Environmental Reports (ASERs) for these facilities (DOE 2017b, 2017c). The ASERs describe the results of ongoing environmental monitoring in and around the facilities. Generally, the offsite impacts of normal operations are minimal and within regulatory requirements.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 there.
2 And, so, I'm just saying, you know, we always
3 have to be aware of bureaucratic politicians' prior
4 decisions. Always consider the human perspective.
5 Thank you.
6 MS. LOWE: Thank you very much. Cindy Gortner will
7 be followed by Mark Osokow and then Christina Walsh.
8 MS. GORTNER: Hi. I'm Cindy Gortner. I find it
9 morally repugnant that the DOE is not following the
10 AOCs.
11 If I didn't want to pay for a cleanup, I would
12 do what I'm seeing tonight: I would hand out pictures
13 that have flowers on them and animals. I wouldn't talk
14 about the children and the cancer. I would put up
15 alternatives that talk about trucks and water use and
16 time, and I wouldn't talk about people getting sick.
17 But I don't think you want to spend the money, and that
18 makes me sad and I'm frustrated.
19 The DOE does not need to look at alternative
20 cleanup levels. That is false. And the AOC, which you
21 signed, said you need to look at alternative methods to
22 clean up, not alternative cleanup levels. As Arline
23 said so beautifully, we've waited -- somebody said we
24 waited 58 years. It was Maggie. We waited 58 years to
25 have it cleaned up. I can wait 10 years for the trucks

|| 1013-2
cont'd

|| 1014-1

|| 1014-2

- 1014-1 As a Federal agency, DOE is required to evaluate and justify major expenditures of Federal dollars. Because the AOC cleanup is not the normal way DOE, EPA, or California DTSC performs soil cleanups, DOE evaluated the costs and benefits of the AOC cleanup versus what is normally done (that is, a cleanup that is based on risk and future land use). That analysis demonstrated that the AOC cleanup would be much more expensive and with minimal additional protection of public health and the environment. Also, please refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for additional information on this topic. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.
- 1014-2 NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. To meet this obligation this EIS evaluates alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD), as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 to go by. That's okay. I don't need it to be just two
 2 years. We've waited a long time.

3 I want to talk about the rain. There have
 4 been 216 exceedances, which means 216 times that we know
 5 of water coming off the hill has come down into our
 6 communities that will potentially make people sick.
 7 There's no justification for this, not flowers, not
 8 caves that aren't near or are going to be cleaned up.
 9 There's no justification for not doing the right thing.

10 And, as John mentioned, we have one of the
 11 largest EPA studies of all time, 41 and a half million
 12 dollars, and they found 500 places that were still
 13 radioactive. So it doesn't make any sense to me why
 14 we're talking about how many trucks or alternative
 15 methods when we have an AOC that is signed, we have
 16 people that we know are getting sick, and we have water
 17 running off the hills that's still contaminated. Those
 18 are fact. So it's not okay to show the option one that
 19 leaves 39 percent of the contamination, option two that
 20 leaves 91 percent, option three that leaves 99, and
 21 option four that leaves a 100.

22 And, by the way, the statement made earlier
 23 that the DOE is cleaning up toxic chemicals and leaving
 24 non-toxic chemicals is false.

25 Thank you. Please clean up to the AOC. I

1014-2
cont'd

1014-3

1014-3 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

1014-2
cont'd

1014-4

1014-4 Under the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative, DOE would remove chemicals above levels that are harmful to human health and the environment for the designated future open space land use. Concentrations of chemicals below these levels would be left in place.

1014-2
cont'd

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

2 MS. LOWE: Thank you, Ms. Gortner. Okay. Mark
3 Osokow will be followed by Christina Walsh and then
4 Bonnie Klea.
5 MR. OSOKOW: My name is Mark Osokow, and I'm
6 representing the San Fernando Valley Audubon Society. I
7 spoke on Saturday and missed a few things and a few
8 points came up later that I would like to address. And
9 one of the things that I should mention, first of all,
10 is that San Fernando Audubon Society will be supporting
11 the Conservation of Natural Resources alternative for
12 the cleanup.
13 You've heard a lot of talk here about the
14 cluster of cancer. I'm really shocked really to hear
15 this, this kind of talk coming from so many people who
16 believe this, that there's very little evidence to show
17 that anything from Santa Susana has caused cancer, and I
18 have a number of different items to demonstrate from the
19 natural perspective that there's no cancer being caused
20 now on the site. I'm not going to discuss what happened
21 in 1959. But, before I get into that, I'll see what --
22 how much -- you set the maybe the three minutes of time
23 that I have.
24 First of all, I'm going to address the legal
25 issue -- some of the legal issues. The legal reasons

|| 1014-2
cont'd

|| 1015-1

1015-1 DOE acknowledges your support for the Conservation of Natural Resources Alternative. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

|| 1015-2

1015-2 DOE acknowledges your comment and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

|| 1015-3

1015-3 DOE entered into the 2010 Agreement on Consent under the authority granted the Department in the Atomic Energy Act (AEA). The AEA authorizes DOE to "advance the goals of restoring, protecting and enhancing environmental quality, and assuring public health and safety" (42 U.S.C. 7112(13)).

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 that are asserted in support of the AOC are spurious.
 2 I've heard a lot of talk in the whole room as for
 3 proponents of the AOC claiming that the DOE is bound by
 4 it and it was signed voluntarily. And, first, the way
 5 the case, it is questionable as to whether it even --
 6 whether DOE even has the legal right to enter into the
 7 AOC. DOE is a department of the executive branch of
 8 government. It does not pass legislation. DOE's
 9 signing the AOC has so far avoided legal
 10 scrutiny; however, it is likely in violation of the
 11 Supremacy Clause of the United States Constitution,
 12 Article 6, Clause 2. It is likely that the DOE is
 13 barred from unilaterally to signing -- deciding to wave
 14 the rights of the United States. There must be a
 15 specific act of Congress authorizing such an action.

16 The second assertion that DOE was likely
 17 signing voluntarily is clearly preposterous. At the
 18 time, the AOC SB 990 was still state law. The DOE was,
 19 therefore, under the duress of signing the AOC or else
 20 face penalties. SB 990 has since been found to be
 21 unconstitutional in "Boeing versus Raphael." It is
 22 unlikely that the DOE would have signed the AOC were it
 23 not for the duress this SB 990 and actors then and by
 24 various elected officials. I'm not going to attempt to
 25 go further with the impacts that would have been

1015-3
cont'd

DTSC did not enforce SB 990 with respect to DOE, so DOE was under no duress attributable to SB 990 when the 2010 AOC was negotiated. The 2010 AOC states that DTSC agreed that compliance with the 2010 AOC would constitute DOE compliance with applicable provisions of the California Health and Safety Code (Section 1.6), including Senate Bill 990. However, after the law was declared unconstitutional, SB 990 was no longer enforceable.

1015-4 1015-4 Please see the response to comment 1015-3.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 interference from various congressional, state and local
2 elected officials, some of whom control the purse --
3 purse strings of DOE and other agencies involved.
4 Voluntarily signed. Get real. Okay.
5 There are several lines of evidence from the
6 natural history of the site, which looks like I'm not
7 going to have time to address. However, I've been
8 studying bird logs at Santa Susana Field Laboratory for
9 going on seven years now, and I'm doing a cancer study
10 of the bird life, and I have found no examples, that is
11 zero, no examples of any --
12 (Clock timer ringing)
13 MR. OSOKOW: -- birds that have been infected by
14 contaminants, and birds are far more sensitive in
15 environmental indicators than humans are.
16 (Clock timer ringing)
17 MR. OSOKOW: Cancers don't take many years to
18 develop in many cases. Birds have their own types of
19 cancers and they're not going to die.
20 MS. LOWE: Thank you, Mr. Osokow. I think this is
21 an opportunity to remind everybody that you can submit
22 as many comments as you want in writing. So, we have
23 three minutes tonight. Christina Walsh will be followed
24 by Bonnie Klea and then Devyn Gortner.
25 MS. WALSH: Good evening. My name is Christina

1015-4
cont'd

1015-5 1015-5 Thank you for your comment. It has been included in the Administrative Record for the EIS and agrees with the preparers' observations of a healthy ecosystem outside the industrially developed portions of the site.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 Walsh. I represent cleanuprocketdyne.org, which I
 2 founded in 2001, as well as the National Monument
 3 Project that I had hoped that there could be a future
 4 for this site.

5 The first thing I'd like to introduce that I
 6 am -- I'm deeply disturbed about -- first of all, the
 7 prior speaker has had seven years of full access to the
 8 site on his own, and so he's clearly motivated to keep
 9 it that way.

10 This is a chart -- excuse me -- a chart that
 11 has been distributed to the public by the CAG. It is
 12 false. It describes all three alternatives as AOC
 13 alternatives. It also says that they take 12 years,
 14 five years, and four years, so this -- this has been
 15 redone, and then it's been altered and distributed so
 16 that people in West Hills will vote thinking all of them
 17 are compliant. So, that's a serious misdirection from
 18 the group that is funded by DOE that says that they were
 19 told to keep it a secret, that was the condition of
 20 funding.

21 Now I'm going to talk about these maps that
 22 you've provided. According to the -- this first one,
 23 this is your paint areas. It shows that the AOC version
 24 requires that you remove all of the roads across the
 25 entire site, so miles and miles of roads, so that

1016-1

1016-1 DOE does not control information distributed by those it has funded, including not only the CAG, but also the SSFL Advisory Board, SSFL Work Group, Committee to Bridge the Gap, Physicians for Social Responsibility, Rocketdyne Cleanup Coalition, and Teens against Toxins. DOE does not direct grantees on publicizing the receipt or source of grants. It was at the discretion of the CAG whether to publicize the grant. DOE posted notification of the grant in September 2015 on USASpending.gov, an official website disclosing grants, loans and other financial assistance awards. Information on the SSFL CAG grant can be found here: <http://go.usa.gov/xWpte>.

1016-2

1016-2 Within Area IV, about 10,000 feet (less than 2 miles) of paved road remains. As stated in the Draft EIS, DOE does not plan to remove any road as roads will be needed to access well and stormwater sampling stations. An exception may be made for roads where soil contamination has been shown to extend below a road.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 increases the number of trucks to that 70,000. It
2 certainly helps along the way.

3 Then I'd like to look at these shaded areas.
4 I've been told that the shaded areas that are supposed
5 to be deducted from the number of trucks are not
6 deducted from the number of trucks. So, it's falsely
7 inflated to make that big, bad AOC cleanup look too
8 impossible to do.

9 Now I look at the shaded green areas, and I'm
10 very disappointed to see that there are no -- there's
11 really -- there's no contrast on these, so it's very
12 hard to see where they reach. But I -- I do see,
13 because I know the site very well, that these shaded
14 areas include -- excluding the old conservation yard,
15 which had more than 10,000 barrels and containers of
16 contaminated waste strung across it, it showed that part
17 of the SRE, where they had the nuclear partial meltdown,
18 is also now a -- a shaded green area. The Building 56
19 Landfill and Building 56 Excavation have been shaded
20 green as if they are something special, as well as the
21 Area IV Burn Pit partial area, and S -- STR4, and even
22 the Hot Lab Back Yard is being shaded as -- as if it
23 shouldn't have to go. The little white areas, the few
24 that you see, are actually buildings. So, this is
25 showing us that they're not even going to remove.

1016-2
cont'd

1016-3 1016-3 The Old Conservation Yard has been subject to prior soil cleanup actions, all drums and materials have been removed, and EPA's data show no radiological impact today. The green areas identify locations where exemptions to cleanup may be applied to protect biological and cultural resources. The green areas are not exempt to cleanup actions, focused cleanup actions would be performed in areas where contamination exceeds human health and ecological risk-based limits.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 I just -- I'm -- I'm extremely disappointed.
 2 I wanted -- I want to protect these areas. I think that
 3 they're critical, one of our corridor native species --
 4 (Clock timer ringing)
 5 MS. WALSH: -- and as sacred Native American sites.
 6 But you are all taking advantage of that --
 7 MS. LOWE: Thank you, Ms. Walsh.
 8 (Clock timer ringing)
 9 MS. WALSH: -- and using that to falsely --
 10 (Clock timer ringing)
 11 MS. LOWE: Thank you very much. Bonnie Klea will
 12 be followed by Devyn Gortner, will be followed by Ronald
 13 Smith.
 14 MS. KLEA: Hello. My name is Bonnie Klea. I
 15 worked in the early years at the Santa Susana, and in
 16 1994 I was diagnosed with brain cancer. All my doctors
 17 said they were treating many, many employees from the
 18 site, and my -- my cancer was a work-related cancer.
 19 By -- by the end of the 1990s they're -- the
 20 Department of Energy's -- and the head of the Department
 21 of Energy was Hazel O'Leary saw that all the cancer
 22 studies done of all the nuclear sites in America showed
 23 a high rate of cancer among the workers, and she got
 24 together with President Clinton then and they passed a
 25 nuclear compensation program for 350 companies in

1016-4

1016-4 DOE is applying the exemptions allowed in a very reasoned manner. Please refer to "Application of Exemptions under the 2010 Administrative Order on Consent" (Section 2.4 of this CRD) for a discussion of this topic and DOE's response. Regardless of exemption area boundaries, soils with concentrations of chemical and/or radioactive constituents that pose a threat to human health or the environment would be cleaned up. The relationship of Area IV and the NBZ to wildlife corridors in the region is an important topic that has been updated with additional information in this Final EIS.

1017-1

1017-1 DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. One of these studies, by the University of Southern California Cancer Surveillance Program, reviewed the incidence of retinoblastoma in children in Los Angeles and Ventura Counties (CSP 2007). The study authors concluded that the incidence of retinoblastoma among children under age 5 residing in the area around SSFL between 1988 and 2005 was slightly, although statistically not significantly, higher than expected based on incidence statewide. Section 3.9.5 also summarizes the published health studies for workers at SSFL, as well as cancer mortality and incidence rates for the United States, California, and Los Angeles and Ventura Counties.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 America for all the workers who got one of 22 cancers
2 and worked there at least 250 days.

3 And I was shocked to see that Atomics
4 International, Santa Susana, Canoga, Desoto and the
5 Downey facility were all listed and covered. But guess
6 what? We couldn't get paid. Boeing got involved. They
7 were on our phone calls with the Department, they came
8 to our meetings, and none of us -- there were two people
9 who got paid when I got involved, and I filed a special
10 exposure covert, and I had to prove that they didn't
11 have the records to figure out how much dose we had
12 received, and I won. Just last December, they gave us
13 24 more years. So, all workers can get paid without any
14 burden of proof by them from 1948 through 1988.

15 I have counseled many wives whose husbands
16 were dying. I counseled many husbands who knew they
17 were dying, that I'd help their wives get the
18 compensation. Children had both parents who worked
19 there and died of cancer, I helped them get their claims
20 paid.

21 I lived at -- in 1959, in each homes, all of
22 the -- the houses they removed -- or built in 1959, and
23 after I was diagnosed, I did a survey of all our
24 neighborhoods with a note pad, and I found out that
25 every single house on my street had one or two deaths,

1017-1
cont'd

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 every single house, and it was the same way in every
 2 single neighborhood where I live.

3 I know that a study was done of all the
 4 radionuclides. 45.1 million dollars was spent.
 5 Everybody knows exactly where those radionuclides are.
 6 You know where they are. We know where they are. And I
 7 support the AOC to -- to clean it all up. There
 8 shouldn't be any radionuclides left up there. And, if
 9 anything needs to be changed, I would recommend that you
 10 extend the period of time. Instead of trying to figure
 11 out how to have so many trucks per year, just give it a
 12 few more years.

13 And, it's so sad to see all these new families
 14 now with children, 35 -- 35 families with little kids
 15 with leukemia, and it makes me very sad. I was hoping
 16 the danger of cancer would have passed, but obviously
 17 not, and I've seen the -- the retinoblastoma families
 18 and now we have new --

19 (Clock timer ringing)

20 MS. KLEA: -- families with little children with
 21 cancer, and it's very, very sad. Please clean up --
 22 this up.

23 MS. LOWE: Thank you, Bonnie Klea. Devyn Gortner,
 24 and then Michael Smith, and then we will take a five
 25 minute break for the front of the room to have a chance

1017-1
cont'd

1017-2

1017-3

1017-4

1017-1
cont'd

1017-3
cont'd

1017-2 DOE thanks you for your comment. The extensive soil sampling performed by EPA and DOE and the review of those data by EPA and DTSC show that the radioactive contamination is restricted to about 12 locations.

1017-3 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

1017-4 As discussed in Chapter 2, Section 2.4.4, of this EIS, DOE, NASA, and Boeing have entered into a transportation agreement (Boeing 2015a) through which they would manage the daily number of truck round trips on Woolsey Canyon Road to no more than 96. (After consideration of budget and operational constraints, DOE has incorporated a more realistic estimate of 16 truck round trips per day on Woolsey Canyon Road for DOE soil removal activities. The impacts of this reduction in truck traffic have been incorporated into the analysis of all three of the soil remediation action alternatives.) Extending the period of time for remediation activities would reduce the daily and annual risks and other environmental impacts such as water use; however, it would not reduce the overall risks or impacts determined for an alternative but would only spread them over a longer period of time. DOE will consider your recommendation when developing the Record of Decisions for this Final EIS.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 to go to the restroom. Devyn.
2 MS. GORTNER: My name is Devyn Gortner. I grew up
3 less than five miles from the site. I'm the founder of
4 Teens Against Toxins, and I'm here today -- that
5 happened for almost a decade -- to speak on behalf of
6 the undercommittee near SSFL. I wish I could play on
7 the peak, but radiation rise up to you, but, I said, I
8 grew up to Madonna, and the environmental nuclear
9 horror.
10 Research here to debunk the claim that DOE's
11 been making that these alternatives are -- alternatives
12 are protective of human health. The DOE claims their
13 risk-based cleanup option will allow 25 millirems a year
14 exposure. This is the equivalent of a chest X-ray per
15 month for a year for decades.
16 But the actual number is far higher. Please
17 bear with me. I promise what I've got to share is
18 simple math. To calculate this estimated risk to human
19 health, DOE claims to have used the suburban residential
20 scenario, but actually left out the suburban component
21 of that scenario, which is required to be included. In
22 fact, the DOE's risk estimate low-balled this by a
23 factor of at least a hundred thousand.
24 By comparison, if you run the EPA's dose
25 compliance calculator for the same scenario used but

1018-1

1018-1 The EPA dose calculator default residential exposure pathways include a garden pathway which assumes 25 percent of the fruits and vegetables consumed by the resident are raised in a home garden. The EPA dose calculator results in the same risk slope factors as were used in the Draft EIS when the garden pathway is not included.

In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. The use of RBSLS that do not include the indirect garden pathway is appropriate for this future land use.

In this Final EIS (see Chapter 2, Section 2.4), DOE has retained the Cleanup to Revised LUT Values Alternative, which uses chemical RBSLS based on an Onsite Suburban Residential Scenario without a garden pathway. The Final EIS also retains the Conservation of Natural Resources Alternative, but evaluates two scenarios. The Open Space Scenario is based on the future land use of Area IV and the NBZ as open space, consistent with Boeing's conservation easement and agreement (i.e., cleanup levels are based on exposure of an onsite recreational user as the receptor). The Onsite Suburban Residential Scenario is the scenario evaluated in the Draft EIS, that is, cleanup levels are based on a suburban residential scenario without a garden pathway. This latter scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space.

In Chapter 4, Section 4.9 of this Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that local residents may get some portion of their food from a home garden.

When a risk assessment is performed, EPA Risk Assessment Guidance (EPA 1989) does allow for some averaging and prescribes the use of an upper confidence limit (UCL) on the arithmetic average (UCL95) and only suggests the use of a maximum value as a screening tool. It is important to note that under any of the soil remediation alternatives, those soils with the higher levels of chemical and/or radioactive constituents, that is, those that would pose a risk to human health or the environment, would be removed. Soils that would be left on site would have lower concentrations of chemical and/or radioactive constituents. Each of the three action alternatives analyzed in this EIS would leave SSFL Area IV and the NBZ safe for their designated future land.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 include the background suburban component as required
 2 and look at the amount of strontium-90, that would yield
 3 a dose of 25 millirem, which is what the DOE's
 4 proposing, you'd be looking at 19.4 picocuries per gram.
 5 The DOE is proposing a standard of 1200
 6 picocuries per gram of strontium-90. That is 62 X-rays
 7 a month or 744 a year for a decade. Children like Grace
 8 and Ryan, pregnant women, and families would be exposed
 9 to those levels.
 10 And now the DOE's proposed standard is based
 11 on a dose and concentrations that are averaged over a
 12 wide area, meaning the contaminated places are diluted
 13 by averaging lower readings half a mile away, so the
 14 actual exposure could be more than 744 X-rays a year,
 15 even in the thousands. I've been reading the history of
 16 Round-Robin in order to be aware of chest X-rays, and
 17 even our doctors recommend no more than one a year. The
 18 following forset (ph) values is totally inconceivable
 19 and infuriating.
 20 I said it on Saturday. I'll say it again.
 21 You promised me you would protect me, my family and my
 22 community. You promised six years ago that you would
 23 clean up the mess you made so if there's any left, you
 24 never made it in the first place (sic). The cleaning up
 25 debunked every single one of your excuses as to why you

1018-1
cont'd

1018-2 1018-2

DOE chose to identify the 25 millirem per year in its risk-based alternative for clean in this EIS, consistent with the upper limit for dose-based release criteria under DOE requirements (DOE Order 458.1). The 25 millirem in a year exposure limit would represent a maximum possible dose. It did not take into account the Department's requirement to apply ALARA. DOE does not propose in the Final EIS radionuclide cleanup standards based on dose. DOE instead has conducted a risk-assessment based approach for soil remediation. DOE notes that the methodology used in the cleanup evaluation for the Conservation of Natural Resources Alternative in the final EIS results in doses that are well below the 25 millirem year upper limit and are in a range that is consistent with the CERCLA target risk range.

DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 cannot keep this promise.
2 Maybe we will never have definitive proof that
3 the exact contamination you left created a cancer that
4 braced Grace and Ryan dozens of other children, but even
5 the slightest chance it could be linked should be more
6 than enough to act and act now. Better safe than sorry.
7 It rained today, washing more and more of the
8 contamination down into the neighborhood below the site.
9 Tomorrow it's going to be sunny, and the kids are going
10 to go back playing in their yards. Your move.
11 MS. LOWE: Michael Smith.
12 MR. SMITH: Hi. I'm Michael Smith. I'm an
13 attorney and legal advocate. I was born and raised in
14 the area, yet I'm just learning about all this with
15 Santa Susana Laboratory. I think this is sad. I think
16 how does something so significant and tragic become
17 undermind.
18 Moving on to jurisdictional issues, I think
19 provided by NEPA versus the AOC, that's the
20 questionable -- a questionable thing. Also the DTSC
21 should be imposing more strict standards, particularly
22 because this affects public health and safety. There's
23 also legal issues and logistics I want to discuss.
24 First of all, the AOC, as a lot of people have
25 pointed out, is a legally binding agreement which

|| 1018-2
cont'd

|| 1018-3

1018-3 DOE acknowledges your concern. Please refer to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for additional information on these subjects. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

|| 1019-1

1019-1 Thank you for your comment. Because the comment is not on the scope or content of this EIS, no response is provided. It has been included in the Administrative Record for the EIS.

Section 3 - Public Comments and DOE Responses

3-1627

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 imposes legal obligations and guidelines for cleanup.
 2 The AOC provides a -- the schedule for implementation of
 3 planned remedial actions shall ensure that identified
 4 activities be accomplished by 2017 or sooner. It's now
 5 nearly two months into 2017, and there's been no
 6 implementation of remedial actions. As put in
 7 compliance, the DTSC should be imposing a \$15,000 per
 8 day fine for noncompliance. However, there -- there's
 9 yet to be any fine imposed by -- and by a number of
 10 calculations, that's near \$900,000 worth of fines by
 11 March 2017. Where's the accountability on that?
 12 And there should be no issuance of legislation
 13 based on arbitrary and/or skewed statistics and
 14 timelines, which I think we all -- or most of us believe
 15 is the case. This very -- the charts and graphs, this
 16 small geographical radius considered, and this is also
 17 an issue of transparency, and I think we need to be a
 18 little bit more transparent here.
 19 The AOC does include -- also the note issues,
 20 is that AOC does not include a leave-in-place
 21 alternative or any alternatives, that the DEIS proposal
 22 should not even be considered pursuant to this order, as
 23 they consider leave-in-place options like natural
 24 attenuation.
 25 We're dealing -- we're dealing here with

1019-1
cont'd

1019-2

1019-2 The AOC allows for onsite treatment of soil, of which monitored natural attenuation is considered treatment. DOE applied this treatment to soil with "low concentrations" of petroleum-like chemicals. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 governmental agencies and public health. I want us to
2 be better safe than sorry, no matter -- just -- just
3 than take a risk.
4 Thank you.
5 MS. LOWE: Thank you. So, we will take a
6 five-minute break. We will reconvene at 8:05. To just
7 give you a sense of where we are, that 19 people have
8 testified so far. At this time, I've got 43 registered.
9 If you haven't signed up to speaking and you would like
10 to, please do so while we're on a break. The next three
11 people are Matt Chin, Catherine Lincoln and Dorri
12 Raskin.
13 (Recess Taken)
14 MS. LOWE: Okay. People, could you please be --
15 sit back down and quiet down. Okay. If you could
16 please sit down and stop talking. Matt Chin will be
17 followed by Catherine Lincoln and then Dorri Raskin.
18 Please quiet down for Mr. Chin to offer his comments.
19 MR. CHIN: My name is Matt Chin. I grew up in
20 Agoura Hills and I'm a current resident of Agoura Hills,
21 and I've been told Saturday -- I was completely unaware
22 everything else happening, and -- and I was scared. I
23 got to reading -- they scared -- the amount of time
24 that's gone by without any action at all. We're talking
25 about nuclear waste here, and they're not saying that

1019-2
cont'd

1020-1

1020-1 Chapter 1, Section 1.3, contains a history of the SSFL site that summarizes DOE's past activities in Area IV, including previous cleanup efforts. Additional information can be obtained from the DOE Energy Technology Engineering Center website (see <http://www.etec.energy.gov/>). DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. DOE will complete contamination removal and site remediation based on the decisions made pursuant to this Final EIS and in compliance with regulatory requirements, including regulations, orders, and agreements. Like other waste generated at Area IV, radioactive waste generated under the activities evaluated in this EIS will be managed (disposed in the case of radioactive waste) in accordance with applicable State and Federal regulations. Generation and management of radioactive and other wastes resulting from the activities evaluated in this Final EIS are addressed in Chapter 4, Section 4.10, of this EIS.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 we've been told -- a person to understand, nuclear waste
 2 is really a big deal. The thought that I grew up there,
 3 possibly having family and their lives really scared me.
 4 As a resident, I would like to see this thing
 5 cleaned up as soon as possible. All the timelines that
 6 I've been shown, so far, they contaminated, but there's
 7 nothing they're doing about. It's going to be there for
 8 a long time until you take action and remove it. And,
 9 as a resident, I just want to say, I want trucks. I
 10 don't care if it's 10 years, 20 years. It's going to be
 11 there for potentially 100,000 years or more unless
 12 someone cleans it up. If you have responsibility, then
 13 it's your responsibility to clean it up. Somebody has
 14 to do it. I think I should voice issues that AOC is the
 15 original contract.
 16 Thank you.
 17 MS. LOWE: Thank you. Catherine Lincoln will be
 18 followed by Dorri Raskin and then Jane Londi.
 19 MS. LINCOLN: Hi. My name is Catherine Lincoln,
 20 and I've been a resident of San Fernando Valley for
 21 almost 35 years. I am deeply upset that the DOE is
 22 breaking its legally binding commitment to clean all of
 23 the contamination at their SSFL site.
 24 Every one of the cleanup options violates the
 25 AOC cleanup agreement, leaving in place 39 to 100

1020-1 cont'd

1020-2

1020-3

1021-1

1020-2 Thank you for your comment. It has been included in the Administrative Record for the EIS.

1020-3 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. There has been a lot of cleanup performed in Area IV. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation at those portions of SSFL for which DOE is responsible, Area IV and the NBZ.

1021-1 Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 percent of the contamination while the AOC bars
2 consideration of any leave-in-place alternatives.

3 But as my time is limited, I'd like to focus
4 on particularly the egregious violation: One of the
5 excuses the DOE is using to not clean up about 330,000
6 cubic yards of soil is what they claim to be a
7 biological exemption, but DOE is grossly representing
8 this exemption, which is strictly limited in the AOC and
9 for which it does not qualify. The AOC states that the
10 entire site must be cleaned up to local background
11 levels. It allowed a very narrow exception to be
12 considered only to the extent that the U.S. Fish and
13 Wildlife Service -- and I quote -- "issues a Biological
14 Opinion with a determination that implementation of the
15 cleanup action would violate Section 7(a)(2) or Section
16 9 of the Endangered Species Act, and no reasonable and
17 prudent measures or reasonable and prudent alternatives"
18 would "exist that would allow for the use of the
19 specified cleanup standard in that portion of the
20 site." That's the quote. There has, however, been no
21 such biological opinion from the U.S. Fish and Wildlife
22 Service. The exception does not apply.

23 Indeed, the U.S Fish and Wildlife Service did
24 issue a biological opinion several years -- several
25 years ago to EPA when they were pretending to work for

1021-1
cont'd

1021-2

on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

1021-2 Please refer to "Application of Exemptions under the 2010 Administrative Order on Consent" (Section 2.4 of this CRD) for a discussion of DOE's activities to implement exemptions in compliance with the 2010 AOC. Contrary to the commenter's assertion that this EIS says DOE is not going to clean up anything in any of the biological exemption areas, Chapter 2, Section 2.3.2 of this EIS, indicates that these areas would be cleaned up if chemical or radioactive constituents in the soil pose a risk to human health or the environment, as determined using risk-based screening levels (RBSLs). The text in this EIS was revised to more clearly make this point.

This Final EIS provides an updated assessment of cleanup activity and exemption areas, and also has incorporated the results of consultation with U.S. Fish and Wildlife Service.

The 2010 Biological Opinion issued for EPA's activities has very limited applicability to the present project as explained in Section 2.3 of this EIS. Soil remediation requires removal of vegetation and soils in the treated areas, a profound and difficult-to-mitigate impact, whereas the EPA action that was the subject of the 2010 Biological Opinion involved trimming or mowing vegetation, a much less severe impact, which leaves the potential for rapid recovery of the vegetation and habitat by re-sprouting or germination from the soil seed bank. The impacts of extensive removal of soils and vegetation under cleanup to AOC LUT values would be much more severe and recovery after this disturbance has many uncertainties and would be prolonged at best.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 the cleanup, which was to involve cutting down some
 2 vegetation part so a radiation survey could be done, and
 3 they concluded that mitigation measures could be done
 4 and that indeed the cleanup of the contamination was
 5 critical for protecting the biological resources.

6 So, the Draft EIS, however, says they're not
 7 going to clean up anything in any of their self-declared
 8 biological exemption areas. DOE has no right to declare
 9 these areas or to decide for themselves how to handle
 10 it. And, furthermore, the guidelines say that if
 11 biological resources are identified, mitigation measures
 12 are to be taken, not that the DOE should avoid cleanup
 13 altogether. DOE claims they want to protect the
 14 environment and species by not cleaning up the
 15 contamination. However, leaving contamination on the
 16 site would actually hurt the ecosystem.

17 I would ask that DOE fully comply with the
 18 AOC, clean up all of the contamination and stop trying
 19 to greenwash a plan which appears to be wanting to avoid
 20 the cost of the cleanup behind the ESA. Please, clean
 21 this site fully.

22 MS. LOWE: Thank you. Thank you, Ms. Lincoln.
 23 Dorri Raskin will be next, followed by Jane Londi,
 24 followed by --
 25 (Clock timer ringing)

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 MS. LOWE: -- sorry -- followed by Catherine
2 Stettner.

3 MS. RASKIN: Hi. I'm Dorri Raskin. I'm ready to
4 comment on DOE's Draft DES for the SSFL Area IV cleanup.

5 As you know, SSFL was primarily used for
6 rocket engine tests that -- that went on for decades,
7 leaving a legacy of contamination of dangerous
8 radionuclides and toxic chemicals. These contaminants
9 migrate from the site and put nearby communities at risk
10 of cancer and other illnesses. Federal studies indicate
11 higher rates of certain cancers for both workers at the
12 site as well as off-site population. It is, therefore,
13 imperative that the site be fully cleaned up as DOE
14 committed to do in 2010 when it signed a -- a AOC to
15 clean up to background level the contamination.

16 Unfortunately, all the cleanup options
17 presented in the DOE DES violate the AOC cleanup
18 agreement, leaving between 34 to 94 percent of the site
19 not cleaned up. The AOC requires that all detectable
20 contamination be cleaned up and it expressly bars any
21 leave-it-in-place option.

22 DOE claims that its recent cleanup options are
23 sufficiently protective of public health, but they are
24 not. In deed, DOE's second and third options manipulate
25 long-standing EPA protective standards and guidelines.

1022-1

1022-2

1022-3

1022-4

- 1022-1 This Final EIS is being prepared to evaluate alternatives for completing the remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Chapter 1, Section 1.3, provides a history of the SSFL site that summarizes DOE's past activities in Area IV, including previous cleanup efforts. Additional information can be obtained from the DOE Energy Technology Engineering Center website (see <http://www.etc.energy.gov/>). Rocket engine testing was a completely separate activity from the nuclear research DOE and its predecessor agencies conducted in Area IV; and was conducted in locations other than and physically separated from Area IV, by entities other than DOE. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. DOE will complete contamination removal and site remediation based on the decisions made pursuant to this Final EIS and in compliance with regulatory requirements, including regulations, orders, and agreements.
- 1022-2 DOE acknowledges your concern. Please refer to Section 2.7, "Offsite Impacts," of this CRD regarding what is known about offsite contamination and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for a discussion of the public health studies worker health studies related to SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.
- 1022-3 Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 Furthermore, the National Academy of Scientists and all
 2 federal agencies state that there is no safe level of
 3 radiation exposure.

4 DOE failed to consider routes for the
 5 transportation of contaminated soil that avoids
 6 neighborhoods. DOE failed to consider, for example,
 7 alternative truck routes, as well as the railroad
 8 station less than a quarter mile north of the site that
 9 is able to ship out contaminated soil. The station is
 10 accessible by routes that do not pass any residents.
 11 Instead, it only considers trucking the waste to a
 12 railroad line 50 miles away.

13 DOE must comply with the AOC and reject all of
 14 the cleanup alternatives imposed in making ES, as well
 15 as the no action alternative for soil remediation. DOE
 16 also must recognize that the (inaudible) SSFL, it does
 17 not have the authority to decide what the cleanup will
 18 be. Under both the Resource Conservation Property Act
 19 and the AOC, it's the California DTSC that makes the
 20 cleanup decision, not DOE.

21 Rocketdyne has left contaminated far too long.
 22 It's high time for the DOE to fulfill its cleanup
 23 obligation, honor the AOC that it signed, and ensure
 24 that the current, future generations are not at risk
 25 from the SSFL contamination. It's time to do it now.

1022-4

1022-6

1022-3
cont'd

1022-4

action alternatives evaluated is protective of the health and safety of the public and the environment. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. The use of RBSLS that do not include the indirect garden pathway is appropriate for this future land use.

In this Final EIS (see Chapter 2, Section 2.4), DOE has retained the Cleanup to Revised LUT Values Alternative, which uses chemical RBSLS based on an Onsite Suburban Residential Scenario without a garden pathway. The Final EIS also retains the Conservation of Natural Resources Alternative, but evaluates two scenarios. The Open Space Scenario is based on the future land use of Area IV and the NBZ as open space, consistent with Boeing's conservation easement and agreement (i.e., cleanup levels are based on exposure of an onsite recreational user as the receptor). The Onsite Suburban Residential Scenario is the scenario evaluated in the Draft EIS, that is, cleanup levels are based on a suburban residential scenario without a garden pathway. This latter scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space.

In Chapter 4, Section 4.9 of this Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that local residents may get some portion of their food from a home garden. DOE chose to identify the 25 millirem per year in its risk-based alternative for clean in this EIS, consistent with the upper limit for dose-based release criteria under DOE requirements (DOE Order 458.1). The 25 millirem in a year exposure limit would represent a maximum possible dose. It did not take into account the Department's requirement to apply ALARA. DOE does not propose in the Final EIS radionuclide cleanup standards based on dose. DOE instead has conducted a risk-assessment based approach for soil remediation. DOE notes that the methodology used in the cleanup evaluation for the Conservation of Natural Resources Alternative in the final EIS results in doses that are well below the 25 millirem year upper limit and are in a range that is consistent with the CERCLA target risk range.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 Clean up everything.
2 Thank you.
3 MS. LOWE: Thank you, Ms. Raskin. Okay. Jane
4 Londi.
5 MS. UNIDENTIFIED: She's in the bathroom.
6 MS. LOWE: Okay. Catherine Stettner and then Chris
7 Rowe.
8 MS. UNIDENTIFIED : Oh, I'm sorry. She is right
9 here.
10 MS. LOWE: Oh. Okay. Jane Londi.
11 MS. LONDI: I'm representing the Decision Solehood
12 of Rocketdyne, the Rocketdyne Cleanup Coalition, and the
13 San Fernando Workshop. I've been coming out here since
14 1989, and I've seen the same thing over and over again,
15 all these studies that are being done, and their -- and
16 examining over and over the quality of this, and the
17 quality of that, and we're not going no place, and it's
18 very sad, and mirror kind of thought me, that we live in
19 kind of society that we can't depend on the government
20 to take care of us, especially after they had made
21 promises. And I've heard a lot about the AOS (sic), the
22 -- and I felt so good that we had accomplished so much
23 until we got -- because they -- and then what happened
24 is history occurred over and over.
25 So, well, I'm 96 years old, and so I'll be

1022-3
cont'd

1023-1

Due to the uncertainty of risk at low dose and low dose rates risk assessments are performed under current regulatory guidance with a conservative assumption that cancer from exposure to radiation is linearly proportional to the total amount of radiation received with no threshold. Therefore, the risks for this EIS have been calculated for all exposures assuming a linear no-threshold model. However, in view of the rate of cancer in the general population (nearly 1 out of 2 in a lifetime), EPA CERCLA guidance has established that risks of getting cancer less than 1 in 1,000,000 are insignificant and that risks in the range of 1 in 10,000 to 1 in 1,000,000 may be acceptable when all impacts of remediation options are evaluated. Therefore, risks in that range are typically evaluated for acceptability during evaluation of alternatives and selection of a remedy for remediation.

For a discussion of uncertainties in risk assessment at low dose and low dose rates and the conclusions of the National Academy of Science's National Research Council Committee on the Biological Effects of Ionizing Radiation, the commenter is referred to "Uncertainty In Risk Assessment," a Position Statement of The Health Physics Society which can be found at http://hps.org/documents/riskassessment_ps008-2.pdf.

- 1022-5 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of transportation issues and DOE's response.
- 1022-6 DOE recognizes DTSC's authority over the cleanup at SSFL. DOE recognizes that DTSC needs to approve soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC and DOE-prepared RCRA closure plans for building demolition.
- 1023-1 Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD, which addresses steps that must be completed before cleanup can resume, including information on the steps necessary prior to DOE making a decision on alternatives for cleanup of Area IV and the NBZ. Briefly, DOE must complete an EIS (this EIS) and issue a Record of Decision pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions:

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 coming out here probably until I'm a hundred, from the
 2 way things look. So, I hope that everybody will do
 3 their very best to get this thing cleaned up so we don't
 4 have to keep coming back and sitting through these
 5 meetings and trying to figure out all these statistics
 6 and stuff in here and everything. And, let's just not
 7 dilly dally like this over and over. Let's just get
 8 going.

9 MS. LOWE: Thank you, Ms. Londi. Catherine
 10 Stettner will be followed by Chris Rowe and then Kim
 11 Wong.

12 MS. STETTNER: Hi. My name is Catherine Stettner,
 13 and I am appalled that the DOE is trying to break out of
 14 its commitments to clean up the contamination at the
 15 Santa Susana Field Laboratory to the most protective
 16 standard. When people's lives are at stake, cleaning up
 17 to background is the only acceptable solution.

18 The DOE raises several unsubstantiated issues
 19 on the entire -- on the Administrative Order on Consent
 20 that it signed. The first is that supposedly is it's
 21 too difficult to find soil fill that does not exceed the
 22 AOC cleanup standard values. However, the DEIS showed
 23 that Gillibrand fill meets all the requirements with the
 24 minor exception of two constituents. The DOE itself said
 25 these constituents are not a risk for human health or for

1023-1
cont'd

1024-1

1024-2

(1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

1024-1 In this EIS, DOE does not propose breaking the 2010 AOC signed with its regulator, DTSC. However, NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. To meet this obligation this EIS evaluates alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup levels (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). This latter approach, use of a risk assessment, is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 the environment. Furthermore, the AOC states if a soil
2 -- a backfill soil -- if a soil or backfill soil does
3 not meet all of the AOC cleanup values, the DTSC and DOE
4 will discuss this, and DTSC would determine the best
5 available fill, which it appears to be Gillibrand.
6 There is, therefore, no issue with finding the suitable
7 fill under the AOC and the DOE's argument is a
8 non-issue.

9 In regards to transportation, like Christina
10 mentioned, the DOE has also heavily inflated soil volume
11 estimates, and the DOE overestimated the number of truck
12 trips to scare the local community in support of the
13 DOE's efforts to avoid cleaning up the contamination
14 that it created. These slides they're trying to sell,
15 these alternatives, which means that it makes it seem
16 less appealing for them to clean up to background by
17 showing a larger number of trucks passing near their
18 homes instead of showing how much more dangerous it is
19 to leave these contaminants in the soil. This level of
20 -- this level of misrepresentation is reprehensible.

21 The DOE had at least 15 years to do their
22 first environmental assessment to address ways of
23 avoiding truck and pass our neighborhoods but have not.
24 It has also been barred -- but I feel it's necessary to
25 leave you this, but there are numerous routes that will

1024-2
cont'd

1024-2 Please see Section 2.3 "Suitable Backfill Soil" of this CRD for discussion of this topic.

1024-3 DOE used the geographic information system (GIS) database for Area IV and the NBZ to identify on a point-by-point basis, any sample location that had an exceedance of an LUT value (radionuclides published by DTSC on January 30, 2013 [DTSC 2013a] and chemicals on June 11, 2013 [DTSC 2013b]). The GIS system was then used to mark the locations of exceedances, map the extent of exceedance, develop areas and depth of exceedances, and then calculate soil volumes exceeding the LUT values. The sample volume development process was independently reviewed by remediation engineers and the volumes were validated.

1024-3

DOE's intent is not to alarm people, but it is true that the more soil that is removed to clean up the site, the larger the transportation effort (i.e., a larger number of truck trips) that would be required. The analyses in this Final EIS were performed to evaluate the potential impacts associated with the various alternatives for cleanup of Area IV and the NBZ. Results of the analyses allow a comparison of potential impacts and tradeoffs between alternatives. In the case of soil remediation, leaving soil containing low concentrations of chemicals and/or radionuclides on site reduces the number of truck trips from the site. Conversely, removing soil with low concentrations of chemicals and/or radionuclides results in more truck trips from the site. Under any of the three soil remediation action alternatives, Area IV and the NBZ would be cleaned up to a level that is protective of the public and environment (see Chapter 4, Section 4.9). The EIS also shows that the transportation risks are very small; Chapter 4, Section 4.8.1, and Appendix H of this EIS provide details of the transportation risk analysis.

1024-4

1024-4 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of transportation issues and DOE's response.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 only pass a few homes, avoiding residential
 2 neighborhoods, and the DOE has not considered these.

3 There is nothing about the conveyance part
 4 such a conveyor to send to a nearby rail line. The DOE
 5 refused to consider it.

6 There are rail lines a mile -- a mile or so of
 7 this site that can only be reached without passing a
 8 single home. The DOE refuses to consider this. The
 9 only rail option they consider is trucking material 60
 10 miles to Puente Hills to a rail depot that hasn't even
 11 been built yet.

12 I am infuriated by this blatant lie the -- the
 13 DOE is considering cleanup to anything besides what's
 14 protective standard. There is no excuse for not
 15 adhering to the legally binding AOC, and there's
 16 absolutely no better alternative because these proposed
 17 alternatives are merely insufficient but are partially
 18 interests.

19 Thank you.

20 MS. LOWE: Thank you. Chris Rowe will be followed
 21 by Kim Wong and then Bruce Rowe.

22 MS. ROWE: Chris Rowe. It is impossible to address
 23 in the time limits the misinformation that has been
 24 given out in this community for more than 30 years:
 25 There was no meltdown, and it's not a scientific term,

1024-4

1025-1

1025-1 DOE acknowledges the comment. Chapter 3, Sections 3.9.5 and 3.9.6, of this Final EIS contain summaries of the 1959 SRE accident. Additional information can be found at http://www.etec.energy.gov/Operations/Major_Operations/SRE_Accident.html.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 and the only thing that was released was radioactive
2 gas, the Xenon and Krypton. DOE had an expert panel in
3 2009 and it addresses this. Dr. Jan Veah (ph), who was
4 a part of the advisory group, stated that there was no
5 waterfall effect or admitting the effect felt around the
6 site. There are no cancer -- no cancer clusters in our
7 area, Dr. Mathew's presentation on this for a DTS
8 meeting for the areas around the site.

9 But, more specifically, I've been reading the
10 ruling on SB 990, a Boeing suit, DTSC on SB 990, and it
11 was held up in the 9th Circuit Court of Appeals, and it
12 is my opinion based on reading that, that the AOCs are
13 target SB 990, and because SB 990 is found to be
14 unconstitutional, the AOCs internal would be
15 unconstitutional. And, there is a May 2012 EPA fact
16 sheet that says the site -- says it's restricted, and,
17 therefore, the public is not exposed to the
18 contamination they found.

19 I recommend reducing the number of trucks on
20 the site to 50 -- 50 per day maximum; out of state, all
21 this water we lose. I oppose the use of trains. I
22 oppose to the via the 210 Freeway to the 15. I want an
23 alternate route. I do support the immediate domination
24 -- the first thing you do of the -- the buildings, I
25 support that -- I think we -- that's your greatest

1025-1
cont'd

1025-2

1025-3

1025-1
cont'd

1025-4

1025-5

1025-2 DOE acknowledges your comment and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses and cancer clusters in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this EIS, which includes a summary of Dr. Mack's comments at a community meeting. He indicated that although it was not possible to completely rule out offsite carcinogenic effects from SSFL, no evidence was found of measurable offsite cancer causation resulting from emissions from SSFL or cancer causation from any environmental factor. Chapter 3, Section 3.9.5, of this Final EIS also summarizes a number of other studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties

1025-3 DOE entered into the 2010 Agreement on Consent under the authority granted the Department in the Atomic Energy Act (AEA). The AEA authorizes DOE to "advance the goals of restoring, protecting and enhancing environmental quality, and assuring public health and safety" (42 U.S.C. 7112(13)).

DTSC did not enforce SB 990 with respect to DOE, so DOE was under no duress attributable to SB 990 when the 2010 AOC was negotiated. The 2010 AOC states that DTSC agreed that compliance with the 2010 AOC would constitute DOE compliance with applicable provisions of the California Health and Safety Code (Section 1.6), including Senate Bill 990. However, after the law was declared unconstitutional, SB 990 was no longer enforceable.

1025-4 As discussed in Chapter 2, for the Final EIS DOE revised the EIS analysis to reflect a more realistic average of 16 heavy-duty truck round trips per day for soil removal activities, although on some days the number of dally truck shipments could increase to 32. DOE evaluated transport of waste from SSFL down Woolsey Canyon Road, then via multiple local roadways to local freeways. In addition to evaluating all-truck transport, DOE also evaluated the option of using a representative intermodal facility (Puente Hills Intermodal Facility) to allow transport of waste to more distant disposal facilities by train. Regarding the use of alternative transportation routes, please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

Considering all remediation activities at Area IV and the NBZ (i.e., soil remediation, building removal, and groundwater remediation), daily shipments attributable to DOE remediation activities would not exceed 32 and generally would be considerably less. However, NASA and Boeing could also be making shipments of waste, backfill, and equipment during some of the same years that DOE would be making shipments

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 radioactive risk -- and the cleanup to background flex
 2 -- look-up tables, with the qualifiers that I have sent
 3 in to you, because people fear the radionuclides, that
 4 80,000 cubic yards of soil, I want to see the rads go
 5 first. Then I support a risk-based cleanup for the
 6 chemicals. And I -- I'm concerned about the soil
 7 volume, the air contamination, the particulate matter,
 8 the PM2.5, PM10 that will come. I know someone that's
 9 in -- with the moderate -- environmental remediation
 10 field, and he pointed out if you disturb an acre of a
 11 site how much particulate matter is in the air. And
 12 despite watering it down, I've seen these dust devils or
 13 whatever they're called in the Santa Susana Field Lab
 14 parking lot, so when the soil has been disturbed and
 15 it's loose, it's more likely to be airborne.

16 The EPA guidelines to NASA stated that there
 17 should be one cleanup standard for the whole site, and I
 18 believe that should be a risk-based cleanup so the --
 19 (Clock timer ringing)

20 MS. ROWE: -- there with the 2007 Consent Order and
 21 again only 8,000 of the --
 22 (Clock timer ringing)

23 MS. ROWE: -- 80,000 cubic yards of the soil is
 24 radioactively contaminated.

25 MS. LOWE: Thank you, Ms. Rowe. Kim Wong will be

1025-5
cont'd

1025-6

1025-5
cont'd

of waste, backfill, and equipment. As discussed in Chapter 2, Section 2.4.4, of this Final EIS, DOE, NASA, and Boeing have entered into a transportation agreement (Boeing 2015a) through which they would manage the daily number of trucks allowed on Woolsey Canyon Road to no more than 96. The potential cumulative impacts of site remediation by DOE, NASA, and Boeing are evaluated in Chapter 5 of the EIS, including the risks associated with transport of waste and material and the potential impacts on traffic in the SSFL area. DOE expects that daily heavy-duty truck shipments potentially as high as 96 per day from DOE, NASA, and Boeing would only occur for a few years.

Consistent with this estimate, DOE evaluated transport of waste from SSFL down Woolsey Canyon Road, then via multiple local roadways to local freeways. In addition to evaluating all-truck transport, DOE also evaluated the option of using a representative intermodal facility (Puente Hills Intermodal Facility) to allow transport of waste to more distant disposal facilities by train. Regarding the use of alternative transportation routes, please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

Appendix H, Section H.13, of this EIS evaluates the conditions and suitability of the roads that are considered for transporting various materials from and to the site. These evaluations are summarized in Chapter 4, Section 4.8.2. These roads are built to the standard for heavy-duty trucks and are adequate for the vehicles that would be used during the cleanup activities, although some repairs to some roads may be required over the duration of site remediation operations. The operations at the site, including management oversight, the expected traffic volumes, and the consequential traffic speeds, would result in traffic flow conditions with minimum potential for accidents. Section H.13 also provides details on the potential impacts of increased traffic on the roads in the vicinity of SSFL (including potential pavement damage) as well as on the roads near the evaluated disposal and recycle facilities. The EIS indicates that impacts would be small. Water use by DOE for site remediation activities is estimated for each action alternative and combination of alternatives in Chapter 4, Section 4.1, and by DOE, NASA, and Boeing in Chapter 5, Section 5.5.1.

1025-5 DOE acknowledges your support for the Building Removal Alternative. DOE also acknowledges your support for remediation of radionuclide contamination in soil, a risk-based standard for chemicals, and a single cleanup standard for the whole site. DOE's purpose in preparing this EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 followed by Bruce Rowe and then William Bowling. Is Kim
2 Wong present? Okay. I can call for Kim later. Bruce
3 Rowe, followed by Bill Bowling, followed by Abraham
4 Weitzberg.
5 MR. ROWE: Bruce Rowe. I'm emeritus professor at
6 Pierce College in biological science.
7 I believe that the site should be cleaned up
8 on the basis of health risk. Standards of protecting
9 human health is protecting the environment. This must
10 be determined based on scientific studies, not anecdotal
11 ordinations. Most epidemiological studies have shown
12 that there's minimal to no off-site -- and I'm not
13 talking about on-site -- off-site risk from the SSFL
14 site. On-site risk is limited to certain areas of the
15 site and groundwater pollution. The risk should be --
16 these risks should be evicted by rocket poll and
17 scientifically sound methods.
18 As tragic as illnesses of a child or an adult
19 is, anecdotal conclusions that a particular illness is
20 caused by a particular environmental cause of an
21 innocupational types of things -- and I'm not talking
22 about 1959 over people who worked at the site when it
23 was active -- we have no scientific views whatsoever
24 except as a starting point for scientific studies to see
25 if the correlation involves causation. In my opinion,

1026-1

1026-2

- 1025-6 The Final EIS demonstrates that by complying with applicable Ventura County Air Pollution Control District (VCAPCD) Rules, combustive and fugitive dust emissions generated from cleanup activities proposed by DOE would produce less than significant air quality impacts on locations outside of the SSFL boundary. Given the heightened concerns the public has regarding the environmental effects of the proposed soil excavation activities, DOE proposes to achieve very high control levels on all sources of fugitive dust. The need to comply with VCAPCD Rule 55, which restricts emissions of fugitive dust from being visible beyond the property line of a source, also would require DOE to achieve extremely high control levels on all sources of fugitive dust. The proposed cleanup activities would adhere to a fugitive dust control plan that identifies a variety of measures to minimize emissions and therefore to comply with VCAPCD Rule 55. For example, personnel would visually monitor the proposed cleanup activities on a real time basis and if there were any noticeable increase in fugitive dust emissions, they would quickly implement additional measures to mitigate these emissions. As a result, these controls and restrictions would ensure that the proposed cleanup activities would minimize emissions of fugitive dust impacts at offsite locations.
- 1026-1 DOE acknowledges your support for site cleanup on the basis of health risk. DOE's purpose in preparing this Final EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.
- 1026-2 DOE acknowledges your comment and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 such studies have so far failed to show causation
 2 between pollutants at the SSFL site and increased risk
 3 of cancers and other illnesses off-site in the
 4 contemporary period of time.

5 Public opinion also should not drive public
 6 health policy, but many are not always informed or
 7 qualified to make decisions on scientific issues that
 8 have been allowed in today. If a majority of people
 9 think that manmade climate change is not happening, that
 10 does not mean that climate change is not happening.
 11 Climate scientists who are a very small percentage of
 12 the total population are better able to make that
 13 conclusion. In the same way, epidemiologists, chemists,
 14 and public health professionals are better at evaluating
 15 health risk than the general population.

16 In conclusion, I believe that the site should
 17 be cleaned up using balanced criteria that protects
 18 health -- human health and takes into consideration what
 19 the end use of the site will be in that analysis. I
 20 also believe that it would be tragic to apply the most
 21 stringent cleanup and thereby destroy a rare focused-
 22 based setting in the city, a space that acts as a
 23 wildlife corridor while if no -- no health benefit is
 24 gained.

25 It would be also be a tragedy to lose cultural

cont'd

1026-3

1026-3 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 recording that. And, in the same breath, you're saying
 2 what levels do we clean this up to.

3 And, I think that we should clean it up to
 4 background levels because there is no safe levels for
 5 these cancer causing chemicals, not to mention the
 6 radionuclides. We should stick to the AOCs, and I think
 7 the whole site needs to look towards the AOCs, and
 8 Boeing should do the right thing and clean up to those
 9 same levels as well.

10 There's -- like Chris Rowe said, there's a lot
 11 of misinformation in the community, and one of them is
 12 about the road in Woolsey Canyon. It was built to haul
 13 trucks up and down there. It was built by government
 14 contractors.

15 But, there are other alternatives we -- that
 16 we could look at to transport the waste up and down.
 17 There can be conveyor systems that go straight to the
 18 rail line down in Simi Valley or even a direct line into
 19 the Chatsworth landfill or anything like that.

20 It was very sad to see these kids come up and
 21 talk about what they went through. And if we clean this
 22 up to a background level, then we don't have to see this
 23 happen ever again, to have these kids come up and tell
 24 their stories, and it was just -- it really hit me
 25 hard.

1027-1

1027-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

1027-2

1027-2 Thank you for your comment. The scope of this EIS is limited to cleanup of DOE's portions of SSFL, Area IV and the NBZ. Because the comment/statement is not on the scope or content of this Final EIS, no response is provided. It has been included in the Administrative Record for the EIS.

1027-3

1027-3 DOE agrees with the commenter that the selected roads (e.g, Woolsey Canyon and Roscoe Boulevard) are capable of handling large trucks, especially those that would be used during the cleanup activities. Appendix H, Section H.13, of this EIS provides additional details on the roads and the potential impacts from hauling materials on these roads.

1027-4

1027-4 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of transportation issues and DOE's response.

1027-5

1027-5 DOE acknowledges your concerns and refers you to Section 2.1, "Preferences for Cleanup," of this CRD regarding your preference for cleanup to a background level. Also refer to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 Thank you.

2 MS. LOWE: Thank you. I just want to apologize
3 for -- you can tell what I was using for a timing
4 device, and so I apologize for the interruption in the
5 seriousness. I know it's hard to speak in public.

6 So, with that, Mr. Weitzberg.

7 MR. WEITZBERG: The name is Abraham --

8 MS. LOWE: Oh, hang on. Ron Ziman will be next and
9 then Kristin Story. Go.

10 MR. WEITZBERG: My name is Abraham Weitzberg. I'm
11 mostly retired, living at Woodland Hills, and I worked
12 at SSFL on space reactors from 1962 to 1965.

13 I would like to commend the Department for its
14 diligence in preparing the draft which presents
15 evaluations of reasonable remediation alternatives in
16 strict compliance with NEPA. The technical data
17 accurately reflects the information that has been
18 developed in recent years, and the evaluations are
19 sufficiently detailed to allow the decisionmakers to
20 compare benefits, risks, and costs of the alternatives
21 in reaching their decisions. In choosing the preferred
22 alternative and issuing its Record of Decision, the
23 Department should rely on the technical information
24 presented in the DEIS and ignore the widely disseminated
25 but false information about reported public health

1028-1 1028-1 Thank you for your comment.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 effects.

2 The DEIS concludes that for a hypothetical

3 future suburban resident, "Cancer risk and toxicity

4 impacts from chemical and/or radionuclides in Area IV

5 and the NBZ are comparable to or less than the risk

6 determined for background soil." This clearly means

7 that SSFL now poses no additional risks from soil to

8 off-site residents, and that it is questionable whether

9 any soil removal is necessary to protect unlikely future

10 on-site residents under any land use scenario.

11 A second conclusion is that the AOCs as

12 written are unworkable and are in need of revision.

13 This is based on the accepted error rate in the sample

14 analysis of five percent for each contaminant of

15 concern, which means that DOE would likely be

16 remediating clean soil, not just contaminated soil.

17 Also, if the point-by-point, AOC remediation decision

18 process was applied to the background study locations,

19 42 percent would be declared contaminated and subject to

20 soil remediation.

21 DOE concluded that low AOC LUT -- that's Look-

22 Up Table Values -- resulted in data showing that almost

23 the entirety of Area IV to exceed an AOC LUT value for

24 at least one chemical. DOE also concluded that it

25 appears unlikely that replacement soil meeting the AOC

|| 1028-1
cont'd

Response side of this page intentionally left blank.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 requirements can be found. The absurdity of the
2 exceedingly low AOC LUT values should be apparent to any
3 objective observer or a decisionmaker.
4 Based on the discussion of environmental
5 consequences and cost benefit analysis, I conclude that
6 the DOE preferred alternative should be the Low Impact
7 Combination of Conservation of Natural Resources for
8 soil, plus Building Removal, plus Monitored Natural
9 Attenuation for groundwater. While some might suggest
10 that the Cleanup to Revised LUT Values for soil, which
11 removes radionuclides to AOC levels and chemicals to
12 risk-based levels, represents a reasonable compromise --
13 (Clock timer ringing)
14 MR. WEITZBERG: -- I contend that no compromise is
15 necessary simply to assuage the angst of individuals who
16 have an irrational fear of radiation, no matter how
17 small or close to background the dose. As a taxpayer, I
18 believe that the Department should not waste the
19 additional estimated 44 million, damage the additional
20 acres, or inflict --
21 MS. LOWE: Thank you.
22 MR. WEITZBERG: -- the additional truck traffic --
23 MS. LOWE: Thank you, Mr. Weitzberg.
24 MR. WEITZBERG: Thank you.
25 MS. LOWE: Ronald Ziman will be followed by Kristin

1028-2

1028-2

DOE acknowledges your support for the combination of the Conservation of Natural Resources, Building Removal, and Groundwater Monitored Natural Attenuation Alternatives. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

3-1647

Section 3 - Public Comments and DOE Responses

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 Story and then Robert Dodge.

2 MR. ZIMAN: I'm Ronald Ziman. I'm a physician and

3 a scientist. I'm boarded in internal medicine and

4 neurology. I'm a resident of Bell Canyon, stakeholder,

5 co chair of the SSFL Community Advisory Group.

6 Bell Canyon is in the direct line of fire.

7 We're at the doorstep of SSFL. We are downwind,

8 downstream, and downhill from SSFL. It is paramount to

9 protect public health, and then after public health, the

10 environment, the natural, and cultural resources,

11 historical resources, and proper cleanup needs to be

12 balanced in order to properly address these complete --

13 competing goals.

14 I'm not here to criticize the AOCs, but as the

15 2017 deadline clearly will not be met, it will need to

16 be renegotiated to address the extremely low values,

17 among other things, in the look-up tables. The lab

18 confidence intervals of these extremely low levels

19 erodes the ability to clean up the site to background or

20 detect -- to detect standards. It is a scientifically

21 poor methodology. Many are talking of risk but don't

22 want a risk-based clean up. That doesn't make sense to

23 me.

24 Air monitoring off-site to look at the

25 potentially -- should look at the potentially

1029-1

1029-2

1029-1 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

1029-2 This Final EIS demonstrates that by complying with applicable Ventura County Air Pollution Control District (VCAPCD) Rules, combustible and fugitive dust emissions generated from cleanup activities proposed by DOE would produce less than significant air quality impacts on locations outside of the SSFL boundary. Direct transport of these emissions to a distance of nearly one mile to the nearest residence or farther would further dilute these pollutant concentrations to well below any level of health concern.

The proposed cleanup activities would adhere to a fugitive dust control plan that identifies a variety of measures to minimize emissions and therefore to comply with VCAPCD Rule 55 – Fugitive Dust. Personnel would monitor the proposed cleanup activities on a real time basis and if there were any noticeable increase in emissions, such as fugitive dust, they would quickly implement measures to mitigate their intensities, thereby avoiding any substantial air pollutant exposure to the public.

DOE, NASA, and Boeing each implemented their respective baseline air monitoring programs in early 2018 for their areas of responsibility at SSFL. For DOE the program includes a meteorological station within Area IV and four air monitors along the perimeter of Area IV (as described in NASA/Boeing/DOE 2017). The perimeter stations include two along the north border near the SRE and RMHF, one along the western border, and one along the southern border. DOE is operating the system to establish a pre-remediation baseline. The system will continue to operate during remediation activities to monitor any potential air pollutant releases of concern. If the air monitoring network indicates any elevated levels of air pollution, onsite staff would take action to mitigate the releases to acceptable levels. A description of the DOE air monitoring system was added to Chapter 3, Section 3.6.1 of this Final EIS.

Air quality impacts from proposed offsite haul truck transport would be minimal, due to the relatively low emission rates of these vehicles. As discussed in Final EIS Chapter 4, Section 4.6.4.2, the air quality analysis estimates that unmitigated diesel particulate matter (DPM) emissions generated by a 2023 average California truck fleet within the entire South Coast Air Basin analysis domain under the nearby disposal site scenario would amount to less than 31 pounds per year, or about 0.4 pounds during a peak day (based on 32 truck round trips per peak day) (Leidos 2018b; Tables 1.A-23 and 1.A-24; [DPM is about 20 percent of the PM10 values in these tables]). These emissions would occur over about 160 miles of roadway that span a large portion of the SCAB. As a result, populations adjacent to roadways proposed for the transport of materials from

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 contaminated communities, not just be air monitoring on
2 site. It needs to include looking for Valley Fever,
3 which is endemic to this area, and infectious via the
4 air route.

5 Though I favor the conserve -- Conservation of
6 Natural Resources alternative, it could be argued in
7 view of no evidence of contaminants being present in or
8 affecting Bell Canyon, Runkle Canyon, and Simi Valley,
9 and likely San Fernando Valley, one could argue strongly
10 for the No Action Monitoring alternative, which would
11 benefit the site, save it for use as open space by
12 natural attenuation, and preserve the environment,
13 natural, cultural, and historic resources.

14 No backfill has been identified, as has
15 already been mentioned, that really meets all of the
16 look-up table standards, and that should be an
17 indication of the unrealistic cleanup which is being
18 dictated by the AOCs in their current form.

19 Cancer is always a concern. I have my own
20 family members with cancer but clearly not related to
21 SSFL. My heart goes out to those today who have family
22 members and who are themselves affected by cancer, but
23 it must be remembered that cancer is multifactorial and
24 even the Morgenstern/Cohen studies from UCLA --
25 (Clock timer ringing)

1029-2
cont'd

1029-3

1029-4

the SSFL would be exposed to very low DPM emissions from project haul trucks and likely would experience no noticeable health effects from these emissions.

Regarding the request to test for the presence of Valley Fever, this Final EIS Section 4.9.2.6 states that there are no commercially available tests to reliably test the soil for Coccidioides spores before working in a particular location (CDC 2014; HESIS 2013). Soil testing is currently only done for scientific research, and the available methods to detect Coccidioides in the soil do not always detect the spores, even when they are present (CDC 2014). Because the spores may be present in the soil, reasonable precautions would be taken to reduce potential for exposure, including the fugitive dust controls mentioned above. For example, the fugitive dust control plan mentioned above will include measures to reduce the risk of spreading Valley Fever that focus on fugitive dust controls recommended by the VCAPCD to minimize fungal spore entrainment, as well as minimizing worker exposure (VCAPCD 2003).

Due to the low air pollutant impacts on nearby residents that would occur from the proposed cleanup activities, DOE's visual monitoring and perimeter air monitoring stations are adequate to identify the need for any corrective actions to mitigate unacceptable air emissions.

1029-3 DOE acknowledges your support for the Conservation of Natural Resources Alternative. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. Please also note that DOE does not own the property in Area IV or the NBZ and cannot determine the ultimate land use for the property. As discussed in Chapter 1, Section 1.5, of this EIS, the property owner, Boeing, intends to preserve the land as open space for the public's benefit. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site.

1029-4 DOE acknowledges your comment and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD, which discusses the studies referred to in the

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 MR. ZIMAN: -- indicated that they couldn't
 2 attribute the occurrence of those cancers to SSFL for a
 3 multitude of reasons.
 4 Thank you.
 5 MS. LOWE: Thank you, Mr. Ziman. Kristin Story.
 6 MS. STORY: My name is Kristin. My name is Kristin
 7 Story. I'm a public school teacher and a mother and I'm
 8 not irrational. I'm not an irrational person. I'm a
 9 very rational person. I live in a world where I look at
 10 facts. I study up on things. I pay attention to
 11 scientists and doctors, people who I trust to know what
 12 is dangerous and what is not. I have a Paulie
 13 Conbeaversite (ph), who is also a teacher. She is not
 14 -- was not in place now due to an illness. She lived in
 15 Bell Canyon, and when Boeing lied to her face and said
 16 that there was no cancer cluster danger because it was
 17 on the other side from where she was living, she packed
 18 up her house, her husband, and she sold that house, and
 19 got out of there with their two small children. Thank
 20 God.
 21 I am in outrage the DOE's proposing to
 22 breaking its AOC commitments to clean up all of the
 23 radioactive, toxic chemical contamination. It's an
 24 outrage. The AOCs expressly prohibits consideration of
 25 any leave-in-place alternatives, yet DOE's proposing to

1029-4
cont'd

1030-1

comment. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

1030-1 In this EIS, DOE does not propose breaking the 2010 AOC signed with its regulator, DTSC. NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 leave in place huge amounts of contamination. DOE
2 estimates that it could take up to 70 years for specific
3 toxic materials to attenuate to required levels. I'm
4 glad attenuation was just brought up. It's outrageous.
5 The DOE wants to leave the hazardous material, which
6 have already been contaminating SSFL for 70 years, in
7 place another 70 years, so the nearby communities would
8 have faced 140 years of migration SS exposure. That
9 means for all our lifetimes, the contamination that DOE
10 created will be in the midst of our community, migrating
11 down to expose people, and they have little children,
12 and the environment. But even the 70-year estimate for
13 leaving the toxic total petroleum hydrocarbons, or TPHs,
14 to supposedly attenuate is false. DOE's slide show,
15 Particular Report as the basis for that conclusion,
16 when, in fact, you simply cite to another report which
17 doesn't actually conclude the hazardous materials will
18 degrade in 70 years. In fact, that report said it could
19 take very much longer, because the easiest materials to
20 degrade long ago did, and what is now left degrades very
21 slowly, if at all. In fact, when the study measured the
22 degradation rate, given the actual conditions of the
23 site, it found no -- no natural attenuation at all. So,
24 what do we get? DOE misrepresenting the facts. That's
25 a fact. That is what is sad as I -- as a quote from a

|| 1030-1
cont'd

1030-2 1030-2 The 2010 AOC allows for onsite treatment of soils and natural attenuation was included as a treatment option at the suggestion of DTSC staff. The Draft EIS states that natural attenuation would be applied to soil with "low concentrations" of TPH's where they are the only chemical exceeding comparison criteria. See Chapter 2, Section 2.3.2 of this Final EIS for additional information. Based on soil treatability studies, it appears that monitored natural attenuation will be able to degrade TPH concentrations in these soils to below their AOC LUT values within 70 years. Soils with higher concentrations of TPH would be removed, as they would take longer than 70 years to attenuate.

3-1651

Section 3 - Public Comments and DOE Responses

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 DOE document that we -- that quote from the Ventura
 2 County Star, this last article that was done. Whether
 3 it is 70 years DOE wants to leave the TPHs in place or
 4 far longer is totally and completely unacceptable.
 5 Also, the great majority of the contamination DOE now
 6 proposes to walk away from, it -- it admits that there
 7 is basically no attenuation at all, that it will be here
 8 for all practical purposes for eternity, capable of
 9 continued migration off-site. This isn't an irrational
 10 statement I'm making. This is fact that's --
 11 (Clock timer ringing)
 12 MS. STORY: -- gone final. Thank you.
 13 MS. LOWE: Thank you. Robert Dodge will be
 14 followed by Jim Summers and then Margery Brown.
 15 MR. DODGE: My name is Rob Dodge. I'm a family
 16 physician in Ventura, and I'm the president of
 17 Physicians for Social Responsibility Los Angeles.
 18 For over 30 years PSRLA has advocated for a
 19 cleanup of the Santa Susana site that's fully protective
 20 of the public health. That standard was met by the 2010
 21 Agreement on Consent that DOE signed which stipulates
 22 that DOE's portion of the Santa Susana Lab will be
 23 cleaned up to background levels of contamination, that
 24 is any contamination that is detected will be cleaned
 25 up. In the DEIS risk assessment, the DOE is either

1030-3

1030-3 Please see the response to comment 1030-2. The Cleanup to Revised LUT Values Alternative and Conservation of Natural Resource Alternative would remove soils that present a risk to human health and the environment in accordance with the designated future use as open space. Chemicals remaining in the soil would be below human health and ecological risk levels.

1031-1

1031-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," of this CRD.

The "Cleanup to AOC Look-Up Table Values Alternative" incorporates all of the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels determined by laboratory capabilities. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for an explanation of how the Cleanup to AOC LUT Values Alternative complies with the 2010 AOC. As discussed in that section, the 2010 AOC does allow onsite treatment (e.g., attenuation) of contamination and natural attenuation was

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

Section 3 – Public Comments and DOE Responses

1 incompetent, purposely misleading, or both, and neither
2 is acceptable. DOE has claimed today and vis-a-vis
3 articles -- vis-a-vis Star article that it is complying
4 with the AOC, and all of its alternatives are protective
5 of public health, but that is not true. All four of the
6 options that DOE has presented violate the AOC and risk
7 public health.

8 DOE says that option one entails cleaning up
9 933,000 cubic yards, but on Page 29 of the DEIS, the
10 Summary I missed, that the total soil contaminated is
11 1,400,000 cubic yards. That would be one half a million
12 cubic yards of contaminated soil in place which violates
13 the AOC. DOE tries to justify this by declaring that
14 the soil may be subject to natural attenuation or
15 degrading over time, and by grossly misrepresenting the
16 AOCs biological exemption, which is strictly limited in
17 the AOC, and which they do not qualify for.

18 Option two claims to clean up the site to
19 risk-based screening levels for suburban residential use
20 and that the cancer risk would be one in a million or 10
21 to the minus six. But a footnote on Page S-31, number
22 22, of the DEIS Summary indicates the DOE is not as
23 claims following the DTSC approved Standard Risk
24 Assessment Methodology and has left out the major
25 required exposure pathways and using values that are a

1031-1
cont'd

1031-2

included as a treatment option at the suggestion of DTSC staff. In this EIS DOE is not “grossly misrepresenting the AOCs biological exemption.” The exemption process presented in the Draft EIS was jointly developed through a series of meetings attended by USFWS, CDFW, and DTSC. Both USFWS and CDFW provided their concurrences for the process. This process addresses both the biological exemptions of the AOC and DOE’s obligations to meet Federal, state and local laws and regulations for the protection of biological resources.

Also, refer to Section 2.4, “Application of Exemptions under the 2010 Administrative Order on Consent,” of this CRD. DOE notes that the process developed for application of the exemptions does not mean that no cleanup would occur in exemption areas, but involves focused cleanup within those areas of any contamination that exceeds risk levels that typically require remediation.

1031-2 As explained in Chapter 4, Section 4.9 and in Appendix G of the Draft EIS, DOE used suburban residential RBSLs or risk slope factors based on the direct exposure pathways and without the indirect garden pathway to evaluate potential impacts to an onsite receptor. In April 2017, Boeing made a legally binding commitment to a conservation easement held by North American Land Trust that permanently preserves as open-space habitat nearly 2,453 acres Boeing owns at SSFL, including Area IV and the NBZ, forever prohibiting residential, agricultural, and commercial development or uses of the site (Ventura County 2017a, 2017b). The use of RBSLs that do not include the indirect garden pathway is appropriate for this future land use.

The comment that RBSLs used in the Draft EIS are “a thousand times higher risk than the one-in-a-million risk assessment.” is in error. The RBSL concentrations used in the Draft EIS were taken from the DTSC-approved Standard Risk Assessment Manual (SRAM) developed for use at SSFL. Risk assessments are developed using a most likely future land use consideration and are consistent to what EPA would do at CERCLA sites and DTSC would do at other DTSC-regulated sites in California.

In Chapter 4, Section 4.9 of this Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that local residents may get some portion of their food from a home garden.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 thousand times higher than the standard suburban
 2 residential goals. That means a thousand times higher
 3 risk than the one-in-a-million risk assessment.

4 Option three is most certainly not health
 5 protective. The EPA states that the exposure to 25
 6 millirem a year is not health protecting and should not
 7 be used for cleanup. You have exposure to 25 millirem,
 8 it's the equivalent of a dozen unnecessary chest X-rays
 9 per year every year over an average life span. And
 10 because the DOE uses averaging, which they are precluded
 11 from doing, and keeps out the garden pathway required to
 12 the individual and representing 99 percent of the dose,
 13 it is closer to hundreds of unnecessary chest X-rays per
 14 year, at a lifetime is thousands or tens of thousands
 15 times higher than the DOE claims. This is unacceptable.

16 The National Academy of Scientists has
 17 concluded there is no safe level of radiation, no safe
 18 level. Every amount exposes you to some increased risk
 19 over time having cancer, particularly for pregnant women
 20 and children. The DOE must comply by the AOC and clean
 21 up --

22 (Clock timer ringing)

23 MR. DODGE: -- all of the contamination.

24 MS. LOWE: Thank you, Mr. Dodge. Jim Summers will
 25 be followed by Margery Brown and then Rick McFadden.

1031-2
cont'd

1031-3

1031-1
cont'd

1031-3 See the response to comment 1031-2 for a discussion and response to concerns over choice of exposure pathways.

The Conservation of Natural Resources Alternative (both scenarios) would result in the removal of all soil containing chemicals and radionuclides at concentrations posing a risk to human health and the environment in excess of levels requiring remediation. The soil not excavated would be similar to soil that EPA would not excavate at CERCLA sites or DTSC at comparable sites in California. DOE chose to identify the 25 millirem per year in its risk-based alternative to cleanup this EIS, consistent with the upper limit for dose-based release criteria under DOE requirements (DOE Order 458.1). DOE notes that the Conservation of Natural Resources Alternative (both scenarios) analysis in this Final EIS is a risk-based analysis and results in radiological risks in the 10⁻⁵ range; this would correspond to a dose much lower than 25 millirem per year. Please refer to Section 2.6, "Comparison of Radiation Doses," of this CRD for further discussion of the 25 millirem per year dose-based release criteria.

Regarding the comment about averaging and not including the garden pathway, when a risk assessment is performed, EPA Risk Assessment Guidance (EPA 1989) does allow for some averaging and prescribes the use of an upper confidence limit (UCL) on the arithmetic average (UCL95) and only suggests the use of a maximum value as a screening tool. And as noted in the response to comment 1031-2, conservation easements that include Area IV and the NBZ prohibit residential, agricultural, and commercial development or uses of the site (Ventura County 2017a, 2017b). Therefore, even though DOE includes a conservative analysis of a hypothetical onsite resident, it is appropriate to not include a garden pathway. It is important to note that under any of the soil remediation alternatives, those soils with the higher levels of chemical and/or radioactive constituents, that is, those that would pose a risk to human health or the environment, would be removed. Soils that would be left on site would have lower concentrations of chemical and/or radioactive constituents.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 MR. SUMMERS: My name is Jim Summers. I'm from
2 Granada Hills, not from around West Hills or -- or Simi.
3 But, well, I'm just shocked that this is even
4 going on. I've been going to these hearings and it's
5 over 20 years ago. This should have been done, done to
6 the standards the community wants and what is
7 reasonable. And, I agree there are no safe levels of
8 radiation to human beings. I went to medical school in
9 Sweden. I actually was there when Chernobyl happened.
10 They would never let anything like this happen in
11 Sweden.
12 It's your ability. You're our government.
13 You're the ones that protect us. We pay your taxes.
14 You guys won't lose your jobs. Nothing will happen to
15 you, and you may not get a pay raise, but you should do
16 what the community is requesting and what you agreed to.
17 And, I would just like to say that coming from
18 outside the area, it's a little bit hard for me to see
19 this, and an injustice here -- to quote Dr. Martin King,
20 an "Injustice anywhere is a threat to justice
21 everywhere."
22 Thank you.
23 MS. LOWE: Thank you: So Margery Brown, followed
24 by Rick McFadden, followed by Elena Semper.
25 MS. BROWN: My name is Margery Brown. I'm on the

1032-1

1032-1 Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for information on alternatives and preferences for cleanup. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

1032-2

1032-2 Due to the uncertainty of risk at low dose and low dose rates, risk assessments are performed under current regulatory guidance with a conservative assumption that cancer is from exposure to radiation is linearly proportional to the total amount of radiation received with no threshold. Therefore, the risks for this Final EIS have been calculated for all exposures assuming a linear no-threshold model. However, in view of the rate of cancer in the general population (nearly 1 out to 2 in a lifetime), EPA CERCLA guidance has established that risks of getting cancer less than 1 in 1,000,000 are insignificant and that risks in the range of 1 in 10,000 to 1 in 1,000,000 may be acceptable when all impacts of remediation options are evaluated. Therefore, risks in that range are typically evaluated for acceptability during evaluation of alternatives and selection of a remedy for remediation.

1032-1 cont'd

For a discussion of uncertainties in risk assessment at low dose and low dose rates and the conclusions of the National Academy of Science's National Research Council Committee on the Biological Effects of Ionizing Radiation, the commenter is referred to "Uncertainty In Risk Assessment," a Position Statement of The Health Physics Society which can be found at http://hps.org/documents/riskassessment_ps008-2.pdf.

Section 3 - Public Comments and DOE Responses

3-1655

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 board of the West Hills Neighborhood Council, but I'm
 2 speaking only for myself.

3 I just finished my 30th year of being a Red
 4 Cross disaster worker. I've been in the floods and the
 5 earthquakes and the fires, and I have never encountered
 6 a disaster like this one, where you can exactly talk to
 7 the people, some of them who caused some of the disaster
 8 that we're talking about today. This is really unusual.

9 I would not take away anything good the
 10 Department of Energy has done. And, one of those things
 11 was this: In 2010, you had somehow had some kind of a
 12 moment of enlightenment where you were willing to sign
 13 this agreement of the AOCs voluntarily and clean up to
 14 background. What's happened since then? The problem is
 15 that I recognize that we're -- what we're really having
 16 here today is not a scientific discussion or a legal
 17 discussion or a discussion of cleanup plans. We're
 18 having a talk about money, millions of dollars of it
 19 that's sitting out in the middle of the floor here for
 20 everybody to see, millions of dollars that you could
 21 save by any one of the four plans that you put into
 22 effect, all of which break the AOCs and do not protect
 23 human health.

24 You want to talk about risk? I'll tell you
 25 who's taking the risk. The people who live around the

1033-1

1033-2

1033-3

1033-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

1033-2 As a Federal agency, DOE is required to evaluate and justify major expenditures of Federal dollars. Because the AOC cleanup is not the normal way DOE, EPA, or California DTSC performs soil cleanups, DOE evaluated the costs and benefits of the AOC cleanup versus what is normally done (that is, a cleanup that is based on risk and future land use). That analysis demonstrated that the AOC cleanup would be much more expensive and with minimal additional protection of public health and the environment. The Cleanup to AOC LUT Values Alternative included in this Final EIS does comply with the 2010 AOC; please see Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.

1033-3 DOE acknowledges your concerns and refers you to Section 2.7, "Offsite Impacts," of this CRD for a discussion of offsite contamination and risk and to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completion of cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. All of the action alternatives evaluated in this EIS would result in a cleanup of Area IV and the NBZ that would be protective of public health and safety and the environment.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 field lab in the Valley are the ones taking all the
2 risk. The four plans leave tremendous amounts of -- oh,
3 well, the radiation, CVS, strontium-90, plutonium, the
4 most deadly of the deadly, plus all the toxic chemicals.
5 The risk, you know, is in the neighborhoods all around.
6 There is no way that you can walk away from an agreement
7 that will protect human health and still cover the
8 beast. Okay?
9 I would urge you to stay with it even though
10 we know that the -- you are not going to make the final
11 decision, that the state, being DTSC, or EPA will make
12 it. So, please give the risk a lot of thought.
13 Thanks.
14 MS. LOWE: Thank you. Rick McFadden will be
15 followed by Elena Semper and then Tom Nachtrab. Is Rick
16 McFadden not present? Okay. Then Elena Semper. Elena
17 will be followed by Tom Nachtrab and then Mark Daww.
18 MS. SEMPER: Hi. My name is Elena Semper. I spoke
19 the other day but I would like to reiterate. I'm a
20 conduct reality project leader, and I'm on the Porter
21 Ranch Neighborhood Council Sustainability Committee. As
22 a near life-time Valley resident, I'm speaking on behalf
23 of myself.
24 I fully support the AOC and urge you to do the
25 same. DOE's alternatives are not in compliance and risk

1033-3
cont'd

1033-1
cont'd

1034-1

1034-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," of this CRD. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 human, animal, and environmental health. We need this
 2 long-term solution and not alternative pockets risk.
 3 Truck conditions and volumes are countable, and you
 4 can't mitigate radionuclides. I've lived in the Valley
 5 since 1970 and its various tall and major earthquakes,
 6 including the Northridge quake, which rose the ground 12
 7 feet. This critical earthquake fault runs under Aliso
 8 Canyon and are heavy winds. There's no guarantee now or
 9 decades to come, but one -- centuries. Your alternative
 10 methods and solutions resemble alternative facts, and
 11 they remain opposite of quality of life. You mentioned
 12 educating the public over there, as I understand,
 13 cleaning up the site. Now the majority of the public
 14 want the site thoroughly cleaned up and fully comply
 15 with AOs.

16 Thank you.

17 MS. LOWE: Thank you. Tom Nachtrab, then Mark
 18 Dauw, then Farideh Kioumehr. I'm sure I gnawed that
 19 one. Yeah. Okay. Mr. Nachtrab first.

20 MR. NACHTRAB: I'm Tom Nachtrab. I live in
 21 Chatsworth, and I'm a director of the Santa Susana
 22 Mountain Park Association, SSMPA. I have three brief
 23 comments focusing on the present and moving forward in
 24 the future:

25 Regarding the EIS as a document, for it's, you

1034-1
cont'd

1034-2

1034-1
cont'd

1034-2 Earthquakes are a hazard in California; however, as stated in Chapter 3, Section 3.2.1.3 of the Draft EIS, Geologic Faults, "None of the faults in Area IV have been classified as "active" faults by the California Geological Survey (Jennings and Bryant 2010). Active faults are those that have had movement within the last 11,700 years. Area IV and the NBZ are, however, susceptible to earthquakes due to movement along distant faults. Some slopes in the valleys in the NBZ and the north-facing slope of the hill in the southernmost part of Area IV have been identified as Earthquake-Induced Landslide Zones (California Department of Conservation 1998). This designation is based on topography, geologic materials and structure, geotechnical data, rock strength data, and estimates of earthquake-related shaking." Stability of the remediated contamination areas will be taken into consideration in the excavation and grading plans. The risk from accidents caused by earthquakes is addressed qualitatively in Chapter 4, Section 4.2.2 of the EIS. Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts, including wind-blown contamination.

1035-1

1035-1 Thank you for your comment.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 know, compared to many EISs, it is a very well written,
2 very logically and clearly written document, and I give
3 you credit for that.

4 Point number two: I am pleased that you
5 listened to some of the comments that you received in
6 the scoping related to the necessity and the obligation
7 to present a range of possible, feasible, practical
8 alternatives, and you put the alternatives together very
9 forthrightly, and we thank you for that.

10 And, number three, the EIS makes a nice
11 distinction between your proposed action and your
12 preferred alternative, and, as you say, your proposed
13 action is in accordance with the AOC. The preferred
14 alternative has not yet been chosen, and that will be
15 chosen, and I believe that your alternatives are
16 protective of human health.

17 And I and my organization support the
18 Conservation of Natural Resources alternative.

19 Thank you.

20 MS. LOWE: Thank you. Mark Daw. I'm going to try
21 a little better. Then Farideh Kioumehr and then Karen
22 DiBiase.

23 MR. DAUW: Hi. I'm Mark Daw. I'm a West Hills
24 resident. I've been a resident there since 1996. My
25 wife and I had two children, both born in West Hills.

1035-1
cont'd

1035-2

1035-2 Thank you for your comment. It has been included in the Administrative Record for the EIS.

1035-3

1035-3 DOE's Preferred Alternatives are identified in Chapter 2, Section 2.7 of this Final EIS. DOE's preferred alternative for soils remediation is the Conservation of Natural Resources, Open Space Scenario. DOE's preferred alternative for building demolition is the Building Removal Alternative. Under this alternative DOE would demolish the 18 DOE-owned buildings in Area IV and transport the resulting waste off site for disposal. DOE's preferred alternative for groundwater remediation is a combination of the Monitored Natural Attenuation Alternative and the Treatment Alternative.

1035-4

1035-4 DOE acknowledges your support for the Conservation of Natural Resources Alternative. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 We live about a mile from the site over the hill.
 2 My daughter was diagnosed recently with
 3 leukemia, a rare form called APL, which the doctor said
 4 was directly related to an environmental issue. They
 5 didn't say what issue, but he said that it was an
 6 environmental issue. She was treated at Children's
 7 Hospital for the last eight months.
 8 My neighborhood has also had other cancers.
 9 We've had two children with brain cancer. We've had --
 10 an adult died from brain cancer. We've also had two
 11 other cancers within a block. So, when people say
 12 there's no direct correlation, I have to object to the
 13 --- the doctor -- the doctor, I mean -- I mean, it is
 14 related to the environment from all that our doctors
 15 told us.
 16 So, I've been coming to these since the early
 17 2000s. I never thought that my daughter or son would be
 18 affected, and I'm troubled that it's taking this long to
 19 get to where we're at, considering all the involvement
 20 of all these people who have been working very, very
 21 hard to try to get you guys to wake up, and it is just
 22 appalling. And to watch my daughter go through what she
 23 went through in the hospital, it -- it was gut
 24 wrenching.
 25 Try to reiterate: You guys have got to get

1036-1

1036-1 DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. One of these studies, by the University of Southern California Cancer Surveillance Program, reviewed the incidence of retinoblastoma in children in Los Angeles and Ventura Counties (CSP 2007). The study authors concluded that the incidence of retinoblastoma among children under age 5 residing in the area around SSFL between 1988 and 2005 was slightly, although statistically not significantly, higher than expected based on incidence statewide. Section 3.9.5 of this EIS also presents data comparing cancer mortality and incidence rates for the United States, California, and Los Angeles and Ventura Counties.

1036-2

1036-2 DOE acknowledges your concern about cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

1036-1 cont'd

1036-2 cont'd

Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 your act together. You're operating like a typical
2 bureaucratic government and no sense of urgency.

3 We were there when the fires burned that site,
4 and I could see the ashes coming into my yard, and they
5 looked extremely strange. They weren't typical ashes,
6 and you could see it was muddy and gooey particles
7 coming into our neighborhoods, and it was appalling.

8 And, so, I -- I went to the people who are better -- a
9 lot more knowledgeable than I am on it, that it needs to
10 be cleaned up.

11 And, my daughter was on that map that Melissa
12 presented earlier, and I think that's grossly -- the
13 gross understatement of the number of children have been
14 affected, and I'm appalled that there's never been a
15 study -- cancer study of children, and I have -- I've
16 seen the adult ones, but adults can handle what -- a lot
17 better than children or pregnant women, and my wife was
18 pregnant during -- during that time.

19 So, do your job. Thank you.

20 MS. LOWE: Okay. You can bring up the proper --

21 MS. KIOUMEHR: It's (inaudible) --

22 MS. LOWE: Sure. Then Karen DiBiase, and then
23 Kelly Holland.

24 MS. KIOUMEHR: My name is Farideh Kioumehr, if you
25 would like the spelling. And --

1036-2
cont'd

1036-3

1036-2
cont'd

1036-1
cont'd

1036-3

workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

With respect to the timeliness of DOE's completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record of Decision pursuant to NEPA. Additionally, in accordance with CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

DOE assumes that the commenter's reference is to the September 2005 Topanga fire, which affected much of the SSFL site. Chapter 3, Section 3.9.6, of this EIS, includes a summary of damage that was sustained by brush and structures at SSFL (no structures were damaged at Area IV, however) and the environmental monitoring and sampling program conducted at SSFL and surrounding areas both during and after the fire. Additional information can be obtained by searching the DOE Energy Technology Engineering Center website (<http://www.etc.energy.gov/>) for "Topanga fire."

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 MS. LOWE: I'll show you how to spell it.
 2 MS. KIOUMEHR: And --
 3 THE REPORTER: Maybe closer to the mic.
 4 MS. LOWE: Can you get closer to the mic?
 5 MS. KIOUMEHR: I'm sure.
 6 MS. LOWE: Yeah.
 7 MS. KIOUMEHR: (Inaudible) Okay. My name is
 8 Farideh Kioumehr. Good evening. And, I'm the founder
 9 of International Health & Epidemiology Research Center.
 10 I am an epidemiologist, and our work is keeping people
 11 healthy. So, having said that, I'm also a member of the
 12 Physicians for Social Responsibility Los Angeles, and
 13 I'm here and I'm an activation defender, so this is the
 14 right place to come and talk.
 15 Our main operation -- right -- warning DOE
 16 doing what it doing, and knowing and hearing all these
 17 people, scientists from scientists, doctors, too. No
 18 more people -- we love people -- which have had the
 19 children and themselves, you know, struck with cancer
 20 and other diseases. I myself also has seen many family
 21 friends and family members which have, you know, got
 22 cancer and some other rare diseases, as one example is
 23 two husband and wife -- a husband and wife, which they
 24 were in their 50s, and they had within one year got the
 25 disease, and one of them is not even diagnosed. He

1037-1

1037-1

DOE acknowledges your preference for cleanup according to the 2010 AOC and refers you to Section 2.1, "Preferences for Cleanup," of this CRD which notes that all of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment. See also Section 2.7, "Offsite Impacts," of this CRD regarding what is known about offsite contamination and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 didn't know what kind of disease. It was so later that
2 he couldn't really find out. And the other one -- and
3 both of them, if they were here, they could come, but
4 they are -- they lost their lives, so I'm speaking in
5 their behalf and behalf of all these people with cancer
6 caused by Santa Susana Field Laboratory in the last
7 year.

8 What I wanted to also add, that it is
9 completely clear that DOE, once you get out of the --
10 the commitment to clean up all the contamination of
11 Santa Susana Field Lab -- Laboratory, instead proposes
12 leaving between 39 to 99 percent of dangerous
13 radionuclides and toxic chemicals on site, where they
14 will continue to migrate in community -- communities and
15 trees, and this is unacceptable. DOE must abide by the
16 2010 AOC and reject all the cleanup -- and instead that
17 we're talking with partial cleaning. You should really
18 stick with the, you know, agreement that they had and
19 clean up totally, not just partially. And, if all the
20 contamination of SSFL is not cleaned up, and, you know,
21 by the agreement, people who live in that area, they're
22 going to be -- they're furthering the more increased
23 risk of, you know, getting cancer and many other
24 diseases.

25 Since we don't have time, I just want to ask

1037-1
cont'd

1037-2

1037-1
cont'd

1037-3

- 1037-2 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors (refer to Section 2.5, "Toxicity of Soil Contaminants," of this CRD). Each of the action alternatives evaluated is protective of the health and safety of the public and the environment. As discussed in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.
- 1037-3 Considering public comments on the Draft EIS is an important step in this Final EIS process. Regardless of the submission method, DOE considered all comments equally when developing this Final EIS.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 you, please, listen to all these people. They take time
 2 to come here and speak from their heart, and my heart is
 3 bleeding when I see the -- the kids in front a few years
 4 old --
 5 (Clock timer ringing)
 6 MS. KIOUMEHR: -- dying from cancer. So, please do
 7 the right thing.
 8 Thank you.
 9 MS. LOWE: Thank you, Ms. Kioumeh. Karen DiBiase
 10 and Kelly Holland and Sharon Ford.
 11 MS. DIBIASE: My name is Karen DiBiase. I've lived
 12 in Woodland Hills for almost 30 years, and worked in
 13 Chatsworth for about 18, very, very close to the site.
 14 I'm a member of Woodland Hills Work Center, member of
 15 the council, and I chair the Environmental Committee.
 16 In 2015, our neighborhood council took the
 17 position of a risk-based cleanup at the time -- I
 18 believe it was 2015 -- to protect the natural resources,
 19 wildlife, and neighboring communities, noticeably for
 20 the extensive transportation, the soil remediation. I
 21 will be submitting a letter based on the DOE, and we are
 22 sending that at this time. I am representing myself, my
 23 personal opinions, as our neighborhood council has not
 24 come up with their own opinion as of yet.
 25 I believe that we should remove all the

|| 1037-3
cont'd

|| 1037-1
cont'd

|| 1038-1

1038-1 DOE acknowledges your support for removal of all radionuclides from the site as well as your general support for risk-based cleanup. Please refer to Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. The purpose of this EIS is to

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 radionuclides from the site. We seem to be across the
2 board all your decisions. I believe we should treat
3 chemical contamination on site wherever possible. This
4 will reduce the amount of dust and reduce the impact of
5 10-years plus of truck traffic going through our
6 community, which as a default, will be increasing risk
7 to everyone else. I believe a risk-based cleanup is
8 still the best standard for the entire site. I also
9 believe there's a real risk of not locating a backfill
10 or soil to replace the amount to be removed per the AOC.
11 I believe a -- the revised look-up table, a risk-based
12 consideration of cleanup should be considered to
13 preserve what is up there now so that wildlife continue
14 to survive, protect yard cats, and the plant life. I
15 have a concern of cleaning up to a background level that
16 will not -- that will leave the site with permanent
17 scarring in order to fulfill a political agreement.
18 We need a reasonable and achievable cleanup
19 other than what the AOC seems to be doing right now.
20 With the timing, it seems to be our opportunity to
21 actually look at all the levels there and make it clean
22 but risk based for all the deals to survive.
23 Thank you.
24 MS. LOWE: Thank you. Kelly Holland will be
25 followed by Sharon Ford and then Thomas Ridge.

1038-1
cont'd

evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

As discussed in Chapter 2, Section 2.3.2, of this Final EIS, one potentially effective form of onsite remediation would be to use monitored natural attenuation for management of certain low-concentration, petroleum-contaminated (TPs) soil. DOE has estimated that this onsite treatment method would reduce the amount of soil to be considered for removal at Area IV and the NBZ by about 620,000 cubic yards, with corresponding reductions in truck traffic and emissions of air pollutants. This or any other onsite treatment method would have to be approved by DTSC.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 MS. HOLLAND: Well -- I --

2 MS. LOWE: Put it up. Please lift it up. Thank

3 you, Dr. -- Mr. Dodge.

4 MS. HOLLAND: Actually might not help me at all.

5 My name is Kelly Holland. I live at 10945 Old Santa

6 Susana Pass Road.

7 And, I'm going to go a little off script right

8 now. I'm angry and shocked at anybody that got up here

9 and waived their hand contemptuously and said, well,

10 these are just a bunch of civilians, they're terribly --

11 they're superstitious, they're not fact based. How many

12 times have we seen this before? How many guys in grey

13 suits and women in grey suits have stood here and said,

14 oh, well, there's no problem, you need to trust us,

15 we're going up fast. That works until it doesn't work.

16 Right? It always doesn't work. Flint Michigan was

17 great. Aliso Gas Fields, great. Three Mile Island, not

18 a big deal until it is, and then it's too late, and then

19 it just becomes a bad movie with Meryl Streep in it.

20 Shame on all of you.

21 It's not that man's responsibility to prove

22 that there was a connection with his child's cancer.

23 It's your responsibility to prove that it isn't a

24 connection. It's not his -- his issue, and you haven't

25 proved it. For every health study that's been done that

1039-1

1039-1

DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further information about contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 says there is no connection, there's a health study that
2 says there is a connection. So, if there's even a
3 slight chance that there's a connection, you have a
4 responsibility as a government agency to listen to this
5 community and respond, not waste time. You have a
6 responsibility to do your job. (Indicating)
7 I'll go back on script now. If it wasn't so
8 tragic, I would find it hilarious this concept of
9 natural attenuation. When I hear "natural
10 attenuation," you know what I hear? Cheap, lazy,
11 irresponsible, and perhaps criminal. It's not a
12 solution.
13 When people are defrauded, we have a verb
14 that we use, we say we've been "Madoffed." When they've
15 been lied to, we have another verb we use, we say
16 they've been "trucked." I would suggest that Grace and
17 Ryan not grow up saying they've been "Jonesed" or
18 "Jenningsed," that you do your job, that you not become
19 a grey-suited character in a tragic movie about the
20 cancer causes that occurred around the meltdown, that
21 you take these people's concerns seriously and you act
22 responsibly. It's your job. Do your job.
23 MS. LOWE: Sharon Ford followed by Thomas Ridge.
24 MS. FORD: Sharon Ford. I sit on the SSFL CAG, and
25 I'm on the San Fernando Valley Audubon Environmental

1039-1

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 Committee, but I'm here as myself, representing myself.
 2 I'm in favor of a risk-based cleanup, and in
 3 no way am I minimizing the feelings of those who have
 4 experienced losses from cancer. I understand your
 5 grief, your loss, because I lost a grandmother, my
 6 mother, my brother to cancer. My husband is a recent
 7 survivor of colon cancer and bladder cancer. So, I can
 8 understand, I can relate to how you feel.
 9 But, it is human nature to want to blame
 10 someone and blame something when there is a tragedy or a
 11 great loss. What we aren't looking at is ourselves. We
 12 want to blame DOE, we want to blame NASA, the DTSC, you
 13 name it, Boeing, all of them. Everyone of us every day
 14 does something with toxic materials for their eating, we
 15 drink up the earth, and we do not consider that it's
 16 going to affect ourselves or our children. Those
 17 bottles of water are toxic. They are made from oil
 18 products. A pregnant woman who drinks from there drinks
 19 oil toxins which goes into her baby. So, I understand
 20 the emotions of this, but we have to take a look at
 21 ourselves. It isn't just our government. And, as of
 22 now, with the change in government, the current
 23 administration is throwing out all regulations. They're
 24 trying to degrade EPA. So, we have no idea what we're
 25 up against.

1040-1

1040-1 DOE acknowledges your support for a risk-based cleanup. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

1040-2

1040-2 Thank you for your comment. It has been included in the Administrative Record for the EIS.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 The bottom line is with the AOC is if DOE and
2 NASA cannot meet their obligation, it is up to DTSC to
3 make the decision. So, while there's a blame going on
4 for the federal government agencies, we may end up with
5 a state agency handling it.
6 So, I just -- I want people to stop and think
7 about it. This is a political thing. Boxer's gone,
8 Powerleaf (ph) gone, so are the Obama administration.
9 So, who have -- who are you going to go to now?
10 A risked-based cleanup is the way we should
11 go. If -- if -- think about it. If -- cleanup to
12 background cannot bring clean soil up there. You are
13 working, living, recreating --
14 (Clock timer ringing)
15 MS. FORD: -- on contaminated soil. That's what
16 this is telling of.
17 MS. LOWE: Thank you, Ms. Ford. Thomas Ridge, and
18 then our final registered speaker is Eugene Burke.
19 MR. RIDGE: Yes, good evening. Thomas Ridge. I
20 initially wasn't going to say anything. I feel like I'm
21 probably the most uninformed person in this room. I
22 just found out about this yesterday. I've lived in the
23 area --
24 MS. LOWE: Did you say your name?
25 MR. RIDGE: Thomas Ridge.

1040-3

1040-3

DOE proposes to complete remediation of DOE's administered portions of SSFL Area IV and the NBZ in compliance with applicable requirements. Information on the selection of alternatives for cleanup of SSFL Area IV and the NBZ will be included in the Record(s) of Decision (ROD[s]) for this EIS. The ROD(s) will follow no sooner than 30-days after publication in the *Federal Register* of the EPA Notice of Availability for this Final EIS. DTSC is currently preparing a program environmental impact report (EIR) under CEQA that applies to cleanup of the entire SSFL (Areas I, II, III, and IV and the Northern and Southern Buffer Zones which includes the areas for which DOE is responsible); the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

1040-1
cont'd

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 MS. LOWE: Thank you.

2 MR. RIDGE: I've lived in the area for nearly 20

3 years, and I've never knew there was a nuclear disaster.

4 It's kind of crazy. It's a little bit surreal. So, I

5 came here to try to -- I'm a father of two. I have a

6 baby on the way in about a month, and I honestly came

7 here not knowing much, and I have been kind of walking

8 away not knowing much at all either, which is just

9 insane to me, and I feel like the woman earlier

10 mentioned a movie. I kind of feel -- have you guys ever

11 seen that movie "Armageddon"? Right? They're at the

12 end and they're trying to turn the space shuttle, like a

13 bomb is going to go off, and Bruce Willis and the other

14 guy are arguing, and there's the one guy that's like,

15 "Well, just -- just turn it off, you know." I feel kind

16 of like that guy. I'm just, "What the hell is going on

17 right now?" And, you know, I try to use my -- I own

18 several businesses, both overseas and domestically, and

19 I try to use experience, guide it with common sense, and

20 I -- I don't have a lot of experience with what everyone

21 else is talking about, so I'll just try to rely on my

22 common sense.

23 But there was some type of event that

24 occurred. Obviously, everyone agrees things are

25 contaminated to some degree. I -- I just think we

1041-1

1041-1

Chapter 3, Sections 3.9.5 and 3.9.6, of this Final EIS provide information about accidents at Area IV, including the 1959 SRE accident, which was the only accident that caused a measureable release of radioactive material. Section 3.9.6 explains that at the time of the accident it was estimated that the accident resulted in the release over a 2-month period) of about 28 curies of radioactive noble gases such as krypton-85, in low, controlled concentrations that met Federal requirements. The release was estimated to result in a maximum radiation dose at the location of the nearest resident of 0.018 millirem. Using current risk factors, this dose would have resulted in a risk of a fatal cancer to an exposed individual of 1×10^{-8} (one chance in about 93 million). A 1999 study by ATSDR estimated a maximum dose to a potentially exposed individual of 0.005 millirem with an even smaller risk of a fatal cancer.

Because of public concern about the SRE accident, DOE hosted an informational workshop on August 29, 2009, with testimony from three independent experts (see http://www.etec.energy.gov/Community_Involvement/Public%20Meetings/SRE_Workshop.html). Two of these experts supported the estimate made at the time of the accident. They stated that releases at the time of the accident should have primarily involved noble gases, with only small releases of volatile fissions products such as iodine and cesium isotopes. One of the experts was skeptical of the estimates of large health effects being experienced by individuals and the population. The third expert concluded that available information was inadequate to resolve the fraction of the noble gases and fission products that may have been released. This expert did not quantify public risks from the accident but thought that the risk to the maximally exposed individual was smaller than the risk of cancer from other causes, but that the collective exposure could have resulted in some cancers in the population.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to

1041-1 cont'd

1041-2

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 should clean it up, just -- I -- I don't know if I'm
2 being too simple, and I apologize if I am, but let's
3 just clean it up, and let's worry about the natural
4 settings later after it's cleaned up. And, you know,
5 it's got to be good, and I don't have to worry about my
6 kids and thinking, you know, should I move out of the
7 area. Because I have no freaking clue what's going on
8 here for 20 years and have no idea there was a nuclear
9 incident.

10 I'm not an uninformed person, which is crazy,
11 because I literally had to like -- basically my wife and
12 I were talking about Fukushima, because it came up in
13 the news, and I ran in my -- right -- we were talking,
14 "Hey, what would be the worst accident here in the
15 United States?" And, I was thinking Three Mile Island.
16 We literally Googled it yesterday, and freaking Simi
17 Valley came up. What? This is a joke; right? I mean,
18 that's -- and I'm a pretty informed person. I just
19 didn't know to look in my own back yard. And, I'll be
20 honest with you, with Fukushima out there, my wife and I
21 were kind of talking about, "Hey, you know, that
22 radiation could come over here." We were having a
23 serious discussion about that. And, I'm five miles from
24 this thing.

25 So, anyway, I know I don't have a lot of time.

1040-2

1041-1
cont'd

Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ.

1041-2 Much cleanup has previously been performed. As stated in the response to comment 1041-1 DOE has removed most of the buildings in Area IV. DOE has also removed much of the contamination within the soil and remaining buildings that resulted from nuclear research activities. (Please see Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD.) The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the action alternatives would be protective of the health and safety of the public and the environment.

Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information, including information on the steps necessary prior to DOE continuing cleanup of Area IV and the NBZ.

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 I'd just like you guys to know it must be enormously
 2 tough sitting here. I -- I go around the country doing
 3 this, so I'm not -- I'm not crazy. I'm just trying to
 4 use common sense.

5 Let's do some cleaning this up as best we can
 6 so that there's no mess left, and then we'll worry about
 7 all the -- the other environmental habitat things later,
 8 just common sense.

9 MS. LOWE: Thank you. Eugene Burke.

10 MR. BURKE: Eugene Burke. Glad to be here. I came
 11 here tonight to really listen to see what was going on
 12 here. I didn't come with a prepared speech. But, I --
 13 I appreciate the opportunity to share in this, and I
 14 want to thank DOE for providing this public forum, and I
 15 do hope maybe you consider doing this again. Maybe we
 16 could have even brain-storm sessions. Couple of
 17 thoughts come to mind. Before I come to that point,
 18 though, I'm a man living here. I've got a number of
 19 dots I'm trying to connect. I'm a retired environmental
 20 investigator, 11 years, licensed, very much involved.
 21 Oh, mainly indoor environmentals. Okay? Certainly not
 22 a expert of any kind on radiation problems. Three years
 23 of chemistry, all of the three college units that I
 24 built up, it really didn't help me one tiny bit when it
 25 comes to radiation and radiation waste. What to do with

1041-2
cont'd

1042-1

1042-1 Thank you for your comment; DOE appreciates your desire to get involved in the public outreach for this Final EIS. Any additional public involvement opportunities will be advertised by DOE through its email contact list and on the Energy Technology Engineering Center website (<http://www.etc.energy.gov>). To be added to the email contact list please contact DOE at debbie.kramer@emcbc.doe.gov.

1042-2

1042-2 A statement was added to Chapter 4, Section 4.10, of this Final EIS that all wastes generated under the activities evaluated in this EIS will be managed in accordance with State and Federal regulations that are applicable to each type of waste. All wastes generated under the alternatives evaluated in this EIS will be disposed of or recycled at

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 it now? So, I think that we don't know. And, I think
2 the DOE -- I sympathize with the DOE, you know. Hey,
3 what are we going to do with this stuff?
4 I'm going to say another thing. I don't hear
5 anybody -- I've got a, by the way, home in here since
6 1970, couple of homes, and right now I've been living on
7 an Area I, very short distance from the Rocketdyne
8 facility. Okay? My wife died of cancer about seven
9 years ago, and I'm no fan of radiation therapy, by the
10 way, or cancer either, so don't let me get started
11 there. So, I want to say, that for the Valley, I just
12 want to call attention to that, to remove, how to remove
13 the stuff, too, that's a -- that's a big question, and
14 when to remove it. We don't -- I would say we don't
15 want to be removing the kind of waste, the contamination
16 we have during the summertime in the Valley with all of
17 the building, the lands that are going on. My goodness,
18 we don't want to do that.
19 The other thing is, the -- the -- you look --
20 we've got to go for the whole -- we -- we can't sit back
21 and just say, "Oh." There's no proof of safety, by the
22 way. You want to -- somebody else brought up a good
23 point. Where's the proof of safety --
24 (Clock timer ringing)
25 MR. BURKE: -- for not removing all of the stuff?

1042-2
cont'd

1042-3

1042-4

offsite facilities. Chapter 3, Section 3.10, of this EIS identifies representative radioactive and nonradioactive waste disposal or recycle facilities that may be used to manage the different types of wastes that would be generated under each of the EIS alternatives. The environmental impacts that could occur from transport of the wastes to these facilities and the subsequent management of the wastes at these facilities are addressed primarily in Chapter 4, Sections 4.8, 4.10, 4.13, and 4.14 of this EIS.

1042-3 To complete timely removal of the buildings and the large volume of soil projected for cleanup of Area IV and the NBZ, DOE plans to transport soil the year round, within the limitations of Mitigation Measure SW-1 which restricts the excavation of soils to bedrock and backfill in drainage areas leading offsite to avoid any increases in runoff volume during periods of high rainfall. Transportation activities would be suspended only if there were a health and safety reason for doing so.

1042-4 This EIS evaluates alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment. Refer to Chapter 4, Section 4.9 of this Final EIS for information about potential impacts on the public under the different alternatives.

Section 3 - Public Comments and DOE Responses

Comments from the Van Nuys, California Public Hearing (February 21, 2017)

1 And, there's certainly -- and it certainly isn't helpful
 2 right now -- is time up?
 3 MS. LOWE: Yeah, it is.
 4 MR. BURKE: Okay. I'll start a close. But I --
 5 let's do this again, please. I look forward to it. By
 6 the way, I'll volunteer, no -- no charge to -- to -- if
 7 you get involved with the how part, I -- I could go on
 8 for an hour on that.
 9 MS. LOWE: Thank you.
 10 MR. BURKE: Keep my name around. I would really
 11 be -- be glad to chip on it.
 12 MS. LOWE: Okay. I would like to recall two people
 13 that registered but did not respond when I called their
 14 names. Kim Wong and Rick McFadden. Okay. I believe
 15 that's all the people that are registered to speak.
 16 On behalf of the U.S. Department of Energy, I
 17 want to thank you very much for your time and attention.
 18 Let the record reflect that it is now 9:17 p.m. and all
 19 registered speakers have been called upon to speak. The
 20 project team looks forward to working with you
 21 throughout this process. We will now adjourn this
 22 meeting. Thank you so much for coming tonight.
