Simi Valley, CA 93063
Telephone: 1-805-842-3864

Printed with soy ink on recycled paper

Reader's Guide

This Comment Response Document (CRD) portion of the *Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory (SSFL Area IV EIS)* consists of four sections:

- **Section 1 – Overview of the Public Comment Process**

This section describes the public comment process for the *Draft SSFL Area IV EIS*; the format used in the public hearings on the *Draft SSFL Area IV EIS*; the organization of this CRD and how to use the document; and the changes made by the U.S. Department of Energy (DOE) to the *Final SSFL Area IV EIS* in response to the public comments and recent developments that occurred since publication of the *Draft SSFL Area IV EIS*.

- **Section 2 – Topics of Interest**

This section presents summaries of topics identified from the public comments received on the *Draft SSFL Area IV EIS* and DOE's response to each issue.

- **Section 3 – Public Comments and DOE Responses**

This section presents a side-by-side display of all of the comments received by DOE on the *Draft SSFL Area IV EIS* and DOE's response to each comment. The comments were obtained at two public hearings on the *Draft SSFL Area IV EIS* and via telephone, email, and U.S. mail.

- **Section 4 – References**

This section contains the references cited in this CRD.

To Find a Specific Comment and DOE Response

Refer to the "List of Commenters" immediately following the Table of Contents. This list is organized alphabetically by commenter name and shows the corresponding page number(s) where commenters can find their comment(s).

DOE has made a good faith effort to interpret the spelling of names that were either hand-written on comment forms and letters, or transcribed from oral statements made during public hearings.

ACRONYMS, ABBREVIATIONS, AND CONVERSION CHARTS

ACRONYMS, ABBREVIATIONS, AND CONVERSION CHARTS

AEA	Atomic Energy Act
AFB	Air Force Base
ALARA	as low as reasonably achievable
AOC	Administrative Order on Consent
ASER	Annual Site Environmental Report
ATSDR	Agency for Toxic Substances and Disease Registry
BMP	best management practice
BTV	background threshold value
CAG	Community Advisory Group
CC14	carbon tetrachloride
CDFW	California Department of Fish and Wildlife
CDPH	California Department of Public Health
CERCLA	Comprehensive Environmental Response, Compensation, and Liability Act
CEQ	Council on Environmental Quality
CEQA	California Environmental Quality Act
CESA	California Endangered Species Act
CIF	Community Involvement Fund
CLL	chronic lymphocytic leukemia
CMWD	Calleguas Municipal Water District
CNEL	Community Noise Equivalent Level
CO	Consent Order
COCs	contaminants of concern
CRD	Comment Response Document
DOE	U.S. Department of Energy
DOT	U.S. Department of Transportation
DPM	diesel particulate matter
DTSC	Department of Toxic Substances Control
EA	Environmental Assessment
ECL	Environmental Chemistry Laboratory
EIR	Environmental Impact Report
EIS	Environmental Impact Statement
EPA	U.S. Environmental Protection Agency
ESA	Endangered Species Act
ESALs	equivalent single axle loads
ETEC	Energy Technology Engineering Center
FR	<i>Federal Register</i>
GIS	Geographical Information System
GWIM	Groundwater Interim Measures

HSA	Historical Site Assessment
HI	Hazard Index
HQ	Hazard Quotient
IDLH	Immediately Dangerous to Life or Health
IEI	International Epidemiology Institute
LLW	low-level radioactive waste
LUT	Look-Up Table
MDC	minimum detectable concentrations
MLLW	mixed low-level radioactive waste
MORe	Mandatory Commercial Organics Recycling
MOU	Memorandum of Understanding
MRL	method reporting limit
NAAQS	National Ambient Air Quality Standard
NASA	National Aeronautics and Space Administration
NBZ	Northern Buffer Zone
NCI	National Cancer Institute
NEPA	National Environmental Policy Act
NHPA	National Historic Preservation Act
NO _x	nitrogen oxides
NPDES	National Pollutant Discharge Elimination System
NPS	National Park Service
NRC	Nuclear Regulatory Commission
NRHP	<i>National Register of Historic Places</i>
OSWER	Office of Solid Waste and Emergency Response
PAH	polycyclic aromatic hydrocarbon
PCB	polychlorinated biphenyl
ppb	parts per billion
ppm	parts per million
PSD	Prevention of Significant Deterioration
RESRAD	RESidual RADioactivity
RBSL	risk-based screening level
RCRA	Resource Conservation and Recovery Act
RFI	RCRA Facility Investigation
RMHF	Radioactive Materials Handling Facility
ROD	Record of Decision
RWQCB	Regional Water Quality Control Board
SCAB	South Coast Air Basin
SHPO	State Historic Preservation Officer
SRAIP	Soils Remedial Action Implementation Plan
SRAM	Standardized Risk Assessment Methodology
SRE	Sodium Reactor Experiment

SSFL	Santa Susana Field Laboratory
SWEIS	Sitewide Environmental Impact Statement
TACs	toxic air contaminants
TCE	trichloroethylene
TPH	total petroleum hydrocarbons
UCL	upper confidence limit
UCL95	95 percent upper confidence limit on the arithmetic mean
UCLA	University of California, Los Angeles
USFWS	U.S. Fish and Wildlife Service
VCAPCD	Ventura County Air Pollution Control District
WAC	waste acceptance criteria

SECTION 1
OVERVIEW OF THE PUBLIC COMMENT PROCESS

1.0 OVERVIEW OF THE PUBLIC COMMENT PROCESS

This section of this Comment Response Document (CRD) describes the public comment process for the *Draft Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory (Draft SSFL Area IV EIS)* and the procedures used to respond to those comments. Section 1.1 describes the public comment process and the means of receiving comments on the *Draft SSFL Area IV EIS*. It also identifies the comment period and the locations and dates of the public hearings on the *Draft SSFL Area IV EIS*. Section 1.2 addresses the public hearing format. Section 1.3 describes the organization of this CRD, including how the comments were categorized, addressed, and documented. Section 1.4 summarizes the changes made to the environmental impact statement (EIS) that resulted from the public comment process. Section 1.5 summarizes the next steps the U.S. Department of Energy (DOE) will take after publication of the *Final SSFL Area IV EIS*.

Comment document – A communication in the form of an electronic statement (website entry, document upload, or email), a letter, transcript, or written comment from a public hearing that contains comments from a sovereign nation, government agency, organization, or member of the public regarding the *Draft SSFL Area IV EIS*.

Comment – A statement or question regarding the draft EIS content that conveys approval or disapproval of proposed actions, recommends changes, or seeks additional information.

1.1 Public Comment Process

DOE prepared the *Draft SSFL Area IV EIS* in accordance with the National Environmental Policy Act of 1969 (NEPA) and Council on Environmental Quality and DOE NEPA regulations (Title 40 of the *Code of Federal Regulations* Parts 1500–1508 (40 CFR Parts 1500–1508) and 10 CFR Part 1021, respectively). An important part of the NEPA process is solicitation of public comments on a draft EIS and consideration of those comments in preparing a final EIS. DOE distributed copies of the *Draft SSFL Area IV EIS* to those Federal agencies, State and local governmental entities, American Indian tribal governments, and members of the public known to be interested in or affected by implementation of the alternatives evaluated in the EIS, as well as those organizations and individuals who requested a copy. Copies also were made available on the Internet and in regional public libraries.

On January 13, 2017, the U.S. Environmental Protection Agency (EPA) published a notice in the *Federal Register* (FR) on behalf of DOE, announcing the availability of the *Draft SSFL Area IV EIS* (82 FR 4336). A 60-day comment period, from January 13 to March 14, 2017, was announced to provide time for interested parties to review and comment on the *Draft SSFL Area IV EIS*. DOE decided to extend the comment period based upon several requests for extensions. On March 17, 2017, EPA published an amended *Federal Register* notice announcing DOE's extension of the public comment period to April 13, 2017 (82 FR 14217). During the public comment period, DOE held two public hearings and a hearing for Native American groups to provide participants with opportunities to learn more about the content of the *Draft SSFL Area IV EIS* from exhibits, fact sheets, and other materials; hear DOE representatives present an overview of the results of the *Draft SSFL Area IV EIS* analyses; ask questions; and provide oral or written comments.

Table 1–1 lists the date and location of each hearing as well as the numbers of attendees and commenters. The attendance estimates are based on the number of registration forms completed and returned as well as a rough “head count” of the audience.

Table 1–1 Hearing Locations, Attendance, and Numbers of Commenters

<i>Location</i>	<i>Date</i>	<i>Attendance</i>	<i>Number of Oral Commenters</i>
Native American Hearing, DOE offices	February 17, 2017	7	3
Simi Valley, California	February 18, 2017	87	32
Van Nuys, California	February 21, 2017	73	43
Total		167	78

In addition, Federal agencies, State and local governmental entities, American Indian tribal governments, and members of the public were invited to submit comments via the U.S. mail or online at www.SSFLAreaIVEIS.com. **Table 1–2** lists the number of comment documents received by each method of submission.

Table 1–2 Numbers of Comment Documents Received by Method of Submission

<i>Method of Submission</i>	<i>Number of Comment Documents</i>
Online at www.SSFLAreaIVEIS.com	477
U.S. mail	104
Email	35
Campaigns ^a	660
Petitions ^a (Petition 1, signed by 7 individuals; Petition 2, signed by 10 individuals)	2
Public hearings (oral)	78
Public hearing (written)	7
Total	1,363

^a Campaign comments were submitted by U.S. mail or email and petitions were submitted via U.S. mail.

Upon receipt, all written comment documents were assigned a document number for tracking during the comment response process. Each commenter in the transcripts from the public hearings also was assigned a document number. All comment documents were then processed for inclusion in this CRD. In processing the comment documents, each document was analyzed to identify individual comments (which were numbered sequentially) and DOE prepared responses to each numbered comment. DOE responded to all comments received, including the few received after the end of the comment period, April 13, 2017 in preparing this *Final SSFL Area IV EIS*. Comments that DOE determined to be outside the scope of the *SSFL Area IV EIS* are acknowledged as such in this CRD. The remaining comments were then reviewed and responded to by policy experts, subject matter experts, and NEPA specialists, as appropriate. This CRD presents the comment documents, including the campaign letters,¹ as well as the public hearing transcripts and DOE’s responses to the comments. **Figure 1–1** illustrates the process used for collecting, tracking, and responding to the comments.

The comments and DOE responses were compiled in a side-by-side format, with each identified comment receiving a separate response. All comments and responses are numbered with a comment identification number to facilitate matching a comment with its response.

¹ A letter was considered to be part of a campaign, if a significant number of letters were received with the same text appearing in the body of the letters.

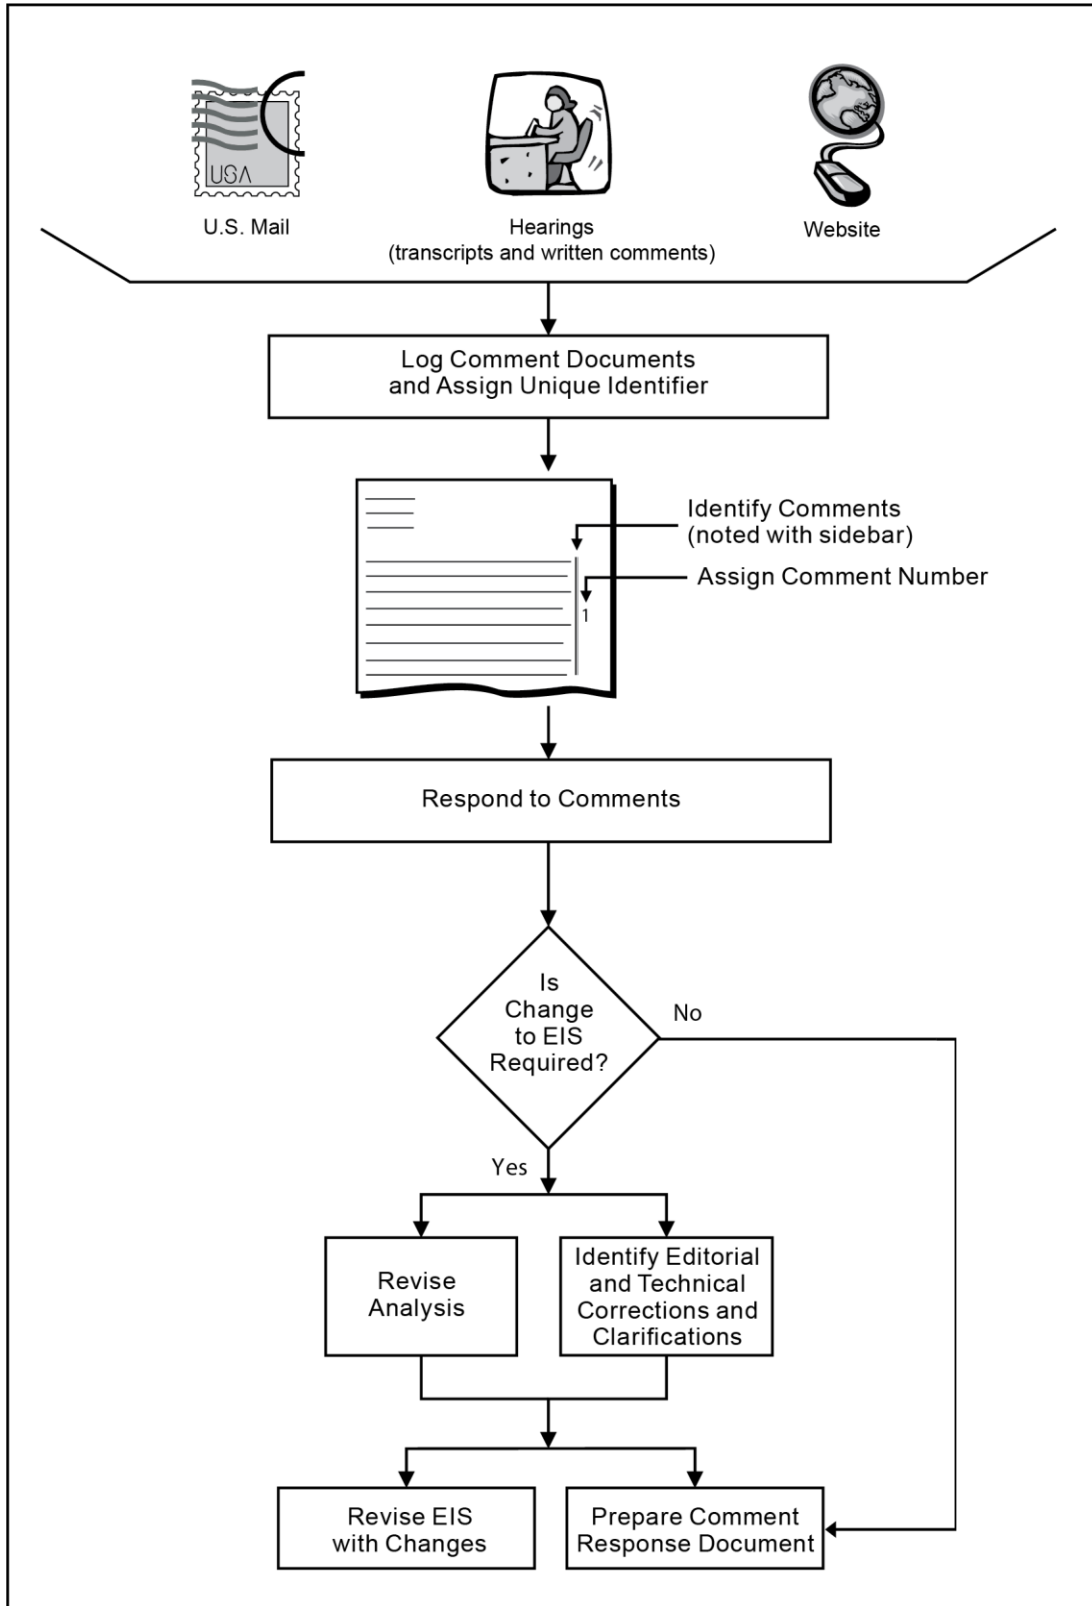

Figure 1-1 Comment Response Process for the *Final SSFL Area IV EIS*

During preparation of this *Final SSFL Area IV EIS* all comments received on the *Draft SSFL Area IV EIS* were considered and responses were prepared. This effort served to focus the revision process and ensure consistency throughout the final document. The comments assisted in determining whether the alternatives and analyses presented in the *Draft SSFL Area IV EIS* should be modified or augmented, whether information presented in the *Draft SSFL Area IV EIS* needed to be corrected or updated, and whether additional clarification was necessary to facilitate better understanding of certain issues. Change bars in the margins of pages in Volumes 1 and 2 of this *Final SSFL Area IV EIS* indicate where substantive changes were made and where text was added or deleted. Editorial changes are not marked.

1.2 Public Hearing Format

The two public hearings and a hearing for Native American groups were designed to provide information about the NEPA process, DOE's proposed action, and the results of analysis of alternatives presented in the *Draft SSFL Area IV EIS* and to invite public comments on the document. A court reporter was present at all three hearings to record and prepare a transcript of the comments that were expressed at the hearing. These transcripts are included in Section 3 of this CRD. Written comments were also collected at the hearings. Comment forms were available at the hearings for anyone wishing to use them.

Before each public hearing and the hearing for Native American groups, DOE hosted an open house where poster displays were presented on various topics known to be of interest to the public, including the NEPA process and the alternatives evaluated in the *Draft SSFL Area IV EIS*. The displays were staffed by DOE subject matter experts who were knowledgeable of the analyses presented in the *Draft SSFL Area IV EIS* and able to respond to questions. Attendees were invited to view the displays and ask questions of the subject matter experts prior to the formal hearings.

The DOE Site Manager for the Energy Technology Engineering Center (ETEC) opened all three hearings with welcoming remarks and a brief history of ETEC. The DOE NEPA Document Manager then provided an overview of the *Draft SSFL Area IV EIS* and the NEPA process. Following the overview presentation, a meeting moderator opened the comment session. A time limit was established to ensure that everyone who wished to speak would have an opportunity to provide oral comments. Everyone who was asked to conclude their remarks to comply with the time limitation was encouraged to provide additional comments in writing. As part of the comment response process, the transcripts and written comments collected at the hearings were reviewed for comments on the *Draft SSFL Area IV EIS*, as described in Section 1.1 of this CRD.

1.3 Organization of this Comment Response Document

This CRD is organized into the following sections:

- Section 1 describes the public comment process for the *Draft SSFL Area IV EIS*, the format used in the hearings on the *Draft SSFL Area IV EIS*, the organization of this document and how to use this CRD, and the changes made by DOE to the *Draft SSFL Area IV EIS* in preparing the *Final SSFL Area IV EIS* in response to the public comments.
- Section 2 presents topics of interest from the public comments received on the *Draft SSFL Area IV EIS* that required a detailed response or appeared frequently in the comments as well as DOE's response to each topic of interest.
- Section 3 presents comment documents received via the *SSFL Area IV EIS* website, email, and U.S. mail, as well as the transcripts of the oral comments and written comments received during

the hearings. The comment documents and DOE’s responses to the comments delineated within each comment document are presented side by side.

- Section 4 lists the references cited in this CRD; the references are available at www.SSFLAreaIVEIS.com.

1.4 Changes from the *Draft SSFL Area IV EIS*

In preparing this *Final SSFL Area IV EIS*, DOE made revisions to the *Draft SSFL Area IV EIS* in response to comments received from other Federal agencies and State and local government entities; American Indian tribes; and the public. In addition, DOE updated information due to events or the availability of information in other documents that were not completed in time to be incorporated into the Draft EIS that was released for public comment in January 2017. DOE also changed this to provide more environmental baseline information, update project data, and revise consequence analyses, as well as to correct inaccuracies, make editorial corrections, and clarify text. Vertical change bars appear alongside such changes in Volumes 1 and 2 of this Final EIS. Editorial changes are not marked. The following summarizes the major changes made to the *Final SSFL Area IV EIS*.

Public Comment Period and Comments Received on the *Draft SSFL Area IV EIS*

Sections 1.10.5 and S.8.2 were added to the Final EIS in Chapter 1 and the Summary, respectively, to describe the public comment period on the Draft EIS and the types of comment received.

Changes Made for the *Final SSFL Area IV EIS*

Sections 1.9.6 and S.9 were added to Chapter 1 and the Summary, respectively, to list the substantive changes made to the Draft EIS in preparing the Final EIS.

Additional Studies and Reports

Sections of this Final EIS were updated based on new reports, studies, and agreements that became available after publication of the Draft EIS. These reports include:

- *Draft RCRA Facility Groundwater Remedial Investigation Report, Area IV, Santa Susana Field Laboratory, Ventura County, California* (CDM Smith 2018a)
- *Draft Area IV RCRA Corrective Measures Study* (CDM Smith 2018b)
- Report on the results of groundwater pumping as an interim measure at the Former Sodium Disposal Facility (CDM Smith 2018c)
- 2015 and 2017 archaeological studies² (Corbett et al. 2015; CH2M Hill 2017)
- Results from Bravo Bedrock Vapor Extraction Treatability Study³ (CH2M Hill 2015)
- U.S. Fish and Wildlife Service Biological Opinion for the Cleanup of Area IV of the Santa Susana Field Laboratory, Ventura County, California (see Appendix J of this Final EIS)
- *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (DTSC 2017b)

Boeing Land Use Covenants

This Final EIS was revised to reflect the Grant Deeds of Conservation Easement and Agreement (Ventura County 2017a, 2017b) executed by Boeing and North American Land Trust, which restrict

² While completed prior to the publication of the Draft EIS, the document was completed in time to be incorporated into the Draft EIS.

³ See preceding footnote.

future land use of Boeing's property to open space, including the property DOE is cleaning up. In April and November 2017, Boeing made legally binding commitments to conservation easements held by North American Land Trust that permanently preserve as open space habitat nearly 2,453 acres of land that Boeing owns at the Santa Susana Field Laboratory (SSFL), which includes Area IV and the NBZ. In accordance with the easement, "the Property shall be managed and maintained in a manner such that any use of the Property must be consistent with preservation, protection, and maintenance in perpetuity of the Conservation Values of the Property..." Those conservation values are identified as significant natural, ecological, cultural, historic, aesthetic, educational, scientific, scenic, and open space values. The conservation easement is a legally enforceable document that, among other restrictions, forever prohibits residential, agricultural, or commercial development or uses of the site.

Updates to Alternatives

In response to comments on the Draft EIS regarding volume estimates, DOE re-evaluated the geographical information system (GIS) and soil characterization data used in estimating the area and volume of soil subject to remediation. This resulted in minor adjustments to a revised estimate of the total volume of soil estimated to exceed the *Administrative Order on Consent for Remedial Action* (AOC) Look-Up Table (LUT) values of 1,616,000 cubic yards compared to 1,413,000 cubic yards presented in the Draft EIS. The re-evaluation also resulted in a revised estimate of the volume of soil, following adjustments for soil that exceeds the AOC LUT value for total petroleum hydrocarbons (TPH) only and the areas in which the exemption process would be applied. The volume of soil to be removed under the Cleanup to AOC LUT Values Alternative following these adjustments is 881,000 cubic yards, compared to 933,000 cubic yards evaluated in the Draft EIS. Information regarding soil volume calculations is included in Appendix D.

To fully reflect future land use in accordance with the Boeing conservation easements described above, DOE modified the Conservation of Natural Resources Alternative to include two scenarios. The first scenario uses risk-based cleanup levels based on the exposure scenario as evaluated in the Draft EIS, which is, an onsite resident with no garden. A second scenario was added to more accurately reflect the future open space use of the site; it establishes risk-based cleanup levels commensurate with exposure of an onsite recreational user.⁴ The soil remediation alternatives, including the two Conservation of Natural Resources scenarios, were also revised to account for removal of an area of mercury-contaminated soil and to reflect risk-based protection of ecological resources.

Substantial changes in the volume of soil requiring removal under the Conservation of Natural Resources Alternative resulted from the performance of additional risk assessments. The more extensive risk assessments resulted in reductions in volumes of soil requiring removal for the identified exposure scenarios. In this Final EIS, the Conservation of Natural Resources, Residential Scenario would remove 52,000 cubic yards of soil. In the Draft EIS, this same scenario was estimated to remove 148,000 cubic yards of soil. A discussion of the basis for and the process that resulted in the reduced volumes is presented in Appendices D and K.

In the Draft EIS, the area and volume of soil that would be remediated in areas in which the exemption process would be applied were not quantified, but were expected to be a small increment. The additional risk assessment work combined with the re-evaluation of GIS and soil characterization data conducted in developing this Final EIS shows that about 4 acres would require cleanup in the areas in which the exemption process would be applied.

In response to comments and based on a construction-estimating evaluation (DOE 2018), the level of operations and the daily number of trucks hauling Area IV soil and backfill was revised. Rather than 32

⁴ Impacts to an onsite recreational user were addressed in the Draft EIS under all alternatives. However, cleanup levels (this alternative scenario that is addressed in the Final EIS) were not based on this receptor in the Draft EIS.

to 48 heavy-duty truck round trips per day, a lower number of 16 daily truck trips was used. This extended the planning-level schedule for completion from 10 to 26 years for the Cleanup to AOC LUT Values Alternative; from a little over 3 to 6 years for the Cleanup to Revised LUT Values Alternative; and from a little over 1 to less than 2 years for the Conservation of Natural Resources Alternative (both scenarios).

Use of Risk rather than Dose in Risk Assessments

In this Final EIS, the risk assessments performed for determining areas requiring remediation under the Conservation of Natural Resources Alternative (both scenarios) used the target risk range for alternatives of 1×10^{-6} to 1×10^{-4} (1 in 10,000 to 1 in 1 million) to evaluate cleanup of soil with radioactive constituents. Soil with radioactive constituents would be removed to ensure that the risk to an onsite user (either a hypothetical resident or recreational user) following remediation would not exceed the upper end of the risk range. This is different than the approach presented in the Draft EIS, which used 25 millirem per year plus ALARA [as low as reasonably achievable] for cleanup of radioactive constituents. Cleanup that results in cancer incidence that falls within the risk range would be well below the 25 millirem per year dose objective of DOE Order 458.1.

Sensitivity Analyses

DOE added a sensitivity evaluation appendix (see Appendix L) to evaluate how various uncertainties or possible changes would affect environmental consequences. In response to public comments, a sensitivity evaluation of the Cleanup to AOC LUT Values Alternative was added. The purpose of the evaluation, which assesses the potential impacts if all areas exceeding the AOC LUT values were excavated and removed from the site, was two-fold. It serves as a comparison point for commenters who believed that DOE's application of the 2010 AOC exemption process for protection of biological and cultural resources was overly broad and/or objected to use of natural attenuation to treat certain low-concentration contaminants. It also responds to commenters who suggested that DOE's volume estimates may be low for the Cleanup to AOC LUT Values Alternative.

Sensitivity evaluations were included for all soil remediation alternatives to evaluate the effects of events (e.g., funding constraints, weather events) that may result in remediation proceeding at a slower rate than anticipated under the base case analyses (that is, the soil remediation action alternatives evaluated in Chapter 4, Environmental Consequences). For these sensitivity evaluations, it was assumed that remediation would proceed at about half the rate as under the base cases, thereby essentially doubling the durations.

A sensitivity evaluation of the Building Removal Alternative was performed to evaluate the effects of accelerating building demolition activities. The sensitivity evaluation assumes that building demolition and removal of debris from the site would be completed in about a year's time rather than the 2 to 3 years evaluated under the Building Removal Alternative.

Updated Alternative Concepts Considered but Dismissed from Detailed Study

Chapter 2, Section 2.2.3, Alternative Concepts Considered but Dismissed from Detailed Study, was revised to provide additional information regarding transportation options that were considered but not studied in detail. The revised Section 2.2.3 includes information based on the *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California (Draft Program EIR)* (DTSC 2017b). Transportation options considered include use of roads other than Woolsey Canyon Road for truck travel to and from SSFL; construction of overland conveyor systems move soil to a truck or train loading station; and transporting contaminated soil as a slurry in a pipeline.

Preferred Alternative

At the time the Draft EIS was prepared, DOE did not have a preferred alternative.⁵ DOE has identified its preferred alternative in this Final EIS.

DOE's preferred alternative for soils remediation is the Conservation of Natural Resources, Open Space Scenario. DOE is identifying this as the preferred alternative because it would be consistent with the risk assessment approach typically used at other DOE sites, other Department of Toxic Substances Control (DTSC)-regulated sites, and EPA Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) sites that accounts for the specific future land use of the site. Use of a risk assessment approach is consistent with the process being used by Boeing for the land it owns at SSFL and recognizes the Grant Deeds of Conservation Easement and Agreements (Ventura County 2017a, 2017b) that commit Boeing's SSFL property, including Area IV and the NBZ, to remaining as open space. This scenario would use a CERCLA risk assessment approach that would be protective of human health and the environment rather than LUT values (action levels). The 2010 AOC, Section 6.2, allows DOE and DTSC to agree upon changes to the AOC to better meet cleanup objectives. DOE expects to engage DTSC in discussions about such changes in order to implement this soil remediation alternative.

For building demolition, DOE's preferred alternative is the Building Removal Alternative. Under this alternative DOE would demolish the 18 DOE-owned buildings in Area IV and transport the resulting waste off site for disposal. Demolition of thirteen facilities and disposition of the resulting debris would be in accordance with DOE requirements and applicable laws and regulations. Three facilities at the Radioactive Materials Handling Facility (RMHF) and the two facilities comprising the Hazardous Waste Management Facility (HWMF) would be closed in accordance with DTSC-approved RCRA facility closure plans.

DOE's preferred alternative for groundwater remediation is a combination of the Monitored Natural Attenuation Alternative and the Treatment Alternative. DOE would treat groundwater plumes with higher concentrations of contaminants (the Former Sodium Disposal Facility, Hazardous Materials Storage Area, Building 4100/56, and Building 4057 plumes) in accordance with the results of the final Corrective Measures Study. Source removal is the preferred action for the strontium-90 source. Monitored natural attenuation would be used for plumes that are not amenable to active treatment – the two plumes with the lowest concentrations of trichloroethylene (TCE) (the Metals Clarifier and RMHF plumes) and the tritium plume. DOE's proposed groundwater remedial actions would be included in the final Corrective Measures Study submitted to DTSC for approval.

Updated Groundwater Characterization Information

DOE has completed additional groundwater investigations and reported the results in the *Draft RCRA Facility Groundwater Remedial Investigation Report, Area IV, Santa Susana Field Laboratory, Ventura County, California* (CDM Smith 2018a). Chapter 3, Section 3.4, of this Final EIS was updated with information from the draft remedial investigation report, including a reference to the detailed discussion of the site's geology; a summary of the conceptual site model of three-dimensional groundwater flow and contaminant migration at the site; updated information on the magnitude and extent of the existing groundwater contamination plumes in Area IV and the NBZ; and additional information on the impact

⁵ The preferred alternative is the alternative an agency believes would fulfill its statutory mission and responsibilities, giving consideration to economic, environmental, technical, and other factors. A preferred alternative, if one or more exists, must be identified in the Final EIS unless another law prohibits the expression of such a preference (40 CFR 1502.14(e)). It is not the agency's final decision regarding the selection of an alternative to implement. That decision is presented to the public in the Record of Decision which cannot be published until at least thirty days after publication of the Final EIS (40 CFR 1506.10).

of fine-grained units on the groundwater flow and contaminant migration. A figure was added to this Final EIS to show the current location of known groundwater seeps.

Updated Information on Groundwater Remedies

The *Draft Area IV RCRA Corrective Measures Study, Santa Susana Field Laboratory, Ventura County, California* (CDM Smith 2018b) was completed after publication of the Draft EIS. This Final EIS incorporates additional groundwater remedies identified in the draft corrective measures study.

Stormwater Control Plan

DOE added information to this Final EIS in Chapter 4, Section 4.3.1 regarding the Stormwater Pollution Prevention Plan (SWPPP) that will be developed for soil remediation actions. The Final EIS notes that the SWPPP will be developed in coordination with and incorporate all appropriate runoff control measures recommended by the Stormwater Expert Panel (an independent committee of experts who have been providing guidance on stormwater control for SSFL to Boeing and the Los Angeles Regional Water Quality Control Board since 2008). This Final EIS also notes that the SWPPP would detail the potential configuration and design of the additional erosion control measures required by Mitigation Measure SW-2 to respond to any runoff from the site that exceeds the design capacity of the best management practices and National Pollutant Discharge Elimination System monitoring locations identified in Section 4.3.1, along with the avoidance measures identified by Mitigation Measure SW-1.

Protection of Biological Resources

Prior to and subsequent to issuance of the Draft EIS, DOE consulted with the U.S. Fish and Wildlife Service (USFWS) in compliance with the Federal Endangered Species Act (ESA) and the California Department of Fish and Wildlife (CDFW). The purpose of the consultation was to comply with regulatory requirements and identify ways to avoid potential impacts on rare, threatened, and endangered species and develop appropriate measures to mitigate or offset project-caused impacts on listed species populations and their essential habitats. As a result of DOE's analysis and this process, DOE identified proposed areas where the exemption process would be applied in the Draft EIS. The areas proposed for application of the exemption process in this Final EIS reflect a continuation of consultations with USFWS and CDFW, as well as input received in the public comments.

The 2010 AOC explicitly provides for exemptions to cleanup for impacts to species or habitat protected under the ESA. In addition to complying with the ESA, DOE has a responsibility to protect species and habitats in accordance with other laws and regulations. This Final EIS was revised to reflect completion of the consultation process with USFWS, which included DOE's preparation and submission of a biological assessment to USFWS and USFWS issuing a biological opinion (see Appendix J); biological resources (species and habitat protected under the ESA) will be protected in accordance with the results of the biological opinion. In order to comply with State and local laws and regulations and based on consultation with CDFW and comments from Ventura County, DOE also proposed areas in which the exemption process would be applied for the protection of State-listed species, sensitive species, and sensitive habitats. The Final EIS was also revised to reflect that the soil remediation plan (referred to as a soil remedial action implementation plans [SRAIP] in the 2010 AOC) to be prepared by DOE and approved by DTSC will reflect the final determination of cleanup areas, including identification of the areas in which the exemption process would be applied.

Ecological Risks

In response to public comments on the Draft EIS, this Final EIS more quantitatively addresses ecological risk. Ecological RBSLs (similar in concept to human health RBSLs) were identified for biota. These were used to evaluate potential risk impacts to ecological resources from soil with chemical constituents in concentrations that exceed these ecological risk based levels. Where appropriate, the

Final EIS reflects cleanup levels that are based on human health risks and ecological risks (see Appendix K).

Onsite Human Health Impacts

In response to comments, DOE added a quantitative evaluation of human health impacts to potential onsite post-remediation receptors for all alternatives, see Appendix K for a discussion of the evaluation. These post-remediation receptor scenarios include an onsite recreational receptor and an onsite suburban resident (without a garden). The modeling results are included in Chapter 4, Section 4.9 of this Final EIS.

Offsite Human Health Impacts

Potential risks to the offsite public under all proposed alternatives were added to Chapter 4, Section 4.9, of this Final EIS. Impacts were evaluated both during remediation and post-remediation. Potential impacts were calculated for a recreational user and a suburban resident with a garden. A discussion of the potential cumulative impacts on human health for the offsite public was added to Chapter 5, Section 5.5.9, of this Final EIS.

Protection of Cultural Resources

Chapter 4, Section 4.11, of this Final EIS was revised to clearly address inadvertent discovery of cultural resources during cleanup activities and cleanup within exemption areas. Text was added to acknowledge the possibility of identifying previously unrecorded resources during soil removal and building demolition and to indicate that procedures in the National Historic Preservation Act, Section 106 programmatic agreement⁶ would be followed if such resources are discovered. The text was also revised to correct statements implying that cleanup would not occur in the areas in which the exemption process is applied. Cleanup would occur in the areas in which the exemption process is applied to remove chemicals or radionuclides that exceed risk-based cleanup criteria. These cleanups would be carefully planned and executed to minimize impacts on cultural resources.

Childcare Centers, Preschools, Parks, and Recreation Centers

In this Final EIS, DOE added the locations of childcare centers, preschools, parks, and recreation centers, in addition to schools, to its evaluation of truck traffic and potential adverse effects on children.

Revised Information for NASA and Boeing Activities

The soil volumes and other cumulative impacts information presented in Chapter 5, Table 5–1, of the Draft EIS were up to date at the time of its publication. Subsequent to release of the Draft EIS in January 2017, new information became available (Boeing 2017a, 2017b; NASA 2017b). Therefore, the NASA and Boeing values in Table 5–1 were updated in this Final EIS to reflect the latest information.

Additional Laws, Regulations, Permits, and Agreements

Additional laws, regulations, permits, and agreements were added to Chapter 8 of this Final EIS including:

- Access Agreement between DOE and Boeing, dated December 20, 2013
- New Requirements
 - Mandatory Commercial Organics Recycling (Assembly Bill Number 1826) (signed by Governor Brown October 2014)

⁶ This programmatic agreement is being developed through consultation with the SHPO, the Santa Ynez Band of Chumash Indians, members and representatives of other tribes, and other consulting parties.

- Potential Permits or Approvals
 - U.S. Army Corp of Engineers, Clean Water Act Section 404 permit
 - California Department of Fish and Wildlife, Streambed Alteration Agreement
 - Los Angeles Regional Water Quality Control Board, Section 401 Water Quality Certification
 - Ventura County, Oak Tree Permit

1.5 Next Steps

Based on this *Final SSFL Area IV EIS* and consistent with the requirements of NEPA, DOE may announce a decision regarding future actions in one or more Records of Decision (RODs). A ROD is to be issued no sooner than 30 days after the EPA publication of the Notice of Availability of the *Final SSFL Area IV EIS* in the *Federal Register*. The ROD would describe the alternative(s) selected for implementation and explain how environmental impacts will be avoided, minimized, or mitigated. For example, DOE could proceed with demolition of non-RCRA-permitted buildings following issuance of the ROD. A number of other actions would be necessary prior to DOE undertaking soil or groundwater remediation or demolition of RCRA-permitted buildings. DTSC must complete the program EIR and issue a finding in accordance with the California Environmental Quality Act. In accordance with the 2010 Administrative Order on Consent (2010 AOC) (DTSC 2010), and the approval process described in the *Draft Program EIR* (DTSC 2017b), soil remediation could begin following DOE preparation and DTSC approval of a soil remediation plan. Prior to DTSC approval however, the soil remediation plan would be subject to public review and comment. Groundwater remediation could begin following DOE submittal and DTSC approval of the DOE-prepared Final Corrective Measures Study that describes remediation methods for each groundwater plume and the strontium-90 contaminated bedrock. Demolition of RCRA-permitted DOE buildings is contingent on DTSC approval of the facility closure plans that DOE has submitted; DTSC made the draft plans available for public review in August 2018.

SECTION 2
TOPICS OF INTEREST

2.0 TOPICS OF INTEREST

Upon review of the comments received on the *Draft Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory (Draft SSFL Area IV EIS)*, the U.S. Department of Energy (DOE) identified several topics of interest to be addressed in this section of the Comment Response Document (CRD). These include topics of broad interest or concern as indicated by their recurrence in comments or technical topics that warrant a more detailed discussion than might be afforded in responding to an individual comment. This section summarizes the comments received on a topic of interest, followed by DOE's response:

- Preferences for cleanup
- Compliance with the 2010 Administrative Order on Consent (AOC)
- Suitable backfill soil
- Application of exemptions under the 2010 AOC
- Toxicity of soil contaminants
- Comparison of radiation doses
- Offsite impacts
- Cancer and other illnesses near Santa Susana Field Laboratory (SSFL)
- Options for transportation of waste from SSFL
- Public perceptions about waste and contamination in Area IV

2.1 Preferences for Cleanup

Comment Summary

Many commenters expressed support for a particular alternative, especially among the alternatives evaluated for soil remediation. With respect to soil remediation, several commenters stated either an explicit or implied preference for the Cleanup to AOC Look-Up Table (LUT) Values Alternative. These commenters called for removal of radioactive and hazardous wastes from Area IV and the Northern Buffer Zone (NBZ) of SSFL to background levels in accordance with the 2010 AOC (2010 AOC). Reasons for this preference generally centered on concerns about contamination migrating off site, impacts on human health, and impacts on plants and animals. In addition, commenters supporting this alternative felt that DOE should uphold its commitment to abide by the 2010 AOC.

Other commenters stated a preference for the site to be cleaned up based on a calculated risk. Some with this preference specifically referenced a cleanup in accordance with the Conservation of Natural Resources Alternative; some of these commenters indicated that their second choice would be the Cleanup to Revised LUT Values Alternative. Commenters indicated that they supported this alternative because it provides a risk-based cleanup that is consistent with typical U.S. Environmental Protection Agency (EPA) practice for calculating ecological and human health risks, suitable for the future end use of the site as open space, minimizes environmental impacts to biological and cultural resources, and minimizes the amount of contaminated soil to be excavated from the site and transported along local roads. Some commenters also stated that this alternative would be more cost effective than other alternatives.

A commenter expressed support for the Cleanup to Revised LUT Values Alternative.

A number of commenters supported cleanup of SSFL but did not reference a specific alternative.

With respect to building demolition, commenters who did express an opinion were generally in favor of removing the buildings as proposed under the Building Removal Alternative.

With respect to groundwater remediation, some commenters expressed a preference for the Monitored Natural Attenuation Alternative. Other commenters expressed an objection to the Monitored Natural Attenuation Alternative. The reason for their objection was related to the long duration (70 years or longer) that would likely be needed for some constituents to attenuate.

Response

DOE appreciates and acknowledges the commenters' preferences for cleanup of SSFL and notes there were a variety of preferences expressed by commenters, some for a cleanup in accordance with the 2010 AOC (DTSC 2010) and others for a cleanup based on risk. DOE reiterates the Council on Environmental Quality (CEQ) statement that "Commenting is not a form of 'voting' on an alternative" (CEQ 2007). The number of comments received for or against a particular alternative does not dictate the action that a Federal agency must take.

As discussed in Chapter 1, Section 1.3 of this environmental impact statement (EIS), there are multiple parties responsible for cleanup at SSFL. This EIS evaluates the potential environmental impacts associated with remediating the portions of SSFL for which DOE is responsible, that is, Area IV and the NBZ. In addition to DOE, the National Aeronautics and Space Administration (NASA) and Boeing are responsible for remediating portions of SSFL. NASA is responsible for cleanup of Area II, a portion of Area I, and portions of the NBZ impacted by NASA operations. Boeing is responsible for cleanup of Areas I and III and for demolition of four company-owned buildings in Area IV. Boeing and NASA cleanup activities are only considered in this EIS as part of cumulative impacts (Chapter 5).

As discussed in Chapter 1, Section 1.3 of this EIS, DOE has removed all nuclear material from Area IV at SSFL, all but 22 buildings (18 owned by DOE and 4 owned by Boeing) of the 272 structures that were used during its operational period at Area IV, and much of the radioactive and chemical contamination within the soil and remaining buildings that resulted from nuclear research activities. For further details, see Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," in this CRD.

DOE proposes to complete remediation of Area IV and the NBZ in accordance with applicable requirements for cleanup of radiological and chemical substances. In accordance with the National Environmental Policy Act (NEPA) and CEQ and DOE NEPA implementing regulations, this EIS evaluates a No Action Alternative and several reasonable action alternatives for conducting cleanup activities (for soil remediation, building demolition, and groundwater remediation) in Area IV and the NBZ at SSFL. DOE evaluated three action alternatives for soil remediation (one that evaluates two scenarios), one action alternative for building demolition, and two action alternatives for groundwater remediation (the Groundwater Treatment Alternative includes a variety of possible technologies, for example, pump and treat, bedrock vapor extraction, and source removal). The purpose of evaluating a range of reasonable alternatives under NEPA is to provide comparative and objective information for consideration by the public and the decision-maker about the impacts of multiple alternative approaches to accomplishing the Federal government's proposed action. In developing these alternatives, DOE considered comments received during scoping and from an alternatives development workshop involving community members. Evaluating a range of reasonable alternatives provides information to the public and decision-makers about the relative

environmental impacts of each of the alternatives. Refer to Chapter 2 of this EIS for a description of the alternatives evaluated and a summary of the potential environmental impacts.

DOE considered all of the comments received on the Draft EIS in the development of this Final EIS. While the Final EIS identifies preferred alternatives for soil remediation, building demolition, and groundwater remediation (Chapter 2, Section 2.7), DOE has not made a decision on the remediation actions to be taken in Area IV and the NBZ. DOE will announce its decision in one or more Records of Decision (RODs), issued no sooner than 30 days after publication in the *Federal Register* of the EPA Notice of Availability for this Final EIS. The potential environmental impacts presented in this EIS, along with public input, cost, policy, and other factors, will be considered by the DOE decision-makers in selecting alternatives for soil remediation, building demolition, and groundwater remediation. The ROD(s) will present DOE's decisions regarding cleanup (describe the alternative(s) selected for implementation and explain how environmental impacts will be avoided, minimized, or mitigated) and describe the factors considered in making those decisions.

As discussed in Chapter 1, Section 1.9.2 of this EIS, the Department of Toxic Substances Control (DTSC) is preparing a program environmental impact report (program EIR) under the California Environmental Quality Act. The report addresses cleanup of the entire SSFL (Areas I, II, III, and IV and the Northern and Southern Buffer Zones). The *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California (Draft Program EIR)* (DTSC 2017b) was issued in September 2017. The *Draft Program EIR* addresses cleanup actions to be undertaken by NASA and Boeing, in addition to DOE's cleanup actions in Area IV and the NBZ. The *Draft Program EIR* evaluates potential environmental impacts and mitigations that will be considered by DTSC in selecting soil and groundwater remediation to be implemented at SSFL. DTSC will issue a Notice of Determination identifying its selected remedial actions. While similar, DOE's EIS and DTSC's program EIR are separate efforts and the completion of each is not dependent upon the other. Implementation of the selected alternative for DOE's 13 buildings that are not regulated under the Resource Conservation and Recovery Act (RCRA) could begin following issuance of a ROD for this EIS. Other cleanup of Area IV and the NBZ will not begin until DOE and DTSC have reached agreement about how the cleanup will be implemented. Specific remedial actions will be included in documents prepared by DOE and approved by DTSC: soil remediation plans (called Soils Remedial Action Implementation Plans [SRAIPs] in the 2010 AOC); the final Corrective Measures Study for groundwater; and facility closure plans for buildings regulated by DTSC (i.e., RCRA-permitted buildings).

2.2 Compliance with the 2010 Administrative Order on Consent

Comment Summary

Many individuals indicated that DOE is breaking its legal commitment and commitment to the public by not following the 2010 AOC. Also, a number of commenters stated that none of the alternatives for soil remediation evaluated in the Draft EIS meets all of the requirements of the 2010 AOC. Commenters indicated that the action alternatives presented in the Draft EIS would leave behind up to 39 percent (under the Cleanup to AOC LUT Values Alternative), 91 percent (under the Cleanup to Revised LUT Values Alternative), or 99 percent (under the Conservation of Natural Resources Alternative) of the contaminated soil. Many of these commenters stated their desire that DOE conduct the cleanup at Area IV and the NBZ at SSFL in accordance with the standards set forth in the 2010 AOC and expressed concern that, by not doing so, the extent of the cleanup would be reduced and would put the public at an increased health risk. Finally, some commenters observed that the cleanup was not completed by 2017 as stated in the 2010 AOC.

Response

DOE Actions Taken to Comply with the 2010 AOC

DOE received comments implying that DOE was not complying with the 2010 AOC, that in preparing this EIS, DOE violated the AOC, and that DOE was trying to get out of the AOC. Since signing the AOC in December 2010, DOE has and will continue to comply with the AOC. The text below demonstrates of how DOE has complied with the 2010 AOC.

Section 2.4 of the 2010 AOC identified an interagency agreement between DOE and EPA providing for EPA to conduct a radiological soil background study and a radiological investigation of Area IV and the NBZ. This agreement was established in 2010 and EPA investigations – a background study; records review; gamma surveys; and soil, sediment, and groundwater sampling – were initiated in 2010. All EPA studies were completed by 2012, with final reports issued in December 2012.

Section 2.5 of the 2010 AOC describes required soil chemical investigation activities. Section 2.5.1 directed DOE to conduct co-located (chemical and radionuclide) sampling with EPA with the samples to be provided to DTSC or its designee for chemical analysis. This work was initiated with EPA in October 2010 and completed in 2012. Section 2.5.2 also directed DOE to conduct random soil sampling with EPA with these samples also provided to DTSC or its designee. This work was also completed in 2012.

Section 2.5.3 of the 2010 AOC describes the required soil chemical data gap investigation. Working closely with DTSC staff and using the soil chemical data base in a geographic information system (GIS), soil data gaps were identified, sampling plans developed, and soil samples were collected throughout Area IV and the NBZ. Through a series of public meetings, the community also provided input to the selection of sampling locations. The data gap process and sampling were initiated in 2012, with soil sampling conducted in 2013 and 2014. Final reports were issued in 2015.

Section 2.6 of the 2010 AOC provides the basis for soil treatability studies. DOE contracted with California Polytechnic State University, San Luis Obispo and University of California, Riverside to perform the studies. The studies were scoped through a series of community meetings led by Sandia National Laboratory starting in 2011 and the studies implemented in 2012 and continued into 2014. Reports for the studies were issued in 2015.

Section 2.7 of the 2010 AOC requires DOE to prepare a Chemical Data Summary Report presenting all soil characterization data for Area IV and the NBZ. The *Draft Chemical Data Summary Report, Santa Susana Field Laboratory, Ventura County, California* was submitted to DTSC for review in January 2017 (CDM Smith 2017).

Section 3.0 of the 2010 AOC provides the public participation details. Throughout the scoping of the chemical soil investigations, DOE hosted a series of meetings with the community to review data needs and to obtain suggestions for sampling. The same was done for the soil treatability studies. Sampling documents and study plans were posted on the DOE web site for review.

Section 6.1 of the 2010 AOC recognizes that DOE is required to prepare this EIS under a court order. Section 6.2 acknowledges that once completed, DOE and DTSC may need to “make any necessary modifications” to the AOC. In compliance with NEPA, DOE was required to evaluate a full range of reasonable alternatives as analyzed in this EIS.

Section 7.11 of the 2010 AOC states that, “All actions taken pursuant to this Order by DOE shall be undertaken in accordance with applicable local, State, and federal laws and regulations.” DOE asserts that the impact analyses and mitigation/minimization measures discussed in this EIS were developed based on the requirement to comply with all laws, including air quality, water quality, endangered species protection, and cultural resource protection.

Section 8.0 of the 2010 AOC recognizes the potential need for modification of the AOC. DOE's evaluation of the implementability of the AOC has identified concerns that need to be addressed with DTSC. One example is the backfill requirement. DOE provided a letter to DTSC on the backfill issue in December 2016 (DOE 2016) and continues a dialog with DTSC.

The Agreement in Principle, which is an attachment to the AOC, addresses compliance with the Federal endangered species act. Because DOE is required to comply with applicable Federal, state, and local laws and regulations, DOE expanded in the EIS, protection of state-listed endangered species, and species of state and local importance. Per the AOC language, DOE engaged with U.S. Fish and Wildlife Service (USFWS) starting in 2009 and began discussions on endangered species protection and compliance. Through a series of meetings with USFWS, which were attended by DTSC and California Department of Fish and Wildlife (CDFW) staff, the exemption (exception) process was developed for endangered species protection. The exemption process analyzed in the EIS and the USFWS Biological Opinion are the outcomes of those meetings.

The Agreement in Principle also provides for protection of cultural resources. The Agreement in Principle uses the language "Native American artifacts that are formally recognized as Cultural Resources" for potential exemption (exception) from soil cleanup. Concerning the Native American artifacts exemption in the AOC, the particular application and scope of the phrase "Native American artifacts that are formally recognized as Cultural Resources" will be determined in cooperation with DTSC and in consultation with the California SHPO, Santa Ynez Band of Chumash Indians, other tribes, and other consulting parties in the Section 106 process. DOE plans to propose exemptions for historic properties in the soil remediation plans submitted to DTSC for its review. The Final EIS does identify and analyze potential impacts to cultural resources. As described in Chapter 3, Section 3.11.1, of this EIS, DOE defines cultural resources for the purposes of impact analysis broadly to encompass definitions of cultural resources in NEPA and the CEQ NEPA implementing regulations, historic properties as defined in the National Historic Preservation Act (NHPA) Section 106 regulations, and Native American artifacts in the 2010 AOC (see Chapter 3, Section 3.11.1, including the text box titled "Types of Cultural Resources").

Throughout the process of implementing the 2010 AOC, DOE has worked closely with DTSC staff on technical issues. This includes the backfill issue, the need to incorporate natural occurring TPH chemicals in soil cleanup considerations, and the development of the exemption process to protect sensitive biological and cultural resources.

EIS Alternatives Compliance with the 2010 AOC

DOE remains committed to a cleanup of contamination in Area IV and the NBZ of the SSFL in a manner that is protective of human health and the environment. Under NEPA, DOE has a legal obligation to rigorously explore and objectively evaluate the potential environmental impacts of a range of reasonable alternatives for cleanup in this EIS. Chapter 2, Sections 2.3 and 2.4 of this Final EIS, describe the three action alternatives that DOE analyzed for soil remediation: (1) Cleanup to AOC LUT Values Alternative, (2) Cleanup to Revised LUT Values Alternative, and (3) Conservation of Natural Resources Alternative (a Residential Scenario and an Open Space Scenario). The latter two alternatives incorporate risk-based criteria and reflect recognition by DOE that concentrations in soil exceeding the 2010 AOC LUT values do not necessarily equate with harm to people.¹ The AOC LUT values were developed to represent background concentrations and are not associated with risk-based standards. The Conservation of Natural Resources Alternative

¹ EPA has developed screening criteria for chemical and radiological risks to humans (a measure of potential damage to human health or harm). These include the use of RBSLs based on exposure pathways and carcinogenic effects/toxicity of the chemicals and Preliminary Remediation Goals (PRGs) for radionuclides. The RBSLs and PRGs provide a basis with which to compare soil concentrations to determine whether the soil could pose a risk or be toxic under a specific exposure scenario.

considered impacts to two different onsite receptors – an onsite suburban resident (no garden) and an onsite recreational user (consistent with the area’s end use as open space). As required by CEQ NEPA regulations (40 CFR Part 1502.14), DOE also analyzed a No Action Alternative, which establishes a baseline against which the potential environmental impacts of the action alternatives can be compared.

DOE disagrees with commenters who assert that none of the alternatives evaluated in the EIS meets the technical elements of the 2010 AOC (DTSC 2010). The Cleanup to AOC LUT Values Alternative, described in Chapter 2, Section 2.3 of this EIS incorporates the technical elements of the 2010 AOC, that target cleanup to background levels or levels based on laboratory capabilities, as identified in the AOC LUT values.

DOE disagrees with the comment that not cleaning up soil contamination to 2010 AOC LUT values would put the public at an increased health risk that should be remediated. EPA scientists have spent years evaluating the concentrations at which chemicals manifest effects of toxicity. The results of the studies have been used to establish concentrations that scientists deem to be safe based on ingestion, inhalation, and skin exposure. Exceeding an AOC LUT value, but remaining below risk based screening level (RBSL), does not mean that a chemical is present at toxic levels (i.e., levels that manifest health effects following exposure). Similarly, exceeding an AOC LUT value for a radionuclide does not mean it presents a human health risk that requires remediation. Recognizing the difference between background cleanup requirements and risk-based criteria, this EIS analyzes alternatives that meet the purpose and need to be protective of the health and safety of the public and the environment that use risk to human health, as well as the protection of natural resources, to determine cleanup levels. The risk-based criteria approach is consistent with that used for cleanup actions at other DOE sites, other DTSC-regulated sites, and EPA Superfund sites. The comparative analysis of these alternatives allows the reader to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ. For further discussion of this topic, see Section 2.5, “Toxicity of Soil Contaminants,” in this CRD.

Commenters are correct in saying that varying amounts of material would remain on site under the three soil remediation action alternatives. Some commenters correctly indicated that the percentages were based on soil volumes with chemicals exceeding the AOC LUT values. Other commenters inaccurately referred to the percentages as the amount of contaminants that would remain on site. It is important to note that under any of the soil remediation action alternatives, those soils with the higher levels of chemical and/or radioactive constituents, that is, those that would pose a risk to human health or the environment that requires remediation, would be removed, including those within the areas in which the exemption process would be applied (see Section 2.4, “Application of Exemptions under the 2010 Administrative Order on Consent,” in this CRD). Soils that would be left on site within areas where the exemption process would be applied or through the application of risk-based criteria would have concentrations of chemical and/or radioactive constituents lower than the risk-based levels identified for human health and ecological risk. Each of the three action alternatives analyzed in this EIS would leave SSFL Area IV and the NBZ safe for the designated future end use as open space and is consistent with the DOE Environmental Management mission of completing the safe cleanup of the environmental legacy of nuclear research development.

Cleanup to AOC Look-Up Table Values Alternative

The Cleanup to the AOC LUT Values Alternative described in Section 2.3.2 of this EIS is based on the technical elements and descriptions of soil cleanup provided in the 2010 AOC, summarized below:

1. Use of the LUTs published by DTSC for chemicals and radionuclides.

2. The chemical-by-chemical (radionuclide-by-radionuclide), point-by-point comparison of soil sample results with respective LUT values to identify exceedances.
3. Exemption criteria for the protection of biological and cultural resources that were discussed with DTSC, wildlife agencies, and the State Historic Preservation Office. This Final EIS reflects the exemption process based on the U.S. Fish and Wildlife Service (USFWS) Biological Opinion (Appendix J); interactions with the California Department of Fish and Wildlife (CDFW) and consideration of State and local laws and regulations for protection of State-protected species and sensitive habitats; compliance with the National Historic Preservation Act (NHPA) with respect to historic properties; and collaboration with Native American groups regarding other (non-NHPA) cultural resources.
4. Onsite treatment of soil. For purposes of analysis in the EIS, DOE included its best estimate of the volume of soil that would be addressed using in-situ treatment.²
5. Backfill soil cannot exceed local background levels (i.e., LUT values).

DOE used a GIS database for Area IV and the NBZ to identify, on a point-by-point basis, any sample location associated with one or more exceedances of any LUT value (provisional radionuclide LUT values published by DTSC on January 30, 2013 [DTSC 2013a] and chemical LUT values published on June 11, 2013 [DTSC 2013b]). The GIS system was then used to mark the locations of exceedances, map the extent of each exceedance, develop areas and depth of exceedances, and calculate soil volumes exceeding the AOC LUT values. For this Final EIS, the sample soil volume development process was independently reviewed by remediation engineers, and the volume calculations were validated.

DOE worked closely with DTSC staff and personnel from the USFWS and CDFW to develop a process for the application of 2010 AOC exemptions for protection of biological resources (see Appendix E, Table E-4 of this EIS). The wildlife agencies indicated their concurrence with the process in a CDFW letter dated December 8, 2016 (CDFW 2016) and a USFWS letter dated February 2, 2017 (USFWS 2017). DOE notes that the process developed for application of the exemptions was not an avoidance of the areas in which the exemption process would be applied for cleanup, but that the cleanup strategy involves removal of contaminated soil from these areas in instances where concentrations exceed human and ecological risk-based limits. For further discussion of the biological and cultural resources exemption process, see Section 2.4, “Application of Exemptions Under the 2010 Administrative Order on Consent,” in this CRD.

In addition, the 2010 AOC, Section 2.9, Item 5 allows consideration of *in situ* and onsite treatment of soils. In consultation with DTSC technical staff, DOE considered natural attenuation for chemicals reported as total petroleum hydrocarbons (TPH) and polycyclic aromatic hydrocarbons (PAHs). Chemicals detected as TPH and PAHs can be naturally occurring and are continuously being created in the environment. Soil treatment studies found evidence that natural attenuation (degradation) of chemicals has been occurring at SSFL since they were first released and predicted that natural processes will continue (Nelson et al. 2015a). DOE therefore identified natural attenuation as a suitable means to treat the TPH-contaminated soil. No PAH-containing soil has, as yet, been identified as amenable to natural attenuation. However, during the development of soil remediation plans to be submitted to DTSC for approval, DOE may propose some additional small

² In response to public comments on the Draft EIS, in this Final EIS, DOE added a sensitivity evaluation of the Cleanup to AOC LUT Values Alternative (see Appendix L). The purpose of the evaluation was to assess the potential impacts if all areas exceeding the AOC LUT values were excavated and removed from the site. Under this scenario, ecological and cultural resources would not be protected as required by applicable regulations and the AOC, but it serves as a comparison point for commenters who objected to DOE’s proposed use of monitored natural attenuation to treat certain low-concentration chemical contaminants and to the application of the exemption process.

quantities of soils containing simple PAHs that may be amenable to natural attenuation. Implementing provisions in the 2010 AOC for *in-situ* treatment would result in approximately 620,000 cubic yards of soil exceeding AOC LUT values for TPH remaining on site; application of the exemption process to protect biological and cultural resources would result in about an additional 115,000 cubic yards of soil exceeding AOC LUT values remaining on site. This total of 735,000 cubic yards is approximately 45 percent of the 1,616,000-cubic-yard volume of soil exceeding AOC LUT values, but the concentration of chemical and radiological constituents in that volume of soil would be below risk-based levels.

Cleanup to Revised Look-Up Table Values Alternative

The Cleanup to Revised LUT Values Alternative was developed to address the decision error problems (e.g., identifying non-contaminated soil as contaminated) and other technical issues related to the AOC LUT values proposed by DTSC, see Section 2.3.3.1 of the EIS. These problems could be a factor in the finding that 42 percent of the sample locations at DTSC's background site fail to meet the AOC LUTs (the acceptable error rate is 5 percent) and could contribute to the inability to find backfill soil that meets the AOC LUT limits. Under this alternative, DOE proposed to substitute risk-based screening levels (RBSLs) as the soil cleanup criteria for the chemical constituents that have chemical LUT values (when an RBSL is below the AOC LUT value for a given chemical constituent, the LUT value would be used). Radiological LUT values under this alternative are the same as used in the Cleanup to AOC LUT Value Alternative. By doing so, the soil background site and previously evaluated potential sources of backfill borrow soil would meet the revised LUT values. Cleanup under this alternative would mean that all radionuclides that exceed provisional LUT values (background concentrations) and the toxic and carcinogenic chemicals that exceed RBSLs (see Appendix D, Table D-4 for a listing of these chemicals) would be removed, making the site safe for use as open space, the planned end use by the land owner, Boeing. Only low concentrations of chemicals and background concentrations of radionuclides would remain. This alternative would leave on site an additional 691,000 cubic yards of soil (compared to the Cleanup to AOC LUT Values Alternative) with low concentrations of chemicals, or about 88 percent of the 1,616,000 cubic yards of soil exceeding the AOC LUT values. This alternative would maintain the point-by-point cleanup comparison for chemicals and radiological constituents as stated in the 2010 AOC. The exemption process for protection of biological and cultural resources would remain the same as described for the Cleanup to AOC LUT Values Alternative.

Conservation of Natural Resources Alternative

This alternative, with its Residential and Open Space Scenarios, is based on the soil cleanup methodology normally applied by DTSC throughout California, including that for Boeing's proposed soil cleanup at SSFL. The alternative is based on the Standardized Risk Assessment Methodology approved by DTSC for use at SSFL, but using more-recent guidance and updated parameters from EPA. DOE included this alternative as a reasonable approach to site remediation comparable to that used at other DOE sites and sites being addressed by EPA under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) and to answer questions posed by the community on what a typical risk-based cleanup project would entail. It provides a basis of comparison with the Cleanup to AOC LUT Values Alternative, but it is not based on most of the AOC criteria, e.g., the LUT values and the point-by-point application of the LUT cleanup values. The exemption process for protection of biological and cultural resources would remain the same as described for the Cleanup to AOC LUT Values Alternative. The Residential Scenario of this alternative would leave on site an additional 138,000 cubic yards of soil and the Open Space Scenario would leave an additional 151,800 cubic yards of soil (compared to the Cleanup to Revised LUT Values Alternative) with low concentrations of chemicals and

radionuclides. About 97 percent of the 1,616,000 cubic yards of soil exceeding the AOC LUT values would not be removed under these two scenarios.

2.3 Suitable Backfill Soil

Comment Summary

Several commenters echoed DOE's concern that it may not be possible to locate and acquire adequate volumes of backfill soil that can meet the AOC LUT values. These commenters cited concerns about constituent concentrations above AOC LUT values; the physical, chemical, and biological makeup of the backfill soils being different from the soils they would be replacing; and the backfill soils not supporting SSFL native vegetation.

Other commenters believed that suitable backfill is available. These commenters cited the Gillibrand soils that meet all but two of the AOC LUT values, believing that DTSC would accept the Gillibrand soils as suitable backfill. Some commenters believed that DOE needs to look harder to find suitable backfill.

Some commenters were concerned that DOE underestimated the quantity of backfill materials needed and that this would result in changes in topography at SSFL that would affect the visual character of the site, surface hydrology, and natural vegetation and biota. Other commenters were concerned that DOE overestimated the amount of backfill needed and that DOE could produce acceptable changes in topography by recontouring portions of SSFL.

A few commenters believed that overburden and other materials excavated for other purposes could be used as backfill. Some commenters stated that gravel or other non-soils would not be suitable backfill materials.

Finally, some commenters recommended that the impacts on the offsite areas from which backfill would be taken should be addressed in this EIS.

Response

DOE used soil samples taken during soil investigation processes to determine where and at what depth soil exhibited chemicals and/or radionuclides above LUT values. In several locations in Area IV, the depth of soil exceeding an LUT value was greater than 15 feet below ground surface. Following soil removal, DOE would need to replace excavated soil to the approximate prior ground surface contours. DOE determined that there would not be a need for a one-to-one soil replacement, but estimates that about 75 percent of the volume of soil removed would be required to restore the landscape. In addition, there is no overburden soil because surface soil generally exceeds LUT values. DOE recognizes that the backfill soil volume presented in the EIS is a "planning estimate" developed for purposes of impact analysis and that the volume will most likely be revised as soil remediation engineering plans are refined. However, DOE believes that the backfill volume is an appropriate estimate for purposes of this EIS.

Regarding backfill, the 2010 AOC states that backfill soil "must not exceed local background levels." The AOC further states that backfill soils must achieve "all Look-Up Table values." DOE interprets the AOC language to mean that all constituents in the backfill soil must meet the LUT values. Otherwise, DOE would be removing soil to LUT values and then replacing the soil with constituents that exceed those values.

DOE does not own any land at SSFL and, therefore, cannot develop an onsite soil backfill borrow area without Boeing's permission. DOE tested three potential backfill borrow sources, two local

offsite commercial soil backfill borrow sources and a source of dredged soil³ and found the samples to exceed three AOC LUT values for chemicals at one commercial source and nine at the other (see Appendix D). Because the replacement soil would likely require incorporation of soil amendments (fertilizers and organic matter) to support effective restoration and plant growth, DOE also tested commercial soil products for LUT chemicals. The soil products contained between 11 and 24 chemicals exceeding LUT values. Finally, the soil background study area sampled by DTSC also exceeds some of the LUT values, thus, it could not be used as a backfill source. For these reasons, DOE concluded that finding backfill soil meeting the AOC LUT values would be problematic.

DOE shares commenters' concerns about the quality of backfill needed so that the site can be restored and support the plant and animal communities currently thriving at the site. Therefore, candidate soils must not only comply with established criteria (be less than the AOC LUT values per the 2010 AOC), but must also have physical and chemical characteristics similar to those of the soil removed. NASA has also tested materials from multiple offsite backfill locations in the region and found material that NASA believes meets the AOC LUT values. However, NASA notes that these materials are predominantly a sand-and-gravel mixture with no materials capable of restoring excavated areas at SSFL to pre-cleanup conditions (NASA 2017a). A sand and gravel mixture is not soil and, therefore, would most likely not support regrowth of native vegetation, and would require the use of soil amendments to support revegetation efforts. As indicated above, DOE tested soil amendments and found that the tested samples exceeded LUT values.

Per the 2010 AOC, Attachment C section on Backfill/Replacement Soils Confirmation Protocol, "If an onsite or offsite source of backfill soils that achieves all Look-Up Table values cannot be reasonably found, then DTSC, DOE and EPA shall enter a consultation process and DTSC shall determine the best available source of backfill." Consistent with this provision, DOE sent a letter to DTSC in December 2016 identifying the difficulty of finding suitable backfill soil and met with DTSC on July 26, 2017 to discuss the issue. DTSC's is in the process of developing a response regarding finding AOC suitable backfill soil. DOE expects additional meetings with DTSC to discuss this issue.

Because no source for backfill has been identified at this time, the need to evaluate impacts at source locations has not been determined. After DOE and DTSC agree on a location (or multiple locations) for backfill material, DOE will evaluate whether additional NEPA analysis will be required.

2.4 Application of Exemptions under the 2010 Administrative Order on Consent

Comment Summary

Commenters indicated that DOE does not have the authority to delineate exemption areas under the 2010 AOC and were concerned that DOE was using the AOC exemption process as a way to avoid the expense and effort of cleanup. They indicated that exemption areas identified in the Draft EIS were larger than justified by conditions in the AOC, had not been approved by DTSC, and that other conditions set forth in the AOC concerning exemption areas had not been satisfied. Some commenters were concerned that the exemption areas would pose a risk to public health because DOE would not remove contamination from these areas.

Commenters were concerned that the proposed exemption areas as drawn appeared to incorporate clearly disturbed and contaminated areas, including concrete pads, for example, and that these need

³ This third source, recovered lake sediment from dredging, was evaluated and found to have 11 samples that exceeded AOC LUT values for chemicals.

to be cleaned up and not protected as part of an exemption. Commenters stated that there has been an “exemption area overreach” and/or “gross misrepresentation of the actual areas that qualify for exemption.” In other words, too many areas have been classified as exemption areas, including disturbed (concrete pads, power grid) and contaminated (radionuclide concentrations greater than the AOC LUT values) areas.

Commenters noted that the USFWS issued a “no jeopardy” Biological Opinion in response to the EPA’s proposal to conduct an Area IV-wide gamma-scan survey for radiological contaminants and inferred that this “no jeopardy” opinion indicates that there would be “no jeopardy” as a result of DOE’s cleanup of Area IV and the NBZ. Commenters asserted that current biological exemption areas are contrary to a 2010 USFWS Biological Opinion that stated there were no unavoidable or inmitigable negative biological impacts at SSFL. Others stated that the referenced Biological Opinion was issued too long ago to be valid.

Commenters asserted that cleaning up the radioactive and toxic damage to the SSFL environment would help biological features in the long run, not harm them.

Commenters noted that DOE must consult with Federal and State wildlife agencies to define the biological exemption areas. A formal assessment of the suggested protected habitat is needed and final input, and opinions from both the USFWS and CDFW are required.

Commenters suggested that there are no formally recognized Native American artifacts and, therefore, no basis for proposing exemption of a vast amount of the contamination from cleanup because of isolated small artifacts, as DOE has done, because such artifacts can be fully protected while also allowing the site to be returned to its natural state. The results of previous cultural resources surveys, the quality of reports, and determinations of National Register of Historic Places (NRHP) eligibility were topics of interest to some. In addition, some commenters have stated that cultural resources should not be considered eligible unless there is a formal concurrence with the State Historic Preservation Office (SHPO). Commenters were concerned with the definition of cultural resources as stated in the AOC in contrast to other laws and regulations and how the definition of cultural resources related to impact analysis, including the differences between NEPA and the NHPA. Commenters requested that DOE comply with the applicable environmental laws and regulations governing cultural resources, including the requirements of NEPA and NHPA to consult with Native Americans.

Response

In planning and executing the cleanup of SSFL Area IV and the NBZ, DOE is required to comply with NEPA, the Endangered Species Act (ESA), and NHPA. The areas within which the exemption process would be applied (called exemption areas in the Draft EIS) contemplated by DOE are consistent with requirements to protect biological and cultural resources in accordance with the ESA and NHPA and are being coordinated with the appropriate regulatory agencies. The 2010 AOC (DTSC 2010) also acknowledges the need to comply with other external requirements in Section 7.11, “Compliance with Applicable Laws and Regulations,” which states that “actions taken pursuant to the order by DOE will be undertaken in accordance with applicable local, State, and Federal laws and regulations.”

DOE notes that the process developed for application of the exemptions was undertaken to comply with Federal and State law, and not to avoid cleanup. Cleanup would involve removal of soil contaminated above risk-based levels regardless of the presence of sensitive biological and/or cultural resources.

In the Draft EIS, the exemption areas were identified as “proposed AOC exemption areas” and in the Final EIS are referred to as areas within which the exemption process would be applied or areas

subject to the exemption process. Areas within which the exemption process would be applied as described in this EIS were identified based on DOE's extensive investigation of the location of sensitive biological and cultural resources and early and ongoing interactions with USFWS, CDFW, DTSC, SHPO and others. Some of the areas subject to the exemption process include formerly disturbed and potentially contaminated sites within their boundaries. This is typically because, over much of the northern and eastern parts of the site, sandstone outcrops supporting populations of State-listed Santa Susana tarplant frequently lie in very close proximity to intervening areas that were developed and may be contaminated, and it is impractical to separate these areas completely on the small-scale maps included in the EIS for planning purposes.

In this Final EIS, DOE's approach to remediation is to designate areas within which the exemption process would be applied. These include areas identified for protection of Federally-listed species and critical habitat, as well as areas identified consistent with state and local laws, regulations, and ordinances, plus areas identified for protection of cultural resources. These areas would then be investigated in detail prior to cleanup so that areas posing a risk to human health and/or the environment can be identified for careful cleanup using risk-assessment-based cleanup levels established to protect human health or the environment. These areas subject to the exemption process include the protected resource and a buffer area (for cultural resources) to provide additional protection against inadvertent disturbance of the protected resource. In its soil remediation plan(s), DOE would include implementation of the protections required by the USFWS in its biological opinion and would propose cleaning up soil in other areas in which the exemption process would be applied to avoid damage to other biological resources protected under state and local laws and to protect cultural resources.⁴ By this process, areas supporting endangered, threatened, or rare species or cultural resources and not posing an appreciable risk to human health and the environment can be avoided. There would be fewer impacts on biological and cultural resources within areas within which the exemption process would be applied because remediation within these areas would occur via focused removal actions that would minimize soil and habitat disturbance.

As indicated in Chapter 2, Section 2.3.2 of this EIS, of the 222 acres containing chemical or radioactive constituents exceeding AOC LUT values, 77 acres would be subject to the exemption process. Of the 77 acres subject to the exemption process it is estimated that 4 acres would require remediation by removal of soils because they exceed risk-based levels established to protect human health or the environment. Under all of the soil remediation action alternatives, those 4 acres would be subject to focused removal actions that would minimize disturbance of adjoining soils. The degree of disturbance caused by removal actions within areas subject to the exemption process would vary from one such area to another, depending on the nature and extent of the removal actions required. The areas within which the exemption process would be applied and soil that may be removed, will be determined based on the results of consultations with USFWS, CDFW, DTSC, SHPO, Native Americans with interest in SSFL cultural resources, and others and ultimately will be approved by DTSC as it approves the soil remediation plans for cleanup of Area IV and the NBZ. The soil remediation plans will include detailed plans for cleanup including the identification of cleanup methodologies to be used in areas subject to the exemption process.

DOE worked closely with DTSC staff and personnel from the USFWS and CDFW to develop a process for the application of AOC exemptions for the protection of biological resources. The process was refined during several meetings attended by DTSC staff and proposed to both wildlife agencies. These meetings began in June 2013 (see Appendix E, Table E-4 of this EIS). The wildlife

⁴ DOE will implement an NHPA Section 106 Programmatic Agreement to address historic properties. The Programmatic Agreement will have provisions for addressing inadvertent discoveries. DOE is also working with Native Americans to develop and implement a process for addressing other cultural resources that do not fall within the purview of NHPA.

agencies indicated their concurrence with the process in a CDFW letter dated December 8, 2016 (CDFW 2016), and a USFWS letter dated February 2, 2017 (USFWS 2017).

As described in the Chapter 2, Section 2.3.2 of this EIS, the process of identifying the areas subject to the exemption process and cleanup within these areas is as follows: The areas subject to the exemption process for biological resources were identified through consultation with USFWS and CDFW and others as part of consultation under the Federal Endangered Species Act (ESA) and California Endangered Species Act (CESA). The USFWS Biological Opinion (BO) resulting from this consultation is included as Appendix J of this Final EIS. The areas subject to the exemption process include areas identified in the BO for protection under the ESA, as well as areas identified by DOE for protecting sensitive species and sensitive habitat consistent with state laws and regulations and local ordinances. Cleanup in these areas will be described in the soil remediation plans to reflect the USFWS BO and to address state and local requirements for species and habitat protection. The soil remediation plans are subject to approval by DTSC. As needed and appropriate, DOE would pursue State or local authorizations to “take” State-protected species and/or disturb sensitive habitats.

The previous “no-jeopardy” Biological Opinion issued by USFWS on EPA’s proposed radiological sampling in Area IV (USFWS 2010) was not an indication that ESA consultation on the cleanup of Area IV and the NBZ was not necessary. This is for several reasons, including the nature of the action and changes in the state of knowledge.

- *Nature of the action:* The EPA project involved mowing or trimming vegetation followed by going over the site with radiation scanning equipment and taking soil samples at specific points. Generally, the mowing and trimming left root systems of plants and the soil profile intact with minor surface disturbance caused by foot traffic and the off-road gamma scanning equipment. After the EPA project, vegetation in most areas was able to resprout from the root systems or germinate from seeds in the soil seed bank and the habitat recovered relatively rapidly. In contrast, the DOE cleanup actions would remove vegetation and soil over a large area of the site. For the cleanup of Area IV, acceptable soil for backfill similar to that on site and meeting AOC LUT standards must be located and transported and the topography of the site recontoured. Vegetation would have to be re-established using transplants and seeds of native species, a very laborious process with uncertain results that could take decades.
- *Changes in the state of knowledge.* Prior to the EPA gamma scan study, there had been a high level of public concern over the possibility that radiological contamination was widespread and severe at Area IV, given the site’s history. We now know, based on the Area IV-wide EPA gamma scan and intensive soil sampling and analysis, that potential areas of radiological contamination are localized at a few sites that historically focused on using radiological materials. EPA reported that approximately “70 percent of soil samples with radionuclide concentrations greater than the FAL [field action levels] are located within five Area IV Radiological Areas of Interest: RMHF complex, Sodium Reactor Experiment (SRE) complex, 17th Street drainage, Former Fuel Element Storage Facility, and New Conservation Yard Drainage Area” (HGL 2012b). Thus, there is no widespread radiological contamination in Area IV or the NBZ.

Impacts associated with DOE’s cleanup actions would be more severe than those resulting from the EPA soil sampling project. Based on this fact coupled with information regarding the concentrations of chemical and radiological constituents and their locations (e.g., localized pattern of radiological contamination), the biological assessment and consultation related to DOE’s proposed cleanup of Area IV and the NBZ resulted in a different set of controls for protecting biological

resources (i.e., the identification of areas in which the exemption process would be applied and the USFWS Biological Opinion [see Appendix J]).

As stated in Chapter 4, Section 4.5.1.2.3 of this EIS, Section 7 consultation with USFWS under the Federal ESA and consultation with CDFW under the California ESA was conducted. Informal consultation between DOE, USFWS, and CDFW had been ongoing since 2009 in face-to-face meetings and telephone conferences, most attended by DTSC staff. After issuance of the Draft EIS, DOE conducted additional analysis of potential impacts on sensitive species and habitats, prepared a biological assessment addressing the requirements of ESA Section 7 and submitted it to USFWS and CDFW in support of the consultation, and received a Biological Opinion from USFWS (see Appendix E, Consultations, in this Final EIS for additional detail on this consultation). Implementing the impact avoidance, minimization, and species conservation measures summarized in this EIS and identified through the consultations would further reduce impacts on sensitive species.

Although cleanup of toxic and radiological materials followed by restoration and revegetation would, in the long run, help biological features at severely disturbed areas such as parking lots and building foundations, these areas do not represent the majority of Area IV and the NBZ. The opposite is true in areas supporting native or naturalized plant and animal communities. The latter conditions exist on the majority of Area IV and the NBZ, except areas that were subject to industrial development and use. Cleanup of sites supporting native or naturalized plant and animal communities would result in an adverse impact to these areas due to the profound disturbance to vegetation and soils caused by the removal of vegetation and soils. Additionally, as described in this EIS, there are uncertainties surrounding the ability to secure appropriate topsoil for backfilling the remediated areas and to restore soils and vegetation after it has been removed. At best, restoration and revegetation after remediation would be a resource-intensive and time-consuming process. The impacts of remediation on biota and the difficulties and uncertainties associated with restoration after such profound soil disturbance are detailed in Chapter 2, (Table 2–8) and under each of the Soil Cleanup Alternatives (e.g., Chapter 4, Table 4–25, Sections 4.5.1.1 and 4.5.1.2) of this EIS.

As stated in Chapter 4, Section 4.5.1.2.1 of this EIS, management measures, including conducting pre-construction surveys, identifying impact-minimizing access routes, deploying biological monitors during work activities, avoiding nesting season for migratory birds or incorporating adequate setbacks, and implementing soil stabilization and restoration techniques would help to further minimize impacts in all areas, including the areas in which the exemption process would be applied. DOE would take action in these areas in compliance with conditions in the Biological Opinion to remove soil with chemical or radionuclide levels that pose a risk to human health or the environment. As needed, DOE would pursue DTSC approval for other exemptions consistent with the 2010 AOC, i.e., to comply with State and local laws and regulations (e.g., to avoid removal of oak trees) or to address unforeseen circumstances (prevent environmental damage and avoid unsafe work environments in remote locations). Final areas subject to the exemption process will be identified in the individual soil remediation plans, which are subject to DTSC approval.

DOE's recommendations for areas in which the exemption process would be applied to protect cultural resources were determined through consultation with the SHPO, the federally recognized Santa Ynez Band of Chumash Indians, and non-federally recognized tribes.

The definition of cultural resources is an important basis for NEPA impact analysis and the determination of exemptions as allowed in the 2010 AOC. The 2010 AOC exemption for cultural resources employs the phrase "Native American artifacts that are formally recognized as Cultural Resources," but it does not elaborate further as to the meaning of that terminology. To comply with the AOC, and also with NEPA and NHPA, the EIS defines in detail the types of cultural resources

considered (see Chapter 3, Section 3.11.1, including the text box titled “Types of Cultural Resources”). These definitions are inclusive of the AOC’s broad terminology.⁵

Cultural resources in Area IV and the NBZ have been identified through decades of surveys and research at SSFL, resulting in an intensive inventory of these areas. DOE considered the results of this research with the intention of identifying cultural resources that may be impacted by the cleanup efforts (see Chapter 3, Section 3.11.2.3, and Appendix F, Section F.2 of this EIS). In addition to surveys, DOE conducted Extended Phase 1 testing (sub-surface testing to determine the presence/absence of cultural resources) following a process developed in consultation with the Santa Ynez Band of Chumash Indians, non-federally recognized tribes, and SHPO (see Appendix F, Section F.2.3 of this EIS). Based on this evaluation program DOE determined that 8 of the 10 archaeological sites were individually eligible for inclusion on the NRHP and 2 sites were individually ineligible for listing on the NRHP. The Extended Phase I report has been filed with the SHPO and reviewed by the Santa Ynez Band of Chumash Indians and non-federally recognized tribes. Efforts are currently on-going to further define the relationship of archaeological resources at the SSFL. NASA is developing a proposal for an NRHP-eligible Burro Flats Archaeological District to the California SHPO that includes several archaeological sites in Area IV, and DTSC discussed the NRHP-eligibility of an SSFL-wide archaeological district, the Simi Hills Archaeological District, in its Draft Program EIR (DTSC 2017b). Therefore, some of the archaeological sites in Area IV and the NBZ could be included in or identified as contributing elements to archaeological districts that are currently under consideration for NRHP eligibility.

Although at this time, no archaeological sites in Area IV or the NBZ have been listed on the NRHP, DOE, as the Federal agency responsible for complying with Section 106 of the NHPA, considers some of these sites to be eligible for listing on the NRHP, which confers the same status as actual listing on the NRHP (36 CFR 800.16(l) (2)). Determinations of eligibility are based on data collected during archaeological surveys and through laboratory analyses of artifacts or other evidence. These analyses were conducted by archaeological professionals (defined as meeting the Secretary of the Interior’s Professional Qualifications Standards for Archeology and Historic Preservation (36 CFR 61)).

As described in Section 3.11.2.3.4, the Santa Ynez Band of Chumash Indians, a federally recognized tribe, has identified the entire SSFL as a Native American sacred site, and also notified DOE of its identification of a portion of SSFL as an Indian sacred site for consideration consistent with Executive Order 13007, *Indian Sacred Sites*. There have been additional efforts by NASA, the Santa Ynez Band of Chumash Indians, non-federally recognized tribes, and others related to documenting SSFL’s special significance to Native Americans. These efforts may result in the designation of one or more NRHP-eligible traditional cultural properties. DOE and Native Americans with ties to SSFL prefer avoiding disturbance at archaeological sites and disturbance to unknown sites if there is no threat to human health or ecological resources. DOE considered these possibilities when analyzing impacts from cleanup activities (see Chapter 4, Section 4.11 of the EIS, under each alternative, and summarized in Section 4.11.4). Proposed methods to mitigate impacts and resolve adverse effects through avoiding, minimizing, or mitigating them are described in Chapter 6, Sections 6.1 and 6.2. DOE determined that cultural resources exemptions allowed by the 2010 AOC would result in recommended exclusion zones (protective buffers) around cultural resources that are listed on or eligible for listing on the NRHP (i.e., historic properties) (see Chapter 4, Section 4.11). Exclusion zones would provide a buffer around the cultural resources within the area in which the exemption process would be applied and only those soils with contaminant concentrations that pose a risk to human health or the environment would be removed. The

⁵ Types of Cultural Resources include: Archaeological resources, Architectural or structural resources, Historic properties, Traditional cultural properties, Traditional cultural resources, Sacred sites, and Cultural landscapes.

process for identifying these areas will be included in the NHPA Section 106 Programmatic Agreement being developed in consultation with the SHPO and other consulting parties, including the federally-recognized Santa Ynez Band of Chumash Indians and other Native Americans with interests or ties to SSFL, and DTSC.

DOE has diligently conducted consultation during the NEPA process, as demonstrated by its extensive program of meetings and other communications with consulting parties (please refer to Chapter 4, Section 4.11.4, and Appendix E, Consultations), that will result in the creation of an NHPA Section 106 Programmatic Agreement. This legally binding agreement, being developed in consultation with DOE, the SHPO, the federally recognized Santa Ynez Band of Chumash Indians, non-federally recognized tribes, and other consulting parties, will establish a framework for addressing NRHP-eligible historic properties during implementation of the cleanup program, including measures to be taken to avoid, minimize, and mitigate impacts on historic properties during cleanup. For example, the Programmatic Agreement will specify the need for Native American monitoring during ground-disturbing activities to aid in identification of any cultural resources unearthed as a result of cleanup. A process for determining specific mitigations will be set forth in the Programmatic Agreement, which also will include procedures for inadvertent discovery of archeological deposits, human remains, and funerary/sacred objects. Additional mitigations, if required, would not be deferred, but could occur during cleanup. The Programmatic Agreement will be subject to a public review prior to being signed. Under its NEPA responsibilities, DOE also will work with the Native Americans to establish processes to appropriately address cultural resources that are not eligible for the NRHP.

The identification of proposed areas in which the exemption process would be applied as defined for cultural resources was based on previous research and extensive consultation. The locations will be finalized through completion and implementation of the NHPA Section 106 Programmatic Agreement (for resources eligible for the NRHP) and continued consultation regarding all cultural resources. Final areas in which the exemption process would be applied will be identified in the individual soil remediation plans, which are subject to DTSC approval.

2.5 Toxicity of Soil Contaminants

Comment Summary

Comments were received stating that any soil containing any chemical exceeding its LUT value would be toxic (i.e., manifest health effects following exposure) to people and wildlife, irrespective of concentrations and the manner under which exposure to the chemicals could occur. Some commenters have argued that allowing soil with low concentrations of chemical and/or radiological constituents to remain on site might be the more responsible approach. There were also comments received that compared the presence of chemicals in soil with concentrations of chemicals in products, industrial use, and laboratory studies of animals.

Response

The 2010 AOC did not dictate a volume of soil that was necessary to be cleaned up to be protective. In establishing the AOC LUTs, DTSC and EPA collected samples from a number of locations unaffected by site operations with soil and subsurface soil overlying the same geologic formations that are present at SSFL. The soil samples were sent to laboratories for testing chemical and radiological constituents. The AOC LUT values for each chemical and radiological constituent were established at background or the lowest concentration that the laboratory was able to determine. This approach was premised on an assumption that any concentration over the minimum level that a laboratory could “see” was caused by human activity associated with SSFL operations. It should be noted that the background sites were chosen by DTSC and EPA because there was no

mechanism for DOE's SSFL activities to have caused higher concentrations at these locations. DTSC's presumption in establishing the LUT values at the lowest possible level implies an assumption that any concentration of any constituent found in Area IV or the NBZ above a minimum detectable level found at a background site was caused by DOE's activities and therefore must be cleaned.

DOE believes that the AOC LUT values might be interpreted to imply an assumption that any detectable amount of any of those constituents could cause harm to humans or ecological receptors. However, for many of the constituents, LUT values were set below levels that have been demonstrated as not being harmful to humans or ecological receptors, that is below the RBSLs for the receptors being considered in this EIS (resident [no garden], recreational user, and ecological) (see Appendix D of the EIS for a comparison). Most substances known to man have levels at which they are safe for humans and levels at which exposure is harmful. EPA has established risk assessment processes that require removal of constituents posing risks to humans. The DTSC has established conservative AOC LUT values for SSFL, which may give the perception that exposure to concentrations greater than LUT values will cause human health or ecological harm (an approach which is not supported by public health professionals or epidemiologists). This use of background/detection level quantities for AOC LUT values is inconsistent with the approach taken at other DOE sites, other DTSC sites, and other sites being cleaned up by the EPA around the nation. This position is not consistent with the risk-based screening criteria developed by EPA for CERCLA sites.

Consider the fact that at the locations from which background soil samples were taken 42 percent of the chemicals exceeded AOC LUT values in at least one sample and would require cleanup (see Appendix D of this Final EIS). All of the locations from which background samples were taken had elevated concentrations of at least one constituent despite the fact that the background sites were chosen by DTSC and EPA because they were deemed to be "pristine," that is unaffected by operations at SSFL.

The soil being left behind under the each of the cleanup alternatives is not contaminated at levels requiring remediation because it poses a risk to humans as implied by commenters. In assessing the health impacts of the soil left onsite after remediation, the volume of soil remaining is not the most relevant number; rather, the volume of soil remaining that contains contaminants in concentrations that pose a risk to human health or the environment is much more relevant. The action alternatives other than the Cleanup to AOC LUT Values Alternative were designed to address soil concentrations that pose a risk using standard EPA risk assessment procedures. These alternatives were evaluated to allow the public and the decision-maker to compare the impacts associated with different sets of assumptions about how levels targeted for cleanup affect the overall magnitude of the cleanup program.

For a chemical in the environment to be toxic, several conditions must exist. First, a person or animal must come into direct contact with the chemical, resulting in an exposure. Exposure can either be via ingestion, inhalation, or absorption through the skin. The physical state of the chemical (i.e., solid, liquid, or gaseous) is important. At SSFL, chemicals are generally strongly adsorbed to soil particles and, thus, are considered solids. They generally do not exist in a liquid (or product) state; therefore, skin adsorption is not a primary exposure route of concern. The chemicals generally do not exist in a gaseous state, so direct inhalation is not a primary exposure route of concern. Therefore, ingestion of contaminated soil and inhalation of contaminated dust are the two exposure pathways of concern.

Ingestion of soil containing chemicals can occur only after an individual or animal comes in direct contact with the soil (it must be touched) and the soil is put into the mouth (e.g., hand-to-mouth

contact). If dust is produced, inhalation becomes a pathway for exposure. The act of walking across soil does not necessarily result in an exposure.

Another important consideration for toxicity is the concentration of the chemical in the soil. Toxicologists from multiple universities and EPA scientists have spent years evaluating the concentrations at which chemicals manifest effects of toxicity. The results of the studies have been used to establish concentrations that scientists deem to be safe based on ingestion, inhalation, and skin exposure. For SSFL, concentrations of chemicals in soil above which there would be a health concern, termed RBSLs, have been established for all chemicals of concern for different exposure scenarios (MWH 2014). The RBSLs provide a basis with which to compare soil concentrations to determine whether the soil could be toxic under a specific exposure scenario. A review of the soil chemical data for Area IV shows that approximately 90 percent of the soil sample test results had chemical concentrations below RBSLs determined for a suburban resident without a garden exposure scenario. Therefore, exceeding an AOC LUT value, but not an RBSL value, does not mean that an observed chemical is present at a toxic concentration. **Table 2–1** illustrates the percentage of soil samples that exceeded the suburban residential RBSL for the most frequently observed chemicals reported to be above the AOC LUT values.

Table 2–1 Percentage of Soil Samples Exceeding the 2010 AOC Look-Up Table Values and Suburban Residential Risk-Based Screening Levels

<i>Chemical</i>	<i>Percentage Above LUT</i>	<i>Percentage Above RBSL</i>	<i>Chemical</i>	<i>Percentage Above LUT</i>	<i>Percentage Above RBSL</i>
Antimony	3.65	0.12	PCB-1254	9.34	1.22
Cadmium	5.08	0.22	PCB-1260	6.02	0.54
Mercury	5.06	0.17	PCB-5460	2.71	0.6
Selenium	3.92	0.0	Dioxins	33.3	10.4
Silver	6.85	0.07	Benzo(a)pyrene	18.8	6.41
Zinc	2.2	0.0	Dieldrin	5.22	0.21

LUTs = Look-Up Table; PCB = polychlorinated biphenyl; RBSL = risk-based screening level

The removal of soil that exceeded the chemical RBSLs, as is proposed under the Cleanup to Revised LUT Values Alternative, would mean that 100 percent of the remaining soil would contain chemical constituents at concentrations less than the risk-based standards, thus making Area IV safe for the land owners designated future use of open space.

Comments that compare concentrations of chemicals in soil to industrial protection standards and concentrations in products and laboratory animal foods contribute to public misperception of the hazards associated with exposure to chemicals. Industrial settings use chemicals in high concentrations and afford a much greater exposure potential for skin absorption and inhalation pathways. In such a setting, identifying a chemical as having an “immediately dangerous to life or health (IDLH)” concentration is appropriate. Worker safety standards developed for the industrial environment reflect exposures to chemical products and industrial process dusts. It would be inappropriate to use IDLH concentrations for a chemical in the soil at SSFL. There is no direct comparison to chemicals in soil generally due to the much lower concentrations in soil and the fact that at SSFL chemicals are adsorbed to soil particles and not present as process dusts. Consequently chemicals at SSFL are not as readily available for exposure via skin contact and inhalation (even though inhalation is one of the primary pathways for exposure to contaminants at SSFL). Similarly, chemicals in animal feeds are at much higher concentrations than those observed in SSFL soil and are intended for direct assessment of chemical toxicity in laboratory animals. Comparable exposure conditions do not exist for chemicals associated with SSFL soils due to their comparatively low concentrations.

2.6 Comparison of Radiation Doses

Comment Summary

A number of commenters objected to the use of the 25 millirem per year dose as the upper limit identified for establishing cleanup levels under the Conservation of Natural Resources Alternative, as well as for making decisions on disposal of low-level radioactive waste. Some commenters noted that use of this dose limit violates the 1995 DOE-EPA Joint Policy that all DOE sites must be cleaned up consistent with EPA Superfund guidance, noting that EPA has declared 25 millirem per year to be nonprotective.

Response

In this Final EIS, DOE used chemical risk, radiological risk (not dose), and chemical toxicity hazard to establish the levels of cleanup under the Conservation of Natural Resources Alternative (both scenarios). DOE chose to identify cleanup to a 25 millirem per year dose in the discussion of the Conservation of Natural Resources Alternative because that is the upper limit of the range of acceptable doses based on release criteria under DOE requirements (DOE Order 458.1). As stated in the Draft EIS, as-low-as-reasonably-achievable (ALARA) considerations are also required to limit the dose further for any specific application. The limit is part of DOE's radiation protection system which follows the principles of and is fully consistent with the recommendations of the National Council on Radiation Protection and Measurement (NCRP) and the International Commission on Radiological Protection (ICRP). In addition, DOE's 25 millirem per year limit is consistent with Nuclear Regulatory Commission regulations in 10 CFR Part 20, Subpart E, Radiological Criteria for License Termination. DOE's requirements and protection system are protective of the public and environment. DOE notes that the methodology used in the cleanup evaluation for the Conservation of Natural Resources Alternative in the final EIS results in doses that are well below the 25 millirem year upper limit and are in a range that is consistent with the CERCLA target risk range.

Under the CERCLA, EPA uses a lifetime risk range to guide cleanup decisions. EPA considers a range of risks between 10^{-6} and 10^{-4} to be the acceptable range of risk for most cleanups to be protective. The specific reference to EPA's statement that 25 millirem per year is not protective (EPA 1997) is based on a worst case assumption that an individual is exposed to 25 millirem per year for a life-time. This is rarely the case in real life or for most radionuclides at DOE sites. In many cases, establishing a maximum cleanup concentration based on an annual dose limit based on 25 millirem in a year results in cleanups that result in risk estimates well within or below the CERCLA risk range. Conversely, cleanups designed to meet the lifetime risk goals can actually exceed the annual radiation dose limit of 25 millirem in a year when the radionuclides' half-lives are short. Doses from these short half-lived radionuclides declines rapidly with time and the doses in later years do not contribute as significantly as the doses in early years to a lifetime exposure.

DOE, NRC, and most other agencies regulating radionuclides base their standards on annual dose limits rather than lifetime risk limits. There are several reasons for this; two important ones are:

- 1) Radiation cleanup standards use annual dose for consistency with worker protection limits and release limits for public protection (including those for waste management), which are based on annual dose limits, and
- 2) DOE uses annual dose limits because of the greater uncertainty associated with lifetime risk estimates.

DOE and others regulate radiation based on an assumption that risks are linear with those associated with high doses and dose rates, and without a threshold. The fact is that at lower doses,

below about 10 rem (10,000 millirem), there has been no epidemiological evidence of increased radiation risks. So the risk may or may not exist. However, if the scenarios assumed in the dose analyses occur, the calculated doses will occur. For comparison, the average per capita dose to a person in the United States is approximately 620 millirem per year, with an average of 320 millirem coming from natural background sources (311 millirem) and from occupational, industrial, and consumer sources. The remaining 300 millirem is the result of average medical exposures over the entire U.S. population. The average dose from medical exposures includes those who had no medical procedures so that the average for the subset receiving medical exposures is much higher.

In any case, the 25 millirem in a year exposure limit represents a maximum possible dose. It does not take into account DOE's requirement to apply ALARA to the decision. Results of the risk assessments performed for this Final EIS indicate that cleanup of chemicals and radionuclides in those areas with the highest concentrations result in radiological risks of 5×10^{-5} or less, consistent with the CERCLA risk range (see Appendix K).

2.7 Offsite Impacts

Comment Summary

A wide variety of comments were received that discussed offsite health impacts due to releases and migration of contamination from the SSFL site.

Some commenters were concerned about contamination already present off site that they attributed to past SSFL operations. Some commenters were concerned that erosion, rain, wind, and recent brush fires have already contaminated and continue to contaminate offsite locations that are downwind, downstream, and downhill. Many were concerned about exceedances of National Pollutant Discharge Elimination System (NPDES) surface water discharge limits. Some were concerned about contaminated surface water discharges that could leave the site during heavy rain periods. Others were concerned about groundwater contamination plumes extending off site. Specifically, some were concerned about elevated radionuclide and chemical concentrations found on the Brandeis Bardin property.

Other commenters were concerned about contamination that would be released off site during remediation activities via windblown dust, surface water runoff, and truck transportation. Some commenters expressed a belief that such impacts are greatest under the Cleanup to AOC LUT Values Alternative, which could generate significantly more dust—over a much greater time horizon—than the other alternatives. These commenters asked for an assessment of the risks to offsite receptors from radionuclides, chemicals, and pathogens present in the dust generated by the remediation alternatives.

Still others were concerned about the long-term migration of contaminants left on site to offsite receptors after remediation is completed. A number of commenters believe that leaving any contamination on site would pose substantial long-term health risks to offsite residents. Therefore, commenters asked for the assessment of offsite impacts on people and other species from the contamination that would remain on site under the various remediation alternatives.

Response

The scope of this *SSFL Area IV EIS* is the cleanup of DOE-administered areas of SSFL, Area IV and the NBZ. DOE and EPA have conducted extensive studies to map the chemicals and radioactivity on SSFL Area IV and the NBZ. Based on extensive sampling (both onsite and offsite) and analysis of surface water, groundwater, and soil, DOE is confident that significant levels of contamination (as discussed below) have not traveled off site. See EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE

jointly with DTSC (CDM Smith 2017), DTSC’s review of chemical and radiological related to the American Jewish University, Brandeis-Bardin Campus (DTSC 2017a), and other studies such as an offsite investigation conducted in 2007 for Boeing, NASA, and DOE (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act. Based on modeling results, DOE also believes the plumes will not move off site during or after remediation activities (Chapter 3, Section 3.4.3, of this EIS and CDM Smith 2018a) in concentrations that exceed the target risk range of 10^{-6} to 10^{-4} (1 in 10,000 to 1 in 1 million).

Concern about Contamination Already Present Off Site

Surface Water Discharge

DOE has researched historical surface water discharge events. A summary of surface water discharge findings is included in Chapter 3, Section 3.3 of this Final EIS. This summary updates the data presented in the Draft EIS with results from 2014 through the first quarter of 2018, including results during high rain events. Among the outfalls included in the SSFL sitewide NPDES permit, only discharges through seven outfalls (Outfalls 002, 003, 004, 005, 006, 007, and 018) receive surface water runoff from portions of Area IV and are monitored for compliance with the NPDES-permit benchmarks and limits. Outfall 002 is downstream from ponds that collect drainage from multiple areas at SSFL, including Area IV and areas that are not DOE’s responsibility. Other outfalls included in the permit receive discharges from portions of SSFL that are not DOE’s responsibility. The following summarizes the historical results from the NPDES monitoring.

There were multiple exceedances of regulatory limits (for dioxin, cyanide, lead, mercury, copper, nickel, zinc, iron, total suspended solids, chloride, pH, gross beta, and nitrate) in the years immediately following the 2005 Topanga fire. These exceedances have diminished over time, with exceedances only for iron in 2011 and 2012. There were no exceedances at the outfalls in 2013 through 2016 and none for outfalls 003, 004, 005, 006, 007, and 018 in 2017. There was an exceedance for iron and “chronic toxicity” at Outfall 002 in 2017 and an exceedance for iron in 2018. Implementation of water quality control measures (including upgrades of outfall treatment controls), restoration of burned hillslopes, and best management practices (BMPs) contributed to these reductions in regulatory exceedances.

During the first quarter of 2017, SSFL received a large amount of rain. Six rain events exceeded a reporting criterion that is used for the stormwater report; that is, they produced greater than 0.1 inches of rainfall within a 24-hour period and were preceded by at least 72 hours of dry weather. Five of the six rain events produced stormwater discharges at Outfalls⁶ 002, 004, 006, 008, and 018 during the first quarter of 2017. Through the middle of February 2017, SSFL received 16.74 inches of rain for the current rainy season, then on February 17, received 4.6 inches. As summarized in the *First Quarter 2017 NPDES Monitoring Report* (Boeing 2017a), exceedances of daily maximum benchmark limits, daily maximum permit limits, or receiving water limits occurred at Outfall 002, which receives discharges from multiple areas within SSFL, and three other outfalls (001, 009, and 011) not associated with Area IV discharges.

Outfalls 003, 004, 005, 006, 007, and 018, which are associated or contributed to by Area IV stormwater, did not show any exceedances of either daily maximum benchmark limits or daily maximum permit limits from rain events, even though the rain events were considered to be at near-record levels. Exceedances from sources outside Area IV were previously evaluated by Boeing and were judged to have originated from various sources, including natural soil components, rainfall dry

⁶ These rain events also produced stormwater discharges at Outfalls 001, 009, and 011. These three outfalls are not associated with or contributed to by Area IV stormwater.

atmospheric deposition from local and regional sources, and wildfire combustion processes followed by atmospheric deposition. (Boeing 2008c) Boeing believes that the higher concentrations observed in stormwater runoff resulted from mobilization of total suspended solids after high intensity rainfall events.

Monitoring was also conducted at one offsite location, Frontier Park in Arroyo Simi Valley, which does receive water contributions from Area IV. The monitoring showed E. coli concentrations above the single sample maximum receiving water limit and above the geometric mean receiving water limit. Analysis of the cultures showed the bacteria must have originated from nonhuman, natural sources (wildlife) and did not include bacteria originating from human sources at SSFL. Future monitoring will continue evaluation of the surface water discharges against NPDES benchmarks and limits. Exceedance of a benchmark triggers an evaluation of the BMPs implemented at the site. The evaluation may determine that the BMPs require augmentation, upgrading, or replacement. Exceedance of a permit-limit requires corrective actions and further sampling.

Groundwater

DOE has completed additional groundwater investigations and reported the results in the *Draft RCRA Facility Groundwater Remedial Investigation Report, Area IV, Santa Susana Field Laboratory, Ventura County, California* (CDM Smith 2018a). Chapter 3, Section 3.4 of this Final EIS was updated with information from the draft groundwater remedial investigation report, including information on the magnitude and extent of the existing groundwater contamination plumes in Area IV and the NBZ. The groundwater investigations have identified areas of contaminated groundwater (plumes). The characterization data indicate that, while some of the groundwater plumes extend into the NBZ, none extend off site at concentrations above what is allowed under the Safe Drinking Water Act. Considering the known rate of movement of the groundwater and the low concentrations of radionuclides and chemicals, impacts on offsite members of the public are not expected. Modelling shows that groundwater migration is not expected to reach offsite receptors before natural processes (chemical degradation, radioactive decay, dispersion) reduce contaminant concentrations below levels based on health-based criteria (e.g., levels allowed under the Safe Drinking Water Act). Nevertheless, evaluation of remedial actions for these groundwater plumes is considered in the alternatives evaluated in this Final EIS.

Air Emissions

As described in Chapter 3, Section 3.6 of this Final EIS, DOE currently conducts limited site investigation and maintenance activities in Area IV that produce minor emissions from the use of on- and off-road mobile sources and the occasional generation of fugitive dust. Past emissions from the Radioactive Materials Handling Facility (RMHF) stack were subject to the requirements of Ventura County Air Pollution Control District Permit to Operate, Number 00232. This permit also covered other stationary sources in Areas I and III of SSFL. In May 2007, DOE suspended all decontamination and decommissioning operations in Area IV and placed the entire RMHF into a safe shutdown mode. As a result, no emissions have been released to the atmosphere through the RMHF stack since that time.

Boeing, NASA, and DOE jointly issued the *Offsite Data Evaluation Report, Santa Susana Field Laboratory, Ventura County, California* in December 2007 (MWH 2007). This report evaluated the data collected from 18 field sampling and analysis events within a 15-mile radius of SSFL over the past 60 years. Offsite properties included American Jewish University Brandeis-Bardin Campus, Sage Ranch Park, Black Canyon, Woolsey Canyon, West Hills, Dayton Canyon, Bell Canyon, and Ahmanson Ranch. The media sampled included soil vapor, soil, sediment, groundwater, surface

water, springs and seeps, bedrock, vegetation, municipal water, and debris. Over 4,000 samples representing over 110,000 analyses of chemicals or radionuclides were evaluated.

The offsite results for chemical and radiological data were evaluated for significance based on comparisons to suburban residential (including garden pathway) risk-based or agency-published screening levels and comparison to background levels considered appropriate at the time. The data results were deemed not significant if:

- a) Concentrations were all below the screening levels, or
- b) Concentrations above screening levels were not repeatable, persistent, and/or limited by surrounding data with results less than screening levels and may or may not be related to SSFL operations.

The results of the offsite data evaluation showed the following:

- The offsite sample results for dioxins, polychlorinated biphenyls, perchlorate, TPH, and radionuclides were judged to be not significant based on the definitions above.
- The offsite sample results for metals and PAHs were not significant except in the Northern Drainage above Areas I and II where a DTSC-approved soil and construction and clay pigeon debris removal action was underway by Boeing, including removal of down-drainage sediments.
- Offsite sample results for volatile organic compounds were not significant except for the presence of volatile organic compounds in groundwater and soil vapor in the area northeast of SSFL (north of the main entry gate), which were to continue to be evaluated and are subject to future work.

The DTSC recently performed a review of the radiological and chemical data from investigations conducted at and near the SSFL and the American Jewish University Brandeis-Bardin Campus and published results in a white paper on May 2, 2017 (DTSC 2017a). The data reviewed included historical data collected at Brandeis-Bardin during the Multi-Media Study in 1992 and 1994 under oversight of the EPA. The review also included data collected by Brandeis-Bardin's consultant, Joel Cehn, and the AJU Brandeis-Bardin data collected in 2016 by Tetra Tech. Also reviewed were Area IV radiological characterization data collected by EPA and the site chemical investigation data collected recently by DOE.

The white paper conclusions are as follows:

- While chemicals within the undeveloped portions of the Brandeis-Bardin property bordering SSFL may exceed background or detection limit-based LUT values, levels do not exceed the respective RBSLs. Most of the samples that slightly exceeded the LUT values, likely did so because the analytical methods were not accurate and precise enough to make definitive comparison to an LUT value. Chemical levels within the active Brandeis-Bardin Campus areas are within the range of local background levels.
- Levels of radionuclides at the Brandeis-Bardin property are within the range of local background levels.
- The levels of chemicals and radionuclides at Brandeis-Bardin Campus are safe for human health, as determined using RBSLs derived using State and Federal standards and guidelines.
- The Brandeis-Bardin Campus is safe for use by campers, visitors, students, and staff.
- Contamination at SSFL does not pose a health threat to users of Brandeis-Bardin Institute or other offsite areas.

- Any credible data demonstrating a threat to human health at Brandeis-Bardin or any other areas from SSFL would result in DTSC taking immediate actions to stop that threat.

It should be noted that the white paper points out that most of the detections for chemicals and radionuclides on the Brandeis-Bardin property that have been raised as concerns by commenters were from samples taken during the 1992/1994 Multi-Media Study from areas that were subsequently acquired by Boeing in 1997 to create the NBZ and are no longer part of the Brandeis-Bardin property.

Concern about Contamination Released Off Site During Remediation

As described in Section 2.10, “Public Perceptions About Waste and Contamination in Area IV,” in this CRD, DOE has removed the nuclear material and all but 22 buildings (18 owned by DOE and 4 by Boeing) of the 272 structures that have been used during the operation period of Area IV. DOE has also removed much of the contamination within the remaining soil and buildings that resulted from nuclear research activities (see Section 3.2.5.3). Therefore, DOE does not agree with commenters who suggest that SSFL Area IV and the NBZ are “highly contaminated” nor that the site will result in offsite contamination during remediation.

In response to comments on the Draft EIS, DOE has added an offsite human health impact assessment by modeling potential releases of windblown dust to offsite receptors during remediation for all alternatives. The results of the modeling are included in Chapter 4, Section 4.9 of this Final EIS.

All alternatives in this EIS would be implemented in compliance with applicable Federal, State, and local regulations and agreements and in a manner that would be protective of the surrounding communities by incorporating BMPs during remediation activities. BMPs such as traveling at low speeds on roadways and off-road areas; using water and/or surfactants during soil-disturbing activities; and covering or wetting disturbed soil and soil piles would be employed to control the airborne migration of dust off site. A BMP of washing the undercarriage of the trucks prior to leaving the site would avoid the direct transmission of potentially contaminated soil off site. Additional BMPs such as the use of silt fences, straw wattles, and contouring would be used to control stormwater and prevent the offsite transport of sediments from disturbed areas.

Concern about the Long-Term Migration of Contaminants Left On Site after Remediation

As described in Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” in this CRD, DOE has already removed all nuclear material, most buildings in Area IV, and much of the contamination within the soil and remaining buildings. The cleanup activities proposed in this EIS for DOE’s portions of Area IV and the NBZ would further reduce contamination to levels protective of human health and the environment or to background/detection limits.

In response to concerns about potential offsite human health impacts caused by migration of residual contamination left on site after remediation, DOE has added analyses in Chapter 4, Section 4.9 of this Final EIS for an offsite resident. As discussed in Section 4.9, the impacts to an offsite suburban resident from the migration of contamination under the No Action Alternative have been compared to the impacts to the same resident from background concentrations of the same chemicals and radionuclides. The risks from the SSFL contaminants are considerably smaller than the risks from background concentrations of chemicals and radionuclides in soil. The calculated risk of cancer to an offsite suburban resident (with garden) from the migration of chemical and radiological contamination under the No Action Alternative is approximately 1.2×10^{-11} . The incremental impacts from exposure to windblown, post-remediation residual concentrations of chemicals and radionuclides on the site to persons living off site near SSFL would

be expected to be less than the impacts from the No Action Alternative, because the remaining onsite concentrations would be lower than those under the No Action Alternative.

2.8 Cancer and Other Illnesses Near SSFL

Comments Summary

A wide variety of comments were received that addressed concerns about health effects attributed to sources at SSFL. Some commenters who live or lived in the vicinity of SSFL reported personally experiencing cancer and other illnesses. Commenters also reported of family members or others they personally know who live or lived in the vicinity of SSFL having experienced cancer or other illnesses. Health effects mentioned include colon cancer, gastritis, Hashimoto's disease, hypothyroidism, leukemia, lymphoma, neuroblastoma, regressive autism, retinoblastoma, salivary gland cancer, thyroid cancer, uterine sarcoma, unspecified cancers, and unspecified diseases. In some cases, the illnesses resulted in death.

Some commenters made nonspecific comments about rare forms of cancer occurring in the vicinity or children in the vicinity developing rare forms of cancer. One commenter displayed a map and stated that it showed the locations of 35 children within 20 miles of SSFL who have been diagnosed with cancer within the last 5 years. Multiple other commenters made similar statements regarding more than 30 children with cancer within 20 miles of SSFL or preliminary evidence of a pediatric cancer cluster.

Those commenting expressed various opinions regarding the cause of these illnesses. Some commenters stated that SSFL was affecting the health of adults and children; some of those commenters specifically cited radioactive contamination in the area as the cause. Some wondered whether there is a relationship between the illnesses and SSFL.

An opposing viewpoint regarding the source of illnesses in the vicinity was also expressed by some commenters. A commenter indicated that he believes there is little evidence to show that anything from SSFL has caused cancer. Another commenter indicated not being familiar with any convincing epidemiological evidence of current offsite risk from the site. Further, the commenter stated that many of the reported cancers are known to be or suspected of being the result of genetic factors and others could have a variety of environmental triggers (e.g., air pollution, household air pollution from formaldehyde and/or household products). This commenter further stated that there are many variables related to the origin of specific cancers and that it is hard or impossible to control the variables. Examples given were the amount of time a person lived in the vicinity of SSFL, the uncertainty that a person was exposed to a carcinogen from SSFL, and if they were exposed, the duration and dose of the exposure. Commenters also noted that data indicate that some areas within the vicinity of SSFL have elevated levels of naturally occurring radon. A commenter asserted that there were no cancer clusters in the area, referring to a presentation by Dr. Mathew [Mack] at a DTSC meeting.

Commenters expressed a general sentiment regarding the necessity and responsibility of protecting the health of people living near SSFL. Some of those commenters were particularly concerned about protecting children, with a number specifically concerned about their own children. A commenter stated that, contrary to DOE's claim that the contamination poses little risk, that it poses a very significant risk to public health and that under any of the alternatives evaluated in the Draft EIS, human health and the environment will suffer. A number of people indicated concern that families are moving nearby with no real understanding of the potential dangers. Commenters indicated that residents in the area surrounding SSFL deserve to know they are raising their families in a safe and healthy environment.

Commenters referred to some of the studies of health effects near SSFL that have been conducted and presented different interpretations of the results. Commenters pointed to the September 1997 Tri-Counties Regional Cancer Registry-reported increases in lung and bronchial cancers near SSFL as evidence that pollution has already migrated off site to adjacent populated areas, carried by wind, rainfall runoff, and fires.

Commenters cited the March 2007 study by Dr. Hal Morgenstern of the University of Michigan as identifying increases in thyroid cancer cases, while others stated that the study found a greater than 60 percent increase in incidence of various cancers based on proximity to the site. Another commenter referred to the study as a preliminary study that indicated that if the site was left intact, people would continue to suffer or die in the nearby community but noted that no study has been made about the increased amount. The commenter said that Dr. Cohen at the University of California, Los Angeles (UCLA) agreed that leaving it (site contamination) in place all these years continues to hurt people.

Another commenter said the 2007 Morgenstern study showed limited concerns for some cancers and only close to the site, noting that beyond 5 miles from the site there is no effect from the SSFL. The commenter also noted that nearer the site (i.e., less than 2 miles) the incidence of melanoma, breast, and prostate cancers are actually lower than the normal incidence rate. The commenter posited that these numbers need to be considered along with those showing increases in incidences of other cancers. The commenter concludes that the current risk is *de minimis*. Another commenter commented that cancer is multifactorial and stated that the 2006 Cohen and 2007 Morgenstern studies indicated that they could not attribute the occurrence of cancer to SSFL for a multitude of reasons.

Commenters referred to a number of other studies stating that cancer registries found elevated rates of bladder cancer associated with proximity to SSFL and that the Public Health Institute's 2012 California Breast Cancer Mapping Project found that the rate of breast cancer is higher (10 to 20 percent) in Thousand Oaks, Simi Valley, Oak Park, and Moorpark than in almost any other place in the State.

Some commenters called for there to be research into the links between cancer and the chemicals deposited in the earth. A number of commenters stated that "[n]ot having a full survey done of the risk to children in our communities" is not acceptable. Commenters requested that a study be conducted to evaluate all cancers and childhood cancers within 20 miles of SSFL. Others suggested that there should be an ongoing record of rare cancers and illnesses that occur within certain distances from SSFL.

Some commenters also referred to cancer claims from former SSFL workers. One commenter referred to a study by the UCLA School of Public Health and said it found markedly increased rates of death from key cancers for SSFL workers associated with their exposures and the most highly exposed workers had triple the deaths from those cancers as did less exposed SSFL workers.

Response

Cancer has touched most if not all of our lives and DOE understands the impact it can have on those who have chronic illnesses or cancer or who have lost family or friends to disease. Cancer has a major impact not only on family and friends but also on society at large in the United States. As noted by the National Cancer Institute (NCI), "Although statistical trends are usually not directly applicable to individual patients, they are essential for governments, policy makers, health professionals, and researchers to understand the impact of cancer on the population and to develop strategies to address the challenges that cancer poses to the society at large" (NCI 2017). The number of new cases of cancer (cancer incidence) in the United States is about 454.8 per 100,000

men and women per year⁷ (based on 2008–2012 cases) (NCI 2017). That means it is estimated that 1.48 million new cases of cancer will be diagnosed in the United States this year (based on an estimated U.S. population of 325.98 million in 2017). The California Department of Public Health (CDPH) estimated 176,140 Californians will be diagnosed with cancer in 2017 (ACS 2017) and yet California has the 9th lowest rate of incidence of cancer among all states at 409.8 per 100,000 men and women per year (based on 2010–2014 cases) (NCI/CDC 2017). Approximately 41 percent of men and 38 percent of women will be diagnosed with cancer at some point during their lifetimes (ACS 2017). The CDPH estimated that 1,492,000 Californians alive today have a history of cancer (ACS 2017).

Cancer is caused by both external factors (e.g., tobacco, infectious organisms, chemicals, and radiation) and internal factors (e.g., inherited mutations, hormones, immune conditions, and mutations that occur from metabolism). Risk factors for cancer include age, alcohol, cancer-causing substances, chronic inflammation, diet, hormones, immunosuppression, infectious agents, obesity, radiation, sunlight, and tobacco (NCI 2017). Therefore, to determine the cause of any incidence of cancer can be very difficult as there are many confounding factors.

NCI defines a cancer cluster as “the occurrence of a greater than expected number of cancer cases among a group of people in a defined geographic area over a specific time period” (NCI 2014). Cancer clusters can help scientists identify cancer-causing substances in the environment. Suspected cancer clusters are investigated by comparing information about cases in the suspected cluster with State cancer registry records and census data. If a statistically significant excess of cancer cases is found, an epidemiology study is performed to investigate whether the cluster is associated with risk factors in the local environment and a true cancer cluster exists.

In spite of, and also because of the high rates of cancer incidence nationally and in California, the variability in the rates by location resulting from many confounding factors make it difficult to identify clusters at localities where increased rates occur due to local exposure to an environmental contaminant. NCI has noted that “most suspected cancer clusters turn out, on detailed investigation, not to be true cancer clusters. That is, no cause can be identified, and the clustering of cases turns out to be a random occurrence.” They appear to be clusters because cancer is so common. NCI further states, “Even if a possible association with an environmental contaminant is found, further studies would be needed to confirm that the environmental contaminant did cause the cluster.” They also note that “even a cluster that shows a significant difference between actual and expected numbers of cases can arise by chance” (NCI 2014).

Eight different health effect and cancer cluster studies have been performed for the counties and census tracts surrounding SSFL. As summarized in Chapter 3, Section 3.9.4, these studies have either found no evidence of elevated cancer rates for areas surrounding SSFL that were statistically significant, that rates could be explained by uncontrolled confounding or imprecision in the data, or that excess rates could not be associated with known carcinogens in the environment associated with activities at SSFL.

The September 1997 Tri-Counties Regional Cancer Registry finding reported to show increases in lung and bronchial cancers within a 5-mile radius around SSFL in Ventura County was from a letter from Dr. Nasserri (Nasserri 1997a). The study included census tracts in eastern Ventura County near SSFL and compared their cancer rates with the rest of the Tri-County Region (Ventura, San Luis Obispo, and Santa Barbara Counties). In context, the letter explains, “Among the moderately radiosensitive cancers, the total number of registered cancers of the lung & bronchus is significantly higher than expected. Close to 85 percent of all lung cancers are due to smoking tobacco.

⁷ Cancer rates are age adjusted, meaning age-specific rates are combined into a single rate that applies to the population as a whole.

Unfortunately, the cancer registry does not collect proper data on smoking.” Because of the possible confounding of the data with smoking effects, specific correlations of lung and bronchus cancers with distance from SSFL were not possible and further studies were recommended. Dr. Nasserri wrote another letter 2 days earlier to a resident in Bell Canyon (Nasserri 1997b) stating “residents of census tract 75.03 [the census tract that includes SSFL] in Ventura County that includes your neighborhood, are not at higher risk of being diagnosed with cancer when compared to the rest of the population in the Tri-Counties Region.” This letter was followed up with another letter in 2006 that showed lower than expected cases of lung and bronchus cancers for tract 75.03 and stated “I conclude that occurrence of newly diagnosed invasive cancers in census tract 75.03 in Ventura County, that includes your neighborhood, does not show any unusual pattern and has actually decreased by 7.5 percent from 1988 through 2004” (Nasserri 2006). Furthermore, there is no evidence of environmental exposure to radiological contaminants in the area surrounding SSFL, the area examined in the study (see below).

The 2007 University of Michigan report by Morgenstern et al. (University of Michigan School of Public Health 2007) investigated the rates at which newly diagnosed cases of cancer occurred in Ventura and Los Angeles Counties between 1988 and 2002 as a function of distance from SSFL by dividing the region into three exposure areas (less than 2 miles, 2 to 5 miles, and greater than 5 miles from SSFL). The investigation showed standardized incidence rate ratios were close to 1, indicating little or no association for total cancers and radiosensitive cancers among adults, but the incidence rate of chemosensitive cancers was slightly elevated during both follow-up periods in the population living within 2 miles of SSFL. However, the report explained there were two main limitations in the study. First is the absence of either environmental or individual-level data for measuring exposures to ionizing radiation or toxic chemicals. The report explained that, “Distance from SSFL is a very crude proxy that does not take into consideration the fate and transport of hazardous substances migrating off site, local geological and meteorological conditions, and the behavior of residents that would affect their levels of exposure.” Second is the lack of information on potential confounders associated with exposure status in the population. They explained that, “It is possible that differences in cancer rates between the three regions were partly due to the effects of other cancer risk factors, such as cigarette smoking for lung, bladder, and upper-aerodigestive-tract cancers, air pollution for lung, bladder, and childhood cancers, diet for colon, breast, and prostate cancers, and socioeconomic status and various occupational exposures for several cancers.” The report concludes, “Since there are several alternative explanations for our findings, including chance and bias, it is tempting to recommend extending our study to include additional information on environmental exposures and potential confounders and the use of more sophisticated Bayesian methods of statistical analysis. ... It is not clear, however, if this ecologic approach will yield more informative and less biased results.” The study further states “An alternative approach for learning more about environmental risk factors for cancers in the communities near SSFL is to conduct an observational study at the individual level, e.g., a cohort or case-control study. Unfortunately, this approach would be costly, and it would still be subject to problems of exposure measurement, population mobility, and relatively small numbers of exposed residents.” There is no evidence of environmental exposure to radiological contaminants in the area within the 5-mile area surrounding SSFL, the area of the study (see below).

Cohen et al. studied potential exposure pathways and investigated how contaminants might migrate from the SSFL to nearby communities (UCLA 2006). The report on the study concludes that, because of data limitations, the authors could not conduct a quantitative dose reconstruction and health risk assessment. Instead, the report only discusses potential community exposures and stresses, stating that “Assessing health impacts in a quantitative manner is beyond the scope of the present study.” Since the report was issued in early 2006, it did not have the benefit of the offsite data report jointly issued by Boeing, NASA, and DOE in 2007 that presented results of over 4,000

samples jointly collected from offsite areas surrounding SSFL, representing over 110,000 analyses of chemicals or radionuclides (MWH 2007). These results are discussed below.

A report by the California Department of Health Services on cancer incidence rates in five Los Angeles County census tracts within a 5-mile radius of SSFL stated that age-adjusted incidence rates were consistent with random variations (DHS 1992). Although in 1990 one census track showed a significantly higher age-adjusted rate of bladder cancer, the 1992 report stated that its analysis suggested that people living near SSFL were not at increased risk for cancers associated with radiation exposure. The increase in bladder cancer in the 1990 study appeared to be restricted to men in Los Angeles County, and there was an increase in lung cancer among Ventura County men. Lack of an increase in the most strongly radiosensitive cancers suggested causes other than exposure to radiation.

Public Health Institute's 2012 California Breast Cancer Mapping Project (PHI 2012) found that the rate of breast cancer was higher in west Los Angeles County/east Ventura County (areas adjacent to SSFL) than the California State average. However, the project found a couple of anomalies in the demographics data. The west Los Angeles/east Ventura area had a higher proportion of white females and a lower proportion of Hispanic females compared to California as a whole. The female population also tends to be slightly older compared to the California population. Although the rates were age-adjusted, they were not adjusted based on race. The study said that white women face an increased risk of breast cancer, which may have caused the higher results. In addition, Ventura County as a whole has higher rates of breast cancer than the State average. When west Los Angeles/east Ventura area rates are compared to county-wide rates for both counties, the incidents of breast cancer are indistinguishable when the confidence interval (or uncertainty range) is considered, and is less than the Ventura County rates as a whole for most years. Therefore, the data indicate that there is no significant difference in rates relative to proximity to SSFL.

DOE and EPA have conducted extensive studies to map the chemicals and radioactivity, respectively, on SSFL Area IV and the NBZ (CDM Smith 2017, HGL 2012b). Boeing, NASA, and DOE have also jointly collected over 4,000 samples from offsite areas surrounding SSFL, representing over 110,000 analyses of chemicals or radionuclides (MWH 2007). Based on these monitoring data, DOE is confident that significant levels of contamination have not traveled and are not now traveling off site from Area IV. Therefore, DOE believes there is no association of cancer incidences in the surrounding community with environmental contaminants released from Area IV. See Section 2.7, "Offsite Impacts," in this CRD for a response to concerns about offsite health impacts and a discussion of offsite environmental sampling results. Note that DOE's responsibility, and the subject of this EIS, is for Area IV and the NBZ (not the entirety of SSFL).

Furthermore, the focus of DOE's current effort is cleanup of residual contamination at the site. Therefore, consideration of further health studies evaluating historical releases and impacts is outside the scope of the EIS. However, a report from the CDPH's California Cancer Registry on cancer statistics for any California county is available online (CCR 2017) and a study by the Tri-Counties Cancer Registry can be obtained upon request. The additional information discussed above on the existing health studies has been added to the Final EIS.

While the health effects of previous site worker occupational exposures during SSFL operations are outside the scope of this EIS, health effects among workers could inform health effects among the offsite population who would have, by reason of distance, received much lower exposures from any potential releases at the site. Therefore, the findings from several worker health effect studies are included below.

In June 1997, UCLA released a worker health study on workers exposed to ionizing radiation at Rocketdyne (UCLA 1997), and issued an addendum health study on workers exposed to selected

chemicals in January 1999 (UCLA 1999). The study concluded that Rocketdyne workers who were monitored for external radiation and received higher doses (especially more than 20,000 millirem) had an increased risk of dying from cancers of the blood and lymph system (such as leukemia and lymphoma) and from lung cancer. The study also found that Rocketdyne workers monitored for internal radiation and that received a relatively higher dose (especially more than 3,000 millirem) had an increased risk of dying from cancers of the blood and lymph system and upper aero-digestive tract cancers (mouth, throat, esophagus, and stomach). The addendum study reported an observed positive association between presumptive exposures to hydrazine and the rates of death from lung cancer.

The Agency for Toxic Substances and Disease Registry (ATSDR) comprehensively studied the two UCLA study reports (ATSDR 1999). ATSDR observed a number of limitations in the interpretation of data from the first report (i.e., UCLA 1997) on ionizing radiation exposure impacts. Although the study measured cumulative SSFL exposures, exposures received before employment at SSFL could not be accounted for because of inconsistency in the recording practices. ATSDR also noted that the study attempted to control for the effect of other chemical exposures (i.e., hydrazine and asbestos) but that misclassification of the chemical exposures was highly likely. Additionally, ATSDR noted another problem with the study was the small number of cancer deaths reported, particularly in the high-dose group (e.g., greater than 20,000 millirem). Considering the limitations of the study, ATSDR concluded that the most consistent and biologically plausible finding of the study was the association with hemato-lymphopoietic cancers. They noted that an observed positive relationship between external radiation and lung cancer mortality has not been reported consistently in other studies of nuclear workers.

ATSDR also observed some limitations of the study on chemical exposure impacts detailed in UCLA 1999. Although the study was able to identify work locations with a high probability of exposure to hydrazine and asbestos at the SSFL site, information was not sufficient to link individual workers with job locations. As a result, there was inadequate information on exposures to individual workers because the exposure classification was based on job titles. In addition to the possible exposure misclassification, bias may also have been introduced by confounding factors. Exposure information on other risk factors, such as exposure to other chemicals (e.g., trichloroethylene and nitrosamines) or personal characteristics was not available for the study. ATSDR also noted that there was also a possibility that the radiation exposures are misclassified, hindering the ability to control for confounding by radiation exposures. ATSDR concluded that, given the uncertainties, the authors' recommendation that the worker group should be studied further is reasonable, since the result shows a positive association and health effects of exposure to these chemicals in humans are not well understood.

In 2005, International Epidemiology Institute (IEI) studied 46,970 Rocketdyne workers employed for at least 6 months in either nuclear technology development or in rocket engine testing since 1948 at SSFL and at nearby facilities, including Canoga Park and De Soto Avenue in Chatsworth (IEI 2005). The IEI study estimated radiation doses from biokinetic models for 16 organs or tissues and combined external and internal dose measurements in their analyses of specific cancers. They also included radiation doses received before and after employment at Rocketdyne to estimate radiation effects and compared radiation-monitored workers with unmonitored workers assumed to be unexposed. They also took into consideration a greater smoking prevalence among hourly workers, based on a survey of 139 workers, as compared to the general population of California.

The IEI report concluded the following:

- “The Rocketdyne workforce overall, including those monitored for radiation, those employed at SSFL and test stand mechanics potentially exposed to hydrazines or TCE

[trichloroethylene], did not experience a statistically significant increased mortality for any cancer, including lung cancer, that could be linked to radiation dose, years of employment at SSFL, years of employment as a test stand mechanic, or years of potential exposure to hydrazines or TCE.”

- “No statistically significant internal cohort dose-response relationship was seen for leukemia, lymphoma, or cancers of the esophagus, liver, bladder, kidney or any other cancer over categories of radiation dose or years of potential chemical exposure.”
- “We conclude that radiation exposure has not caused a detectable increase in cancer deaths in this population and that work at the SSFL rocket engine test facility or as a test stand mechanic is not associated with a statistically significant⁸ increase in cancer mortality overall or for any specific cancer.”
- “A slight non-significant increase in leukemia (excluding CLL [chronic lymphocytic leukemia]) was seen among radiation workers, although a similar non-significant increase in CLL (a malignancy not associated with radiation) was also observed. A slight non-significant increase in kidney cancer and a slight non-significant decrease in bladder cancer were also seen among radiation workers.”

The IEI study was more rigorous and had fewer data limitations than the UCLA study. The lack of a significant increase in cancer mortality among workers who had measured occupational exposures to radiation and potential occupational exposures to chemicals suggests that any increase in cancer rates among the offsite population who would have, by reason of distance, received much lower exposures from any potential releases at the site would be even less significant if present at all.

2.9 Options for Transportation of Waste from SSFL

Comment Summary

Commenters were concerned that DOE inflated soil volume estimates and, therefore, the estimated number of truck trips and failed to consider alternative routes and methods to transport soil and waste off the site that would minimize truck traffic and neighborhood impacts. (For purposes of the Draft EIS, DOE assumed that all soil and waste would leave the site by truck, using Woolsey Canyon Road, but after reaching Valley Circle Drive, taking alternative routes to local freeways.) This was done, some commenters assert, to scare the public into believing that the impacts of transportation of the soil and waste would be greater than the impacts of leaving substantial contamination on site.

Assuming soil and waste was transported off site by truck, commenters suggested that DOE avoid or minimize routes through neighborhoods by considering use of less-populated roads from SSFL, including fire roads and other routes that could be constructed or improved for truck traffic. Commenters suggested use of a northern route to a freeway that would involve passing few, if any homes. One commenter referred to options presented in a 2014 alternative transportation study for SSFL cleanup by the SSFL Transportation Options Task Force (SSFL TF 2014).

With respect to the option of transporting soil and waste by truck to a location where the material could be loaded onto a train for transport to a disposal facility, commenters were concerned that DOE evaluated transport of the material 60 miles to the Puente Hills Intermodal Facility. Commenters were concerned that this analysis minimized the possible effectiveness of the truck/rail option. Factors cited by the commenters included the added effort in completing the Puente Hills Intermodal Facility as this station was not yet open and the failure to consider an existing rail siding,

⁸ For events to be statistically significant their likelihood can be attributed to something other than random chance.

rail line, or rail station north of the site that could be reached without passing many homes. Commenters described this alternative waste transfer location as being a block, a quarter mile, or a mile from SSFL.

Commenters also recommended that DOE consider options for removal of soil and waste from SSFL that would not involve trucking the material. One suggested option was to construct a rail line from SSFL. Other options involved construction of systems that would transfer the material to the rail siding north of SSFL, where the material would be loaded onto trains for shipment to disposal facilities. These transfer systems included conveyor systems, tunnels, and pipelines. Conveyor systems were suggested that would use closed containers. Suggested tunnel systems would entail construction of a small-diameter (about 6 feet) tunnel that would transfer materials within bins. In addition, a pipeline was suggested that would move soil that had been converted into slurry by adding water.

Response

DOE did not inflate estimates of soil volumes or truck trips, but used the available information to develop estimates for analysis. The analyses reflect the more than 8,000 soil samples analyzed for chemicals and 3,000 soil samples analyzed for radionuclides. Since the Draft EIS was prepared, DOE has independently evaluated the estimate of the soil volume associated with cleaning up to the 2010 AOC LUT values. Details of the estimation process are provided in Appendix D of this EIS. Based on the characterization data and an improved understanding of the soil depth over uneven bedrock across Area IV and the NBZ, DOE has greater confidence in the soil volume estimate than it did at the time the Draft EIS was prepared. DOE has reduced the uncertainty factor used in the soil volume estimate to 20 percent. This Final EIS estimates that 881,000 cubic yards of soil would be removed from SSFL under the Cleanup to AOC LUT Values Alternative compared to 933,000 cubic yards estimated in the Draft EIS.

At the time the Draft EIS was prepared, DOE understood that the DTSC was conducting a transportation study to evaluate alternative means of transporting debris and soil from SSFL. DOE intended to use the results of that study, should it identify potentially viable routes or transportation methods, as the basis for evaluating their feasibility (including needed permits, land purchases, costs, resource studies, and impacts to schedule) and potential environmental impacts (as necessary to comply with NEPA). The draft transportation study is now available in the *Draft Program EIR* (DTSC 2017b), Appendix J. DTSC concluded that the environmentally superior option that meets the purpose of the proposed action includes transporting waste to disposal sites by truck via Woolsey Canyon Blvd. This method of transportation was identified as the least environmentally impactful while being the most technically feasible.

Many of the options noted by commenters were discussed in the Draft EIS, in both Chapter 2, Section 2.2.3, and in Appendices D and H. Chapter 2, Section 2.2.3 of this Final EIS was revised to expand the discussion of transportation options considered but dismissed from detailed evaluation. As described in the revised Section 2.2.3, DOE considered concepts such as improving fire roads and Black Canyon Road as potential alternative truck routes north from SSFL into Simi Valley. (Many of these concepts were also considered in the DTSC *Draft Program EIR*. Section 2.2.4 of this Final EIS discusses the treatment of transportation concepts in that document.) Concepts involving constructing new roads or making major improvements to existing currently unsuitable roads were not evaluated in detail because, DOE believes that, the time required to study, design, and construct such large infrastructure projects would unreasonably delay initiation of the SSFL cleanup relative to the currently available option of transportation via Woolsey Canyon Road and existing local roadways. In addition, there would be a substantial risk of additional delay and cost escalation associated with lawsuits and right-of-way issues.

In Chapter 2, Section 2.2.3 of this EIS, DOE also considers other transportation modes, including building a conveyor or other transport system (including tunneling) to a railroad siding. Concepts involving developing alternate transport systems such as conveyors or tunnels were not evaluated in detail. (The DTSC treatment of these transportation modes is also discussed in the Final EIS Chapter 2, Section 2.2.4.) As with alternative truck routes, DOE believes that the time required to study, design, secure rights-of-way, and construct such large infrastructure projects would unreasonably delay initiation of cleanup relative to the currently available transportation option via Woolsey Canyon Road and existing local roadways..

As described in Appendix D of this EIS, for purposes of analysis under the truck/rail transportation option, the Puente Hills Intermodal Facility in City of Industry, California (about 60 miles from SSFL), was used as the representative facility for the transfer point where wastes would be placed on railcars for delivery to appropriate disposal facilities. As opposed to a passenger train station (which for safety reasons would not be considered), an intermodal facility is designed to accommodate large trucks and industrial equipment (cranes or forklifts) for transferring containers between trucks and trains. In selecting this facility as a representative facility for purposes of analysis, there was no intent to preclude other locations that could be used or developed for intermodal transfer of SSFL material to trains. However, any location to be used for intermodal transfer would need to be assessed for suitability (e.g., sufficient space for access roads, truck parking areas, cranes, and other required infrastructure), security, and safety. Development of an intermodal transfer facility could require purchasing land, acquiring right-of-ways, preparing environmental assessments, obtaining permits, and constructing or modifying the facility.

The Puente Hills facility was selected as a representative facility for analysis because it is a reasonable distance from SSFL, so that a single driver would be able to make the roundtrip two to three times a day; there is existing or planned infrastructure such as access roads, rail sidings, cranes, etc., that would support waste transfer from truck to train; environmental assessments for construction and operation of the facility have been prepared and published (City of Industry 2008, 2009); and the facility was completed in 2016 (although the facility is not being operated for economic reasons). As discussed in Appendix D of this EIS, other existing facilities near the ports of Los Angeles and Long Beach are closer to SSFL. These facilities are designed for intermodal transfers from cargo ships rather than trucks, and modifications would likely be required to use these facilities.

Regarding the cited rail system north of SSFL, DOE acknowledges that, as described in Chapter 3, Section 3.8.5 of this EIS, a rail line exists north of SSFL; it is a Los Angeles Metropolitan Transportation Authority/Union Pacific line. This is a high-speed public transportation line with no intermodal freight service in Simi Valley. The railroad station north of SSFL referenced by some commenters appears to be the Santa Susana Railroad Depot and Museum at Santa Susana Park & Railroad, near the intersection of Santa Susana Pass Road and Katherine Road. This is a museum, not a functioning rail depot or intermodal facility. There is also a Simi Valley Train Station, as one commenter referenced, at 3030 Los Angeles Avenue, which is a stop for public transportation and not an intermodal rail facility.

DOE acknowledges that a railroad siding exists off Santa Susana Pass Road and east of the Santa Susana Railroad Depot and Museum. The available space at this location appears to be narrow, with a rocky outcrop on one side. In its *Draft Program EIR*, DTSC evaluated a location in this vicinity as the terminus of a conveyor system and a rail loading facility. Sufficient land would need to be acquired; appropriate environmental assessments would need to be prepared and permits acquired; and the infrastructure required to transfer soil and waste from trucks to rail cars would need to be constructed. These activities would take time to complete, which could delay initiation of the project relative to the availability of other options. Also note that the suggested railroad siding is located between two recreational areas: the Santa Susana Railroad Depot and Museum to the east

and Corriganville Park to the west. The potential impact on these two recreational areas would need to be evaluated.

The most direct route to the cited railroad siding would cover approximately 4.6 road miles and would entail truck travel over a road that is asphalt over only a portion of this distance and would require capacity and safety improvements such as widening, paving, and installing guard rails before it could be safely used. Appropriate environmental assessments and permits would need to be prepared and acquired for the road improvements. There would be the same considerations if this route was used as the northern route to a freeway (Highway 118) as suggested by commenters. As discussed above, DOE addressed alternative truck routes in Chapter 2, Section 2.2.3 of this EIS.

Building a conveyor, tunnel, or pipeline to transport waste and soil to the railroad siding instead of building a new or improving a roadway would be subject to the similar issues as a roadway, including developing the proper infrastructure at the railroad siding; obtaining the right-of-way; and conducting environmental assessments and obtaining permits. Additionally construction of a conveyor, tunnel, or pipeline system would be more complex, costly, and time consuming than any roadway construction. Making soil into a slurry (as would be required to use a pipeline) would have other potential impacts beyond tunnel and conveyor options, namely water usage, the need for soil drying facilities, and additional air emissions from those drying facilities. (Waste cannot be transported or disposed with the amount of free liquid that would be required to fluidize the soil to allow flow through such a pipeline.)

2.10 Public Perceptions about Waste and Contamination in Area IV

Comment Summary

Commenters expressed concern about the waste and contamination present on site. These commenters expressed their belief that the site is still severely chemically and radioactively contaminated due to testing, dumping, meltdowns, accidents, spills, and releases of dangerous nuclear and chemical contamination in the past. In addition, several of these commenters indicated a belief that no study has ever been conducted by DOE to show the extent of the contamination on site or “no actual study had been done to show how far and in what manner the contamination is spreading.” Other commenters believe that while these kinds of studies have been conducted, many highly contaminated areas were left out. Some commenters go further and demand that “the DOE will need to conduct additional Site investigations to further address the data gaps and more adequately characterize” the toxic conditions of the site. The following items summarize specific statements included in comments:

- Commenters referred to the test stands on the hill and the thousands of rocket tests that were performed. They noted that large quantities of water and toxic solvents, specifically trichloroethylene were used in support of these tests and allowed to percolate into the soil and groundwater.
- Commenters made reference to waste being taken up the hill from all across the country from other nuclear facilities for destructive examination or de-cladding and reprocessing and reuse. They also referred to a factory for fabricating reactor fuel rods out of plutonium. They also noted that there were 10 nuclear reactors, at least 4 of which suffered accidents (including the 1959 SRE accident).
- Commenters made reference to the poor environmental and safety practices of DOE and the Atomic Energy Commission (AEC), a predecessor agency of DOE. Some commenters referred to past releases and spills. Others stated that there were decades of discharge of

chemicals and radionuclides into the environment and referred to illegal storing, disposal, and burning of radioactive and chemical materials.

- Commenters also made note of specific items, including that
 - The Building 56 landfill consists of unknown debris, the landfill excavation is a 50-foot deep hole that was not used during reactor construction because it intercepted groundwater, that outfall 7 was constructed because the landfill was an acknowledged problem area, and that the bottom of the pit and the ramp area contain debris.
 - The Building 4024 driveway/loading area contains deep below ground storage tanks.
 - The Old Conservation Yard had tens of thousands of containers of waste disposed of by throwing them down the hill.
 - The Sodium Reactor Experiment vicinity has highly radioactive tanks in the hills above the site and the site and its surroundings are massively contaminated at thousands times background.

Response

DOE understands that many remain concerned about contamination and past practices at SSFL. The EIS was prepared to support DOE's plans to address contamination that remains at the site today. The EIS is based on currently available information developed from the more than 3,000 samples taken by EPA for radionuclides and 10,000 samples taken by DOE with DTSC oversight for chemicals. DOE's current plans and the actions evaluated in this Final EIS addressed the cleanup of Area IV and the NBZ as they exist today. A number of the comments received on the Draft EIS addressed practices or events that occurred in the past; some address activities that occurred in locations at SSFL other than Area IV and the NBZ, and some statements are inaccurate characterizations of past or current conditions.

As noted in Chapter 1, Section 1.3 of this EIS, SSFL is divided into four administrative areas and two contiguous buffer zones north and south of the administrative areas. This EIS was prepared to address the remediation of Area IV and the NBZ, those parts of SSFL for which DOE is responsible. This does not include the test stands and rocket tests performed in other areas of SSFL; the responsibility of NASA and The Boeing Company. The scope of remediation addressed in this EIS does not include the other parts of SSFL, which are the responsibility of NASA and Boeing. Commenter references to rocket stands, rocket tests, and the use of chemicals and water associated with those tests apply to locations at SSFL other than Area IV and the NBZ. Those locations are being cleaned up by NASA or Boeing under the oversight of DTSC.

DOE's facilities in Area IV performed research and technology development throughout its operating history. As part of that work, DOE (and the AEC) operated 10 small nuclear reactors and operated test laboratories for liquid metals (sodium and potassium) research, nuclear energy development, and radioactive waste management. As part of those research activities, various nuclear materials were received from off site for testing and examination, and laboratories fabricated and tested materials in onsite laboratories. The purpose was technology research and development. None of the facilities (e.g., reactors) or activities (e.g., fuel examination, processing, and fabrication) were conducted at a commercial scale.

Regarding comments about past waste management practices at SSFL being illegal, DOE acknowledges that many of the waste management practices employed in Area IV in the past would not be acceptable today. However, these practices occurred before the enactment of many of the State and Federal environmental laws that exist today and were consistent with then-current practices and governed by then-current regulations. This included the use of leach fields for

disposal of certain types of wastes, onsite disposal and storage, as well as open-air burning and the open-air reaction of sodium and/or potassium. Because sodium and potassium react violently when exposed to water, components from research (e.g., valves, piping, vessels, and insulation) with small quantities of these elements were treated by exposure to water. Components were either tossed into a pool of water or sprayed with water hoses. On occasion, vessels with residual materials were punctured remotely by shooting with a rifle (Rockwell 1988). These past practices, as well as inadvertent releases, are the source of the residual contamination addressed in this EIS. As discussed below, most of the buildings and much of the contamination associated with past practices have been remediated during previous cleanup activities.

Soil cleanup actions within Area IV were undertaken starting in the 1960s whenever a spill or release was observed (see Chapter 3, Section 3.2.5.3, of this EIS). The majority of the cleanup actions in the 1960s and 1970s focused on radioactively impacted soils. In the 1980s and 1990s, soil cleanup actions also included removal of soil contaminated by chemicals. In all, more than 50 soil removal actions have occurred within Area IV. Figure 3–14 of the EIS shows locations of the prior cleanup actions discussed below (additional discussion of these activities is also provided in Chapter 3, Section 3.2.5.3, of the EIS). Notable soil cleanup actions include the following (HGL 2012a):

- Former Sodium Disposal Facility – During the 1990s, 14,000 cubic yards of soil and 20,000 pounds of debris were removed during a series of cleanup actions.
- Building 100 Trench – In 2003, 330 cubic yards of scrap metals, asbestos, and building debris were removed.
- Building 56 Landfill – In the early 1980s, drums containing industrial wastes and building materials such as asphalt, concrete, and scrap metal were removed from the surface.
- Radioactive Materials Handling Facility (RMHF) – The RMHF and surrounding area have been subject to a series of soil cleanup actions following spills or when survey data identified elevated readings of radioactivity. The leach field, including impacted bedrock and soil, was removed in 1978. Approximately 296 cubic yards of impacted materials were removed. In 2003, 130 cubic yards of radiologically contaminated soil in the main RMHF storage area was excavated. In 2006, 7 cubic yards of impacted soil were removed from the RMHF north slope along with 20 cubic yards from the RMHF catch basin. In 2008, an additional 13 cubic yards of impacted soil were taken from a location west of the RMHF boundary. All materials excavated from the RMHF and vicinity were transported to a licensed radioactive waste disposal facility.
- Sodium Reactor Experiment Watershed – Demolition of the buildings and support facilities that composed the Sodium Reactor Experiment started in 1974 and was completed in 2001. When contaminated soil was observed during building removal, the soil was excavated and transported to a licensed radioactive waste disposal facility.
- Old Conservation Yard – The yard area once had two 1.5-million-gallon diesel storage tanks (removed in 1994) and was also used for the storage of drummed wastes and salvageable materials. All drums and materials have been removed. When discovered, soil impacted by radionuclides and chemicals was removed.
- 17th Street Drainage and Pond – The 17th Street Drainage directed surface water flow from the central part of Area IV to a bermed pond in the southern part of Area IV. Releases of chemicals and radionuclides from several facilities impacted the drainage and pond. Surveys were used to locate impacted soils and sediment. The drainage and ponds were subject to several cleanup actions ending in 2001.

- Leach fields – From the mid-1950s to 1961, sanitary wastes generated during operations were directed to 1 of 15 leach fields. In 1961, Area IV was connected to the central waste water treatment facility in Area III, and the leach fields were taken out of service for sanitary purposes. As each associated building was demolished, the leach field sites were removed and sampled for contamination.
- Building removals – Over the operating life of Area IV, there have been over 250 numbered structures built. As the missions of individual buildings ended, the buildings were removed. During the process of building removal, contaminated soil that was encountered was also removed. Today, only 22 buildings remain in Area IV; 18 are the responsibility of DOE and 4 are the responsibility of Boeing.

Chemical and Radiological Contamination in Area IV of SSFL

During the late 1990s to about 2005, soil samples were collected under a Resource Conservation Recovery Act (RCRA) Facility Investigation (RFI). Locations where chemicals were used, stored, or disposed of were sampled. During the RFI, 2,259 soil samples were collected for chemical characterization. These included samples from drainages north of Area IV (in the NBZ).

In 2011, following the signing of the AOC, DOE provided \$41 million to EPA to conduct on site and background radiological studies for Area IV. EPA's first activity was performing a review of hundreds of historical records of facility operations, waste management practices, and releases during operations, including an evaluation of aerial photographs of Area IV over the years (HGL 2012a). EPA also conducted a walk-over gamma scan to identify areas of elevated radioactivity and performed magnetometer surveys. EPA used the historical records review and field surveys to guide its sampling of soil for radionuclides. EPA collected 3,487 soil samples for radionuclide determination, including samples in drainages leading from Area IV. EPA identified cesium-137 and strontium-90 as the two radionuclides that exceeded its Field Action Levels⁹ most frequently. EPA only identified nine locations where cesium-137 exceeded 9 picocuries per gram (the soil cleanup standard was 9 picocuries per gram at the time the earlier cleanup activities were performed), and three locations where strontium-90 exceeded 9 picocuries per gram. Elevated concentrations of radionuclides were not observed in drainages leaving Area IV.

In addition, DOE with oversight by DTSC, collected soil samples at EPA's sample locations and analyzed those samples for chemicals. DOE collected additional soil samples at locations of suspected chemical contamination following the completion of EPA's study. From 2011 through 2014, DOE collected 5,854 soil samples for chemical analysis throughout Area IV and the drainages.

All data collected under the RFI, EPA's radiological program, and DOE's efforts in 2011 to 2014 were entered into a GIS database. The GIS was used to identify and plot locations where background was exceeded, and where RBSLs were exceeded. This database was also used to establish the basis for the soil cleanup alternatives and soil volume estimates presented in this EIS.

DTSC also used this database to evaluate the migration of contaminants from Area IV and determine whether users of the Brandeis-Bardin property would be at risk due to the contamination. DTSC's review of EPA's and DOE's data concluded that "The Northern Buffer Zone results showed no pattern or grouping of exceedances that indicate offsite migration of contamination that would pose a threat to students, faculty, staff or visitors to the Brandeis Bardin." Regarding chemical contamination DTSC concluded "The contaminants of greatest concern, identified

⁹ The Field Action Levels or FALs represent EPA's first derivation of soil background levels for radionuclides. EPA cautioned the use of FALS for identification of contamination stating, "Sample results exceeding the FAL do not necessarily represent locations of contamination" (HGL 2012b, page 4-1).

through extensive soils investigation, are confined to the SSFL site and do not extend off site” (DTSC 2017a).

The extensive soil sampling performed by EPA and DOE and the review of those data by EPA and DTSC show that the contamination has remained within Area IV. Radioactive contamination is restricted to about 12 locations, but chemical contamination is more widespread. The locations are well understood and primarily reflect locations where soil cleanup actions have not been undertaken or where prior removal actions did not remove all contamination. These locations do not pose a risk to offsite residents, as the contaminants are not moving off site.

DOE’s cleanup program will include confirmation sampling. After any excavation of contaminated material (building debris or soil) is completed, the location will be sampled and the samples will be sent to a laboratory for analysis. Cleanup will not be declared complete in any specific location until this sampling confirms that the remaining materials meet the cleanup standards agreed to by DOE and DTSC.

SECTION 3
PUBLIC COMMENTS AND DOE RESPONSES

3.0 PUBLIC COMMENTS AND DOE RESPONSES

This section presents a side-by-side display of the comments received by the U.S. Department of Energy (DOE) during the public comment period on the *Draft Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory (Draft SSFL Area IV EIS)* and DOE's response to each comment. To find a specific commenter or comment in the following pages, refer to the "List of Commenters" immediately following the Table of Contents. This list is organized alphabetically by commenter name and shows the corresponding page number(s) where commenters can find their comment(s).

If commenters provided written comment documents that are essentially the same, these comment documents may be treated as a campaign. Commenters submitting documents as part of a campaign are referred to a copy of that comment document. This section only contains one representative copy of each campaign.

This page left blank intentionally.

Commenter No. 1: Michael W. Kuhn, PhD,
SSFL Community Advisory Group

January 31, 2017

Ms Stephanie Jennings
NEPA Document Manager, SSFL Area IV EIS
U. S. Department of Energy
4100 Guardian Street, Ste. 160
Simi Valley, CA 93063

From: Michael W. Kuhn, PhD
[REDACTED]

Subject: Comments on the Draft Summary of the EIS on the Cleanup of the Santa Susana Field Laboratory Area IV

Dear Ms Jennings:

As a member of the SSFL Community Advisory Group, I have read the summary of the draft EIS on the cleanup of the Department of Energy portion of the SSFL site. The document is thorough and exhaustive. However, I do have some comments.

P. x: The discussion of the 2007 cleanup standard should indicate that the risk for someone living on site 24/7, 350 days per year for 30 years of developing cancer due to exposure to man made contaminate would be one in one million. Since we all have a one in four risk of developing a life-threatening cancer during our lifetime, the 2007 risk-based residential standard would seem to provide adequate protect to all possible users of the site. While the risk standard represented by the 2007 AOC is noted elsewhere in the document, I think it is important to mention its meaning up front. The document is intended to communicate to the general public, not just to the well informed reader.

P. 11: This paragraph definitively states that places where soil and other geological material is removed would be backfilled and re-contoured. It is my understanding that to date, no one has been able to identify a suitable source of backfill. Any removal site would begin by removing soil section. Replacement with gravel or other non-soils would not represent satisfactory mitigation. In addition, there is the question of the off-site impacts to the environment at "borrow" sites.

P. 52: Noise Impacts: I cannot imagine that drivers of loaded vehicles hauling loads of material off the mountain down Woolsey Canyon Road would not be using their "Jake" brakes. The use of "Jake" brakes has an irritating impact on residents that is not adequately expressed by "noise equivalent levels." I am not suggesting that drivers should be prohibited from using Jake brakes. However, their use should be acknowledged when discussing potential noises.

P. 55: Cultural Resources: The removal of buildings and pavement is stated as not having a cultural impact. I would assume most of the remaining building are 50 or more years old. The other factor here is that nearly all of the built up area on the site was done without any consideration of the possible presence of archaeological materials. Certainly some areas underlying built up areas may include some significant prehistorical archaeological materials. All

- 1-1 DOE added information on risk associated with the 2007 consent Order Cleanup Standards (2007 Consent Order for Corrective Action) to Chapter 1, Section 1.3 and to the Summary, Section S.4, of this *Final SSFL Area IV EIS* (Final EIS).
- 1-2 DOE intends to continue consultation with the California Department of Toxic Substances Control (DTSC) to find a suitable backfill soil and would not use gravel or other material that would not be appropriate for restoring excavated areas of Area IV and the Northern Buffer Zone (NBZ). Refer to Section 2.3, "Suitable Backfill Soil," of this Comment Response Document (CRD) for further discussion of the responsibilities and actions necessary to identify a backfill source.
- 1-3 Because no source for backfill has been identified at this time, the need to evaluate impacts at backfill source locations has not been determined. After DOE and DTSC agree on a location (or multiple locations) for backfill material, DOE would evaluate whether additional National Environmental Policy Act (NEPA) analysis will be required.
- 1-4 Noise generated by engine braking, also known as "Jake Brake[®]" or "engine compression braking" is discussed in Chapter 3, Section 3.7.3, Chapter 4, Section 4.7.1.2, and Chapter 6 of this Final EIS. Chapter 3, Section 3.7.3 indicates that SSFL trucks currently operating on the haul routes generate between 80 and 95 dBA [decibels A-weighted] with the loudest noise levels associated with engine braking. Chapter 4, Section 4.7.1.2 acknowledges that the use of engine braking would continue under the Proposed Action, with individual SSFL truck pass-by events generating noise levels similar to those currently generated. In Chapter 6, Table 6-1, DOE indicates that, in order to minimize impacts, trucks will limit the use of engine compression braking on Woolsey Canyon Road and in neighborhoods to the extent practicable, consistent with the safe operation of heavy-duty trucks (e.g, avoiding overheating of brakes). Table 6-1 also states that all SSFL trucks are required to be equipped with properly operating mufflers. Although mufflers do not eliminate the signature staccato sound pattern of truck engine braking, they greatly reduce the sound level relative to vehicles whose mufflers have been removed (also known as "straight stacks").
- 1-5 DOE acknowledges that archaeological sites could be present beneath existing foundations, subsurface vaults, or concrete slabs. A National Historic Preservation Act (NHPA) Section 106 Programmatic Agreement is being developed by DOE through formal and informal consultation with the State Historic Preservation Officer, the federally recognized Santa Ynez Band of Chumash Indians, and non-federally recognized tribes. This NHPA Section 106 Programmatic Agreement will establish

Commenter No. 1 (cont'd): Michael W. Kuhn, PhD,
SSFL Community Advisory Group

demolition and removal the historical landscape should be conducted with the presence of archaeological monitors.

P. 71, Aesthetics: This discussion assumes that suitable replacement material will be available. If none is available, a "moonscape" would be created. If excavated areas are partially filled with crushed rock, the visual damage to site would be substantial.

P. 81, last paragraph: States that finding of previously unidentified archaeological resources is "unlikely." I can assure you, from my own years of experience, if archaeological monitors are employed and are allowed to do their work, new sites will be identified. (See comments from p. 55.) If you examine the recordings done for the last three "Phase I" archaeological surveys done in Area LV, you will note that new sites were identified with each survey.

I have two final concerns:

1. The "cleanup to background or detection" based upon point by point cleanup, rather than the averaging standard used by the U. S. Environment Protection Agency will result in much greater removal of soil and subsoil without any appreciable health benefits to future users of the site.
2. The use of the "Look Up Table" standards will result in many "false positive" errors. With more than 100 chemicals listed and several radionuclides, the potential for false positives will result in far more soil being removed than if there was no possibility of false positive readings. The likelihood of 3-5 percent false positives for any chemical pretty much assures that any soil sample will have more than one false positive reading.

Sincerely,

Michael W. Kuhn, member
Santa Susana Field Laboratory Community Advisory Group

procedures for making eligibility determinations on unevaluated sites, as needed, and inadvertent discoveries, along with procedures to assess effects and resolve adverse effects if they are determined eligible for the NRHP. This Programmatic Agreement will be legally binding and will be available to the public once finalized.

DOE agrees with the comment and during soil remediation will work to avoid a "moonscape" appearance (i.e., a rocky, barren landscape) of Area IV. DOE does not intend on removing soil until a suitable backfill material is identified.

The Cleanup to AOC LUT Values Alternative for soil remediation described in Chapter 2, Section 2.3.2, of this Final EIS (covering a soil cleanup that removes contaminants in concentrations above background levels or above levels determined by detection capabilities) was developed to implement the technical elements of the 2010 AOC. The 2010 AOC includes the following: "Residual concentrations 'not to exceed' local background concentrations i.e., if during site survey efforts or during confirmatory sampling the level of any constituent detected in a soil sample is above local background levels, step-outs will be taken to delineate the contamination and removed; soil above local background will not be averaged with other soil" (DTSC 2010). While the Cleanup to Revised LUT Values Alternative would continue to apply cleanup criteria on a point-by-point basis, the Conservation of Natural Resources Alternative (both the Residential Scenario and the Open Space Scenario) would apply a traditional risk-assessment approach to making cleanup decisions, including using area averaging (over approximately 2.5 acre areas) to determine concentrations and developing risk and dose criteria. However, to implement either of these alternatives, a change to the 2010 AOC would be required.

DOE acknowledges the commenter's concern. As discussed in the Summary, page S-26, of this EIS, DTSC has set an acceptable error rate in sample analysis at 5 percent. Compounding a 5 percent error rate over 132 different potential constituents in each sample means a much greater chance that DOE would be remediating clean soil, not contaminated soil. DOE is also evaluating, for comparison, two other soil alternatives: (1) Cleanup to Revised LUT Values Alternative and (2) Conservation of Natural Resources Alternative (two scenarios). While the Cleanup to Revised LUT Values Alternative would continue to apply cleanup criteria on a point-by-point basis, the Conservation of Natural Resources Alternative would apply a traditional risk-assessment approach to making cleanup decisions, including using area averaging (over approximately 2.5 acre areas) to determine concentrations and developing risk and dose criteria. However, to implement either of these alternatives, a change to the 2010 AOC would be required.

Subject: Comment on DOE's Draft EIS for SSFL

U.S. Department of Energy NEPA Document Manager, SSFL Area IV EIS Stephanie Jennings
stephanie.jennings@emcbc.doe.gov

Dear Ms. Jennings:

I am outraged by the DOE's Draft Environmental Impact Statement (DEIS) for the Santa Susana Field Laboratory (SSFL) Area IV cleanup.

DOE's DEIS makes it abundantly clear that DOE wants to break out of its commitment to clean up all of its contamination at SSFL. Instead, DOE proposes leaving between 34% and 94% of the dangerous radionuclides and toxic chemicals on site, not cleaned up, where they will continue to migrate and put nearby communities at risk. That is unacceptable!

DOE must abide by the 2010 AOC and reject all three of the cleanup alternatives proposed in the DEIS, as well as the "no action" alternative for soil remediation, all of which are prohibited under the AOC. Any "leave in place" cleanup methods, including natural attenuation and "no action" and should not be considered.

DOE also fails to acknowledge that the AOC is a legally binding agreement with the DTSC, and DTSC as the regulator makes the cleanup decisions, not DOE. The legal obligations in the AOC already require full cleanup, and even if it didn't exist, the state toxics agency is the regulator who decides cleanup requirements for the toxic chemicals. That isn't within the power of the polluter, DOE. DOE should withdraw the EIS, as it violates cleanup commitments and DOE has no legal authority to decide the cleanup in the first place.

If all of the contamination at SSFL is not cleaned up per the AOC cleanup agreement, people who live nearby and future visitors to the site will be at increased risk of cancer and illnesses related to exposure to SSFL contaminants. I demand that you help protect our health and keep your cleanup commitment by ensuring that DOE's final EIS fully comply with the AOC provisions and clean up ALL of the contamination.

Sincerely,

Amy Pelayo

2-1

2-2

2-3

2-1
cont'd

2-1 The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine soil cleanup levels. Use of risk-based criteria for soil cleanup is consistent with the approach used by DOE at other DOE sites, by DTSC at other DTSC-regulated sites, and by U.S. Environmental Protection Agency (EPA) at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information regarding the technical components of the Cleanup to the AOC Lookup Table alternative. Section 2.2 also presents the soil volumes that would be left on site under each alternative. Under all of the action alternatives concentrations of chemicals or radionuclides would be reduced to levels that would be protective of human health and the environment for the intended use of the site as open space (please see Section 2.5 "Toxicity of Soil Contaminants" of this CRD for further information).

The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

2-2 NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. In addition, as discussed in Chapter 1, Section 1.3, of this EIS, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record(s) of Decision (ROD[s]) pursuant to NEPA. DOE recognizes that the 2010 AOC is a legally binding agreement with DTSC and that DTSC has regulatory authority over aspects of DOE's cleanup of Area IV and the NBZ. In accordance with the 2010 AOC, Chapter 7, Section 7.11, "Compliance with Applicable Laws and Regulations," all actions taken by DOE pursuant to the order will be undertaken in accordance with applicable local, State, and Federal laws and regulations. This clause recognizes that DOE must comply with NEPA, as do Sections 6.1 and 6.2 of the AOC. Section 6.1 acknowledges DOE's

Commenter No. 2 (cont'd): Amy Pelayo

obligation to prepare an EIS and ROD pursuant to a court order. Section 6.2 recognizes the need to complete an environmental review that meets the requirements of the court order.

This EIS analyzes an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory. In response to public input received, and consistent with its obligations under NEPA, DOE also analyzed alternatives that are based on risk to human health as well as the protection of natural resources. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ.

DOE will issue a ROD(S) for this EIS no sooner than 30 days after the EPA Notice of Availability for this Final EIS is published in the *Federal Register*. The potential environmental impacts presented in this EIS, along with public input, cost, policy, and other factors, will be considered by decision-makers in selecting alternatives for soil remediation, building demolition, and groundwater remediation.

As discussed in Chapter 1, Section 1.9.2, of this Final EIS, DTSC is currently preparing a program environmental impact report (EIR) under the California Environmental Quality Act (CEQA) that applies to cleanup of the entire SSFL. The *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* was issued by DTSC in 2017 (DTSC 2017b). DTSC will issue a Notice of Determination for the program EIR identifying the selected remedial actions. The Area IV and NBZ site cleanup activities covered by this Final EIS would begin following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

2-3 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

Commenter No. 3: Tessa Mykel

Subject: DOE Draft EIS

Dear Ms Jennings,

I am troubled by the Draft EIS. The DOE should uphold the 2010 AOC to ensure a proper cleanup. I am also troubled by the phrasing in the Draft EIS regarding public comments. The document indicates that one can mail comments or submit them online, but cannot email comments. This makes it seem like the DOE is intentionally making it difficult for people to submit comments as email is a much easier, quicker and more efficient way for people to communicate with one another. I urge you to accept comments via email for this feedback process to be truly transparent and for the public to easily comment.

Thank you,
Tessa Mykel

|| 3-1
|| 3-2

- 3-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information.
- 3-2 Thank you for the feedback on the *Draft SSFL Area IV EIS*. Considering public comments on the Draft EIS is an important step in the EIS process. DOE provided multiple means for public comments. Comments could have been submitted directly via the website. In response to comments about the website, early during the public comment period DOE expanded the capacity of the website to accept longer comments and added the ability to upload entire documents. Members of the public were also invited to attend the public hearings in Simi Valley on February 18, 2017 and Van Nuys on February 21, 2017 to make comments orally or submit paper copies. DOE also accepted comments by U.S. mail. Regardless of the submission method, DOE considered all comments equally when developing this Final EIS.

Subject: Santa Susana EIS draft

Ms. Jennings

After reading the Environmental Impact Statement draft that was recently posted, I'm troubled by the proposal to drastically reduce the extent of the cleanup that was supposed to be completed by 2017. My family is lives in an area affected by this pollution, and the community has already begun to feel the effects. I believe that the DOE should uphold the 2010 cleanup agreement standards and accelerate the cleanup as much as possible, since the previous deadline was blatantly missed. I'm also very troubled by the fact that that you're not accepting email comments about the impact statement. Many that may want to comment will be impeded by the requirements to mail physical letter or sign up on the website.

Thank you for your time,

Matt Ruhland

4-1
4-2

4-1 DOE acknowledges your support for cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information, including necessary steps prior to continuing cleanup. The purpose of the EIS is to evaluate alternatives for completing remediation at those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," for a discussion of soil remediation alternatives. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act

4-2 Thank you for the feedback on the Draft EIS. Considering public comments on the Draft EIS is an important step in the EIS process. DOE provided multiple means for public comment. Comments could have been submitted directly via the website. In response to comments about the website, early during the public comment period DOE expanded the capacity of the website to accept longer comments and added the ability to upload entire documents. Members of the public were also invited to attend the public hearings in Simi Valley on February 18, 2017 and Van Nuys on February 21, 2017 to make comments orally or submit paper copies. DOE also accepted comments by U.S. mail. Regardless of the submission method, DOE considered all comments equally when developing this Final EIS.

Sent: Thursday, January 19, 2017 3:52 PM
To: Jennings, Stephanie
Subject: SSFL public comment request

Dear Ms. Jennings,

You are getting this email because there does not seem to be an email address for public comment regarding the Draft Environmental Impact Statement (EIS) for Santa Susana.

I would like to stress how important it is not only for me, but for the communities who live around the Santa Susana Field Laboratory, that the DOE follow through with the cleanup plan it agreed to in the 2010 AOC.

The problem is that this does not count as an official comment. I would like to request that the DOE create an official email address for the submission of public comments, and not just take comments submitted through the website and postal mail. This makes it seem like the DOE is deliberately trying to avoid public comment on the Draft EIS by not making it as easy as possible for the community to submit feedback.

I look forward to your response regarding this issue.

Thank you in advance,
Kiryl K.

6-1

6-1

DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

6-2

6-2

All comments received by DOE during the public comment period were considered as part of the revisions to the Draft EIS, irrespective of how DOE received the comment. This includes your comment. In response to comments about the website, early during the public comment period DOE expanded the capacity of the website to accept longer comments and added the ability to upload entire documents. Members of the public were also invited to attend the public hearings in Simi Valley on February 18, 2017 and Van Nuys on February 21, 2017 to make comments orally or submit paper copies. DOE also accepted comments by U.S. mail. Regardless of the submission method, DOE considered all comments, including this one, equally when developing this Final EIS.

Commenter No. 7: Garima

Sent: Tuesday, January 17, 2017 3:47 PM
To: Jennings, Stephanie
Subject: Public Comments

Dear Ms. Jennings,

My name is Garima and I feel highly about the lack of clean up in Santa Susanna. People are getting sick because the clean up that should have already been done by 2017 is not complete.

I believe that the DOE should continue the Administrative Order on Consent 2010 to complete the clean up of this site in order to protect the lives of those who live there.

I would also like to ask that you take public comments by email because the public should be allowed to easily comment on this issue facing the community and today, many people have access to emailing.

Thanks and have a great day,

|| 7-1
|| 7-2
|| 7-3

7-1 DOE acknowledges your concern about cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information. Please refer to Section 2.7, “Offsite Impacts,” and Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for a discussion of offsite contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

With respect to the timeliness of DOE’s completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup activities covered by this EIS can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record of Decision pursuant to NEPA. Additionally, in accordance with the CEQA, DTSC must complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DTSC will also need to approve DOE’s soil remediation, groundwater cleanup, and facility closure plans (see Section 1.5, “Next Steps,” of this CRD) before cleanup activities can start. DOE will work closely with DTSC to ensure initiation of cleanup starts as early as possible.

7-2 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information.

7-3 Thank you for the feedback on the Draft EIS. Considering public comments on the Draft EIS is an important step in the EIS process. DOE provided multiple means for public comment. Comments could have been submitted directly via the website. In response to comments about the website, early during the public comment period DOE expanded the capacity of the website to accept longer comments and added the ability to upload entire documents. Members of the public were also invited to attend the public hearings in Simi Valley on February 18, 2017 and Van Nuys on February 21, 2017 to make comments orally or submit paper copies. DOE also accepted comments by U.S. mail. Regardless of the submission method, DOE considered all comments equally when developing this Final EIS.

Commenter No. 8: Maria Caine

From: [REDACTED]
Sent: Wednesday, January 18, 2017 10:24 AM
To: Jennings, Stephanie
Subject: Public Comment Questions

Ms. Jennings,

I am writing to you because of my concerns regarding the Santa Susana Field Laboratory. I was relieved to hear in 2010 that the site would be cleaned up, and am deeply saddened to find out the Department of Energy is no longer planning to uphold the AOC.

It is my belief that the DOE should uphold this agreement, not only for the people who currently live near the site, but because of the precedent it will set for cleanup of other contaminated sites in our state and country. Do not allow the draft EIS to work as an excuse to break your promise. Please uphold the AOC and clean up the site as was promised almost seven years ago.

I would also like to add that formal comments to the EIS should be allowed through email. It is common nowadays for people to have email, and have access to emails via laptop, cellphone, and a great number of other devices. Emails, while more convenient than formal letter mail, should hold no less merit when it comes to public comments. I ask that you accept comments through emails for the sake of receiving comments from all interested parties and stakeholders.

Thank you so much for your time and your hard work regarding the SSFL.
Best,
Maria Caine

8-1

8-1

DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information, including information on the steps necessary prior to DOE making a decision on alternatives for cleanup of Area IV and the NBZ.

8-2

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD). The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at other DOE sites, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

8-2

Thank you for the feedback on the Draft EIS. Considering public comments on the Draft EIS is an important step in the EIS process. DOE provided multiple means for public comment. Comments could have been submitted directly via the website. In response to comments about the website, early during the public comment period DOE expanded the capacity of the website to accept longer comments and added the ability to upload entire documents. Members of the public were also invited to attend the public hearings in Simi Valley on February 18, 2017 and Van Nuys on February 21, 2017 to make comments orally or submit paper copies. DOE also accepted comments by U.S. mail. Regardless of the submission method, DOE considered all comments equally when developing this Final EIS.

To: Jennings, Stephanie
Subject: Request for Public Comment

Dear Stephanie Jennings,

I would like to issue a complaint about the public's ability to comment on the Draft EIS for Santa Susana. Failing to clean up the site to the standards of the 2010 AOC is not only breaching the agreement but directly threatening the safety of the public. When people realize that they are being endangered they should have the easy ability to comment on plans that will affect the public via email. Forcing them to struggle through a complicated webpage will mean losing comments which it seems to me is the goal of the DOE. It is the DOE's responsibility as a government entity to listen to the public and protect them.

Thank You,
Dallas

9-1

9-2

9-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," of this CRD. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). This latter use of a risk assessment approach for soil cleanup is consistent that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

Considering public comments on the Draft EIS is an important step in the EIS process. DOE provided multiple means for public comment. Comments could have been submitted directly via the website. Members of the public were also invited to attend the public hearings in Simi Valley on February 18, 2017 and Van Nuys on February 21, 2017 to make comments orally or submit paper copies. DOE also accepted comments by U.S. mail. Regardless of the submission method, DOE considered all comments equally when developing this Final EIS.

9-2 Thank you for the feedback on the Draft EIS. Considering public comments on the Draft EIS is an important step in the EIS process. DOE provided multiple means for public comment. Comments could have been submitted directly via the website. In response to comments about the website, early during the public comment period DOE expanded the capacity of the website to accept longer comments and added the ability to upload entire documents. Members of the public were also invited to attend the public hearings in Simi Valley on February 18, 2017 and Van Nuys on February 21, 2017 to make comments orally or submit paper copies. DOE also accepted comments by U.S. mail. Regardless of the submission method, DOE considered all comments equally when developing this Final EIS.

Commenter No. 10: Bradley Visacki

Subject: Public comments on EIS

To whom it may concern,

It has come to my attention that the *Draft SSFL Area IV EIS* has violated commitment by breaking the 2010 Clean-up Agreement in Santa Susana. I feel it utterly unnecessary and archaic that comments concerning the matter must be submitted directly to you via U.S. mail, but you will not allow us to submit them to you via email. This appears to be intended as an impediment to comment on an urgent matter. Please consider revising your public comment policy, and allow the public to email directly to you.

Regards,
Bradley Visacki

|| 10-1
|| 10-2

10-1 The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) This risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at other DOE sites, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

10-2 Thank you for the feedback on the Draft EIS. Considering public comments on the Draft EIS is an important step in the EIS process. DOE provided multiple means for public comment. Comments could have been submitted directly via the website. In response to comments about the website, early during the public comment period DOE expanded the capacity of the website to accept longer comments and added the ability to upload entire documents. Members of the public were also invited to attend the public hearings in Simi Valley on February 18, 2017 and Van Nuys on February 21, 2017 to make comments orally or submit paper copies. DOE also accepted comments by U.S. mail. Regardless of the submission method, DOE considered all comments equally when developing this Final EIS.

Subject: EIS Concerns

Hello Stephanie,

I am emailing you because I have been informed that according to your environmental impact statement (EIS), the radiation exposure at the Santa Susana field laboratory will not be cleaned up as promised. I have also noticed that the EIS does offer another alternative for cleaning up the pollution, however it does not meet the standards of the original clean up plan. This raises my concerns about the local communities around the area and their safety.

The public should also be allowed to make comments on this issue via email. This makes it easier for the public to input their opinion on what's going on in the community

Thank you for your time,
Gabe S.

11-1

11-1

DOE notes that you have been misinformed regarding the content of this EIS. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that would incorporate the technical elements (including for radioactive constituents) of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) It also evaluates two other cleanup alternatives. Under one, radioactive constituents would be cleaned up the same as under the 2010 AOC. The other alternative considers risk to human health and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

11-2

11-2

Subject: Comment System for EIS Draft

Ms. Jennings,

Will you accept email comments regarding the draft EIS that appears to break the cleanup agreement? It concerns me that the document states we can mail in comments to you at 4100 Guardian Street, Suite 160 in Simi Valley, CA 93063 at the U.S. Department of Energy, but no option is given to send in email responses. In today's age, many more citizens have access and available time to send an email over a written letter than must be sent with paid postage. If your department is seriously looking for feedback, the process of comment submission should be significantly more transparent.

I see a grave precedent set when a government seems to make it difficult to respond and comment on the status of an agreement that seems to be broken. It is my understanding that the DOE does not have any current plans or statements regarding legitimate intention to the cleanup of the SSFL area that was previously promised. It seems as though they no longer intend to cleanup as competently or as completely as previously promised in the Administrative Order on Consent established in 2010 and is honestly appalling that cleanup has yet to be even started.

Please return an answer ASAP so that my community has adequate time to review and comment on the DOE's retraction of their 2010 cleanup promise.

Sincerely,
A concerned citizen

To: Jennings, Stephanie
Subject: Re: Comment System for EIS Draft

Ms. Jennings,

I appreciate the response. It's my understanding with the oral comments that we are to only receive 3 minutes and there is no guarantee that persons who are interested in commenting in person will be given the time to due so since many people can appear to comment. I also noticed that the online comments on the website limit comments to a certain number of characters and even the submission of documents only allows a certain size. I do see that the attached document size has now been increased from 5MB to 25MB which is an improvement. However, it seems dismaying that public comment is still being requested in outdated methods that limit response pools.

I also was informed there was an email opened to the public for comment submission. This made me rather excited as I felt my comments were being heard. However, when I tried submitting an email to ssfl_doe_eis@emchc.doe.gov, all I received was a response saying the email was no longer active. Since I have reputable sources showing evidence of their successful submission, I am rather disappointed that this method of submission has been retracted and is no longer available to the public. It seems as a deliberate act on the authority of the DOE to limit the amount of comment submissions and to quell groups of concerned citizens as their main means of comment have now been closed. Will the DOE be reopening this email address? Does the DOE respond with a confirmation to submissions via physical mail? As of right now, physical mail seems to be the only way to send in uninhibited responses for comments despite not receiving confirmation on submission or receipt.

I appreciate your responses and it is good to hear from the agency in regards to their efforts to work in the public interests. Thank you for your time and I look forward to your response.

Joshua Osborne

12-1

12-1

Thank you for the feedback on the Draft EIS. Considering public comments on the Draft EIS is an important step in the EIS process. Multiple means of submitting comments were available. Comments could have been submitted directly via the website. In response to comments about the website, early during the public comment period DOE expanded the capacity of the website to accept longer comments and added the ability to upload entire documents. Members of the public were also invited to attend the public hearings in Simi Valley on February 18, 2017 and Van Nuys on February 21, 2017 to make comments orally or submit paper copies. DOE's time limit on oral comments at the public hearings was set to allow all stakeholders equal time to present their comments. DOE also accepted comments by U.S. mail, but DOE does not respond with a confirmation to submissions via U.S. mail. Regardless of the submission method, which included an older e-mail address discussed below, DOE considered all comments equally when developing this Final EIS.

12-2

12-1
cont'd

DOE apologizes for the confusion over the older email address. The email address was previously created for scoping comments, it was not intended for comments on the Draft EIS and DOE did not identify it as a means to submit such comments. The email address was discontinued when DOE realized stakeholders had begun to use it for comments on the Draft EIS. In order to better track comments, DOE had determined the website was the best method for electronic comments. Comments received at this older e-mail address before it was discontinued were considered equally with all other submitted comments.

12-1
cont'd

12-2

DOE remains committed to cleaning up Area IV and the NBZ in a manner that is protective of human health and the environment. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information, including information on the necessary steps prior to DOE making a decision on alternatives for cleanup of Area IV and the NBZ. Section 2.2 specifically addresses cleanup in accordance with the 2010 AOC.

**DRAFT ENVIRONMENTAL IMPACT STATEMENT FOR REMEDIATION OF AREA IV AND
THE NORTHERN BUFFER ZONE OF THE SANTA SUSANA FIELD LABORATORY**

PUBLIC HEARING COMMENT FORM

PLEASE PRINT LEGIBLY

Location: SSFL Date: 2-17-17

- ① I would like to see a overlay map of the Arch sites versus the contaminated areas slated for removal.
- ② I would like to see when the removal of the soils begin that the area is completed before moving on to another part of the site, because the animals need the space to inhabit w/out further disturbance.
- ③ I would like to see sample testing done during the excavation at depth of impact, for evaluation.

13-1

13-2

13-3

13-1 Archaeological location information is maintained as confidential in order to protect the integrity of archaeological sites, and is not available to the public. This information has been presented to you as one of the Native American consulting parties (e.g., the Santa Susana Field Laboratory Sacred Sites Council [SSFL Sacred Sites Council], an organization of Native Americans with historical ties to SSFL land). These consulting parties were required to sign a non-disclosure agreement with DOE before being given access to this information.

13-2 The cleanup would likely take place in stages, leaving some areas relatively intact while other areas are remediated. DOE acknowledges that despite best efforts, soil removal and other remediation activities may leave large areas severely disturbed during cleanup activities. To the extent feasible, restoration will begin as soon as practical as the remediation activities are finished. Furthermore, the proposed cleanup activities would be conducted in a manner that would minimize impacts to biological resources. See Chapter 6 of this EIS for a discussion of minimization measures and potential mitigations. Numerous measures to minimize impacts have been included to protect plant and wildlife species, including several measures aimed at minimizing the removal of existing vegetation during remediation. For example, as stated in minimization measure 5-2 (Sensitive habitats) steps would be taken to "Avoid and minimize disturbance to sensitive upland vegetation, including Ventura coastal sage scrub, dip slope grassland, sandstone outcrops, unburned northern mixed chaparral, sandstone outcrops/northern mixed chaparral, California walnut woodland, and riparian and coast live oak woodland and savanna." Measures associate with minimization measure 5-2 include: a) Design final project to avoid or minimize impacts to sensitive native habitats by reducing disturbance and b) Restore sensitive habitats that are temporarily disturbed as a result of project implementation to pre-project conditions as soon as possible to prevent net loss of habitat. Areas that cannot be restored within a short period of time (long-term impact) or are permanently impacted by project activities may require additional mitigations incorporated into the project design to compensate for temporary or permanent loss of sensitive habitats. Furthermore, revegetation of disturbed areas would be initiated the first fall after completion of final grading activities and before the winter rainfall season to minimize the need for watering and encourage early establishment of plants to reduce the potential for erosion associated with rain events.

13-3 As required in Section 2.12 of the 2010 AOC, confirmation sampling to demonstrate cleanup standards have been met will be performed at the bottoms and sides of the excavations.

Re: Draft Environmental Impact Statement (EIS) for cleanup of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory

I believe that the site should be cleaned up on a risk based standard that protects human health and protects the environment. Protecting the environment is important to long term human health and environmental sustainability.

Risk must be determined based on scientific studies, not anecdotal correlations. Most epidemiological studies have shown that there is minimal to no off-site risk from the SSFL site. On site risk is limited to certain area of the site and ground water pollution. These risks should be abated by logical and scientifically sound methods.

As tragic as the illness of a child or adult is, anecdotal conclusions that a particular illness is caused by a particular environment cause are of no scientific use except as a starting point for a scientific study to see if the correlation involves causation. In my opinion, such studies have so far failed to show causation between pollutants at the SSFL site and increased risk of cancers or other illnesses off site.

Public opinion also should not drive public health policy. The "many" are not always informed or qualified to make decisions on scientific issues. If a majority of people think that manmade climate change is not happening, that does not mean that it is not happening. Climate scientists, who are a small percentage of the total population are better able to make that conclusion. In the same way, epidemiologists, chemists, and public health professions are better at evaluating health risk than the general population.

In conclusion, I believe that the site should be cleaned up using balancing criteria that protects human health and takes into consideration what the end use of the site will be in that analysis. I also believe that it would be tragic to apply the most stringent cleanup standard and thereby destroy a rare open space setting in this city, a space that acts as a wildlife corridor while gaining no known health benefit. It would also be a tragedy to lose cultural resources through the destruction of archeological sites, many of which might not have been discovered to date. The dust released into the air, the pollutants from truck, the potential disruption of water shed, and other factors, might lead to an increased off site health risk.

I believe for a lot of people the "smoke detector effect" is illustrated by the belief that the site needs to be cleaned up to the most stringent standards possible. Smoke detectors often go off when there is no fire. Cleaning the site up to detect levels might be a similar over reaction, that will be more harmful than beneficial.

DOE acknowledges your support for a risk-based standard that protects human health and protects the environment. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

14-2

14-2

DOE's purpose in preparing this EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. DOE's evaluation of the potential human health impacts is based on established, scientifically accepted risk-assessment practices. Please refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

15-1
15-2

15-1 DOE acknowledges that there are chemical and radioactive constituents above background levels in parts of that portion of SSFL for which it is responsible, Area IV and the NBZ. See Chapter 3, Section 3.9, of this Final EIS for information on chemical and radioactive constituents in Area IV and the NBZ. DOE's purpose in preparing this EIS is to evaluate alternatives for completing cleanup of those portions of the site for which it is responsible. Please refer to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

15-2 DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

Section 3 - Public Comments and DOE Responses

Commenter No. 16: Joan C. Edwards

hearing Feb 21 Thu + Feb 18 Sat

WWW.SSFLAREAIV.EIS.COM

Energy Dept. Contaminated Hot Site - Melissa Simon
Building Cleanup Action Jan 26, 2017 by

Please include comments

Draft EIS released Jan 6, 2017

1. Demolish 18 structures in Area IV
2. Remediate contaminated soil
 - remove, provide dust prevention, & chemical fixative
 - advertise routes for removal
 - let public know entire route, from clean-up site to the disposal repository site.
 - let public know the level of radioactivity contained: ex. low-level, high-level
3. Remediate the groundwater.
 - latest technology for treating groundwater as it will continue to seep ^{plumes} into the soil
 - testing wells will not suffice.

DOE should be responsible for the entire cleanup. Boeing bought the Rocketdyne Site, & probably had no idea ~~that~~ of the N-meltdown in the 1950s.

- SSFL must be returned to safe background standards. All detectable contamination needs to be eliminated now.

Ms. Joan C. Edwards

16-1

DOE acknowledges your support for demolishing the 18 DOE structures in Area IV, an activity that would be accomplished under the Building Removal Alternative. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

16-2

DOE acknowledges your concern about SSFL remediation. Please see the response to comment 16-1. During remediation, DOE will employ best management practices. For example, best management practices include water sprays and chemical fixatives to minimize the generation of dust. DOE will also be operating an air monitoring network to detect whether adequate control of dust is being maintained. (DOE, NASA, and Boeing each implemented their respective baseline air monitoring programs in early 2018 for their areas of responsibility at SSFL. For DOE the program includes a meteorological station within Area IV and four air monitors along the perimeter of Area IV (as described in NASA/Boeing/DOE 2017[.]) Regarding transportation routes, please refer to Chapter 3, Sections 3.8.2 and 3.8.3, which show the entire transportation routes from SSFL to the evaluated disposal facilities. Because much of the radioactive contamination at Area IV was previously remediated, soil removed under any of the action alternatives would contain low levels of radioactive material. All radioactive waste from cleanup activities would be transported to licensed offsite disposal facilities in compliance with U.S. Department of Transportation requirements.

16-3

DOE acknowledges your concern about the use of the latest technology for treating groundwater. DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. The alternatives include those for remediating contaminated groundwater. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

16-4

As discussed in Chapter 1, Section 1.3, of this EIS, there are multiple parties with responsibilities at SSFL. This EIS is evaluating the potential environmental impacts associated with remediation of that portion of SSFL for which DOE has cleanup responsibility, that is, Area IV, the location of DOE's Energy Technology Engineering Center, and the NBZ. The Sodium Reactor Experiment, site of the 1959 accident, was located at the Energy Technology Engineering Center. The reactor accident was known and information was readily available in 1996 when Boeing purchased the Rockwell International Corporation interests at SSFL. NASA and Boeing are responsible for remediating portions of SSFL that historically were used for non-DOE activities.

16-5

NASA is responsible for cleanup of Area II, a portion of Area I, and portions of the NBZ impacted by its operations. Boeing is responsible for cleanup of Areas I and III and for demolition of 4 buildings in Area IV that it owns.

Commenter No. 16 (cont'd): Joan C. Edwards

- 16-5 DOE acknowledges your concern about remediation of SSFL in a manner that returns the site to safe background standards with the elimination of all detectable contamination. DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Following the soil removal actions, all action alternatives evaluated in this EIS would leave soil with contaminant levels protective of human health and the environment based on a future open space land use. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

RE: Santa Susana Field Laboratory (SSFL) Area IV and Northern Buffer Zone DEIS

Dear Ms. Jennings:

I am the Tribal Chairman of the Fernandeño Tataviam Band of Mission Indians (FTB). I thank you and DOE for the opportunity to provide comments on the DOE Draft EIS. DOE is covered by Executive Order 13175 as reaffirmed by that Presidential Memorandum on Tribal Coordination dated November 5, 2009 that reaffirmed [Executive Order 13175](#), "Consultation and Coordination with Indian Tribal Governments," and emphasized the importance of strengthening government-to-government relationships with Native American tribes.

In addition, DOE is an original signatory to that MOU REGARDING INTERAGENCY COORDINATION AND COLLABORATION FOR THE PROTECTION OF INDIAN SACRED SITES (2012) and the **Action Plan to Implement the Memorandum of Understanding (MOU) Regarding Interagency Coordination and Collaboration for the Protection of Indian Sacred Sites dated March 5, 2013**. I believe the MOU and Action Plan should be applied to the SSFL site to engage DOE and Interior as signers to the MOU and the National Park Service as part of Interior. I hereby requests that DTSC be added as a Non-federal Partner under Section IV(9).

REQUEST FOR EXTENSION OF TIME TO COMMENT: I am informed that others have requested an additional thirty (30) days to comment and I make the same request.

Subject to my right to supplement, add to and modify them, I make the following DEIS comments:

1019 Second Street, San Fernando, California 91340
(818) 837-0794 | FAX (818) 837-0796 | www.tataviam-nsn.us

17-1

17-2

- 17-1 Indian sacred sites Traditional cultural resources are described in Chapter 3, Section 3.11, Appendix B, and Appendix F of the Final EIS. Note that the MOU referenced in the comment expired on December 31, 2017. DOE will continue to consult with the Santa Ynez Band of Chumash Indians on a government-to-government basis on an account of this Tribe's status as a federally recognized Tribe. Regarding the role of the Department of the Interior, National Park Service, DOE invited the NPS to participate in the Section 106 consultation for this undertaking, and the NPS is participating as a consulting party. Regarding the role of DTSC, DOE invited DTSC to participate in the Section 106 consultation for this undertaking, including participating in the development of the NHPA Section 106 Programmatic Agreement. DTSC declined to participate. Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for information regarding the process that will be used to determine exemptions.
- 17-2 The 60-day public comment period began on January 13, 2017 and was scheduled to end on March 14, 2017. In response to requests from stakeholders on March 7, 2017, the public comment period was extended to April 13, 2017.

**Commenter No. 17 (cont'd): Rudy Ortega, Tribal President,
Fernandeño Tataviam Band of Mission Indians**

FTB Comments – March 2 2017: 2

**(1) The EIS Must Address Cultural Resources (copied from
<http://www.npi.org/NEPA/impact>)**

Cultural resources are referred to in different ways at different points in the CEQ regulations. The regulatory definition of the term “human environment” at 40 CFR 1508.14 – impacts on the quality of the human environment being the subjects of any EIS – includes “the natural and physical environment and the relationship of people with that environment.” The definition of “effects” at 40 CFR 1508.8 – as in “effects on the quality of the human environment” – includes changes in the human environment that are “aesthetic, historic, cultural, economic, (or) social.”

The regulatory definition of the word “significantly” at 40 CFR 1508.27 – as in “major federal action significantly affecting the quality of the human environment” – includes as measures of impact intensity:

- Impacts on an area’s unique characteristics, such as “historic or cultural resources, park lands, prime farmlands, wetlands, wild and scenic rivers, and ecologically critical areas” (40 CFR 1508.27(b)(3)).
- Impacts on “districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register of Historic Places” and on “significant scientific, cultural, or historical resources” (40 CFR 1508.27(b)(8)).

Clearly, impacts on cultural resources are to be addressed in an EIS. Note that it is not just impacts on historic properties that should be addressed. The regulations use “historic” and “cultural” in parallel, not as synonyms.

**(2) Record of Decision Must Mitigate any Impacts to Cultural Resources (copied from
<http://www.npi.org/NEPA/impact>)**

Once the EIS analysis has resulted in a draft environmental impact statement (DEIS), it is subjected to public and agency review, and comments are addressed – this may require further analysis. Then, assuming the project has not been abandoned, or so changed that a supplemental DEIS is needed, a final EIS (FEIS) is prepared and published. The FEIS is considered in making the agency’s decision about whether and how to proceed with the action that was the subject of the EIS. This decision is recorded in a Record of Decision (ROD). According to 40 CFR 1505.2, the ROD must:

- State what the decision was.
- Identify all alternatives considered.
- Specify the alternative or alternatives considered to be “environmentally preferable.” (Note that the agency does not have to select the environmentally preferable alternative, but it does have to discuss what it is.)
- Identify and discuss the factors balanced in making the decision (whether for or against the environmentally preferable alternative).
- State whether “all practicable means to avoid or minimize environmental harm . . . have

17-3

17-3

As described in Chapter 3, Section 3.11.1, of this EIS, DOE defines cultural resources for the purposes of impact analysis broadly to encompass definitions of cultural resources in NEPA and the CEQ NEPA implementing regulations (see Chapter 3, Section 3.11.1, including the text box titled “Types of Cultural Resources”). Impacts on this broadly defined category of resources are addressed in Chapter 4, Section 4.11, of this EIS. Proposed methods to avoid, minimize, or mitigate impacts are described in Chapter 6, Sections 6.1 and 6.2.

17-4

17-4

As required by CEQ’s and DOE’s NEPA implementing regulations, DOE will describe the proposed alternatives, announce its decisions, and discuss any adverse impacts and mitigating actions in the Record of Decision for this Final EIS. The Record of Decision will also discuss the Section 106 Programmatic Agreement being developed in consultation with the California SHPO, the Santa Ynez Band of Chumash Indians, other tribes, and other consulting parties.

Commenter No. 17 (cont'd): Rudy Ortega, Tribal President, Fernandeño Tataviam Band of Mission Indians

FTB Comments – March 2 2017: 3

been adopted, and if not, why they were not.”

Having notified the world of its decision, the agency implements it. In doing so, it must carry out any mitigation, i.e., “means to avoid or minimize environmental harm,” it has said in the ROD or EIS that it will carry out (40 CFR 1505.3).

(3) Deferral of Mitigation does not Comply with NEPA (copied from <http://www.npi.org/NEPA/impact>)

Deferral. With respect to historic properties, a very common problem is “deferral,” in which the agency:

- Acknowledges that it does not know much about what effects there may be on historic properties (often because such properties have not yet been identified); but
- Says that whatever effects there may be, [NHPA Section 106 review](#) (of the National Historic Preservation Act), to be performed later, will take care of them; and
- Concludes that therefore, whatever alternative is decided on, impacts on historic properties will not be a problem.

Considering environmental impacts *after* a decision has been made defeats NEPA’s purpose of considering impacts in *preparing* to make decisions. It also almost guarantees last-minute conflicts between project implementation and historic preservation.

Failure to consider things that are not historic properties. With respect to other kinds of cultural resources, a common problem is that they are not considered at all. Historic properties, or even more narrowly, archeological sites, are sometimes the only things discussed in the “[cultural resource](#)” part of an EIS. If social impacts are considered, they are often considered only terms of easily quantifiable socioeconomic variables like population, employment, and use of public services. The result is that impacts on many classes of cultural resource simply are not identified or considered in deciding whether significant impacts may occur.

(4) Significant Negative Unmitigated Impacts to Sacred Sites and Cultural Resources by Soil Cleanup to Background:

Indian Sacred Site and Traditional Cultural Property: The Santa Ynez Band of Chumash Indians (Chumash Tribe) has already designated all of the NASA administered property as a sacred site under E.O. 13007. The Chumash Tribe has also made a similar EO 13007 designation for the areas leased to DOE.

Archeological Resources: The proposed cleanup of the Burro Flats site (CA-VEN-1072); could result in *significant, negative, local, and long-term* impacts to the site and would constitute an *adverse effect* under Section 106. The proposed cleanup of newly discovered and previously

17-4
cont'd

17-5

17-6

17-7

17-5 DOE has analyzed potential environmental impacts to cultural resources in this Final EIS. As described in Chapter 3, Section 3.11.2.3, and Appendix F, Section F.2, of this EIS, Area IV and the NBZ have been intensively surveyed for cultural resources with the intention of identifying cultural resources that may be impacted by the cleanup efforts. Potential impacts of the proposed alternatives are described in Chapter 4, Section 4.11, under each alternative, and summarized in Section 4.11.4. Proposed methods to avoid, minimize, or mitigate impacts are described in Chapter 6, Sections 6.1 and 6.2.

17-6 See response to comment 17-4 above.

17-7 Chapter 3, Section 3.11.2.3.4, Appendix B, and Appendix F of this Final EIS describes traditional cultural resources within the APE, including Indian sacred sites and traditional cultural properties. Measures provided in Chapter 6, Sections 6.1 and 6.2, and being developed through the NHPA Section 106 Programmatic Agreement, present DOE’s approach for addressing adverse effects on traditional cultural resources.

Site CA-VEN-1072 is a large, NRHP-eligible archaeological site with numerous components spread over a large area. Although DOE understands that sites can extend for long distances and may be related to each other, CA-VEN-1072 and its features, as defined in site records, appears to lie completely within Area II (La Monk 1953, Grant 1965; Knight 2001; see also Appendix F); which is outside of DOE’s area of responsibility. However, DOE acknowledges that NASA is developing a proposal for an NRHP-eligible Burro Flats Archaeological District to the California SHPO that includes several archaeological sites within DOE’s APE in Area IV, and the Santa Ynez Band of Chumash Indians is developing a proposal for an NRHP-eligible Simi Hills Archaeological District that includes all the recorded archaeological sites in DOE’s APE (including CA-VEN-1803). The NHPA Section 106 Programmatic Agreement (being developed by DOE in consultation with the California SHPO, the Santa Ynez Band of Chumash Indians, other tribes, and other consulting parties) will establish procedures for addressing adverse effects on historic properties, including any archaeological districts that are determined eligible for the NRHP.

See response to comment 17-2 above regarding efforts made to identify and evaluate cultural resources within the APE, including extended Phase I testing. The NHPA Section 106 Programmatic will establish procedures for making eligibility determinations on unevaluated sites, as needed, and inadvertent discoveries, along with procedures to assess effects and resolve adverse effects if they are determined eligible for the NRHP.

**Commenter No. 17 (cont'd): Rudy Ortega, Tribal President,
Fernandeño Tataviam Band of Mission Indians**

FTB Comments – March 2 2017: 4

undiscovered archeological sites found to be NRHP-eligible could be a *significant, negative, local, and long-term* impact on archeological resources, thus resulting in a finding of *adverse effect* under Section 106.

Deferral of eligibility determination: A determination of eligibility all newly discovered archeological sites in consultation with the SHPO and the federally recognized tribes, needs to be completed before cleanup begin if any site is going to be affected by soil cleanup activities.

Deferral of boundary research as to VEN-1072 and VEN-1803: Additional boundary research on Area IV is required to conclude that any avoidance of excavation within the boundaries of Burro Flats (CA-VEN-1072) would diminish or eliminate adverse impacts to known archeological sites and reduce the impacts to *negligible, negative, local, and long term* and could result in a finding of *no adverse effect* under Section 106.

Deferral of additional testing as to unknown archaeological deposits: Additional subsurface testing is required to conclude that reducing the amount of excavation on newly discovered archeological deposits (commonly referred to as “inadvertent or accidental discoveries”) could minimize the impact if the newly identified sites were avoided, thus reducing the impacts to *minor, negative, local, and long-term* impacts from excavation.

(5) Failure to Address Executive Order 13007

On March 5, 2014, the Santa Ynez Band of Chumash Indians, a federally recognized tribe (“Chumash Tribe”), designated the DOE portion of the SSFL as an Indian sacred site pursuant to Executive Order 13007. This Indian sacred site also includes the former Rocketdyne and now Boeing portion of SSFL and the Chumash Tribe is open to discussing the exact boundaries at a later date.

E.O. 13007 requires Federal land managing agencies to accommodate access to and ceremonial use of Indian sacred sites by Indian religious practitioners and to avoid adversely affecting the physical integrity of such sacred sites. It also requires agencies to develop procedures for reasonable notification of proposed actions or land management policies that may restrict access to or ceremonial use of, or adversely affect, sacred sites.

Sacred sites are defined in the executive order as “any specific, discrete, narrowly delineated location on Federal land that is identified by an Indian tribe, or Indian individual determined to be an appropriately authoritative representative of an Indian religion, as sacred by virtue of its established religious significance to, or ceremonial use by, an Indian religion; provided that the tribe or appropriately authoritative representative of an Indian religion has informed the agency of the existence of such a site.” There is no review of such determinations by a Federal agency.

It is important to note that a sacred site may not meet the National Register criteria for a historic property and that, conversely, a historic property may not meet the criteria for a sacred site. However, in those instances where an undertaking may affect a historic property that is also considered by an Indian tribe to be a sacred site, the Federal agency should, in the course of the Section 106 review process, consider accommodation of access to and ceremonial use of the property and avoidance of adverse physical effects in accordance with E.O. 13007.

17-7
cont'd

17-8

17-8

As discussed in Chapter 3, Section 3.11.2.3.4 of this Final EIS, the Santa Ynez Band of Chumash Indians filed paperwork nominating the entire SSFL to be included in the *State of California Native American Heritage Commission Sacred Lands Inventory* (NAHC 2014), and also notified DOE of its identification of a portion of SSFL as an Indian sacred site for consideration consistent with Executive Order 13007, *Indian Sacred Sites*. While DOE does not own property at Area IV or the NBZ, DOE is working with the Native American tribes with ties to the SSFL area to preserve the cultural resources and the sacred nature of Area IV and the NBZ.

**Commenter No. 17 (cont'd): Rudy Ortega, Tribal President,
Fernandeño Tataviam Band of Mission Indians**

FTB Comments – March 2 2017: 5

The Advisory Council on Historic Preservation (ACHP) has explained “**The Relationship Between Executive Order 13007 Regarding Indian Sacred Sites and Section 106,**” <http://www.achp.gov/eo13007-106.html>

To the extent that the requirements of the executive order and ACHP’s regulations are similar, Federal agencies can use the Section 106 review process to ensure that the requirements of E.O. 13007 are fulfilled. For example, E.O. 13007 requires that agencies contact Indian tribes regarding effects and the Section 106 regulations require consultation with Indian tribes to identify and resolve adverse effects to historic properties.

Consultation regarding the identification and evaluation of historic properties of religious and cultural significance to an Indian tribe could include identification of those properties that are also sacred sites. Similarly, consultation to address adverse effects to such historic properties/sacred sites could include discussions regarding access and ceremonial use.

(6) Failure to address the DOE Site is a Traditional Cultural Property (TCP) eligible for protection on the National Register:

National Register Bulletin No. 38 (hereinafter referred to as “NPS Bull. No. 38”), Guidelines for evaluating and Documenting Traditional Cultural Properties (1990; revised 1992; 1998) under NHPA <http://www.nps.gov/nr/publications/bulletins/pdfs/nrb38.pdf>

A Locations for traditional ceremonies are defined as a TCP: NPS Bull No. 38, p. 1, provides:

The traditional cultural significance of a historic property, then, is significance derived from the role the property plays in a community’s historically rooted beliefs, customs, and practices. Examples of properties possessing such significance include: ***

- a location where Native American religious practitioners have historically gone, and are known or thought to go today, to perform ceremonial activities in accordance with traditional cultural rules of practice;

B Mountain tops and rock outcroppings like at SSFL are TCP’s: NPS Bull. No. 38, p. 2, provides:

Traditional cultural properties are often hard to recognize. A traditional ceremonial location may look like merely a mountaintop, a lake, or a stretch of river; a culturally important neighborhood may look like any other aggregation of houses, and an area where culturally important economic or artistic activities have been carried out may look like any other building, field of grass, or piece of forest in the area. As a result, such places may not necessarily come to light through the conduct of archeological, historical, or architectural surveys. The existence and significance of such locations often can be ascertained only through interviews with knowledgeable users of the area, or through other forms of ethnographic research.

C DOE must engage specialists as part of its TCP study: NPS Bull. No. 38, p. 10, provides:

17-8
cont'd

17-9

17-9

As discussed in Chapter 3, Section 3.11.2.3.4 of this Final EIS, DOE acknowledges that the Santa Ynez Band of Chumash Indians has identified the entire SSFL as a Native American sacred site (referred to as the Santa Susana Sacred Sites and Traditional Cultural Property). The Final EIS also acknowledges that additional efforts by NASA, the Santa Ynez Band of Chumash Indians, other tribes, and others may result in the designation of one or more NRHP-eligible traditional cultural properties that overlap with the APE. Measures provided in Chapter 6, Sections 6.1 and 6.2, and being developed through the NHPA Section 106 Programmatic Agreement, present DOE’s approach for addressing adverse effects on traditional cultural properties.

**Commenter No. 17 (cont'd): Rudy Ortega, Tribal President,
Fernandeño Tataviam Band of Mission Indians**

FTB Comments – March 2 2017: 6

In general, the only reasonably reliable way to resolve conflict among sources is to review a wide enough range of documentary data, and to interview a wide enough range of authorities to minimize the likelihood either of inadvertent bias or of being deliberately misled. Authorities consulted in most cases should include both knowledgeable parties within the group that may attribute cultural value to a property and appropriate specialists in ethnography, sociology, history, and other relevant disciplines.⁷

D Specific events like the Solstice ceremony at SSFL qualify as TCP: NPS Bull. No. 38, p. 11, provides:

For example, the National Register defines a “site” as “the location of a significant event, a prehistoric or historic occupation or activity, or a building or structure, whether standing, ruined, or vanished, where the location itself possesses historic, cultural, or archeological value regardless of the value of any existing structure.”⁹ Thus a property may be defined as a “site” as long as it was the location of a significant event or activity, regardless of whether the event or activity left any evidence of its occurrence.

A culturally significant natural landscape may be classified as a site, as may the specific location where significant traditional events, activities, or cultural observances have taken place. A natural object such as a tree or a rock outcrop may be an eligible object if it is associated with a significant tradition or use. A concentration, linkage, or continuity of such sites or objects, or of structures comprising a culturally significant entity, may be classified as a district.

E Native American ceremonies qualify as TCP: NPS Bull. No. 38, p.15, provides:

National Register guidelines stress the fact that properties can be listed in or determined eligible for the Register for their association with religious history, or with persons significant in religion, if such significance has “scholarly, secular recognition.”¹³ The integral relationship among traditional Native American culture, history, and religion is widely recognized in secular scholarship.¹⁴ Studies leading to the nomination of traditional cultural properties to the Register should have among their purposes the application of secular scholarship to the association of particular properties with broad patterns of traditional history and culture. The fact that traditional history and culture may be discussed in religious terms does not make it less historical or less significant to culture, nor does it make properties associated with traditional history and culture ineligible for inclusion in the National Register.

F Lack of use does not make a property TCP ineligible: NPS Bull. No. 38, p. 18, provides:

The fact that a property may have gone unused for a lengthy period of time, with use beginning again only recently, does not make the property ineligible for the Register. For example, assume that the Indian tribe referred to above used the mountain peak in prehistory for communication with the supernatural, but was forced to abandon such use when it was confined to a distant reservation, or when its members were converted to Christianity. Assume further that a revitalization of traditional religion has begun in the last decade, and as a result the peak is again being used for vision quests similar to those carried out there in prehistory. The fact that the contemporary use of the peak has little continuous time depth does not make the peak ineligible; the peak’s association with the traditional activity reflected in its contemporary use is

**Commenter No. 17 (cont'd): Rudy Ortega, Tribal President,
Fernandeño Tataviam Band of Mission Indians**

FTB Comments – March 2 2017: 7

what must be considered in determining eligibility.

(7) Traditional Cultural Landscapes must also be included in Section 106 consultations and the EIS

Traditional cultural landscapes, because they are often a property type such as a district or site, are identified in the same manner in the Section 106 process as other types of historic properties of religious and cultural significance to Indian tribes or Native Hawaiian organizations. The regulations at 36 CFR Section 800.4 outline several steps a federal agency must take to identify historic properties. In summary, to determine the scope of identification efforts, a federal agency, in consultation with the State Historic Preservation Officers (SHPO)/Tribal Historic Preservation Officer (THPO), must:

1. Determine and document the area of potential effect for its undertaking;
2. Review existing information; and,
3. Seek information from consulting parties including Indian tribes or Native Hawaiian organizations.

Based on the information gathered through these efforts, the federal agency, in consultation with the SHPO and any Indian tribe or Native Hawaiian organization that attaches religious and cultural significance to historic properties that may be affected by the undertaking, develops and implements a strategy to identify historic properties within the area of potential effects. Identification efforts may include background research, oral history interviews, scientific analysis, and field investigations. <http://www.achp.gov/natl-qa.pdf>

There is no single defining feature or set of features that comprise a traditional cultural landscape. Such places could be comprised of natural features such as mountains, caves, plateaus, and outcroppings; water courses and bodies such as rivers, streams, lakes, bays, and inlets; views and view sheds from them, including the overlook or similar locations ; vegetation that contributes to its significance; and, manmade features including archaeological sites; buildings and structures; circulation features such as trails; land use patterns; evidence of cultural traditions, such as petroglyphs and evidence of burial practices; and markers or monuments, such as cairns, sleeping circles, and geoglyphs. <http://www.achp.gov/natl-qa.pdf>

Based on such research, the ACHP TRADITIONAL CULTURAL LANDSCAPES ACTION PLAN advises as follows:

The ACHP, as the agency with responsibility for overseeing the Section 106 review process, and DOI, through the National Park Service (NPS), as the agency with responsibility for overseeing the National Register of Historic places, should provide leadership in addressing Native American cultural landscapes in the national historic preservation program. Together, the ACHP and NPS should:

--Promote the recognition and protection of Native American traditional cultural landscapes both within the federal government and the historic preservation community as well as at the state and local levels, and,

17-10

17-10

DOE has not been provided information relating to any specific, stand-alone traditional cultural landscapes on DOE's portion of SSFL. However, Chapter 4, Section 4.11 of this Final EIS describes how soil remediation would result in changes to the setting and general landscape (e.g, topography, soil color, vegetation) associated with traditional cultural resources at Area IV and the NBZ. DOE will continue to consult with the Santa Ynez Band of Chumash Indians on a government-to-government basis to consider their interests and concerns about the proposed cleanup.

**Commenter No. 17 (cont'd): Rudy Ortega, Tribal President,
Fernandeño Tataviam Band of Mission Indians**

FTB Comments – March 2 2017: 8

--Address the challenges of the consideration of these historic properties in the Section 106 review process as well as in NEPA reviews. <http://www.achp.gov/pdfs/native-american-traditional-cultural-landscapes-action-plan-11-23-2011.pdf>

(8) U.N. Declaration on the Rights of Indigenous Peoples must now be followed after December 2010

In December 2010, the United States announced support for the **United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP)**. In announcing this support, President Obama stated: "The aspirations it affirms—including the respect for the institutions and rich cultures of Native peoples—are one we must always seek to fulfill...[W]hat matters far more than any resolution or declaration – are actions to match those words." The UNDRIP addresses indigenous peoples' rights to maintain culture and traditions (Article 11); and religious traditions, customs, and ceremonies (Article 12); to participate in decision making in matters which would affect their rights (Article 18); and to maintain spiritual connections to traditionally owned lands (Article 25).

The ACHP will now incorporate UNDRIP in the Section 106 review process:

While the Advisory Council on Historic Preservation's (ACHP) work already largely supports the United Nations Declaration on the Rights of Indigenous Peoples, additional and deliberate actions will be taken to more overtly support the Declaration. The Section 106 review process provides Indian tribes and Native Hawaiian organizations (NHOs) with a very important opportunity to influence federal decision making when properties of religious and cultural significance may be threatened by proposed federal actions. While federal agencies are required to consult with Indian tribes and NHOs and to take their comments into account in making decisions in the Section 106 review process, adding the principles of the Declaration to that consideration may assist federal agencies in making decisions that result in the protection of historic properties of religious and cultural significance to Indian tribes and NHOs. <http://www.achp.gov/docs/UN%20Declaration%20Plan%203-21-13.pdf>

(9) Official recognition in the EIS need to be made of the areas surrounding Burro Flats

While the Southern half of Area II contains the pictographs and additional 16 sites, Area IV of SSFL needs additional investigation, including, without limitation:

- a Geography—this areas contains numerous flat areas that would be suitable camp sites;
- b Areas of food—this areas contains forests and riparian areas that could be utilized in the gathering of food;
- c Support for ceremonial area in the Southern half of Area IV—It is not inconceivable that the Northern half of the SSFL site provided support for the ceremonies in the Southern half of SSFL;
- d Separate areas for different tribes—if SSFL was an inter-tribal gathering place, then each tribe would have congregated separately in different parts of the site.

(10) Subsurface testing is required.

17-10
cont'd

17-11

17-12

17-13

17-11 Thank you for bringing this to DOE's attention. DOE will continue to consult with the Santa Ynez Band of Chumash Indians on a government-to-government basis, as well as with other tribes with a demonstrated interest in the undertaking, regarding their interests and concerns about the proposed cleanup.

17-12 See response to comment 17-2 above regarding efforts made to identify cultural resources within the APE. In particular, Chapter 3, Section 3.11.2.3.2 of this Final EIS describes the Burro Flats Painted Cave site complex, and acknowledges that NASA is developing a proposal for an NRHP-eligible Burro Flats Archaeological District to the California SHPO that includes several archaeological sites within DOE's APE in Area IV. The NHPA Section 106 Programmatic Agreement (being developed by DOE in consultation with the California SHPO, the Santa Ynez Band of Chumash Indians, other tribes, and other consulting parties) will establish procedures for addressing adverse effects on historic properties, including the Burro Flats Archaeological District if it is determined eligible for the NRHP.

17-13 As described in Chapter 3, Section 3.11.2.3.2 and Appendix F, Section F.2.3, of this Final EIS, DOE developed and implemented an extended phase 1 testing program to evaluate the NRHP eligibility of 10 archaeological sites in the APE. The 10 sites were chosen based on: (1) the extent of the contamination known at the time the testing program was designed; (2) sites where NRHP eligibility was unclear; and (3) consultation with Native American representatives. This program of limited subsurface excavation was developed in consultation with SHPO and EIS cooperating agencies, including the federally recognized Santa Ynez Band of Chumash Indians, as well as non-federally recognized tribes. Additionally, the NHPA Section 106 Programmatic Agreement (being developed by DOE in consultation with the California SHPO, the Santa Ynez Band of Chumash Indians, other tribes, and other consulting parties) will include procedures for the development of a monitoring plan and an inadvertent discovery plan that spells out steps to follow if cleanup activities inadvertently encounter archaeological resources, human remains, or burial-related artifacts.

**Commenter No. 17 (cont'd): Rudy Ortega, Tribal President,
Fernandeño Tataviam Band of Mission Indians**

FTB Comments – March 2 2017: 9

Pedestrian surveys are of limited utility and never alone are sufficient when there are known areas of habitation or ceremony. We are informed that DOE has recently completed a Phase I Pedestrian Survey of the site. While such Phase I is an excellent first step, we request additional subsurface archaeological testing for all areas scheduled for any excavation.

If the project is in a region where there are many sites, there may be reason to suspect that buried sites may be present that went undetected during the survey. If the soils profile of the project location shows that heavy erosion has washed away soils then it may explain the absence of cultural resources. However, if the soils profile is depositional then there may be a need to conduct additional subsurface testing, particularly in areas where ground disturbance is planned. In archaeological terminology, this is referred to as "Extended Phase I" testing because it is an intermediate step between Phase 1 (survey), and Phase 2 (controlled excavation to assess the significance of a site). Extended Phase I testing often done by excavating a small pit with a shovel and screening the excavated soil through steel mesh ("shovel test pit" or "STP"). If it is considered to be necessary that a large amount of soil should be examined at deeper levels, then backhoes are sometimes used and informal sampling procedures are often employed while screening the backdirt.

Sometimes the lead agency will argue that archaeological survey is not warranted for a particular project or there may be factors that justify additional investigation even though a Phase I study has been completed with negative results. Following is a list of environmental and cultural factors that should be considered when assessing the overall cultural sensitivity of the SSFL. (Please note that this list is not exhaustive and each factor must be weighted both individually and collectively on a case-by-case basis.)

- a. Areas with high viewshed or visibility such as or ridgelines, peaks, ledges, outcrops, benches, or prominent hills; and
- b. Areas with a relatively high density of sites in the vicinity; and
- c. Areas where past ethnographic studies have revealed associated placenames. Keep in mind that placenames do not always refer to places where evidence of past cultural activity exists; and
- d. Areas near known sites. Mapped boundaries of sites most frequently reflect only cultural residue that was visible on the surface when the site was recorded and do not necessarily reflect the actual extent of the site. In addition, loci such as cemeteries or other areas may be adjacent to or nearby but separate from the main habitation; and
- e. Areas near known rock art sites or rocky outcroppings of the type where rock shelters and art have traditionally been located; and
- f. Areas in or near known gathering areas; and
- g. Though all sites are potentially worthy of protection, named, ethnohistorically documented village sites are of the highest priority and therefore warrant the greatest amount of protection

Fernandeño Tataviam Band of Mission Indians**

FTB Comments – March 2 2017: 10

possible.

(11) Exhaustion of Non-Excavation Methods of remediation.

To the extent feasible, DOE should exhaust all non-excavation methods of remediation before performing any excavation that could potentially impact cultural and historic sites.

(12) Soil Prior disturbance is NOT Dispositive:

The mantra that cultural sites have been disturbed and therefore automatically are not significant is oftentimes incorrect:

- a. Disturbed sites still may contain valuable information. The newer approach is to treat disturbed sites as having the potential to provide information even if they have been disturbed;
- b. Disturbed sites still have spiritual significance;
- c. Disturbance may only be on the surface, while much excavation may continue to depths of up to 20 feet.

(13) Need to Analyze Cumulative Impacts to Cultural Resources:

The EIS must account for other remediation projects in other areas of SSFL:

- a. Need to add NASA cultural sites;
- b. Need to add Boeing cultural sites;
- c. Other areas within SSFL.

(14) NEW MITIGATION: Cultural Interpretive Center:

- a. Can use existing building;
- b. Preferably near saved historic structure and/or test stand;
- c. Preferably away from CA-VEN-1072;
- d. Need to reserve operation and maintenance funds.

(15) NEW MITIGATION: Native American monitoring during any ground disturbing activities.

(16) Need to protect CA-VEN-1072 from trespassers and vandals.

(17) Deferral of Mitigation until Record of Decision (ROD):

- a. It is problematic to defer any mitigation until ROD as it prevents meaningful comment;
- b. Commenter reserves the right to ask for recirculation of the DEIS and EIS for any such deferred mitigation.

17-14

17-15

17-16

17-17

17-18

17-19

17-5
cont'd

17-14 To the extent possible and in accordance with the Native Americans artifact exemption in the 2010 AOC and the NHPA Section 106 Programmatic Agreement being developed by DOE with consulting parties, DOE prefers to avoid soil removal where cultural resources are known and present.

17-15 DOE is aware that disturbance does not necessarily mean that a cultural resource is no longer significant in terms of the information it provides or its spiritual significance. For example, DOE conducted extended Phase I testing on a site that was disturbed by looters in the past. This site, VEN-1775, was first recorded in 2001 (W&S Consultants 2001), when the investigators concluded that 75 percent or more of the site had been removed, seriously compromising the site's integrity. However, following DOE's extended Phase I testing, researchers determined that this site retained enough integrity to be considered eligible for listing on the NRHP.

17-16 Chapter 5, Section 5.5.11, of this Final EIS analyzes cumulative impacts to cultural resources, as required by NEPA. As discussed in Sections 5.5.11.1, 5.5.11.2, and 5.5.11.3, impacts to archaeological, architectural, and traditional cultural resources in NASA and Boeing areas of SSFL are considered to contribute to the cumulative effects of DOE's cleanup activities. The effects of actions outside of SSFL are also considered in the analysis.

17-17 DOE appreciates your interest in future land uses at SSFL and points out that this Final EIS addresses only those areas of the site for which DOE has cleanup responsibilities, Area IV and the NBZ. DOE will continue to work with the Native Americans and the land owner, Boeing, to address potential impacts to cultural resources potentially affected by DOE cleanup of Area IV and the NBZ. Area IV and the NBZ are remote from the test stands and CA-VEN-1072. DOE does not believe any of its buildings in Area IV would be appropriate for a cultural interpretive center as suggested and cannot determine or commit to future land uses because it is not within DOE's authority to do so (as Boeing, not DOE, is the landowner).

17-18 In accordance with the Section 106 Programmatic Agreement currently under development, DOE will prepare a monitoring plan before ground-disturbing activities begin, and DOE will consult with the California SHPO, the Santa Ynez Band of Chumash Indians, and other tribes to determine where and when Native American monitoring is appropriate for building removal, groundwater cleanup, and soil cleanup.

17-19 CA VEN-1072 is located in Area II of SSFL, which is controlled by Boeing and NASA. It is not under DOE's purview, nor would it be affected by DOE's actions and, therefore, it is not evaluated in this Final EIS. Access to Area IV and the NBZ is controlled by Boeing.

(18) Need NEPA Mitigation Plan

<http://www.whitehouse.gov/sites/default/files/microsites/ceq/20100218-nepa-mitigation-monitoring-draft-guidance.pdf>

February 18, 2010

**MEMORANDUM FOR HEADS OF FEDERAL DEPARTMENTS AND AGENCIES
FROM: NANCY H. SUTLEY, Chair, Council on Environmental Quality
SUBJECT: DRAFT GUIDANCE FOR NEPA MITIGATION AND MONITORING**

I. INTRODUCTION

To provide for the performance of mitigation, agencies should create internal processes to ensure that mitigation actions adopted in any NEPA process are documented and that monitoring and appropriate implementation plans are created to ensure that mitigation is carried out. See *Aligning NEPA Processes with Environmental Management Systems* (CEQ 2007) at 4 (discussing the use of environmental management systems to track implementation and monitoring of mitigation).

http://ceq.hss.doe.gov/nepa/nepapubs/Aligning_NEPA_Processes_with_Environmental_Management_Systems_2007.pdf (<http://www.slideshare.net/whitehouse/aligning-nepa-processes>).

Agency NEPA implementing procedures should require clearly documenting the commitment to mitigate the measures necessary in the environmental documents prepared during the NEPA process (40 C.F.R. § 1508.10) and in the decision documents such as the Record of Decision. When an agency identifies mitigation in an EIS and commits to implement that mitigation to achieve an environmentally preferable outcome, or commits in an EA to mitigation to support a FONSI and proceeds without preparing an EIS, then the agency should ensure that the mitigation is adopted and implemented.

Methods to ensure implementation should include, as appropriate to the agency's underlying authority for decision-making, appropriate conditions in financial agreements, grants, permits or other approvals, and conditioning funding on implementing the mitigation. To inform performance expectations, mitigation goals should be stated clearly. These should be carefully specified in terms of measurable performance standards to the greatest extent possible. The agency should also identify the duration of the agency action and the mitigation measures in its decision document to ensure that the terms of the mitigation and how it will be implemented are clear.

If funding for implementation of mitigation is not available at the time the decision on the proposed action and mitigation measures is made, then the impact of a lack of funding and resultant environmental effects if the mitigation is not implemented warrant disclosure in the EA or EIS. In cases where, after analyzing the proposed actions with or without the mitigation, the agency determines that mitigation is necessary to support the FONSI or committed to in the ROD, and the necessary funding is not available, the agency may still be able to move forward

17-20

17-20

As discussed in Chapter 6 of the Final EIS, DOE will prepare a mitigation action plan for those mitigation commitments made in its Record of Decision (ROD) for the proposed remediation activities at SSFL Area IV and the NBZ. The plan would identify specific mitigation measures associated with alternatives selected in the ROD, and would describe plans for implementing the mitigation measures, monitoring their implementation and effectiveness, and reporting the results of mitigation efforts to DOE management and applicable Federal, State, local, and tribal entities and the public.

**Commenter No. 17 (cont'd): Rudy Ortega, Tribal President,
Fernandeño Tataviam Band of Mission Indians**

FTB Comments – March 2 2017: 12

with the proposed action once the funding does become available. The agencies should ensure that the expertise and professional judgment applied in determining the appropriate mitigation measure is reflected in the administrative record, and when and how those measures will be implemented are analyzed in the EA or EIS.

Under NEPA, a federal agency has a continuing duty to gather and evaluate new information relevant to the environmental impact of its actions. See 42 U.S.C. § 4332(2)(A). For agency decisions based on an EIS, the regulations require that, “a monitoring and enforcement program shall be adopted...where applicable for mitigation.” 40 C.F.R. §1505.2(c). In addition, the regulations state that agencies may “provide for monitoring to assure that their decisions are carried out and should do so in important cases.” 40 C.F.R. §1505.3. Monitoring plans and programs should be described or incorporated by reference in the agency decision documents.

(19) Incorporation by reference of Memo dated March 12, 2014, “Santa Susana Cleanup,” discussing NEPA alternatives analysis for selection of cleanup standards for the Santa Susana Field Laboratory Site.

Sincerely,

Rudy Ortega
Tribal President

20-1

20-1

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) The use of risk-based criteria to determine soil cleanup is consistent with that used by DOE throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Following the soil removal actions, all action alternatives evaluated in this Final EIS would leave soil with contaminant levels protective of human health and the environment based on a future open space land use.

Commenter No. 21: Anonymous

Basic points:

- The Dept. of Energy created serious environmental danger at SSFL - the meltdowns, accidents, spills and releases of dangerous nuclear and chemical contamination - it should clean up all of its mess.
- DOE did the right thing in 2010 when it signed a legally binding agreement, the AOC, to clean up ALL of the contamination.
- DOE is now breaking its word. **NOT ONE of DOE's proposed 4 actions complies with the AOC - all violate the AOC and all would leave hazardous contamination behind.**
- DOE's EIS repeatedly refers to its preference for "natural attenuation" which means doing nothing and letting it deteriorate over time, which they say is 70 years - that's 70 more years of migration into nearby communities. That's outrageous.
- **DOE says the weaker alternatives would be protective of public health but that is false. They have manipulated EPA risk-based standards to be quite literally thousands of times higher than EPA would allow.**
- DOE should not be looking at risk-based cleanups because they signed the AOC. In addition to risking public health, refusing to follow the AOCs means they've wasted \$41.5 million dollars spent on the radiological survey.
- **DOE must uphold the AOC. It's EIS should be focused on how to clean up to background, not whether to.**
- DOE has refused to look at routes that would avoid neighborhoods, there is a route to a nearby rail station that would avoid homes. This appears to be an effort to whip up opposition to the cleanup.
- DOE doesn't have the authority to decide how much gets cleaned up - the state DTSC has that authority per the AOCs.
- **DOE must uphold the AOC.**

BACKGROUND INFORMATION AND KEY POINTS ABOUT DOE's DEIS FOR SSFL

In 2010 the community celebrated a tremendous victory when both NASA and the Department of Energy (DOE) signed an Administrative Order on Consent (AOC) with the state's toxic regulatory agency, the Department of Toxic Substance Control (DTSC), that requires NASA and DOE to clean up their portions of SSFL to background levels of contamination. Unfortunately, the DOE's recently released Draft Environmental Impact Statement (DEIS), which is over 2 years overdue, proposes to break the legally binding commitments of the AOC and walk away from cleaning up large amounts of radioactive and toxic chemical contamination.

Key problems with DOE's EIS include:

- DOE proposes three alternatives that would leave 34%, 86% or even 94% of the contamination not cleaned up. All of the alternatives violate the AOC cleanup agreement that DOE signed in 2010.
- DOE's first proposed option claims to use the AOC's lookup tables, but proposes exempting nearly half a million cubic yards of soil it admits is contaminated from cleanup and to leave it in place instead - despite a requirement in the cleanup agreement that no "leave in place" alternatives be considered. DOE justifies the exemption on its hope that the contamination might lessen on its own 70 years from now and on potential exemptions that in fact violate the AOC's very limited exemptions.
- DOE claims that the second option involves cleanup to suburban residential standards, but it has manipulated that standard to be 100 - 1,000 times more lax than the true EPA suburban residential standard. DOE should not have included risk-based estimates, because the AOC

cont'd

21-5

21-6

21-2
cont'd

21-4
cont'd

21-1 As indicated in Chapter 1 of this Final EIS, DOE acknowledges that past activities at SSFL resulted in chemical and radiological releases that impacted soils, buildings, and groundwater, and intends to complete remediation of SSFL Area IV and the NBZ in compliance with applicable requirements (including regulations, orders, and agreements) for cleanup of radioactive and hazardous substances. Chapter 1, Section 1.3, contains a history of the SSFL site that summarizes DOE's past activities in Area IV, including previous cleanup efforts. Additional information can be obtained from the DOE Energy Technology Engineering Center website (see <http://www.etc.energy.gov/>). This EIS is being prepared in accordance with NEPA to evaluate alternatives for completing the remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. The EIS will inform Federal decisions about remediation of contaminated soil and groundwater, building demolition, restoration of the impacted environment, and disposal of chemical and radioactive waste. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ.

21-2 As the commenter notes, in 2010, DOE signed the AOC. As described in Chapter 2, Section 2.3.3, of this EIS, there are issues with implementing the technical elements of the AOC. These issues, the adverse effects of a massive excavation of Area IV, stakeholder input, and DOE's responsibility under NEPA regulations to "identify and assess the reasonable alternatives to proposed actions that will avoid or minimize adverse effects" resulted in DOE identifying and evaluating additional alternatives that met its purpose and need (Please see Chapter 1, Section 1.1.) Each of the three soil remediation action alternatives analyzed in this EIS would leave SSFL Area IV and the NBZ safe for their designated future use as open space and is consistent with the DOE Environmental Management mission of completing the safe cleanup of the environmental legacy of nuclear energy research.

Contrary to the commenter's assertion that pursuing risk-based alternatives would be a waste of the funds spent on radiological characterization, that activity provided valuable

Commenter No. 21 (cont'd): Anonymous

agreement is to clean up to background. Yet even without the AOC requirement for cleanup to background, longstanding EPA guidance says that DOE should rely on local zoning for setting the cleanup standard, which at SSFL is agricultural which would be sufficiently protective. DOE ignores that requirement. If suburban residential is to be used, as they claim they are, it needs to be the true standard, not one hundreds of times weaker.

- DOE's third option—to clean up to a standard of 25 millirem per year, the equivalent of a medically unnecessary chest X-ray every month of your life—also violates the 1995 DOE-EPA Joint Policy that all DOE sites must be cleaned up consistent with EPA Superfund guidance, which has declared 25 millirem to be non-protective. The option also involves averaging contaminated areas with cleaner ones, rather than cleaning up anything over the cleanup level, which is also barred by EPA guidance.
- DOE claims that a protective cleanup poses undue harm to the environment and that the contamination poses little risk. However, the contamination poses a very significant risk to public health in all DOE's options, risks that far outweigh environmental concerns which can be mitigated. Also, most of the cleanup is occurring in areas that are already disturbed by DOE activities. DOE was not concerned about the environment when it was polluting the land so badly, nor about trucks when they were driving up to SSFL every day bringing hazardous loads of spent commercial nuclear fuel from around the country.
- DOE's draft EIS fails to acknowledge that the AOC is a legally binding agreement, which DOE cannot choose to ignore unilaterally. DOE as the polluter doesn't have the authority to decide how much of the mess that it made is going to get cleaned up. The decision rests with DTSC for the chemicals under the Resource Conservation and Recovery Act, even if there were no AOC, and for the radioactivity under the AOC, which gave the authority to DTSC.
- The DOE states numerous times in the DEIS their desire to defer to "natural attenuation" (leaving much of the contamination in place to supposedly deteriorate over time) which they say would take at least 70 years. This is concerning, because it would mean that contamination would have remained on site for more than a century from the time it was created, constantly leaking offsite. Leaving the site contaminated for most of the rest of the century also raises serious questions about future use, given talk of converting the remediated site into a park, which thus couldn't happen with the left-in-place pollution.
- DOE failed to consider routes for the transportation of contaminated soil that avoid neighborhoods. DOE failed to consider, for example, alternative truck routes as well as the railroad station less than a quarter mile north of the site that is able to ship out contaminated soil. The station is accessible by routes that do not pass by any residences. Instead it only considered trucking the waste to a railroad line 60 miles away.
- All of DOE's proposed actions will result in dangerous radionuclides and toxic chemicals remaining on the site where they can continue to migrate and impact nearby communities. Future site visitors could also be impacted by contamination left in place that should be remediated before any public access occurs.

information regarding the locations of radiological constituents in Area IV and the NBZ. As shown in Chapter 2, Figure 2-1, the locations with radiological constituents exceeding the provisional radiological look-up table (LUT) values are well delineated. The radiological characterization, along with chemical characterization of Area IV and the NBZ provide the data used by DOE in developing the three soil remediation action alternatives, all of which are protective of human health and the environment.

DOE disagrees that none of the alternatives evaluated in this EIS complies with the 2010 AOC. This EIS evaluates a soil remediation alternative (the Cleanup to AOC LUT Values Alternative) that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. This topic, including the application of exemptions and onsite treatment, are addressed in Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD. Please also see Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD. With regard to chemical and radioactive constituents that would be left on site, the percentage values presented by the commenter are based solely on soil volume. As discussed in Section 2.2 of this CRD, each of the action alternatives evaluated for soil remediation would remove soil with chemical and radioactive constituents that pose a risk to human health or the environment.

21-3 The Draft EIS does not state a preference for any alternative or component of any alternative. The Final EIS states that monitored natural attenuation is being considered for "low concentrations" of total petroleum hydrocarbons (TPH) chemicals only. (Simple polycyclic aromatic hydrocarbons may be amenable to natural attenuation and would be evaluated on a location-by-location basis during development of soil remediation plans.) See Section 2.3.2 of this Final EIS for additional information. Following the soil removal actions, all action alternatives evaluated in this EIS would leave soil with contaminant levels protective of human health and the environment based on a future open space land use.

21-4 Please see Section 2.1, "Preferences for Cleanup," of this CRD for a response to comments about alternative preference. Also please see Section 2.7, "Offsite Impacts," of this CRD for a response to concerns about offsite impacts.

The EPA dose calculator default residential exposure pathways include a garden pathway which assumes 25 percent of the fruits and vegetables consumed by the resident are raised in a home garden. The EPA dose calculator results in the same risk slope factors as were used in the Draft EIS when the garden pathway is not included.

Commenter No. 21 (cont'd): Anonymous

The RBSLs used in the Draft EIS are comparable to soil cleanup standards applied by DTSC throughout California. Just because a soil value is above background, does not mean that the chemical is toxic at that concentration. Therefore the order-of-magnitude comparison is also moot.

A garden pathway was not used in the RBSLs for the Draft EIS, as residential development with garden is not a future land use for the SSFL property. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. The use of RBSLs that do not include the indirect garden pathway is appropriate for this future land use.

In this Final EIS (see Chapter 2, Section 2.4), DOE has retained the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative. For both alternatives, the Final EIS retains the scenario evaluated in the Draft EIS, that is, a suburban residential scenario without a garden pathway for an Onsite Suburban Resident. This scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space. However, the garden pathway is included in the evaluation of an Offsite Suburban Resident. A second scenario was added for the Final EIS for the Conservation of Natural Resources Alternative and considers a scenario based on a future land use of Area IV and the NBZ as open space, consistent with Boeing's conservation easement and agreement (i.e., evaluates a recreational user as the onsite receptor).

When a risk assessment is performed, EPA Risk Assessment Guidance (EPA 1989) does allow averaging and prescribes the use of an upper confidence limit (UCL) on the arithmetic average (UCL95) and only suggests the use of a maximum value as a screening tool. It is important to note that under any of the soil remediation alternatives, those soils with the higher levels of chemical and/or radioactive constituents, that is, those that would pose a risk to human health or the environment, would be removed. Soils that would be left on site would have lower concentrations of chemical and/or radioactive constituents. Each of the soil remediation action alternatives analyzed in this EIS would leave SSFL Area IV and the NBZ safe for their designated future land.

Commenter No. 21 (cont'd): Anonymous

The 1995 DOE-EPA Joint Policy creates a framework for the conduct of decommissioning of DOE facilities and provides guidance to EPA Regions and DOE Operations Offices on the use of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA, also known as Superfund) response authority to decommission such facilities. However, it only ensures compliance with CERCLA requirements for remedy selection at National Priorities List (NPL) facilities. While SSFL is not on the NPL, this EIS does include an alternative/scenario consistent with the approach and process used by EPA in CERCLA cleanups.

DOE chose to identify the 25 millirem per year in its risk-based alternative for cleanup in this EIS, consistent with the upper limit for dose-based release criteria under DOE requirements (DOE Order 458.1). The 25 millirem in a year exposure limit would represent a maximum possible dose. It did not take into account the Department's requirement to apply ALARA. DOE does not propose in the Final EIS radionuclide cleanup standards based on dose. DOE instead has conducted a risk-assessment based approach for soil remediation. DOE notes that the methodology used in the cleanup evaluation for the Conservation of Natural Resources Alternative in the final EIS results in doses that are well below the 25 millirem year upper limit and are in a range that is consistent with the CERCLA target risk range.

- 21-5 Due to safety concerns, DOE would not be allowed to use passenger stations as a location to transfer soil to train freight cars. In addition, there is no route off of SSFL to a railroad facility where soil transfers could occur that does not go through a residential area. Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of the transportation topic and DOE's response.

DOE's intent is not to generate opposition to the SSFL cleanup, but it is true that the more soil that is removed to clean up the site, the more transportation will be required. The analyses in this EIS were performed to evaluate the potential impacts associated with the various alternatives for cleanup of SSFL. Results of the analyses allow a comparison of potential impacts, in this case transportation impacts, and tradeoffs between the alternatives. In the case of soil remediation, leaving more soil, and consequently low concentrations of chemicals and/or radionuclides on site, reduces the number of truck trips from the site. Conversely, removing the soil with low concentrations of chemicals and/or radionuclides would result in more truck trips from the site. The EIS shows that the transportation risks are very small; Chapter 4, Section 4.8.1, and Appendix H of the EIS provide details of the transportation risk analysis.

Commenter No. 21 (cont'd): Anonymous

21-6 NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action.

DOE recognizes that the 2010 AOC is a legally binding agreement with the DTSC. Discussion of the 2010 AOC and the legal implications are discussed in Chapter 1, Sections 1.4, of this Final EIS. Please refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for a discussion of this topic and DOE’s response.

21-7 EPA guidance for conducting a risk assessment and soil cleanup does not state that risk should be based solely on zoning rules. Zoning rules are always subject to change. EPA’s Risk Assessment Guidance for Superfund, Part A (EPA 1989) states that in identifying future land use one should “determine possible alternate future land uses based on available information and professional judgment.” The decision-makers should “evaluate pertinent information sources (master plans, Bureau of Census projections, established land use trends in the general area and the area immediately surrounding the site).” More recently, OSWER Directive 9355.7-19 (EPA 2010b) stated that “Regions should use information related to reasonably anticipated future land use to formulate realistic assumptions regarding future land use and clarify how these assumptions fit in and influence the baseline risk assessment, the development of alternatives, and the CERCLA remedy selection process”. The “reasonably anticipated” future use for SSFL property will be that of open space. Therefore DOE is justified in evaluating future use based on that scenario.

Commenter No. 22: Lynn E. McKie

2/25/17

RE: SSFL Remediation Project
TO: STEPHIE JENNINGS, Document Manager

Dear Ms Jennings,
I am writing for my husband, Lynn E. McKie, who worked on "the Hill" for 47 years, and of course myself and daughter who have lived at the base of the Hill in the Sini Valley Knolls area for 41 years. We did not attend this round of public meetings, as we have tried three times before, but because my husband is very deaf, hearing and understanding was (in possible hearing aids amplify all sound). We have both read at least part of the remediation Draft EIS, tho found it difficult to understand. Perhaps we are both just not too bright, but found ourselves bego that the premise was so flawed, indeed not at all to the point of fact.

So, ...FACT we understand that all parties involved in decision making want to only address AREA 4, as the DOE does not want to be responsible for the reality that not only is the whole of SSFL contaminated, but unfortunately, everyone or everything downstream. This would be the San Fernando Valley and Sini Valley. There were leach lines in AREA 4 that did what they were supposed to do, distribute contaminants, waste water and radioactive materials and all manner of toxic stuff to be absorbed down into the water table all over the hill and downstream. There are at least nine test

22-1

22-1

Thank you for your feedback. In preparing this Final EIS, DOE revised passages that were identified as confusing or that readers misunderstood in an effort to make it easier to understand.

22-2

22-2

DOE notes your concern that the entire SSFL site should be addressed with respect to remediating contamination from past operations. As discussed in Chapter 1, Section 1.3, of this EIS, there are multiple parties with responsibilities at SSFL. This EIS is evaluating the potential environmental impacts associated with remediating that portion of SSFL for which DOE has cleanup responsibility, that is, Area IV, the location of DOE's Energy Technology Engineering Center, and the NBZ. No rocket engine testing occurred in Area IV and the NBZ. In addition to DOE, NASA, and Boeing are responsible for remediating portions of SSFL. NASA is responsible for cleanup of Area II, a portion of Area I, and portions of the NBZ impacted by its operations. Boeing is responsible for cleanup of Areas I and III and for demolition of 4 buildings in Area IV that it owns. Chapter 1, Section 1.9.2, of this EIS explains

Commenter No. 22 (cont'd): Lynn E. McKie

P.S. I am partially blind, I am not thinking anymore by city planning, I am not monitoring the location cleanup contract. I want approval with a response.

stands on the hill that used well water in flame defectors every time a rocket engine was tested which used hundreds of gallons of water for hundreds of such tests. Contaminated well water from the site. So... lots of ways for contamination to be spread. Ergo... THE WHOLE PREMISE OF ONLY AREA 4 CLEANUP IS FALSE.

We urge the powers that be who make the decisions to do nothing because it is already 40 to 60 years too late. Just wait the 100 or so years more. Lets let nature get on with it and not waste money, time, water to make so half-assed effort that will only in our estimation, raise more dust, push more contaminants into the water table and cause more harm.

Please, consider this proposal instead... Plant Trees and put up a stout fence. Let the animals and plants have it back. If the DOE is serious about making energy, let them use the property for solar collectors and wind generators. Lots of room. Don't worry, the few workers needed will not hesitate to go up there, just as my husband did not hesitate to go there every day for 47 years. No fear.

Feel free to use us as poster people for do nothing, local residents and former workers,
Sincerely, B. McKie For Lynn E. McKie

22-2
cont'd

22-3

22-3

that the DTSC is preparing a draft program environmental impact report (the *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California*), in accordance with the CEQA, to evaluate the potential impacts of the combined remedial actions of DOE, NASA, and Boeing at SSFL (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). Regarding the distribution of contaminants from past site operations, Chapter 1, Section 1.4 describes the extensive sampling that has been performed to identify the concentration and extent of chemical and radioactive constituents in soil in Area IV and the NBZ. Maps provided in Chapter 2, Sections 2.3.2, 2.4.1, and 2.4.2 show the extent of constituents in soil based on the different cleanup levels evaluated in this EIS. Groundwater has also been extensively characterized, with the extent of groundwater plumes that pose a potential risk shown in Chapter 2, Figure 2-11. As shown in that figure, the characterization data do not indicate that groundwater with concentrations above the Safe Drinking Water Act maximum contaminant levels has left the site from Area IV and the NBZ. Please refer to Section 2.7, "Offsite Impacts," of this CRD for discussion of this topic and DOE's response.

DOE acknowledges your concern about the environmental harm that could result from an extensive remediation effort at SSFL. It is not DOE's intent to conduct activities that would be harmful to the environment. Any soil remediation conducted by DOE would be performed in a manner that would minimize dust production and prevent migration of contaminants to groundwater. Remediation would also be performed in a manner that would protect existing biological resources by only removing contaminants that pose a risk, thereby minimizing damage. The intent of the remediation is to enhance the environment and thus would be a beneficial use of some resources. Because Boeing, and not DOE, is the land owner, it is not considering use of the land for energy generation. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

Re: DOE/EIS-0402, Area IV and Northern Buffer Zone
Santa Susana Field Laboratory

Dear Ms. Jennings,

The Chatsworth Neighborhood Council has reviewed selected data from the DOE's very thorough DEIS, and thanks the DOE for its willingness to include a wide variety of alternatives in the DEIS.

All cleanup alternatives provide for cleanup of the site to either suburban residential standards or cleaner. All presented cleanup alternatives provide a reasonable level of cleanup, or even excessive cleanup, when long term use of the property as open space is the intended use.

Having initially determined the ending condition of the site under any cleanup approach that was presented is sufficiently clean; we then considered the impact to our community under the presented alternatives.

The major effect of the different cleanup alternatives is the amount of truck traffic and potential related effects on our community from pollutants, wear and tear on the roads, and traffic. We would like to minimize these effects, as well as the taxpayer costs of the cleanup.

Based on the foregoing, our preferred alternative is the "Conservation of Natural Resources Alternative". This provides the least number of truck trips, the least soil removal, the least number of trips to replace soil, and the least cost to the taxpayers for the cleanup.

Our second choice of an alternative is the "Cleanup to Revised LUT Values Alternative". We note projected cancer risks are fairly similar under this proposal (1 chance in 100,000 to 270,000) to the extremely lengthy and problematic "Cleanup to AOC LUT Values Alternative", that is 1 chance in 100,000 to 310,000. Cleanup to Revised LUT Values Alternative provides the second best opportunity to minimize cleanup impacts to our community.

We are opposed to the Cleanup to AOC LUT Values Alternative. The cleanup is excessive, with severe environmental effects to our community for many years as the trucks continue to move soil with contamination that is not significant. The site will be further impacted by the unresolved absence of "adequate" replacement soil.

23-1

23-1

DOE acknowledges your support for the Conservation of Natural Resources Alternative. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

Commenter No. 23 (cont'd): Andre van der Valk, President,
Chatsworth Neighborhood Council

We encourage that DOE adopt the "Conservation of Natural Resources Alternative" to clean up significant contamination, with the most minimal impacts to the site and surrounding community that is protective of human health and practical for the scope of cleanup.

|| 23-1

Simi Valley CA. 93063

.What are the list of contaminates on site in soil and ground water & surface water? Will all these contaminates be cleaned up?

Are all these contaminates listed in the (LUT list?

How come radioactive contaminates are not listed in the IUT table. Will they be cleaned up & to what level ?

Why was only one sample taken at a local quarry- is one sample really representative?

How come samples were not taken at other quarrrys?

Why was money wasted taking samples of packaged soil which would never be use?

I hope you will consider these questions.

Eleanor & George Rembaum

24-1

24-2

24-3

24-1 The chemicals of concern in soil are identified in the *Area IV Chemical Data Summary Report* (CDM Smith 2017) and the radionuclides of concern in soil are identified in the EPA report *Final Radiological Characterization of Soils, Area IV and the Northern Buffer Zone, Area IV Radiological Study* (HGL 2012b). The chemical and radiological constituents of concern in groundwater are presented in the *Draft RCRA Facility Groundwater Remedial Investigation Report, Area IV, Santa Susana Field Laboratory, Ventura County, California* (CDM Smith 2018a). Chapter 3, Section 3.2.5 summarizes the chemicals and radionuclide constituents in soil and Chapter 3, Section 3.4.3 identifies the chemical and radioactive constituents in the groundwater below Area IV. Surface waters in Area IV are principally the result of precipitation and are therefore intermittent. They have the potential to contain the constituents in the Area IV soil. Chapter 3, Section 3.3.1 of this Final EIS identifies constituents that exceeded discharge limits in surface water releases following the 2005 Topanga wildfire. All of the soil removal action alternatives in this Final EIS address removal of chemical and radiological contamination in soil; the criteria for removal of this contamination depends on the action alternative being evaluated as discussed in Chapter 2 of this Final EIS. Please refer to Chapter 2, Sections 2.3 and 2.4 for description of the alternatives and cleanup levels. All of the soil removal action alternatives are protective of public health and safety and the environment.

24-2 DOE initiated the search for locating backfill soil meeting the AOC requirements by sampling at three sites (two commercial sites and a source of dredged lake sediment), evaluating existing data from a third potential site, and sampling of soil products that could serve as soil amendments. All samples did not meet the AOC requirements. In accordance with the AOC, DOE in December of 2016 notified DTSC of these initial findings. As of release of this Final EIS, DOE is awaiting a response from the DTSC.

24-3 In order to encourage new vegetation growth in disturbed soils, including backfill soils, nutrients and soil amendments are required. DOE sampled soil amendment products to see if they could be used. Based on the sampling of soil products that could serve as soil amendments, soil products used in backyard gardens would not meet the requirements of the 2010 AOC, illustrating the difficulty in re-establishing vegetation at SSFL. Section 2.3, "Suitable Backfill Soil," of this CRD provides additional information regarding backfill, including findings of backfill soil analyses conducted by NASA.

Commenter No. 25: Jean Graham

Dear Ms. Jennings,
I favor a risk-based clean-up of the Boeing site (Rocketdyne) in Siskiyou Valley. The site is home to many animal & plant species that could not well withstand the more extreme clean up. Plus, removal & replacement of so much soil could not be safe for the surrounding community.
Thank you, Jean Graham

25-1

25-1

DOE acknowledges your support for a risk-based cleanup effort at SSFL. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. Please note that DOE is only responsible for cleanup of Area IV and the NBZ at SSFL; cleanup of other areas of SSFL is the responsibility of NASA and Boeing.

Commenter No. 26: Mikala Partington

March 1, 2017

Dear Ms. Jennings,

RE: EIS for Area IV of the SSFL

I am writing because I have many concerns regarding the proposed EIS (Environmental Impact Statement). In 2010 the Department of Energy and DTSC agreed to a cleanup plan and per that AOC agreement plan it was agreed upon to cleanup to background levels. In the new EIS it states that it will at best be cleaned up to "suburban residential levels". This deviates from the agreed upon action, and is unacceptable! I am worried about this because it will leave behind a lot of contamination. This new action not only will not be followed by the EPA's suburban residential standards, but it usually means that in the near future people can now live there! I don't want anyone to live there! As you are aware, there is large amounts of toxic contamination from decades long of testing, multiple accidents and dumping! In one of your proposed options the "leave in place" option- it is proposed that your agency does not know if it will clean up the groundwater because the contaminants will go away by itself, also known as "natural attenuation". Which is patently a provable false statement on your behalf. The three options that are now being presented will leave behind between 39% and 99% of the contamination behind! This is completely unacceptable! It's time for the DOE to fulfill its cleanup obligations to help ensure that current and future generations are not at risk from SSFL contamination.

Very Respectfully,

Mikala Partington

26-1

26-2

26-3

26-1
cont'd

26-1 Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. As discussed in Section 2.2 the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

26-2 It is true that the Draft EIS evaluated alternatives based on a suburban resident, without garden, exposure scenario; however, it also evaluated an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background or levels based on laboratory capabilities. (Please refer to Section 2.2, "Compliance with the Administrative Order on Consent," of this CRD.) In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site.

26-3 DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. Therefore, SSFL Area IV and the NBZ do not contain "large amounts of toxic contamination."

DOE does not consider Monitored Natural Attenuation a 'leave in place' treatment methodology. As described in Chapter 2, Section 2.6.3 of this Final EIS, monitored natural attenuation as used in this EIS when considered as the only groundwater treatment method applies to locations with low concentrations of contaminants that are not amenable to treatment (the Metals Clarifier and RMHF [Radioactive Materials

Commenter No. 26 (cont'd): Mikala Partington

Handling Facility] TCE plumes) and where the natural decay of tritium would result in meeting the maximum contaminant level (MCL) by 2025. The reason that DOE would continue to monitor the location of impacted groundwater is to ensure that conditions do not change. Should the groundwater concentrations increase or monitoring indicates that contaminants are moving off site, DOE would take actions to control the contaminated groundwater.

Comments: Draft SSFL DOE EIS Area IV

Thank you for the opportunity to comment on the Draft EIS. I am the co-chair of the SSFL Community Advisory Group and a member of the West Hills Neighborhood Council, however I am submitting my own comments for your consideration.

The EIS is a well-written document with cleanup analysis, alternates and consequences, and it allows the public to evaluate a technical and complicated subject.

The No Action alternate is not acceptable since it does not clean up the site which is owned by Boeing and is inconsistent with Boeing's intent to have their entire property used for open space. The end use of the property for open space is an important consideration for the public.

The AOC describes a flawed cleanup method that has a list of chemicals and radioactive nuclides to be removed to background or detect using point-to-point sampling without any consideration of toxicity or threats to human health. This method guarantees the removal of an extraordinary amount of soil and the cleanup values are to be used for the selection of backfill soil and are so exacting that no acceptable backfill has been found. The AOC cleanup method should not be considered.

The next alternate proposes revising the AOC to allow the use of risk-based levels for cleanup, and of the 132 chemicals listed only 32 are potential threat to human health, and the amount of soil to be removed is greatly reduced, but the point-to-point sampling is retained. Unnecessary excavation will be included and this method is not recommended for consideration.

I support the last alternate, Conservation of Natural Resources, which revises the AOC, and uses risk based screening levels and area averaging for the clean up of chemicals and nuclides. This alternate would use U.S. EPA guidelines, and would minimize excavation, air pollution and truck traffic. In situ remediation could be used and backfill soil would be available under the safe and realistic cleanup values.

The reduction of the excavation is important for the conservation of the environment, culture and wildlife habitat at the SSFL this further supports the selection of this alternate.

I recommend that the air monitoring be expanded for residents' safety and testing be done for diesel fume particles, Valley Fever and other health threats such that excavation and transport could be curtailed while mitigation takes place.

Alec Uzemeck 3/5/17
Alec Uzemeck

27-1

27-2

27-3

27-1 Thank you for your comment. It has been included in the Administrative Record for this Final EIS.

27-2 DOE acknowledges your support for the Conservation of Natural Resources Alternative. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

27-3 Regarding the commenter's request that the air monitoring be expended for residents nearby, due to the low air pollutant impacts on nearby residents that would occur from the proposed cleanup activities, DOE's visual monitoring and perimeter air monitoring stations are adequate to identify the need for any corrective actions to mitigate unacceptable air emissions.

This Final EIS demonstrates (Chapter 4, Section 4.6) that by complying with applicable Ventura County Air Pollution Control District (VCAPCD) Rules, combustible and fugitive dust emissions generated from cleanup activities proposed by DOE would produce less than significant air quality impacts on locations outside of the SSFL boundary. (One indication of the significance of air quality impacts is that air emissions would be well below any level of health concern to sensitive members of the population.) Direct transport of these emissions to a distance of nearly one mile to the nearest residence or farther would further dilute these pollutant concentrations to well below any level of health concern.

The proposed cleanup activities would adhere to a fugitive dust control plan that identifies a variety of measures to minimize emissions and therefore to comply with VCAPCD Rule 55 – Fugitive Dust. Personnel would visually monitor the proposed cleanup activities on a real time basis and if there were any noticeable increase in emissions, such as fugitive dust, they would quickly implement measures to mitigate their intensities, thereby avoiding any substantial air pollutant exposure to the public. Minimization measures are identified in Chapter 6, Table 6-1 (Subsection: Air Quality and Greenhouse Gases). Monitoring of cleanup activities is identified in Minimization Measure 6-1.

DOE, NASA, and Boeing each implemented their respective baseline air monitoring programs in early 2018 for their areas of responsibility at SSFL. For DOE, the program includes a meteorological station within Area IV and four air monitors along the perimeter of Area IV (as described in NASA/Boeing/DOE 2017). The perimeter stations include two along the north border near the SRE and RMHF, one along the western border, and one along the southern border. DOE is currently operating the system to establish a pre-remediation baseline. The system will continue to operate

Commenter No. 27 (cont'd): Alec Uzemeck

during remediation activities to monitor any potential air pollutant releases of concern. If the air monitoring network indicates any elevated levels of air pollution, onsite staff would take action to mitigate the releases to acceptable levels. A description of the DOE air monitoring system was added to Chapter 3, Section 3.6.1 of this Final EIS.

Air quality impacts from proposed offsite haul truck transport would be minimal due to the relatively low emission rates of these vehicles (See Chapter 4, Section 4.6 and Chapter 6, Table 6-1, items 6-2 and 6-4.) As discussed in Chapter 4, Section 4.6.4.2 of this Final EIS, the air quality analysis estimates that unmitigated diesel particulate matter (DPM) emissions generated by a 2023 average California truck fleet within the entire South Coast Air Basin analysis domain under the nearby disposal site scenario would amount to less than 500 pounds per year, or about 5 pounds during a peak day (based on 250 days per year) (Leidos 2018b; Tables 1.B-15 and 1.B-17). These emissions would occur over about 160 miles of roadway that span a large portion of the SCAB. As a result, populations adjacent to roadways proposed for the transport of materials from the SSFL would be exposed to very low DPM emissions from project haul trucks and likely would experience no noticeable health effects from these emissions.

Regarding the request to test for the presence of Valley Fever, this Final EIS, Section 4.9.2.6, states that there are no commercially available tests to reliably test the soil for *Coccidioides* spores before working in a particular location (CDC 2014; HESIS 2013). Soil testing is currently only done for scientific research, and the available methods to detect *Coccidioides* in the soil do not always detect the spores, even when they are present (CDC 2014). Because the spores may be present in the soil, reasonable precautions would be taken to reduce potential for exposure. For example, the fugitive dust control plan mentioned above will include measures to reduce the risk of spreading Valley Fever that focus on fugitive dust controls recommended by the VCAPCD to minimize fungal spore entrainment, as well as minimizing worker exposure (VCAPCD 2003).

Subject: Comments on the Draft Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory in Ventura County, California (DOE/EIS-0402).

Dear Ms. Jennings:

We have reviewed the Draft Environmental Impact Statement (DEIS) for the Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory. The Santa Susana Field Laboratory is the site of former nuclear energy testing, rocket engine testing, and other industrial research that caused soil and water contamination. The Department of Energy (DOE) is proposing to conduct cleanup activities to remove this soil and water contamination from Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory site located in Ventura County, California.

The mission of the U.S. Fish and Wildlife Service (Service) is working with others to conserve, protect, and enhance fish, wildlife, plants, and their habitats for the continuing benefit of the American people. To assist in meeting this mandate, the Service provides comments on public notices issued for projects that may have an effect on those resources, especially federally-listed plants and wildlife. The Service's responsibilities also include administering the Endangered Species Act of 1973, as amended (Act). Section 9 of the Act prohibits the taking of any federally listed endangered or threatened wildlife species. "Take" is defined at Section 3(19) of the Act to mean "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." The Act provides for civil and criminal penalties for the unlawful taking of listed wildlife species. Such taking may be authorized by the Service in two ways: through interagency consultation for projects with Federal involvement pursuant to section 7, or through the issuance of an incidental take permit under section 10(a)(1)(B) of the Act.

In 2010, DOE signed an Administrative Order on Consent (AOC) with the California Department of Toxic Substances Control (DTSC) related to the cleanup of contaminated soils within Area IV. The AOC requires excavation and/or treatment of soil containing any chemical that exceeds a Look-Up Table value set by DTSC. The Look-Up Table values are set at either background or analytical method limits, and do not consider risk of the chemical to human health or the environment. This method is intended to remediate the site to conditions which occurred prior to the industrial research activities at the site, or "cleanup to background." The AOC allows for an exemption to the mandate

U.S. Fish & Wildlife Service

Stephanie Jennings

2

to cleanup to background, for the protection of sensitive biological resources such as listed species and their designated critical habitat, contingent on the opinion of the Service demonstrating that such an exemption is warranted. In a letter dated February 2, 2017, (08EVEN00-2016-TA-0583) the Service provided technical assistance to DOE regarding the status of Braunton's milk-vetch within Area IV as well as general information about the potential effects of the cleanup on Braunton's milk-vetch and its critical habitat. The letter is attached for your reference.

Our review of the proposed project alternatives indicates that the area that would be affected supports the endangered Braunton's milk-vetch (*Astragalus brauntonii*) and its designated critical habitat. The DOE has previously provided us with data indicating that both Braunton's milk-vetch and its designated critical habitat are present in the proposed cleanup area and would likely be impacted by cleanup activities within Area IV (DOE 2016). The extent of this impact would vary according to the alternative chosen by DOE for cleanup activities.

The proposed biological and cultural exemption area shown in Figure S-5 of the DEIS includes the most important habitat areas for Braunton's milk-vetch, including its designated critical habitat. We support DOE's proposal to evaluate the need for cleanup actions within this exemption area using risk-based screening levels. We understand the intent of the cleanup to background as remediating the site to conditions which existed prior to the industrial testing activities; however, there is the possibility that chemicals may exist in the soil at concentrations that are above background but pose no appreciable risk to humans or the environment. In these instances, soil excavation would pose a far greater environmental risk than allowing low levels of soil contamination to persist. The proposed use of risk-based screening levels within the biological exemption area would achieve the objective of removing harmful contamination while minimizing impacts to Braunton's milk-vetch and its critical habitat.

In December 2016, the Service published an Endangered Species Act Compensatory Mitigation Policy (81 FR 95316). Under this policy any unavoidable impact to listed species or their habitats would require compensatory mitigation to ensure a "net gain" or, at a minimum, "no net loss" in the conservation status of affected resources. Accordingly, if DOE chooses to implement an alternative for this project that would impact the Braunton's milk-vetch or its designated critical habitat, the Service would expect DOE to incorporate suitable compensatory mitigation in the project description.

If you have any questions, please contact Dou-Shuan Yang or Jenny Marek of my staff at [REDACTED]

Sincerely,

Stephen P. Henry
Field Supervisor

28-1

28-1

Thank you for your comment. It has been included in the Administrative Record for this Final EIS.

28-2

28-2

Consistent with the Biological Assessment prepared by DOE and the Biological Opinion issued by the U.S. Fish and Wildlife Service (see Appendix J), DOE would incorporate suitable compensatory mitigation measures to protect the Braunton's milk-vetch and its designated critical habitat, as appropriate, into the detailed plans for remediation of Area IV and the NBZ.

**Commenter No. 28 (cont'd): Stephen P. Henry, Field Supervisor,
U.S. Fish & Wildlife Service**

Subject: Technical Assistance Related to Proposed Cleanup Actions Affecting Braunton's
Milk-vetch and its Critical Habitat at the Santa Susana Field Lab, Ventura
County, California

Dear Mr. Jones:

We are responding to your letter received via electronic mail on July 26, 2016, requesting technical assistance from the U.S. Fish and Wildlife Service (Service) on potential effects to the federally endangered Braunton's milk-vetch (*Astragalus brauntonii*) and its critical habitat during cleanup activities within Area IV of the Santa Susana Field Laboratory. The Santa Susana Field Laboratory is the site of former nuclear energy testing, rocket engine testing, and other industrial research that caused soil and water contamination that is the subject of current cleanup efforts. The U.S. Department of Energy (DOE) is responsible for cleanup actions within Area IV.

In 2010, DOE signed an Administrative Order on Consent (AOC) with the California Department of Toxic Substances Control (DTSC) related to the cleanup of contaminated soils within Area IV. The AOC requires excavation and/or treatment of soil containing any chemical that exceeds a Look-Up Table value set by DTSC. The Look-Up Table values are set at either background or analytical method limits, and do not consider risk of the chemical to human health or the environment. This method is intended to remediate the site to conditions which occurred prior to the industrial research activities at the site, or "cleanup to background." Your letter included a map showing Braunton's milk-vetch habitat within Area IV that would be affected by a cleanup to background (Figure 1). The AOC allows for an exemption to the mandate to cleanup to background, for the protection of sensitive biological resources, contingent on the opinion of the Service demonstrating that such an exemption is warranted.

This letter is intended to provide DOE with information about the methodology that the Service uses to evaluate the effects of projects on listed species and critical habitat, important characteristics of Braunton's milk-vetch and its critical habitat, the general types of effects we anticipate if a cleanup to background is conducted, and our recommendations for minimizing the impact of the cleanup on Braunton's milk-vetch.

Jeopardy Determination Methodology

Section 7(a)(2) of the Endangered Species Act requires that Federal agencies ensure that any action they authorize, fund, or carry out is not likely to jeopardize the continued existence of listed species. "Jeopardize the continued existence of" means "to engage in an action that reasonably would be expected, directly or indirectly, to reduce appreciably the likelihood of both the survival and recovery of a listed species in the wild by reducing the reproduction, numbers, or distribution of that species" (50 Code of Federal Regulations (CFR) 402.02).

The jeopardy analysis relies on four components: (1) the Status of the species, which describes the range-wide condition of the species, the factors responsible for that condition, and its survival and recovery needs; (2) the Environmental Baseline, which analyzes the condition of the species in the action area, the factors responsible for that condition, and the relationship of the action area to the survival and recovery of the species; (3) the Effects of the Action, which determines the direct and indirect impacts of the proposed Federal action and the effects of any interrelated or interdependent activities on the species; and (4) the Cumulative Effects, which evaluates the effects of future, non-Federal activities, that are reasonably certain to occur in the action area, on the species.

In accordance with policy and regulation, the jeopardy determination is made by evaluating the effects of the proposed Federal action in the context of the current status of the species, taking into account any cumulative effects, to determine if implementation of the proposed action is likely to reduce appreciably the likelihood of both the survival and recovery of the species in the wild by reducing the reproduction, numbers, and distribution of that subspecies.

Adverse Modification Methodology

Section 7(a)(2) of the Endangered Species Act requires that Federal agencies ensure that any action they authorize, fund, or carry out is not likely to result in the destruction or adverse modification of designated critical habitat. A final rule revising the definition of "destruction or adverse modification of critical habitat" was published on February 11, 2016 (81 Federal Register (FR) 7214). The revised definition states: "Destruction or adverse modification means a direct or indirect alteration that appreciably diminishes the value of critical habitat for the conservation of a listed species. Such alterations may include, but are not limited to, those that alter the physical or biological features essential to the conservation of a species or that preclude or significantly delay development of such features."

The revised "destruction or adverse modification" definition necessitates that we focus our analyses on how Federal actions affect the quantity and quality of the physical or biological features of the designated critical habitat for a listed species and, especially in the case of unoccupied habitat, on any impacts to the critical habitat itself. Specifically, the Service will generally conclude that a Federal action is likely to "destroy or adversely modify" designated critical habitat if the action results in an alteration of the quantity or quality of the essential physical or biological features of designated critical habitat, or that precludes or significantly delays the capacity of that habitat to develop those features over time, and if the resulting effect of the alteration is to appreciably diminish the value of critical habitat for the conservation of the species.

Response side of this page intentionally left blank.

**Commenter No. 28 (cont'd): Stephen P. Henry, Field Supervisor,
U.S. Fish & Wildlife Service**

John Jones

4

The Service may also consider other kinds of impacts to designated critical habitat. For example, some areas that are currently in a degraded condition may have been designated as critical habitat for their potential to develop or improve and eventually provide the needed ecological functions to support species' recovery. Under these circumstances, the Service generally may conclude that an action is likely to "destroy or adversely modify" the designated critical habitat if the action alters it to prevent it from improving over time relative to its pre-action condition. The "destruction or adverse modification" definition applies to all physical or biological features; as described in the proposed revision to the current definition of "physical or biological features" (50 CFR 424.12), "[f]eatures may include habitat characteristics that support ephemeral or dynamic habitat conditions" (79 FR 27066).

The adverse modification analysis relies on four components: (1) the Status of Critical Habitat, which describes the range-wide condition of designated critical habitat for the species in terms of the essential physical or biological features, the factors responsible for that condition, and the intended recovery function of the critical habitat overall; (2) the Environmental Baseline, which analyzes the condition of the critical habitat in the action area, the factors responsible for that condition, and the recovery role of the critical habitat in the action area; (3) the Effects of the Action, which determines the direct and indirect impacts of the proposed Federal action and the effects of any interrelated and interdependent activities on the essential physical and biological features and how that will influence the recovery role of the affected critical habitat units; and (4) Cumulative Effects, which evaluates the effects of future non-Federal activities, that are reasonably certain to occur in the action area, on the essential physical and biological features and how that will influence the recovery role of affected critical habitat units.

Braunton's Milk-vetch and its Critical Habitat

Braunton's milk-vetch was listed as Endangered on January 29, 1997 (62 FR 4172). Extensive information on the life-history and status of Braunton's milk-vetch is available in a variety of reference materials, including several documents that have been prepared specifically for Area IV of the Santa Susana Field Lab (Fotheringham and Keeley 1998, Service 1997, Service 2006, Service 2009, DOE 2016). The aspects of Braunton's milk-vetch biology that are particularly relevant to understanding the effects of the cleanup are listed below.

- Braunton's milk-vetch is restricted to carbonate limestone substrates that occur as rare outcroppings in disjunct parts of the Los Angeles basin (Fotheringham and Keeley 1998).
- Braunton's milk-vetch is a short-lived perennial that germinates in response to disturbances such as wildfires and other surface alterations.
- Braunton's milk-vetch has a life-history strategy that involves long periods of time where the species is present in the environment in the form of seeds, with few or no vegetative (i.e., above-ground) plants present at an occupied site. These seeds survive within the soil and sprout in response to an event that triggers germination.

Response side of this page intentionally left blank.

Commenter No. 28 (cont'd): Stephen P. Henry, Field Supervisor,
U.S. Fish & Wildlife Service

John Jones

5

- Neither the fruits nor the seeds have specialized adaptations to facilitate seed dispersal by wind, therefore it is likely that most seeds fall within a short distance of the parent plant, with a fraction being transported further by water or animals (Fotheringham and Keeley 1998).
- The number of Braunton's milk-vetch plants at the Santa Susana Field Lab is greater than any other known population, with over 30,000 individuals documented on site in 2009 (DOE 2016).
- Since the time of listing in 1997, two occurrences on local agency lands have been extirpated by development activities. Additionally, half of the currently known occurrences, 10 out of 20, are on private or local agency lands and are potentially threatened by indirect or direct effects from existing or future urban development, recreational activities, and/or other land management activities (Service 2009).

Critical habitat for Braunton's milk-vetch was designated at the site on November 14, 2006 (71 FR 66374). The Northern Simi Hills Unit 1D (Unit 1D) occurs largely within the Santa Susana Field Lab, within Area IV (Figure 1). The South Simi Hills Unit 2F, has a small overlap with the Santa Susana Field Lab, in a portion of the site that is not subject to cleanup by DOE and will not be discussed further in this letter. The Northern Simi Hills Unit 1D was listed because it is occupied by the species and because multiple populations within an entire range increase a species' chance of persistence. As described above, the Service evaluates effects to critical habitat by analyzing how the physical and biological features of the critical habitat may be affected by the project. The physical and biological features of Braunton's milk-vetch critical habitat are:

- Calcium carbonate soils derived from marine sediment;
- A low proportion (less than 10 percent) of shrub cover directly around the plant; and
- Chaparral and coastal sage scrub communities characterized by periodic disturbances that stimulate seed germination (e.g., fire, flooding, erosion) and reduce vegetative cover.

Effects of the Cleanup on Braunton's Milk-vetch and its Critical Habitat

The Service is not aware of any soil treatment technologies that may be considered for application in the areas shown in Figure 1. Excavation of soil that exceeds Look-Up Table values is the only viable cleanup option being considered that would meet the cleanup to background standard outlined in the AOC. The effects to Braunton's milk-vetch and its critical habitat from this cleanup strategy include the following:

- 81 percent (54.7 acres) of Braunton's milk-vetch habitat within Area IV would be subject to excavation under a cleanup to background;

Response side of this page intentionally left blank.

Commenter No. 28 (cont'd): Stephen P. Henry, Field Supervisor,
U.S. Fish & Wildlife Service

John Jones

6

- 63 percent (44.3 acres) of Braunton's milk-vetch critical habitat Unit 1D would be subject to excavation under a cleanup to background;
- Removal of the soil would also remove the seed bank that is essential to support the Braunton's milk-vetch population at the site;
- Removal of the soil would also remove the chaparral and coastal sage scrub community that Braunton's milk-vetch relies on;
- Braunton's milk-vetch requires calcium carbonate soils derived from marine sediments; back-fill that may be brought in following the removal of native soils may not be suitable to support the species and would not have any seedbank and soil microorganisms native to the site;
- The remaining Braunton's milk-vetch habitat within Area IV that would not be affected by the cleanup to background (11.8 acres) was previously used as a borrow area and has already been subject to the removal of calcium carbonate soils, loss of a majority of its seedbank, and destruction of the chaparral and coastal sage scrub community; and
- The highest quality habitat for Braunton's milk-vetch remaining at this occurrence is within the area that would be subject to soil removal. Habitat areas adjacent to Area IV, outside of the Santa Susana Field Laboratory boundary, are not known to support a substantial number Braunton's milk-vetch and are not expected to serve as a source population to reestablish the occurrence following the cleanup.

In summary, the cleanup to background approach would substantially affect the Braunton's milk-vetch occurrence at Area IV, which represents the largest number of individuals of any known occurrence throughout the species' range. The nature and extent of effects to Braunton's milk-vetch from a cleanup to background could potentially cause the extirpation of the species from this occurrence due to loss of seedbank, loss of suitable soils, and loss of appropriate co-occurring vegetation community. The cleanup to background would also destroy 63 percent of the physical and biological features of Braunton's milk-vetch designated critical habitat Unit 1D. An additional 17 percent of that same critical habitat unit is already degraded by previous actions, creating a combined total of 80 percent of the critical habitat unit with physical or biological features that are either completely removed/destroyed or degraded to a potentially irreversible extent.

Through a formal consultation, we would analyze whether the effects to Braunton's milk-vetch and its critical habitat at Area IV would jeopardize the continued existence of Braunton's milk-vetch range-wide and/or destroy or adversely modify critical habitat for Braunton's milk-vetch to a level that appreciably diminishes the value of critical habitat for the conservation of the species. Prior to completing that analysis we cannot definitively state the effects of a cleanup to background on the fate of the species; however, the anticipated effects within Area IV are direct and are substantial. The cleanup to background would potentially extirpate Braunton's milk-

Response side of this page intentionally left blank.

Commenter No. 28 (cont'd): Stephen P. Henry, Field Supervisor,
U.S. Fish & Wildlife Service

John Jones

7

vetch from the largest of 20 remaining occurrences, in a landscape where 10 of those occurrences are threatened by potential future development and land management activities. The cleanup to background would also likely destroy or substantially degrade the physical and biological features in a majority of critical habitat unit 1D, which was designated because it is occupied by the species and because having multiple occurrences of the species throughout its range increases the chance that the species will survive into the future.

We recommend that DOE and DTSC consider exercising an exemption to the AOC within Braunton's milk-vetch habitat, such that cleanup actions are only conducted in areas where contamination poses a risk to human health or the environment. We understand the intent of the cleanup to background as remediating the site to conditions which existed prior to the industrial testing activities; however, there is the possibility that chemicals may exist in the soil at concentrations that are above background but pose no appreciable risk to humans or the environment. In these instances, soil excavation would pose a far greater environmental risk than allowing low levels of soil contamination to persist. We recommend that DOE conduct human health and ecological risk assessments to identify areas where soil contamination exceed risk thresholds, and target soil excavation in those areas only. We can re-evaluate the effects to Braunton's milk-vetch from this revised cleanup scenario upon request, and can recommend strategies to implement the cleanup while minimizing effects to Braunton's milk-vetch.

If you have any questions regarding this letter, please contact Jenny Marek of my staff at [REDACTED]

29-1

DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

29-2

29-2

DOE agrees with placing a high priority on health and safety and remains committed to protecting the human health and safety of current and future users of the site and of the residents in the surrounding communities.

Commenter No. 30: Richard C. Parker

RE: Comment on SSFL Draft Environmental Impact Statement

Sirs:

On March 8, 2017 I attended a community meeting regarding the SSFL cleanup progress and process. I've lived in West Hills for 31 years and to my complete and utter disdain and amazement there has been little to no progress at the Santa Susana Field Laboratory nuclear melt down site. Now I'd come to my attention that the DOE is not willing to abide to their 2010 contractual agreement to clean up the site. John Jones the DOE Project Director for the SSFL stated in February 2014 that the DOE would completely clean up the site to the agreed upon background levels for both chemical and radiological constituents. This delay is both reprehensible and immoral. The DOE is now stalling and trying to manipulate the agreed upon settlement in order to pay little or no cleanup at all. This is unacceptable and will not be tolerated. Signed: *Richard C. Parker*

30-1

30-1

There has been a lot of cleanup performed in Area IV. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). (Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation at those portions of SSFL for which DOE is responsible, Area IV and the NBZ.

Please see Section 2.1, "Preferences for Cleanup," of this CRD, which addresses steps that must be complete before cleanup can resume, and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Ms. Stephanie Jennings
NEPA Document Manager, SSFL Area IV EIS
U.S. Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 91063

Dear Ms. Jennings:

Thank you for the opportunity to comment.

Unfortunately the EIS does not analyze cleaning the DOE site to the agreed upon stipulations in the 2010 Agreement On Consent. Instead, hundreds of thousands of cubic yards of soil, some with known significant chemical and radiological contamination that would be covered by the AOC, are exempted from remediation. The public's health must be your first priority. A clear analysis of a project that will remediate contamination as agreed upon in the AOC needs to be thoroughly evaluated in the EIS.

The DOE must not leave unknown quantities and concentrations of contamination on site, nor avoid due diligence in analyzing full remediation of known contaminants in excess of background levels. The EIS's exemption of hundreds of thousands of cubic yards of soil, on the basis that it may impact biological or cultural resources, is premature, lacks transparency, reneges on DOE's agreement from the 2010 AOC, and if implemented, would threaten the public's health.

The Ventura County Board of Supervisors strongly recommends that the EIS be consistent with remediation of DOE's SSFL site to the levels stipulated in the AOC.

Sincerely,

John Zaragoza
Chair, Board of Supervisors

cc: Matt Rodriguez, Secretary, Cal EPA
Barbara Lee, Director, DTSC

31-1 The Draft EIS and this Final EIS include an alternative that incorporates the technical elements of the 2010 AOC, the Cleanup to AOC LUT Values Alternative. The Cleanup to AOC LUT Values Alternative does not leave “hundreds of thousands of cubic yards of soil” with “significant chemical and radiological contamination” within Area IV. It removes all soil that could pose a risk to human health and the environment, as well as other soil that does not pose a threat, exceeding what would occur at EPA CERCLA sites and DTSC-regulated sites throughout California. There is no soil with “significant chemical and radiological contamination” being exempted from soil cleanup. As discussed in Chapter 2, Section 2.3.2, of this Final EIS, soils within areas in which the exemption process would be applied that have higher concentrations of chemicals or radionuclides, that is, those that pose a risk to human health or to plants and animals, would be removed. Please refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD, for a discussion of soil remediation alternatives, including the alternative that incorporates the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. In none of the alternatives does DOE propose leaving soil with chemical and/or radiological contamination that would pose an unacceptable human health or ecological risk based on the future open space land use.

31-1

31-2 The exemption process described in the EIS is not premature nor does it lack transparency. The process for biological exemptions is based on several years of meetings with the U.S. Fish and Wildlife Service (USFWS), the California Department of Fish and Wildlife (CDFW), and DTSC staff. DOE received letters from USFWS and CDFW accepting the exemption process. Appendix E of this EIS lists those meetings and the names and affiliations of the attendees. Application of exemptions would be based on the process described in this EIS and the USFWS Biological Opinion (see Appendix J of this EIS). Appendix E also list meetings and attendees that were held to address cultural resources. Exemptions for historic resources would be based on the process in an NHPA Section 106 Programmatic Agreement, which is being developed by DOE in consultation with the California Office of Historic Preservation, the federally recognized Santa Ynez Band of Chumash Indians, non-federally recognized tribes, and other consulting parties. Please refer to “Application of Exemptions under the 2010 Administrative Order on Consent” (Section 2.4 of this CRD) for a discussion of this topic and DOE’s response.” None of the action alternatives presented in this EIS would threaten the public’s health.

Simi Valley, CA 93063

Re: DOE/EIS-0402, Area IV and Northern Buffer Zone
Santa Susana Field Laboratory

The West Hills Neighborhood Council has reviewed the DOE's Environment Impact Statement in which the DOE presents cleanup alternatives with explanations of each process and evaluations of the consequences for the environment, cultural resources, public health, and surrounding communities.

We believe that it is in the public interest to clean up the property to a level safe for humans and for use as open space; therefore we do not accept the "No Action" alternative.

The remaining three alternatives provide for cleanup of the site to suburban residential standards and, with the exception of the AOC, meet acceptable contamination levels per US EPA standards.

We are opposed to the "Cleanup to AOC LUT Values" alternative. This cleanup is destructive and uses chemical lists and extraordinary cleanup levels provided by unknown sources without consideration of whether they pose any threats to human health. We believe that it will be a large-scale excavation that will impact the environment and the surrounding communities. Although no replacement soil has been identified to date, after a suitable backfill is found this process will result in a tremendous increase in truck and related traffic on local streets and airborne contaminants in surrounding communities.

The selection between the remaining two alternatives is based on the consequences to the communities, which are driven by the size of the excavation, in situ treatment, and backfill and include the resulting air pollution and truck traffic. We prefer an alternative, which provides the least amount of truck traffic, soil removal, soil disturbance, soil replacement and airborne pollution. Additionally we want DOE to use on-site remediation to the maximum extent possible to further reduce air pollution and truck traffic.

West Hills will be the community most impacted by the site cleanup and a minimization of activity would generate minimal air pollution. It is important that the DOE monitor the dust and gases in the surrounding communities so that activities can cease and mitigation take place when airborne contaminant levels become unacceptable. We also recommend that local residents be monitored for any unusual illness trends that may be related to the site activity.

Respectfully,

President

P.O. Box 4670, West Hills, CA 91309-4670
mail@westhillsnc.org * www.westhillsnc.org

32-1 DOE acknowledges your support for an alternative that provides the least amount of truck traffic, soil removal, soil disturbance, soil replacement, and airborne pollution. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

As discussed in Chapter 2, Section 2.3.2, of this EIS, one potentially effective form of onsite remediation would be to use monitored natural attenuation for management of certain low-concentration, petroleum-contaminated (TPH) soil. DOE has estimated that this onsite treatment method would reduce the amount of soil to be considered for removal at Area IV and the NBZ by about (620,000 cubic yards, with corresponding reductions in truck traffic and emissions of air pollutants. (Simple polycyclic aromatic hydrocarbons may be amenable to natural attenuation and would be evaluated on a location-by-location basis during development of soil remediation plans.). This or any other onsite treatment method would have to be approved by DTSC.

32-2 This Final FEIS demonstrates (Chapter 4, Section 4.6) that by complying with applicable Ventura County Air Pollution Control District (VCAPCD) Rules, combustive and fugitive dust emissions generated from cleanup activities proposed by the DOE would produce less than significant air quality impacts on locations outside of the SSFL boundary. Direct transport of these emissions to a distance of nearly one mile to the nearest residence or farther, such as the West Hills community about 3 miles away, would further dilute these pollutant concentrations to well below any level of health concern.

The proposed cleanup activities would adhere to a fugitive dust control plan that identifies a variety of measures to minimize emissions and therefore to comply with VCAPCD Rule 55 – Fugitive Dust. Personnel would visually monitor the proposed cleanup activities on a real time basis and if there were any noticeable increase in emissions, such as fugitive dust, they would quickly implement measures to mitigate their intensities, thereby avoiding any substantial air pollutant exposure to the public.

DOE, NASA, and Boeing each implemented their respective baseline air monitoring programs in early 2018 for their areas of responsibility at SSFL. For DOE the program includes a meteorological station within Area IV and four air monitors along the perimeter of Area IV (as described in NASA/Boeing/DOE 2017). The perimeter stations include two along the north border near the SRE and RMHF, one along the western border, and one along the southern border. DOE is operating the system to establish a pre-remediation baseline. The system will continue to operate during remediation activities to monitor any potential air pollutant releases of concern. If the

32-1

32-2

32-3

Commenter No. 32 (cont'd): Daniel Brin
West Hills Neighborhood Council

air monitoring network indicates any elevated levels of air pollution, onsite staff would take action to mitigate the releases to acceptable levels. A description of the DOE air monitoring system was added to Chapter 3, Section 3.6.1 of this Final EIS.

Air quality impacts from proposed offsite haul truck transport would be minimal, due to the relatively low emission rates of these vehicles. As discussed in Final EIS Chapter 4, Section 4.6.4.2, the air quality analysis estimates that unmitigated diesel particulate matter (DPM) emissions generated by a 2021 average California truck fleet within the entire South Coast Air Basin analysis domain under the nearby disposal site scenario would amount to less than 31 pounds per year, or about 0.4 pounds during a peak day (based on 32 truck round trips per peak day) (Leidos 2018b; Tables 1.A-23 and 1.A-24; [DPM is about 20 percent of the PM10 values in these tables]). These emissions would occur over about 160 miles of roadway that span a large portion of the SCAB. As a result, populations adjacent to roadways proposed for the transport of materials from the SSFL would be exposed to very low DPM emissions from project haul trucks and likely would experience no noticeable health effects from these emissions.

Due to the low air pollutant impacts on nearby residents that would occur from the proposed cleanup activities, DOE's visual monitoring and perimeter air monitoring stations are adequate to identify the need for any corrective actions to mitigate unacceptable air emissions.

- 32-3** Health studies for the area around SSFL have been conducted in the past. DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for discussion of data on offsite contamination, historical health monitoring, and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. Based on available data and the analysis in this EIS, DOE does not believe health monitoring in the vicinity of the site is necessary, but notes that the State of California collects data on and maintains a registry of incidences of cancer.

**Commenter No. 33: Matthew Ottoson, President,
USGBC Central Coast Green Building Council**

February 20, 2017

To: **Ms. Stephanie Jennings**
NEPA Document Manager
SSFL Area IV EIS
U.S. Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 93063

Dear Ms. Jennings,

We are the Central Coast Green Building Council, a local chapter of the U.S. Green Building Council representing the communities of Ventura, Santa Barbara, and San Luis Obispo Counties. We are concerned that the Department of Energy's Draft Environmental Impact Statement (DEIS) for the Santa Susana Field Laboratory (SSFL) Area IV cleanup will not remove the long term community and environmental hazards associated with the remaining pollution at the SSFL site. We acknowledge the great scientific work produced at the SSFL that enabled the U.S. to fly to the moon and we expect the DOE to clean up the site so that it can be celebrated by the community as a monument to American ingenuity.

A basic philosophy of the U.S. Green Building Council is to balance the health of the environment, the people and the economy in order for all three to thrive. The past activities at the SSFL resulted in pollution that has damaged the health of the environment and the adjacent community. The DOE can restore the balance by proceeding with a full cleanup of all toxic chemicals and radioactive materials at the site, so that the environment, community and economy in this area can continue to heal and thrive. We think that it would be appropriate to err on the side of caution, given the unfortunate exposure to carcinogens and known toxins to both the environment and the community in the past.

The DOE should respect the 2010 Administrative Order of Consent (AOC) agreement (as described in the DEIS Section 1-7) and provide no less than full site cleanup. Any "leave in place" cleanup methods, including natural attenuation and "no action" methods should not be considered. The AOC

Central Coast Green Building Council

P.O. Box 31017, San Luis Obispo, CA 93106

www.usgbc.org/centralcoast

33-1

33-1
cont'd

33-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," of this CRD, for further discussion of this topic. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) Use of a risk-based criteria to determine soil cleanup is consistent with the approach used by DOE at other DOE sites, by DTSC at DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. (In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site.) Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives. As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD, for

**Commenter No. 33 (cont'd): Matthew Ottoson, President,
USGBC Central Coast Green Building Council**

is a legally binding agreement with the California Department of Toxic Substance Control (DTSC), and the DTSC should continue to manage the extent of the cleanup. The legal obligations in the AOC already require full cleanup, and even if it didn't exist, the California DTSC is the regulator who decides cleanup requirements for these toxic chemicals. We request adherence to the 2010 AOC Agreement in full, and maintain that the management of the cleanup remain with the California DTSC.

DOE's recently submitted DEIS and its proposed options for cleanup make it clear that DOE wants to abandon its 2010 commitment to clean up all of its contamination at SSFL (See DEIS Soil Remediation Alternative S.10.2). Instead, the DOE proposes leaving between 39% and 99% of the dangerous radionuclides and toxic chemicals on site, not cleaned up, where they will continue to migrate and put nearby communities at risk. The long term damage to the ecosystem, watershed and biological environment outweigh the short term impacts of full cleanup to the natural ecosystem and cultural artifacts on the site.

Although complete remediation of the toxic materials on the site is more expensive to the DOE, the alternative long term cost to the nearby communities will be even greater in terms of illness, ongoing pollution to the water table and ongoing medical care for the community. The pollution onsite has already migrated into the adjacent populated areas via rainwater runoff, prevailing westerly winds, and via natural fires as evidenced by increased local cancer rates among nearby residents as identified by the September 1997 Tricounty Regional Cancer Registry that shows increases in lung and bronchial cancers, the March 2007 University of Michigan identifying increases in thyroid cancer cases, and the 2012 California Breast Cancer Mapping project that identified a 10-20% increase in breast cancers for people living in the vicinity of SSFL. We have the opportunity to clean up the site once and for all and the time is now.

Large amounts of water will be used to control dust during the full removal of the hazardous soil, and if the DOE can use reclaimed water for that purpose, this will be more sustainable than using our valuable potable water resource for dust control.

If all of the contamination at SSFL is not cleaned up per the AOC cleanup agreement, people who live nearby and future visitors to the site will continue to experience increased risk of cancer and

a discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE acknowledges your concern about cleanup of SSFL per the 2010 AOC and your concern about offsite migration of contaminants and health risk. As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD, for a discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer mortality and incidence rates for the United States, California, and Los Angeles and Ventura Counties. DOE acknowledges that there are chemical and radioactive constituents above background radiation levels in parts of that portion of SSFL for which it is responsible, Area IV and the NBZ. See Chapter 4, Section 4.9, of the EIS for information on chemical and radioactive constituents in Area IV and the NBZ. DOE's purpose in preparing this EIS is to evaluate alternatives for completing cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. All of the action alternatives evaluated in this EIS would result in a cleanup of Area IV and the NBZ that would be protective of the public health and safety and the environment.

33-3

DOE agrees that use of reclaimed water would be desirable for dust control. Chapter 6, Table 6-1 of this Final EIS identifies minimization measures that DOE proposes to use as part of the remediation action alternatives. Included in these minimization measures are 1) Use captured rainwater, uncontaminated wastewater, or treated water for building demolition and soil and groundwater remediation activities or site restoration activities when possible (e.g., for wash water, irrigation, dust control, constructed wetlands, or other uses), and 2) Water used in the remediation technologies will be treated and released to the surface under a National Pollutant Elimination Discharge System Permit, discarded offsite, or used for dust suppression.

Chapter 7, Table 7-1, of this Final EIS, summarizes the applicability of greener cleanup using best management practices (BMPs) in DOE's remediation activities. DOE would use the minimization measures in Table 6-1 for the action alternatives. The BMPs in Table 7-1 offer additional measures that DOE would evaluate and decide whether

**Commenter No. 33 (cont'd): Matthew Ottoson, President,
USGBC Central Coast Green Building Council**

illnesses related to exposure to SSFL contaminants. The DEIS Appendix G identified 28 found radionuclides, and 56 additional toxic chemicals including PCB's, PAH's, dioxins, petroleum chemicals, mercury and silver. The Agency for Toxic Substances and Disease Registry identifies many of these as chemicals known to cause various cancers, and are classified as Group 1 Carcinogens to humans by the International Agency for Research on Cancer. We request your faithful dedication in protecting the health of our communities and keep your cleanup commitment by ensuring that DOE's final EIS fully comply with the AOC provisions and clean up all SSFL contamination. We look forward to the day when the site has been cleaned up, and we can celebrate the achievements of the Southern California aerospace industry at this historical site. Thank you.

33-2

33-1
cont'd

Sincerely,

Matthew Ottoson
President | USGBC Central Coast Green Building Council

to implement during the cleanup process as opportunities arise. In this table, DOE addresses the potential for use of reclaimed water for such activities as dust control or wash water. Sources of water could include captured stormwater runoff or treated extracted groundwater. The use of captured stormwater runoff, however, would require coordination with the landowner (Boeing), and the use of treated extracted groundwater (a minor potential source of reclaimed water) would require approval by the State of California. There are no wastewater treatment facilities in the vicinity of SSFL capable of supplying reclaimed water and DOE is not considering construction of a parallel reclaimed water distribution system for site reclamation activities. Such a distribution system would need to pass through urbanized areas and then up the steep slope to SSFL, and it would potentially result in additional environmental impacts.

Simi Valley, CA 93063

Re: **DOE/EIS-0402, Area IV and Northern Buffer Zone of the Santa Susana Field Laboratory**

The Santa Susana Mountain Park Association ("SSMPA") has reviewed the DEIS for Area IV and parts of the Northern Buffer Zone (January 2017) and offers the following comments:

In formulating our comments, we note the property that is the subject of the EIS is owned by Boeing, who has publicly stated on multiple occasions that this property will be used as open space after the cleanup, with restrictions to ensure open space will be the permanent use of the site.⁷

The property is located in the Simi Hills on the west side of the San Fernando Valley. The DOE site, combined with the rest of the Boeing and NASA properties, encompasses approximately 2800 acres and serves as a key portion of a wildlife habitat and migration corridor in the western San Fernando Valley and the eastern Simi Valley. This corridor provides significant access points for animals, as well as plants, to move between the Santa Monica Mountains National Recreation Area and the Los Padres National Forest to the north. This site represents one of the largest parcels in the Rim of the Valley study area that is expected to become open space in the future. Long term use of the site will include hiking trails and public use as open space.

All cleanup alternatives ("No Action" Alternative aside) provide for cleaning up soil to suburban residential standards or cleaner.⁽⁵⁻¹²⁾ Suburban residential cleanup standards assume residential use by humans who live on the site for life. Therefore the risk statistics cited in the DEIS⁽⁵⁻³⁰⁾ are considerably higher than would be incurred in occasional recreational use, rather than constant presence on the land. We note cleanups traditionally use risk-based standards such as suburban residential, open space (a lesser level of cleanup), or agricultural (a higher level of cleanup since food is grown on the land), but soil cleanups to background LLIT values are extraordinarily uncommon.

The "Cleanup to AOC Look-Up Table Values Alternative" has been shown through the DOE EIS to place a heavy financial burden on taxpayers, and carries significant negative impacts to nearby residents due to haul truck traffic and related pollution impacts over many, many years.⁽⁵⁻²⁸⁾ We see no rationale for removing background-level chemicals that are not typically tested for, and are not generally viewed as dangerous to humans.

Concerns with the effects of this "Background" level cleanup also include the inability to replace removed soil due to no soil being available that has a composition clean enough to be approved as replacement soil.⁽⁵⁻²⁹⁾ Although this issue was identified in 2010, no solution has become evident and DTSC has suggested no practical alternative. The AOC requires replacement of the soil that is removed. The DOE DEIS has made it clear that even soil sold commercially for landscaping is not sufficiently clean.⁽⁵⁻²⁹⁾ We ask what benefit, if any, we all would gain under the "Background" level cleanup compared to a more traditional risk-based standard.

SSMPA Comments on DOE EIS v1_0

Page 1 of 3

34-1

34-1

DOE acknowledges your opposition to the Cleanup to AOC LUT Values Alternative. Please refer to Section 2.1, "Preferences for Cleanup," of this CRD for further discussion of this topic.

34-1
cont'd

Commenter No. 34 (cont'd): Teena A. Takata, President,
Santa Susana Mountain Park Association

We oppose the "Cleanup to AOC LUT Values Alternative." It is excessive, with severe negative environmental effects for many years as trucks continue to haul soil with inconsequential contamination through local communities to distant dump sites. As the SSFL shifts to its long term use as open space, it would continue to be impacted by the unresolved absence of "adequate" replacement soil. The removal of additional chemicals under the "AOC LUT Values Alternative," does not serve any useful purpose, and yet entails many years of traffic and related pollution effects.

34-1
cont'd

We feel that minimizing the proposed action to provide cleanup to suburban residential standards is effective and imposes much milder negative effects on surrounding communities. The long term use of the site as open space, combined with the presence of significant native cultural artifacts and native vegetation on the site, including several uncommon and rare native plants, guides us to a risk-based cleanup approach.

Based on the above discussion, our preferred alternative is the "Conservation of Natural Resources Alternative." This provides the fewest truck trips, the least soil removal, the fewest trips to replace soil, and the least cost to taxpayers.

34-2

34-2

DOE acknowledges your support for the Conservation of Natural Resources Alternative for soil remediation and Groundwater Monitored Natural Attenuation Alternative for groundwater remediation. Please see Section 2.1, "Preferences for Cleanup," of this CRD for further discussion of this topic.

A valid similar alternative is the "Cleanup to Revised LUT Values Alternative." We note projected cancer risks are fairly similar under this proposal (1 chance in 100,000 to 270,000) to the extremely lengthy and problematic "Cleanup to AOC LUT Values Alternative," (1 chance in 100,000 to 310,000).⁽⁵⁻³⁶⁾ The "Cleanup to Revised LUT Values Alternative" provides the second best opportunity to minimize cleanup impacts to our communities.

We note that cancer risks cited in the DOE EIS ⁽⁵⁻³⁶⁾ are based on suburban residential standards, not on the lesser exposures that will be experienced by open space users of the site. Consequently the stated cancer risks in the DEIS are significantly above the actual risk anticipated for future users of the site. Cleanups that would be done under all of the presented alternatives are highly protective of human health for the less intense use of this site as open space.

We encourage the DOE to adopt the "Conservation of Natural Resources Alternative" to clean up significant contamination, with the most minimal impacts to the site and surrounding communities.

34-2
cont'd

We also urge the DOE to implement the "Groundwater Monitored Natural Attenuation Alternative" in conjunction with the "Conservation of Natural Resources Alternative" for soils, thereby adopting what the DOE EIS designates the "Low Impact Combination," the alternative combination with the smallest environmental consequences.⁽⁵⁻⁷⁰⁾

36-1

36-1 DOE acknowledges your concern about cleanup of SSFL. DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

36-2

36-2 NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. Additionally, DOE is under court order from the U.S. District Court for the Northern District of California to prepare an EIS. DOE may not transfer possession or otherwise relinquish control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision.

Commenter No. 37: Andrea Horigan

Dear Stephanie Jennings,

I am writing to urge you to stick to your commitment as DOE to clean up the Santa Susana Field Laboratory Area IV.

You need to help protect our community and clean up all of the contamination at SSFL.

Sincerely Andrea Horigan

37-1

37-1

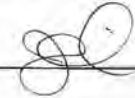

DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

NOW! SOONER RATHER THAN
LATER, PEOPLE ARE DYING!

Signed: Jeri Oliver

39-1

39-2

39-1 DOE acknowledges your concern about cleanup of SSFL. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

With respect to the timeliness of DOE's completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record of Decision pursuant to NEPA. Additionally, in accordance with the CEQA, DTSC must also complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). DTSC will also need to approve DOE's soil cleanup, groundwater cleanup, and facility closure plans before those activities can start. DOE will work closely with DTSC to ensure initiation of cleanup starts as early as possible.

39-2 DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of data on offsite contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 40: Gustavo Miramontes

RE: Comment on SSFL Draft Environmental Impact Statement

Uphold The AOC!
Clean SSFL to BACKGROUND.

Cleanup will begin following completion of these regulatory actions. DTSC will also need to approve DOE's soil and groundwater cleanup plans before those activities can start. DOE will work closely with DTSC to ensure initiation of cleanup starts as early as possible.

Commenter No. 41: Shari Freedman

None of the proposed alternatives clean up SSFL to the standards that DOE committed to in the Agreement on Consent (AOC)

- DOE must not violate the agreement by looking at alternatives to following it (other than the baseline do-nothing alternative)
- The agreement is a debt that the United States owes to the people of California, and the United States cannot question its debts
- DOE should consider various alternatives for HOW to follow the AOC, including alternatives to using trucks, using alternate routes, and isolating the most contaminated soil to reduce the amount of soil that must be removed

Signed:

41-1

41-1

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup levels (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). The use of risk-based criteria to determine soil cleanup is consistent with the approach used for cleanup actions at other DOE sites, by DTSC at DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. A discussion of suggested transportation options and the DOE response to these suggestions are discussed in Section 2.9 "Options for Transportation of Waste from SSFL," of this CRD.

Commenter No. 42: Julie Korenstein

Re DOE EIS Area IV and Northern Buffer Zone

Santa Susana Field Laboratory

Thank you for the opportunity for the CAG to comment on your SSFL Environment Impact Statement. The document is well researched, develops alternatives with their benefits and consequences, and allows for the future selection of a cleanup method.

The CAG supports the Conservation of Resources alternative, which satisfies the National Contingency Plan, The California Health Act, NEPA and the US EPA guidelines, and includes development of alternatives, the use of risk assessment and area averaging. The existing AOC agreement between DOE and DTSC does not satisfy any of these laws and regulations and needs to be rewritten. This alternate would accurately identify those areas for remediation that present threats to human health, and would result in less excavation, backfill, pollution and truck traffic. The amount of truck traffic and pollution are the selection criteria for an alternate since they are the primary concerns of the surrounding communities. Backfill would be readily available.

The No Action alternative should not be considered. This site is leased by DOE from Boeing, and if DOE does not clean up the site, that action would not support Boeing's commitment to clean their property to an US EPA standard of suburban residential for ultimate use as open space.

The existing AOC contains directions for a severely flawed process and should not be selected for implementation. This contractual agreement contains a list of chemicals that are to be removed from the DOE site that was compiled from unknown sources, and directs cleanup to background or detect. The document does not have any consideration of end use, human health, toxicity or health threats, and it does not comply with any of the federal and state laws and regulations governing such cleanups. Furthermore it requires point-by-point sampling for 132 substances with extraordinarily low test values that almost guarantee rejection and the requirement for removal of massive amounts of soil. The backfill must meet the same values as the cleanup, and to date no backfill soil has been found that meets those criteria.

The Revised LUT Values alternative accounts for toxicity, end use of the site and threats to human health. It reduces the number of substances that would trigger rejection of soil by approximately 80 percent, with corresponding reductions of excavation, backfill, trucks and pollution. However this

45-1

45-1

Thank you for your comment. It has been included in the Administrative Record for this Final EIS.

45-2

45-2

DOE acknowledges the SSFL Citizen Advisory Group's (CAG's) support for the Conservation of Natural Resources Alternative for soil remediation and Groundwater Monitored Natural Attenuation Alternative for groundwater remediation. Please see Section 2.1, "Preferences for Cleanup," of this CRD for further discussion of this topic. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

Commenter No. 45 (cont'd): Alec Uzemeck
SSFL Community Advisory Group

alternate uses point-by-point sampling, and does not reduce the excavation as much as the Conservation of Natural Resources. This alternate is our second choice.

The choice for Groundwater Remediation should be Monitored Natural Attenuation. The bedrock is holding the contamination in place with the exception of several plumes that are being monitored, pumped and treated. The groundwater is not used for drinking water.

The EIS does include an air-sampling program that will monitor the site when work is under way, but for the community, the CAG recommends that the sampling include health risks such as Valley Fever and diesel fine particulates.

45-3

45-3

Due to the low air pollutant impacts on nearby residents that would occur from the proposed cleanup activities, DOE's visual monitoring and perimeter air monitoring stations are adequate to identify the need for any corrective actions to mitigate unacceptable air emissions.

This Final FEIS demonstrates (Chapter 4, Section 4.6) that by complying with applicable Ventura County Air Pollution Control District (VCAPCD) Rules, combustive and fugitive dust emissions generated from cleanup activities proposed by the DOE would produce less than significant air quality impacts on locations outside of the SSFL boundary. (One indication of the significance of air quality impacts is that air emissions would be well below any level of health concern to sensitive members of the population.) Direct transport of these emissions to a distance of nearly one mile to the nearest residence or farther would further dilute these pollutant concentrations to well below any level of health concern.

The proposed cleanup activities would adhere to a fugitive dust control plan that identifies a variety of measures to minimize emissions and therefore to comply with VCAPCD Rule 55 – Fugitive Dust. Personnel would visually monitor the proposed cleanup activities on a real time basis and if there were any noticeable increase in emissions, such as fugitive dust, they would quickly implement measures to mitigate their intensities, thereby avoiding any substantial air pollutant exposure to the public. Minimization measures are identified in Chapter 6, Table 6-1 (Subsection: Air Quality and Greenhouse Gases). Monitoring of cleanup activities is identified in Minimization Measure 6-1.

DOE, NASA, and Boeing each implemented their respective baseline air monitoring programs in early 2018 for their areas of responsibility at SSFL. For DOE, the program includes a meteorological station within Area IV and four air monitors along the perimeter of Area IV (as described in NASA/Boeing/DOE 2017). The perimeter stations include two along the north border near the SRE and RMHF, one along the western border, and one along the southern border. DOE is currently operating the system to establish a pre-remediation baseline. The system will continue to operate

Commenter No. 45 (cont'd): Alec Uzemeck
SSFL Community Advisory Group

during remediation activities to monitor any potential air pollutant releases of concern. If the air monitoring network indicates any elevated levels of air pollution, onsite staff would take action to mitigate the releases to acceptable levels. A description of the DOE air monitoring system was added to Chapter 3, Section 3.6.1 of this Final EIS.

Air quality impacts from proposed offsite haul truck transport would be minimal, due to the relatively low emission rates of these vehicles. (See Chapter 4, Section 4.6 and Chapter 6, Table 6-1, items 6-2 and 6-4.) As discussed in Final EIS Chapter 4, Section 4.6.4.2, the air quality analysis estimates that unmitigated diesel particulate matter (DPM) emissions generated by a 2023 average California truck fleet within the entire South Coast Air Basin analysis domain under the nearby disposal site scenario would amount to less than 500 per year or 5 pounds during a peak day (based on 250 days per year) (Leidos 2018b; Tables 1.B-15 and 1.B-17). These emissions would occur over about 160 miles of roadway that span a large portion of the SCAB. As a result, populations adjacent to roadways proposed for the transport of materials from the SSFL would be exposed to very low DPM emissions from project haul trucks and likely would experience no noticeable health effects from these emissions.

Regarding testing for the presence of Valley Fever, Chapter 4, Section 4.9.2.6, of this Final EIS indicates that there are no commercially available tests to reliably test the soil for *Coccidioides* spores before working in a particular location (CDC 2014; HESIS 2013). Soil testing is currently only done for scientific research, and the available methods to detect *Coccidioides* in the soil do not always detect the spores, even when they are present (CDC 2014). Because the spores may be present in the soil, reasonable precautions would be taken to reduce potential for exposure. For example, the fugitive dust control plan mentioned above will include measures to reduce the risk of spreading Valley Fever that focus on fugitive dust controls recommended by the VCAPCD to minimize fungal spore entrainment, as well as minimizing worker exposure (VCAPCD 2003).

Commenter No. 46: Bruce Boyer

NEPA DOCUMENT MGR 3-20-2017

I am a resident of Cobble Lake. My daughter and mother are all residents (we own three homes there.) do not want the SSFL dug-up. The area should be preserved. We do not want our neighborhood ruined for science to appear the favorites. We are science based people. We do not support "green" (drum) we want science based actions, or non-actions. We are educated, not "internet-educated". We live near nuclear in Germany. My wife worked science and I was an NBC NBC in the US Army. I know a good deal about nuclear and chemical contamination.

Bruce Boyer
[Redacted]

46-1

46-1

DOE acknowledges your concern about preservation of SSFL and application of science-based actions or non-actions. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

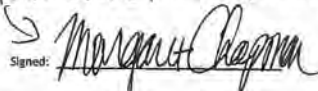

Commenter No. 47: Margaret Chapman

Stephanie

RE: Comment on SSFL Draft Environmental Impact Statement

DOE proposes four alternatives that would leave 39%, 91%, 99% or 100% of the contamination not cleaned up. All of the alternatives violate the cleanup agreement that DOE signed in 2010, which prohibits leaving contamination on site.

UPTOLD THE AOC and Start Charging fines!

Margaret Chapman
Signed: 

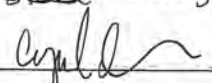

47-1

47-1

DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," of this CRD. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

Commenter No. 48: Crystal Cunningham

RE: Comment on SSFL Draft Environmental Impact Statement

UPHOLD THE AOC!
Clean up to background
Nothing else is acceptable!
Crystal Cunningham
Signed:

48-1

DOE acknowledges your concern about cleanup of SSFL to background radiation levels and upholding the AOC. DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

Commenter No. 49: William Clark

Dear Stephanie,

I'm not sure if this is the proper forum to express a thought I have for several years now regarding the future use of Santa Susanna Field lab, but here it is.

The property in question is an incredibly beautiful paradise in the Santa Mountains and though the area is considered tentatively uninhabitable, it would none-the-less make a world class Senior Citizen community and recreation Mecca. Leisure Village in Camarillo would pale in comparison.

Just some thoughts,

Sincerely,

William Clark

49-1

49-1

This EIS addresses those portions of SSFL for which DOE has cleanup responsibility, Area IV and the NBZ. However, DOE does not own the land; it is owned by The Boeing Company (Boeing). Boeing has stated its intent on maintaining the land as open space and formalized that intent. In 2017, Boeing and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site.

Re: DOE/EIS-0402, Area IV and Northern Buffer Zone
Santa Susana Field Laboratory

Dear Ms. Jennings,

I recently filed the attached email with the County Board of Supervisors related to their March 14, 2017 agenda item demanding full support of the AOC's. After they processed the DOE extension period for comments on the DEIS, they adjusted the agenda item to ask for studies, and backed off slightly from their original position in the agenda.

I find ten extra years of shipping dirt off the site that normally would be deemed fine under usual cleanup standards, combined with an inability to replace the soil due to lack of "clean" soil as an incomprehensible action. The "cleanup" of inert chemicals has no benefit whatsoever for the community or the DOE portion of the SSFL, and only creates detriments from traffic and pollution from that "extra" cleanup, further damage to the site due to lack of adequate soil replacement, and the extraordinary cost of that "extra" cleanup that provides no actual benefits. This comment is only strengthened by the long term use of the property as open space that Boeing has promised for many years.

I fully support the Conservation of Natural Resources approach as providing a reasonable cleanup, and as protective of human health and the wildlife that lives on the site. The Cleanup to Revised LUT Values would also be acceptable, but the AOL LUT Values have no valid purpose, and in fact, the California Courts have struck down SB 990, the law the AOC's were based on.

Please accept this cover letter and the attached memo to the Los Angeles County Board of Supervisors as my personal comments on the DOE Draft EIS.

Sincerely,

Teena A Takata

50-1

50-1

DOE acknowledges your support for the Conservation of Natural Resources Alternative. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

Subject: Regarding Item 14, regarding the DOE EIS at the Santa Susana Field Lab on the March 14 agenda:
Attachments: DOE The Truck Slide Final Hearing Presentation 2-20-17.pdf

Hi Jarrod and others,

I saw the changes to the Board of Supervisors agenda item relating to the SSFL and am very disappointed to see language requiring compliance with the AOCs. As the site has been studied, many problems have been identified that prove the AOC's to be impossible to comply with, and the gigantic cost of removing non-toxic "chemicals" has been quantified. Many people in the community have attended hours and hours of educational meetings with presentations by scientists, epidemiologists, attended tours, PPG and CAG meetings, and read a multitude of environmental documents relating to the SSFL cleanup. Those who have taken time to educate themselves understand what a disaster the AOC's are for the site and nearby communities. Please pass this out to key people involved in this decision.

It is regrettable that our Los Angeles County Supervisors seem to scorn NEPA, which like CEQA, requires a review of the full range of alternatives. While spending 10 years removing the non-harmful chemicals that are part of the AOC's dangerously over-aggressive "background standard" may be important to keep funding going into Dan Hirsch's "charity," it is indecent to subject our lungs, homes, and communities to the traffic and pollution it will cause.

The DOE truck graphic, presented at the public hearings (attached), makes it painfully clear. The chemicals that typically are subject to cleanup (on projects other than the SSFL) are shown as yellow, red, or blue. Those hundreds of thousands of cubic yards of "green" soil are "contaminated" by fiat, in name only, by the application of the arbitrary "background" cleanup "standard." The soils are not contaminated under conventional rules; they are "contaminated" only under the cleanup to "background" rule that was contrived to mimic the discredited SB 990 California law, which was long ago ruled unconstitutional by the courts.

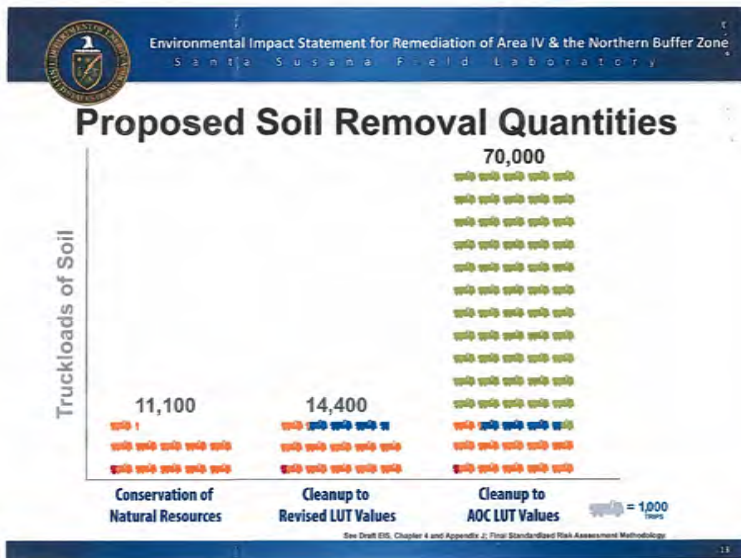

I drove behind about 4 haul off trucks on a recent morning at about 5am on Valley Circle Road going through the Lake Manor area before they turned up Woolsey Canyon Road. Presumably they were empty since they were going to the site. They move at about 10-14 miles per hour on that windy road. Wait until we have them going in and out every five minutes for ten years (for no good reason), it will be a real mess.

I urge the Supervisors, at a bare minimum, to ask an impartial, intelligent staff person to at least read the executive summary of the EIS and file a staff report, so the Supervisors will better understand what they are voting on. And the Supervisors should vote after they understand what the cleanup entails. We all want the SSFL land cleaned up. But there is no reason to strip the soil away pretending that we are conforming to a standard that is fundamentally impossible. The DEIS provides an outstanding analysis to explain and analyze what cleanup is needed, and what cleanup is based on a site specific technicality. Should we pretend to conform to an impractical, non-standard "standard" at the cost of 30 years of truck traffic, and their related negative impacts, including huge taxpayer costs? Why?

March 27, 2017

To Whom It May Concern:

Re: Draft Environmental Impact Statement for Remediation of Area IV and the Northern Buffer of the Santa Susana Field Laboratory (DOE/EIS-0402).

As a resident of the Santa Susana Knolls, I was dismayed to find out at the most recent Community Meeting you held in Simi Valley that: number one, the Department of Energy wants to renege on its promise to completely clean up the nuclear mess in our community; and number two that, if I am correct, no actual study had been done to show how far and in what manner the contamination is spreading. How can we have faith in government if they want to cut back on their clean-up when they don't know what the result will be?

Sincerely,

Rochelle Lapidès

Simi Valley, CA 93063

RE: SSFL Draft Environmental Impact Statement

Dear Ms. Jennings:

In response to the Department of Energy's Draft Environmental Impact Statement regarding the Santa Susana Field Laboratory (SSFL), none of the proposed alternatives will clean up the SSFL to the standards that DOE committed to in the Agreement on Consent. To not clean up this area to the standards that you committed to, is a violation of that agreement. The SSFL site has already adversely affected the lives of many of the people in this community and will continue to do so without proper and complete clean-up. I grew up in the San Fernando Valley and was a child at the time of the accident. I am now 67 years old with children and grandchildren living in Simi Valley. We have waited a VERY long time for a solution to this mess. Please honor the commitment you made to clean-up this site.

Respectfully,

Patricia Merchant

52-1

52-2

52-1
cont'd

52-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.)

52-2 All of the action alternatives would leave concentrations of chemicals or radionuclides that are protective of human health and the environment for the intended use of the site as open space. Regarding your concern about affecting people in the community, please refer to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for additional information on these subjects. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

RE: Comments for the SSFL DOE Area 4/Northern Buffer Zone Draft EIS

Dear Ms. Jennings:

I'm writing you not only as a naturalist and educator who has lead nature walks and activities for more than 23 years but also as someone whose mother lives a few minutes away from the Santa Susana area.

I strongly favor the **Conservation of Natural Resources** alternative in the DEIS. This balanced alternative offers a cleanup to a risk-based suburban residential standard and is the least damaging to SSFL natural, cultural, and historical resources and to adjacent communities.

This alternative solution uses a risk-based standard, based on prospective land use, which is standard operating procedure that the EPA uses to govern the clean-up of polluted sites throughout the country.

This alternative would help ensure that all clean-up activities would be implemented to minimize a) traffic (especially from trucks) to and from SSFL and b) the transport of contaminated materials through the residential, institutional and commercial areas of Los Angeles (my mother lives in a nearby West Hills, assisted-living community for example).

This alternative would support the inclusion of the entire SSFL in a National Monument ideally administered by the National Park Service, in order to protect the cultural and natural resources as well as preserve the important wildlife corridor through the Simi Hills between the Santa Monica Mountains and Susana Mountains (Alternatively, the site could be protected as a wildlife refuge or park administered by some other agency.) Of course any areas disturbed by clean-up activities should be restored by replanting the areas using native plants, which would be maintained and monitored until they are established.

I'm aware there are other more extreme, expensive proposals for cleanup that would involve transporting large amounts of contaminated soil on public streets and highways -- many years' worth of trucks hauling away many hundreds of thousands, if not millions, of cubic yards. Consequently, the extreme proposals would a) pose a serious threat to public health and b) unnecessarily destroy wildlife and habitats as well as important Native American cultural resources.

Not only are such destructive and expensive proposals completely out of keeping with myriad toxic waste cleanups that have been deemed sufficient and cost-effective in other U.S. locations, these proposals are inconsistent with the end use of the SSFL property as open space.

In conclusion, I strongly urge the Department of Energy to select the **Conservation of Natural Resources** alternative in the DEIS.

Respectfully,

Susan Silver
Naturalist and Educator, Los Angeles

53-1

53-1

DOE acknowledges your support for the Conservation of Natural Resources Alternative. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. Please also note that DOE does not own the property in Area IV or the NBZ and cannot determine the ultimate land use for the property. As discussed in Chapter 1, Section 1.5, of the EIS, the property owner, Boeing, intends to preserve the land as open space for the public's benefit. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site.

RE: Santa Susana Field Laboratory (SSFL)
Area IV and Northern Buffer Zone Draft EIS (DEIS)
Comment deadline: March 14, 2017

Dear Ms. Jennings:

The Santa Ynez Band of Chumash Indians ("Chumash" or "Tribe") thanks you and DOE for the opportunity to provide comments on the DOE DEIS. DOE is covered by Executive Order 13175 as reaffirmed by that Presidential Memorandum on Tribal Coordination dated November 5, 2009 that reaffirmed Executive Order 13175, "Consultation and Coordination with Indian Tribal Governments," and emphasized the importance of strengthening government-to-government relationships with Native American tribes.

In addition, DOE is an original signatory to that MOU REGARDING INTERAGENCY COORDINATION AND COLLABORATION FOR THE PROTECTION OF INDIAN SACRED SITES (2012) and the Action Plan to Implement the Memorandum of Understanding (MOU) Regarding Interagency Coordination and Collaboration for the Protection of Indian Sacred Sites dated March 5, 2013. The Tribe believes the MOU and Action Plan should be applied to the SSFL site to engage DOE and Interior as signers to the MOU and the National Park Service as part of Interior. The Tribe hereby requests that DTSC be added as a Non-federal Partner under Section IV(9).

NEPA REQUIRES AN ANALYSIS OF CULTURAL RESOURCES IN THE DEIS

Pursuant to Council on Environmental Quality NEPA Regulations, the definition of "Effects" requires that the EA/EIS must address historic and cultural resources. (40 CFR 1508.8). Adverse and beneficial effects must be addressed in NEPA documents. (40 CFR

54-1 Indian sacred sites Traditional cultural resources are described in Chapter 3, Section 3.11, Appendix B, and Appendix F of the Final EIS. Note that the MOU referenced in the comment expired on December 31, 2017. DOE will continue to consult with the Santa Ynez Band of Chumash Indians on a government-to-government basis on an account of this Tribe's status as a federally recognized Tribe. Regarding the role of the Department of the Interior, National Park Service, DOE invited the NPS to participate in the Section 106 consultation for this undertaking, and the NPS is participating as a consulting party. Regarding the role of DTSC, DOE invited DTSC to participate in the Section 106 consultation for this undertaking, including participating in the development of the NHPA Section 106 Programmatic Agreement. DTSC declined to participate. Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for information regarding the process that will be used to determine exemptions.

54-2 The Final EIS does analyze potential impacts to cultural resources. Concerning the affected environment, Chapter 3, Section 3.11 presents a summary of the prehistory and history of the area and describes the state of knowledge regarding cultural resources in Area IV and the NBZ at SSFL. Appendix F provides more detailed background on cultural resources in the region and at SSFL. Cultural resources in Area IV and the NBZ have been identified through decades of surveys and research at SSFL, resulting in a complete and intensive inventory of these areas. DOE considered the results of this research with the intention of identifying cultural resources that may be impacted by the cleanup efforts (refer to Chapter 3, Section 3.11.2.3, and Appendix F, Section F.2). In addition to surveys, DOE has conducted extended Phase I testing to evaluate the NRHP eligibility of 10 archaeological sites in the APE (refer to Appendix F, Section F.2.3). This program of limited subsurface excavation was developed in consultation with SHPO and EIS cooperating agencies, including the federally recognized Santa Ynez Band of Chumash Indians and other tribes. The Final EIS also acknowledges that additional efforts by NASA, the Santa Ynez Band of Chumash Indians, other tribes, and others may result in the designation of one or more NRHP-eligible traditional cultural properties and/or archaeological districts that overlap with the APE.

Concerning analysis of potential impacts, as presented in Chapter 4, Section 4.11 of this Final EIS, DOE has analyzed the impacts of the proposed action and alternatives on cultural resources, including historic properties and traditional cultural resources. The analysis is based on the location of known archaeological resources throughout

54-1

54-2

Commenter No. 54 (cont'd): Sam Cohen
Santa Ynez Band of Chumash Indians

1508.8). The "Affected Environment" section of an EA/EIS should provide background information on the prehistory and history of the area and describe known historic and cultural resources that may be affected by the project. (40 CFR 1502.15). The "Environmental Consequences" section of the EA/EIS must address effects to historic or cultural resources that could result from the proposed action and each alternative. (40 CFR 1502.16(f)).

This DEIS defers all analysis of cultural resources until the NHPA 106 process is completed and therefore it is impossible to comment on cultural resources in this DEIS.

THE TRIBE THEREFORE RESERVES THE RIGHT TO COMMENT ON CULTURAL RESOURCES AT ANY TIME THROUGHOUT THE NHPA 106 PROCESS AND IN ANY SUBSEQUENT DRAFT OR FINAL EIS.

IN ADDITION, THE TRIBE REQUESTS AN EXTENSION OF TIME TO MAKE SUCH COMMENTS AT ANY TIME THROUGHOUT THE NHPA 106 PROCESS AND IN ANY SUBSEQUENT DRAFT OR FINAL EIS.

In the absence of any analysis of cultural resources in the DEIS, the Tribe, therefore, reiterates its scoping comments from March 30, 2014:

(1) The EIS Must Address Cultural Resources (copied from <http://www.npi.org/NEPA/impact>)

Cultural resources are referred to in different ways at different points in the CEQ regulations. The regulatory definition of the term "human environment" at 40 CFR 1508.14 –impacts on the quality of the human environment being the subjects of any EIS – includes "the natural and physical environment and the relationship of people with that environment." The definition of "effects" at 40 CFR 1508.8 – as in "effects on the quality of the human environment" – includes changes in the human environment that are "aesthetic, historic, cultural, economic, (or) social."

The regulatory definition of the word "significantly" at 40 CFR 1508.27 – as in "major federal action significantly affecting the quality of the human environment" – includes as measures of impact intensity:

- Impacts on an area's unique characteristics, such as "historic or cultural resources, park lands, prime farmlands, wetlands, wild and scenic rivers, and ecologically critical areas" (40 CFR 1508.27(b)(3)).
- Impacts on "districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register of Historic Places" and on "significant scientific, cultural, or historical resources" (40 CFR 1508.27(b)(8)).

54-2
cont'd

54-3

54-4

54-3

54-4

Area IV and the NBZ and on the assumption that DOE and DTSC can agree on areas of exemption that allow avoidance of, or minimization of impacts to, NRHP-eligible cultural resources while still being protective of human health. It is true that the outcome of these consultations is not known at this time. In addition, because of the nature of archaeological sites, there is always the possibility that activities associated with cleanup will inadvertently encounter previously unknown and unrecorded archaeological sites. For this reason, the NHPA Section 106 Programmatic Agreement currently being developed by DOE will include procedures for the development of a monitoring plan as well as an inadvertent discovery plan that addresses unanticipated archaeological resources, human remains, or burial-related artifacts.

Because of the government-to-government relationship between DOE and the federally recognized Santa Ynez Band of Chumash Indians, DOE will continue to work with the tribe to ensure its concerns regarding potential effects of cleanup Area IV and NBZ are considered.

As described in Chapter 3, Section 3.11.1, of this EIS, DOE defines cultural resources for the purposes of impact analysis broadly to encompass definitions of cultural resources in NEPA and the CEQ NEPA implementing regulations (see Chapter 3, Section 3.11.1, including the text box titled "Types of Cultural Resources"). Impacts on this broadly defined category of resources are addressed in Chapter 4, Section 4.11, of this EIS. Proposed methods to avoid, minimize, or mitigate impacts are described in Chapter 6, Sections 6.1 and 6.2.

Commenter No. 54 (cont'd): Sam Cohen
Santa Ynez Band of Chumash Indians

Clearly, impacts on cultural resources are to be addressed in an EIS. Note that it is not just impacts on historic properties that should be addressed. The regulations use "historic" and "cultural" in parallel, not as synonyms.

54-4
cont'd

(2) **Record of Decision Must Mitigate any Impacts to Cultural Resources** (copied from <http://www.npi.org/NEPA/impact>)

Once the EIS analysis has resulted in a draft environmental impact statement (DEIS), it is subjected to public and agency review, and comments are addressed – this may require further analysis. Then, assuming the project has not been abandoned, or so changed that a supplemental DEIS is needed, a final EIS (FEIS) is prepared and published. The FEIS is considered in making the agency's decision about whether and how to proceed with the action that was the subject of the EIS. This decision is recorded in a Record of Decision (ROD). According to 40 CFR 1505.2, the ROD must:

- State what the decision was.
- Identify all alternatives considered.
- Specify the alternative or alternatives considered to be "environmentally preferable." (Note that the agency does not have to select the environmentally preferable alternative, but it does have to discuss what it is.)
- Identify and discuss the factors balanced in making the decision (whether for or against the environmentally preferable alternative).
- State whether "all practicable means to avoid or minimize environmental harm . . . have been adopted, and if not, why they were not."

54-5

54-5

As required by CEQ's and DOE's NEPA implementing regulations, DOE will describe the proposed alternatives, announce its decisions, and discuss any adverse impacts and mitigating actions in the Record of Decision for this Final EIS. The Record of Decision will also discuss the Section 106 Programmatic Agreement being developed in consultation with the California SHPO, the Santa Ynez Band of Chumash Indians, other tribes, and other consulting parties.

Having notified the world of its decision, the agency implements it. In doing so, it must carry out any mitigation, i.e., "means to avoid or minimize environmental harm," it has said in the ROD or EIS that it will carry out (40 CFR 1505.3).

(3) **Deferral of Mitigation does not Comply with NEPA** (copied from <http://www.npi.org/NEPA/impact>)

Deferral. With respect to historic properties, a very common problem is "deferral," in which the agency:

- Acknowledges that it does not know much about what effects there may be on historic properties (often because such properties have not yet been identified); but
- Says that whatever effects there may be, NHPA Section 106 review (of the National Historic Preservation Act), to be performed later, will take care of them; and

54-6

54-6

DOE has analyzed potential environmental impacts to cultural resources in this Final EIS. As described in Chapter 3, Section 3.11.2.3, and Appendix F, Section F.2, of this EIS, Area IV and the NBZ have been intensively surveyed for cultural resources with the intention of identifying cultural resources that may be impacted by the cleanup efforts. Potential impacts of the proposed alternatives are described in Chapter 4, Section 4.11, under each alternative, and summarized in Section 4.11.4. Proposed methods to avoid, minimize, or mitigate impacts are described in Chapter 6, Sections 6.1 and 6.2.

Commenter No. 54 (cont'd): Sam Cohen
Santa Ynez Band of Chumash Indians

- Concludes that therefore, whatever alternative is decided on, impacts on historic properties will not be a problem.

Considering environmental impacts *after* a decision has been made defeats NEPA's purpose of considering impacts in *preparing* to make decisions. It also almost guarantees last-minute conflicts between project implementation and historic preservation.

Failure to consider things that are not historic properties. With respect to other kinds of cultural resources, a common problem is that they are not considered at all. Historic properties, or even more narrowly, archeological sites, are sometimes the only things discussed in the "cultural resource" part of an EIS. If social impacts are considered, they are often considered only terms of easily quantifiable socioeconomic variables like population, employment, and use of public services. The result is that impacts on many classes of cultural resource simply are not identified or considered in deciding whether significant impacts may occur.

(4) Significant Negative Unmitigated Impacts to Sacred Sites and Cultural Resources by Soil Cleanup to Background:

Indian Sacred Site and Traditional Cultural Property: The tribe has already designated all of the NASA administered property as a sacred site under E.O. 13007. The Tribe has also made a similar EO 13007 designation for the areas leased to DOE.

Archeological Resources: The proposed cleanup of the Burro Flats site (CA-VEN-1072); could result in *significant, negative, local, and long-term* impacts to the site and would constitute an *adverse effect* under Section 106. The proposed cleanup of newly discovered and previously undiscovered archeological sites found to be NRHP-eligible could be a *significant, negative, local, and long-term* impact on archeological resources, thus resulting in a finding of *adverse effect* under Section 106.

Deferral of eligibility determination: A determination of eligibility all newly discovered archeological sites in consultation with the SHPO and the federally recognized tribes, needs to be completed before cleanup begin if any site is going to be affected by soil cleanup activities.

Deferral of boundary research as to VEN-1072 and VEN-1803: Additional boundary research on Area IV is required to conclude that any avoidance of excavation within the boundaries of Burro Flats (CA-VEN-1072) would diminish or eliminate adverse impacts to known archeological sites and reduce the impacts to *negligible, negative, local, and long term* and could result in a finding of *no adverse effect* under Section 106.

Deferral of additional testing as to unknown archaeological deposits: Additional subsurface testing is required to conclude that reducing the amount of excavation on newly discovered archeological deposits (commonly referred to as "inadvertent or

54-6

54-7

54-8

54-7 See response to comment 54-4 above.

54-8 Chapter 3, Section 3.11.2.3.4, Appendix B, and Appendix F of this Final EIS describes traditional cultural resources within the APE, including Indian sacred sites and traditional cultural properties. Measures provided in Chapter 6, Sections 6.1 and 6.2, and being developed through the NHPA Section 106 Programmatic Agreement, present DOE's approach for addressing adverse effects on traditional cultural resources.

Site CA-VEN-1072 is a large, NRHP-eligible archaeological site with numerous components spread over a large area. Although DOE understands that sites can extend for long distances and may be related to each other, CA-VEN-1072 and its features, as defined in site records, appears to lie completely within Area II (La Monk 1953, Grant 1965; Knight 2001; see also Appendix F); which is outside of DOE's area of responsibility. However, DOE acknowledges that NASA is developing a proposal for an NRHP-eligible Burro Flats Archaeological District to the California SHPO that includes several archaeological sites within DOE's APE in Area IV, and the Santa Ynez Band of Chumash Indians is developing a proposal for an NRHP-eligible Simi Hills Archaeological District that includes all the recorded archaeological sites in DOE's APE (including CA-VEN-1803). The NHPA Section 106 Programmatic Agreement (being developed by DOE in consultation with the California SHPO, the Santa Ynez Band of Chumash Indians, other tribes, and other consulting parties) will establish procedures for addressing adverse effects on historic properties, including any archaeological districts that are determined eligible for the NRHP.

See response to comment 54-2 above regarding efforts made to identify and evaluate cultural resources within the APE, including extended Phase I testing. The NHPA Section 106 Programmatic will establish procedures for making eligibility determinations on unevaluated sites, as needed, and inadvertent discoveries, along with procedures to assess effects and resolve adverse effects if they are determined eligible for the NRHP.

Commenter No. 54 (cont'd): Sam Cohen
Santa Ynez Band of Chumash Indians

accidental discoveries”) could minimize the impact if the newly identified sites were avoided, thus reducing the impacts to *minor, negative, local, and long-term* impacts from excavation.

(5) Failure to Address Executive Order 13007

On March 5, 2014, the Santa Ynez Band of Chumash Indians, a federally recognized tribe (“Tribe”), designated the DOE portion of the SSFL as an Indian sacred site pursuant to Executive Order 13007. This Indian sacred site also includes the former Rocketdyne and now Boeing portion of SSFL and the Tribe is open to discussing the exact boundaries at a later date.

E.O. 13007 requires Federal land managing agencies to accommodate access to and ceremonial use of Indian sacred sites by Indian religious practitioners and to avoid adversely affecting the physical integrity of such sacred sites. It also requires agencies to develop procedures for reasonable notification of proposed actions or land management policies that may restrict access to or ceremonial use of, or adversely affect, sacred sites.

Sacred sites are defined in the executive order as “any specific, discrete, narrowly delineated location on Federal land that is identified by an Indian tribe, or Indian individual determined to be an appropriately authoritative representative of an Indian religion, as sacred by virtue of its established religious significance to, or ceremonial use by, an Indian religion; provided that the tribe or appropriately authoritative representative of an Indian religion has informed the agency of the existence of such a site.” There is no review of such determinations by a Federal agency.

It is important to note that a sacred site may not meet the National Register criteria for a historic property and that, conversely, a historic property may not meet the criteria for a sacred site. However, in those instances where an undertaking may affect a historic property that is also considered by an Indian tribe to be a sacred site, the Federal agency should, in the course of the Section 106 review process, consider accommodation of access to and ceremonial use of the property and avoidance of adverse physical effects in accordance with E.O. 13007.

The Advisory Council on Historic Preservation (ACHP) has explained “The Relationship Between Executive Order 13007 Regarding Indian Sacred Sites and Section 106,” <http://www.achp.gov/eo13007-106.html>

To the extent that the requirements of the executive order and ACHP’s regulations are similar, Federal agencies can use the Section 106 review process to ensure that the requirements of E.O. 13007 are fulfilled. For example, E.O. 13007 requires that agencies contact Indian tribes regarding effects and the Section 106 regulations require consultation with Indian tribes to identify and resolve adverse effects to historic properties.

54-8
cont'd

54-9

54-9

As discussed in Chapter 3, Section 3.11.2.3.4 of this Final EIS, the Santa Ynez Band of Chumash Indians filed paperwork nominating the entire SSFL to be included in the *State of California Native American Heritage Commission Sacred Lands Inventory* (NAHC 2014), and also notified DOE of its identification of a portion of SSFL as an Indian sacred site for consideration consistent with Executive Order 13007, *Indian Sacred Sites*. While DOE does not own property at Area IV or the NBZ, DOE is working with the Native American tribes with ties to the SSFL area to preserve the cultural resources and the sacred nature of Area IV and the NBZ.

Commenter No. 54 (cont'd): Sam Cohen
Santa Ynez Band of Chumash Indians

Consultation regarding the identification and evaluation of historic properties of religious and cultural significance to an Indian tribe could include identification of those properties that are also sacred sites. Similarly, consultation to address adverse effects to such historic properties/sacred sites could include discussions regarding access and ceremonial use.

(6) Failure to address the DOE Site as a Traditional Cultural Property (TCP) eligible for protection on the National Register:

National Register Bulletin No. 38 (hereinafter referred to as "NPS Bull. No. 38"), Guidelines for evaluating and Documenting Traditional Cultural Properties (1990; revised 1992; 1998) under NHPA
<http://www.nps.gov/nr/publications/bulletins/pdfs/nrb38.pdf>

A. Locations for traditional ceremonies are defined as a TCP: NPS Bull No. 38, p. 1, provides:

The traditional cultural significance of a historic property, then, is significance derived from the role the property plays in a community's historically rooted beliefs, customs, and practices. Examples of properties possessing such significance include: ***

• a location where Native American religious practitioners have historically gone, and are known or thought to go today, to perform ceremonial activities in accordance with traditional cultural rules of practice;

B. Mountain tops and rock outcroppings like at SSFL are TCP's: NPS Bull. No. 38, p. 2, provides:

Traditional cultural properties are often hard to recognize. A traditional ceremonial location may look like merely a mountaintop, a lake, or a stretch of river; a culturally important neighborhood may look like any other aggregation of houses, and an area where culturally important economic or artistic activities have been carried

54-9
cont'd

54-10

54-10 As discussed in Chapter 3, Section 3.11.2.3.4 of this Final EIS, DOE acknowledges that the Santa Ynez Band of Chumash Indians has identified the entire SSFL as a Native American sacred site (referred to as the Santa Susana Sacred Sites and Traditional Cultural Property). The Final EIS also acknowledges that additional efforts by NASA, the Santa Ynez Band of Chumash Indians, other tribes, and others may result in the designation of one or more NRHP-eligible traditional cultural properties that overlap with the APE. Measures provided in Chapter 6, Sections 6.1 and 6.2, and being developed through the NHPA Section 106 Programmatic Agreement, present DOE's approach for addressing adverse effects on traditional cultural properties.

Commenter No. 54 (cont'd): Sam Cohen
Santa Ynez Band of Chumash Indians

out may look like any other building, field of grass, or piece of forest in the area. As a result, such places may not necessarily come to light through the conduct of archeological, historical, or architectural surveys. The existence and significance of such locations often can be ascertained only through interviews with knowledgeable users of the area, or through other forms of ethnographic research.

C. DOE must engage specialists as part of its TCP study: NPS Bull. No. 38, p. 10, provides:

In general, the only reasonably reliable way to resolve conflict among sources is to review a wide enough range of documentary data, and to interview a wide enough range of authorities to minimize the likelihood either of inadvertent bias or of being deliberately misled. Authorities consulted in most cases should include both knowledgeable parties within the group that may attribute cultural value to a property and appropriate specialists in ethnography, sociology, history, and other relevant disciplines.⁷

D. Specific events like the Solstice ceremony at SSFL qualify as TCP: NPS Bull. No. 38, p. 11, provides:

For example, the National Register defines a "site" as "the location of a significant event, a prehistoric or historic occupation or activity, or a building or structure, whether standing, ruined, or vanished, where the location itself possesses historic, cultural, or archeological value regardless of the value of any existing structure."⁹ Thus a property may be defined as a "site" as long as it was the location of a significant event or activity,

54-10
cont'd

Response side of this page intentionally left blank.

Commenter No. 54 (cont'd): Sam Cohen
Santa Ynez Band of Chumash Indians

regardless of whether the event or activity left any evidence of its occurrence. A culturally significant natural landscape may be classified as a site, as may the specific location where significant traditional events, activities, or cultural observances have taken place. A natural object such as a tree or a rock outcrop may be an eligible object if it is associated with a significant tradition or use. A concentration, linkage, or continuity of such sites or objects, or of structures comprising a culturally significant entity, may be classified as a district.

E. Native American ceremonies qualify as TCP: NPS Bull. No. 38, p.15, provides:

National Register guidelines stress the fact that properties can be listed in or determined eligible for the Register for their association with religious history, or with persons significant in religion, if such significance has "scholarly, secular recognition." 13 The integral relationship among traditional Native American culture, history, and religion is widely recognized in secular scholarship.¹⁴ Studies leading to the nomination of traditional cultural properties to the Register should have among their purposes the application of secular scholarship to the association of particular properties with broad patterns of traditional history and culture. The fact that traditional history and culture may be discussed in religious terms does not make it less historical or less significant to culture, nor does it make properties associated with traditional history and culture ineligible for inclusion in the National Register.

F. Lack of use does not make a property TCP ineligible: NPS Bull. No. 38, p. 18, provides:

54-10
cont'd

Response side of this page intentionally left blank.

Commenter No. 54 (cont'd): Sam Cohen
Santa Ynez Band of Chumash Indians

The fact that a property may have gone unused for a lengthy period of time, with use beginning again only recently, does not make the property ineligible for the Register. For example, assume that the Indian tribe referred to above used the mountain peak in prehistory for communication with the supernatural, but was forced to abandon such use when it was confined to a distant reservation, or when its members were converted to Christianity. Assume further that a revitalization of traditional religion has begun in the last decade, and as a result the peak is again being used for vision quests similar to those carried out there in prehistory. The fact that the contemporary use of the peak has little continuous time depth does not make the peak ineligible; the peak's association with the traditional activity reflected in its contemporary use is what must be considered in determining eligibility.

54-10
cont'd

(7) Traditional Cultural Landscapes must also be included in Section 106 consultations and the EIS

Traditional cultural landscapes, because they are often a property type such as a district or site, are identified in the same manner in the Section 106 process as other types of historic properties of religious and cultural significance to Indian tribes or Native Hawaiian organizations. The regulations at 36 CFR Section 800.4 outline several steps a federal agency must take to identify historic properties. In summary, to determine the scope of identification efforts, a federal agency, in consultation with the State Historic Preservation Officers (SHPO)/Tribal Historic Preservation Officer (THPO), must:

1. Determine and document the area of potential effect for its undertaking;
2. Review existing information; and,
3. Seek information from consulting parties including Indian tribes or Native Hawaiian organizations.

Based on the information gathered through these efforts, the federal agency, in consultation with the SHPO and any Indian tribe or Native Hawaiian organization that attaches religious and cultural significance to historic properties that may be affected by the undertaking, develops and implements a strategy to identify historic properties within the area of potential effects. Identification efforts may include background research, oral history interviews, scientific analysis, and field investigations.
<http://www.achp.gov/natl-qa.pdf>

54-11

54-11

DOE has not been provided information relating to any specific, stand-alone traditional cultural landscapes on DOE's portion of SSFL. However, Chapter 4, Section 4.11 of this Final EIS describes how soil remediation would result in changes to the setting and general landscape (e.g., topography, soil color, vegetation) associated with traditional cultural resources at Area IV and the NBZ. DOE will continue to consult with the Santa Ynez Band of Chumash Indians on a government-to-government basis to consider their interests and concerns about the proposed cleanup.

Commenter No. 54 (cont'd): Sam Cohen
Santa Ynez Band of Chumash Indians

There is no single defining feature or set of features that comprise a traditional cultural landscape. Such places could be comprised of natural features such as mountains, caves, plateaus, and outcroppings; water courses and bodies such as rivers, streams, lakes, bays, and inlets; views and view sheds from them, including the overlook or similar locations ; vegetation that contributes to its significance; and, manmade features including archaeological sites; buildings and structures; circulation features such as trails; land use patterns; evidence of cultural traditions, such as petroglyphs and evidence of burial practices; and markers or monuments, such as cairns, sleeping circles, and geoglyphs. <http://www.achp.gov/natl-qa.pdf>

Based on such research, the ACHP TRADITIONAL CULTURAL LANDSCAPES ACTION PLAN advises as follows:

The ACHP, as the agency with responsibility for overseeing the Section 106 review process, and DOI, through the National Park Service (NPS), as the agency with responsibility for overseeing the National Register of Historic places, should provide leadership in addressing Native American cultural landscapes in the national historic preservation program. Together, the ACHP and NPS should:

--Promote the recognition and protection of Native American traditional cultural landscapes both within the federal government and the historic preservation community as well as at the state and local levels, and,

--Address the challenges of the consideration of these historic properties in the Section 106 review process as well as in NEPA reviews. <http://www.achp.gov/pdfs/native-american-traditional-cultural-landscapes-action-plan-11-23-2011.pdf>

(8) U.N. Declaration on the Rights of Indigenous Peoples must now be followed after December 2010

In December 2010, the United States announced support for the **United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP)**. In announcing this support, President Obama stated: "The aspirations it affirms—including the respect for the institutions and rich cultures of Native peoples—are one we must always seek to fulfill...[W]hat matters far more than any resolution or declaration – are actions to match those words." The UNDRIP addresses indigenous peoples' rights to maintain culture and traditions (Article 11); and religious traditions, customs, and ceremonies (Article 12); to participate in decision making in matters which would affect their rights (Article 18); and to maintain spiritual connections to traditionally owned lands (Article 25).

The ACHP will now incorporate UNDRIP in the Section 106 review process:

While the Advisory Council on Historic Preservation's (ACHP) work already largely supports the United Nations Declaration on the Rights of Indigenous Peoples, additional and deliberate actions will be taken to more overtly support the Declaration. The Section 106 review process provides Indian tribes and Native Hawaiian organizations (NHOs) with a very important opportunity to influence federal decision making when properties of religious and cultural significance may be threatened by proposed federal actions. While federal agencies are required to consult with Indian tribes and NHOs and to take their

54-11
cont'd

54-12

54-12

Thank you for bringing this to DOE's attention. DOE will continue to consult with the Santa Ynez Band of Chumash Indians on a government-to-government basis, as well as with other tribes with a demonstrated interest in the undertaking, regarding their interests and concerns about the proposed cleanup.

Commenter No. 54 (cont'd): Sam Cohen
Santa Ynez Band of Chumash Indians

comments into account in making decisions in the Section 106 review process, adding the principles of the Declaration to that consideration may assist federal agencies in making decisions that result in the protection of historic properties of religious and cultural significance to Indian tribes and NHOs. <http://www.achp.gov/docs/UN%20Declaration%20Plan%203-21-13.pdf>

9. Official recognition in the EIS need to be made of the areas surrounding Burro Flats

While the Southern half of Area II contains the pictographs and additional 16 sites, Area IV of SSFL needs additional investigation, including, without limitation:

- a. Geography—this areas contains numerous flat areas that would be suitable camp sites;
- b. Areas of food—this areas contains forests and riparian areas that could be utilized in the gathering of food;
- c. Support for ceremonial area in the Southern half of Area IV—It is not inconceivable that the Northern half of the SSFL site provided support for the ceremonies in the Southern half of SSFL;
- d. Separate areas for different tribes—if SSFL was an inter-tribal gathering place, then each tribe would have congregated separately in different parts of the site.

10. Subsurface testing is required.

Pedestrian surveys are of limited utility and never alone are sufficient when there are known areas of habitation or ceremony. We are informed that DOE has recently completed a Phase I Pedestrian Survey of the site. While such Phase I is an excellent first step, we request additional subsurface archaeological testing for all areas scheduled for any excavation.

If the project is in a region where there are many sites, there may be reason to suspect that buried sites may be present that went undetected during the survey. If the soils profile of the project location shows that heavy erosion has washed away soils then it may explain the absence of cultural resources. However, if the soils profile is depositional then there may be a need to conduct additional subsurface testing, particularly in areas where ground disturbance is planned. In archaeological terminology, this is referred to as "Extended Phase I" testing because it is an intermediate step between Phase 1 (survey), and Phase 2 (controlled excavation to assess the significance of a site). Extended Phase I testing often done by excavating a small pit with a shovel and screening the excavated soil through steel mesh ("shovel test pit" or "STP"). If it is considered to be necessary that a large amount of soil should be examined at deeper levels, then backhoes are sometimes used and informal sampling procedures are often employed while screening the backdirt.

Sometimes the lead agency will argue that archaeological survey is not warranted for a particular project or there may be factors that justify additional investigation even though a Phase I study has been completed with negative results. Following is a list of environmental and cultural factors that should be considered when assessing the overall

54-12
cont'd

54-13

54-13

See response to comment 54-2 above regarding efforts made to identify cultural resources within the APE. In particular, Chapter 3, Section 3.11.2.3.2 of this Final EIS describes the Burro Flats Painted Cave site complex, and acknowledges that NASA is developing a proposal for an NRHP-eligible Burro Flats Archaeological District to the California SHPO that includes several archaeological sites within DOE's APE in Area IV. The NHPA Section 106 Programmatic Agreement (being developed by DOE in consultation with the California SHPO, the Santa Ynez Band of Chumash Indians, other tribes, and other consulting parties) will establish procedures for addressing adverse effects on historic properties, including the Burro Flats Archaeological District if it is determined eligible for the NRHP.

54-14

54-14

As described in Chapter 3, Section 3.11.2.3.2 and Appendix F, Section F.2.3, of this Final EIS, DOE developed and implemented an extended phase 1 testing program to evaluate the NRHP eligibility of 10 archaeological sites in the APE. The 10 sites were chosen based on: (1) the extent of the contamination known at the time the testing program was designed; (2) sites where NRHP eligibility was unclear; and (3) consultation with Native American representatives. This program of limited subsurface excavation was developed in consultation with SHPO and EIS cooperating agencies, including the federally recognized Santa Ynez Band of Chumash Indians, as well as non-federally recognized tribes. Additionally, the NHPA Section 106 Programmatic Agreement (being developed by DOE in consultation with the California SHPO, the Santa Ynez Band of Chumash Indians, other tribes, and other consulting parties) will include procedures for the development of a monitoring plan and an inadvertent discovery plan that spells out steps to follow if cleanup activities inadvertently encounter archaeological resources, human remains, or burial-related artifacts.

Commenter No. 54 (cont'd): Sam Cohen
Santa Ynez Band of Chumash Indians

cultural sensitivity of the SSFL. (Please note that this list is not exhaustive and each factor must be weighted both individually and collectively on a case-by-case basis.)

- a. Areas with high viewshed or visibility such as or ridgelines, peaks, ledges, outcrops, benches, or prominent hills; and
- b. Areas with a relatively high density of sites in the vicinity; and
- c. Areas where past ethnographic studies have revealed associated placenames. Keep in mind that placenames do not always refer to places where evidence of past cultural activity exists; and
- d. Areas near known sites. Mapped boundaries of sites most frequently reflect only cultural residue that was visible on the surface when the site was recorded and do not necessarily reflect the actual extent of the site. In addition, loci such as cemeteries or other areas may be adjacent to or nearby but separate from the main habitation; and
- e. Areas near known rock art sites or rocky outcroppings of the type where rock shelters and art have traditionally been located; and
- f. Areas in or near known gathering areas; and
- g. Though all sites are potentially worthy of protection, named, ethnohistorically documented village sites are of the highest priority and therefore warrant the greatest amount of protection possible.

11. Exhaustion of Non-Excavation Methods of remediation

To the extent feasible, DOE should exhaust all non-excavation methods of remediation before performing any excavation that could potentially impact cultural and historic sites.

12. Soil Prior disturbance is NOT Dispositive:

The mantra that cultural sites have been disturbed and therefore automatically are not significant is oftentimes incorrect:

- a. Disturbed sites still may contain valuable information. The newer approach is to treat disturbed sites as having the potential to provide information even if they have been disturbed;
- b. Disturbed sites still have spiritual significance;
- c. Disturbance may only be on the surface, while much excavation may continue to depths of up to 20 feet.

13. Need to Analyze Cumulative Impacts to Cultural Resources:

54-14
cont'd

54-15

54-16

54-17

54-15 To the extent possible and in accordance with the Native Americans artifact exemption in the 2010 AOC and the NHPA Section 106 Programmatic Agreement being developed by DOE with consulting parties, DOE prefers to avoid soil removal where cultural resources are known and present.

54-16 DOE is aware that disturbance does not necessarily mean that a cultural resource is no longer significant in terms of the information it provides or its spiritual significance. For example, DOE conducted extended Phase I testing on a site that was disturbed by looters in the past. This site, VEN-1775, was first recorded in 2001 (W&S Consultants 2001), when the investigators concluded that 75 percent or more of the site had been removed, seriously compromising the site's integrity. However, following DOE's extended Phase I testing, researchers determined that this site retained enough integrity to be considered eligible for listing on the NRHP.

54-17 Chapter 5, Section 5.5.11, of this Final EIS analyzes cumulative impacts to cultural resources, as required by NEPA. As discussed in Sections 5.5.11.1, 5.5.11.2, and 5.5.11.3, impacts to archaeological, architectural, and traditional cultural resources in NASA and Boeing areas of SSFL are considered to contribute to the cumulative effects of DOE's cleanup activities. The effects of actions outside of SSFL are also considered in the analysis.

Commenter No. 54 (cont'd): Sam Cohen
Santa Ynez Band of Chumash Indians

The EIS must account for other remediation projects in other areas of SSFL:

- a. Need to add NASA cultural sites;
- b. Need to add Boeing cultural sites;
- c. Other areas within SSFL.

54-17
cont'd

14. NEW MITIGATION: Cultural Interpretive Center:

- a. Can use existing building;
- b. Preferably near saved historic structure and/or test stand;
- c. Preferably away from CA-VEN-1072;
- d. Need to reserve operation and maintenance funds.

54-18

54-18 DOE appreciates your interest in future land uses at SSFL and points out that this Final EIS addresses only those areas of the site for which DOE has cleanup responsibilities, Area IV and the NBZ. DOE will continue to work with the Native Americans and the land owner, Boeing, to address potential impacts to cultural resources potentially affected by DOE cleanup of Area IV and the NBZ. Area IV and the NBZ are remote from the test stands and CA-VEN-1072. DOE does not believe any of its buildings in Area IV would be appropriate for a cultural interpretive center as suggested and cannot determine or commit to future land uses because it is not within DOE's authority to do so (as Boeing, not DOE, is the landowner).

15. NEW MITIGATION: Native American monitoring during any ground disturbing activities.

54-19

16. Need to protect CA-VEN-1072 from trespassers and vandals.

54-20

17. Deferral of Mitigation until Record of Decision (ROD):

- a. It is problematic to defer any mitigation until ROD as it prevents meaningful comment;
- b. Commenter reserves the right to ask for recirculation of the DEIS and EIS for any such deferred mitigation.

54-6
cont'd

54-19 In accordance with the Section 106 Programmatic Agreement currently under development, DOE will prepare a monitoring plan before ground-disturbing activities begin, and DOE will consult with the California SHPO, the Santa Ynez Band of Chumash Indians, and other tribes to determine where and when Native American monitoring is appropriate for building removal, groundwater cleanup, and soil cleanup.

18. Need NEPA Mitigation Plan

54-21

<http://www.whitehouse.gov/sites/default/files/microsites/ceq/20100218-nepa-mitigation-monitoring-draft-guidance.pdf>

February 18, 2010

MEMORANDUM FOR HEADS OF FEDERAL DEPARTMENTS AND AGENCIES
 FROM: NANCY H. SUTLEY, Chair, Council on Environmental Quality
 SUBJECT: DRAFT GUIDANCE FOR NEPA MITIGATION AND MONITORING
 I. INTRODUCTION

To provide for the performance of mitigation, agencies should create internal processes to ensure that mitigation actions adopted in any NEPA process are documented and that monitoring and appropriate implementation plans are created to ensure that mitigation is carried out. See *Aligning NEPA Processes with Environmental Management Systems* (CEQ 2007) at 4 (discussing the use of environmental management systems to track implementation and monitoring of mitigation). http://ceq.hss.doe.gov/nepa/nepapubs/Aligning_NEPA_Processes_with_Environmental_Management_Systems_2007.pdf (<http://www.slideshare.net/whitehouse/aligning-nepa-processes>). Agency NEPA implementing procedures should require clearly documenting the commitment to mitigate the

54-20 CA VEN-1072 is located in Area II of SSFL, which is controlled by Boeing and NASA. It is not under DOE's purview, nor would it be affected by DOE's actions and, therefore, it is not evaluated in this Final EIS. Access to Area IV and the NBZ is controlled by Boeing.

54-21 As discussed in Chapter 6 of the Final EIS, DOE will prepare a mitigation action plan for those mitigation commitments made in its Record of Decision (ROD) for the proposed remediation activities at SSFL Area IV and the NBZ. The plan would identify specific mitigation measures associated with alternatives selected in the ROD, and would describe plans for implementing the mitigation measures, monitoring their implementation and effectiveness, and reporting the results of mitigation efforts to DOE management and applicable Federal, State, local, and tribal entities and the public.

Commenter No. 54 (cont'd): Sam Cohen
Santa Ynez Band of Chumash Indians

measures necessary in the environmental documents prepared during the NEPA process (40 C.F.R. § 1508.10) and in the decision documents such as the Record of Decision. When an agency identifies mitigation in an EIS and commits to implement that mitigation to achieve an environmentally preferable outcome, or commits in an EA to mitigation to support a FONSI and proceeds without preparing an EIS, then the agency should ensure that the mitigation is adopted and implemented.

Methods to ensure implementation should include, as appropriate to the agency's underlying authority for decision-making, appropriate conditions in financial agreements, grants, permits or other approvals, and conditioning funding on implementing the mitigation. To inform performance expectations, mitigation goals should be stated clearly. These should be carefully specified in terms of measurable performance standards to the greatest extent possible. The agency should also identify the duration of the agency action and the mitigation measures in its decision document to ensure that the terms of the mitigation and how it will be implemented are clear.

If funding for implementation of mitigation is not available at the time the decision on the proposed action and mitigation measures is made, then the impact of a lack of funding and resultant environmental effects if the mitigation is not implemented warrant disclosure in the EA or EIS. In cases where, after analyzing the proposed actions with or without the mitigation, the agency determines that mitigation is necessary to support the FONSI or committed to in the ROD, and the necessary funding is not available, the agency may still be able to move forward with the proposed action once the funding does become available. The agencies should ensure that the expertise and professional judgment applied in determining the appropriate mitigation measure is reflected in the administrative record, and when and how those measures will be implemented are analyzed in the EA or EIS.

Under NEPA, a federal agency has a continuing duty to gather and evaluate new information relevant to the environmental impact of its actions. See 42 U.S.C. § 4332(2)(A). For agency decisions based on an EIS, the regulations require that, "a monitoring and enforcement program shall be adopted...where applicable for mitigation." 40 C.F.R. §1505.2(c). In addition, the regulations state that agencies may "provide for monitoring to assure that their decisions are carried out and should do so in important cases." 40 C.F.R. §1505.3. Monitoring plans and programs should be described or incorporated by reference in the agency decision documents.

21. Incorporation by reference of Memo dated March 12, 2014, "Santa Susana Cleanup," discussing NEPA alternatives analysis for selection of cleanup standards for the Santa Susana Field Laboratory Site.

Sincerely,

Sam Cohen
Government and Legal Specialist
Santa Ynez Band of Chumash Indians

54-22

54-22

The subject memo and its accompanying email were considered in the development of the EIS. Chapter 2, Section 2.1, of this Final EIS identifies the reference as Santa Ynez Band of Chumash Indians 2014, noting that the Santa Ynez Band of Chumash Indians, a cooperating agency on this EIS, expressed their expectation that DOE would include "a robust analysis of alternatives."

Bell Canyon, CA 91307-1001

March 23, 2017

Stephie Jennings
NEPA Document Manager, SSFL Area IV – EIS
U. S. Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 93063

Dear Ms. Jennings:

We are writing to express our concerns regarding the Draft Environmental Impact Statement (Draft EIS) for Remediation of Area IV and the Northern Buffer Zone (NBZ) of the Santa Susana Field Laboratory (SSFL). As you hopefully know, the SSFL is located less than one mile to the north of our community. Given this proximity, the Bell Canyon Homeowners Association retained an environmental consultant, Aquilogic, to review the Draft EIS. Their memorandum accompanies this letter.

In the Draft EIS, the DOE evaluated several soil and building remediation alternatives. Groundwater alternatives were considered; however, we understand that groundwater remediation will be addressed in more detail in a subsequent corrective measures study.

The Draft EIS assesses the risks to hypothetical future site residents and visitors from residual contamination that will remain at Area IV and NBZ after remediation. It does not address the risks associated with contamination present at the NASA and Boeing portions of the SSFL, or the cumulative risks associated with all contamination at the SSFL. More importantly, the Draft EIS does NOT address the potential impacts to Bell Canyon residents from the various remedial alternatives. Therefore, the analysis by DOE fails to get to the most relevant question of Bell Canyon residents: "Will the materials being cleaned-up at the site migrate to Bell Canyon during remediation and what are the resulting health risks?"

The excavation and off-site disposal of contaminated soil will result in the generation of contaminated dust, increased vehicular traffic in the area, and possibly contaminated surface water runoff. These issues were not adequately addressed in the Draft EIS. Therefore, the impact of possible wind-borne dust, increased truck traffic, and surface water runoff on the surrounding community during remedial implementation needs to be assessed before the EIS can be finalized and approved.

In addition, rigorous monitoring of wind-borne dust and surface water throughout the surrounding communities needs to be implemented during any remediation activities. Greater detail regarding such programs needs to be described in the

818.346.0879
818.883.8490 FAX
bellcanyon.com

55-1

55-2

55-3

55-1 Cumulative impacts are discussed in Chapter 5 of the EIS. The residential risks for Area IV were calculated assuming the exposure was for 24 hours per day, 350 days per year, for 30 years. The 350 days per year assumes the resident is traveling away from home 2 weeks per year, and the 30 years assumes the average resident will live on the same property for 30 years. These assumptions do not leave any time for exposure to contamination on an adjacent property. Although a recreational user's time on site is not nearly as much as that for a resident, the assumed exposure time of 8 hours a day, 75 days per year, for 30 years for recreational activities (e.g., hiking) is sufficient justification for an assumption that additional recreational time at other properties would not be available. Therefore, any time spent on adjacent property subtracts from time available for exposure on Area IV.

55-2 All alternatives in this EIS would be implemented in compliance with applicable Federal, State, and local regulations and agreements, and in a manner that would be protective of the surrounding communities by incorporating the best management practices (e.g., dust control measures, and washing the undercarriage of trucks before leaving the site) during remediation activities. In response to comments on the Draft EIS, DOE has added an offsite human health impact assessment by modeling of potential releases of wind-blown dust to a variety of offsite receptors during remediation for all alternatives. The results of the modeling are included in Chapter 4, Section 4.9 of this Final EIS. Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

55-3 DOE and its predecessor, the Atomic Energy Commission, conducted an extensive environmental monitoring and media sampling program for Area IV operations since the mid-1950s. This environmental monitoring program included samples of air, water, soil, and vegetation. The program is described and annual monitoring data are provided in DOE's annual environmental reports (accessible at http://www.etec.energy.gov/Environmental_and_Health/ASER.html). Furthermore, extensive media sampling programs of SSFL and surrounding areas have been conducted by a variety of organizations, including DTSC, EPA, and the Regional Water Quality Control Program. Information about these programs can be obtained at http://www.etec.energy.gov/Environmental_and_Health/Enviro_Monitoring.html. DOE will continue environmental monitoring and reporting to regulatory agencies and the public during building demolition and site remediation activities.

We demand that the DOE consider the risks of its proposed remedial actions not only to "hypothetical" future residents at the SSFL, but to "actual" current residents in the surrounding communities. We look forward to reviewing a future draft of the EIS that will hopefully address our concerns.

DOE, NASA, and Boeing submitted an air monitoring program plan to DTSC in late 2017 that includes a meteorological station within Area IV and four air monitors along the perimeter of Area IV (NASA/Boeing/DOE 2017). The perimeter stations include two along the north border near the SRE and RMHF, one along the western border, and one along the southern border. DOE is operating the system to establish a pre-remediation baseline. The system will continue to operate during remediation activities to monitor any potential air pollutant releases of concern. If the air monitoring network indicates any elevated levels of air pollution, onsite staff would take action to mitigate the releases to acceptable levels. A description of the DOE air monitoring system was added to Chapter 3, Section 3.6.1 of this Final EIS.

As described in Chapter 6 of this Final EIS, DOE is committed to minimizing and mitigating both onsite and offsite impacts from building demolition and site remediation. Table 6.1 describes these minimization and mitigation measures by resource area. As described in Section 6.2, before demolition and remediation actions would begin, as required by DOE regulations (10 CFR 1021.331), DOE would prepare a mitigation action plan for any mitigation commitments made in its Record(s) of Decision (ROD[s]) for the proposed remediation activities at SSFL Area IV and the NBZ. This plan would identify specific mitigation measures associated with alternatives selected in the ROD(s) and would describe plans for implementing the mitigation measures, monitoring their implementation and effectiveness, and reporting the results of mitigation efforts to DOE management and applicable Federal, State, local, and tribal entities and the public. In response to monitoring data, DOE may revise the mitigation action plan to better achieve desired results.

MEMORANDUM

Dated: March 3, 2017
To: Diane Rossiter, Bell Canyon Homeowners Association
From: Anthony Brown, aquilologic
James Clark, PhD

Subject: Review of Draft Environmental Impact Statement (Draft EIS) – January 2017
Remediation of Area IV and the Northern Buffer Zone of the
Santa Susana Field Laboratory (SSFL), Ventura County, California

Project No.: 036-01

Aquilologic, Inc. (aquilologic) has been retained by the Bell Canyon Homeowners Association (Bell Canyon) to review the Draft Environmental Impact Statement (Draft EIS) for Remediation of Area IV and the Northern Buffer Zone (NBZ) of the Santa Susana Field Laboratory (SSFL), in Ventura County, California (the Site). Figure 1-2 in the Draft EIS (attached hereto) shows the location of Area IV and the NBZ at the SSFL. The scope of our assignment was as follows:

- Review the Draft EIS
- Summarize the potential remedies
- Summarize the risk assessment
- Identify data gaps or deficiencies

Introduction

The U.S. Department of Energy (DOE) (2017) prepared a *Draft Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory* in accordance with the National Environmental Policy Act (NEPA) and Council on Environmental Quality (CEQ) and DOE implementing regulations at Title 40, Code of Federal Regulations, Parts 1500-1508 (40 CFR Parts 1500-1508) and 10 CFR Part 1021, respectively.

Past activities at the SSFL resulted in chemical and radiological releases that impacted soil, buildings, and groundwater. Residual chemicals and radionuclides from historical operations are present in soil, buildings, and groundwater in Area IV of the Energy Technology Engineering Center (ETEC), as well as in soil in the NBZ. Extensive soil sampling and analysis in recent years has demonstrated that the chemical contamination is more widespread than the radiological contamination, and that contaminants are concentrated near certain facilities, rather than being evenly distributed across the Site. In 2013, the California Department of Toxic Substances Control (DTSC) published remediation Look-Up Table (LUT) values for 116 chemicals at SSFL and

*Technical Memorandum - Review of Draft EIS
Remediation of Area IV and the Northern Buffer Zone of the
Santa Susana Field Laboratory (SSFL), Ventura County, California*

provisional LUT values for 16 radionuclides. Remediation is needed to clean up these residual chemicals and radionuclides, in compliance with Federal and State regulations, orders, and agreements.

The Draft EIS analyzes the potential environmental impacts of alternatives for conducting cleanup activities in Area IV and the NBZ. Separate remedial alternatives for soil remediation, building demolition, and groundwater remediation are described.

Remedial Alternatives Summary

Soil Remediation

For soil remediation, DOE's proposed action is to implement the technical requirements of the 2010 Administrative Order on Consent for Remedial Action (2010 AOC); that is, clean up contaminated soil to levels specified by DTSC in the LUT values (Cleanup to AOC LUT Values Alternative). In preparing the EIS, DOE identified challenges to implementing this alternative, including difficulties determining when the AOC LUT values have been met and difficulty finding replacement soil that meets the AOC LUT values.

Consistent with NEPA requirements, this EIS also analyzes a no action alternative (no soil treatment or removal), as well as two additional action alternatives (Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative). DOE believes that the additional action alternatives would be protective of the environment and the health and safety of the public and workers while avoiding some of the technical challenges and potential adverse environmental impacts associated with cleanup to the 2010 AOC LUT values.

The areas of soil contamination where remedial actions are proposed are shown on Figures 2-2, 2-4, and 2-5 in the Draft EIS (attached hereto).

For all of the alternatives, DOE will begin soil remediation once building demolition and decontamination has been completed. The details of each soil remediation alternative are summarized in Table 1. As shown in Table 1, the cancer risks and toxic hazards (as indicated by the hazard index) decrease across the alternatives from the highest risk level (No Action Alternative) to lowest risk level (under the Cleanup to AOC LUT Values Alternative).

Response side of this page intentionally left blank.

and Richard Levy, Bell Canyon Community Services District**

Technical Memorandum - Review of Draft EIS
Remediation of Area IV and the Northern Buffer Zone of the
Santa Susana Field Laboratory (SSFL), Ventura County, California

Table 1: Summary of Soil Remediation Alternatives

Alternative	Description	Duration	Cancer Risk	Hazard Index
No Action	No soil would be (1) treated to reduce contaminant concentrations to levels that would meet cleanup criteria or (2) removed for off-site disposal.	NS	1 chance in 3,000 to 16,000	0.8 to 30
Conservation of Natural Resources	DOE would divide Area IV and the NBZ into risk assessment units and evaluate those units against risk and dose criteria. An assessment of each area would be required to determine the relative quantities of chemicals and/or radionuclides that would trigger a cleanup decision. Approximately 145,000 cubic yards of soil would be removed and disposed of off-site. Approximately 11,100 truck round trips to remove the soil and 7,200 truck round trips for transporting backfill to the Site would be required.	Over 2 years	1 chance in 25,000 to 91,000	0.6 to 1
Cleanup to Revised LUT Values	The revised chemical LUT values would be based on risk-based screening levels (RBSLs). Cleanup decisions would be made on a point-by-point basis; that is, if the soil in a particular area exceeded the revised LUT value for any chemical or radioactive constituent, the soil would be removed. Approximately 192,000 cubic yards of soil would be removed and disposed of off-site. Approximately 14,400 truck round trips to remove the soil and 9,000 truck round trips for transporting backfill to the Site would be required.	Over 2 years	1 chance in 100,000 to 270,000	0.04 to 0.5
Cleanup to AOC LUT Values	Approximately 933,000 cubic yards of soil would be removed and disposed of off-site. Approximately 70,000 truck round trips to remove the soil and 46,000 truck round trips for transporting backfill to the Site. Soil with low concentrations of total petroleum hydrocarbons (TPH) and poly-nuclear aromatic hydrocarbons (PAHs) (~150,000 cubic yards) would remain in-place to be addressed by monitored natural attenuation (MNA).	Over 10 years	1 chance in 100,000 to 310,000	0.02 to 0.4

NS: not specified

Response side of this page intentionally left blank.

Commenter No. 55 (cont'd): Eric Wolf, Bell Canyon Association and Richard Levy, Bell Canyon Community Services District

Technical Memorandum - Review of Draft EIS
Remediation of Area IV and the Northern Buffer Zone of the
Santa Susana Field Laboratory (SSFL), Ventura County, California

On-site treatment and/or on-site disposal of contaminated soil was considered; however, the conditions in the current regulatory orders prohibit on-site disposal and various on-site treatment alternatives were not considered viable.

Building Demolition

For buildings, DOE's proposed action is to demolish the 18 structures it owns in Area IV and dispose of or recycle the materials off-site (Building Removal Alternative); the EIS also analyzes a no action alternative of leaving the structures in place, in accordance with NEPA requirements. The details of each building demolition alternative are summarized in Table 2.

The locations of buildings that may be demolished are shown on Figure 2-6 of the Draft EIS (attached hereto).

Table 2: Summary of Building Demolition Alternatives

Alternative	Description	Duration
No Action	Eighteen DOE-owned structures in Area IV would remain in place. DOE would conduct surveillance and maintenance, as needed for safety (e.g., preventing access). Because radiological materials would remain in some buildings, DOE would continue its responsibilities in accordance with the Atomic Energy Act and ensure continuation of security that restricts access to Area IV and the structures.	NS
Building Demolition	Demolish the 18 structures in Area IV and dispose of or recycle the materials off-site. Building removal activities are estimated to disturb about 8.4 acres. Approximately 1,500 truck round trips over a 2 year period would be required.	Over 2 years

Groundwater Remediation

No active groundwater remediation alternative is proposed in the Draft EIS. The following groundwater remediation alternatives are presented in the Draft EIS:

1. No action
2. Groundwater MNA

The location of groundwater contaminant plumes where remedial actions are being proposed are shown on Figure 3-18 in the Draft EIS.

The details of each groundwater remediation alternative are summarized in Table 3.

55-4

55-4

The statement “No active groundwater remediation alternative is proposed in the Draft EIS” is incorrect. The Draft EIS addresses active remediation actions, including pump and treat, soil vapor extraction, and source removal, see Section 2.6.3 of this Final EIS. This Final EIS includes revised groundwater sections that reflect the completion of the *Draft Resource Conservation and Recovery Act (RCRA) Facility Investigation Groundwater Investigation Report for Area IV, Ventura County, California* (CDM Smith 2018a) and *Draft Area IV RCRA Corrective Measures Study* (CDM Smith 2018b). Treatability studies conducted by Boeing in Area IV (CH2M Hill 2016) resulted in the elimination of one groundwater treatment technology, Enhanced Groundwater Treatment, from consideration in the Final EIS. The study identified difficulties that would limit the effectiveness of the technology.

Commenter No. 55 (cont'd): Eric Wolf, Bell Canyon Association and Richard Levy, Bell Canyon Community Services District

Technical Memorandum - Review of Draft EIS
Remediation of Area IV and the Northern Buffer Zone of the
Santa Susana Field Laboratory (SSFL), Ventura County, California

Table 3: Summary of Groundwater Remediation Alternatives

Alternative	Description	Duration
No Action	Current groundwater monitoring would continue (40 wells annually). DOE would not implement additional monitoring. As part of the SSFL-wide groundwater interim measures, the currently planned Former Sodium Disposal Facility (FSDF) Groundwater Interim Measure would be initiated to extract trichloroethene (TCE) contaminated groundwater.	NS
Monitored Natural Attenuation	No active remediation of any DOE groundwater plumes would occur. In addition to the wells that would continue to be monitored under the No Action Alternative, DOE would install and monitor additional wells. The contaminant plumes would be sampled (i.e., monitored) on an established schedule to confirm that reduction of the contaminant concentrations continues as anticipated.	The time frames for monitoring would be adjusted based on sampling results. Radionuclides or chemicals: 10 to 50 years Strontium-90: More than 100 years

The assessment of groundwater remediation alternatives was limited and appears premature. As stated in the Draft EIS, a Resource Conservation and Recovery Act (RCRA) Corrective Measures Study (CMS) is currently being developed independently from this EIS. An evaluation of active groundwater treatment alternatives is pending based on the RCRA CMS (anticipated sometime in 2017). It is anticipated that the groundwater treatment alternative would include one or a combination of the following methods: pump and treat, followed by local re-injection of treated water; enhanced groundwater treatment, consisting of *in-situ* treatment such as chemical injection or biological enhancement; or soil vapor extraction.

Discussion

The Draft EIS focuses on the impacts to hypothetical residents and recreational users of the SSFL following remediation of the impacted areas. The Draft EIS does not address any human-health impacts to the surrounding community, notably the residents of Bell Canyon. In addition, the analyses presented in the document, notably the risk assessment, lack the necessary quantitative back-ups for a complete peer review evaluation.

Remediation of contaminated media (i.e. buildings, soil, groundwater) will reduce the potential exposure of future receptors. However, soil remediation alternatives 2, 3, and 4 involve the excavation and off-site disposal of contaminated soil (between 145,000 and 933,000 cubic yards). This may result in the inadvertent spreading of impacted materials outside the boundaries of the current areas of contamination. Dust generated at the Site during remedial activities has the potential to leave the confines of the SSFL, resulting in possible exposure of receptors (including residents of Bell Canyon) for decades. Of note, radio-isotopes identified as being present at SSFL are very energetic and have half-lives that are hundreds of years long.

55-4
cont'd

55-2
cont'd

55-5

55-2
cont'd

55-5

The analyses in this EIS are all reviewed in accordance with rigorous procedures developed to ensure the quality, reproducibility, and adequacy of the analyses. These procedures require that personnel qualified and knowledgeable in the specific subject areas thoroughly review and confirm the technical analyses. The analyses (the commenter's quantitative backup) and reviews are documented and maintained in the administrative record for the EIS.

Commenter No. 55 (cont'd): Eric Wolf, Bell Canyon Association and Richard Levy, Bell Canyon Community Services District

*Technical Memorandum - Review of Draft EIS
Remediation of Area IV and the Northern Buffer Zone of the
Santa Susana Field Laboratory (SSFL), Ventura County, California*

The analysis of potential air quality impacts (and ultimately the potential health impacts to receptors) is in general accordance with most analyses of project impacts. Mitigation measures are proposed to minimize dust generation in compliance with air quality permit requirements. However, the simple assumption that adequate control of emissions will always be maintained to prevent small, respirable dust particles impacted with chemical or radioactivity contamination from ever leaving the Site is not health protective or reliable. Some wind-borne dust will likely occur, and the analysis by the DOE fails to get to the most relevant question to Bell Canyon residents. Will the materials being remediated at the Site migrate to Bell Canyon? The analysis by the DOE lacks the specificity to answer this critical question. The lack of any air-dispersion modeling to show that particulate matter generated at the Site cannot reach beyond the boundaries of the SSFL is particularly problematic. Thus, the impact of possible wind-borne dust on the surrounding communities requires further evaluation by the DOE. In addition, rigorous monitoring of wind direction, air-borne particulates, and contaminant presence in wind-borne dust throughout the surrounding community needs to be implemented during any remediation activities.

55-2
cont'd

55-3
cont'd

The excavation would also lead to large volumes of truck traffic from the SSFL to an off-site disposal facility (between 18,300 and 116,000 truck trips over 2 to 10 years, or approximately 35 to 45 truck trips per day, assuming a 5-day work week). Most of the truck traffic would be directed along Woolsey Canyon Road and thence either east or south on Valley Circle Boulevard (Figure 3-28 in the Draft EIS – attached hereto). Truck traffic would not pass directly through Bell Canyon, and various truck routings were evaluated to minimize traffic congestion and risks to residential neighborhoods. In addition, the remedial alternatives would only result in approximately 35 to 45 truck trips per day. Some increased traffic congestion may occur in the area at certain times of the day, especially on Valley Circle Boulevard. Given the volume of truck traffic anticipated, this should not be significant. However, the risks to the surrounding community from this increased truck traffic (e.g. increased vehicle emissions, increased risk of traffic accidents, increased damage to road surfaces, risks to property) require further evaluation.

55-6

As with the soil remediation alternatives, building demolition would result in the generation of wind-borne dust and increased truck traffic in the area. This only compounds the concerns expressed above regarding soil remediation.

55-2
cont'd

In addition to wind-borne contamination, there is the potential that contaminants could migrate from the Site via surface water run-off. Such instances have reportedly occurred in the past. During excavation activities, large volumes of contaminated soil will be exposed to the elements, including large storm events. Run-off protection measures will be implemented during remedial activities to minimize both local and off-site flow of surface water. However, the impact of possible contaminated surface water discharging to the surrounding communities requires further evaluation by the DOE. In addition, rigorous monitoring of surface water flows

55-3
cont'd

55-6

Assuming implementation of the Cleanup to AOC LUT Values Alternative, there could be an average of 16 heavy-duty truck round trips per day. (Empty waste trucks would enter the site and leave loaded, while loaded trucks with backfill would enter the site and leave unloaded.) Considering additional cleanup activities by DOE, Boeing, and NASA, there could be up to 96 daily heavy-duty truck round trips per day during some years. DOE acknowledges that this traffic could result in increased emissions of pollutants in the SSFL neighborhood, increased risk of traffic accidents which could be harmful to people or property, and increased potential for damage to road pavement due to passage of heavy trucks. These emissions and traffic risks would increase given an increase in the number of trucks in the SSFL vicinity that are required for SSFL remediation. In this Final EIS, DOE explicitly evaluates the potential for increased air emissions in Ventura County and the area directly adjacent to SSFL in Chapter 4, Section 4.6. Potential risks from transport of waste and materials are addressed in Chapter 4, Section 4.8.1, while the potential for damage to road pavement due to the passage of heavy-duty trucks and other traffic is addressed in Chapter 4, Section 4.8.2. The possible impacts of increased traffic on government services and local revenue are evaluated in Section 4.12. DOE discusses environmental justice issues in Section 4.13 and potential effects on age-sensitive individuals in Chapter 4, Section 4.14.

**Commenter No. 55 (cont'd): Eric Wolf, Bell Canyon Association

Santa Susana Field Laboratory (SSFL), Ventura County, California

and contaminant concentrations throughout the surrounding community needs to be implemented during any remediation activities.

The health risk analysis focuses on theoretical residents and visitors at the SSFL property. The health risk analysis indicates that each of the remedial actions will result in a decreased lifetime cancer risk. Estimates of current cancer risks and toxic hazards have a maximum of 1 in 3,000 and 30, respectively. These values far exceed the generally accepted thresholds of 1 in 1,000,000 and 1, respectively. Following the most conservative remedial measures (i.e. cleanup to AOC LUT values), the lifetime cancer risk values decrease to 1 in 310,000. This is significantly less than the current values, but still above the optimal value of 1 in 1,000,000.

Data Gaps

Soil

In June 2009, the United States Environmental Protection Agency (EPA) initiated a radiological study of Area IV and the NBZ with funding provided by the DOE. The EPA determined that four locations required further evaluation for naturally occurring radionuclides in soil. It was recommended that the DOE conduct a review of decay series and radionuclide ratios to support a determination of the origin of the radionuclides.

Backfill Soil

DOE conducted an initial evaluation of three off-site locations for soil to be used as backfill at the SSFL and found that none meet the requirements of the 2010 AOC (i.e. that the backfill meets the AOC LUT values). Because the AOC LUT values are very low, the DOE has had difficulties identifying a source of backfill soil, especially soil that is comparable to the existing local soil (i.e., that would support the native plant communities). Additional potential sources of backfill soil that meets the requirements of the 2010 AOC LUT values need to be identified and evaluated.

Groundwater

As stated in the Draft EIS, there are six primary areas within Area IV that require remediation measures to protect the groundwater:

1. F5DF TCE plume
2. Hazardous Materials Storage Area (HMSA) TCE plume
3. Building 4100/4056 landfill TCE plume
4. Building 4057 Warehouse perchloroethylene (PCE) plume
5. Tritium plume (in the area of the former Building 4010)
6. RMHF leach field strontium-90 source

55-3
cont'd

55-7

55-8

55-9

55-10

55-7 It is not clear where the commenter is obtaining the risk and toxicity values. The risk above natural background radiation level estimates in the Draft EIS for residents under the No Action scenario is 1 chance in 500,000 for radionuclides and is negative for chemicals in soil. (The site's radiation levels are indistinguishable from background levels.) The net hazard index is only 0.1. It appears that the commenter may be referring to risk from background levels or perhaps even site values without background subtraction. However, even the background and site toxicity levels are only 3.5 and 3.6 respectively, not 30. No quantitative risk values were presented in the Draft EIS for the Cleanup to AOC LUT Values Alternative or any other action scenario. As discussed in Chapter 4, Section 4.9 of the Draft EIS, The risk values are compared to an EPA defined acceptable risk range of 1 in 1,000,000 to 1 in 10,000. In response to comments, DOE has added a quantitative evaluation of human health impacts to potential onsite post-remediation receptors for all alternatives. The results of the modeling are included in Section 4.9 of this Final EIS.

55-8 DOE has performed the review of naturally occurring radionuclides in soil. A Technical Memorandum *Evaluation of Naturally Occurring Uranium and Thorium Decay Chain Radionuclides in Santa Susana Field Laboratory Area IV Soils* (Rucker 2015) was issued in August 2015 and will be used in developing the Site Remedial Action Implementation Plan. This reference has been cited and referenced in Chapter 3, Affected Environment, in this Final EIS.

55-9 DOE acknowledges that an acceptable source of backfill that meets the LUT values has not been identified and notes the importance of a backfill soil that would support native plant communities. DOE initiated the search for locating backfill soil meeting the AOC requirements by sampling at three sites (two commercial sites and a source of dredged lake sediment), evaluating existing data from a third potential site, and sampling of soil products that could serve as soil amendments. All samples did not meet the AOC LUT requirements. Refer to Section 2.3, "Suitable Backfill Soil," of this CRD for discussion of the responsibilities and actions necessary to identify a backfill source.

55-10 DOE has completed the additional groundwater investigations identified in this comment and reported the results in the *Draft RCRA Facility Groundwater Remedial Investigation Report, Area IV, Santa Susana Field Laboratory, Ventura County, California* (CDM Smith 2018a). Chapter 3, Section 3.4 of this Final EIS was updated with information from the final groundwater remedial investigation report, including information on the magnitude and extent of the existing groundwater contamination plumes in Area IV and the NBZ. The report is included as a reference for this Final EIS and is available for review on DOE's SSFL EIS website, http://www.ssflareaiveis.com/ssfl_areaiv_eis.aspx.

Commenter No. 55 (cont'd): Eric Wolf, Bell Canyon Association and Richard Levy, Bell Canyon Community Services District

Technical Memorandum - Review of Draft EIS
Remediation of Area IV and the Northern Buffer Zone of the
Santa Susana Field Laboratory (SSFL), Ventura County, California

Based on our review of the Draft EIS, it appears that the magnitude and distribution of the following three contaminant plumes has not been fully characterized in the following directions:

1. FSDP TCE plume: east and northeast direction
2. Building 4100/4056 landfill TCE plume: west direction
3. Building 4057 Warehouse PCE plume: east direction

In addition to the six primary areas identified above, two other areas with lower concentrations of groundwater contamination, mainly solvents, also need to be evaluated: RMHF TCE plume, and Metals Clarifier TCE plume.

The DOE will need to conduct additional Site investigations to further address the data gaps and more adequately characterize groundwater plume conditions. It is stated in the Draft EIS that "additional information about investigation of impacted groundwater can be found in the Area IV Groundwater Remedial Investigation Work Plan" (RIWP).

Furthermore, a comprehensive feasibility study on active groundwater treatment alternatives is needed after the Site is fully characterized. As stated in the Draft EIS, a RCRA CMS is currently being developed independently from this Draft EIS. The study, which is anticipated sometime in 2017, will evaluate and select groundwater treatment technologies (e.g., pumping and treatment, soil vapor extraction, MNA) to be applied as remedial actions.

The results of the investigation proposed in the RIWP and the findings of the RCRA CMS will need to be reviewed to evaluate the effectiveness of the selected groundwater remedy.

Closing

The Draft EIS, as presented, focuses on the health impacts to hypothetical future residents at, and visitors to, the SSFL property. The Draft EIS does not address the potential impacts to Bell Canyon residents from the various remedial alternatives. Given the volume of material to be excavated, the potential risks to the surrounding communities associated with wind-borne contaminants, surface water runoff, and increased vehicular traffic, further evaluation by the DOE is needed.

groundwater in the 290 acres of Area IV and the NBZ. DOE shares responsibility with NASA for cleanup of soil in the 182-acre NBZ; NASA is responsible for cleanup of contamination in the NBZ that emanates from areas that it administers (DTSC 2010b). DOE shares responsibility with Boeing for groundwater remediation in Area IV and the NBZ, as defined in the 2007 *Consent Order for Corrective Action* (2007 CO) (DTSC 2007). Not all of the energy research conducted in Area IV was performed for DOE. Some energy research was performed by Boeing and its predecessors. Boeing is responsible for decontamination and demolition of the buildings it owns in Area IV.

Figure 1-2 Santa Susana Field Laboratory and Surrounding Communities

Starting in the mid-1950s, AEC funded nuclear energy research on a 90-acre parcel of land in what is now SSFL Area IV, which was leased from Rocketdyne. ETEC was established by AEC on this parcel in the early 1960s as a “center of excellence” for liquid metals research (primarily sodium, potassium, and mercury) and general metals compatibility testing. DOE (or its predecessor agencies) also operated a total of 10 small nuclear reactors built for various research activities over the years of operation. As part of the operations of a research and development site, structures were constantly used, cleaned, and refurbished for a new purpose or demolished. As a result, cleanup activities have been ongoing since the 1960s. By 1980, all reactor operations had ceased, and nuclear research at ETEC was terminated in 1988. By the time non-nuclear liquid metals research ended in 1998, many facilities had been decontaminated, decommissioned, and demolished, and associated contaminated materials had been removed. As appropriate, these activities were covered by categorical exclusions in accordance with DOE’s “NEPA Implementing Regulations” (10 CFR Part 1021, Appendix B to Subpart D).

Operating research reactors and conducting nuclear research resulted in some localized releases of chemicals and radionuclides to the soil, bedrock, and groundwater. The concrete containments that surrounded the reactors became radioactive. Leaks from some liquid radioactive waste holdup tanks contaminated surrounding soil. Releases of wastes into leach fields contaminated soil, bedrock, and groundwater. DOE (or its predecessor agencies) decontaminated and demolished several of its structures and facilities in Area IV to the standards established at the time decommissioning occurred (see, for example, the discussion of prior cleanup in Chapter 2, Section 2.3.3.1, under 2010 AOC Soil Cleanup Standards), in accordance with its authority under the Atomic Energy Act of 1954, as amended. The major periods of building demolition were 1975 through 1977 and 1995 through 2005. DOE has removed all nuclear materials from the site, as well as all but two of its reactor buildings, and has performed cleanup of radioactive buildings, soil, and bedrock to the standards established in the 1980s and 1990s.

Draft Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory

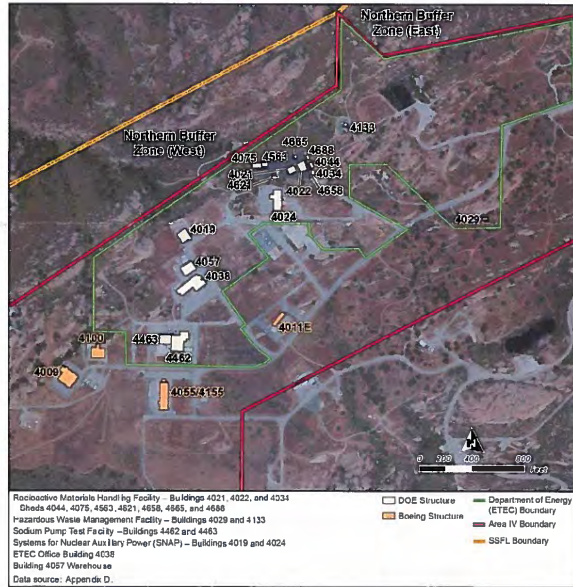

Figure 2-6 Remaining Structures in Area IV

At least two staging areas would be established to support building demolition and soil remediation work. The first would be the main staging area within the north-central portion of Area IV, near Building 4024. This staging area may be supplemented by an additional area south of Building 4038 (see Figure 2-6) that would include a contractor trailer, worker parking, portable restrooms, heavy equipment parking, and a decontamination pad. The main staging area would be situated on level ground where buildings previously stood to take advantage of existing cement foundations. A second staging area would be set up in the eastern portion of Area IV. This staging area, which would be located on level ground where buildings previously stood west of Building 4133, would be used to support soil remediation work in this area. Facilities would be similar to those described for the main staging area. Neither grading nor major vegetation clearance would be required to prepare the staging areas. Other, more-temporary staging and stockpiling areas would be set up within 300 feet of facilities undergoing demolition. These areas would be located on asphalt, concrete, or

The SSFL (Santa Susana Field Laboratory)

**A simplified non-mathematical analysis of the inverse square law,
alleged existing health risks, and the true health and economic risks of the
proposed cleanup unless it is minimized to no more than a residential standard**

By Lee Jay Mandell, B.S.E.E., M.S.E.E., J.D.

So, who am I and why do I care? I live in West Hills. I am a retired microcomputer engineer and patent attorney. I respect science and understand the guilt feelings associated with errors since even the best engineers and scientists do make mistakes. I also understand as a retired attorney that litigation is not desirable and thus an out of court settlement is generally pursued and encouraged by judges to avoid an erroneous decision (which according to at least one side of each dispute occurs 100% of the time). I am not a member of any group associated with this matter although I have met participants on each side and have been to a few educational meetings. All thoughts expressed are solely my own although I have sought assistance to discuss this matter since the unique vocabulary is outside my otherwise extensive background which extends from oil pipelines, oil drilling rigs, refineries, computerized/energy efficient homes, the design and manufacture of networked (S.E.C.S.) semiconductor manufacturing equipment in a near zero particulate atmosphere using a highly toxic chemical etch on a silicon wafer interleaved with a cleaning step using highly purified DI (de-ionized) water, the architecture of all current microprocessors (part of a patent infringement case which extended to the US Supreme Court), implantable medical devices, e.g., improved pacemakers and treatments to avoid DVTs. In my background as a microcomputer consultant and a patent attorney, it was always my job to quickly acquire/learn a lifetime's worth of knowledge in new technological fields before I started work on each new task and to never accept as gospel the prior work of others but to build upon the existing available knowledge.

I thought that it would be useful to first present a simplified technique for understanding the effects of nuclear radiation to the environment and the people living in that environment and thus I will begin with a short simplified non-mathematical description, commonly described as the butter gun effect. Imagine that you have a spray gun that sprays butter, note not a stream, a wide spray. Imagine that you are in front of the gun,

Response side of this page intentionally left blank.

Commenter No. 56 (cont'd): Lee Jay Mandell

you get covered with butter, right? Ok, now move 2 feet back, you get less butter on you. Now, back off 4 feet, you get even less butter on you (1/4, that is the math). Go back 8 feet even less, go back 1000 feet, essentially no butter at all, skip the math.

Now none of us want butter squirted in our face but at some point, there is butter everywhere and the butter from this butter gun is statistically insignificant. The universe is built that way, whether from science or a deity, your choice. Radiation, whether nuclear or electromagnetic, e.g., cell phone RF, abide by these laws, that is why there are so many cell phone towers because they lose their effect in a relatively short distance, that is the basis of cell phones. Thus, radiation goes by the same rules. Radiation is everywhere, some places worse than others, some is just part of living in this universe. Living near the SSFL could arguably be problematic, living a couple of miles away, considerably less so, not so much butter. The medical studies (discussed below) say that there is no significant statistical increase in cancer or butter at the site (actually, some measured decreases), it was not even worthy of consideration, butter on children was too obscure to be studied, although a further study would be warranted (but has never been done and so we are only presented unsupported cases without medical histories, e.g., no geographical history of fertilization, gestation, home addresses, related to the SSFL or were at least a portion of these parents drawn toward a hospital that dealt with rare diseases or cancers, which is a typical and rational act by a desperate parent. Nobody wants radiation or butter on them and everybody knows someone who has cancer and thus there must be a reason but

56-1

56-1

DOE acknowledges your comment and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of data on offsite contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS that provides comparative information about cancer mortality and incidence rates for the United States, California, and Los Angeles and Ventura Counties.

Commenter No. 56 (cont'd): Lee Jay Mandell

scientifically the SSFL clearly is not it. That is the simplified explanation since even "rare" cancers are found everywhere.

The most relevant medical study was done in 2007 by Hal Morgenstern et al. entitled "Cancer Incidence in the Community Surrounding the Rocketdyne Facility in Southern California" (the Morgenstern study) which showed limited concerns for limited cancers but ONLY very close to the site (see its Table 11 below). As noted in this study, >5 miles away there is no effect from the SSFL. However, it shows that at the site, i.e., <2 miles, the incidence of Melanoma, Breast, and Prostate cancers are actually decreased from the normal incidence rate. These numbers are hard to justify but unless (iff, if and only if) you believe these numbers then noting any other increases in the range of <5 miles become questionable. Perhaps, these reduced cancers rates at the site justify those who successfully petitioned the federal government to make the SSFL a national monument but it certainly shows the current risk is de minimis.

Table 11. Standardized rate ratio* (SRR; 95% CI), by distance from SSFL and cancer site: Site-specific cancers, 1988-1995; Los Angeles and Ventura Counties, CA.

Cancer Site	<2 miles	2-5 miles	>5 miles (referent)
Melanoma	0.57 (0.23, 1.36)	1.17 (0.94, 1.46)	1
Colorectal	1.32 (0.86, 2.02)	1.00 (0.87, 1.13)	1
Lymphopoietic [†]	1.62 (0.94, 2.83)	0.93 (0.78, 1.10)	1
Lung	1.29 (0.89, 1.89)	1.12 (1.00, 1.26)	1
Breast	0.92 (0.65, 1.31)	1.00 (0.90, 1.11)	1
Bladder	1.62 (0.67, 4.12)	0.97 (0.74, 1.27)	1
Prostate	0.90 (0.60, 1.35)	0.94 (0.84, 1.06)	1
Thyroid	2.59 (0.49, 18.61)	1.36 (0.89, 1.78)	1
Upper Aerodigestive Tract [‡]	1.83 (0.91, 3.82)	1.14 (0.93, 1.41)	1

* Standardized for age (15-39, 40-59, 60+ years), gender, and race/ethnicity (non-Hispanic white, Hispanic, and other non-Hispanic).
[†] Cancers of lymphatic and hematopoietic tissue (excluding chronic lymphocytic leukemia).
[‡] Includes cancers of the oral and nasal cavities, pharynx, larynx, and esophagus.

56-1
cont'd

56-2

56-2

DOE acknowledges your comment and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. Section 2.8 cites the 2007 Morgenstern study by the University of Michigan, School of Public Health (UM 2007). That study identifies some of the limitations identified in this EIS. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 56 (cont'd): Lee Jay Mandell

Now let us presume that there are cancers here as there are everywhere. There have been no controlled studies disclosed that would show causation between any of the new cancers of children that would identify the SSFL as being related. Apart from the small print which we all saw and ignored in real estate documents which disclosed the 50-year-old event, neither that nor the city stopped anyone from moving in and living in this area. I have not seen any studies which would correlate the childhood cancers to the SSFL, only the suspicions of a few over 50 years. Were the mother's eggs fertilized at the SSFL, was the gestation of each fetus limited to the limited area surrounding the SSFL, did the children grow up their whole lives proximate to the SSFL, did the parents reside large portions of their lives at the SSFL or did parents move here from other states, perhaps to be near Children's Hospital, was there any genetic predisposition of either parent? I just don't know and that needs exploration before there can be any conclusions or rational responses.

Medical science (more specifically its practice because generally medicine is something you practice based on your work and experience, epidemiologic studies, and the work of others) cannot conclude a causation at this point of time and I would question any doctor who claimed that they could. Certainly, further studies should be done before the massive economic and traffic destruction of the West San Fernando Valley proceeded. Why now after 50 years, the current evidence is even less conclusive as are there risks, if any. I do not question the responses of anyone 50 years ago, when the apparent and real risks seemed imminent.

Now, I do understand the query as to why is this happening to me. After the Northridge Earthquake, I was erroneously diagnosed with Valley Fever, why me? Actually, in my case it was a misdiagnosis based on the limited experience of the doctors involved. Doctors practice medicine based on their exposure to patients, they never perfect their profession as a science. Later, a cancer doctor diagnosed my condition as presumptively cancer and ordered invasive biopsies, why me? Eventually, a more experienced specialist diagnosed it (via a considerably less invasive biopsy) as a condition so rare that Dr. House, the fictional TV doctor, used it in almost every episode to show his brilliance that he knew an extremely obscure diagnosis. The worldwide specialist resided at USC and so

56-1
cont'd

Response side of this page intentionally left blank.

Commenter No. 56 (cont'd): Lee Jay Mandell

of course, I went to USC. It was a condition typically correlated to race and nationality, none of which applied, and so back to why me? Sometimes there isn't an answer, sometimes it is genetic, sometimes it is misfortune, sometimes science is not ready to answer the question but spreading misfortune into an economic disruption, i.e., significant drops in housing prices and further restrictions to the already abhorrent highway traffic patterns on freeways and narrow two lane surface streets, will not and can not solve the problem. Sometimes, that means we go to doctors who present the best case that they know an answer to even when there may not be any.

The reason that an overly aggressive cleanup of the SSFL is hazardous is that mistakes happen, like what happened 50 years ago. Trucks do crash, the more trucks, the more likely that a crash will occur (simple, obvious statistics) no matter how well intentioned everyone is. Let's look at the 9/4/13 email from David Collins et al. to the DOE entitled "Rough Order of Magnitude Estimates for AOC Soil Cleanup Volumes in Area IV, and Associated Truck Transport Estimated based on DTSC Look-up Table Values -- DRAFT". In that email they discuss 3 levels of cleanup using "10- to 15-cubic yard capacity roll-off bins, and some will be hauled off in 16- to 18-cubic yard end-dump trucks". The estimates are based on a limit of "35 truckloads per day, 5 days a week, and 50 weeks a year". Depending on the soil cleanup scenario (shown below in its Table 4), the number of truckloads are alternatively 18,900 for 2.2 years, 67,463 for 7.7 years or 104,213 truckloads for 11.9 years.

Now let's hypothesize the worst scenario, the 104,213 truckloads spread over 11.9 years. Presumably, there is a massive demolition/excavation spread over those years (or even the smallest time period). It is unavoidable to not expose the environment to massive levels of particulate over that period of time since how could they seal the excavation cavities each hour, each day as the process continued and thus the risks to the community, which are arguably stable or currently non-existent would now be become massive.

56-3

56-4

56-3 DOE acknowledges that the potential for an accident increases as the volume of traffic increases. The cited truck shipments are estimates based on the evaluated truck-loading configurations and the expected levels of cleanup. DOE agrees that there are some risks associated with the transport of the contaminated soils. However, the risks, as documented in Appendix H, Section H.8, and Chapter 4, Section 4.8.1, of this EIS, are very small. It should be noted that the radioactive contamination level in the soil to be transported is itself very low. Some soil to be shipped likely would have radioactive contamination levels below detection limits. Nevertheless, at least some contamination would exist in the transported soil. It should also be noted that the radioactive contaminants are bonded within the soil matrix and, in the event of an accident, soil would not easily become airborne and be carried over a long distance. If an accident were to occur, the expected releases would be local and manageable Also see the response to comment 162-6.

While the SSFL site has not been designated as a National Monument, DOE is aware of the petition to designate portions of the SSFL site as such. However, these portions of the site are not within Area IV or the NBZ. These efforts are directed at preserving the structures associated with advancement of the space program and cultural resources identified on the NASA portion of the site (NASA has deferred demolition of test stands pending the outcome of the effort to designate the site.)

56-4 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

Commenter No. 56 (cont'd): Lee Jay Mandell

Table 4
Summary of Investigation for Area IV Soil Volumes - Draft
Santa Susana Field Laboratory
Data Prepared - September 5, 2013

Soil Cleanup Scenario ¹	On-Site Soil Volume ²			Total
	Chemical (cubic yds)	Geological (cubic yds)	Anthropogenic (cubic yds)	
2) Chemical Clearly Contaminated Area Soil Volumes				
Volume of Soil Requiring Remediation	233,000	18,000	64,400	515,400
Number of Truckloads	11,710	1,125	4,325	18,300
Days of Operation (years)	3.6	0.1	0.1	3.8
3) Chemical Look-Up Table Preliminary Remediation Area Soil Volumes				
Volume of Soil Requiring Remediation	997,000	74,000	8,400	1,079,400
Number of Truckloads	62,315	4,825	535	67,480
Days of Operation (years)	7.3	0.5	0.1	7.7
3) Upper Range Soil Volumes				
Volume of Soil Requiring Remediation	1,585,000	82,000	400	1,667,400
Number of Truckloads	94,245	5,125	15	104,310
Days of Operation (years)	13.1	0.6	<0.1	13.9

Notes

- Criteria for identifying Chemical Clearly Contaminated Area, Chemical Look-Up Table PRMs, Upper Range, and biological soil volumes is provided in the text of this document.
- Volume estimates are based on validated data available as of August 2013 and are considered preliminary, working draft RCM estimates that will need refinement once validated data is available for all volumes and/or during remedial planning.
- For truckload transport planning, an average volume of 18 cubic yards per truckload has been assumed based on previous soil removal actions at SFL.
- Truckloads estimated assuming 10 truckloads allowed per day, 5 days per week, 50 weeks per year. Does not include allowance for 90% or better truck loading property.

Assuming that the problem could be overcome, my ridiculous fantasy was that military vehicles could surround the trucks carrying contaminants to protect themselves from the public even if this would shut down all traffic for the next 10+ years. We now see, but I am not surprised, that any vehicle, including a military vehicle is subject to a crash and thus catastrophic results.

Military Vehicle Crashes on I-5 Near Camp Pendleton
A military vehicle crashed Sunday morning near Camp Pendleton, halting traffic on...
4.nbcla.com

Response side of this page intentionally left blank.

Commenter No. 56 (cont'd): Lee Jay Mandell

If the truck is carrying radioactive materials, "butter", toxic chemicals, etc., the rules change, you are no longer miles away, you could be feet away, there could be a cloud of particulate, dust, blowing on those who lived 50 miles away and were statistically safe, dust doesn't go by the same butter gun rules. The threat now propagates from a fixed area (now designated as a national monument by the same people looking to level the SSFL, the motivation for that act I will never understand), to the potential of actively contaminating cities, counties, or states by removing contaminants from an otherwise stable site. It is a dangerous proposition to have fear, parents looking for explanations for what is currently unexplainable, panic, and politicians (who disbelieve in science) make technical decisions. Unfortunately, it is also dangerous when a scientific community like NASA, feels reasonable guilt because they screwed up and overly compensate for their guilt by agreeing to further irrational conduct to make the community happy, in the end we are all harmed. It is notable that no decision on this issue has ever been adjudicated, i.e., decided by a court of law after having been presented with the available and uncontroverted facts, this is referred to as the Frye standard, something which does not appear to have been applied here. Instead, as is typically done, a corporation has accepted an out of court settlement. This is not unusual since it expedites a solution and minimizes legal costs. The repercussions of this settlement are more horrendous than the existing problem and should be presented for a full judicial hearing and decision according to the rule of law including the Frye standard.

Thus, in summary, although there is no medical evidence that supports a cleanup at all, I do need to defer to the testing that does show some level of 50-year-old contamination existing but not a risk to the existing population. There is clearly no need to build housing (which large portions of the local community already object to anywhere in Los Angeles) at the SSFL or to make it into farm land. Thus, in respect and deference to those who are actual environmentalists and hike the site as well as the declaration of the site as a national monument, I do support the minimal cleanup standard which I understand to be referenced as the residential standard. I also support additional medical studies which could alter my position and the positions of others, I do support preserving the health and safety of the members of our community.

56-5

56-1
cont'd

56-6

56-7

56-1
cont'd

- 56-5 This Final EIS analyzes the cleanup of DOE-administered portions of Area IV and the NBZ. NASA activities at SSFL are considered as a part of cumulative impacts (Chapter 5).
- 56-6 In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site.
- 56-7 DOE acknowledges your support for a residential-based cleanup standard. In this Final EIS (see Chapter 2, Section 2.4), DOE has retained the Cleanup to Revised LUT Values Alternative, which uses chemical RBSLs based on a suburban residential scenario without a garden pathway. The Final EIS also retains the Conservation of Natural Resources Alternative, but evaluates two scenarios. The Open Space Scenario is based on the future land use of Area IV and the NBZ as open space, consistent with Boeing's conservation easements (i.e., cleanup levels are based on exposure of an onsite recreational user as the receptor). The Suburban Resident Scenario is the scenario evaluated in the Draft EIS, that is, cleanup levels are based on a suburban residential scenario without a garden pathway. This latter scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space. DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

March, 2017.
*Comments and Concerns Regarding the Department of Energy's
Draft Environmental Impact Survey:*

Regarding Building Removal Plan:

Archeological or cultural resources are not expected to be effected as per archaeological survey and I am assuming due to the degree of soil disturbance that occurred during the construction. My concern is the age of these buildings, as I believe their construction occurred prior to the required presence of Native American or archaeological monitoring. It is possible for there to be a sub-surface component in the surrounding area, although I agree it is likely to be disturbed. However, given the importance of the pictograph sites on NASA's property, and the region as a whole, there is likely to be some form of a cemetery within the SSFL. While this has yet to be verified, it is good to keep in mind as the possibility it is uncovered under or around the buildings designated for removal does exist.

Would it be possible for you to provide the Sacred Sites Council, or consulting Native American groups with a copy of the records or plans created prior to the erecting of the buildings now destined for removal? I do not speak for everyone but I know that I, at least, would like to evaluate them. I would also like to know if the removal of the buildings will be monitored by NA groups or archaeologically?

Regarding Unanticipated Discovery of Cultural Resources:

I am concerned with this topic for a few reasons, the first of which surrounds monitoring. Since areas are projected to have more cultural significance than others, will only those at higher risk be monitored by NA groups and archaeologists, or will the entire soil removal process be monitored? In areas where clean-up will alter our pre-historic/historic cultural sites, will their removal be systematic or will it be removed in bulk with excavators?

Second, I know Area 4 and the NBZs were surveyed by a few CRM companies in the past, yet to my knowledge the majority of the known sites, including those which Stephan Bryne and Leidos ground-truthed, were identified by JMA about four years ago. When JMA identified all of the additional site locations, it was while they were monitoring, not surveying. This leads me to suspect other sites may have also been missed by past archaeological surveys and have yet to be identified within the boundary of area 4 and the NBZ. The possibility of a cemetery in the region (previously mentioned above), is a concern raised by the incomplete survey of A4 and the NBZ. It is also possible some sites lack surface evidence due to rain, wind, and even heavy traffic in certain locations. I address this not to lobby for a re-survey of A4 or the NBZ, but reveal the higher likelihood that other sites are present throughout the afore mentioned areas.

Best Regards,
Brian Holguin
Samala (Santa Ynez) Band of Chumash Indians
[Redacted]

57-1

57-1 DOE acknowledges that archaeological sites could be present beneath existing foundations, subsurface vaults, or concrete slabs. For this reason, as described in Chapter 4, Section 4.11.2.2, DOE will comply with applicable regulations and the NHPA Section 106 Programmatic Agreement currently under development in the unlikely event that unexpected archaeological resources are discovered during building demolitions.

57-2

57-2 EPA included photographs and drawings in the historical site assessment documents it developed as part of the radiological characterization of Area IV. The *Final Historical Site Assessment, Santa Susana Field Laboratory Site, Area IV Radiological Study, Ventura County, California* (HGL 2012a), prepared by HydroGeoLogic for EPA, can be found at www.SSFLAreaIVEIS.com, under "References" for Chapters 1 through 8.

57-3

57-3 In accordance with the Section 106 Programmatic Agreement currently under development, DOE will prepare a monitoring plan before ground-disturbing activities begin, and DOE will consult with the California SHPO, the Santa Ynez Band of Chumash Indians, and other tribes to determine where and when Native American monitoring is appropriate for building removal, groundwater cleanup, and soil cleanup. Additionally, at a minimum, archaeological monitors (cultural resources specialist) would be present where there are known archaeological sites, including ground disturbing activities within the buffer zones (protective areas) established around the archaeological sites.

57-4

57-4 If cleanup requires alteration to a known archaeological site, cleanup excavations will be performed in a careful, systematic fashion. In accordance with the Section 106 Programmatic Agreement currently under development, measures to minimize adverse effects on a historic property, like using careful cleanup methods, would be addressed in a Historic Properties Treatment Plan prior to ground disturbing soil clean-up activities. Please also see Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a discussion of the process that will be used to determine exemptions.

57-5

57-5 In the years after John Minch and Associates, Inc. (JMA) reported on the sites located while monitoring, DOE conducted archaeological surveys at locations of monitoring wells, soil sampling, and weed abatement in Area IV and the NBZ. No previously unknown or unrecorded archaeological sites were found. However, as noted in Chapter 4, Section 4.11 of this Final EIS, the possibility of unanticipated archaeological resource exists, and this could include burial sites. For this reason,

Commenter No. 57 (cont'd): Brian Holguin
Samala (Santa Ynez) Band of Chumash Indians

the NHPA Section 106 Programmatic Agreement (being developed by DOE in consultation with the California SHPO, the Santa Ynez Band of Chumash Indians, other tribes, and other consulting parties) will include procedures for the development of a monitoring plan and an inadvertent discovery plan that spells out steps to follow if cleanup activities inadvertently encounter archaeological resources, human remains, or burial-related artifacts.

Commenter No. 58: Virginia Swanson

RE: Comment on SSFL Draft Environmental Impact Statement

Please decide to have the Dept of Energy fulfill the legally binding clean-up agreement to extract and remove all radioactive contamination from the Santa Susana Field Lab. I have lived near the lab in the SF Valley for over 50 years and have seen several friends die from gastric and esophageal cancers. I would like to be able to see my grand kids and their descendants live a normal life. Please demand the Department of Energy clean up the SSFL as promised in 2010. Please feel free to call me [redacted] for further information.

Signed: Virginia M Swanson

58-1

58-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

58-2

58-2 DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of data on offsite contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

58-1 cont'd

Commenter No. 59: Charles Swanson

RE: Comment on SSFL Draft Environmental Impact Statement

I demand you enforce the 2010 Clean-Up agreement signed by the Department of Energy for a 100% cleanup of the Santa Susana Field Lab. Do not let the Dept of Energy breach this agreement which is legal and binding. Too many people have died of cancer due to this contaminated site which continues to reign radioactivity on this community. DO NOT LET THE Department of Energy walk away from their responsibility!!

Signed:

Charles Swanson

59-1

59-1

DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

59-2

59-2

Please refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for a discussion of illnesses within the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. As can be seen in the discussion in Section 2.7, "Offsite Impacts," of this CRD there is no evidence of major amounts of Area IV contamination leaving SSFL. (Groundwater plumes extend from Area IV into the NBZ but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.)

Commenter No. 60: Kathy Lupper

RE: Comment on SSFL Draft Environmental Impact Statement

To whom it may concern,

I have lived in Simi Valley all my life, since 1962. I have 2 daughters with my oldest being 27 years old. She was born w/ 6 major birth defects with a few other anomalies thrown in for good measure. All her defects were things I had never heard of before; imperate anus? tetralogy of Fallot? Her dad and I have lost count of all her hospitalizations and surgeries, maybe 15-20 surgeries - 30 hosp. visits. Our specialist on the East Coast heard of Simi Valley because he had other patients from our fair city! I thought this matter was taken care of years ago. Signed: Kathy Lupper
Shame on you for sitting on your hands - Delay Delay Del.

60-1

60-1

Please refer to Sections 2.7, "Offsite Impacts," and 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for discussions of contamination and illnesses within the vicinity of SSFL. Over the life of SSFL, there has been action taken to clean up Area IV. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated for cleanup of Area IV and the NBZ is protective of the health and safety of the public and the environment.

Commenter No. 61: Members of the Green Building Alliance

March 5, 2017

To: Ms. Stephanie Jennings
NEPA Document Manager
SSFL Area IV EIS
U.S. Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 93063

Ms. Stephanie Jennings,
I am concerned that the Department of Energy's Draft Environmental Impact Statement (DEIS) for the Santa Susana Field Laboratory (SSFL) Area IV cleanup is using the short term environmental impacts of the remediation work as an excuse to leave much of the radioactive and carcinogenic chemical pollution on site with longer term impacts. The DOE has the responsibility, as does Boeing and NASA, to remove the long term community and environmental hazards associated with the remaining pollution at the SSFL site. I acknowledge the great scientific work produced at the SSFL that enabled the U.S. to go into space, however we expect the DOE to clean up the site so that it can be celebrated by the community as a monument to American ingenuity.

The DOE should respect the 2010 Administrative Order of Consent (AOC) agreement (as described in the DEIS Section 1-7) and provide no less than full site cleanup. Any "leave in place" cleanup methods, including natural attenuation and "no action" methods should not be considered. The AOC is a legally binding agreement with the California Department of Toxic Substance Control (DTSC), and the DTSC should continue to manage the extent of the cleanup. We request adherence to the 2010 AOC Agreement in full, and maintain that the

- 61-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," of this CRD for further discussion of this topic. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). This risk assessment approach for soil cleanup is consistent with the approach used for cleanup actions by DOE at other DOE sites, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public, both in the short term and the long term. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.
- 61-2 DOE recognizes that the 2010 AOC is a legally binding agreement with the DTSC. The 2010 AOC and its legal implications are discussed in Chapter 1, Section 1.4 of this Final EIS. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of this topic and for DOE's response.

Commenter No. 61 (cont'd): Members of the Green Building Alliance

management of the cleanup remain with the California DTSC.

|| 61-2
cont'd

DOE's recently submitted DEIS and its proposed options for cleanup make it clear that DOE wants to abandon its 2010 commitment to clean up all of its contamination at SSFL (See DEIS Soil Remediation Alternative S.10.2). Instead, the DOE proposes leaving between 39% and 99% of the dangerous radionuclides and toxic chemicals on site, not cleaned up, where they will continue to migrate and put nearby communities at risk. The long term damage to the ecosystem, watershed and biological environment outweigh the short term impacts of full cleanup to the natural ecosystem and cultural artifacts on the site. This site is at the headwaters of rivers that flow through Simi Valley through Ventura County and through the San Fernando Valley through Los Angeles County.

|| 61-1
cont'd

61-3

Although complete remediation of the toxic materials on the site is more expensive to the DOE, the alternative long term cost to the nearby communities will be even greater in terms of illness, ongoing pollution to the water table and ongoing medical care for the community. The pollution onsite has already migrated into the adjacent populated areas via rainwater runoff, prevailing westerly winds, and via natural fires as evidenced by increased local cancer rates among nearby residents as identified by the September 1997 Tricounty Regional Cancer Registry that shows increases in lung and bronchial cancers, the March 2007 University of Michigan identifying increases in thyroid cancer cases, and the 2012 California Breast Cancer Mapping project that identified a 10-20% increase in breast cancers for people living in the vicinity of SSFL. We have the opportunity to clean up the site once and for all and the time is now.

|| 61-4

Large amounts of water will be used to control dust during the full removal of the hazardous soil, and if the DOE can use reclaimed water for that purpose, this will be more sustainable than using our valuable potable water resource for dust control.

|| 61-5

If all of the contamination at SSFL is not cleaned up per the AOC cleanup agreement, people who live nearby and future visitors to the site will continue to experience increased risk of cancer and illnesses related to exposure to SSFL contaminants. The DEIS Appendix G identified 28 found radionuclides, and 56 additional toxic chemicals including PCB's, PAH's,

|| 61-4
cont'd

- 61-3 DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. All of the remedial action alternatives would be protective of human health and the environment. Please refer to Section 2.7, "Offsite Impacts," of this CRD for a discussion about offsite impacts and DOE's response. As described in Section 2.7 of this CRD, DOE is confident that significant levels of contamination originating in Area IV have not travelled offsite and, based on modeling results, believes they will not move off site during or after remediation activities. As discussed in Chapter 3, Section 3.4, of this EIS, the monitoring well network established for Area IV and the NBZ demonstrates that the contaminants have not moved laterally off of DOE-administered areas of Area IV and the NBZ. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.
- 61-4 DOE acknowledges your comment and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The commenter is correct regarding the range of constituents that have been detected from the extensive sampling and characterization of soil in Area IV and the NBZ. Please refer to Section 2.5, "Toxicity of Soil Contaminants," of this CRD for a discussion of the relevance of exposure parameters in determining whether a constituent presents a health risk.
- 61-5 DOE agrees that use of reclaimed water would be desirable for dust control. Chapter 7, Table 7-1, of this EIS, summarizes the applicability of greener cleanup using best management practices in DOE's remediation activities. In this table, DOE addresses the potential for use of reclaimed water for such activities as dust control or wash water. Sources of water could include captured stormwater runoff or treated extracted groundwater. The use of captured stormwater runoff, however, would require coordination with the landowner (Boeing), and the use of treated extracted

Commenter No. 61 (cont'd): Members of the Green Building Alliance

groundwater (a minor potential source of reclaimed water). That source would require approval by the State of California. DOE is not considering construction of a parallel reclaimed water distribution system for site reclamation activities because such a distribution system would need to pass through urbanized areas and then up the steep slope to SSFL, and it would potentially result in additional environmental impacts.

Commenter No. 61 (cont'd): Members of the Green Building Alliance

dioxins, petroleum chemicals, mercury and silver. The Agency for Toxic Substances and Disease Registry identifies many of these as chemicals known to cause various cancers, and are classified as Group 1 carcinogens to humans by the International Agency for Research on Cancer. We request your faithful dedication in protecting the health of our communities and keep your cleanup commitment by ensuring that DOE's final EIS fully comply with the AOC provisions and clean up all SSFL contamination. We look forward to the day when the site has been cleaned up, and we can celebrate the achievements of the Southern California aerospace industry at this historical site. Thank you.

Commenter No. 62: Paul Poirier

March 5, 2017

To: Ms. Stephanie Jennings
NEPA Document Manager
SSFL Area IV EIS
U.S. Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 93063

Stephanie Jennings,

I am a former resident of the Canoga Park/ West Hills area having spent the first 18 years of my life there from 1961 to 1979. I currently live in Santa Barbara, however my mother still lives in the area as do a few of my old time friends. I am concerned that the Department of Energy's Draft Environmental Impact Statement (DEIS) for the Santa Susana Field Laboratory (SSFL) Area IV cleanup is using the short term environmental impacts of the remediation work as an excuse to leave much of the pollution on site with longer term impacts. The DOE has the responsibility, as does Boeing and NASA, to remove the long term community and environmental hazards associated with the remaining pollution at the SSFL site. I acknowledge the great scientific work produced at the SSFL that enabled the U.S. to accomplish and we expect the DOE to clean up the site so that it can be celebrated by the community as a monument to American Ingenuity.

I went to Our Lady of the Valley School and later to Chaminade High School, both within the shadow of the Santa Susana Field Lab (SSFL). I remember hearing the rocket engines going off at the top of the mountain and seeing a plume of smoke up at the SSFL on occasion from our play yard. I also remember many of my classmates and members of other parish families suffering from leukemia and other cancers as a child in grade school. Many of the students' fathers worked in the local aerospace industry and we were proud of their hard, groundbreaking work to send men into space at Rocketdyne and the other companies. We all spent a lot of time outdoors, as the weather was often warm and there was an abundance of open space to rock climb,

62-1

62-2

62-1 DOE acknowledges your support for cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information, including necessary steps prior to continuing cleanup. The purpose of the EIS is to evaluate alternatives for completing remediation at those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). The use of a risk assessment approach for soil cleanup is consistent with the approach used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public, both in the short term and the long term. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

62-2 DOE acknowledges your comment and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The commenter is correct regarding the range of constituents that have been detected from the extensive sampling and characterization of soil in Area IV and the NBZ. Please refer to Section 2.5, "Toxicity of Soil Contaminants," of this CRD for a discussion of the relevance of exposure parameters in determining whether a constituent presents a health risk.

Commenter No. 62 (cont'd): Paul Poirier

hike and bike. We ate the peaches off our own peach trees, drank the milk from the local Giacopuzzi dairy, and ate local eggs from the Traffcanda egg ranch. Now in my 50's many of my grade school classmates (OLV class of 75) and high school friends (Chaminade class of 79) have died or are getting cancer at an alarming rate. Many of these people, like me, no longer live in the area of the SSFL, and do not show up on the studies of the cancer occurrence among the immediate current residents near to the SSFL. It doesn't seem normal to have 5 high school friends die of cancer in the last three years, and have many others suffering from cancer. Chaminade was a small school back in 1979! It seems like the natural environment and the local community were unknowingly put at risk from the unknown risks associated with the activities at the SSFL. The DOE has now quantified the precise risk that the community has been exposed to, and there is no excuse not to clean it up completely now. Money will have to be spent to resolve this issue, either by the DOE and a full cleanup, or by the community in perpetuity for medical bills dealing with the cancers that will continue to result. The amount of money to completely clean up the site is small when compared to the total budget for the space and nuclear programs of the 1950's and 1960's developed at the SSFL. I believe that the humane solution is for the DOE to complete the full cleanup promised and agreed to in 2010, so that future residents of this area do not have to go through the illnesses that past and current residents are dealing with.

A basic philosophy of the U.S. Green Building Council, of which I am a member, is to balance the health of the environment, the people and the economy in order for all three to thrive. The past activities at the SSFL resulted in pollution that has damaged the health of the environment and the adjacent community. The DOE can restore the balance by proceeding with a full cleanup of all toxic chemicals and radioactive materials at the site, so that the environment, community and economy in this area can continue to heal and thrive. I think that it would be appropriate to err on the side of caution, given the unfortunate exposure to carcinogens and known toxins to both the environment and the community in the past.

The DOE should respect the 2010 Administrative Order of Consent (AOC) agreement (as described in the DEIS Section 1-7) and provide no less than full site cleanup. Any

Commenter No. 62 (cont'd): Paul Poirier

"leave in place" cleanup methods, including natural attenuation and "no action" methods should not be considered. The AOC is a legally binding agreement with the California Department of Toxic Substance Control (DTSC), and the DTSC should continue to manage the extent of the cleanup. The legal obligations in the AOC already require full cleanup, and even if it didn't exist, the California DTSC is the regulator who decides cleanup requirements for these toxic chemicals. We request adherence to the 2010 AOC Agreement in full, and maintain that the management of the cleanup remain with the California DTSC.

DOE's recently submitted DEIS and its proposed options for cleanup make it clear that DOE wants to abandon its 2010 commitment to clean up all of its contamination at SSFL (See DEIS Soil Remediation Alternative S.10.2). Instead, the DOE proposes leaving between 39% and 99% of the dangerous radionuclides and toxic chemicals on site, not cleaned up, where they will continue to migrate and put nearby communities at risk. The long term damage to the ecosystem, watershed and biological environment outweigh the short term impacts of full cleanup to the natural ecosystem and cultural artifacts on the site.

Although complete remediation of the toxic materials on the site is more expensive to the DOE, the alternative long term cost to the nearby communities will be even greater in terms of illness, ongoing pollution to the water table and ongoing medical care for the community. The pollution onsite has already migrated into the adjacent populated areas via rainwater runoff, prevailing westerly winds, and via natural fires as evidenced by increased local cancer rates among nearby residents as identified by the September 1997 Tricounty Regional Cancer Registry that shows increases in lung and bronchial cancers, the March 2007 University of Michigan Identifying Increases In thyroid cancer cases, and the 2012 California Breast Cancer Mapping project that identified a 10-20% increase in breast cancers for people living in the vicinity of SSFL. We have the opportunity to clean up the site once and for all and the time is now.

Large amounts of water will be used to control dust during the full removal of the hazardous soil, and if the DOE can use reclaimed water for that purpose, this will be

Peoplepolicy.org

SUMMARY

Overall Comments:

Serious over reach of exceptions for implementation of AOC agreement. At the same time, the exceptions proposed are not considered in the very large estimates of truck and soil volume, so the math isn't right, and creates a false sense of massive trucks. Graphic displays during scoping and preliminary presentation meeting for comment period focused on mountains of unnecessary truck volumes and almost ZERO focus on the contaminants that are well established as cancer causing constituents of concern. I want to fully support the implementation of the AOC using background AND the exceptions, but they have to be right, and not an exaggeration to minimize the cleanup needed. We need the exceptions to be real, defensible, and based on science and data and a transparent effort to explain those decisions to the public so that they will be understood and respected. This only works if the data presented is accurate and the polluters need to stand for that data and not allow/entice special interest groups to do the bidding for the polluters to minimize the need for cleanup of clearly toxic materials, debris, and water (ground and surface).

Primary Concerns:

As long as the polluters are not willing to stand for accurate information, it will always be very difficult to get any shared understanding about the issues with such divisive antics being tolerated to spin and manipulate the public using fear of contamination, fear of trucks, fear of dust, and fear of change. We need real decisions, real options, real transportation routes and real regulations to truck and transportation process. When is it gonna get real? My primary concerns are really about the fact that so much time has been spent that could have been used to use less destructive passive methods of in situ treatment, now all dismissed, and the frustration by the community of waiting, coupled with fear derived from a "Fear trucks" campaign by SSFL CAG and polluters are leading some to prefer to be "finished now" because we are tired of waiting. We cannot skip the hard work because of this frustration. Many buildings were excluded from investigation, where we were told that they would be handled later, and now, there is a proposal to do nothing again. This feels like betrayal, and promises of cleanup that includes demolition and remediation of these important structures need to be kept.

Inaccurate maps of proposed cleanup areas have been distributed through polluter-supported channels without correction from regulator nor from polluter:

SSFL CAG distributed, held meetings, as well as social media describing all three alternatives as "AOC compliant, which was used to vote on group letters written by West Hills Neighborhood Council who was under the impression that all three alternatives were compliant with the AOC as signed, and therefore voted for the least costly. In this same communication campaign, maps and charts were altered and DTSC and DOE both refused to

63-1

63-2

63-3

63-4

63-1 Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a discussion of this topic and DOE's response. DOE's response concerning the proposed exemption areas explains, among other things, how they were mapped and how they would be investigated and remediated. The identified exemption areas for sensitive and cultural resources are based on consultations with the USFWS, California Fish and Wildlife Service, SHPO, Santa Ynez Band of Chumash Indians, and SSFL Sacred Sites Council. The maps in this EIS are at a small scale and are not intended to show the detail that would go into the final remediation planning. This planning would culminate in preparation of detailed remediation plans that would include point-by-point analysis and site-specific plans for remediation.

The estimates of soil volume and associated truck trips noted in your comment were based on the soils that would be removed outside the proposed exemption areas. So the total truckloads and soil volumes were not overestimated in the EIS or public hearing presentation slides. The numbers would be somewhat larger if the actual amount of soil that would be removed from within the proposed exemption areas identified in this EIS were included. Commenters have inferred that exemption areas would be treated as untouchable and would not be subject to any cleanup. This is not the case. Rather, exemption areas are established to protect certain biological and cultural resources, in accordance with the process described in the USFWS Biological Opinion and the NHPA Section 106 Programmatic Agreement (being developed in consultation with the SHPO and other consulting parties, including the federally recognized Santa Ynez Band of Chumash Indians and non-federally recognized tribes, and DTSC). As indicated in Chapter 2, Section 2.3.2, of this EIS, if levels of constituents in these areas pose a risk to human health or the environment, as determined using risk-based screening levels (RBSLs), DOE would remove them through carefully planned, focused removals that would result in minimal disturbance.

Disturbed areas within proposed exemption areas would be thoroughly investigated and chemicals or radionuclides exceeding risk-based criteria to protect human health would be subject to focused removal actions. The maps in the EIS include sites within exemption areas that may require remediation, but were included in the proposed exemption areas because they also have listed species growing immediately adjacent to them or sometimes on them (e.g., cracks in pavement). Examples of where this is the case include the Sodium Reactor Experiment (SRE) Complex and the Radioactive Materials Handling Facility (RMHF). These sites will be cleaned up using risk-based criteria to protect human health and careful remediation approaches to minimize unnecessary damage to sensitive species or cultural resources.

CHRISTINA WALSH – DRAFT EIS COMMENTS

PEOPLEPOLICY.ORG

correct. For this reason, the comments from these groups recommending a lesser cleanup should be considered with less weight, based on the vote being based on false information.

Exception Overreach (AOC defined exceptions) as presented in Draft EIS:

Areas of site where exception overreach has occurred based on maps provided in the EIS summary and detail reports and supporting documents. Based on the green shading shown on these maps, areas of serious operations, which are not "natural" but instead are pavement or open lots that used to be pavement and building footprints. Further, the green shading in the areas mentioned below, preclude areas which are currently known to be contaminated based on ARRA EPA Survey as well as operational history that includes 18 pages of "incidents that resulted in releases to the environment."

- SRE
- Hot Cave area
- Old Conservation Yard/New Conservation Yard
- SRE Pond and tarp areas
- Hot Lab parking/storage area
- Building 55 perimeter as well as contents which has had very limited sampling.
- Building 100 "backyard area
- Building 19 "backyard area
- Building 56 Landfill
- Building 56 Landfill Excavation Area
- Esada/Shooting Range
- Area IV Burnpit drainage rock outcroppings
- RMHF
- RMHF Holdup Tank Area
- RMHF Dam Area and hillside
- Building 4024 Driveway tank area
- Buffer Zone road area (80 barrel debris area)
- Building 100 Trench

cont'd

During the conduct of its gamma radiation surveys, EPA used the term "gamma radiation anomaly" (or GRA) to identify locations where gamma emission readings were observed to be above background. EPA, however, made it clear during the course of its investigation that observation of gamma readings was not an indication of contamination. Gamma readings varied based on proximity to anthropomorphic materials such as concrete and asphalt, and changes in the geology. EPA used the results of its soil sampling, not gamma readings, to identify soil contamination. In its final report (HGL 2012b) EPA describes five locations as radiological areas of interest. These were not termed GRA's. These locations are the RMHF complex, SRE complex, 17th Street Drainage, Former Fuel Element Storage Facility, and New Conservation Yard Drainage. Although several of these locations overlap with the proposed exemption area to protect the Santa Susana Tar plant, the exemption process was not established to avoid cleanup, but to take extra precautions during cleanup to protect endangered species. Any soil exceeding risk-based standards will be remediated in these exemption areas.

The 130 acres in your comment refers to land that would be affected by remediation outside the proposed exemption area. (Note that in the Final EIS this number has been revised to 150 acres.) As noted in your comment, this land does include "previously disturbed, paved, former slabs and infrastructure that has been altered from its natural state." Table 4-26 of this EIS gives an accounting of the areas that would be affected by remediation and lists 20.3 acres of "unvegetated disturbed/developed" and 8 acres of "weed-dominated formerly disturbed" habitat among the 90 acres affected by soil remediation under cleanup to 2010 AOC LUT values. These previously disturbed areas, which total 28 acres, generally would have less habitat value compared to the remainder of the 90 acres.

Also, refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for a discussion of the current status of Area IV.

63-2 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of transportation issues and DOE's response.

DOE considered several *in situ* soil treatment options. Most of these options were determined to be ineffective or impractical at reducing contaminant levels to the required levels. The EIS provided the reasons for dismissing each of these alternatives in Chapter 2, Section 2.2.3. As discussed in Section 2.3.2, however, one potentially effective form of onsite remediation could be to use monitored natural attenuation for management of certain low-concentration, petroleum-contaminated (TPH) soil. DOE has estimated that this onsite treatment method would reduce the amount of soil to

Commenter No. 63 (cont'd): Christina Walsh
Peoplepolicy.org

COMMENTS

Cover Sheet

The "abstract" describes the EIS as having no preferred alternative, but the alternatives presented inflate the truck traffic and other impacts and does not consider the cost of the "no action" alternative through negative exposures to residual toxic materials as a result of not remediating the site. In fact, there is very little mention in the thousands of pages, about the risks related to these toxic materials, and that erosion, rain, wind, as well as recent and future brush fires add risk to the surrounding population by burning contaminated vegetation.

63-5

While it is true that DOE is proposing three alternatives, they are not reflective of the community included process to develop a variety of solutions for cleanup of the site. In this way, it seems that the process was not very serious, and instead was a way to make the community "feel" included, while not really considering the concerns and recommendations in any real way. The "conservation" alternative is painted as a way to conserve open space, but instead ignores the known problem areas as defined by the data presented in the EIS. In other words, the methods and priorities described in the EIS are not based on the concerns shared by the community, but instead seems to excuse inaction that would leave future residents at higher risk of exposure, where little to no information would be available about the potential risks as they are not adequately described even here, in mid-investigation. This puts future generations at greater risk.

63-6

63-4
cont'd

Abstract claims the EIS report will "inform decision-makers and the public about the potential impacts of the proposed cleanup of both chemicals and radionuclides and will be considered along with other relevant factors in making decisions regarding cleanup of Area IV and the adjoining NBZ," but fails to adequately describe the risks of leaving chemicals and radionuclides behind that clearly exceed health-risk standards. Instead, the reader is wow'd by numbers of trucks, truck emissions, dust, and suggesting that cultural resource areas will demolished during cleanup to create a false choice.

63-5
cont'd

Public Involvement

The EIS describes activities undertaken by DOE to involve the public and seek input from the affected public and describes "Community Alternative Development Workshops" in which "community members were asked to articulate their preferences for alternatives that they would like to see included in the EIS." The public was divided into groups who each developed priorities and concerns related to the public representatives participating in each group. This was done as a "saturday session" where the various groups were combined into four major alternative approaches. As a participant in the process, I was disappointed to first have my preferences mischaracterized, which after spending several hours, thinking this was taken seriously. While I was disappointed to see the alternatives mischaracterized at the time, I am even more baffled to find that NONE of the alternatives are described within the EIS alternatives presented herein. Instead, more false choices are presented by exaggerating

63-7

63-1
cont'd

be considered for removal at Area IV and the NBZ by about 620,000 cubic yards, with corresponding reductions in truck traffic and emissions of air pollutants. (Simple polycyclic aromatic hydrocarbons may be amenable to natural attenuation and would be evaluated on a location-by-location basis during development of soil remediation plans.) This or any other onsite treatment method would have to be approved by DTSC.

DOE's intent is not to generate opposition to the SSFL cleanup, but it is true that the more soil that is removed to clean up the site, the more transportation will be required. The analyses in this EIS were performed to evaluate the potential impacts associated with the various alternatives for cleanup of SSFL. Results of the analyses allow a comparison of potential impacts, in this case transportation impacts, and tradeoffs between the alternatives. In the case of soil remediation, leaving more soil, and consequently low concentrations of chemicals and/or radionuclides on site, reduces the number of truck trips from the site. Conversely, removing the soil with low concentrations of chemicals and/or radionuclides, results in more truck trips from the site. The EIS shows that the transportation risks are very small; Chapter 4, Section 4.8.1 and Appendix H of the EIS provide details of the transportation risk analysis.

Finally, as discussed in Chapter 2, Section 2.4.4, of the EIS, please note that DOE, NASA, and Boeing have entered into a transportation agreement (Boeing 2015a) through which they would manage the daily number of trucks allowed on Woolsey Canyon Road to 96, and would dispatch trucks from the site at intervals of no less than 5 minutes. In this Final EIS, DOE (after consideration of budget and operational constraints) has incorporated a more realistic estimate of 16 truck round trips per day on Woolsey Canyon Road. The impacts of this reduction in truck traffic have been incorporated into the analysis of all three of the soil remediation action alternatives. This change would reduce the daily and annual risks and other environmental impacts, however, it would not reduce the overall risks or impacts determined for an alternative but would only spread them over a longer period of time.

63-3

This EIS evaluates separate sets of alternatives for soil remediation and for building demolition. As required by NEPA regulations, there is a No Action Alternative included for building demolition, which provides a base case against which action alternatives can be compared. The proposed action for building demolition is to remove all 18 buildings owned by DOE in Area IV. This includes the structures and asphalt comprising the RMHF. The Conservation of Natural Resources Alternative is a soil remediation alternative, not a building demolition alternative. Under all three

Commenter No. 63 (cont'd): Christina Walsh
Peoplepolicy.org

Page 5 of 23

the areas to be exempted as per the exception clauses in the AOC. In addition to exaggerating the areas to be exempted, to cover known problem areas that are former slabs, facilities, burn pits, land fills, etc. The purpose of the exceptions are to protect natural resources, rare species and habitat, and cultural sites as identified by local and federally recognized native tribes. The areas shaded in green in the maps contained in EIS include areas covered in pavement, concrete, and former serious impact areas, including designated GRA's as identified by U.S. EPA during the 2012 radiation survey funded through the American Reinvestment and Recovery Act (ARRA). This overreach is inappropriate and should be corrected prior to final publication of the EIS. [Examples listed herein]

Scoping periods described which were conducted in April of 2014 as well as most recent comment meetings for the purpose of this EIS spend the majority of time describing the impacts without the proper context of the reason for the highly protective AOC cleanup, including decades of inaction, water quality and other environmental violations and general lack of control over surface water discharge leaving the site during heavy rain periods as a result of extremely steep terrain, and decades of discharge through operations at Santa Susana.

Inadequate time spent describing historic site activities presents a false narrative that there was no discharge or harm/risk from Santa Susana to the neighboring areas. Even if we are to completely discount the events that took place at the SRE (Sodium Reactor Experiment) in July of 1959, there were decades of operations that included discharge of chemicals and radionuclides to the environment. This includes burn pits that operated for decades under the cover of "Ventura County Burn Days" and these operations alone, would potentially cause a random impact of the surrounding areas that cannot be "mapped." Even using wind roses, we can only estimate, and given that burn pit activities were used to "test to destruction" or eliminate waste which was toxic, burning it would certainly be problematic. Further, the burning of these wastes would also provide an unreliable understanding of "where the waste may have blown" over the course of decades that included subsequent brush fires that burned more than 70% of the site.

Through the use of surrogates such as the SSFL CAG which is funded by DOE, an alternative narrative which blames radioactive impacts on Chernobyl, and other global events is inappropriate and has created a false understanding in the public surrounding the site. These excuse-based theories that blame other possible contributors, coupled with exaggerations on truck and traffic estimates have created a false anxiety among local residents who believe a truck every two to three minutes will leave the site for decades.

By also conflating the soil removal estimates with replacement soils as if it is a one for one replacement process also creates additional exaggeration by then multiplying all truck estimates and further claiming that no clean soil is available. This is false. Using comparisons to "Malibu Lake" has been used by this group to create fear among Calabasas and Malibu Lake residents that their soil is contaminated because it "doesn't match up." This is demonstrated by the ISRA and other recent ISEO soil removal activities that took place at outfalls 8 and 9 as well as the Northern Drainage and Sage Ranch Park where "re-contouring" was used almost exclusively. During a recent visit to see "Happy Valley" with the Regional Board, and the Stormwater Expert Panel who has been working on improving these source areas, we were told that ZERO soil was brought in, and through the use of re-contouring and culvert modifications, combined with installation of treatment train filtration systems, these areas were improved with zero replacement soil. If Boeing can do it, why can't DOE? There is no reason to need large

cont'd**

63-9

63-4 DOE has no control over maps or presentations made by other members of the community.

63-5 Please see Section 2.1, "Preferences for Cleanup," of this CRD for a response to comments about alternative selection. In response to comments, DOE has added a quantitative evaluation of human health impacts to potential onsite post-remediation receptors for all alternatives. These post-remediation receptor scenarios include a recreational receptor and an onsite suburban resident (without garden). DOE has also added a quantitative evaluation of human health for an offsite receptors which includes the impacts from an indirect garden pathway and a quantitative evaluation of ecological impacts for all alternatives. The results of the modeling are included in Chapter 4, Section 4.9 of this Final EIS.

63-6 DOE assumes that the commenter's reference is to the September 2005 Topanga fire, which affected much of the SSFL site. Chapter 3, Section 3.9.6, of the EIS includes a summary of damage that was sustained by brush and structures at SSFL (no structures were damaged at Area IV, however) and the environmental monitoring and sampling program conducted at SSFL and surrounding areas both during and after the fire. Additional information can be obtained by searching the DOE ETEC website (<http://www.etc.energy.gov/>) for "Topanga fire."

Chapter 3, Sections 3.9.5 and 3.9.6, of the EIS provide information about accidents at Area IV, including the 1959 SRE accident, which was the only accident that caused a measurable release of radioactive material. Section 3.9.6 explains that at the time of the accident it was estimated that the accident resulted in the release (over a 2-month period) of about 28 curies of radioactive noble gases such as krypton-85, in low, controlled concentrations that met Federal requirements. The release was estimated to result in a maximum radiation dose at the location of the nearest resident of 0.018 millirem. Using current risk factors, this dose would have resulted in a risk of a fatal cancer to an exposed individual of 1×10^{-8} (one chance in about 93 million). A 1999 study by the Agency for Toxic Substances and Disease Registry estimated a maximum dose to a potentially exposed individual of 0.005 millirem with an even smaller risk of a fatal cancer. With respect to the statements regarding burning radioactive and

Commenter No. 63 (cont'd): Christina Walsh
Peoplepolicy.org

quantities of replacement soil. In further support of re-contouring practices, is the fact that the soil profile across Area IV and the Buffer Zones is extremely thin, so it is not expected that deep holes would be created or necessary.

S.1 Introduction

The first paragraph describes the site as having more widely spread chemical contamination and more severe than the radiological impacts, and also that "contaminants are concentrated near certain facilities, rather than being evenly distributed across the site." Yet, the only maps provided, show us little detail, instead painting nearly the entirety of Area IV in "purple" and no context of facilities for the reader to comprehend the source areas of most concern. ¹

During the radiological investigation, there were several facilities which were not included on the basis that the structures had not yet been removed, and that adequate characterization and sampling could not be conducted until building removal. The EIS describes the potential for leaving in place these buildings, several of which have not had adequate sampling or even access by EPA during the rad investigation, so it is not possible to be certain that leaving these buildings would not result in residual contamination released to the environment in the future. One example is the RMHF which is not even acknowledged in the map depicting the "conservation alternative" when it is known to have high concentrations of radiological contamination that exceeds federal public health standards, yet the reports and the presentations at scoping meetings demonstrate a lack of appreciation for the risk of these cancer-causing substances. Building 55 is another example, the radioactive materials building was also excluded from the ARRA investigation, yet suggested to be left remaining in the less protective alternatives herein.

Proposed groundwater monitored natural attenuation as described as a potential solution, again, mischaracterizes the current conditions to the public. California has a no-degradation policy for groundwater, and the site is surrounded with active seeps that release groundwater to neighboring streams including the headwater to the LA River. Some of these seeps emerge with contaminated water, including WS9a, which is south of Area IV, but receives surface water runoff from Area IV as described in the NPDES Permit by the Regional Water Quality Control Board. WS9a averages 1000ppb in TCE while 5ppb is the action level. Especially in recent higher precipitation levels, this is especially important, yet the narrative of "nothing goes off site" continues at every meeting. This fails to address the problem. Even the GETS system, doesn't help if it isn't turned on. We need solutions that are created, presented and implemented. If it's just on paper, it doesn't protect anyone.

¹ I was involved in every step of the radiological and chemical investigation and background study of the site. As a group, representing the various interests in the community, we participated in every detail of this process, the lab objectives, walking the site with the experts over the course of years. We were human witnesses of the process so that the process could be believed after so many years of disappointment and distrust. After all that, DOE publishes a Draft EIS that doesn't provide any detail or context for the public who was not involved in that step by step journey to possibly understand the nature and scope of the job at hand. Instead it's been politicized by DOE surrogates and contractors to disparage the idea of wanting our communities cleaned up. This public process interference damages the credibility of the NEPA and EIS process intended to inform the affected public and balance risk with action and impact. DOE needs to do much better, and improve trust through transparency and cease funding to special interest groups engaged in manipulation of public understanding of the facts.

63-11

63-12

chemical waste in open pits, the Former Sodium Disposal Facility (FSDF) was used from 1956 to 1978 to clean alkali metals (sodium and potassium/sodium mixtures) from metallic components and other materials, and also received chemical waste and radionuclides. The FSDF was remediated during the 1990s and released for unrestricted use (i.e., declared clean) in 1998 by the California Department of Health Services (now California Department of Public Health). DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. In addition, please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts. As described in Section 2.7, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

63-7 DOE incorporated the public alternative concepts into its alternatives where applicable and appropriate. Additional detail on alternative concepts that DOE evaluated (including those not incorporated from the Community Alternatives Development Workshop) are discussed in Chapter 2, Section 2.2.3, of this EIS.

63-8 As indicated in Chapter 1, Sections 1.3 and 1.4, of this EIS, DOE acknowledges that past activities at SSFL resulted in chemical and radiological releases that impacted soils, buildings, and groundwater; and has funded radiological characterization studies of the environment in and around SSFL, including providing EPA \$1.7 million to determine the local natural background levels of radiation found in soils not affected by the site operations; and approximately \$40 million to characterize radioactivity in the soil, surface water and groundwater in Area IV and the NBZ.

Commenter No. 63 (cont'd): Christina Walsh
Peoplepolicy.org

S.2 Purpose and Need for Agency Action

The EIS purpose and need fails to present the deadline penalty assessment, as described in the AOC and Agreements in Principle, at \$15,000 per day until completion of cleanup, which was due in 2017. This penalty assessment should be accurately described in the EIS as well as mechanisms for collection of penalties, and determination of satisfying requirement upon completion of cleanup.

S.3 Proposed Action

The proposed action as described in the EIS does not adequately describe the background determination process, distance test location analysis to determine potential impact from facility. There was also an acknowledgement in the written report from USEPA about the potential challenges in removing soils exceeding LUT values without potentially removing some clean soil based on error ratio and low detection levels. This was seen as the primary problem with the AOC, yet no real effort appears to have been devoted to resolving these conflicts. Instead, a broad over-reach as demonstrated by the exception shading areas, was employed. Is this a bargaining tool? My concern is that it reduces the trust level when such serious facility areas are being proposed for exclusion instead of using these exceptions responsibly.

S.4 History of the Site

Inadequate presentation of the facts surrounding need for cleanup, instead preying on the fear of cleanup dust impacts and trucks.

S.5 Future of Area IV and the Northern Buffer Zone(s)

Despite public statements made by Boeing about intent to leave as open space, this is not guaranteed. Further, the AOC, signed and agreed to by Department of Energy, does not allow store in place solutions, (or landfilling) for land use restriction or for any other reason.

S.6 Cooperating Agencies

I support the designation as a cooperating agency of the Santa Ynez Band of Chumash Indians as cultural sites require protection and oversight by native tribes. As a cooperating agency and federally recognized tribe, they should be provided priority in decisions made regarding the protection of the cultural sites present at the site.

S.7 Decisions to be Supported – Creating false choices

This section describes the EIS as evaluating reasonable alternatives for how DOE can conduct the cleanup of Area IV and NBZ, but as developed alternatives defined as "reasonable alternatives" but the alternatives described are not consistent with the requirements of the AOCs. So much time, meetings, site walks, soil remediation alternative study group were provided, which the surrounding affected community participated in for years, yet the alternatives described herein provide choices which result with leaving much of the most problematic areas behind. The AOC also requires that in situ treatment alternatives be used to the maximum extent practicable to reduce the impact of soil excavation, removal, and truck traffic. Despite this requirement, none of the many alternatives were chosen on the basis that it would not achieve the result in time for the deadline. 2017 has come

63-13

63-14

63-5
cont'd

63-15

63-16

63-17

Given the intense public interest in SSFL and as part of a public outreach program to foster public engagement, DOE has funded a number of stakeholder groups with divergent views, including Teens Against Toxins, the SSFL Advisory Panel, Physicians for Social Responsibility, the Rocketdyne Cleanup Coalition, Committee to Bridge the Gap and the SSFL CAG. DOE also has engaged in stakeholder outreach with communities near SSFL. For example, DOE organized the SRE Workshop, Groundwater University and the Community Alternatives Development Workshop Series, and hosted the Site Treatability Group and the Soil Characterization Tech Stakeholder Group. Additional information may be obtained by clicking on the Community link on the DOE Energy Technology Engineering Center website (<http://www.etec.energy.gov/>).

63-9 DOE respectfully disagrees. Focused removal of localized soil contamination under the interim soil removal action cleanup (a total of about 12,000 cubic yards according to the NASA EIS [NASA 2014]) is not an equivalent action to removing most of the soil down to bedrock over a large area under the Cleanup to AOC LUT Values Alternative. As stated in the NASA EIS, "These impacts are isolated to the ISRA locations and because excavations include only top soils, no noticeable effect to topography or increase in landslide potential would occur." As described in Chapter 3, Section 3.2.2, of this EIS, soils in Area IV and the NBZ are typically less than 5-feet thick although soils depths can reach 20 feet in some areas. There would likely be little remaining soil to recontour excavated areas if full cleanup to the 2010 AOC LUT values were performed.

DOE's 75 percent estimate for the backfill volume assumes that some recontouring can occur as part of site restoration. The basis for the 75 percent backfill replacement assumption is professional judgment (Appendix D) based on the assumed removal of most of the soil down to the bedrock (little or no soil left to recontour) and the desire to recreate the contours of the current land surface to the extent possible such that the current storm water runoff patterns would be maintained and no large pits or depressions would be produced. Please also note that Boeing is the land owner, not DOE. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site.

Commenter No. 63 (cont'd): Christina Walsh
Peoplepolicy.org

Page 8 of 23

and gone, so the excuse that alternatives are rejected on this basis fails to have merit. Instead, these alternatives should be utilized to address problem areas which will continue to perpetuate beyond the scope of the cleanup time. Examples to be addressed include WS9a where a seep emerges averaging 1000 ppb of TCE from groundwater impacts resulting from the operational history of the site. This will continue whenever the water levels are high, as they are today after recent rains. This is a problem that will continue for decades, and solutions should be considered that are commensurate with such a long-term problem that impacts the headwaters to the LA River.²

S.8 Public Involvement

It is agreed that public involvement is a critical element in the cleanup and closure of SSFL. However, so much political effort to deflect responsibility has been made by responsible parties, including the use of surrogates to infiltrate community with false choices, denial claims, and harmful disparaging of community voices asking for cleanup. This is a failure by DOE, who has been repeatedly asked to clarify false information disseminated by surrogates such as DOE funded SSFL CAG. It is recommended that "community concerns" be referenced instead of ignored during these decisions. Those of use who spent time (years), digging deep into the data required to provide credible comments to this complicated effort that is not deeply understood by the community because of decades of secrecy. This has allowed for theories to take priority over facts, and it is our sincere hope that DOE will take responsibility for the accidents that took place [supported by thousands of documents] instead of deflecting with denial stories and surrogates used to provide *alternative-facts* to the communities affected. This has been extremely damaging to the trust level and can only be restored through responsible and responsive transparency.

Figure S-3 EIS Public Involvement Opportunities

While it is appreciated that the structure and facilitation of these meetings has been effective, the technical contents has been lacking and seems to always support minimization of the impacts of the toxic material that is supposed to be central to the undertaking. After all, the entire process is centered around how to remediate the site, yet years have been dedicated to "look the other way" tactics that include no use of chemical or radiological contaminant names, over utilization of acronyms which despite having a table provided, makes for an audience that just glazes over because the conversation is designed ONLY for those in the know, and makes those not in the know, think they are not capable of understanding the issues. As a public communication professional, these tactics are familiar from political campaigns but should not be used on a topic surrounding public health.

As a participant of the "Community Alternatives Development Workshops" held in 2012, I would have hoped that our efforts would have been considered more thoroughly. More effort should be made to provide the public with the information about why the cleanup should take place instead of focusing mostly on why it should not. The

² Pollution existing elsewhere is not an excuse for allowing pollution to persist at Boeing's Santa Susana Field Laboratory. The pockets are clear and responsibility is clear, so every technological alternative should be considered.

63-18

63-19

- 63-10** The map the commenter refers to with the "purple" (Figure S-4 of the Draft EIS, in the Final EIS this area is represented by the tan and purple areas in Figure S-4) illustrates areas where at least one chemical exceeds a LUT value. As described in Section 2.5, "Toxicity of Soil Contaminants" of this CRD, exceeding a background value does not necessarily mean that the constituent is present at dangerous levels. Companion map Figures S-7 and S-8 illustrates in tan where the soil contaminants that potentially pose a risk occur.
- 63-11** The California anti-degradation policy does not preclude the consideration of natural attenuation for the contaminants demonstrated to degrade in a timely manner. Regarding the remainder of the comment, the scope of this EIS is limited to cleanup of DOE's portions of SSFL Area IV and the NBZ. Groundwater contaminants in Area IV remain within the boundaries of SSFL and are not present in off-site springs or seeps. The issues presented in the comment are related to NASA and Boeing's activities in Areas I and II, not DOE's activities in Area IV. Well WS9a is in Area II, not south of Area IV, and monitors a NASA groundwater plume. Boeing and NASA cleanup activities are only considered in this DOE EIS as part of cumulative impacts (see Chapter 5 of this EIS). Cleanup of the entire SSFL, including Boeing, NASA, and DOE activities are being evaluated by DTSC in a Program Environmental Impact Report under the California Environmental Quality Act. DTSC will issue a Notice of Determination for the program EIR identifying the selected remedial actions. The *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* was issued by DTSC in September 2017 (DTSC 2017b).
- 63-12** It is DOE's position that the EIS provides sufficient information to inform readers of the nature and scope of the remaining cleanup of Area IV and the NBZ. DOE has funded a number of stakeholder groups, including Teens Against Toxins, the SSFL Advisory Panel, Physicians for Social Responsibility, the Rocketdyne Cleanup Coalition, Committee to Bridge the Gap, and the SSFL CAG. Each of these groups shares information and their views regarding SSFL cleanup with the public.
- 63-13** This EIS properly identifies its purpose and need. The levy of any penalties for lapsed deadlines is not an environmental issue and, therefore, was not considered in this EIS. The levy of any penalties, along with the potential environmental impacts presented in this EIS, public input, cost, and policy factors, will be considered by the decision-maker in selecting alternatives for soil remediation, building demolition, and groundwater remediation for implementation. The Record of Decision (ROD[s]) will present DOE's decisions regarding cleanup and describe the factors considered in making those decisions.

Commenter No. 63 (cont'd): Christina Walsh
Peoplepolicy.org

public incorrectly has the understanding that the contamination is somehow sealed beneath the earth's crust and this is no accident. This comes from years of "moon-scaping the public."³

S.10 Alternatives

Developing alternatives for building demolition when years of excuses claiming that sampling data could not be gathered because of the buildings, is inappropriate and disingenuous.

One of the key failures to the LUT process as undertaken by U.S. EPA to comply with the AOC and Agreements in Principle, was that a primary flaw in the process described throughout the sampling investigative process was about how to address "near background" areas where error rates might potentially cause the removal of clean soil despite the purpose of only removing contaminated soil. For this reason, "near background" decision-making processes were needed as described by Mr. Gregg Dempsey of U.S. EPA. All agreed that this was a priority and this was articulated throughout every step of this process, and here we are in the EIS stage and ZERO attention to how to best address these areas has been developed or communicated. This is a primary failure of this document.

It is recommended for the final draft of the EIS, that a decision making process be well defined and communicated in a clear decision-tree format so that unnecessary soil removal is not done in areas where alternative solutions would be more appropriate. All those studies should be applied to these areas which are well defined. Additionally, soil thickness is a key factor to soil volume and has not adequately been shared with the public and instead has relied on inaccurate assumptions to create truck and traffic estimates that are extremely over estimated.

S.10.1 Alternatives Development

Alternative concepts developed and dismissed on the basis that they would not provide a solution in time for the deadline, should be reconsidered. At the very least, since the undertaking is not taking place until long after the deadline has occurred, this is an inappropriate reason for failing to solve the problem by not solving the problem.

S.10.1.1 Applicable Laws, Regulations, Orders, and Agreements

The AOC requires that other environmental regulations such as the Endangered Species Act, National Historic Preservation Act, as well as safety regulations and can be adhered to through use of exceptions as defined in the EIS.⁴ It is requested that the native american sacred sites council developed by DOE be utilized to define the cultural exceptions and work with independent biology oversight to ensure that these exceptions are not used to protect concrete or otherwise impacted areas from operational history of the site, from being remediated. Making exceptions more credible, and implementable will improve the very low trust levels.

³ Moon-scaping — verb, to moonscape: To insinuate the cleanup will result in a moonscape i.e., all soil removed leaving a landscape resembling the moon. This is a false narrative that has been perpetuated by the responsible parties or polluters, as well as by their surrogates, and has resulted in such lacking trust that very few people believe either side of the issues.

⁴ Exceptions as defined on maps within EIS using green shading demonstrate an overreach that is unacceptable.

63-19

63-20

63-14
cont'd

63-21

63-22

63-23

63-14 DOE agrees with the commenter's recognition of the importance of considering decision error, possibly resulting in the removal of soil with less than background contamination, in identifying contamination, along with EPA's caution on this matter. This issue is discussed in Section 2.3.3 of the Final EIS. DTSC did not adequately consider the decision error issue when it selected the LUT values. This is why of the chemicals analyzed, 42 percent exceeded their respective AOC LUT values in at least one sample.

63-15 In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site.

63-16 In addition to their role through NEPA as a cooperating agency on the EIS, the federally recognized Santa Ynez Band of Chumash Indians, through their role on the Sacred Sites Council and with the Indigenous Communities Representatives (tribal consulting parties), are playing a major role in developing the NHPA Section 106 Programmatic Agreement (i.e., an agreement being developed in consultation with the SHPO and other consulting parties, including the federally recognized Santa Ynez Band of Chumash Indians and non-federally recognized tribes, and DTSC) that will specify procedures for managing cultural resources in Area IV and the NBZ during cleanup activities. DOE has consistently looked to the Sacred Sites Council and the Indigenous Communities Representatives (i.e., tribal consulting parties) for input prior to making decisions that could affect cultural resources.

63-17 The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) DOE evaluated the potential for onsite/in situ remedies as part of the soil treatability studies (see Chapter 2, Section 2.3.2 of this Final EIS). However, the determination of those studies performed by the California Polytechnic State University, San Luis Obispo, and the University of California, Riverside (Nelson

Peoplepolicy.org

S.10.1.2 Process and Criteria

While community input has been a major driver, the lack of fact-based presentation to the public has been detrimental to the public understanding of the undertaking at hand.

Risk assumptions described in this section falsely presents a picture of evenly distributed impacts when in fact, the reality or "ground-truthing" is quite different. If we could believe that ALL of the contamination above a given level could be accurately remediated, it would be very different, but despite the portrayal of thousands of samples, because of the steep and extreme terrain and the history of spills, accidents, mishaps, fires, and partial meltdowns, we cannot possibly know where all of it is. Each sample only represents the soil contained in the sample, and with areas like the Old Conservation Yard where literally tens of thousands of barrels and containers were disposed of by tossing down the hill. We cannot assume anything, and that is why the extreme precaution of a more protective level is necessary. Instead, DOE and its' surrogates have continued to propel a narrative that points to a single event in July of 1959, which we can all theorize about all day long (decade in and decade out) with countless efforts to drill it down to a single testimony about 13 of 43 fuel rods. While very important, it cannot begin to compare to fifty years of operational history which included burning of waste for decades as a method of "removal." Additionally, the facts about radioactive waste being taken UP the hill from all across the country from other nuclear facilities for de-cladding and reprocessing and reuse. I was extremely disappointed to see the level of green shading being used to cover areas of clear contamination and serious operational and incident history. [attached]

Using LEED principals for a green cleanup should be a priority in every aspect of the process with the exception of radioactively contaminated metals, which should not be recycled.

It is recommended that responsible parties seek advice and direction on how to minimize impacts to the site, addressing the cleanup needs from the Stormwater Expert Panel assembled by Boeing and the Regional Water Quality Control Board to develop long-range ideas for stormwater management through multiple conditions from drought to high water retention levels as currently experienced, and to suggest treatment train systems that address seep areas that emerge with contaminant impacts.

The process described in the EIS is not consistent with the process described to the public during the public comment period, where balancing discussions were limited to trucks, traffic, unnecessary trucks and traffic, and maps that leave the impression that the entirety of Area IV was being removed. The cost benefit analysis, while important, has been elevated and misused in this case.

S.10.1.3 Alternative Concepts Considered but Dismissed from Detailed Study

As recommended under NEPA regulations under 11502.14, "includes all reasonable alternatives" where in situ approaches which may be effective, eliminate truck/traffic impact or greatly reduce it, should be employed where possible/feasible.

63-19
cont'd

63-24

63-25

63-26

63-27

63-28

2015a, 2015b, 2015c; Matsumoto and Martin 2015) is that cleanup to the 2010 AOC LUT values using onsite remedies was not practical or not effective, with one exception. (The one potentially effective form of onsite remediation identified was the use of monitored natural attenuation for management of certain low-concentration, petroleum-contaminated [TPHs] soil.) Any detection of a chemical following *in-situ* treatment would render the treatment to not comply with the LUT values. Meaning that after treatment, the soil would need to be disposed of offsite anyway.

Regarding the commenters reference to WS9A, this seep is along the southern boundary of SSFL below Areas II and III. There is nothing that indicates that this seep is impacted by materials originating in Area IV and it is, therefore, not within the scope of remediation addressed by DOE in this EIS.

63-18 DOE's goal is to provide a transparent process working towards the cleanup of Area IV and the NBZ. DOE acknowledges your concerns.

63-19 DOE recognizes the alternatives analysis is a difficult topic for many in the community and that the terminology used in a discussion of contamination is of necessity complex. But, DOE has reached out to provide ample public involvement opportunities and information to inform the public. Public involvement for this Final EIS has included opportunities such as the Community Alternatives Development Workshop, the Groundwater University, and the Treatability Studies public involvement. Additional public involvement activities are described in Chapter 1, Section 1.10, of this EIS. DOE has not spent "years ... dedicated to 'look the other way' tactics." DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). (Please see Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD.)

63-20 Please refer to the response to comment 63-3.

63-21 DOE used the GIS (geographic information system) database for Area IV and the NBZ to identify on a point-by-point basis, any sample location that had an exceedance of an LUT value (radionuclides published by DTSC on January 30, 2013 [DTSC 2013a] and chemicals on June 11, 2013 [DTSC 2013b]). The GIS system was then used to mark the locations of exceedances, map the extent of exceedance, identify the surface area

Commenter No. 63 (cont'd): Christina Walsh
Peoplepolicy.org

S.10.2.1 Soil No Action Alternative

This portion of the report should focus more on describing the potential impacts associated with leaving the site without cleanup. Instead it is only described as a money-saver. What about the people who then don't get protected ever? What is the cost associated with that?

S.10.2.2 Cleanup to AOC Look-Up Table Values Alternative

The biggest risk to this alternative is accidentally removing clean soil and potentially replacing clean soil with other clean soil. It is recommended that a better decision process be developed with public comment to make these difficult decisions and remain protective of human health and the environment.

Table S—3 Preliminary Estimated Soil Volumes for Transportation

This table fails to identify the volume of "near background" soils, which was described as of primary importance throughout the investigative process. There should be no difference between "above health risk" and "hazardous waste" for the purpose of making cleanup decisions.

Additionally, not enough consideration has been given to methods to reduce soil volumes, in situ treatment processes, etc. which were incorrectly dismissed on the basis of not being timely enough to meet the 2017 deadline. Since we've already missed the deadline without even starting, it is inappropriate to use this as an excuse to not do the job. Penalty assessment is in place for the purpose of motivating the polluter to stop polluting and engage in needed cleanup. By ignoring timelines, and failing to collect on these failures, there is no incentive for the richest company world and the federal government to do a better job. Compliance to the AOC as written, with full use of exceptions is the only credible way forward from here.

S.10.2.3 Additional Soil Remediation Action Alternatives

It is inappropriate to include additional action alternatives outside of the mandated no-action alternative to be measured for comparison only as "if we don't do this, what will the impacts be?" Outside of the required alternative, and data presentation to the public should instead be focused on cleanup approaches, remediation, effort to minimize replacement soil through recontouring techniques as employed across the Boeing and NASA portions of the site as demonstrated in recent demolition and removal projects such as the ISRA in both Outfall 8 and 9 areas.

The Conservation of Natural Resources alternative recommends "area averaging" to reduce cleanup. The effort to modify the cleanup, by averaging or excusing away higher concentrated areas by averaging them with non-detects or lower concentrated areas should not be allowed under any circumstances when so much remains unknown just based on the published incident report that shows barrels that were discovered burning, etc.

63-31

for the exceedances and depth of exceedances using sample results at multiple depths for soil collected at the sample locations, and then calculate soil volumes exceeding the LUT values. The sample volume development process was independently reviewed by remediation engineers and the volumes were validated (CDM Smith 2017).

63-22 DOE reviewed the alternative concepts proposed and dismissed from detailed analysis in Chapter 2, Section 2.2.3 of this Final EIS (same as the Summary, Section S.10.1).

The only alternative dismissed solely because it did not meet the 2017 date, was the cleanup by 2017 per the 2010 AOC. Other alternatives in which timeliness was mentioned as an issue also suffered from other problems that excluded them from detailed analysis. For example, soil washing was mentioned as having a long time horizon, but it also was noted that it was uncertain whether it would be effective in meeting the 2010 AOC LUT values and that the resulting soil would be sterile because of the chemicals that would have to be used to remove contaminants, requiring adding soil amendments that would exceed LUT requirements. For these reasons soil washing was determined to be impractical for in situ soil remediation.

63-23 As discussed in Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD DOE is working with the appropriate agencies and organizations to define the exemption areas. Under all of the alternatives considered by DOE, locations with concentrations of chemical or radioactive constituents that pose a threat to human health or the environment would be cleaned up. This alternative includes locations within exemption areas.

63-24 The commenter is incorrect in the statement that the risk assessment figure indicates an even distribution of chemicals across the site. Figure 2-5 illustrate just the opposite, localized areas of contamination. The "green areas" referenced in the comment represent habitat for sensitive plant and animal species. Within these areas soil remediation will be performed, but in accordance with procedures worked out with USFWS and California DFW that will protect the sensitive resources (see CRD Section 2.4, "Application of Exemptions under the 2010 Administrative Order of Consent.") The soil sampling investigations conducted by EPA and DOE were based on multiple detailed reviews of site reports, records, data files and assessment of activities including using historical aerial photographs. All areas identified during these reviews and drainages leading from operational areas have been sampled. Based on EPA's work and the more than 10,000 samples collected, DOE is confident that the results indicate where the remaining contamination exists in Area IV. Finally, as indicated by EPA, its investigation efforts represented, "one of the most comprehensive technical investigations ever undertaken for low-level radioactive contamination" (EPA 2012).

Commenter No. 63 (cont'd): Christina Walsh
Peoplepolicy.org

This map indicates that all roads will require removal, whereas the other alternatives described as more "environmentally friendly" do not require industrial infrastructure to be removed. This indicates that this is a potential tactic to increase "soil and debris" volume estimates. The roads are NOT the problem.

Figure S-5 Extent of Radiological and Chemical Constituents Above AOC Look-Up Table Values with proposed biological and culture exemption areas

I fully support biological and cultural exemption areas but feel that the areas shown in maps in EIS are a drastic overreach of this process, exaggerating these areas to include concrete facility areas which are certainly disturbed. In one instance, even the partially tarped SRE Complex is partially excluded from cleanup despite the debris discovered using magnetometer analysis during ARRA Survey. This is inappropriate and should be revised to be more reasonable, defensible, and allow for reasonable debate of issues. Without a credible effort in outlining these areas more accurately, the entire bright-line process is put at risk, and seen as unreasonable.

Figure S-3 Preliminary Estimated Soil Volumes for Transportation [S-24]

Assumption of 75% replacement factor for soils removed is erroneous at best. During most recent site visit to see the ISRA completion of Outfall 8 and Happy Valley portion of Area 1, we were told that ZERO replacement soils were needed and instead they simply re-contoured. Considering the very thin soil profile in Area IV. If there isn't more than 12-18 inches of soil, and in many areas, there is zero where rock outcroppings are visible. With the exceptions of areas like the Building 56 landfill, or the SRE or KEWB or Hot Lab profiles where contamination is at higher concentrations and at depth (4024 and RMHF as well). Please provide basis for the 75% assumption since most actions which have taken place have required very little replacement soil. Please collaborate about solutions with Boeing who has been able to complete ISRA removals without the need of replacement soils and use similar techniques to achieve proper contouring of the property to manage stormwater drainages and include passive "wear the water out" treatment trains to store and allow percolation of surface water to increase bank storage and decrease erosion and surface water quality violations moving forward. This should be treated like it will be here forever, to accommodate all levels of drought and storm-events.

Evaluation of Implementation of 2010 AOC Cleanup Requirements

While there are real challenges to the very low detection limits and caution should be used when defining the GRAYS in the process, which was carefully done with EPA. The effort as described here, makes it seem impossible to get the detection right. Lab requirements was a challenge with EPA and it is therefore recommended that DOE seek assistance from US EPA to achieve similarly defined detection limits and error rates as achieved during ARRA investigation.

Changes in Site Knowledge Since the Signing of the 2010 AOC

This section simply regurgitates the claim that it's too hard, while being less contaminated by the primary concern of radionuclides. If this is the case, why do several of the alternatives suggest leaving behind areas where known radionuclides are present? The statement, "Approximately 70 percent of soil samples of radionuclide concentrations greater than the FALS [field action levels] are located within five Area IV Radiological Areas of Interest: RMHF complex, SRE complex, 17th Street Drainage, Former Fuel Element Storage Facility, and New

63-1
cont'd

63-9
cont'd

63-14
cont'd

63-32

Please refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for a discussion of past cleanup and the current status of Area IV.

63-25 DOE is committed to minimizing the impacts of cleanup of Area IV and the NBZ by using the principles of "green cleanup." To the extent practical, green and sustainable remediation and innovative technology practices will be integrated into all aspects of remediation. The text box in Chapter 2, Section 2.2.2, of the EIS summarizes the green principles that will guide DOE's clean up decisions. Chapter 7 provides a more detailed discussion, which notes that recycling will be considered as part of the contractors' scopes of work for site remediation. Only materials demonstrated to be free of radioactive or chemical contamination and using approved methods and criteria may be released for recycling.

63-26 DOE has added information in Chapter 4, Section 4.3.1, of this EIS regarding the Stormwater Pollution Prevention Plan (SWPPP) that will be developed for soil remediation actions. The SWPPP will incorporate all appropriate runoff control measures recommended by the Stormwater Expert Panel. This EIS has also been revised to note that the SWPPP will detail the potential configuration and design of the additional erosion control measures required by Mitigation Measure SW-2 to respond to any runoff from the site that exceeds the design capacity of the best management practices and NPDES monitoring locations identified in Section 4.3.1 along with the avoidance measures required by Mitigation Measure SW-1.

63-27 Although there is a range in the potential human health impacts, as stated during the DOE presentation at the public hearings, all of the action alternatives evaluated in the EIS are protective of human health. This is illustrated in the text box in Chapter 2, Section 2.4.4 and in Chapter 4, Section 4.9, and Appendices G and K of the Final EIS. Key differences among soil remediation alternatives are the area to be excavated and the corresponding volume of soil that would be removed. Figures 2-3, 2-5, 2-6, and 2-7 show the differences in areas to be excavated under each of the soil remediation alternatives. The difference in soil volume removed drives the duration of the project and many of the impacts (e.g., truck trips, air emissions, water use) and, therefore, was highlighted in the public hearing material.

63-28 Please see the responses to comments 63-2 and 63-17.

63-29 There is no technical definition for what "near background" means. Therefore, there is no means of calculating such a volume. According to the AOC, soil is either at or above background. Therefore, a volume above background can be calculated. Using risk

Commenter No. 63 (cont'd): Christina Walsh
Peoplepolicy.org

Page 13 of 23

Conservation Yard Drainage, [OCY]" claiming that the majority of the contamination is limited to each of these areas.

[PHOTOGRAPH of OCY]

This area where the power grid is located is shaded green as if to be a cultural or biological exception. It is these over-reaching efforts in areas which were so deeply out of control during operation that are critical to accurately assess and sample with the highest level of scrutiny.

While the results from the EPA Radiological Survey and Background Study found that many of the areas were less radioactively contaminated than previously thought, this entire process has been used to "dumb down" the audience or community by providing less and less of the necessary context for the public to have any chance of comprehending the current conditions of the site. The public has been further "dumbed down" by the misinformation campaign conducted by DOE funded SSFL CAG who has exaggerated even the DOE exaggerated numbers to be intolerable in the way of trucks and traffic while nearly completely dismissing the need to remove deadly contamination that is harmful to human health and the environment.

63-32
cont'd

63-30

assessment, a volume of soil posing a risk can be calculated for comparison purposes. However, without "near background criteria", such a volume cannot be calculated. The "above health risk" can be an important differentiator in determining the quantity of soil to be removed and above "hazardous waste" is an important differentiator as to how the soil would be handled and disposed. Soil containing contaminants above hazardous waste limits has handling and disposal requirements that are different from soil containing contaminants but below hazardous waste standards.

NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. This EIS analyzes an alternative that incorporates the technical elements of the 2010 AOC, using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities (see Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for more information). In response to public input received, and consistent with its obligations under NEPA, DOE also analyzes alternatives that are based on risk to human health as well as the protection of natural resources. This latter use of a risk assessment approach for soil cleanup is consistent with the approach used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ. Area averaging is not performed to "excuse away" higher concentrations as the commenter alleges. Prior to area averaging, areas with concentrations that would be a risk to human health and the environment are identified and targeted for cleanup. Area averaging would then be applied to the remaining soil to determine whether additional soil cleanup would be needed.

63-33

63-34

DOE identified the minimization of the amount of soil for disposal through purposeful excavation of only those areas characterized as requiring removal and the use of uncontaminated soil for fill or other purposes, such as erosion control and excavation backfill as minimization measures (see Chapter 6, Table 6-1). However, meeting the criteria of the Cleanup to AOC LUT Values Alternative would involve removing most of the soil down to bedrock over a large part of Area IV. Even with the use of minimization measures, this disruption of the natural contours of the area would require backfill from an offsite source.

Commenter No. 63 (cont'd): Christina Walsh
Peoplepolicy.org

If 70% of soil samples with radionuclide concentrations greater than the FALs are located within five Area IV Radiological Areas of Interest, why are some of these primary areas of interest being recommended for "no action" through green shading exemptions? It is recommended that this be corrected and these primary areas be addressed using the highest level of protection as intended by the spirit of the AOC signing, which was to acknowledge the purpose of SB990, which was to bring about cleanup instead of more decades of delay. Yet here we are, a decade later, still wondering if cleanup will even take place.

The AOC LUT map suggests that all roads be removed as if they are the problem. This level of exaggeration and overreach makes achieving a credible cleanup that has any level of community buy-in incredibly difficult.

Range of Alternatives

This is defined as to include a range of all reasonable alternatives, yet no suggestion of mitigating the leaving behind of toxic material is suggested in any of the alternatives. The one thing we can be certain of, is that time will reveal new 'old' impacts which emerge due to erosion, rain, or surface water flow, or future brush fires which have historically occurred on a somewhat regular basis and should be expected to continue at similar levels. These mechanisms of unexpected release are known, have happened before, and should be expected to happen again and should therefore be planned for. The culvert modification work done by Boeing in the ISRA work directed by the Stormwater Expert Panel has forever REDUCED risk for the areas down-gradient from those areas and we are eternally grateful for that. It is my hope that similar effort be applied to all drainages exiting the site from Area IV and Northern Buffer Zones. Designing the future to manage water using a combination of natural and filtration systems is wise, and far less expensive than waiting for more impacts to be seen or suspected. Plans for implementation of long term management of all drainages [especially those leaving the Area IV burn pit and OCY areas] should be incorporated in the mitigation plan. All areas of exemption should also require down-gradient plans for water management so that the problem we protect for, doesn't become a bigger problem. This cannot be accomplished if the constant tone in every meeting is the exaggeration of trucks, amplification of potential traffic increases and little time devoted to actually addressing how to live safely next door to a nuclear mess.

"Nothing to see here" has been a multi-decade opposition campaign which has damaged the public understanding of the site and is truly a disservice to the communities who have already taken it on the chin in environmental impacts. While we cannot prove the cancer connection, it is widely known that these radionuclides and chemicals are carcinogenic and we also know that they left the site at various levels for decades. The inability to draw a direct line to any particular cancer should not be used as a constant reason to close our eyes to the obvious. We need you to try to get this right, instead of trying to not comprehend the problem because then we have no hope of getting this right.

Potential Environmental Consequences of Cleanup to AOC LUT Values

If we are going to list 62,500 round trips of cars or light-duty trucks primarily due to worker commutes, the number of high-paying jobs created should also be listed. 62,500 / 10 years = 6,250 roundtrip car trips per year / (5/7th or

63-32
cont'd

63-31
cont'd

63-6
cont'd

63-35

63-36

63-37

63-31 Within Area IV, about 10,000 feet (less than 2 miles) of paved road remains. As stated in the Final EIS Section 2.5.2, DOE does not plan to remove any road as part of the soil removal actions. An exception may be made for roads where soil contamination has been shown to extend below a road. Many of the roadways would be necessary to support groundwater remediation and to maintain the storm water control features. Inclusion of the roadways on the figure was not intended to imply that they would be removed. The set of figures the commenter references (and corresponding figures in Chapter 2) have been revised to consistently display features of the site for this Final EIS.

63-32 Please refer to the response to comment 63-1. Inclusion in a green-shaded proposed exemption area does not mean "no action" as indicated in the comment. Disturbed and undisturbed areas within proposed exemption areas would be thoroughly investigated and chemicals or radionuclides exceeding risk-based criteria to protect human health and would be subject to focused removal actions in accordance with the procedures worked out with USFWS and California DFW (see CRD Section 2.4, "Application of Exemptions under the 2010 Administrative Order of Consent").

63-33 Please refer to the response to comments 63-1 and 63-32. The power grid (electrical substation) referenced in this comment is another site in which the developed portion of the site is immediately adjacent to sandstone outcrops supporting the Santa Susana tarplant, other sensitive species, and possibly cultural resources. The maps in this EIS are at a small scale and are not intended to show the detail (i.e., the precise boundaries) that would go into the final remediation planning. These areas will be considered during preparation of detailed remediation plans, which would include a point-by-point analysis and site-specific plans for remediation using risk-based criteria to protect human health and careful remediation approaches to minimize unnecessary damage to sensitive species or cultural resources.

63-34 Chapter 3 describes the affected environment in and around SSFL Area IV and the NBZ. Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. DOE does not control information distributed by those it has funded, including not only the CAG, but also the SSFL Advisory Board, SSFL Work Group, Committee to Bridge the Gap, Physicians for Social Responsibility, Rocketdyne Cleanup Coalition, and Teens against Toxins. The EIS is written to provide more detailed information for those who would like to delve into the details of the analysis. The summary provides an overview of the entire EIS analysis; those who would like more detail are referred to the body of the EIS; and finally the appendices are provided to allow an even more in-depth review of the analysis.

Commenter No. 63 (cont'd): Christina Walsh
Peoplepolicy.org

Page 15 of 23

0.71428 * 365 workdays per year to 260.71. 6250 / 260.71 = 23.97 * 10 = 239 jobs created over ten years in addition to truck driving jobs in the thousands.

Backfill estimates are again over-estimated when re-contouring which is primary utilized, is not being considered. The assumption of backfill should be reduced to no more than 20%.

The map indicating the AOC alternative indicates that all the roads in Area IV will be removed. That is miles and miles of asphalt, and there is no reason to make this assumption, especially given that the alternatives described as "environmental conservation" do not show this similar removal of roads as would be expected for use as an "open space wildlife corridor."

The estimation of 70,000 truckloads does not include the subtraction of green shaded "exemption areas" which appear to cover nearly 40% of the site. This was confirmed by John Wondelleck who gave the reason that the areas have not been finalized, so they have not been included. While this is true, it is known that there are cultural and biological areas that are clearly identified and therefore some estimate must be included in the EIS as the AOC requires BOTH background, AND the exemptions to be met. While I believe these areas are exaggerated, they can clearly and easily be corrected through use of overlay and current mapping from Google Earth. [attached samples]

Background Data AOC LUT Failures

This is false. I was part of every step of the background study with US EPA as well as the chemical background study with URS. We did a distance test location study looking in FOUR directions, I walked each one of them and was involved in the sampling, and that result came back before we all started with the background location sampling process. If on a chemical process, which they did not share with us despite attending the test locations I describe above. The LUT values were supposed to be defined by the test location sampling, so the statement that the AOC's would cause each of them to fail is false. Sampling was taken at each of the locations, in fact, we lost Rocky Peak because of the brush fire that occurred between the selection and sampling time-frame. With DTSC for chemicals they used different locations than EPA, but the development of the data set for chemical AOC LUT values would be developed from the sampling from these locations, so by virtue of the process as described to all of use who participated every step of the way, it is not possible for 46 of 110 chemicals to exceed their value if the value was developed from the sampling in the background study. Please provide a detailed explanation of this effort to discount chemical LUT values as legitimate. By design, they should be driven from the background data, and therefore cannot exceed itself by so much. I hereby request an audit of the chemical background process, data used, and decision points that is explained in depth to the public.

Health Risk

The most glaring false statement or assumption that I have come across so far, in reviewing the draft EIS:

Table 2—10 Summary of Potential Cumulative Impacts Page 2-422:

Cancer risks are thought to have a latency period, and certainly can vary with concentration of contaminant impacts. The argument made in Table 2—10 suggests that cancer risks are realized on an instantaneous basis. Since the health risk potentials are described based on amount of time per day that might be spent at the site by

63-35 DOE has added information to the EIS in Chapter 4, Section 4.3.1 regarding the Stormwater Pollution Prevention Plan (SWPPP) that will be developed for soil remediation actions. The SWPPP will incorporate all appropriate runoff control measures recommended by the Stormwater Expert Panel.

In addition, as required by 10 CFR 1021.331, following completion of the ROD(s) for this Final EIS, DOE would prepare a Mitigation Action Plan that addresses mitigation commitments expressed in the ROD(s), including those that are necessary to prevent movement of contaminants during soil remediation. The Mitigation Action Plan will explain how the corresponding mitigation measures are designed to diminish adverse environmental impacts associated with the course of action directed by the ROD(s) and will be planned and implemented. Also, as described in Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD, DOE has also removed much of the contamination within the soil, bedrock, and remaining buildings that resulted from nuclear research activities at Area IV.

63-36 Consistent with the DOE Environmental Management mission of completing the safe cleanup of the environmental legacy of nuclear energy research, DOE is committed to remediating Area IV and the NBZ. This EIS has proposed alternatives for cleanup, and it evaluates the potential impacts for each alternative. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment. Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts. As described in Section 2.7, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act. Please also refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD, for a discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Peoplepolicy.org

comparing potential receptors from the recreator to the potential resident, it is not reasonable to limit potential impacts felt by the cumulative exposures based on time spent in each of the areas as well as the radiant impacts felt in one area from another.⁵ In this same EIS, is a potential alternative for leaving the RMHF without remediating it or removing it. In the conservation alternative, it isn't even marked in blue to indicate radiological, or to even exist. These inaccurate errors that exist throughout the map shading of areas of cleanup and exemption reduce the credibility of the entire report. (This is almost as bad as the double counting claim used to deflect responsibility on water quality violations). By the logic used in the responsible party's own SRAM documents claiming the "shine from Building 4021 and 4022, if I am standing in Area III over a spill of benzene, am I not exposed both to the benzene I am standing on AS WELL AS the radiation "shine" coming from the RMHF as articulated in the HSA Incident Report. [Appendix B, HSA,]⁶

It is also inappropriate to reference as assumption of 24/7 exposure as "conservative." Can there be anything more than 24/7 exposure?

⁵ Appendix B Historical Site Assessment Summary Page 5 of 18, building 4793 Historical use impacting COCs includes a statement: "Background is relatively high (40µR/hr and 8,000 cts/min due to the shine from nearby buildings 21 and 22. This suggests that 4793 was impacted by nearby buildings containing high levels of radiation. If buildings were impacted according to the USEPA ARRA RAD SURVEY, it is reasonable that impacts would also be felt by people spending hours each day at the site. If the presence of radioactive contamination measured is blamed on nearby facilities to explain away the high readings, then it must be also considered to be radiating and affecting other nearby areas, habitats and potentially, nearby residents

⁶ Numerous building facilities on the incident report explain away the contamination present as "shine from RMHF" which demonstrates the impact to surrounding areas.

63-39
cont'd

63-37 As described in Chapter 4, Section 4.12, of the EIS under any alternative or any combination of action alternatives, site activities would have a minor beneficial impact on the economy in Los Angeles and Ventura Counties, by providing employment and increasing sales for industries that provide equipment, supplies, and rentals.

63-38 To clarify what was included in the Draft EIS: the estimated soil volumes (and therefore, number of trucks) were based on the remediation of areas outside the exemption areas. This is indicated in Chapter 2, Table 2-3, of this EIS which shows that the estimated soil volume that exceeds the 2010 AOC LUT values (1.6 million cubic yards), would be reduced by 115,000 cubic yards to adjust for land that is included within the proposed exemption areas. For each soil remediation alternative, the estimated soil volume and corresponding number of truck trips presented in the Draft and Final EIS (see Tables 2-5 and 2-6) take into account proposed biological and cultural exemption areas.

As previously noted, carefully planned, focused cleanup within the exemption areas would be performed to remove soil with constituent concentrations that pose a risk to human health and the environment, as determined using risk-based screening levels (RBSLs). Therefore, additional soil volume and a small number of additional truck trips are expected as a result of these removal activities.

63-39 As described in Chapter 5, Section 5.5.9, and summarized in Chapter 2, Section 2.8.2, of this EIS, the incidence of cancer does have a latency period. However, the probability of incidence of cancer (at some point in the future) is a function of both exposure rate and exposure time. The residential risks for Area IV were calculated assuming the exposure was for 24 hours per day, 350 days per year, for 30 years. The 350 days per year assumes the resident is traveling away from home 2 weeks per year, and the 30 years assumes the resident will live on the same property for 30 years. That assumption does not leave any time for exposure to an adjacent property. Although the recreational user's time allocation is not nearly as much, the assumed exposure time of 8 hours a day, 75 days per year, for 30 years for recreational activities (e.g., hiking) is sufficient to assume additional recreational time on other properties is not available. Therefore, any time spent on adjacent property subtracts from the time available on the Area IV property.

The 40 microrentgen per hour (µR/hr) mentioned in the Final Historical Site Assessment (HSA) (HGL 2012a) for Building 4793 is only "relatively high" relative to natural background radiation levels, which are typically 6 to 8 µR/hr. Building 4793 was located much closer to the RMHF than Area III is. Radiant impacts diminish by the

Commenter No. 63 (cont'd): Christina Walsh
Peoplespolicy.org

Additionally, one of the cumulative impacts of these storage areas which have stood, for many years with expired waste still in place despite requirements of these limitations, so that "exposure" time should also be measured as a negative impact that we have already undergone and will continue under scenarios where many of these undocumented areas will remain a hazard forever.⁷

Appendix D

D-3 Table D-1 DOE Buildings in Santa Susana Field Laboratory Area IV to be removed.

Noted on this list is building 4563 and is noted "not considered a radioactively contaminated structure." This is false and should be corrected. While it might be true that it is not a structure, because it is a storage yard area without walls, but contained yellow birdcage and cask containers. This is an area that has a long history of spills which is why the pavement has been repaired and re-slurried so many times as a mechanism to 'contain contamination' according to interviewed workers. [ACME/Cleanprocketyne 2006 Worker Interviews]

This is also true for 4688 where I photographed barrels marked as radioactive, draining upside-down into pallet cartons. Also, not a building, but the pavement has been slurried over and over and over to contain the radiation. This is reflective in the map indications in blue when overlaid [example overlay, Walsh 2017]

While the designation for 4024 indicates that it is radioactively contaminated [appropriate], but the driveway/loading area which contains deep BGS tanks is partially shaded in green as an exemption. This is inappropriate and should be corrected for final draft.

Figure D-1 Remaining structures shows building 4100, but it is not identified with a number on the photograph, nor is it listed even though it remains at the site. Please correct and provide details as this was the location of the largest tomography machine in the world.

Figure D-2 Radioactive Materials Handling Facility Overview

This figure does not identify the holdup tank area below, which used to be an unlined pond and should be included, as well as remediated according to sampling results and should not be eligible for exemption as the pond was tarped as recently as last year.

Facility areas noted in Appendix D do not seem to include the OCY and NCY areas which are important storage areas, in part because of the steep topography, and the number of years of lack of controlled storage of thousands of containers and debris. Instead, this area is not noted with any relevant detail and shaded largely in green. This is inappropriate and should be corrected.

⁷ Building 56 Landfill consist of unknown debris, is very steep, and acknowledged as a problem area eventually justifying the placement of "outfall 7" to measure this discharge. The Landfill Excavation is a 50 foot deep hole that was never used as a reactor facility because it hit groundwater (like 4024 and so many other deep subterranean facilities). This area is not a biological or cultural resource, and in fact, stands as a hazard, and is therefore fenced including barbed wire. For this reason it can also not be considered habitat, and because the bottom was found to contain debris, as well as the ramp area, this area should not be excluded under biological or cultural exemption unless cultural importance can be demonstrated.

63-40

63-40

square of the distance. The radiant sources in Area IV are not close enough to other areas (e.g., Area III) to give a significant radiant impact in any other area of SSFL. As noted in Chapter 4, Section 4.9.3, of this EIS while the buildings remain standing, only individuals who enter the buildings or stand on a contaminated paved surface are expected to receive a radiation dose. Doses could come from direct external exposure to radioactive material within the buildings or from the outside paved surfaces.

As stated in Chapter 1, Section 1.1, of this EIS, DOE needs to complete remediation of SSFL Area IV and the NBZ to comply with applicable requirements for cleanup of radiological and hazardous substances. To this end, DOE needs to remove the remaining DOE structures in Area IV of SSFL and clean up the affected environment in Area IV and the NBZ in a manner that is protective of the environment and the health and safety of the public and workers. This EIS considers three action alternatives to accomplish these tasks and, no areas will be subject to DOE remediation activities forever.

63-41

Under the ecological and cultural resource exemption process, locations where contamination exceeds human health or ecological risk-based levels would be cleaned up. Through formal and informal consultation with the State Historic Preservation Officer, the federally recognized Santa Ynez Band of Chumash Indians, and non-federally recognized tribes, DOE has also identified areas in which it proposes to apply the exemption process for protection of cultural resources. See Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a description of the exemption process.

The Building 56 excavation was included as part of a proposed exemption area because it supports wetland vegetation and habitat as discussed in Appendix I, "Wetlands Assessment," of this EIS. At this time, the wetland represents the only permanent surface water on Area IV or the NBZ and it supports plant species (e.g., willows, cattails) and may support such wildlife as amphibians and reptiles that require access to surface water. As such, if it is found to have chemicals or radionuclides exceeding human health RBSLs or ecological risk levels, these areas would be subject to focused removal activities. The area does represent a safety hazard due to the nearly sheer walls of the excavation and would need to remain fenced in the future if it is not filled in.

63-41

Waste determined to be LLW from the buildings within RMHF and Building 4024 would be managed and disposed of off site as radioactive waste. In this EIS, waste determined to be LLW from other buildings that have a radioactive history was also assumed to be disposed of as radioactive. Debris from the demolition of these

Commenter No. 63 (cont'd): Christina Walsh
Peoplepolicy.org

Table D—5 Comparison to other Cleanup Projects in California

These comparisons are inappropriate to both Hunter's Point and McClellan AFB because of the military nature of both projects, as well as the topographical location (not at the top of a hill surrounded by communities). Additionally, they did not have operating burn pits that burned waste for decades so the air dispersion impacts will be very different. Finally, the future use of Santa Susana Field Laboratory is not known, coupled with steep drainages and operational history of releases, that a more protective level is needed. TCE is one of the primary drivers for contamination at Santa Susana Field Laboratory and is not present at McClellan AFB, further drawing contrast between these projects.

Summary, continued.

S—25 Evaluation of Implementation of 2010 AOC Cleanup Requirements

This section suggests that AOC background is more stringent than other cleanups, but contains exemptions to address these differences, and was agreed to as a settlement by DOE. It is important that it be articulated clearly that the approach of this cleanup based on a "bright line" strategy is to cleanup all that is detectible, or above background, except for areas that require protection for X⁹ reasons. Under this scenario, the areas that are undisturbed natural open space that contains these features can be protected. For these exceptions, mitigation should be recommended as to how to address the safety requirement for contaminants that remain to sequester the area through use of phyto-remediation techniques or institutional controls that are approved by the regulator with public oversight. In other words, for everything that is suggested to be "left behind" recommendations must be made to mitigate that change. This will create long-term solutions to make down-gradient communities safer both tomorrow and in future generations who will have less available knowledge about the details of what was done here. We need to be willing to create a solution that protects people we will never meet and nature we will never see. That is the only way to make this responsible, trustworthy, and with potential for a real future that protects both the past history and future community residents surrounding the site.

S—28 NEPA Guidance and Regulations for Addressing Alternatives in EIS Documents

"Rigorously explore and objectively evaluate all reasonable alternatives..." has not been followed as all alternatives that included in situ solutions have been dismissed despite being a primary directive of the AOC to use all reasonable methods to reduce soil volumes leaving the site.

S—29 Potential Environmental Consequences of Cleanup to AOC LUT Values

130 acres of land disturbance noted in EIS does not deduct the proposed green shaded exception areas, or the areas that are previously disturbed, paved, former slabs and infrastructure that has been altered from its natural state. These areas are significant and should be deducted from this number for a more accurate picture to the public. Similarly, the soil estimates seem to be based on assumptions of a much deeper soil profile than what is

⁹ X - Exceptions for biological, endangered species and designated cultural site preservation.

63-42

63-43

buildings would be surveyed to ensure it is disposed of properly. While waste only from Buildings 4038, 4057, 4462, and 4463 is not assumed to be radioactive, these buildings would be surveyed for the presence of radioactive material and disposed of appropriately after demolition.

Building 4100 is owned by Boeing and removal is the responsibility of Boeing. Figure D-1 was revised to indicate that numbered buildings are those for which DOE is responsible.

Any contaminated areas (e.g., RMHF holdup tank area, the Old and New Conservation Yards, and the areas associated with building 4024) would be remediated as part of the soil cleanup efforts, based on their characterization and the implemented cleanup levels. That means that even if they are within an exemption area, if they pose a threat to human health or the environment, they would be remediated. These areas will be considered during preparation of detailed remediation plans, which would include a point-by-point analysis and site-specific plans for remediation using risk-based criteria to protect human health and careful remediation approaches to minimize unnecessary damage to sensitive species or cultural resources.

DOE disagrees with the commenter. Hunter's Point in San Francisco and McClellan AFB are situated immediately next to much larger populations than SSFL. Both facilities have operations going back to World War II and earlier, and both had similar chemical practices as SSFL. The future land use of the Boeing portions of SSFL, including Area IV, will be open space. Hunter's Point and McClellan AFB are being redeveloped for other purposes. According to EPA's website, solvents are the primary volatile organic compound in groundwater at McClellan, with TCE mentioned as the volatile organic compound. More than 1.6 million pounds of volatile organic compounds have been removed from groundwater at McClellan. TCE is an issue for groundwater at SSFL, but primarily in Areas I and II. This EIS addresses alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ.

Please see the response to comment 63-1. Revegetation and soil stabilization after remediation as proposed in the EIS is critical in protecting watersheds from erosion and sedimentation. Management of surface water to ensure standards are met would be continued as well as groundwater monitoring in areas subject to monitored natural attenuation would provide further protections.

Much of these areas would be excluded according to the non-AOC alternatives as well as the green shading of exceptions from cleanup. This should be corrected so that these problem areas are not excluded. We should not be arguing about the worst areas and we cannot come together with legitimate debate on exceptions if these areas are so blatantly excluded despite data to the contrary.

Thank you for the opportunity to comment on this important process.

**Commenter No. 64: Mohsen Nazemi, Deputy Director,
Department of Toxic Substances Control**

April 13, 2017

Ms. Stephanie Jennings
NEPA Document Manager
U.S. Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, California 93063

DEPARTMENT OF TOXIC SUBSTANCES CONTROL'S COMMENTS ON THE
DEPARTMENT OF ENERGY'S DRAFT ENVIRONMENTAL IMPACT STATEMENT
FOR REMEDIATION OF AREA IV, SANTA SUSANA FIELD LABORATORY,
VENTURA COUNTY, CALIFORNIA

Dear Ms. Jennings:

The Department of Toxic Substances Control (DTSC) has completed its review of the Department of Energy's (DOE) draft Environmental Impact Statement (DEIS) for *Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory (SSFL)* and would like to thank DOE for the opportunity to provide the following comments. We summarize our key concerns with DOE's DEIS in this cover letter, and include a more thorough discussion of specific concerns in the attachment to this cover letter.

DTSC's Key Concerns with DOE's DEIS

1. The DEIS fails to only include alternatives that describe how DOE will comply with the 2010 Administrative Order on Consent (AOC). This is inconsistent with DOE's earlier statement describing the cleanup's purpose and need. Given this, we must reiterate that DTSC will hold DOE accountable for complying with the AOC.
2. The DEIS fails to provide sufficient information or analysis for DTSC to determine if any of the DEIS' alternatives would comply with the AOC.

64-1

64-2

64-1 The Draft EIS (and Final) includes an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. DOE recognizes that the EIS also includes alternatives, the Cleanup to Revised LUT Values Alternative and the Conservation of Natural Resources Alternative, implementing technical elements that differ from those in the 2010 AOC. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. That is what DOE has done in this EIS through the evaluation of the Cleanup to Revised LUT Values Alternative and the two scenarios of the Conservation of Natural Resources Alternative. NEPA strongly encourages agencies to evaluate alternatives and not limit their consideration to one pre-selected course of action. The 2010 AOC does not change this requirement; in accordance with the AOC, Section 7.11, "Compliance with Applicable Laws and Regulations," all actions taken pursuant to the agreement by DOE will be undertaken in accordance with applicable local, State, and Federal laws and regulations. This clause recognizes that DOE must comply with NEPA.

The specific wording of DOE's purpose and need for agency action has been refined since it was first stated in the 2007 Advance Notice of Intent, but the overall message expressed by the statement has remained consistent. Thus, DOE needs to remediate those portions of SSFL for which it is responsible in a manner that is protective of the environment and the health and safety of the public and workers. The change noted by the commenter in the statement does not change DOE's responsibility for complying with agreements, as well as with other requirements such as regulations and orders. DOE disagrees with the commenter's statement that the EIS does not support the conclusion that the Cleanup to AOC LUT Values Alternative supports an AOC Cleanup. Please see Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of assertions that none of DOE's alternatives would clean up Area IV and the NBZ in accordance with the 2010 AOC. DOE's understanding of the implementability of cleanup in accordance with the 2010 AOC has evolved since 2012. As discussed in Chapter 2, Section 2.3.3 of the EIS, DOE determined that there were technical issues with implementing a cleanup according to the 2010 AOC. As a consequence, and in keeping with its responsibilities under NEPA, DOE developed two alternatives in addition to the Cleanup to AOC LUT Values Alternative that meet the purpose and need of being protective of the environment and the health and safety of the public and workers. These two risk-based alternatives, the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative, are presented in Chapter 2, Section 2.4, of this EIS.

Commenter No. 64 (cont'd): Mohsen Nazemi, Deputy Director,
Department of Toxic Substances Control

Ms. Stephanie Jennings
April 13, 2017
Page 2

3. The DEIS describes at length a number of challenges to implementing of the AOC, however, it fails to take a hard look at how to overcome those challenges, including:
 - a. Inadequate survey, analysis, and use of agreed upon processes to identify potential options for acquiring clean backfill soil. DOE will use this soil to achieve cleanup standards and restore the land's natural contours following the removal of contaminated soil.
 - b. Conclusory statements about DOE's inability to achieve the AOC's preliminary cleanup standards, which are contained in the project's "Look-Up Table" (LUT), without a thorough examination of available options for overcoming those challenges.
4. The DEIS assumes habitat for protected plants and animals is exempted from cleanup, but fails to explain how DOE proposes to utilize the AOC's process of conferring with state and federal agencies on site-specific decisions to protect habitat.
5. The DEIS proposes to rely on the natural process of degradation (monitored natural attenuation) to reduce levels of certain contaminants to achieve cleanup standards, which may take decades and therefore violate the AOC's prohibition on leaving contamination where it is found. Moreover, the DEIS fails to examine ways to accelerate the natural degradation process.
6. The DEIS assumes trucks will use 2019 air pollution control technology over the estimated 15-year timeline for the cleanup. This fails to account for the use of improved air pollution control technologies over time, which in turn undercuts the analysis needed of the project's potential air pollution impacts.

The DEIS Appears to be Inconsistent with DOE's Established Purpose and Need for the Cleanup Project

The National Environmental Policy Act (NEPA) compels DOE to analyze the environmental impacts of this cleanup project, and establishes certain requirements when DOE conducts its analysis. One such requirement is that DOE must describe the purpose and need for taking this action. This Purpose and Need Statement explains the reason DOE is proposing the cleanup, what DOE expects to achieve with the cleanup, and provides the basis for DOE's development of a reasonable range of alternatives in its NEPA document for the cleanup.

DOE issued a Notice of Intent (NOI) to prepare an Environmental Impact Statement for this cleanup in February of 2014. This NOI contained a revised purpose and need for

64-3

- 64-2 Please see Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD regarding your concern about how DOE addressed the 2010 AOC in the EIS. Also see Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for further discussion on biological and cultural exemptions. The application of exemptions is pertinent to all alternatives, and is not only contemplated by the elements of the AOC, but also meets applicable Federal, State and local laws, as required by the AOC. Monitored natural attenuation is an acceptable form of in situ treatment as allowed by the AOC (see Section 1.8.2 of the AOC). DOE's proposed application of monitored natural attenuation to address low concentrations of TPH is addressed in the revised Chapter 2, Section 2.3.2 of this Final EIS. The Draft EIS estimates of soil removal, proposed exemption areas, and monitored natural attenuation soil volumes are based on data available to develop the EIS and will be refined as additional data becomes available. Refined estimates will be included as soil remediation implementation action plans are developed that would be submitted to DTSC for approval prior to implementation. DOE will continue to work with DTSC to ensure the analysis and information provided is sufficient for DTSC's evaluation.
- 64-3 Despite the technical challenges associated with implementing the AOC, DOE evaluated an alternative that meets the technical elements of the AOC (the Cleanup to AOC LUT Values Alternative). The Cleanup to AOC LUT Values Alternative and the potential impacts are evaluated based on the actions needed to implement it. However, based on currently available information on the technical elements of the 2010 AOC, DOE evaluated soil remediation alternatives that, when completed, would leave Area IV and the NBZ in a state that was protective of human health and the environment. These are the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative which are based on CERCLA-like risk assessment protocols. The Cleanup to Revised LUT Values Alternative uses chemical RBSLs based on a suburban residential scenario without a garden pathway. The Final EIS also retains the Conservation of Natural Resources Alternative, but evaluates two scenarios. The Open Space Scenario is based on the future land use of Area IV and the NBZ as open space, consistent with Boeing's conservation easements and agreement, i.e., cleanup levels are based on exposure of an onsite recreational user as the receptor. (In 2017, Boeing and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements [conservation easements] with Ventura County [Ventura County 2017a, 2017b] in 2017 that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit

Page 3

the cleanup project that stated, "DOE needs to complete remediation of SSFL Area IV and the Northern Buffer Zone to comply with applicable requirements for radiological and hazardous contaminants. These requirements include regulations, orders, and agreements, including the 2007 Consent Order, as applicable, and the 2010 AOC."

In our April 1, 2014 letter regarding DOE's NOI, DTSC emphasized the importance that DOE's EIS alternatives must comply with the AOC and applicable State laws and regulations for the soil cleanup.

The draft EIS identifies four possible soil cleanup alternatives:

1. No Action Alternative
2. Cleanup to AOC Look-up Table (LUT) Values
3. Cleanup to Revised LUT Values
4. Conservation of Natural Resources

Based on the information provided in the DEIS, the alternatives appear to be inconsistent with DOE's Purpose and Need Statement. It appears that alternatives 3 and 4 do not meet the AOC requirements. In addition, while DOE states that alternative 2 does meet the AOC requirements, the data and analysis in the DEIS do not sufficiently support an AOC cleanup.

The DEIS Fails to Provide Sufficient Information to Determine if any Alternatives Comply with the AOC

The DEIS fails to completely justify the interpretation of areas that contain protected biological and cultural resources that may qualify for an exception to the AOC's cleanup requirement. DOE has failed to justify these exception areas, as defined in the AOC, for all alternatives. Similarly, DOE identifies monitored natural attenuation of waste that is overly broad given the potential lengths of time needed to complete degradation. There is uncertainty about whether this process can achieve sufficient degradation to comply with the AOC.

Because alternatives 1, 3, and 4 do not, on their face, comply with the AOC, they are not feasible for analysis. Therefore, DTSC did not comprehensively review those alternatives and has provided only limited comments related to these three alternatives.

64-1
cont'd

64-2
cont'd

residential, agricultural, or commercial development or uses of the site.) The Residential Scenario is the scenario evaluated in the Draft EIS, that is, cleanup levels are based on an onsite suburban residential receptor without a garden pathway. This latter scenario is conservative (i.e., more protective) of human health in terms of the future use of the land as open space.

64-4 DOE does not agree with DTSC that DOE has used "Inadequate survey, analysis, and use of agreed upon processes" to identify potential options for acquiring backfill. Nor does DOE agree that "DTSC has neither been engaged in, nor aware of any efforts DOE has made to coordinate its efforts with EPA as specified in the AOC." As discussed in the 2010 AOC confirmation protocol, DOE is to "identify the potential backfill source locations" for EPA to sample. DOE notified DTSC in a letter dated December 21, 2016 (DOE 2016) of DOE's efforts to locate backfill meeting the AOC requirements. The AOC states: "If an onsite or offsite source of backfill soils that achieves all (emphasis added) Look-up Table values cannot be reasonably found, then DTSC, DOE and EPA shall enter a consultation process." DOE is still awaiting DTSC's response on this matter.

DOE conducted an initial evaluation to identify locations to provide to EPA and those locations sampled failed to meet the LUT values. There is no reason to engage EPA until viable locations are identified. That is why on December 21, 2016, DOE (John Jones, ETEC Federal Project Director) provided a letter to DTSC (Ray Leclerc, DTSC SSFL Division Chief, Brownfield & Environmental Restoration Program) that presented DOE's efforts to date to locate a source of backfill that meets 2010 AOC requirements (DOE 2016). Because a source of backfill that meets all chemical LUT values had not been located, the letter was DOE's initiation of consultation with DTSC on this subject, as is required by the 2010 AOC. Additionally, based upon DTSC's request for more information, DOE in January 2017 provided DTSC all backfill soil sampling results. The responsibility for identifying backfill ultimately lies with DTSC per the 2010 AOC, which states: "If an onsite or offsite source of backfill soils that achieves all LUT values cannot be reasonably found, then DTSC, DOE and EPA shall enter a consultation process and DTSC shall determine the best available source of backfill" (emphasis added). Regardless of whether EPA is engaged, it is DOE's interpretation that the 2010 AOC puts the responsibility for finding backfill that meets the requirements of the AOC clearly on DTSC.

In response to the commenter's statement that "DOE did not adequately explore areas for potential fill that had similar lithology and chemical makeup," DOE did explore

Page 4

The DEIS Focuses on Technical Challenges Without Sufficiently Analyzing Options to Overcome Those Challenges

The DEIS identifies a number of areas where it claims that implementing the AOC poses technical challenges, but does not sufficiently pursue possible solutions. By overlooking solutions to these challenges, DOE is making the case that it cannot implement the AOCs in an effective manner. DTSC is committed to require that DOE comply with the AOC, and DOE must pursue solutions to achieve that compliance.

For example, DOE's assertion that it is not possible to find backfill that will meet the LUT values is not fully supported. Whether the goal is to meet the LUT values or biological needs for successful mitigation, the composition of the backfill is a very important factor. While DOE did find backfill areas that had values exceeding the LUT values, DOE did not adequately explore areas for potential fill that had similar lithology and chemical makeup. In addition, DTSC has neither been engaged in, nor aware of any efforts DOE has made to coordinate its efforts with US EPA as specified in the AOC. Finally, the Confirmation Protocol, Attachment C of the AOC, includes the following:

If an onsite or offsite source of backfill soils that achieves all Look-up Table values cannot be reasonably found, then DTSC, DOE and USEPA shall enter a consultation process and DTSC shall determine the best available source of backfill.

Please note that, while DOE provided limited information to DTSC in a December 21, 2016 letter regarding backfill material, as of this writing there has not been any follow-up with DTSC about this consultation process.

DOE makes a number of conclusive criticisms of the LUT values. DTSC does not accept all of DOE's conclusions. For example, while DOE's DEIS has identified the technical false positive, and achieving the Minimum Detection Concentrations (MDCs) as issues associated with implementation, DOE has not proposed specific resolutions. There are a number of concepts that DTSC believes may help resolve these issues, such as the following:

- o Improving specific cleanup data quality objectives.
- o Examining multiple laboratories' capacity to achieve MDCs.
- o Evaluating methods to improve polychlorinated biphenyl detection issues.

The AOC Confirmation Sampling Protocol refers to comparing the "contaminants of concern observed in the confirmation samples" to LUT values. Developing a more precise list of contaminants of concern that more accurately reflects the most indicative

64-3
cont'd

64-4
cont'd

64-5
cont'd

additional locations for backfill, including DTSC's background sampling sites (see Appendix D). DOE considers the background sites to be "reasonable" locations as they have "similar lithology and chemical makeup" as Area IV (DTSC 2012b, HGL 2011). But the soil cannot be used as backfill because at the background location 42 percent of the chemicals sampled had at least one sample above its 2010 AOC LUT value and 26 percent of the sample locations had a sample with at least one chemical above its LUT value.

Most of DTSC's suggestions (listed below) require that DTSC amend the 2010 AOC and/or chemical LUT values. As discussed below, the options suggested by DTSC (see, "Main Comments Item 5 of the Attachment "The Department of Toxic Substances Control's (DTSC's) Detailed Comments on The Department of Energy's (DOE) draft Environmental Impact Statement (DEIS) for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory (SSFL) (January 2017," to this DTSC comment letter) would require modifications to the AOC, as allowed in Section 8 of the AOC, in order to be implemented.

- "Since the first proposed project involves priority cleanup of radionuclides to LUT values with cleanup of nearby chemicals to RBSLs, these suggested steps for determining if potential backfill exceeds local background for chemicals may be of lesser priority." This statement by DTSC is one that is difficult to understand. It seems that DTSC is suggesting that DOE, as part of the first soil remediation action, remove soil down to LUT values and then replace that soil with backfill that also does not meet the LUT values. DTSC has the responsibility to resolve the problems relative to finding suitable backfill.
- "Develop Constituents of Concern." The 2010 AOC does not allow for constituents of concern. The AOC confirmation protocols state that soil results "will be compared directly to the concentrations listed in the 'Look-Up' Tables." "The 'Look-Up' levels cannot be exceeded by any sample." The 2010 AOC does not allow DOE or DTSC to pick and choose amongst the LUT values. Therefore, DOE must consider all LUT values and cannot selectively choose to utilize only a subset of the LUT values. DTSC has the responsibility to address the issues with LUT values (such as the background site soil failing the LUT values). The use of "constituents of concern" is not a consideration in the 2010 AOC.
- "Sample results used for comparison to 2010 AOC LUT values should be at or above the Method Reporting Limit (MRL)." The use of multi-laboratory MRLs was the subject of lengthy discussions during a series of meetings with DTSC technical

Commenter No. 64 (cont'd): Mohsen Nazemi, Deputy Director,
Department of Toxic Substances Control

Ms. Stephanie Jennings
 April 13, 2017
 Page 5

chemicals at the site, rather than all of the possible chemicals, would reduce both the likelihood of false positives, and focus attention on the impacted areas.

64-5
 cont'd

The DEIS Assumes Habitat is Exempt from Cleanup Without Explaining how DOE will Confer with State and Federal Wildlife Agencies Responsible for Assessing Protected Habitat

The DEIS' identification of areas subject to no cleanup through the application of biological exceptions, as defined in the AOC, is far too generalized. These determinations will require specific and final input and opinions from both the US Fish and Wildlife Service and California Department of Fish and Wildlife. DTSC is not endorsing the areas DOE identified as exceptions in the DEIS. As they represent preliminary estimates, DTSC will oversee and approve the final determination regarding exceptions as defined in the AOC when there is sufficient data and area specific analysis to support a final decision.

64-6
 cont'd

The DEIS Presumes the Natural Degradation of Certain Contaminants will Achieve AOC Cleanup Standards Without Sufficient Support or Analysis

In the DEIS, DOE referenced the use of in-situ biotreatment of soil. DTSC recommends that DOE explore methods and technologies that can accelerate the degradation of key contaminants such as total petroleum hydrocarbons and polycyclic aromatic hydrocarbons in order to shorten cleanup timeframes and reach the goals of the AOC with greater certainty. DTSC retains authority and jurisdiction to direct additional actions over any areas where monitored natural attenuation or biotreatment is part of the proposed remedy. DTSC will consider the cleanup actions ability to achieve the cleanup values and timeliness to complete cleanup when evaluating cleanup methods.

64-7
 cont'd

The DEIS Fails to Appropriately Analyze Vehicles' Use of Air Pollution Control Technologies that Improve Over Time

The DEIS discusses mitigation measures designed to minimize the project's potential harmful impacts on air quality. A key mitigation measure is the assumption that DOE will require trucks, which haul soil to and from Santa Susana, to use 2019 emission control technologies over DOE's estimated 15-year timeline for the cleanup project. This fails to recognize that air pollution control technology improves over time. Since construction of the project will probably take several years, DTSC recommends that DOE's final EIS specify, for each year of the project, the earliest allowable model year of truck that DOE

64-8
 cont'd

and management staff in 2011 and 2012. DTSC's lead chemist was critical of the process that was being promoted by DTSC's management in developing MRLs. "The Environmental Chemistry Laboratory does not recommend the process outlined in the current Draft Technical Memorandum to serve as the foundation for site characterizations and for the development of the MRL LUT values. ECL cannot attest to the process as robust, technically sound, and defensible" (DTSC 2012a). DOE agrees with DTSC that adjusting MRLs to reflect reasonable decision values would be one way of addressing the backfill suitability issue. This would require modifications to LUT values that would take into consideration reasonable laboratory reporting limits consistent with the ECL recommendations EPA protocols used nationwide for laboratory development procedures (not ad hoc) and would be technically defensible as recommended by the DTSC technical staff.

- "Sample analyses and results should consider, and minimize to the extent possible, analytical challenges for low levels of TPH and naturally occurring organic materials." The challenges for TPH are twofold. One deals with the failure by DTSC in its background study to analyze for TPH. As the soil treatability studies showed, TPH-like chemicals are present naturally in the environment. DTSC also did not consider whether the 5 parts per million (ppm) LUT value was technically achievable in most laboratories. Per the 2010 AOC LUT value footnote: "For locations where TPH is the sole contaminant, a cleanup strategy will be considered based on the findings of the soil treatability study." DOE's recommendation regarding a "cleanup strategy" is for DTSC to recognize the technical challenges of a 5 ppm LUT value and to replace it with a value that is used in California (typically in the 100 to 400 ppm range [San Mateo 2006]). DOE does note that the soil treatability studies determined that between 300 and 500 parts per million of TPH-like chemicals observed in Area IV soil samples have a natural origin (Nelson 2015a).
- "Sample analyses should consider, and minimize to the extent possible, analytical challenges for pesticides, herbicides and PCBs." DTSC's Office of Analytical Chemistry brought this issue to DTSC's management in 2012, disagreeing with the approach being promoted by DTSC for establishing LUT values for pesticides, herbicides and PCBs (Dr. Ting memorandum of October 30, 2012). DOE cannot consider addressing the challenges until DTSC management addresses Dr. Ting's concerns. The Draft and Final EIS address this issue in Chapter 2, Section 2.2.3.

will use during construction. Relatedly, the final EIS should also analyze the air pollution control benefits related to this revised mitigation measure.

Please note that DTSC's additional section-specific comments are attached. Again, DTSC appreciates the opportunity to comment on DOE's DEIS for this site and we look forward to working with DOE in achieving the cleanup in a manner consistent and in compliance with the AOC.

cont'd

- “Sampling of potential source should be designed to minimize sampling error.” Decision criteria (in this case, as they are affected by the LUT values) are a key design element that contributes to sampling and analytical error. It would appear that DTSC did not adequately address decision criteria when selecting the LUT values (e.g., soil at the background location does not meet the LUT values).
- “Backfill should be assessed for biological suitability.” DOE agrees that the backfill should be suitable for biological growth, but this is not the issue. The issue is finding soil that meets the current soil 2010 AOC LUT values and is of the same geologic formation (per AOC Confirmation Protocol, page 3).

Subsequent to this DTSC comment submittal, DOE and DTSC staff met on July 26, 2017 to discuss the issues associated with finding acceptable backfill. At that time, DTSC informed DOE that this issue would not be addressed by DTSC for at least 2 years. Given this schedule, DOE indicated that if backfill soil that incorporates the technical provisions of the 2010 AOC was not addressed by this Final EIS completion, DOE would only be able to conclude that no backfill soil supporting implementation of the AOC is available. DTSC staff acknowledged that fact and said this conclusion in this Final EIS is agreeable to them at that time. DOE communicated that the identification of a backfill source is a critical component of soil cleanup and restoration planning, and it cannot complete remedial action plans until a source is identified.

Refer also to Section 2.3, “Suitable Backfill Soil,” of this CRD for discussion of the responsibilities and actions necessary to identify a backfill source.

64-5 DOE does not agree with DTSC that the manner to improve analytical detection is to research alternative methods of analysis. There is nothing the AOC that requires DOE to improve analytical methods. With regard to the commenter's criticism of the statement about DOE's inability to achieve the AOC preliminary cleanup values, see comment response 64-3.

DOE agrees that “improving specific cleanup data quality objectives” is an important first step. The 2010 cleanup to background AOC objectives as currently being considered by DTSC are not implementable because the analytical objectives sought by DTSC management cannot technically be met. DTSC needs to address the decision error issue, and establish 2010 AOC LUT values that the background site can meet. DOE and DTSC staff have already gone through multiple laboratory MDC exercises. It was DTSC's decision to drive laboratories to achieve lower detection limits than those typically used by the analytical industry, a posture that DTSC's lead chemist objected to. The primary issue that needs to be addressed is one of making cleanup decisions

using the analytical MDC without consideration of the decision error; an omission that results in the misidentification of uncontaminated soil as contaminated soil. EPA cautioned DTSC on this matter (HGL 2012c) and DTSC's own staff have discussed the issue at public forums (DTSC 2013c). DOE agrees that "developing a more precise list of contaminants of concern that more accurately reflects the most indicative chemicals at the site..." is one step towards reducing the decision-error problem. DOE would welcome the opportunity to discuss this issue with DTSC.

64-6 The Draft EIS and this Final EIS do not assume that habitat for protected plants and animals is exempted from cleanup. As indicated in Chapter 2, Section 2.3.2, of this EIS, if levels of constituents in exemptions areas pose a risk to human health and the environment, as determined using risk-based screening levels (RBSLs), DOE would remove them through carefully planned, focused removals. There would be some disturbance, but DOE's objective would be to minimize disturbance to that needed to protect public health and the environment. Please refer to "Application of Exemptions under the 2010 Administrative Order on Consent" (Section 2.4 of this CRD) for a discussion of this topic and DOE's response. The Draft EIS indicated that exemption areas for biological resources would be determined through consultation with the U.S. Fish and Wildlife Service (USFWS) as part of the USFWS Biological Opinion and the California Department of Fish and Wildlife (CDFW) through its permitting authority. Appendix E, Table E-4 of the Draft EIS and this Final EIS provides a summary of meetings with USFWS and CDFW held by DOE, most of which involved participation by DTSC. The USFWS subsequently issued its Biological Opinion, a copy of which is included as Appendix J of this EIS. Proposed exemption areas would be considered in detailed remediation plans that include a point-by-point analysis and site-specific plans for remediation using risk-based criteria to protect human health and careful remediation approaches to minimize unnecessary damage to sensitive species or cultural resources.

64-7 Monitored natural attenuation (MNA) was only one of several soil treatment options considered by DOE. As is stated in the Draft EIS, monitored natural attenuation would be only considered for "low concentrations" of TPH impacted soils and would be used only after DTSC approves its use. See Chapter 2, Section 2.3.2, of this Final EIS for additional information. DOE did look at other alternative treatment methods for the soil (Matsumoto and Martin 2015; Nelson et al. 2015b). However, soil treatment is normally performed to reduce contaminant levels to below hazardous waste or risk-based standards. Treatment is not intended to remove 100 percent of the contaminant. There will always be detectable contaminants in the soil following treatment above LUT values. This issue is even more relevant for TPH chemicals that are produced naturally

Commenter No. 64 (cont'd): Mohsen Nazemi, Deputy Director,
Department of Toxic Substances Control

The Department of Toxic Substances Control's (DTSC's) Detailed Comments on the Department of Energy's (DOE) draft Environmental Impact Statement (DEIS) for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory (SSFL) (January 2017).

Main Comments

1. **Chapter 1: Project Approach:** DTSC strongly reiterates that the completed soils cleanup in Area IV and the Northern Buffer Zone (NBZ) will ultimately require full compliance with the 2010 Administrative Order on Consent (AOC) requirements and this must be reflected in DOE's EIS.

Also, the EIS must make it clear that key elements of the proposed soil remediation alternatives must comply with the AOC requirements. For example, Section 7.11 of the AOC states "All actions taken pursuant to this Order by DOE shall be undertaken in accordance with applicable local, State, and federal laws and regulations". DTSC recognizes that DOE's evaluation of the Soil No Action Alternative is required by Council on Environmental Quality National Environmental Policy Act (CEQ NEPA) regulations. Ultimately however, the cleanup remedy selected must comply with the AOC.

The EIS must include a clearer discussion of potential use of the alternatives analysis in various phases of the cleanup, and clarify that ultimate requirement of full compliance with the AOC is necessary.

2. **Section 1.3, Page 1-7, 2010 AOC Text Box:** The last sentence in the text box indicates "Per the 2010 AOC, the schedule shall ensure that the identified activities can be accomplished by 2017 or sooner". To clarify, the DTSC-approved Soils Remedial Action Implementation Plan (SRAIP) will include a schedule for implementation of the planned remedial actions. Section 7.17 of the AOC states that all plans, schedules, and reports that require DTSC approval and are submitted by DOE pursuant to the Order and are not subject of dispute resolution under Section 7.19.1 through 7.19.9 are incorporated in the Order upon approval by DTSC. The schedule contained in the DTSC-approved SRAIP decision document will be the DTSC approved schedule, under the Order.
3. **Section 2.2.1, Page 2-4:** DOE states their expectation, that in order for implementation of any alternative to be consistent with the AOC, changes to the AOC would be required. Please note that as mentioned earlier, DTSC is committed to fully enforcing the 2010 AOC requirements.
4. **Section 2.2.3, Page 2-12:** DOE states if an area with chemicals or radionuclides exceeding AOC LUT values is inaccessible for safety reasons, the AOC allows exemptions of up to 5 percent of the total volume of soil above AOC Look-Up Table (LUT) values. This exemption is described in Attachment B "Final

in the soil. DOE does note that the soil treatability studies determined that between 300 and 500 parts per million of TPH-like chemicals observed in Area IV soil samples can have a natural origin (Nelson et al. 2015a). [DOE also notes that DTSC knew that the TPH LUT would require adjusting. The asterisk in the DTSC LUT memo states: "For locations where TPH is the sole contaminant, a cleanup strategy will be considered based on the findings of soil treatability study". Those studies were completed 4 years ago. In addition, DOE disagrees that MNA leaves contamination where it is found. By the very nature of MNA, contamination is reduced via natural processes and is an acceptable method to deal with contamination in certain situations, such as those in Area IV and NBZ, and is consistent with Section 2.9 of the AOC.

64-8 The Draft EIS Mitigation Measure AQ-1 proposed to implement a haul truck fleet where individual trucks would be no more than five years old during each year of cleanup activities. This measure would ensure that trucks would have (1) the newest or relatively new on-road emission standards and (2) a minimum level of engine deterioration and resulting degradation in emissions due to being relatively young in age. This mitigation measure is intended to reflect a rolling 5-year limit. For example, in year 2034, the goal would be for the oldest truck in the fleet at that time to be model year 2029. The Draft EIS presented the air quality benefits associated with implementation of Mitigation Measure AQ-1 in Chapter 4, Sections 4.6.4.1, 4.6.4.2, and 4.6.4.3 under subsection Green Cleanup Impacts and this Final EIS also presents this analysis. This Final EIS also clearly states the goal that individual on-road trucks within the project fleet would be no more than 5 years old during each year of cleanup activities.

64-9 This Final EIS was revised to clarify the interrelation of the SRAIP and DTSC's required approval of the SRAIP and that the 2017 date is no longer an AOC issue.

64-10 DOE agrees that the use of the 5 percent exception to the 2010 AOC for issues such as safety and accessibility is subject to DTSC's approval.

64-1
cont'd

64-9

64-1

64-10

Commenter No. 64 (cont'd): Mohsen Nazemi, Deputy Director,
Department of Toxic Substances Control

Agreement in Principle" of the AOC. However, DOE's example for use of this exemption (safety issues due to inaccessibility) is subject to DTSC approval in the final cleanup decision documents.

64-10
cont'd

5. **Section 2.3.2, Page 2-22 and Appendix D, Page D-45 Concerns about Locating Backfill Material Meeting AOC LUT Values:** The Final Agreement in Principle of the AOC states that backfill/replacement soils must not exceed local background levels, but if backfill that meets the LUT values cannot be reasonably found, then after consultation between DTSC, DOE and USEPA, DTSC shall determine the best available source of backfill. The following concepts are potential systematic approaches for working within the framework of the AOC's point-by-point comparison process with the LUT for chemicals, and for managing the uncertainty that may lead towards generation of false positives. Ultimately, DTSC will need more data to evaluate the acceptability of off-site backfill soils, as well as the ability to verify these results.

Since the first proposed project involves priority cleanup of radionuclides to LUT values with cleanup of nearby chemicals to RBSLs, these suggested steps for determining if potential backfill exceeds local background for chemicals may be of lesser priority.

64-4
cont'd

- Develop Constituents of Concern.
- Sample results used for comparison to AOC LUT values should be at or above the Method Reporting Limit (MRL).
- Sample analyses and results should consider, and minimize to the extent possible, analytical challenges for low levels of TPH and naturally-occurring organic materials.
- Sample analyses should consider, and minimize to the extent possible, analytical challenges for pesticides, herbicides and PCBs.
- Sampling of potential source should be designed to minimize sampling error.
- Backfill should be assessed for biological suitability.

6. **Section 2.3.3, Page 2-25: Third Ppgh:** This section indicates, "The 2010 AOC confirmation protocol addresses and compares every soil sample with the AOC LUT values for 116 chemicals and 16 radionuclides." The AOC's Confirmation Protocol (Attachment C) states that "*The concentrations of radiological and chemical contaminants of concern (COCs) observed in the confirmation samples will be compared directly to the concentrations listed in the "Look-up" Tables of radiological and chemical cleanup levels.*" Confirmation sampling can potentially utilize COCs to represent the key contaminants of interest for purposes of making confirmation decisions. The AOC requirements refer to COCs in the confirmation sampling process.

64-11

7. **Section 2.4.1, Page 2-31, Cleanup to Revised LUT Values Alternative:** As previously stated, this Alternative does not appear on its face to comply with the

64-12

- 64-11 DOE notes that DTSC states that confirmation sampling "can potentially utilize COCs" [contaminants of concern]. Until DTSC demonstrates that it is willing to accept a reduced number of contaminants of concern (effectively reducing the number of contaminants with AOC LUT values), DOE must assume that it will not be allowed.
- 64-12 Please refer to the response to comment 64-1. The Cleanup to Revised LUT Values Alternative proposes use of revised chemical LUT values based on risk-based screening levels instead of background or laboratory detection levels as detailed in the 2010 AOC. Otherwise, it meets the technical elements of the 2010 AOC (e.g., this alternative assumes use of the radionuclide AOC LUT values).

DOE considers this to be a complete alternative; therefore, there would be no second phase under this alternative.

Commenter No. 64 (cont'd): Mohsen Nazemi, Deputy Director,
Department of Toxic Substances Control

AOCs. Regarding phased approaches to cleanup, any soil with contamination above the LUT values at the end of the first phase would need to be remediated to comply with the AOCs in the second phase.

8. **Page 2-33, Conservation of Natural Resources Alternative:** The first paragraph in this section states that under this alternative, Area IV soils would be cleaned up to Suburban Residential risk-based screening levels (RBSLs) for chemicals. Radionuclides would be remediated "to levels as low as reasonably achievable (ALARA) below the DOE standard of 25 millirem per year (DOE Order 458.1) to the hypothetical suburban resident." However, the AOC states that soil cleanup is to be to Background levels. The Natural Resources Alternative does not comply with the AOC.

9. **Section 3.4.2.1, Pg. 3-41, Pgph 4.** The text in the draft EIS states:

"The purpose of the GWIM is to collect data on aquifer properties, remove some contaminants mass, and possibly control plume migration for locations within SSFL that exceed 1,000 parts per billion TCE in groundwater. For Area IV, this definition applies to FSDF."

To clarify, DTSC stated that "groundwater extraction should be initiated at all groundwater monitoring wells within source zones, defined as any monitoring wells where the reported concentrations of TCE have been 1,000 ug/L or higher and/or any monitoring wells where TCE concentrations and water levels are trending higher since shut-down of groundwater extraction wells." The text in the EIS should be modified to accurately reflect the purpose of the Groundwater Interim Measures (GWIM).

10. **Section 4.1.1, Page 4-8:** Please confirm the statement regarding zoning for the Northern Buffer Zone and other areas of Santa Susana for consistency with Ventura County's zoning designations, including the county's General Plan.

11. **Table 6-2 (Potential Mitigations), Page 6-17:** Mitigation Measure AQ-1 states "For on-road trucks, a fleet of trucks no more than 5 years old." In order to minimize the air quality impacts of the project, DTSC recommends that the final EIS specifies the use of the earliest allowable model year of truck during construction, which may expand over several years. DOE should also specify which model year haul trucks will be used in each year during construction phase of the project, in DOE's Final EIS. Relatedly, the final EIS should also analyze the air pollution control benefits related to this revised mitigation measure.

cont'd

64-13 As discussed in response to comment 64-1, the Conservation of Natural Resources Alternative is a risk-based alternative that would implement cleanup criteria that differ from the AOC LUT values. In conformance with the AOC and in compliance with NEPA, this EIS does analyze an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. In response to public input since the 2010 AOC was signed and in light of identified technical issues with implementing the 2010 AOC, this EIS also analyzes alternatives that consider risk to human health and ecological risks as well as the protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with the approach used by DOE at other DOE sites, by DTSC at other DTSC-regulated sites, and by U.S. Environmental Protection Agency (EPA) at CERCLA sites. The comparative analysis of these alternatives allows the reader to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ.

Although the Draft EIS addressed radionuclide cleanup based on DOE's 25 millirem dose per year objective, the Conservation of Natural Resources Alternative (both scenarios) analyzed in this Final EIS employed a risk assessment similar to that used under CERCLA. The risk analysis resulted in radiological risks in the 10⁻⁵ range as determined based on CERCLA-based risk assessment considerations. Soil cleanup based on risk resulted in a predicted dose much lower than 25 millirem per year. Please refer to Section 2.6, "Comparison of Radiation Doses," of this CRD for further discussion of the 25 millirem per year dose limit.

64-14 Chapter 3, Section 3.4.3.1 of this Final EIS was revised to clarify the purpose of the groundwater interim measures per DTSC's comment.

64-15 For this Final EIS text was reviewed and revised to reflect Boeing's conservation easements and agreements. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. These conservation easements and agreements imposes restrictions beyond those in county zoning and planning documents.

Commenter No. 64 (cont'd): Mohsen Nazemi, Deputy Director,
Department of Toxic Substances Control

Specific Comments

12. **Section 2.6.3, Page 2-52:** Text states "The Metals Clarifier TCE plume and the RMHF TCE plume concentrations are less than 10 parts per million". Units should be corrected to parts per billion.
13. **Section 2.8.1.4, Page 2-106, Ppgh 3 (Climate Change):** Text indicates, "Peak annual emissions of CO2 would range from about 3,000 to 8,900 metric tons". The upper range for the cleanup to revised LUT scenario (17,000 metric tons) is higher than the upper range for the LUT scenario (8,900 metric tons). Please correct or explain these values.
14. **Section 3.1.1, Page 3-3, Ppgh 5:** Text indicates that Runkle Canyon is to the northeast, but it actually is to the northwest of SSFL. Please clarify or correct.
15. **Figure 3-13, Page 3-23:** Features described in the legend are not consistent with what is depicted in the Figure. For example, underground storage tanks are listed in the key, but are not shown in the figure. In addition, some RFI sites shown in the figure are not listed under the key. Please address for consistency.
16. **Section 3.2.5.3, Page 3-27, Ppgh 4:** The reference cited for "Rocketdyne, 2000" does not appear on DOE's website list of references for Chapters 1 through 8.
17. **Section 3.2.5.4, Page 3-29:** The first paragraph of this section indicates, "The 2010 AOC (DTSC 2010a) addresses soil and bedrock containing chemicals and radionuclides exceeding LUT values." To clarify, section 1.8.4 of the AOC includes weathered bedrock within the definition of "soils".
18. **Section 3.4.2.8, Page 3-45:** The cited reference for CH2MHill, 2008 is presumably intended to address Building 4100, yet the document makes no mention of this building. Please clarify.
19. **Section 3.9.2, Page 3-103, (Public Radiation Exposure):** The second paragraph in this section states that DOE collects air samples and monitors radiation at locations in and around Area IV and the Northern Buffer Zone (NBZ). Please indicate how long DOE has been collecting such radiation monitoring data, and where the public can access it.
20. **Section 3.10.2, Page 3-122: Last Ppgh:** To clarify for the RMHF, an interim status Part A application was accepted and unit was granted interim status, and thus subject to RCRA regulations for Interim Status, which are similar to or more prescriptive than RCRA regulations for permitted units. Reference to "HMHF" is likely a typographical error, and likely should be HWMF.
21. **Section 4.3.1.2, Page 4-39: Last Ppgh:** Refers to rainfall season of December through May, yet section 3.3.1 in the EIS refers to a different period (see page 3-31 of Chapter 3). Please clarify or correct.

Page 4 of 7

64-24

64-25

- 64-16 Chapter 2, Section 2.6.3 of this Final EIS was revised to correct the units for the Metals Clarifier TCE plume and the Radioactive Materials Handling Facility (RMHF) TCE plume concentrations.
- 64-17 The values in the text cited in the comment are correct. Material haul trucks would be the main source of emissions from the proposed combinations of cleanup activities. During the peak year of activities, both scenarios (AOC LUT values and revised LUT values scenarios) propose excavating and transporting the same volume of soil. Under the Cleanup to Revised LUT Values Alternative, all of the soil excavated in the peak year exceeds the risk-based standards for site cleanup. As a result, these soils would be transported to disposal facilities that are further from SSFL and designed to handle higher hazard waste (e.g., out-of-state disposal facilities for radioactive waste). Under the Cleanup to AOC LUT Values Alternative, a large percentage (79 percent) of the excavated soil exceeds LUT values (but not the risk-based standards) and these soils would be transported to facilities that are closer to SSFL. Therefore, the Cleanup to Revised LUT Values Alternative would produce greater peak annual miles travelled by haul trucks and corresponding higher air emissions (including CO2) compared to the Cleanup to AOC LUT Values Alternative. Chapter 2, Section 2.8.1.4 of this Final EIS was revised to explain the reason for the differences in annual greenhouse gas emissions among the alternatives.
- 64-18 The text of this Final EIS was revised to correct this error.
- 64-19 Chapter 3, Figure 3-13 of this Final EIS was revised to correct the noted inconsistencies.
- 64-20 The correct date for the decommissioning and decontamination of Building 4010 and the removal of radioactive material from the building is February 28, 1979 and is best referenced as Rockwell (Rockwell International), 1979, *S8ER Facilities Decommissioning*, February 28. This Final EIS includes text edited to reflect this change and the Rockwell International 1979 reference was added to the list of references and DOE's website, http://www.ssfareaiv.eis.com/ssf_areaiv_eis.aspx.
- 64-21 Chapter 11, Glossary, of this EIS, defines soil as "all unconsolidated materials above bedrock," which includes weathered bedrock.
- 64-22 Building 4100 and the adjacent B100 Trench are discussed in Appendix N of the document Group 5 – *Central Portion of Areas III and IV RCRA Facility Investigation Report, Santa Susana Field Laboratory, Ventura County, California* (CH2M Hill 2008).

Commenter No. 64 (cont'd): Mohsen Nazemi, Deputy Director,
Department of Toxic Substances Control

22. **Section 4.4.3, Page 4-48, Pgph 3:** The text states *"The three groundwater remediation alternatives—Groundwater No Action, Groundwater Monitored Natural Attenuation, and Groundwater Treatment—would all positively affect the quality of groundwater resources."*

This statement may be the result of the standard language used in the Draft EIS, however, the determination that the No Action alternative has any effect, let alone a positive effect, is not supported. The statement should be modified.

23. **Section 4.11, Page 165, Pgph 2** -This paragraph fails to mention that DTSC would have discretion (in coordination with the SSFL Native American Council - NAC) over whether a listed or eligible resource would be handled under the exemption.

24. **Section 4.11, Page 165, Pgph 4** – Please indicate if all resources overlapping with clean up areas were tested such that eligibility for each listing could be determined.

25. **Section 4.11, Page 165, Pgph 5** – Please revise the text to include that NASA has determined this resource to constitute a Traditional Cultural Property (TCP).

26. **Section 4.11.1, Page 166, Table 4-75 (Archaeology Cleanup Alternatives)** - No historic properties affected for archaeology means that there will be no eligible or listed archaeological sites impacted whatsoever. The text should acknowledge that DTSC has discretion in applying the exemption. Also, the assertion that there will be no impacts to archaeological resources is contradicted in the TCP entries where it states there is potential discovery of unanticipated archaeological sites.

27. **Section 4.11.1.2, Page 167, Pgph 2** - According to records not all sites within clean up areas were subject to XP1 testing. Please confirm or correct.

28. **Section 4.11.1.2, Page 167, Pgph 4** – The text mischaracterizes the AOC, which allows DTSC, in coordination with the NAC, to exercise discretion. It is not a blanket exception. Please revise the text.

29. **Section 4.11.1.2, Page 167, Pgph 4** - Archaeological resources should be evaluated under more than just Criterion D especially in the context of a TCP. This evaluation of eligibility is insufficient for Section 106 and CEQA.

30. **Section 4.11.1.2, Page 167, Pgph 4** - This section (Cleanup to AOC LUT Values) fails to address archaeological resources discoveries. Please revise the text.

31. **Section 4.11.1.2, Page 168, Pgph 1** – The text infers that archaeological resources could be evaluated on information potential alone. This would be an error in approach. Please revise the text.

64-26

64-27

64-28

64-29

64-30

64-31

64-32

64-33

64-34

64-35

64-23 DOE issues annual site environmental reports that can be found on the Energy Technology Engineering Center website at http://www.etc.energy.gov/Environmental_and_Health/Enviro_Monitoring.php. Additionally, Boeing, NASA, and DOE jointly issued an Offsite Data Evaluation Report in December of 2007 in which they evaluated the data collected from 18 field sampling and analysis events within 15 miles of SSFL over the past 60 years (MWH 2007). This reference is discussed in Section 2.7, "Offsite Impacts," of this CRD.

64-24 Chapter 3, Section 3.10.2, of this Final EIS was revised to reflect the correct regulatory status of RMHF and to correct the abbreviation for HWMF.

64-25 The rainfall season typically starts by mid-October and ends by mid-April, but there are variations in this pattern year to year. Chapters 3 and 4 of this Final EIS were revised to present a consistent discussion of the rainfall season.

64-26 As explained in Chapter 4, Sections 4.4.3.1, 4.4.3.2 and 4.4.3.3, there are some circumstances under which groundwater quality continues to improve under each alternative. For example, tritium will continue to decay (i.e., concentrations will continue to decrease) regardless of any actions taken. Under other instances, the source of contamination would need to be removed to improve the groundwater quality. Chapter 4, Section 4.4.3, of this Final EIS, includes revisions to more explicitly discuss how groundwater quality is impacted in each alternative.

64-27 As the commenter notes, determination of exemption areas will be coordinated through DTSC and consulting parties. The cultural resources sections in this Final EIS were revised to reflect this process. Please also see Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a discussion of the process that was used to determine exemptions.

64-28 All sites overlapping with potential cleanup areas were tested to establish National Register of Historic Places (NRHP) eligibility. Ten sites were tested. The sites were chosen based on: the extent of the contamination known at the time the testing program was designed and consultation with the Sacred Sites Council. The Office of Historic Preservation and the SSFL Sacred Sites Council reviewed the testing program research design and approved it. This Final EIS clarifies the extent of testing.

64-29 This Final EIS was revised to clarify that NASA has determined that there is a traditional cultural property at SSFL, and to update the status of the NRHP nomination of the resource there.

Commenter No. 64 (cont'd): Mohsen Nazemi, Deputy Director,
Department of Toxic Substances Control

- 32. **Section 4.11.1.3, Page 168, Ppgh 2** – The text largely dismisses the potential for archaeological discoveries and follows with statement that "No historic properties would be affected". Provide explanation on how this is possible.
- 33. **Section 4.11.2.2, Page 170, Ppgh 3** - NEPA requires analysis of impacts to "cultural resources" whether they qualify as "historical properties" under the NHPA or not. The State Historic Preservation Officer's concurrence under 106 does not change this NEPA requirement.
- 34. **Section 4.11.2.2, Page 170, Ppgh 5** - Same as previous. Section is analyzing only impacts to "historic properties". This does not meet the NEPA requirement.
- 35. **Section 4.11.5, Page 174** - Which similar criteria for NEPA? NEPA requires consideration of "cultural resources" not limited to the NHPA.
- 36. **Section 4.11.5, Page 174** – The documents should acknowledge that resources may not be able to be avoided, both those we already know about and those that may be discovered. Coordination with the NAC will be of critical importance to address the issue.
- 37. **Table 6-1 Measures to Minimize Impacts of Demolition and Remediation Activities at Santa Susana Field Laboratory and the Northern Buffer Zone; Item 3-2.** *"The long-term groundwater monitoring program will be similar to the interim groundwater monitoring program now in place."*

 Although the DTSC does not currently anticipate extensive changes in the existing groundwater monitoring program, there will be modifications based on the final remedies selected for the site. The extent of these modifications is unknown and will be determined based on the long term data needs only after final groundwater remedies are selected.

"The site contractor will verify these actions to DTSC in semiannual groundwater monitoring reports submitted by DOE."

 The text needs to include a statement that although the current groundwater monitoring program requires semiannual groundwater monitoring reports, this can be modified as needed and directed by DTSC.
- 38. **Section 7.2.3, page 7-17; 1st Ppgh**: Text States: *"All the soil remediation action alternatives, the Building Removal Alternatives, and the Groundwater Treatment Alternative would require replacement of soil with backfill (including topsoil) obtained from offsite sources."*

 The text should specify if soil replacement would be necessary for the Groundwater Treatment Alternative. Appendix B states, *"There would be no soil disturbance from the installation of groundwater treatment systems. Treatment systems would be constructed primarily on existing concrete pads and asphalted"*

64-36

64-37

64-38

64-39

64-40

- 64-30 As the commenter notes, determination of exemption areas will be coordinated through DTSC and consulting parties. The cultural resources sections in this Final EIS were revised to reflect this process. Please also see Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a discussion of the process that will be used to determine exemptions. Because DOE cannot know if there will be inadvertent discoveries in cleanup areas, DOE cannot assert that there will be impacts. The text was clarified to indicate that impacts are possible to archaeological resources if it is necessary to cleanup a site to protect human health and the environment, or if previously unknown sites are located. The text was revised to more clearly differentiate between archaeological sites that are not eligible for listing on the NRHP and historic properties.
- 64-31 As noted in the response to comment 64-28, all sites overlapping with potential cleanup areas were tested to establish NRHP eligibility.
- 64-32 The determination of exemption areas will be coordinated through DTSC, which DOE has been coordinating with on this matter since 2012, and the other consulting parties. The cultural resources sections in this Final EIS (Sections 3.11 and 4.11) were revised to reflect this process. Please also see Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a discussion of the process that will be used to determine exemptions.
- 64-33 The text in this Final EIS was revised to note the other NRHP eligibility criteria. Please refer to Appendix B, Section B.11, Environmental Consequences Methodology, for a discussion of cultural resources analysis methods.
- 64-34 The commenter is correct that Chapter 4, Section 4.11.1.2 of the Draft EIS did not specifically discuss inadvertent finding of archaeological resources during cleanup. Therefore, Sections 4.11.1.2, 4.11.1.3, and 4.11.1.4 of this Final EIS were revised to address inadvertent discovery of cultural resources during cleanup activities.
- 64-35 This wording may have been ambiguous. The text of Chapter 4, Section 4.11.1.2, of this Final EIS was clarified to remove the ambiguity.
- 64-36 The text in this Final EIS was revised to indicate that impacts on archaeological resources could occur if previously unknown sites were located, and to differentiate between archaeological sites that are not eligible for listing on the NRHP and historic properties.
- 64-37 DOE addressed impacts on historic properties (as defined by NHPA) and cultural resources (as intended in NEPA); the SHPO determination was just part of the impact analysis. Chapter 3, Section 3.11 defines cultural resources for the purposes of this

Commenter No. 64 (cont'd): Mohsen Nazemi, Deputy Director,
Department of Toxic Substances Control

ground. Any required piping (for groundwater or pressurized air) would be above ground."

64-40
cont'd

39. **B.2.3.2 Methods Used to Analyze and Quantify Impact; B-8; Pgph 14:** The text states, "There would be no high-pressure injection of treated groundwater or groundwater amendments."

64-41

All groundwater remediation technologies need to be evaluated in the Corrective Measures Study, therefore this statement should be removed.

40. **B.2.3.2 Methods Used to Analyze and Quantify Impact; B-9; 1st Pgph:** The text states, "The soil immediately above the strontium-90-impacted sandstone would be removed, stockpiled, and replaced as backfill after the contaminated sandstone is removed."

64-42

The basis for determining that the excavated soil will be consistent as backfill under the AOC needs to be provided.

41. **Page C1-9.** The following is stated in the table, "Install long-term monitoring wells, including at the base of the Santa Susana Mountains where they intersect with the Simi Valley alluvium to detect migration of contaminants." Should this state "at the base of Simi Hills" instead of "Santa Susana Mountain"?

64-43

42. **Table D-3, Page D-12:** Footnote 5 of this table states, "For locations where TPH is the sole constituent, a cleanup strategy will be considered based on the findings of a soil treatability study, and the soil will be cleaned to the 5 milligrams per kilogram LUT value". Based on findings of the Soil Treatability Studies, it was concluded that TPH analytical limitations plus the presence of naturally occurring organic materials at the LUT level (5 mg/kg) may make cleanup to this level very difficult. Biotreatment to accelerate natural degradation of these constituents may prove useful, however DTSC retains authority and jurisdiction to direct additional actions over any areas where monitored natural attenuation or biotreatment is part of the proposed remedy. DTSC will consider the cleanup actions ability to achieve the cleanup values and timeliness to complete cleanup when evaluating cleanup methods.

64-44

43. **Section D.6.1, Page D-37:** The past paragraph indicates that commercial laboratories have indicated to DOE that they could meet USEPA Laboratory A MDCs, but would have difficulty achieving Lab B MDCs. While no documentation is cited, it is noted that Laboratory B MDCs are an analytical target, and USEPA recommended a process for procuring analytical laboratories that includes a rigorous demonstration for achieving measurement quality objectives and programmatic needs (HGL, 2012).

64-45

44. **RMHF Leach Field Bedrock Excavation, page D-82:** There is no mention of using overburden soil as backfill as stated previously in the document. This should be addressed in the document.

64-46

Final EIS; Appendix B, Section B.11 explains in detail the methodology employed in analyzing environmental consequences for cultural resources, including determination of impact thresholds (an adverse effect on a resource that alters the historical/cultural significance of the resource) for both historic properties (including traditional cultural properties) as defined in 36 CFR 800.16(l), as well as cultural resources that may not be eligible for listing on the NRHP, and sacred sites.

64-38 Chapter 4, Section 4.11.6, of this EIS states that the impact threshold may be met, resulting in potential adverse impacts. It also specifies that if mitigation is required, it would be determined through consultation and agreement with the State Historic Preservation Officer, the Santa Ynez Band of Chumash Indians and non-federally recognized tribes. Mitigation requirements will be further described in the Programmatic Agreement developed under consultation with these parties.

64-39 Chapter 6, Table 6-1 of this Final EIS includes revised text indicating that the frequency of the groundwater monitoring reports may be modified as needed by DTSC.

64-40 As described in Chapter 4, Section 4.4.3.3 of this Final EIS, removal of the subsurface bedrock impacted by strontium-90 is one treatment technology considered in this EIS for the Groundwater Treatment Alternative. If this treatment technology is chosen and implemented, the resulting excavation would need to be backfilled. For purposes of analysis in this EIS, DOE has estimated that 2,300 cubic yards of backfill soil would be needed to fill this excavation.

64-41 Appendix B, Section B.2.3.2 of this Final EIS was revised to remove the statement that there would be no high-pressure injection of treated groundwater or groundwater amendments.

64-42 The basis for determining acceptability of the backfill soil at the Sr-90 location would be the same as the basis for all other backfill soil (Confirmation Protocol section of the AOC).

64-43 The Table in Attachment C1 is a tabulation of the alternative concepts developed by those attending the Alternatives Development Workshop. DOE's intent is to present the information as it was developed and provided by workshop participants; however, to clarify the assumed intent, Simi Hills was added in brackets. Note that DOE's current plans do not include installation of wells at the base of the Simi Hills. As shown in Chapter 2, Figure 2-11 of this Final EIS, groundwater within the scope of DOE's cleanup responsibilities that exceeds drinking water limits remains in Area IV and the NBZ. Groundwater monitoring wells outside of Area IV and the NBZ would be considered if future monitoring data indicates groundwater with concentrations exceeding action criteria is moving off site.

Commenter No. 64 (cont'd): Mohsen Nazemi, Deputy Director,
Department of Toxic Substances Control

- 64-44 DOE recognizes DTSC's authority under the 2010 AOC for the TPH matter. DOE encourages DTSC to review the TPH criterion and consider the soil data to adjust the LUT value for TPH. Natural attenuation is not necessary for locations where the TPH source is decaying organic matter. The issue is not facilitating degradation of soil contaminants, the issue is with LUT values that reflect actual contamination and are set at concentrations the can be achieved using methods such as bioaugmentation.
- 64-45 In July 2012, DOE submitted to 17 radioanalytical laboratories, a request for information regarding normal and enhanced minimum detectable concentrations (MDCs) for 15 radionuclides. These were the radionuclides reported by EPA to exceed their field action levels (also termed trigger levels) as a result of its study of Area IV. Responses were received from 14 radioanalytical laboratories. The results were compared to the surface background values and to the EPA trigger levels. The evaluation was documented in a Technical Memorandum *Summary of Responses to DOE's Request for Information from Laboratories Regarding Detection Limits* (Rucker 2012). Even Laboratory B was unwilling to commit to MDCs that would meet the Laboratory B-based LUT values, even under enhanced request conditions that would cost extra.
- 64-46 Chapter 4, Section 4.4.3.3, of this Final EIS has been revised to note that existing overburden could be used to partially backfill the excavated bedrock if the existing overburden could meet the AOC LUT values. Additional fill would be required to bring the excavation back to grade, assuming that this material would meet 2010 AOC LUT values. Appendix D, Section D.6.5 of the EIS provides additional details regarding the bedrock removal action.

Commenter No. 65: Bruce M. Rowe,
Professor Emeritus of Anthropology, Los Angeles Pierce College

Ms. Stephanie Jennings
NEPA Document Manager, SSFL Area IV EIS
U.S. Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 93063

Re: DOE DEIS

I believe that the Santa Susana Field Lab should be cleaned up based on a scientifically determined risk based standard. I am not familiar with any convincing epidemiological evidence of current off-site risk from the site. Some residents of the areas surrounding the site see their cancers or the cancers of family members or other residents of their neighborhood as evidence of cancer clusters. Some also believe that the cancers were caused or might have been caused by pollution from the SSFL site. Those beliefs are not currently supported by scientific evidence. Many of the reported cancers are known to be or suspected to be primarily the result of genetic factors and others could have a variety of environmental triggers, such as general air pollution, household pollution due to the use of carcinogenic chemicals such as household cleaning products, insecticides, herbicides, formaldehyde, and hundreds of other chemicals that one might come into contact with over time. Naturally occurring radon is also a potential carcinogen present in much of the area within a ten-mile radius of the SSFL.

The **belief** that a specific cancer is caused by pollution originating at the SSFL is **not evidence that it was the cause** of that specific cancer. Cause and effect is very difficult to prove scientifically in an illness such as cancer. Many possible variables could be involved with the origin of a specific cancer. Individual stories (anecdotes) can be used to generate hypotheses that might be able to be tested scientifically. However, with so many types of cancers and other illnesses being suspected by residents living both near and not so near to the SSFL, it is hard or impossible to control the variables. People with the cancers have been in the area for varying amounts of time. Whether they were or were not exposed to a carcinogen from the SSFL might be impossible to determine. And if they were exposed, the degree of and dosage from any exposure is impossible to know.

What we do know is that once someone believes something strongly, it is difficult for that person to alter their opinion even when evidence is presented that clearly places doubt on their beliefs. There are many psychological factors at work. One is called confirmational bias. This is the behavior of automatically rejecting any evidence that contradicts a belief and automatically accepting information that reinforces the belief, no matter how illogical or unscientific that evidence might be. Advocates, activists, and politicians who lead movements can and often do use their standing in society to keep that bias active. Some of these people create a false belief in their competence or

65-1

65-1

DOE acknowledges your support for a scientifically determined risk-based standard for cleanup at SSFL. DOE's purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

65-2

65-2

Thank you for your comment. Please see Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for additional information. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 65 (cont'd): Bruce M. Rowe,
Professor Emeritus of Anthropology, Los Angeles Pierce College

qualifications to make scientific and other types of conclusions. This is very true among the proponents for the strictest possible cleanup of the SSFL.

The cleanup at the SSFL should be risk based and that risk should calculate the possible risk from the cleanup itself. That is, what risks to health and to the physical and cultural environment will the cleanup present. In terms of health, the question should be asked: Will a certain level of cleanup potentially cause more health problems than it would eliminate? For instance, would the removal and transportation of close to one million cubic yards of soil, and that is from the DOE site only, create an offsite risk of exposure greater than not removing that amount of soil? Digging up soil in which low level pollutants are locked in place in the soil and then the cleanup making them friable could release them into the air where they could travel a great distance. The health risk could be greater and to a larger population than leaving them in place or remediating them in place in a way that does not create a potential problem. Transporting such soil also has numerous risks, such as spills. Those risks increase with higher level pollutants, which should be removed from the site, but under strict safety protocols. Along are we not just shifting the risk from one community to the community where the soil is being taken?

The end use of the site needs to be considered. For instance, if the end use of the site is not going to be agricultural, then why should the site be cleaned up to an agricultural or higher standard? And if it is determine through scientific studies that there is no chance of any remaining pollutants affecting off site agricultural areas at levels that are dangerous to human health, again why should the site be cleaned up to an agricultural or higher standard?

If the site is cleaned up to the highest standard, the cost to the physical environment and the cultural resources at the site could be cataclysmic. And this disruption might have been done while yielding no public health benefits at all. In fact, the destruction of a valuable wildlife corridor, watershed, living space and breeding ground for a wide variety of animals and plants, could have a negative effect on the "health" of the ecosystem which could affect human well-being both in the short and long term.

The effect on the cultural resources of this area, which has been an area of human activities for thousands of years, could be significant and of course irreversible. Your document lists the known archeological sites on the property. It is highly probable that there are numerous undiscovered sites. Even if the known sites are protected during the cleanup, it is reasonable to predict that some—perhaps many, undiscovered sites will be destroyed. Also, destroyed would be the cultural context potentially provided by those unknown sites, once they had been discovered and analyzed. The strictest cleanup could remove information important to the understanding of the prehistory of the area and information important to the self-esteem and other factors related to the social and psychological well-being of current native peoples. And again, this loss could be done with no known benefit to public health.

65-1
cont'd

65-3

65-4

65-5

65-6

65-7

65-6
cont'd

- 65-3 DOE agrees with placing a high priority on health and safety and remains committed to protecting the health and safety of current and future users of the site and of the residents in the surrounding communities regardless of which alternative is selected. By evaluating a range of reasonable alternatives for remediation of the soil in Area IV and the NBZ, DOE is providing data so that the public and the decision-maker can make a comparative evaluation of the positive and negative impacts of different cleanup levels.
- 65-4 As discussed in Chapter 3, Section 3.10.3 of this Final EIS, waste would be disposed of in offsite facilities, including nonhazardous waste landfills, hazardous waste landfills, and LLW and MLLW disposal facilities. Some nonhazardous material may be sent to appropriate recycling facilities. The hazardous waste landfills and LLW and MLLW disposal facilities are specifically engineered to permanently retain the waste and prevent exposure of the surrounding community to hazardous materials. Each facility has waste acceptance criteria (WAC) that ensure meeting this objective. The removed soils will be characterized to make sure they meet the WAC. This contextual information has been added to Section 3.10.3 of this Final EIS.
- 65-5 In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. At a minimum, DOE soil cleanup would remove soil contaminants to concentrations safe for future use of Area IV as open space.
- 65-6 DOE recognizes the breadth of resource values in Area IV and the NBZ; this recognition is reflected in the range of alternatives DOE developed and analyzed, which allows a comparison of impacts among the various resource areas, including cultural resources.
- 65-7 As stated in Chapter 3, Section 3.1.1.1, of this EIS, SSFL provides a valuable wildlife corridor and discussed in the Environmental Consequences under Recreation "SSFL sits within a rare and vital wildlife corridor connecting the Sierra Madre Ranges of the Los Padres National Forest to the Santa Monica Mountains and the Pacific Ocean. Termed the Santa Monica - Sierra Madre Connection and comprising approximately 125,000 acres, the corridor consists of sandstone cliffs, oak woodlands, and scrub and meadows, with valley and mountain vistas. Several formally designated open space areas are located within close proximity to SSFL and are a part of this unique corridor" and

So, I ask you to consider your actions wisely and carefully, balance the pros and cons of each action that you take in terms of their short and long term effects.

Sincerely,
Bruce M. Rowe
Professor Emeritus of Anthropology
Los Angeles Pierce College
April 12, 2017

|| 65-8

as stated in Chapter 3, Section 3.5.1, of this EIS “The SSFL site is located along the crest of the Simi Hills and is a part of the linkage design (South Coast Wildlands 2008) or wildlife corridor that provides wildlife passage from the Santa Monica Mountains to the south through the Simi Hills and Santa Susana Mountains to the Sierra Madre range to the north (Penrod et al. 2006). Mammals such as bobcat, coyote, mountain lion, and deer pass through the open space areas of SSFL.” Text has been added that discusses the potential impacts to the valuable wildlife corridor, watershed, living space and breeding ground for a wide variety of animals and plants, and effect on the “health” of the ecosystem. The ability of Area IV and NBZ to serve as important habitat for wildlife will remain and the cleanup activity will be implemented in a manner that will reduce impacts to biological resources and maintain the health of the ecosystem, while remaining safe for humans.

65-8 DOE acknowledges your comment.

Re: NASA Comments on the Department of Energy Santa Susana Field Laboratory Area IV Draft
Environmental Impact Statement

Dear Ms. Jennings,

Thank you for the opportunity to review and comment on the Department of Energy's Draft
Environmental Impact Statement for "Remediation of Area IV and the Northern Buffer Zone of the
Santa Susana Field Laboratory." Enclosed is a comment matrix that lists the National Aeronautics
and Space Administration's comments.

If you have any questions regarding our comments, please contact me at [REDACTED] or

Sincerely,

Peter Zorba
NASA Project Director
Santa Susana Field Laboratory

NASA Comments on DOE SSFL EIS

Official NASA Comments on DOE SSFL EIS						
Number	Page Number	Section/Figure	Location	Commenter	Resource/Location	Comment
1	S-2	S.2		NASA	Summary Document	The proposed activities may be more acceptable to involved stakeholders if there was reference to past activities (taking responsibility), and the suggestion that DOE is cleaning up not only because it's required but also because it's the "right thing" to do.
2	S-6	S.4	Paragraph 2	NASA	Summary Document	When discussing DOE activities in locations other than Area IV, please add a reference that NASA is not responsible for any radiological contamination, either in the NBZ or elsewhere onsite.
3	S-19	S.19.2.2	1st paragraph (under table)	NASA	Summary Document	It would be good to describe more about MNA and also provide context on health and safety rationale for why it was selected, i.e., weighed pros and cons of treatment vs MNA and more aggressive treatment.
4	S-21	S.19.2.2	Paragraph 2	NASA	Summary Document	Again, some context as to what MNA means in terms of health and safety would have been useful from a public risk perception perspective.
5	S-29	S.19.2.2	Paragraph 4	NASA	Summary Document	Under "Range of Alternatives" it may be good to reiterate that a No Action alternative analysis is required by NEPA (even though it may not be "reasonable"). DOE may want to limit its action requirements to areas impacted by their operations. NASA characterized portions of the NBZ where a release occurred from operations that were performed within Area II and would have migrated into the NBZ which is primarily in the drainage ways. These areas are shown in the Soil Data Summary Report (SDSR) as Estimated Remediation Areas (ERAs). Also, due to the low values for some constituents in the Look-up Table, NASA extended some of the ERAs and show them as Extended Remediation Areas in the DSR.
6	1-1	1.1		NASA	Section 1	It is NASA's understanding that there is backfill available that meets LUT requirements. However, this fill would not be suitable for use as top soil, as it is expected to be essentially sterile and would require soil amendments that could exceed LUT requirements.
7	2-1	2.1		NASA	Section 1	It is unclear how certain DOE is that the "Approximately 833,000 cubic yards of soil", represents a known quantity. Is this a median or the extent of a range? It is NASA's understanding that a cleanup to AOC LUT levels would generate significant volumes of AOC impacted soil.
8	2-17	2.3.2		NASA	Section 2	In the description of SVE, DOE refers to bedrock (above water level) as containing VOCs. NASA conducted a study on Bedrock Vapor Extraction (BVE). Suggest that BVE be discussed here too and reference NASA study here (or elsewhere that's appropriate).
9	2-63	2.6.3		NASA	Section 2	In Archaeological Resources, suggest deleting "from impacts (i.e. adverse effects)". The 2014 PA intends to minimize impacts, but it does not protect resources from impacts. It would be clearer to simply state the sites "would be protected".
10	2-123	Table		NASA	Section 2

66-1

66-2

66-3

66-4

66-5

66-6

66-7

66-8

66-9

66-1 The Summary, Section S.2, of this EIS, correctly addresses the purpose and need for DOE to take action to remediate its portion of SSFL. It notes that the cleanup is to be protective of the environment and the health and safety of the public and workers. The prior section, Section S.1, acknowledges that there are residual chemicals and radionuclides from historical operations in Area IV.

66-2 NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In accordance with this requirement, DOE is evaluating its proposed activities for remediation of SSFL Area IV and the NBZ in this Final EIS. Remediation of the entirety of SSFL is being performed as required by the August 16, 2007, Administrative Order for Corrective Action (CO) signed by DTSC, Boeing, NASA, and DOE. (The requirements in the 2010 AOC signed by DTSC and DOE supersede the 2007 CO for soils.) These parties have taken responsibility for remediation of areas in which they conducted operations or in which their activities may have contributed to contamination. As indicated in Chapter 1, Section 1.3, of this EIS, DOE shares responsibility with NASA for cleanup of soils in the NBZ; NASA is responsible for cleanup of contamination in the NBZ that emanates for areas that it administers. DOE also shares responsibility with Boeing for groundwater remediation in Area IV and the NBZ, as defined in the 2007 CO. Consistent with Section 1.7 of the 2007 CO, responsibility for cleanup does not admit fact, fault, or liability for any contamination. Therefore, addition of the requested disclaimer is not necessary, nor is it within DOE's purview to make such a statement.

66-3 In this Final EIS, the use of Monitored Natural Attenuation for low concentration TPHs in soil is included in all of the soil remediation Action Alternatives. Based on soil treatability studies, it was concluded that some of the soil characterized as exceeding TPH contains naturally occurring organic material and that accurately detecting TPHs at low concentrations is problematic. Both of these factors make concentrations of TPH appear higher than those attributable to petroleum-based origins (Nelson 2015d; DTSC 2018). Soil treatability studies also concluded that natural attenuation will be able to reduce TPH concentrations adequately given sufficient time (it would take an estimated 70 years for concentrations to degrade below the AOC LUT values) (CDM Smith 2015b; Nelson 2015a) Chapter 2, Section 2.3.2, of this EIS provides information on the use of MNA as a treatment option. In the various resource impact analyses presented in Chapter 4 of this Final EIS, DOE has provided additional details on the implementation and potential future risks that MNA would pose to the community. Chapter 2, Table 2-9, of this Final EIS, allows a comparison among the impacts of the Soil Remediation Alternatives. Since MNA is included in all of the Soil Remediation Action Alternatives, the impact to human health is included in the

National Aeronautics and Space Administration**

NASA Comments on DOE SSFL EIS

Page Number	Section/ Figure	Location	Commenter	Resource/ Location	Comment
11	3-77	3.6.1.2	Full Paragraph	NASA	Air Quality DOE indicates that "winds at SSFL prevail from the northwest and southeast quadrants". This differs from NASA's wind rose, which suggested that the majority of winds blow from the southwest. This difference is likely due to DOE and NASA using two different locations for collecting meteorological data. However, this difference may cause public concern as it offers a different perspective on where air pollutant concentrations may be dispersed from the site.
12	3-103	3.9.2	Second Paragraph	NASA	H&S There seems to be some detail missing here. Who consults "a person visiting Area IV" and what is the expected length of stay? Seems subjective to state their radiation exposure would be 1/2 of a worker, without providing the detail. Perhaps at a minimum a reference to appendix G can be made.
13	3-136	3.11.2.3.2 Table 3-51 and App F		NASA	cultural Please include NASA 2015 and 2016 archaeological studies in this discussion.
14	3-141	3.11.2.3.4		NASA	cultural TCP - Please include a statement that NASA and DOE partnered on an ethnographic study which will be used on the basis for nomination of the TCP and that NASA is coordinating with DOE to evaluate and define an eligible archaeological district.
15	4-45	4.3.5	Second paragraph; third sentence (starting with "Under the Soil No Action...")	NASA	Surface Water Clarify why this is different from the soil remediation alternatives: assume it's because of the "additional mitigation measures that would 'heavily forestall this risk.'"
16	4-59	4.5.1.2.1		NASA	Biology Are there any potential adverse impacts to recognized wildlife migration corridors? What about increased traffic within these corridors?
17	4-59	4.5.1.2.1		NASA	Biology Vegetation and Wildlife Habitat and Biota (LUT Clean up): There seems to be a lack of discussion of the effects of radiological and chemical contamination on wildlife. NASA considered this, showing some benefit to predators; however, this benefit did not weigh the benefit of clean up.
18	4-61	4.5.1.2.2		NASA	Biology Aquatic and Wetland Habitat and Biota: There is a reference to potential compensatory mitigation, based on CWA, but there is no discussion of any other CWA permit requirements. Please explain the DWA consultation that has occurred to date. Will a 404 permit be required, and if so, is there an understanding of the level of permit (NWP vs. SP)?
19	5-4	Table 5-1		NASA	Cumulative Under "Backfill for Building Removal", please confirm that the quantity is not included as part of the soil back fill. If so, please restate the "Net Provider" as appropriate. As currently written, it implies NASA was planning to share information.
20	5-4	Table 5-1		NASA	Cumulative In areas that state "not provided" for bed rock removal, please restate to "not applicable". These numbers were not provided, because NASA is not removing bedrock and were not relevant.
21	5-4	Table 5-1		NASA	Cumulative It would be beneficial to define the unit of measure in the "Total" row.
22	5-11	5.5.2		NASA	Cumulative (Geology) Please add a statement in this section that explains NASA's SRPs to mitigate erosion of soils on slopes. This comment applies throughout the section. Please be sure to reference NASA's efforts to mitigate impacts where applicable.
23	5-14	5.5.5 and Table 5-2		NASA	Cumulative (Biology) Please reference the fact that NASA is also working on appropriate exemption areas, which would reduce the impact to sensitive areas. Also, please mention, NASA has agreed to mitigation measures which would reduce impacts to defined sensitive areas and Oak habitat.

overall impact from each alternative. The human health impacts associated the low concentration TPH soil would be a fraction of the impacts of each alternative. A separate analysis of the impacts associated with actively removing low concentration TPH soils was not performed.

66-4 The purpose of the paragraph is to demonstrate DOE's responsibility for evaluating other action alternatives beyond the Cleanup to AOC LUT Values Alternative. Although the No Action Alternative is in the range of alternatives, the intent of the discussion is directed towards the range of reasonable action alternatives that should be included in this EIS.

66-5 The commenter is correct that there are areas of the NBZ for which DOE is not responsible. This is made clear in other sections of this Final EIS. For example, Chapter 1, Section 1.0 states that the NBZ is included to ensure that any soil contamination contiguous to and emanating from Area IV is evaluated in this EIS. Further, Section 1.3 states that DOE shares responsibility with NASA for cleanup of soil in the NBZ and that NASA is responsible for cleanup of contamination in the NBZ that emanates from areas that it administers.

66-6 As NASA has indicated, the results of soil tests from multiple possible offsite backfill locations in the region found that materials at these sites are predominantly a sand-and-gravel mixture with no materials capable of restoring excavated areas at SSFL to pre-cleanup conditions (NASA 2017). DOE agrees that such backfill would not support native plant growth without amendment. As described in Chapter 2, Section 2.3.3, of this EIS, DOE is also aware that amended backfill soil would likely not meet all 2010 AOC LUT limits as all soil amendments tested by DOE did not meet these limits. As described in Section 2.4 of this EIS, under the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resource Alternative backfill soils that meet the higher soil contaminant concentration limits (revised LUT values and risk-based limits, respectively) should be easier to locate. But even with the limits of these revised soil concentration values, backfill soil should still have similar physical, chemical, and microbial characteristics, preferably without the use of soil amendments, that could support re-establishment of native vegetation.

66-7 The 881,000 cubic yard volume (the estimate was revised for in the Final EIS) is based on GIS (geographic information system) determinations of contamination above 2010 AOC LUT values as described in Chapter 2, Section 2.3.2 and Appendix D of this EIS. This volume includes assumed reductions for biology/cultural exemptions and monitored natural attenuation of TPH in soils. DOE's estimated total volume that does not include the reductions through the application of exemptions and TPH attenuation

**Commenter No. 66 (cont'd): Peter Zorba, NASA Project Director,
National Aeronautics and Space Administration**

NASA Comments on DOE SSFL EIS

Number	Page Number	Section/ Figure	Location	Commenter	Resource/ Location	Comment
24	5-18	5.5.5		NASA	Cumulative (Biology)	Discussion of regional movement of wildlife was not included in the Environmental Consequences section. If this is a viable impact, it should be first explained in Section 4.0, new impacts should not be introduced in Cumulative Impacts. Furthermore, there is no specific discussion of mountain loon, bobcat and raptal in Section 4.
25	5-18	5.5.5		NASA	Cumulative (Biology)	There seems to be a disconnect between the cumulative impact section, and the Section 4.0 Biology Section (note detailed discussion of SSTEP). This cumulative analysis shows a much more species specific approach, where Section 4.0 was higher level. The level of analysis should be consistent between the sections.
26	5-18	5.5.5		NASA	Cumulative (Biology)	NASA has also identified mitigation measures to protect biological resources. They should be referenced here as well. Specifically, NASA has a Biological Opinion and a ROD that include mitigation and SMPs for roo management, revegetation, threatened and endangered species management, and seed mix.
27	5-18	5.5.6		NASA	Cumulative (Air quality)	This current language is confusing and should be revised. The wind rose direction is somewhat subjective. NASA used multiple wind rose scenarios in its analysis. Please remove the following sentence "The wind direction would result in the shortest transport distance of cumulative cleanup emission to the SSFL fence line (about 3,300 feet from the NASA source in Area II) to the fence (in) and, therefore, potentially the highest offsite pollutant impacts of any wind direction". As it implies that this is a known fact, but NASA does not agree. Also it is not warranted in a cumulative impact analysis, which should focus more on the potential combined impacts with DOE actions, not just the impacts from other agencies.
28	5-21	5.5.7		NASA	Cumulative (Noise)	In paragraph 2, please clarify that truck trips are limited to 96 PER DAY. Also again in the second to last sentence.
29	5-24	5.5.8.1		NASA	(Transportation)	Table 5-8: NASA did not calculate a corresponding number of transportation fatalities. The number in the table is a DOE number attributed to NASA. Please make sure that is made clear.
30	5-25	5.5.8.2		NASA	(Transportation)	NASA did not calculate ESALs. The number of ESALs seems to be a DOE number attributed to NASA. Please make sure that is made clear.
31	5-25	5.5.8.2		NASA	(Transportation)	Pavement Deterioration: please give temporal time frame for "truck shipments" in the first sentences.
32	5-27	5.5.9		NASA	(Health)	Human Health: Please clarify that there is no potential radiation exposure from NASA activities.
33	5-31	5.5.11.2		NASA	Cumulative (Cultural)	"Of particular note are those structures that lie in one of NASA's three historic districts (the A1b, Bravo, and Coca Test Areas). NASA proposes to preserve one or more NRHP-eligible structures, but demolition of other selected structures could have an adverse impact on the NRHP-listed or eligible built environment and would contribute to the cumulative effect on this resource type in the vicinity of SSFL." Please delete these sentences. These resources are unique to NASA and impacts to them do not represent a cumulative concern, as DOE actions would not effect these resources.
34	5-31	5.5.11.1		NASA	Cumulative (Cultural)	It is unclear how this analysis explains the cumulative impact. It appears to be the impact from DOE activities only. In order for there to be a cumulative effect the DOE activity would need to combine with one of the other cumulative activities.
35	5-35	5.5.13		NASA	Cumulative (EJ)	Paragraph 4: Please clarify that there is no potential radiation exposure from NASA activities.

is 1,616,000 cubic yards. All of the estimates in this EIS include significant uncertainty, with a range of -30/+20 percent applicable to each estimates.

66-8 For the fractured bedrock conditions tested by NASA, NASA was able to remove 30 pounds of TCE In assessing the groundwater treatment options in this Final EIS, the findings of the Results from Bravo Bedrock Vapor Extraction Treatability Study (CH2M Hill 2015) were considered. However, the discussion of the groundwater treatment options, including soil vapor extraction, is based on the *Draft Area IV RCRA Corrective Measures Study* (CDM Smith 2018b) which was completed after the issuance of the Draft EIS. The text of this Final EIS, Chapter 2, Section 2.6.3, was revised to incorporate the findings of the remedy evaluations.

66-9 The text in Chapter 2, Table 2-12, in the section titled "NASA and Boeing Contribution to Cumulative Impacts," was revised as suggested.

66-10 The commenter is correct that the differences in winds recorded by DOE and NASA are due to the recording of winds in different locations within SSFL. Chapter 3, Section 3.6.1.2.1, of this EIS identifies that the larger-scale regional winds prevail from the westerly direction and the wind directions within Area IV, as presented in the Area IV wind rose, are influenced by the local terrain. This is also the case for the winds recorded by NASA in Areas I and II, where the elevated terrain to the south deflects the prevailing winds, resulting in more winds from the southwest direction. In response to this comment, the term "SSFL" was replaced with "Area IV" in the last two sentences of the referenced paragraph in this Final EIS.

66-11 The text states, "a site visitor's exposure to chemicals or radionuclides at Area IV and the NBZ would be much less than that of an Area IV and/or NBZ worker" and "the radiation dose to a site visitor would be less than the 1 millirem per year that has been reported for workers in recent years." While there is no mention of a factor of 1/2, the actual fraction for the potential dose would be proportional to the amount of time a visitor remains onsite and would depend on where onsite they are. In Chapter 4, Section 4.9, parameters for the modeling of an onsite recreational user were also used as a conservatively high estimate of potential impacts to a site visitor because a site visitor's exposure time would likely be much less than that assumed for the recreational user. The recreational user was assumed to be exposed 8 hours a day, 75 days per year, for 30 years.

66-12 Chapter 3, Section 3.11.2.3.2 and Table 3-33, and Appendix F, of this Final EIS, were revised to reflect NASA's 2015, 2016, and 2017 archaeological studies, as appropriate.

4/12/2017

4 of 4

- 66-13 Chapter 3, Section 3.11.2.3.4, of this Final EIS, was revised as suggested, to discuss the ethnographic study, and the partnership between DOE and NASA for the ethnographic study, the Traditional Cultural Property nomination and the archaeological district.
- 66-14 The text in Chapter 4, Section 4.3.5, of this Final EIS, was expanded to clarify that under the Soil No Action Alternative, the existing NPDES control structures would remain in place, but no additional soil removal/remediation actions would be completed. The text was added to further support the conclusion that contaminant discharge could occur in storm events that exceed the capacity of the control structures, given the absence of additional soil removal/remediation work under the Soil No Action Alternative. This is in contrast to implementation of soil removal/remediation actions and mitigation actions under the action alternatives that would remove contaminants and avoid exceedances of NPDES limits.
- 66-15 Text was added to Chapter 4, Section 4.5.1.2.1, of this Final EIS that discusses the potential impacts to wildlife migration corridors and the effects of increased traffic within these corridors.
- 66-16 The EIS was revised to reflect cleanup levels for the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative that are based on human risk as well as ecological risk. Inclusion of this analysis provides for a more quantitative analysis of ecological risk receptors under the alternatives. DOE remains committed to a cleanup of contamination in Area IV and the NBZ of the SSFL. The cleanup meets the purpose and need to be protective of the environment and the health and safety of the public and workers. Cleanup activities will be performed in a way that will minimize impacts to biological resources while ensuring all cleanup requirements are met and most importantly that the site is safe for humans.
- 66-17 Appendix I of the EIS provides the Wetland Assessment, which has further information on the regulatory requirements and results of jurisdictional determination surveys conducted in Area IV and the NBZ. To date no permit applications have been submitted.
- 66-18 Chapter 5, Table 5-1, of this Final EIS, was revised to change “Not Provided” to “Not Applicable” for the “Area Disturbed for Building Removal” and “Backfill for Building Removal” entries because those values are included in the total volume of disturbed soil removal and backfill emplaced as a result of NASA buildings being primarily located within their soil remediation areas.
- 66-19 Chapter 5, Table 5-1, of this Final EIS was revised to clarify that NASA does not expect to perform any bedrock removal.

**Commenter No. 66 (cont'd): Peter Zorba, NASA Project Director,
National Aeronautics and Space Administration**

- 66-20** The unit of measure is listed for each group for which a total is provided in Table 5-1. Therefore, no change to this Final EIS was made.
- 66-21** Chapter 5, Section 5.5.2, of the Draft EIS includes a statement that best management practices would be used to slow the flow of runoff and decrease soil erosion. Therefore, no change to this Final EIS was made.
- 66-22** Reference to NASAs AOC, which has similar requirements as DOE in regards to include appropriate exemption areas, was incorporated into the text. NASA's EIS is also referenced.
- 66-23** Chapter 3, Section 3.1.1.1 of the Draft EIS stated: "SSFL sits within a rare and vital wildlife corridor connecting the Sierra Madre Ranges of the Los Padres National Forest to the Santa Monica Mountains and the Pacific Ocean. Termed the Santa Monica - Sierra Madre Connection and comprising approximately 125,000 acres, the corridor consists of sandstone cliffs, oak woodlands, and scrub and meadows, with valley and mountain vistas. Several formally designated open space areas are located within close proximity to SSFL and are a part of this unique corridor. Figure 3-2, the Ventura County land use map, illustrates the location of these open space areas in proximity to SSFL." In addition, wildlife corridors are discussed in Section 3.5.1 of the EIS: "The SSFL site is located along the crest of the Simi Hills and is a part of the linkage design (South Coast Wildlands 2008) or wildlife corridor that provides wildlife passage from the Santa Monica Mountains to the south through the Simi Hills and Santa Susana Mountains to the Sierra Madre range to the north (Penrod et al. 2006). Mammals such as bobcat, coyote, mountain lion, and deer pass through the open space areas of SSFL." Impacts, described in general as limited, are discussed in Chapter 4, Section 4.5.1.
- 66-24** Because the cumulative impacts section covers a larger area that includes multiple projects and the potential effect to many other species, there is additional discussion about the various other species in Section 5.5.5.
- 66-25** DOE is aware of the 2013 USFWS concurrence letter to NASA. A reference to the letter was added to the text.
- 66-26** The intent of the air quality cumulative impacts analysis is to evaluate potential scenarios that could produce the highest off-site pollutant impacts from the combination of DOE and non-DOE activities. Due to their proximities and intensities, if the proposed Boeing and NASA cleanup activities occurred at the same time as the proposed DOE cleanup activities, then these combined activities would represent a maximum project cumulative air quality impact scenario. In this Final EIS, the analysis

**Commenter No. 66 (cont'd): Peter Zorba, NASA Project Director,
National Aeronautics and Space Administration**

referred to in the comment was retained, but text was added to clarify that this is referring to a possibility of combined impacts if DOE, NASA, and Boeing activities were underway simultaneously and the wind was from a particular direction.

- 66-27** Chapter 5, Section 5.5.7, of this Final EIS was revised to clarify that truck trips are limited to 96 per day.
- 66-28** Table notes in Table 5-6, in this Final EIS, were revised to indicate that transportation-related accident fatalities were calculated by DOE.
- 66-29** This Final EIS was revised to indicate that equivalent single axle loads were estimated by DOE based on the number of truck trips for NASA presented in Table 5-1.
- 66-30** **The “Pavement Deterioration” section in Chapter 5, Section 5.5.8.2, of this Final EIS, was revised to indicate that pavement deterioration impacts were estimated over the durations of the cleanup activities.**
- 66-31** Chapter 5, Section 5.5 was revised to ensure consistency with the information in the NASA EIS for remediation of Area II. NASA activities are identified as contributing little to the cumulative impact in the health and safety resource area.
- 66-32** Regarding the commenter’s statement that “these resources are unique to NASA and impacts to them do not represent a cumulative concern, as DOE actions would not affect these resources,” DOE does not agree. Although, DOE activities would not impact the test stands, the combined DOE, NASA, and Boeing activities at SSFL would impact the cumulative value of cultural resources across the site and in the larger Region of Influence.
- 66-33** In Chapter 5, Section 5.5.11.1, of this EIS, the text explains that National Register of Historic Places-eligible sites in DOE, NASA, and Boeing administered areas may be protected from impacts by Section 106 agreement documents or through the 2010 AOC, thus not adding to cumulative impacts on cultural resources. However, this section goes on to say that sites that are not individually eligible for listing on the National Register of Historic Places could be adversely affected, adding to cumulative effects on cultural resources. Large-scale developments outside SSFL would contribute to a cumulative adverse impact on cultural resources if archaeological sites are encountered during project construction, are paved over, or are disturbed at a later date due to human activity.
- 66-34** DOE is aware of the 2013 USFWS concurrence letter to NASA but to be clear, the letter does not state that it is a Biological Opinion. The 2013 USFWS letter is referenced in this EIS. The Biological Opinion for this DOE SSFL Area IV EIS does

**Commenter No. 66 (cont'd): Peter Zorba, NASA Project Director,
National Aeronautics and Space Administration**

not address the effects of NASA's proposed activities. As stated in the 2018 USFWS Biological Opinion (see Appendix J), the Biological Opinion addresses "soil cleanup, groundwater cleanup, building and infrastructure removal, and habitat restoration within Area IV and the northern buffer zone of the Santa Susana Field Laboratory (SSFL) under DOE's jurisdiction."

- 66-35** DOE appreciates the updated Integrated Cultural Resources Management Plan provided by NASA. However, DOE did not change the citation in Chapter 9 of this EIS. That chapter contains histories and perspectives provided by Native American contributors. Because the 2010 version was cited by the author, we are leaving the reference in Chapter 9 unchanged. DOE cites the 2017 version in Appendix F, of this Final EIS, where Table F-1 lists previous studies within the region of influence, which for cultural resources includes all of SSFL and the area within a 1-mile radius of SSFL.

Ms. Stephanie Jennings
NEPA Document Manager, SSFL Area IV EIS
U.S. Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 93063

Subject: Comments on Draft Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory (DEIS)(DOE/EIS-0402) in Ventura County, California pursuant to the National Environmental Policy Act (NEPA), as amended (42 U.S.C. §4321 et seq.) and the National Historic Preservation Act (NHPA), as amended (16 U.S.C. §470 et seq.)

Dear Ms. Jennings:

Thank you for the opportunity to review and comment on the subject document. As a potential regulating governmental agency over portions or aspects of the above-referenced project site and in response to the Notice of Availability of the DEIS (DOE/EIS-0140), the County of Ventura Planning Division provides the U.S. Department of Energy (DOE), the NEPA lead agency for this project, the following comments pursuant to NEPA, as amended (42 U.S.C. § 4321 et seq.), the Council on Environmental Quality Regulations for Implementing the Procedural Provisions of NEPA (40 CFR Parts 1500-1508), and DOE implementing regulations of Title 40, Code of Federal Regulations, Parts 1500-1508 (40 CFR Parts 1500-1508) and 10 CFR Part 1021, respectively.

The Planning Division evaluated the DEIS for consistency with the Ventura County General Plan and the Non-Coastal Zoning Ordinance. This consistency evaluation provides an opportunity for the Planning Division to identify key issues of concern related to land use, and to notify the DOE of local regulatory requirements that would be applicable for a non-federally owned property.

The Planning Division has a significant concern that the cleanup alternatives were not developed in a way that reasonably anticipates future land uses. Throughout the DEIS, the DOE bases its assessment on a "hypothetical future suburban residential land use" (DEIS page S-5) that "did not include the indirect garden pathway of ingestion of homegrown fruits and vegetables" because "Boeing has stated that it will restrict future land use and prohibit residential houses and background fruits and vegetables (Boeing 2016b)" (EIS page S-18).

800 South Victoria Avenue, L# 1740, Ventura, CA 93009-1740 (805) 654-2481 Fax (805) 654-2509

67-1

67-1 As the commenter recognizes, Boeing, not DOE, is the landowner and has formalized its stated intentions that its property at SSFL will be maintained as open space. Since release of the Draft EIS, Boeing and North American Land Trust executed and filed with Ventura County Grant Deeds of Conservation Easement and Agreements (conservation easements) restrict future use of the property it owns at SSFL to open space, forever prohibiting residential, agricultural, and commercial development or use of the site (Ventura County 2017a, 2017b)); this includes Area IV and the NBZ. This Final EIS was revised to reflect the conservation easements and their restrictions. This Final EIS adds an assessment scenario that addresses future use as open space (Conservation of Natural Resources Alternative – Open Space Scenario) and retains a scenario from the Draft EIS that evaluates future use as suburban residential (without garden) (Conservation of Natural Resources Alternative – Residential Scenario). An agricultural or any other scenario was not considered in this Final EIS because they are prohibited by the conservation easements.

Commenter No. 67 (cont'd): Winston Wright,
Planning Manager, County of Ventura

Ms. Stephanie Jennings
April 12, 2017
Page 2 of 6

Ventura County's General Plan land use designation for Area IV and the Northern Buffer Area (NBZ) is "Open Space". Without an explanation and a solid commitment from Boeing as to how future land uses will be restricted, the DOE should be obligated to consider the full range of potential land uses that can occur within Area IV and the NBZ. The land uses that are consistent with the Open Space land use designation include commercial agriculture (e.g. row crops and orchards), animal husbandry (e.g. grazing, the keeping of farm animals, and equestrian uses), and a single-family dwelling for each legal lot. Without binding commitments from Boeing, DOE's assessment is premature and speculative.

As the successor in interest to SUP 248, and the owner of the subject property, Boeing has an obligation to openly disclose its intentions and cooperate with the preparation of the EIS. In addition, as a beneficiary to SUP 248, the DOE should fully remediate the contamination caused by the research activities that were approved by the issuance of SUP 248 (NCZO §8111-8.1). A statement made by Boeing that future land uses will be restricted at SSFL is not substantial evidence that DOE can rely on in the EIS. For the DOE to limit its analysis and risk assessments to certain land uses, Boeing must now be willing to commit to and disclose mitigation measures that detail the land use restrictions it plans to place on the SSFL property.

Future land uses for Area IV and the NBZ are specified by the County of Ventura's zoning designation. The current zoning for Area IV is Rural Agricultural with a 5-acre minimum lot size (RA-5 ac) and the NBZ is Open Space with a 160-acre (OS-160 ac) minimum lot size. Article 5 of the NCZO (Uses and Structures by Zone) (starting on pg. 5-1) shows minor differences in the uses that can be permitted by a ministerial permit in the RA-5 ac and the OS-160 ac zones, aside from the size of certain structures (e.g. principal and accessory agricultural structures). The intensity of use and potential number of uses that can be permitted in the SSFL boundaries is directly tied to the number of legal lots within the SSFL boundary. Essentially, each legal lot in these zones can be entitled with a single-family dwelling, an accessory dwelling (e.g. guesthouse), principal buildings used for agricultural (e.g. greenhouses and preliminary packing facilities), and accessory agricultural buildings (e.g. barns and stables). All of these uses are permitted through a ministerial Zoning Clearance with no County discretion. An unlimited area of agricultural crops, including residential gardens, is allowed and an unregulated number of farm animals may be kept on each lot over 10-acres in size. Due to these allowances, it is inappropriate to exclude the risk of consuming agricultural products that could be grown within project area's boundary.

In addition to the number of sensitive uses that can occur on the property, there is unknown number of legal lots within the SSFL boundary, including within Area IV and the NBZ. To reduce the potential number of uses that can be entitled on the property, Boeing should commit to merging the underlying lots and record a single certificate of compliance for the entire property with the Ventura County Recorder [CA Gov. Code §66499.35(a)]. This is a feasible mitigation measure that can, combined with

67-1

Page 3 of 6

recording a legal instrument such as a conservation easement, limit the number of uses that can be permitted on the property.

In addition to evaluating all potential land uses and incorporating mitigation measure that reduce the number of uses that can be entitled on the property, the DOE should include an analysis of cleanup levels stipulated in its Administrative Order on Consent (AOC) with the Department of Toxic Substance Control. Without such an analysis, the DOE cannot honor past commitments made to the Citizens of Ventura County (see attached County of Ventura Board of Supervisor's March 7, 2017 letter). As a beneficiary to a Special Use Permit issued by the County of Ventura (SUP 248), the DOE should remediate the contamination within Area IV and the NBZ to levels stipulated in the AOC and restore the affected environment as near as possible to its original state.

There are several policies contained in the County's General Plan that support protection of biological resources that pertain to the Proposed Action. The Santa Susana Field Laboratory is identified as an area with a "Significant Biological Resource" under the Figure 1.5.6.2, *Biological Resource Map*, in the General Plan Resource Appendix. The EIS should discuss consistency with these General Plan policies by identifying impact intensity, type, context, and duration. Mitigation measures should be developed that preserve and protect SSFL biological resources, and incorporate recommended wetland protections. These General Plan policies include:

(1) wildlife migration corridors, threatened or rare species and their habitats, and locally important species/communities that are considered to be significant biological resources to be preserved and protected from incompatible land uses and development (GP Goal 1.5.1); and

(2) wetland protection policies, such as a 100-foot setback from significant wetland habitat for all discretionary development (GP Policy 1.5.2.4) and a requirement to evaluate biological impacts for discretionary projects within 300 feet of waters and wetlands (GP Policy 1.5.2.3).

The Ventura County General Plan's Goal states that with biological resources identified as Locally Important Species and Communities are significant biological resources that should be preserved and protected from incompatible land uses and development (Goal 1.5.1). Impacts to Ventura County Locally Important Plant Species identified on-site should be evaluated and mapped (e.g., *Allophylum divaricatum* and *Crassula aquatic*). For a complete listing of Locally Important Species please see the following link:

<http://www.ventura.org/rma/planning/conservation/locally-important-species.html>

Impacts to Locally Important Communities (e.g., Venturan coastal sage scrub, oak woodlands) should be acknowledged in the EIS. The EIS should evaluate direct and

67-1
cont'd

67-2

67-3

67-2 The Draft and this Final EIS evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC, the Cleanup to AOC LUT Values Alternative. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of the AOC cleanup alternative. The Special Use Permit (governing the industrial activities [general aerospace industrial research]) allowed the testing and research activities that DOE, NASA, and Boeing (and their predecessor organization) conducted to be performed at SSFL. The 2010 AOC was developed independent of and has no relationship to the Special Use Permit. Boeing, as the landowner and permit holder, will address with the county any requirements remaining for the permit. DOE will continue to work with Boeing to ensure that cleanup of Area IV and NBZ is consistent with Boeing's future land use plans. DOE notes that all of the action alternatives evaluated in this Final EIS would clean up Area IV and the NBZ to a level that is protective of public health and the environment.

67-3 Based on DOE's understanding of the comment, the EIS was revised to provide further discussion of impacts on wildlife and the mitigation measures were revised to reflect suggested text, as appropriate. For example, Chapter 2, Section 2.3.2, of this EIS has been modified to indicate that development of areas in which the exemption process would be applied includes consideration of the Ventura County list of locally sensitive species. As a result, the maps showing areas in which the exemption process would be applied were revised to indicate areas that DOE proposes to protect because they include Ventura County "locally important species and communities" as identified in the comment. For each vegetation community identified in Chapter 3, Section 3.5, the equivalent vegetation mapping according to the current version of *A Manual of California Vegetation* (Sawyer et al. 2009) was incorporated. There is discussion about nighttime work in this Final EIS. For example, in Chapter 4, Section 4.5, this Final EIS states, "For this project, most impacts related to vegetation and soil removal would be long-term due to the length of time required to restore vegetation and wildlife habitat after remediation, except in rapidly establishing vegetation types such as annual grassland. Impacts related to human activity, including noise, dust, and night-time lighting would generally be categorized as short-term. Potential adverse impacts on species federally listed as threatened or endangered would be considered substantial." Section 4.1 of this EIS states "In addition, light pollution would be minimal under any alternative because work would take place during daytime hours, and any need for nighttime lighting (e.g., repairs to equipment) would be infrequent and temporary." Chapter 6, Table 6-1, identifies the use of temporary flagging or fencing to delineate work areas to avoid worker encroachment in sensitive biological areas, including

Commenter No. 67 (cont'd): Winston Wright,
Planning Manager, County of Ventura

Ms. Stephanie Jennings
April 12, 2017
Page 4 of 6

indirect (i.e., dust) impacts to Locally Important Communities. In addition, within the project alternatives the Biological Resource Exemption Areas should include areas that contain Ventura County Locally Important Species and Communities, whenever feasible.

As mentioned previously, Biological Resource Goal 1.5.1 of the Ventura County General Plan describes wildlife migration corridors to be significant biological resources that must be protected. Wildlife corridors have been mapped in Ventura County and throughout southern California in the South Coast Missing Linkages Report¹, and the Santa Susana Field Lab is located directly adjacent to these wildlife migration corridors. The SSFL lies immediately east of these linkages and comprises habitats that are used for local and regional wildlife movement.

The project site contains significant habitat connections and movement patterns for both transitory and permanent wildlife populations. Direct impacts from habitat destruction, fencing, and equipment can create physical barriers to wildlife movement while indirect impacts from lighting, noise, and increased human activity may also discourage wildlife use of the area. Impacts to the regional wildlife corridor, including temporary and long-term introduction of barriers to gene flow, should be considered and mitigated in the DEIS. To ensure consistency with this goal, it is recommended that mitigation measures be incorporated that use fencing to exclude wildlife from construction and remediation zones while utilizing wildlife permeable fencing when needed to allow movement through areas not undergoing active work. In addition, night work should be avoided, to the maximum extent feasible, and measures should be taken to avoid lighting that is of high intensity and illuminates habitat areas. Remediation activities and post-remediation open space use should facilitate wildlife movement and habitat connectivity.

Vegetation communities, which are briefly categorized and discussed in Section 3.5.2 of the DEIS, should be mapped consistent with the California Manual of Vegetation (2010) to the alliance level and the association level in EIS. The current vegetation map was developed using classification system no longer used and does not incorporate updated rarity and conservation designations. This will ensure all vegetation on site is identified using the current vegetation classification system, that all mapped vegetation is assessed adequately for rarity and sensitivity, and that any impacts are avoided, minimized, and mitigated as needed.

The EIS should specify the off-site locations where imported replacement native soil would be obtained. Retention of native topsoil should be prioritized, and replacement native soil should be obtained at a location that is as close as possible to the site and is

¹ Penrod et al. 2006. South Coast Missing Linkages Project: A Linkage Design for the Santa Monica-Sierra Madre Connection. Produced by South Coast Wildlands, in cooperation with National Park Service, Santa Monica Mountains Conservancy, California State Parks, and The Nature Conservancy.

67-3

67-4

67-4

vernal pools, and reduce the likelihood of animals in the work zone; fencing is also identified for protection of sensitive plant species (e.g., oak and other trees). Expanded discussions of the impacts to wetlands and animal movement have also been added to Chapter 4, Section 4.5, of this Final EIS.

DOE and DTSC have not yet identified an offsite source for replacement soil for use as backfill. DOE agrees that the soil characteristics need to be as close as possible to those of the soil being removed from the site. DOE acknowledges the Ventura County policy, requirements, and guidelines on replacement soil and, if the source of backfill soil is within the county, DOE will ensure that applicable requirements are met. Please refer to Section 2.3, "Suitable Backfill Soil," of this CRD for additional information.

Commenter No. 67 (cont'd): Winston Wright,
Planning Manager, County of Ventura

Ms. Stephanie Jennings
April 12, 2017
Page 5 of 6

as close in soil characteristics to minimize the loss of native seed, soil microbes, etc. If this location is within the unincorporated area of Ventura County, a discretionary permit may be required to extract soils, and an analysis of potential impacts associated with the removal of soil from that property should be provided in accordance with the County's thresholds of significance. Those thresholds are found in the Ventura County Initial Study Assessment Guidelines. In addition, the removal of off-site soil must be evaluated for consistency with the County's policies and ordinances.

67-4
cont'd

Measures to minimize impacts for biological resources within the DEIS are found in Table 6-1, including measures for special-status trees and Protected Trees as defined in the Ventura County Non-Coastal Zoning Ordinance (NCZO §8107-25). The DEIS Measures include a Tree Management and Preservation Plan (Table 6-1, Item 5-3). To be consistent with Ventura County's Tree Protection Regulations in the Non-Coastal Zoning Ordinance, mitigation measure should be incorporated that offset the loss of all Protected Trees (e.g. Oaks, Sycamores, Heritage Trees, and Historical Trees). Offsets for the loss of Protected Trees can include transplantation, planting of new Protected Trees, dedication of land containing Protected Trees, or a financial contribution to the County's Tree Mitigation Fund. In addition, it is recommended that this Plan incorporate procedures for monitoring the health of Protected Trees that are encroached upon by remediation activity or development. This monitoring should include an evaluation of the tree's health by a certified arborist before commencement of remediation and for a period of at least five years after encroachment and disturbance activities cease.

67-5

67-5

In Chapter 6, Table 6-1, of this Final EIS, Minimization Measure 5-3 was revised to indicate that offsets for the loss of protected trees and pre- and post-remediation monitoring of protected trees are among the protection measures that may be incorporated into the Tree Management and Preservation Plan.

Conclusions:

The DEIS states that it is the intent of Boeing, the property owner, "to maintain its portion of the SSFL (including Area IV and the NBZ) as undeveloped open space", and that it would "restrict future land use to prevent development for any commercial, industrial, agricultural, or residential purpose." (DEIS S-6) The preservation of the remediated site as open space can continue to support numerous significant biological resources and passive open space uses on the subject property. However, based on the General Plan Land Use designation and zoning of the parcels, numerous sensitive uses (e.g. residential and agricultural) are allowed by right and without County discretion. The Planning Division suggests that the DOE work with Boeing to voluntarily merge all of the underlying lots with the SSFL and execute a legal instrument that would encumber the land to prohibit residential and agricultural uses. Without such a commitment from both the DOE and Boeing, the EIS should evaluate every potential land use that is allowed in the Open Space land use designation and RA-5 ac zone.

67-1
cont'd

While the Planning Division supports remediating the site to cleanup levels stipulated in the AOC, it also acknowledges that this will cause profound disturbance to the biological resources. SSFL contains many rare and sensitive species that have persisted in the area despite the contamination. Affected areas will require a substantial, focused, and

67-6

67-6

DOE acknowledges your preference for "cleanup to levels stipulated in the AOC" and the associated environmental consequences identified in this EIS. By this, we assume you are referring to the cleanup levels established in the Look-Up Tables (DTSC 2013a, 2013b) developed by DTSC in accordance with the AOC. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. As described in Chapter 6 of this Final EIS, DOE would incorporate multiple Measures to Minimize Impacts and would consider numerous other Mitigation Measures for biological resources.

Commenter No. 67 (cont'd): Winston Wright,
Planning Manager, County of Ventura

Ms. Stephanie Jennings

Page 6 of 6

prolonged effort to achieve revegetation and restoration of habitat, including replacement of removed soil with soil similar in parent material, texture, and nutrient status; collection and propagation of native plants including oaks and shrubs; and several years of maintenance, weed control, and monitoring until the vegetation is self-sustaining. The DOE should identify every feasible mitigation measure in the EIS that will make this happen and should follow through with those measures to restore the affected environment to the maximum amount feasible.

Thank you for the opportunity to review and comment on the DEIS. Please do not hesitate to contact me if you have any questions regarding this letter. I can be contacted by telephone at [REDACTED]

Sincerely,

Winston Wright

Board of Supervisors
County of Ventura
800 South Victoria Avenue
Ventura, CA 93009

SUBJECT: Recommendation of Supervisor Parks and Supervisor Bennett that the Board of Supervisors Send a Comment Letter to the U. S. Department of Energy Commenting Stating that its Draft EIS on Remediation of its Santa Susana Field Lab Site Should Include an Analysis of Cleanup to Levels Stipulated in its Administrative Order on Consent with the Department of Toxic Substance Control.

RECOMMENDATIONS:

1. Send a comment letter on the DOE's Draft EIS on remediation of its Santa Susana Field Lab (SSFL) site stating that the EIS should include an analysis of cleanup to levels stipulated in the Administrative Order on Consent.
2. Request the CEO's Office communicate the Board's position to legislative representatives.

DISCUSSION:

Beginning in the 1940s the federal government conducted rocket and nuclear testing activities at the SSFL in Ventura County. The work was conducted with substantial disregard for the environment. One of its nuclear reactors experienced a partial nuclear meltdown in 1959, and two other reactors experienced accidents with significant fuel damage, causing releases of radioactivity into the air. This, in addition to napalm and dioxin incineration in open-air burn pits, dumping of over 500,000 gallons of trichloroethylene (TCE) and perchlorate, and other contamination from over the 50 years of operations, left the site highly polluted with radioactive and chemical contaminants. The parties responsible for cleaning up SSFL are DOE, NASA and the Boeing Company.

In 2010, legally binding cleanup agreements called Administrative Orders on Consent (AOC), were entered into by NASA and DOE with California Department of Toxic Substances

68-1 The Draft EIS and this Final EIS include an alternative that incorporates the technical elements of the AOC cleanup, the Cleanup to AOC LUT Values Alternative. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD, for a discussion of the Cleanup to AOC LUT Values Alternative.

68-2 As indicated in Chapter 1 of this Final EIS, DOE acknowledges that past activities at SSFL resulted in chemical and radiological releases that impacted soils, buildings, and groundwater. With respect to Area IV and the NBZ, the subjects of DOE's EIS, there was no burning of napalm, no dioxin incineration, no open-air burn pits, and no dumping of 500,000 gallons of TCE and perchlorate by DOE or its contractors. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Examples of prior cleanup actions are provided in Chapter 3, Section 3.2.5, of this EIS. Contrary to prior public perception, extensive soil sampling studies conducted by EPA and DOE with DTSC oversight have shown that Area IV and the NBZ are not highly contaminated. Please refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ.

Regarding comments related to NASA and Boeing's responsibilities, this EIS is being prepared in accordance with NEPA to evaluate alternatives for completing the remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. This EIS will inform DOE decisions about remediation of contaminated soil and groundwater, building demolition, restoration of the impacted environment, and disposal of chemical and radioactive waste.

NASA separately prepared an EIS that addresses cleanup of the NASA portions of SSFL. *The Final Environmental Impact Statement (EIS) for Demolition and Environmental Cleanup Activities at Santa Susana Field Laboratory in California* was published by NASA in March 2014 with a ROD issued for building demolition in April 2014. In this ROD, NASA decided to proceed with the demolition of structures activities, but postponed a decision on soil and groundwater cleanup. In accordance with CEQA and consistent with Section 4 of the 2010 AOC, DTSC is preparing an environmental impact report (EIR) that addresses cleanup of all of SSFL (including areas for which DOE, NASA, and Boeing are responsible); the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017]).

68-1

68-2

68-1

Board of Supervisors, County of Ventura

Board of Supervisors
March 7, 2017
Page 2

Control (DTSC). The AOC requires all of the detectible radioactive and chemical contamination at their SSFL operations be cleaned up to background levels similar to those before the site was contaminated.

In May of 2012, DOE issued a notice regarding preparation of an Environmental Impact Statement (EIS) regarding the cleanup and in 2016 a draft EIS was released. The Draft EIS was released for comment in January 2017 and comments are due on March 14, 2017. Unfortunately the EIS does not analyze the impacts of cleaning the DOE site to levels stipulated in the AOC. Instead, hundreds of thousands of cubic yards of soil, some with known significant chemical and radiological contamination that would be covered by the AOC, are exempted from remediation. It is recommended that the Board of Supervisors send a comment letter requesting the EIS be consistent with remediation of DOE's SSFL site to the levels stipulated in the AOC.

Sincerely,

Steve Bennett
Supervisor, First District

Linda Parks
Supervisor, Second District

Attachment: Letter to DOE

68-1
cont'd

The analyses in this DOE Final EIS were performed to evaluate the potential environmental impacts associated with the various alternatives for cleanup of SSFL. Results of the analyses allow a comparison of potential impacts and tradeoffs between the alternatives. All of the action alternatives evaluated in the EIS would result in a proper cleanup (per EPA and DTSC guidance) of those areas of SSFL for which DOE is responsible, Area IV and the NBZ, and be protective of human health and the environment given the future land use. In the case of soil remediation, leaving more soil, and consequently low concentrations (below EPA and DTSC risk levels) of chemicals and/or radionuclides on site, reduces the number of truck trips from the site. Conversely, removing the soil with low concentrations of chemicals and/or radionuclides would result in more truck trips from the site. The EIS shows that the transportation risks are very small; Chapter 4, Section 4.8.1 and Appendix H of the EIS provide details of the transportation risk analysis.

Project: **Santa Susana Field Laboratory (SSFL) Area IV and Northern Buffer Zone**
Lead Agency: **U.S. Department of Energy**
Contaminated Soil and Groundwater Remediation Projects at the SSFL, Simi Hills, Ventura County

Pursuant to your request, the Public Works Agency Transportation Department (PWATD) has reviewed the DEIR for the Santa Susana Field Laboratory (SSFL) Area IV project.

The U.S. Department of Energy (DOE) has prepared a Draft Program Environmental Impact Report (DEIR) to assess alternatives for environmental cleanup at the Santa Susana Field Laboratory site in Ventura County. Two public scoping meetings were previously held in 2014 to provide information on the DEIR preparation process and to invite public comments on the scope of the environmental issues and the alternatives to be considered in the DEIR. Three sets of alternatives have been proposed. The Groundwater Characterization and Cleanup Program is one of many programs at the SSFL and consists of ongoing groundwater monitoring of existing wells, sampling of new groundwater locations, and treatment of contaminated groundwater when needed.

We offer the following comment:

The Transportation Department has received and will continue to receive notices regarding the activities at the SSFL. We have reviewed several documents in regard to the SSFL cleanup and our previous comments are still valid and applicable. We understand that we will receive the EIR when it becomes available, in addition to a transportation study currently underway by the Department of Toxic Substance Control, therefore we will not reiterate our previous comments. Our previous comments are provided in memorandums for the following thirteen (13) RMA reference numbers: 10-024; 10-027; 10-031; 10-035; 11-008; 11-009; 11-016; 11-021; 12-027; 13-010; 13-019; 13-027 and 17-004.

Our review is limited to the impacts this project may have on the County's Regional Road Network.

69-1

69-1

Thank you for your comment; however, DOE notes that it was not the recipient of the referenced 13 memoranda. Your comment has been included in the Administrative Record for the EIS.

MEMORANDUM

DATE: February 8, 2017
TO: U.S. Department of Energy, Office of Environmental Management
SUBJECT: RMA 17-004 Santa Susana Field Laboratory Area IV (EIS-042)
 Draft Environmental Impact Statement for Remediation of Area IV & the
 Northern Buffer Zone of the Santa Susana Field Laboratory
 South of Meire Canyon, Simi Valley, CA
 Arroyo Simi Watershed, Zone 3
 Ventura County Watershed Protection District Proj. No. WC2017-0005

Pursuant to your request dated January 2017, this office has reviewed the submittal of a Draft EIS for the remediation of Area IV and the northern buffer zone of the Santa Susana Field Laboratory and offers the following responses.

1. Boeing has committed to clean up the Site to a standard that is equivalent to a suburban residential standard that is more protective of human health than that applicable to open space uses. The DOE Report Chapter 2 Page 2-28 states "... As a result, cleanup planning for Area IV and the NBZ was transformed from a radionuclide-base (91,000 cubic yards) to a chemically impact soil cleanup (1,410,000 cubic yard)." In other words, the radionuclide pollution becomes minor and the chemical pollution is the major problem.
2. In Action S.3, DOE proposes to undertake the standard steps for DOE-owned facilities. Will the Boeing Company and NASA also complete and implement similar plans to address soil, buildings, and groundwater issues? A postponement or refusal by the Boeing Company and NASA to clean up their contributions will potentially result in soil, building, and groundwater pollution continuously remaining onsite and potentially spreading. The Ventura County Watershed Protection District (District) recommends that the Boeing Company and NASA implement the same time action that DOE is proposing.
3. As presented on Table S-1, it is the position of DOE that "No Action Alternative of continued maintenance" is the recommended method. Under these conditions, the Project Areas could be safely transferred to an open space use. If the radionuclide-base (91,000 cubic yards) soil and mercury contaminated soil (? cubic yards) is removed from Area IV and NBZ, the Project Site could become safer and representative of DOE's statement: "No Action Alternative of continued maintenance".

70-1

70-2

70-3

70-1 Thank you for your comment, DOE agrees that the cleanup of chemically impacted soil would be the larger component of the soil remediation activity.

70-2 The scope of this EIS is limited to cleanup of DOE's portions of SSFL, Area IV and the NBZ. Boeing and NASA cleanup activities are only considered as part of cumulative impacts (Chapter 5). Cleanup of the entire SSFL, including Boeing, NASA, and DOE activities is being evaluated by DTSC in a Program Environmental Impact Report under the California Environmental Quality Act. DTSC will issue a Notice of Determination for the Program EIR identifying the selected remedial actions. The *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (Draft Program EIR) was issued by DTSC in September 2017 (DTSC 2017). The Draft Program EIR considers the timing of the Boeing, NASA, and DOE cleanups.

70-3 The commenter is mistaken; it is not "the position of DOE that 'No Action Alternative of continued maintenance' is the recommended method." The "No Action Alternative of continued maintenance" would not meet DOE's purpose and need for agency action and is not DOE's Preferred Alternative. The statement in the Draft EIS, Table S-1, was that the No Action Alternative of continued maintenance was adequate to provide a baseline (emphasis added) for evaluating action alternatives.

The Draft EIS did not identify a "recommended" or Preferred Alternative. DOE's Preferred Alternatives are described in Chapter 2, Section 2.7, of this Final EIS.

DOE's preferred alternative for soils remediation is the Conservation of Natural Resources, Open Space Scenario. DOE is identifying this as the preferred alternative because it is consistent with the risk assessment approach typically used at other DOE sites, other DTSC-regulated sites, and EPA Superfund sites, which accounts for the specific future land use of the site. Use of a risk assessment approach would be consistent with the process being used by Boeing for the land it owns at SSFL and recognizes the Grant Deeds of Conservation Easement and Agreements (Ventura County 2017a, 2017b) that commit Boeing's SSFL property, including Area IV and the NBZ, to remaining as open space. This scenario uses a CERCLA risk assessment approach that would be protective of human health and the environment rather than LUT values (action levels). The 2010 AOC allows DOE and DTSC to agree upon changes to the AOC to better meet cleanup objectives. DOE expects to engage DTSC in discussions about such changes in order to implement this soil remediation alternative.

Advanced Planning, Ventura County Watershed Protection District**

February 8, 2017
Draft Environmental Impact Statement for Remediation of Area IV & the Northern
Buffer Zone of the Santa Susana Field Laboratory
Page 2 of 2

- 4. DOE has estimated that there is approximately 1,413,000 cubic yards of contaminated soil on the Site. The District suggests the following mitigation measures:
 - a. Remove all 1,413,000 cubic yards of contaminated soil from the Site.
 - b. There are 62 bedrock wells in Area IV (two wells are abandoned). DOE should provide historical mapping of all pollution on the Site including depth and spatial areas of chemical and radiological impacts.
 - c. The Boeing Company should implement an outside groundwater tracing wells network system along with annual public reporting of test findings and recommendations.

70-4

70-5

70-6

END OF TEXT

DOE's preferred alternative for building demolition is the Building Removal Alternative. Under this alternative DOE would demolish the 18 DOE-owned buildings in Area IV and transport the resulting waste off site for disposal. Demolition of thirteen facilities and disposition of the resulting debris would be in accordance with DOE requirements and applicable laws and regulations. Three facilities at the Radioactive Materials Handling Facility (RMHF) and the two facilities comprising the Hazardous Waste Management Facility would be closed in accordance with DTSC-approved Resource Conservation and Recovery Act (RCRA) facility closure plans.

DOE's preferred alternative for groundwater remediation is a combination of the Treatment Alternative and the Monitored Natural Attenuation Alternative. DOE would treat the groundwater plumes with higher concentrations of contaminants (the Former Sodium Disposal Facility, Hazardous Materials Storage Area, Building 4100/56, and Building 4057 plumes) in accordance with the results of the final RCRA Groundwater Corrective Measures Study. Source removal is the preferred alternative for the strontium-90 source. Monitored natural attenuation would be used for plumes not amenable to active treatment – the two plumes with the lowest concentrations of trichloroethylene (Metals Clarifier plume and the RMHF plume) and the tritium plume. DOE's proposed groundwater remedial actions would be included in the final Corrective Measures Study submitted to DTSC for approval.

70-4 In this Final EIS, DOE has included a sensitivity evaluation that assesses the impacts of removing all soil that exceeds the AOC LUT values (the revised estimated volume in this Final EIS is 1,616,000 cubic yards); please see Appendix L.

70-5 DOE has performed additional groundwater investigations and reported the results in the *Draft RCRA Facility Groundwater Remedial Investigation Report, Area IV, Santa Susana Field Laboratory, Ventura County, California* (CDM Smith 2018a). Chapter 3, Section 3.4 of this Final EIS was updated with information from the draft groundwater remedial investigation report, including information on the magnitude and extent of the existing groundwater contamination in Area IV and the NBZ. The report is included as a reference for this Final EIS and is available for review on DOE's website.

70-6 Thank you for your comment. The scope of this EIS is limited to cleanup of DOE's portions of SSFL, Area IV and the NBZ. Regarding the commenter's recommendation that "The Boeing Company should implement an outside groundwater tracing wells network system..." suggestions regarding Boeing should be submitted directly to Boeing.

Ms. Stephanie Jennings
NEPA Document Manager, SSFL Area IV EIS
U.S. Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 93063

Dear Ms. Jennings:

I am writing on behalf of the Los Angeles County Board of Supervisors. The County of Los Angeles has reviewed the draft Environmental Impact Statement (EIS) for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory (SSFL) proposed by the U.S. Department of Energy (DOE) as lead agency under the National Environmental Policy Act. The draft EIS analyzes the potential environmental impacts of alternatives for conducting cleanup activities in Area IV of the SSFL and the adjoining Northern Buffer Zone, located in the County of Ventura, adjacent to the County of Los Angeles. The County of Los Angeles Board of Supervisors has noted that radioactive and chemical contaminants from the long-closed SSFL have affected the soil, air and water in nearby Los Angeles County communities for decades and have posed serious health risks, such as possible clusters of rare cancers in children and adults, in neighboring communities. The County of Los Angeles therefore urges a full and timely cleanup of the site.

The County of Los Angeles Board of Supervisors submits the following comments on the draft EIS during the public comment period which is currently scheduled to end on April 13, 2017:

1. Lack of Full Cleanup

The EIS does not address the full cleanup of the site, a clear violation of the 2010 Administrative Order on Consent (AOC) between the California Department of Toxic Substances Control and DOE. There are currently four alternatives considered in the EIS: three that address partial cleanups (i.e. "leave in place alternatives") and

71-1

71-2

71-3

71-1 As described in Section 2.7, "Offsite Impacts," of this CRD, there has been extensive onsite and offsite characterization of soil and groundwater contaminants; based on the available data, DOE is confident that significant levels of contamination have not migrated off site from Area IV and the NBZ. The commenter is referred to USEPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts DTSC 2017a), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act. Please refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. Also, please refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for a description of the current site conditions.

71-2 DOE acknowledges the County's concern regarding a full and timely cleanup of SSFL. DOE's purpose in preparing this EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

71-3 The Cleanup to AOC LUT Values Alternative incorporates the technical elements of the 2010 AOC. The commenter is referred to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of the CRD for further information on this topic. All of the soil remediation action alternatives analyzed in the EIS would be protective of human health and the environment, meaning that under each alternative all contamination posing a risk would be removed. The AOC contemplates in-situ treatment of soils, which would include monitored natural attenuation as described in this EIS. Section 2.9 of the AOC states that the DOE soil remediation plan to be submitted to DTSC for approval describe, "Any areas proposed for in situ or onsite treatment to achieve cleanup goals..." The AOC (Section 6.0) also contemplates that DOE may have to undertake a NEPA analysis; one of the requirements of NEPA is a consideration of a range of reasonable alternatives that meet the purpose and need, without pre-selection of any one alternative.

**Commenter No. 71 (cont'd): Lori Glasgow, Executive Officer,
County of Los Angeles Board of Supervisors**

Ms. Jennings:
April 5, 2017
Page 2

one that is the null (no cleanup). The AOC does not allow for consideration of lower levels of cleanup. The EIS should be based on remediation of SSFL to the levels stipulated in the AOC, provide full analysis of Full Cleanup and full restoration back to the site's environmental native state, and not include consideration of alternatives that would violate the AOC.

71-3
cont'd

2. Lack of Full Analysis of Multiple Alternative Routes and Modes of Transportation

The EIS offers limited analysis of routes and transportation methods, and has pre-selected certain routes and methods that may have the most impact on surrounding neighborhoods. The limited analysis and pre-selection are misleading because the EIS makes it appear as though no other options are available that would further minimize impacts on residents and businesses. However, during the 2012-2014 alternatives development period, a number of other routes and transport methods were identified that could further minimize neighborhood impacts. These are not analyzed in the EIS and are dismissed as too time consuming to evaluate and/or implement (Pages 2-11 and 2-12). The lack of comprehensive analysis is a disservice to Los Angeles County neighborhoods, residents, businesses, and travelers. Alternate transportation types, methods, and routes should be analyzed in full including, but not limited to, the direct conveyance of contaminated materials from the site to rail and other options, as well as the use of fire roads and other routes to minimize truck traffic and impacts to residents and traffic.

71-4

71-4

In response to the commenter's statement regarding a "lack of full analysis of multiple alternative routes and modes of transportation," please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response. Also note that the DTSC included a transportation study in the *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* that evaluated alternative routes and modes of transporting materials from SSFL. DTSC concluded that, "transporting soil by truck via Woolsey Canyon Road was the most technically feasible and least environmentally impactful option..." (DTSC 2017b). DOE agrees with the analysis in the Draft Program EIS and consistent with NEPA, DOE considered and dismissed from detailed evaluation a number of transportation routes and modes.

3. Burden of Proof

The AOC mandates full cleanup with limited exemptions allowed only if based upon a Biological Opinion rendered by the U.S. Fish and Wildlife Service (USFWS). However, even though the Biological Opinion has not yet been rendered, every one of the EIS' cleanup alternatives already exempt several hundred thousand cubic yards of soil. Further, this exemption is contrary to a 2010 USFWS Biological Opinion issued to the U.S. Environmental Protection Agency that stated there were no unavoidable or unmitigable negative biological impacts at SSFL. It is not within the DOE's discretion to make such a determination of exemption. Exemptions utilized in the EIS that violate the AOC, and those that could increase the risk of cancers, should be excluded. The DOE should provide compelling and fact-based evidence rather than assertions as to why it believes certain amounts of soil should be exempt from cleanup.

71-5

71-5

The 2010 AOC establishes no specific limits regarding exemptions with respect to compliance with the Federal Endangered Species Act and any U.S. Fish and Wildlife Service (USFWS) Biological Opinion. DOE has worked closely with USFWS, the California Department of Fish and Wildlife (CDFW), and DTSC staff in developing the exemption process described in the EIS. USFWS issued its Biological Opinion in August 2018 (Appendix J of this Final EIS) which is based on the exemption process described in the EIS. DOE proposes applying the process for species and sensitive habitats protected under state and local laws and regulations. The 2010 Biological Opinion for the EPA project has no bearing on the DOE soil cleanup project. The 2010 Biological Opinion addressed the cutting of vegetation only. It did not address any type of soil excavation and removal. Finally, the exemption process worked out with

Commenter No. 71 (cont'd): Lori Glasgow, Executive Officer,
County of Los Angeles Board of Supervisors

Ms. Jennings:
April 5, 2017
Page 3

4. Additional Public Review Period Between Release of Biological Opinion and Final EIS

The EIS should be recirculated for additional public review and comments after the USFWS Biological Opinion is submitted and all public comments from the current review period are addressed, and before the EIS is finalized.

On behalf of the Los Angeles County Board of Supervisors, your consideration of the above issues related to this critical public health and safety cleanup project is greatly appreciated. The County of Los Angeles looks forward to your response with respect to the comments on the draft EIS.

Sincerely,

Lori Glasgow
Executive Officer

LG:ls

c: Board of Supervisors

71-6

71-6

USFWS, CDFW, and DTSC does not imply that soil cleanup would not be performed in areas in which the exemption process is applied. It is a process that would remove contamination that poses a risk to human health and the environment, but protects endangered species and sensitive habitat where contaminant concentrations fall within the EPA target risk range. Please refer to "Application of Exemptions under the 2010 Administrative Order on Consent" (Section 2.4 of this CRD) for a discussion of this topic and DOE's response.

In response to the commenter's request for additional public review between release of the USFWS Biological Opinion and the Final EIS, another Draft EIS review is not planned. The USFWS Biological Opinion (Appendix J) is consistent with the exemption process description provided in the Draft EIS. Data from the USFWS Biological Opinion (Appendix J) was integrated into this Final EIS, (for example, used to refine the extent of the areas in which the exemption process would be applied).

Re: *Comments on Draft Environmental Impact Statement for
Remediation of Area IV and the Northern Buffer Zone of the
Santa Susana Field Laboratory*

Dear Ms. Jennings:

Thank you for the opportunity to comment on the Draft Environmental Impact Statement (DEIS) for remediation of Area IV and the Northern Buffer Zone (NBZ) of the Santa Susana Field Laboratory (SSFL) prepared by the U.S. Department of Energy (DOE). In this transmittal letter we summarize our concerns. A detailed treatment of these concerns is set forth in the attachment.

Background – A Highly Contaminated Site With Half a Million People Living Nearby

SSFL is one of the most contaminated sites in the state. Over the years it housed ten nuclear reactors, a plutonium fuel fabrication facility, a “hot lab” for disassembling highly irradiated nuclear fuel, and open-air “burn pits” where radioactively and chemically contaminated items were burned. One reactor had a partial meltdown; three others had accidents; there were radioactive fires at the hot lab; and decades of open burning of contaminated items. The poor environmental and safety practices of DOE and its predecessor agency, the Atomic Energy Commission, resulted in numerous releases and spills which contaminated soil, groundwater, and surface water, as well as numerous buildings, with radioactivity and toxic chemicals.

72-1

72-1

DOE conducted historic operations under the laws and regulations applicable at the time. Chapter 1, Section 1.3, contains a brief history of activities at SSFL Area IV and describes the radiological and chemical characterization studies performed for Area IV and the NBZ. Chapter 3, Sections 3.9.5 and 3.9.6, of the EIS contain information about accidents at Area IV, including the 1959 Sodium Reactor Experiment (SRE)

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

SSFL was established seventy years ago and was supposed to be a remote field lab for work too dangerous to conduct near populated areas. However, over the decades the population nearby mushroomed, so that there are now more than 150,000 people living within 5 miles of the site and more than half a million people living within 10 miles.

Federally funded studies found significant increases in death rates from key cancers among the SSFL workers associated with their work exposures, offsite migration of pollutants at levels in excess of U.S. Environmental Protection Agency (USEPA) levels of concerns, and a greater than 60% higher incidence of key cancers among people living near SSFL than those living further away. Because SSFL is located in hills overlooking the City of Los Angeles and other populated areas below, the contamination migrates downgradient, where neighboring communities can be exposed. Cleanup of the contamination source is therefore critical. However, DOE has had a history of resisting those cleanup obligations.

NRDC, City of Los Angeles, CBG v. DOE Lawsuit Blocked DOE's Prior Attempt to Walk Away from Cleaning Up Most of the Contamination

Fifteen years ago, DOE proposed cleanup standards for SSFL that would have left the great majority of the contamination not cleaned up. The City of Los Angeles, the Natural Resources Defense Council (NRDC), and the Committee to Bridge the Gap (CBG) filed a lawsuit in U.S. District Court, challenging the legality of DOE's actions under the National Environmental Policy Act (NEPA), 42 U.S.C. §4321, *et seq.* In 2007, in an Order highly critical of DOE, Federal District Judge Samuel Conti, granted summary judgment for the plaintiffs and against DOE.¹

In 2010, DOE and the California Department of Toxic Substances Control (DTSC) executed an Administrative Order on Consent (AOC), a legally binding agreement requiring the cleanup of contaminated soil (including the buildings) in Area IV and the NBZ to local background levels, to be completed by 2017. *2017 has arrived and the promised cleanup not only has not been completed, it has not yet even begun.*

In 2012, DOE committed that any EIS would be limited, with the exception of the required No Action alternative, to cleanup alternatives that were compliant with the AOC's required cleanup to background. Any alternative would be about how, not whether, to comply with AOC requirements, as the agreement mandated.

The 2017 DEIS Breaches DOE's 2010 and 2012 Commitments

Despite the above commitments, all alternatives considered in the DEIS would violate the AOC. As DOE states on page S-12 in the DEIS: "DOE expects that, in order for the implementation of any alternative to be consistent with the 2010 AOC, changes to the AOC would be required."

¹ Citations for all sources referenced in this letter are found in the Detailed Comments, attached.

72-1
cont'd

72-2

accident. With respect to the statements regarding burning radioactive and chemical waste in open pits, the Former Sodium Disposal Facility (FSDF) was used from 1956 to 1978 to clean alkali metals (sodium and potassium/sodium mixtures) from metallic components and other materials, and also received chemical waste and radionuclides. However, there was no active practice of burning of wastes in Area IV. The FSDF was remediated during the 1990s and released for unrestricted use (i.e., declared clean) in 1998 by the California Department of Health Services (now California Department of Public Health). During the course of operations and the period following operations there were numerous soil cleanup actions to remove radiologically and chemically-impacted soils. Some of these actions are described in Chapter 3, Section 3.2.5.3 of the EIS. Over the operation history of the site, there have been 272 numbered structures in Area IV. As the missions for the buildings ended, they were decontaminated and removed. Today only 22 structures, 18 DOE-owned and 4 Boeing-owned, remain in Area IV. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Please refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. As described in Section 2.10 of this CRD, SSFL Area IV is not "highly contaminated."

Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion of this topic and DOE's response. As described in Section 2.7 and as confirmed by EPA's radiological study and DTSC's evaluation of Area IV data, only small amounts of chemicals and no radiological contamination extends from Area IV. As stated in Chapter 3, Section 3.4.3, of this EIS, the monitoring well network established for Area IV and the NBZ demonstrates that the contaminants have not moved laterally off of DOE-administered areas of Area IV and the NBZ (groundwater plumes extend from Area IV into the NBZ but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.) Please refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

72-2 The commenter's statement that "The 2017 DEIS Breaches DOE's 2010 and 2012 Commitments" is inaccurate. DOE was sued by NRDC/City of LA/CBG for not complying with NEPA regarding the Environmental Assessment. The preparation

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

The AOC bars consideration of any "leave in place" alternatives. Yet all four of the DEIS alternatives would leave in place hundreds of thousands of cubic yards of contaminated soil, not cleaned up. **Alternative 1 would leave in place 34-39% of the contamination; Alternative 2 would leave in place 86-91%; Alternative 3 would leave in place at least 90%, and perhaps as much as 95 or 99%; and Alternative 4 would leave 100%.** For the second and third alternative, 98 of 116 toxic chemicals contaminating the area would not be cleaned up at all.

In Alternative 1, DOE proposes to exempt approximately half a million cubic yards of contaminated soil from cleanup. None of the claimed reasons comports with the very narrowly constrained exceptions allowed in the AOC.

In Alternative 2, DOE proposes to leave in place as much as a million cubic yards of contaminated soil. It proposes to not comply at all with the AOC's cleanup standard for toxic chemicals and to instead do no cleanup until contaminant concentrations are hundreds or thousands of times, and in some cases, millions of times, higher than the AOC's required cleanup levels. DOE asserts that these are risk-based limits based on DTSC's suburban residential Risk Based Screening Levels (RBSLs). However, in fact, the DOE proposed concentrations are hundreds and thousands of times higher than the DTSC-approved suburban residential RBSLs. DOE does this by leaving out the required backyard garden component of the residential RBSL. The risks to human health from these high contaminant concentrations is, thus, far greater than DOE asserts.

In Alternative 3, DOE proposes to leave even more contamination behind. This alternative incorporates the weak standards of Alternative 2, but additionally averages contamination over wide areas, so that if there is contamination in one place, it would not be cleaned up because it would be averaged with many acres of soil further away. Additionally, in this alternative, DOE proposes to allow radioactivity levels hundreds of thousands of times higher than the U.S. Environmental Protection Agency's preliminary remediation goals. Radiation doses equivalent to many chest X-rays a year would be allowed.

In Alternative 4, DOE proposes to do no cleanup whatsoever.

It is important to keep in mind that whatever the final end use of SSFL, large numbers of California citizens live nearby, with backyard gardens, and a primary purpose of the cleanup must be to eliminate the contamination source that puts them at risk from migrating pollution.

While claiming that its proposals to abandon large portions of the contamination are designed to protect biological features, in fact it is its contamination of the environment and reversal of promises to remediate that damage that pose the real ecological risks. DTSC has established ecological RBSLs, and the cleanup levels DOE now proposes to employ instead of those promised in the AOC are hundreds, thousands, and tens of thousands times higher. The refusal to clean up this contamination poses a risk to California's environment and to public health.

72-2
cont'd

72-3

72-4

of this EIS was in compliance with the order issued by the U.S. District Court for the Northern District of California. Section 6.1 of the AOC recognizes that DOE needs to do an EIS. Section 6.2 recognizes that the AOC is potentially inconsistent with that court's order and that the DOE's obligations under the AOC would be stayed, since the court's order remains in effect, and that parties could make modifications to the AOC. Section 6.2 also recognizes that DOE must perform an "environmental review" of which the EIS serves that purpose. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. That is what DOE has done in this EIS through the evaluation of the Cleanup to Revised LUT Values Alternative and the two scenarios of the Conservation of Natural Resources Alternative. The statements the commenter referred to as DOE's 2012 commitments were DOE's based upon information available at that time. The LUT values were not available and the radionuclide and chemical soil investigations were still ongoing. However, DOE's understanding of the implications of fulfilling that intent has changed, both in the impact of the actions required to meet and the feasibility of meeting that intent. Chapter 2, Section 2.3, of this EIS outlines several issues associated with the implementability of the 2010 AOC.

To date DOE has complied with all aspects of the AOC (see Section 2.2 of this CRD). The AOC provides that it can be modified if both DTSC and DOE agree on the need for change. DTSC is in the process of completing its Program Environmental Impact Report (EIR) (the draft was published in September 2017 [DTSC 2017b]). DTSC and DOE would need to reconcile any differences between the outcomes of these two environmental studies (DOE's as decided in the ROD(s) for this EIS and DTSC's Notice of Determination for its Program EIR). Should this reconciliation result in the selection of remediation actions that are not currently identified in the AOC, changes to the AOC would be required. Such changes are allowed (Section 8.0, Modification) upon mutual agreement (in writing) between DOE and DTSC.

DOE's knowledge regarding the nature and extent of soil contaminants, and the impact that the cleanup in accordance with the 2010 AOC LUT values would have without environmental benefit, has evolved since 2012. As discussed in Chapter 2, Section 2.3, of this EIS, DOE determined that there were technical issues and environmental concerns with implementing a cleanup according to the 2010 AOC. As a consequence, and in keeping with its responsibilities under NEPA, in the Draft EIS DOE developed two alternatives to the Cleanup to AOC LUT Values Alternative that meet the purpose and need of being protective of the environment and the health and safety of the public and workers. These two risk-based alternatives, the Cleanup to Revised LUT

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

DOE Lacks the Authority to Decide How Much Cleanup of its Contamination it Will Perform

An EIS is to be performed about *discretionary* federal agency actions. However, DOE has no discretion to ignore the requirements of the AOC. It is a legally binding set of obligations that DOE cannot unilaterally ignore.

Even were there no AOC, decisions as to how much of the chemical contamination to clean up are outside DOE's authority. Under the Resource Conservation and Recovery Act, those decisions are in the hands of DOE's regulator, DTSC. It is the regulator who decides how much cleanup is required, not the party that produced the contamination in the first place.

72-5

The DEIS Fails to Consider Reasonable Transportation Alternatives

Much of the DEIS appears to be an attempt to inflate the impacts of cleaning up while trivializing the risks of abandoning in perpetuity significant amounts of radioactive and chemical contamination. DOE asserts that there is little to no risk from the toxic and radioactive pollution but much inconvenience from the trucks needed to transport the contaminated soil for disposal. As discussed above, it does this by using risk-based screening levels that are orders of magnitude higher than the actual ones approved by DTSC and U.S. EPA, dramatically downplaying the true risks. At the same time, the DEIS fails to evaluate reasonable alternative methods of conveyance and routes.

72-6

Conclusion

DOE is obligated, having contaminated SSFL through its failure to follow proper environmental procedures, to clean the site up fully, as required by the AOC; to do so by the deadlines agreed to; and to mitigate impacts such as trucks hauling away contaminated material by a careful development of alternative transportation options in an EIS. Instead, DOE has dragged its feet for years since the AOC was issued, not only missing the deadline for completion of the cleanup, but not even beginning it. And now in a severely flawed DEIS, the federal agency flouts the authority of the California state agency charged with overseeing this important cleanup by proposing to breach the cleanup agreement it signed and instead leave the great majority of the contamination in place.

72-2
cont'd

The public that resides in the area surrounding the site will be placed at continued and perpetual risk if DOE continues on this course. We call this day for extensive revision of the DEIS so that it is fully in compliance with the AOC and DOE's commitments for a complete cleanup of the contamination for which it is responsible.

Values Alternative and Conservation of Natural Resources Alternative (two scenarios), are presented in Chapter 2, Section 2.4 of this Final EIS. As discussed in Chapter 1, Section 1.3, of this EIS, the U.S. District Court for the Northern District of California (Case No. 3:04-CV-04448-SC, May 2, 2007) issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued Record of Decision(s) (ROD[s]) pursuant to NEPA.

Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public. Under NEPA, DOE has a legal obligation to rigorously explore and objectively evaluate reasonable alternatives for cleanup in this EIS. The specific wording of DOE's purpose and need has been refined since it was first stated in the 2007 Advance Notice of Intent, but the overall message expressed by the statement has remained consistent – DOE needs to remediate those portions of SSFL for which it is responsible in a manner that is protective of the environment and the health and safety of the public and workers. The change noted by the commenter in the statement does not change DOE's responsibility for complying with agreements, as well as with other requirements such as regulations and orders.

Regarding the 2017 date for remediation start, a number of activities need to be completed before remediation can begin. In accordance with CEQA and consistent with Section 4 of the 2010 AOC, DTSC is preparing an EIR that addresses cleanup of all of SSFL (including areas for which NASA and Boeing are responsible). The *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* was issued by DTSC in 2017 (DTSC 2017b). The completion of both the CEQA and NEPA processes and certain regulatory actions must occur before DOE can complete the cleanup of soils and groundwater in Area IV and the NBZ. The regulatory actions required include the following: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by DOE in accordance with its regulatory authority provided in the AOC, and (4) DTSC approves the DOE-prepared RCRA closure plans for building

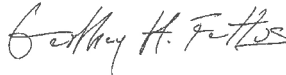

Section 3 – Public Comments and DOE Responses

Detailed Concerns Regarding the DOE Draft EIS on Cleanup of SSFL Area IV and the Northern Buffer Zone

cc:
Barbara A. Lee, Director, California Department of Toxic Substances Control, with Attachment
Matthew Rodriguez, Secretary, California Environmental Protection Agency, with Attachment
John Laird, Secretary, California Natural Resources Agency

demolition. In June 2017, DOE submitted a letter to DTSC (DOE 2017a) documenting the mutually acknowledged situation that cleanup cannot proceed until required environmental documents (e.g., this EIS, the DTSC program environmental impact report, remediation plans) are completed and that DOE was therefore unable to meet the 2017 cleanup expectations as described in the 2010 AOC (DOE 2017a).

72-3 Please see the response to comment 72-1. As described in that response, there is no evidence of contaminants above risk-based standards leaving Area IV and the NBZ. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act. In the Final EIS DOE presents the results of atmospheric modeling deposition of contaminants in nearby neighborhoods.

72-4 The comment is inaccurate. Ecological RBSLs have been developed jointly by all three parties (Boeing/NASA/DOE) and have been reviewed and approved for use by DTSC. The ecological RBSLs applied to the risk assessment are reflective of what DTSC would use throughout California as well as the risk assessment process applied at EPA CERCLA sites and would be protective of human health. DTSC was fully engaged in the development and application of criteria for the biological exemption process (see Appendix E of the Final EIS, Consultations). Protection of ecological receptors and human health were the primary factors in identifying areas where the exemption process would be implemented (i.e., locations with focused cleanup protecting human health and the environment).

72-5 The current provisions of the 2010 AOC are discussed in Chapter 1, Section 1.4 of the Final EIS. The 2010 AOC recognizes on page 19, DOE's legal requirement to prepare an EIS. Section 6.2 of the AOC states that the AOC would be stayed until DOE completes NEPA. NEPA requires every Federal agency to assess the potential impacts of its proposed actions that could have adverse environmental impact. NEPA's requirements apply to all Federal agencies that make discretionary approvals of proposed actions. These requirements apply when the action is proposed by the Federal agency or when another public or private entity's proposed action is being approved, permitted, funded (in whole or in part) or otherwise authorized by a Federal agency.

CONCLUSION45

72-6

As was done in the Draft EIS, this Final EIS analyzed an alternative that incorporates the technical elements of the AOC using the LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities (see Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). In response to public input since the 2010 AOC was signed, and as contemplated by the AOC and consistent with its obligations under NEPA, DOE also analyzed alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup levels. The use of soil risk-based criteria is consistent with the approach used by DOE throughout the US, by DTSC at other sites regulated by DTSC, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ.

DOE disagrees with the commenters' assessment that the EIS inflates the impacts of cleaning up and trivializes the risk associated with leaving chemical and radioactive contamination on site. DOE presented in the Draft EIS, and has refined in this Final EIS, estimates of the quantities of soil that would be removed under each soil remediation alternative, the acreage disturbed, the number of truck trips, the project duration, and the human health risk associated with residual chemical and radiological constituents that would be left on site. To characterize Area IV and the NBZ, there were more than 8,000 soil samples analyzed for chemicals and 3,000 soil samples analyzed for radionuclides. As a result of the radiological characterization, EPA did not find significant amounts of radioactive contamination. The soils characterization was the basis of the estimates of acreage that would be disturbed and the soil volumes that would require removal under each alternative. The magnitude of potential impacts on a number of resource areas (e.g., biological resources, noise, traffic, operational health and safety impacts) have a positive correlation with the acreage disturbed and/or volume of soil removed. For this Final EIS, DOE performed risk assessments of 19 exposure units in Area IV to represent the potential risk remaining following cleanup associated with each soil remediation alternative. The results, presented in Chapter 4, Section 4.9, show that all of the action alternatives would be protective of human health, with the risk of cancer incidence falling within the target risk range for remediation alternatives of 1 in 10,000 (1×10^{-4}) to 1 in 1 million (1×10^{-6}) (EPA 1991).

The commenter is mistaken in the statement that DOE "used risk-based screening levels that are orders of magnitude higher than the actual ones approved by DTSC and U.S. EPA." First, EPA has not established any standards for use by DOE at SSFL. EPA has not been involved in setting risk-based cleanup standards for SSFL.

Detailed Concerns Regarding the DOE Draft EIS on Cleanup of SSFL Area IV and the Northern Buffer Zone

A. BACKGROUND

The history of the site provided in the Draft Environmental Impact Statement (DEIS) is inaccurate and minimizes the problems. We provide here a more complete picture.

72-7

1. A History of Safety Considerations Subordinated to Other Concerns: Accidents, Spills and Releases

The Santa Susana Field Laboratory (SSFL) was established in the late 1940s for rocket testing and in the early 1950s commenced nuclear reactor work. In this initial incarnation, the site was supposed to be a remote field lab for work too dangerous to conduct near populated areas, and the original siting criteria stated that "care must be taken to select an area where prospects for population growth in the near future are not anticipated."¹ However, over the decades the population nearby mushroomed, so that there are now more than 150,000 people living within 5 miles of the site and more than half a million people are within 10 miles.²

SSFL housed ten reactors, plutonium and uranium fuel fabrication facilities, numerous nuclear "critical facilities," and a "hot lab" wherein highly irradiated nuclear fuel from around the nation was cut apart. The facility was operated for the Department of Energy (DOE) and its predecessor agency the Atomic Energy Commission (AEC), as part of the national nuclear complex from the years 1953 to 1998.

Safety considerations were "subordinated to other concerns from the outset."³ Despite being ranked 5th out of 6 candidate sites for the safety of meteorological conditions (in part because of nighttime migration of potentially contaminated air into the San Fernando Valley), the site was chosen as a nuclear testing site nonetheless, in large

¹ NAA-SR-30, *General Reactor Site Survey of the Los Angeles Area*, U.S. Atomic Energy Commission, June 1, 1949, as cited in *Report of the Santa Susana Field Laboratory Advisory Panel*, October 2006 (hereafter SSFL Panel Report), p. 8. <http://www.ssflpanel.org/files/SSFLPanelReport.pdf> The SSFL Advisory Panel was established at the initiative of local legislators in the early 1990s to oversee independent health studies of SSFL and the surrounding areas. Under its auspices, federally-funded worker studies by the UCLA School of Public Health were conducted in the 1990s, and in the next decade a series of studies about potential offsite effects funded by the State Legislature were prepared. This summary of the siting and accident history is drawn in part from the Panel's 2006 report; the reader is referred to the full report for more detail and supporting citations, which is incorporated herein by reference.

² SSFL Panel Report, pp. 8-9.

³ *id.*, p. 8.

Second, the risk-based screening levels used by DOE for the Revised LUT Alternative were taken directly from the SSFL Standardized Risk Assessment Manual (SRAM) (MWH 2014) that has been approved by DTSC for use in risk assessment applications at SSFL. Therefore, DTSC approved risk-based screening levels that were used in developing the Cleanup to Revised LUT Values Alternative in this EIS. These risk-based screening levels are consistent with the future use of SSFL as open space. This future use is established in two Grant Deeds of Conservation Easement and Agreements (conservation easements) The Boeing Company (Boeing) and North American Land Trust recorded with Ventura County in 2017 (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site.

DOE did not address alternative methods of soil transport in the EIS because DTSC was in the process of completing the required study at the time of EIS release. DTSC's transportation study (DTSC 2017) concluded that Woolsey Canyon Road was the only viable means of transport from SSFL.

Chapter 3, Sections 3.9.5 and 3.9.6, of the EIS provide information about accidents at Area IV, including the 1959 SRE accident. Section 3.9.6 explains that at the time of the accident it was estimated that the accident resulted in the release (over a 2-month period) of about 28 curies of radioactive noble gases such as krypton-85. The release was estimated to result in a maximum radiation dose at the location of the nearest resident of 0.018 millirem. Using current risk factors, this dose would have resulted in a risk of a fatal cancer to an exposed individual of 1×10^{-8} (one chance in about 93 million). A 1999 study by ATSDR estimated a maximum dose to a potentially exposed individual of 0.005 millirem with an even smaller risk of a fatal cancer. Because of public concern about the SRE accident, DOE hosted an informational workshop on August 29, 2009, with testimony from three independent experts (see http://www.etec.energy.gov/Community_Involvement/Public%20Meetings/SRE_Workshop.html). Two of these experts supported the estimate made at the time of the accident. They stated that releases at the time of the accident should have primarily involved noble gases, with only small releases of volatile fissions products such as iodine and cesium isotopes. One of the two experts was skeptical of the estimates of large health effects being experienced by individuals and the population. The third expert concluded that available information was inadequate to resolve the fraction of the noble gases and fission products that may have been released. This expert did not quantify public risks

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

measure because of convenient drive times from nearby universities. To compensate for the poor site conditions, and because the reactors would have no containment structures, a reactor power limit was set to limit radioactive inventory. But a decade thereafter, the AEC chose to build the Sodium Reactor Experiment (SRE) with power twenty times the limit, despite people living much closer than the original rule recommended.⁴

Poor environmental and safety practices resulted in at least four of the reactors suffering significant accidents, including a partial nuclear meltdown.

First, in March of 1959, the AE6 reactor released fission gases as a result of malfunction. Then blockage of coolant precipitated a power excursion and partial meltdown of the SRE in July 1959. The SNAP8ER accident damaged 80% of its fuel in 1964. A similar accident in the SNAP8DR resulted in damage to a third of its fuel in 1969.⁵ None of these reactors had a containment structure like modern reactors to prevent radiological releases into the environment.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

The events of June, 1959 at the SRE are emblematic of the problems caused by a troubled safety culture at SSFL.⁷ On that date, a fuel rod at the SRE, coated with sodium, exploded when it was washed with water in a "wash cell." The explosion lifted the shield plug out of the wash cell, and created "extremely high contamination levels within the entire building."⁸ A couple of weeks later, on July 13, the SRE experienced a power excursion—the reactor power suddenly began to increase exponentially, out of control, and the reactor barely was able to be shut down, or "scrammed." Yet, inexplicably, the operators of the reactor, unable to figure out what had caused the incident, started it up again two hours later, and continued to operate it for another week and a half, in the face of rising radioactivity readings (off-scale) and numerous other signs of reactor in trouble. When it was finally shut down, it was determined that 13 of 43 fuel elements had experienced melting.

Photo of Damaged Fuel Element; source: AEC/Atomics International

SRE Fuel "Melted Blob" (label in original); source: AEC/Atomics International

The accidents at the SRE, SNAP8ER and SNAP8DR all involved running the reactors for extensive periods of time while they were failing, despite clear indications of problems. As an AEC analysis⁹ of the SRE partial meltdown concluded:

[S]o many difficulties were encountered that, at least in retrospect, it is quite clear that the reactor should have been shut down and the problems solved properly. Continuing to run in the face of a known Tetralin leak, repeated scrams, equipment failures, rising radioactivity releases, and unexplained transient effects is difficult to justify. Such emphasis on continued operation can and often does have serious effects on safety and can create an atmosphere leading to serious accidents. It is dangerous, as well as being false economy, to run a reactor that clearly is not functioning as it was designed to function.

Nonetheless, the same pattern of continuing to operate reactors for long periods despite evidence of failing cores subsequently resulted in significant fuel damage in two other reactors at the site.

The problem of cutting safety corners was compounded by a culture of secrecy and a lack of candor. The AEC said nothing publicly about the SRE partial meltdown for

nearly five weeks. Finally, it issued a news release, embargoed for Saturday morning papers, saying that "a parted fuel element had been observed," that there were no indications of unsafe operating conditions and no radioactive release. However, in fact, the fuel had experienced not just parting, but melting. A third of the core underwent partial melting, not just a single fuel element. It was a clear indication of unsafe operating conditions, and radioactivity had been intentionally vented into the atmosphere for weeks.

Despite subsequent claims that only noble gases were released, independent experts have concluded that other radionuclides such as iodine-131 could have been vented into the atmosphere. One estimate is that over 260 times the I-131 released at the Three Mile Island accident could have been emitted by the SRE.¹⁰ The reactor had no containment structure; because of the coolant blockage, the coolant vaporized, and volatile radionuclides like iodine, cesium and strontium could have been emitted into the core cover gas, which was deliberately vented from the reactor and into the environment. Furthermore, a report by an eyewitness, John Pace, indicates that the reactor room became so radioactive that the large equipment door had to be kept open to vent radioactivity from the room to the outdoors.¹¹

¹⁰ Declaration of Arjun Makhijani, Ph.D., President of the Institute for Energy and Environmental Research, in *Lawrence O'Connor et al. v. Boeing North American, et al.*, U.S. District Court for the Central District of California, February 12, 2004, p. 24.

¹¹ <http://data.nbcstations.com/national/KNBC/1a-nuclear-secret/> The above photograph is from an AEC film about the accident, taken during the recovery operation. The labels have been added. Pace says the door had to be opened for extended periods during the accident itself because of high radiation readings.

72-7

Response side of this page intentionally left blank.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

By no means was the SRE partial meltdown the only problem at SSFL that led to releases. Much of the work at SSFL involved radioactively contaminated liquid sodium coolants for reactors, which burn if exposed to air and explode in the presence of water. There were radioactive fires at the hot lab and numerous other radioactive and chemical releases and spills. In addition, for decades, despite requirements to the contrary, radioactive and toxic chemical wastes were burned in open "burnpits." The resulting clouds of airborne contamination fell out over wide areas, including beyond the SSFL boundaries.

These and many other activities resulted in widespread radioactive and chemical contamination of air, soil, groundwater and surface water. Contaminants have repeatedly migrated offsite. The Los Angeles Regional Water Quality Control Board has fined Boeing more than a million dollars for scores of violations of pollution discharge limits for surface water leaving the SSFL site.¹²

DOE reports in its DEIS that the majority of the contamination is from over a hundred toxic chemicals. It has not explained how it managed to produce so much chemical contamination in addition to the radioactive pollution, and should do so. Some of the widespread chemical contamination likely came from the decades of open-air burning of wastes with toxic chemicals in burnpits, with the toxic plume spreading widely and resulting in airborne deposition. Any other poor practices that led to the chemical pollution should be disclosed.

A federally-funded study by the UCLA School of Public Health found markedly increased rates of death from key cancers for workers associated with their exposures.¹³ The most highly exposed workers had triple the deaths from those cancers as did less exposed SSFL workers.

A subsequent federally funded study by a team of researchers led by UCLA's Professor Yoram Cohen found evidence of contaminants having migrated outside the site boundaries and exposing the public at levels in excess of EPA levels of concern.¹⁴ A study by Dr. Hal Morgenstern of the University of Michigan, also federally funded, found

72-7
cont'd

72-8

72-9

72-8 A number of the statements in this comment are mistaken or misleading. First, the characterization studies that identified the locations of chemicals and radiological constituents exceeding the AOC LUT values in Area IV, but did not find "widespread" contamination from Area IV. EPA did not observe (HGL 2012b) widespread contamination and DTCS's evaluation of the data showed that the contamination remains primarily within Area IV (DTSC 2017a). The statement regarding violation of surface water discharge limits is general and does not provide information regarding Area IV. There have been no violations of stormwater limits from Area IV in recent years, particularly since the installation of stormwater control systems. See Section 2.7 of this CRD, "Offsite Impacts," for additional details regarding stormwater. DOE also notes that Boeing is responsible for the management of stormwater on its properties.

While DOE does agree that the majority of the constituents exceeding AOC LUT values in Area IV are chemicals (not radionuclides), neither the Draft nor this Final EIS presents this as being from "over a hundred toxic chemicals." The LUT published by DTSC lists 116 chemicals. DOE is not aware of why DTSC selected those 116 chemicals. Of the 116 chemicals listed by DTSC, only 62 were consistently (greater than 1 percent) identified in Area IV soil samples. Of those 62, 52 of the chemicals have a natural origin, meaning that some of them are present in Area IV independent of any DOE operations. The remaining chemicals are man-made. There were no burn pits in Area IV used to routinely burn wastes. The possible sources and causes of environmental contamination in Area IV have been addressed in other documents, including some referenced in this EIS (HGL 2012a, Sapere 2005). This EIS properly considered the contamination that exists at the site today and evaluates alternatives for remediation that would leave the site in a safe condition for its future use as open space.

72-9 DOE acknowledges that there have been numerous past studies of potential worker and human health impacts resulting for operations at SSFL and notes that different studies come to different conclusions and/or acknowledge uncertainty in the results. The older studies evaluate past operational conditions and not all of them distinguish between the areas at SSFL. More important than these past studies are the current conditions in Area IV and the NBZ, proposed remedial actions, and the potential onsite or offsite impacts that are considered and evaluated in this EIS.

The cited UCLA School of Public Health study (UCLA 1997), one of a number of studies that has looked at worker impacts, states that the "study indicates that occupational exposure to ionizing radiation among nuclear workers at Rocketdyne/AI has increased the risk of dying from cancers of the blood and lymph system. Despite the small numbers of deaths from these cancers in workers with relatively high doses,

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

a greater than 60% increase in incidence of various cancers in people living near the site associated with their proximity to it.¹⁵

SSFL is located atop the Santa Susana mountains overlooking significant populations in the City of Los Angeles and elsewhere. The site is contaminated with a wide range of radioactive materials, such as plutonium-239, cesium-137, and strontium-90, and over a hundred hazardous chemicals, such as dioxins, PCBs, heavy metals, and volatile organic compounds. Contaminants at the site can migrate offsite and expose those communities. Thus, the cleanup of the source of pollution above these communities is critical to their health. The issue thus is not merely a question of exposure to people at the site in the future, but to the people who live nearby. As we shall show, the failure to recognize this is a fundamental failure of the DEIS.

2. DOE's History of Resisting Its Cleanup Obligations

Along with the history of weak environmental and safety controls at SSFL, the AEC – and its successor the DOE – have long resisted doing anything more than a minimal cleanup of the contamination for which it was responsible, at this or its other polluted facilities across the country.¹⁶

After incidents like the Rocky Flats fires in the 1970s, the Three Mile Island meltdown in Pennsylvania in the late 1970s, and the 1986 Chernobyl accident in the former Soviet Union raised concerns with the widespread environmental and safety problems throughout the DOE nuclear complex nationwide, tentative attempts at reform were undertaken. Reviews were undertaken of environmental problems at DOE sites; one performed by DOE contractor (and thereafter, NRDC engineer) James Werner found widespread chemical and radioactive contamination at SSFL.¹⁷ Admiral James Watkins was brought in as Secretary of Energy to attempt to change the troubled “safety culture” at DOE. In 1991 an investigative “Tiger Team” team found significant problems in the safety and environmental program at SSFL.¹⁸ In 1995, in an effort to bring DOE into the modern era of environmental regulation, it entered into a Joint Policy with the U.S. EPA

72-9
cont'd

72-10

we observed associations for both external and internal radiation, and these associations are not likely to be chance findings...” A subsequent study by the International Epidemiology Institute (IEI 2005) found “A slight non-significant increase in leukemia (excluding CLL [chronic lymphocytic leukemia]) was seen among radiation workers, although a similar non-significant increase in CLL (a malignancy not associated with radiation) was also observed. A slight non-significant increase in kidney cancer and a slight non-significant decrease in bladder cancer were also seen among radiation workers.”

The Professor Yoram Cohen study did evaluate and identify various modes by which chemical and radioactive constituents migrated from SSFL during the period of operation. However, much of the information in the study is not relevant to DOE's current efforts to remediate Area IV and the NBZ as operations have not occurred for nearly two decades. If one is to use this study, it is appropriate to consider some of the details. The study states, “This study suggests that the major contaminant of concern is TCE...” but also identifies other chemicals and radionuclides. As shown in this EIS, there are TCE groundwater plumes in Area IV for which DOE is responsible. As described in Chapter 3, Section 3.4, DOE there is no longer a source of TCE in the soil above these plumes and the plumes do not extend off of SSFL. Remediation of these plumes is addressed in this EIS. The study also refers to radionuclides in soils of the Brandeis-Bardin Institute and notes that they were above health-based standards. But in footnotes, the study clarifies that the subject land is now part of the NBZ and that the health-based standard was based on a resident farmer scenario which is not applicable to the NBZ. As discussed in the response to comment 72-6, Area IV and the NBZ are part of land that is to be protected as open space in accordance with conservation easements filed with Ventura County (Ventura County 2017a, 2017b). Based on use of the future land use as dictated by the easements, the analysis in this final EIS shows that constituents in the NBZ would meet health-based standards (soil RBSLs). It should also be noted that a 2017 study regarding SSFL contaminants on Brandeis-Bardin property concluded, “While chemicals within the undeveloped portions of the Brandeis Bardin property bordering SSFL may exceed background...they do not exceed their respective risk-based screening levels,” “Contamination at SSFL does not pose a health threat to users of Brandeis Bardin Institute, or other off-site areas,” and “The Brandeis Bardin Campus is safe for use by campers, visitors, students, faculty, administrators or staff.”

Most relevant to the current conditions and the evaluation of remediation in this EIS are the results of more recent data and studies. The EPA characterization studies (HGL 2012a, 2012b) demonstrated that Area IV is not widely contaminated or contaminated

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

committing that all DOE nuclear sites in the country, irrespective of whether they were on the National Priority List, would be cleaned up consistent with EPA's CERCLA (Superfund) guidance.¹⁹ However, significant elements within DOE continued to resist these efforts at reform.

A clear example of this resistance can be found in the cleanup standards for the site. To wit, despite these critical findings and despite the Joint Policy entered into with EPA to carry out environmental remediation pursuant to EPA's CERCLA guidance, in the late 1990s, DOE and its contractor Boeing put forward cleanup standards for SSFL that were orders of magnitude more lax than the EPA CERCLA guidance and which would have left virtually all of the contamination not cleaned up.²⁰ In January 2002, DOE issued a Draft Environmental Assessment, and in 2003 a final Environmental Assessment and Finding of No Significant Impact approving those standards and its plan to leave substantially more than 90% of the radioactive contamination unremediated.²¹

Concerned about the plan to not clean up the great majority of the contamination and the failure to examine the environmental impacts of the harms associated with such weak cleanup choices, the City of Los Angeles, the Natural Resources Defense Council (NRDC), and the Committee to Bridge the Gap (CBG) filed a lawsuit in U.S. District Court, challenging the legality of DOE's actions under the National Environmental Policy Act (NEPA), 42 U.S.C. §4321, et seq. In 2007, in an Order highly critical of DOE, Judge Samuel Conti, granted summary judgment for the plaintiffs and against DOE.²²

In 2007, Judge Conti ruled against DOE. He noted, "Area IV is known to be radiologically contaminated and, in fact, was the location of at least one well-known nuclear meltdown....It is located only miles away from one of the largest population centers in the world....Among the primary purposes of NEPA, and the EIS process more specifically, is assuring the public is informed and aware of the potential environmental impacts of government actions....It is difficult to imagine a situation where the need for such an assurance could be greater." He therefore permanently enjoined DOE from "transferring ownership or possession, or otherwise relinquishing control over, any portion of Area IV until it completed an EIS and issued a Record of Decision pursuant to NEPA." The Court retained jurisdiction over the matter until it is satisfied that the DOE has met its legal obligations related to the remediation.

¹⁹ DOE & EPA, Policy on Decommissioning Department of Energy Facilities Under CERCLA, May 22, 1995, hereafter DOE-EPA 1995 Joint Policy.

²⁰ Approved Sitewide Release Criteria for Remediation of Radiological Facilities at the SSFL, December 12, 1998.

²¹ The EA was restricted to issues related to cleanup of radioactivity, recognizing that the cleanup of the chemicals was subject to the Resource Conservation and Recovery Act (RCRA) and those cleanup decisions were in the hands of the California Department of Toxic Substances Control.

72-10
cont'd

72-10

with a wide range of radionuclides. EPA's data show that strontium-90, cesium-137, and plutonium 239/240 were the most frequently observed radionuclides comprising more than 90 percent of the detections. As discussed in comment response 72-8, there are far less than 100 chemicals observed in Area IV soil samples. Risks to an offsite resident following cleanup of Area IV and the NBZ from material that potentially migrates from Area IV and the NBZ following cleanup would be less than those assessed for someone residing directly on the site. Regarding potential groundwater contamination, The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

As described in response to comment 72-1, DOE conducted historic operations under the laws and regulations applicable at the time.

The commenters are mistaken in stating that DOE has resisted doing cleanup within Area IV. More than 150 structures have been removed and there are numerous examples of soil cleanup actions (see response to comment 72-1.) Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ.

As the commenters state, this Final EIS is being prepared to comply with an order by the U.S. District Court for Northern California, which permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued ROD(s). There are valid reasons for delays in preparing this EIS. Subsequent to the court issuing the order, DOE and DTSC signed the 2010 AOC. In accordance with the AOC, and in response to comments DOE received during scoping activities, an extensive characterization effort was undertaken. DTSC and EPA characterized offsite locations to establish background levels of chemicals and radionuclides, respectively. DOE and EPA sampled and analyzed soil and sediments in Area IV and the NBZ for chemicals and radionuclides, respectively. These characterization data, as well as data collected on groundwater, were essential to defining a range of alternatives for cleanup of Area IV and the NBZ.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

Shortly thereafter, DOE issued a Notice of Intent to prepare an EIS. However, DOE dragged its feet for a decade and only now has issued the DEIS for comment.

3. The 2007 and 2010 Cleanup Agreements

a. The 2007 Consent Order

In 2007, the California Department of Toxic Substances Control (DTSC), which regulates toxic chemicals in California pursuant to federal delegation under the Resource Conservation and Recovery Act (RCRA), entered into a Consent Order with DOE and the other SSFL Responsible Parties (Boeing and NASA) in which the Responsible Parties were obligated to complete cleanup of soil and installation of the permanent groundwater remedy by mid-2017.²³ Contrary to the DEIS's claim at p. 1-4, that Consent Order does not mandate a cleanup to suburban residential standards but instead requires cleanup to normal DTSC procedures.²⁴ Those procedures, as shall be discussed shortly, rely on current County zoning and General Plan land use designations, which in the case of SSFL, allows a wide range of agricultural and residential (with garden) uses and would result in the most protective cleanup standards being employed, comparable, DTSC has written, to a cleanup to background.²⁵

b. The 2010 Administrative Order on Consent (AOC)

In 2010, in the face of mounting frustration by DTSC, the California Environmental Protection Agency (CalEPA), and state and federal legislators with what appeared to be continued foot-dragging by DOE mid-level personnel, Dr. Steven Chu, the Nobel-Prize winning physicist who was then the Secretary of Energy, and Dr. Ines Triay, the DOE Assistant Secretary for Environmental Management, proposed to the state that they enter into an agreement whereby the site would be cleaned up to local background; i.e., remove all the detectable contamination and return it to the condition it was in before DOE contaminated it. Over that year, there were numerous negotiating sessions with DOE and the state, with participation from some of the parties to the successful 2007 NEPA lawsuit, to hammer out the written agreement, first an Agreement in Principle (AIP) and then the full Administrative Order on Consent (AOC), which incorporated the AIP. After two rounds of opportunity for public comment, in which more than 3000 comments were received, of which all but a handful were strongly in favor, DTSC and DOE executed the AOC in December, 2010. The AOC resolved the primary concerns that had resulted in the filing of the action before Judge Conti in the first place.

²³ Consent Order, p. 20.

²⁴ The word "residential" appears in the Order only to describe the existence of residential areas near the facility, and never to specify a cleanup standard for SSFL.

²⁵ DTSC, Response to Comments, Agreements in Principle, State of California and the Department of Energy, of California and the National Aeronautics and Space Administration, (hereafter DTSC Response to Comments on Agreements in Principle), October 26, 2010, Volume I, pp. 11-12, 14-7, 21.

|| 72-10
cont'd

|| 72-11

|| 72-12

72-11 The commenters are mistaken in the assertion that the Consent Order requires a risk assessment based on future land use as agriculture or resident with garden. The Consent order only states that risk assessment would be based on the approved SRAM, which is what DOE followed considering the future use of the land. Risk assessments are based on the most likely future land use scenario, not zoning. County plans and land use designations are always subject to revision based on changes in land use. In addition, the Boeing Land Use Covenant prevents agricultural use of the land, so agricultural is not a potential future land use. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site, and firmly establishes the basis for establishing cleanup levels based on use of the land as open space. The use of RBSLS that do not include the indirect garden pathway is appropriate for this future land use.

72-12 DOE has provided a response to the interpretation of the AOC and the commenter's discussion of commitments in response to comment 72-2. Please refer to the response to comment 72-2 for a discussion of DOE's actions.

In stating the quantity of contamination left behind under each alternative, the commenters have mistakenly correlated the soil volumes associated with each of the alternatives discussed in this EIS with a quantity of contamination. It is important to note that under all of the soil remediation action alternatives, those soils with the higher levels of chemical and/or radioactive constituents, that is, those that would pose a risk to human health or the environment, would be removed. Only soils that do not pose a risk to human health (or the environment) would remain.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

There are several key components of the AOC. (1) It is legally binding; DOE cannot unilaterally choose not to comply with any part of it. (2) Cleanup of soil shall be to local background. (3) For the purposes of the AOC, soil is defined to include structures, debris, and other anthropogenic materials. (4) There is to be no averaging; any contamination above background is to be cleaned up. (5) The deadline for full soil cleanup was 2017. (6) All waste with radioactivity above background must be disposed of in licensed or authorized low-level radioactive waste disposal facilities. (7) No risk assessment would be required, as the cleanup was to background. And (8) critically, no "leave in place alternatives will be considered."

Drs. Chu and Triay subsequently left DOE; the personnel who had frustrated past efforts at cleanup resumed their efforts; and *the deadline for completion of cleanup of soil and installation of the final groundwater remedy passed without either even starting*. In January 2017, DOE issued its DEIS. And in it, DOE broke its commitments in the AOC and its past promises about any EIS. Every alternative DOE presents in the DEIS would abandon in place large amounts of contamination, despite explicit prohibition against such a decision in the AOC. **Alternative 1 would leave in place 34-39% of the contamination; Alternative 2 would leave in place 86-91%; Alternative 3 would leave in place at least 90%, and perhaps as much as 95 or 99%; and Alternative 4 would leave 100%.** Furthermore, DOE also has broken its prior commitments that any EIS would be limited to different technologies that would conform to its obligations under the AOC to clean up all the detectible contamination, i.e., to local background, not whether to do so.

B. DOE VIOLATES PAST COMMITMENTS ABOUT EIS SCOPE, PURPOSE AND NEED

1. Scope of EIS Was to Be How to Meet the AOC, Not Whether to Comply

In 2011, NASA proposed an EIS that would have included numerous alternatives that would have violated the AOC. DTSC wrote to NASA that this was inconsistent with the AOC and demanded that it reverse course.²⁶

The matter was of such concern that Senator Boxer arranged a high-level meeting in Washington, D.C. with herself, the NASA Director, the Chair of the White House Council on Environmental Quality (CEQ), and the DTSC and CalEPA heads.²⁷ NASA asserted that the National Environmental Policy Act required it to evaluate alternatives that would breach the AOC.²⁸ The others disputed that notion, and it was agreed that CEQ, as the federal authority on NEPA, would issue an opinion.

CEQ issued that conclusion on June 19, 2012, finding that NEPA does not require the consideration of infeasible alternatives, and since NASA must comply with the AOC, alternatives that breach it need not be considered.²⁹ As the Chair of CEQ wrote, “there is no requirement that NASA consider alternatives that cleanup to other standards that differ from the agreement NASA signed with the State.” CEQ continued, “In view of NASA’s administrative cleanup resolution with the State of California, which turns upon NASA’s commitment to clean the site to local background levels, CEQ’s view is that – under this rule of reason – NASA is not compelled to consider less comprehensive measures as alternatives.” She noted further that “The Supreme Court has long recognized that CEQ’s interpretation of NEPA and its regulations is entitled to substantial deference.” NASA subsequently agreed to restrict its EIS accordingly.³⁰

In its efforts to get NASA to comply with the AOC in any environmental review, DTSC noted that DOE was preparing an EIS whose scope was consistent, looking at

²⁶ Letter from Debbie Raphael, DTSC Director, to Allen Elliott, SSFL Project Manager, NASA, September 19, 2011. See also letter from DTSC Director Raphael to NASA Administrator Bolden, May 22, 2012, demanding that “NASA modify the scope of its NEPA process to align itself with the project that NASA is actually undertaking – a cleanup to background levels of contaminants in compliance with the AOC – and not an evaluation of alternative cleanup standards that are not related to the project....”

²⁷ See letters of March 29 and 30, 2012, from Senator Boxer to NASA Administrator Bolden, and DTSC public announcement of March 30, 2012.

²⁸ See also letter of Allen Elliott to Debbie Raphael of August 9, 2011.

²⁹ Letter from CEQ Chair Nancy Sutley to Senator Barbara Boxer, June 19, 2012.

³⁰ See Allen Elliot, Program Director, SSFL, NASA, *Update on NASA’s National Environmental Policy Act Compliance for Santa Susana Field Laboratory*, July 19, 2012; and James Wright, NASA Associate Administrator, to DTSC Director Raphael, July 10, 2012.

72-13

72-13

The commenters do not include all of the guidance provided by CEQ in its letter on the NASA EIS. Although CEQ did say that feasibility is a consideration for identification of alternatives, CEQ also stated that “nothing under NEPA or CEQ regulations constrains NASA from looking beyond cleanup to background, even though some may consider the analysis unnecessary and inconsistent with the agreement.” CEQ also made it clear that NEPA regulations require agencies to “rigorously explore and evaluate objectively all reasonable alternatives, including reasonable alternatives that may not be ‘within the jurisdiction of the lead agency.’” DOE considers that alternatives that are consistent with the manner that EPA and DTSC conduct soil cleanups to be reasonable alternatives and thus have incorporated such into the Draft and Final EIS, even though some individuals may consider those alternatives beyond the jurisdiction of the lead agency.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

various ways to achieve the required cleanup to background, not whether to fulfill the requirements of the AOC. Citing DOE's April 2012 fact sheet for its DEIS process, DTSC noted that DOE had made it clear "that it is defining its project as a cleanup to background levels, as required by its AOC. DOE has been careful not to identify potential alternatives that do not meet its AOC cleanup objective."³¹

72-13
cont'd

Indeed, in May 2012, DOE issued a notice "Public Participation in the Development of Alternatives to be considered in the Santa Susana Field Laboratory Area IV Environmental Impact Statement." In it DOE acknowledged that DTSC was the regulator and had the regulatory authority over the cleanup, that DOE was obligated to carry out the AOC requirement to clean up to background, and that the EIS would be limited to alternative ways to achieve that cleanup standard:

What is the cleanup standard (how clean must Area IV be upon completion of cleanup)?

DOE has signed two agreements with the California Department of Toxic Substances Control: the 2007 Consent Order for Corrective Action and 2010 Administrative Order on Consent for SSFL Area IV. Those agreements stipulate cleanup standards – how clean the site must be before cleanup can be declared completed. DOE is committed to full compliance with both the 2007 and the 2010 orders. However, neither Order dictates how DOE should accomplish the cleanup standards. For that reason, the EIS will explore if there are reasonable alternatives for accomplishing the cleanup levels that are stipulated in the Orders.

72-12
cont'd

DOE went on to say "DOE agrees that the AOC committed DOE to clean up to background," and that the EIS would therefore be restricted to how to do that. DOE stated that the "2007 and 2010 orders dictate how clean the site must be before the cleanup can be declared complete" but don't dictate how to achieve that level of cleanup. "[T]here may be more than one way to accomplish cleanup to background; DOE believes that it would be prudent to evaluate if there might be more than one way to accomplish the AOC's requirement of cleanup to background." In short, any EIS would be limited to analysis on how to achieve a cleanup to background, not whether to do so in the first instance.

Response side of this page intentionally left blank.

³¹ Raphael May 22, 2012 letter, *supra*.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

However, the DEIS that DOE just issued breaks those (previously) clearly articulated commitments. Indeed, every option examined would breach the AOC.³² DOE concedes this in the DEIS saying that the AOC

requires soil cleanup to the AOC LUT [Lookup Table] values, which are based on soil background levels or method/minimum detection limits. *DOE expects that, in order for the implementation of any alternative to be consistent with the 2010 AOC, changes to the AOC would be required.*

(emphasis added)³³

2. The DEIS Has Shifted from Matters that Were Arguably within DOE's Discretion (How to Meet the Cleanup Requirements) to Decisions That Are Not Its to Make (Whether to Meet the Cleanup Requirements) and Ignores State Authority Over the Cleanup

NEPA is triggered by *discretionary* federal agency actions. It is to inform federal agency decisions. In 2012, DOE fully recognized that DTSC was the regulator and decision-maker about how much contamination DOE must clean up. As it wrote then in its April 2012 notice:

Who is the regulator for cleanup of Area IV at SSFL?

The California Department of Toxic Substances Control (DTSC) has the regulatory authority to direct the cleanup at SSFL.

In the DEIS as issued, however, DTSC is barely mentioned. As it is currently written, the DEIS suggests the decisions as to how much of DOE's contamination DOE must clean up are DOE decisions, not ones that it will reach under the purview of its regulator for the cleanup of chemical contamination. There is an occasional reference in the text (e.g., at p. S-12) that to undertake any of the alternatives DOE proposes, the AOC would be breached, but no real acknowledgment that that is not DOE's decision to make. The AOC is an enforceable contract between DOE and its hazardous waste regulator the DTSC, and DOE has no discretion to ignore its obligations under the AOC. And in that

³² In so doing, DOE now makes the same arguments NASA had originally made and which CEQ had rejected.

³³ DEIS, p. S-12. The DEIS identifies a total of four soil cleanup alternatives, one of which is characterized as a cleanup to AOC lookup tables, but with roughly half a million cubic yards of contaminated soil excluded from the cleanup to those requirements. All four alternatives are inconsistent the AOC, as conceded here in the DEIS.

72-12
cont'd

72-14

72-14 The commenters misinterpret the meaning of “discretionary” when it applies to a Federal agency’s requirement to assess the impacts of a decision (such as signing the AOC) versus the decision for cleanup. The purpose of the EIS is to fulfill the requirement for DOE to complete the NEPA process. This is an obligation separate from issues with the AOC and requires an analysis according to the parameters of NEPA. These include a full consideration of all reasonable alternatives to accomplish the goal of site remediation.

The authors of the AOC recognized the potential need for changing components of the AOC and included it in Section 8.0 of the AOC. This recognition is stated in Draft EIS Chapter 2, Section 2.2.1 where in order for an alternative to be implemented the AOC would need to be changed. DOE’s assessment of the AOC language is that the AOC cannot be implemented under its current form. DOE has discussed the implementability issues with DTSC and DTSC has identified some areas that could be changed. The Final EIS accurately notes in Chapter 2, Section 2.2.1, that the 2010 AOC allows (allowed by Section 8.0 of the AOC) DOE and DTSC to agree upon changes to better meet cleanup objectives. DOE expects that it would engage DTSC in discussions about such changes in order to implement any soil remediation alternative. (Please see Section 2.2, “Compliance with the 2010 Administrative Order on Consent” of this CRD).

Regarding the commenter’s statement that “DTSC is barely mentioned in the Draft EIS. In the 107 page summary, DTSC is introduced on page S-1 and identified on several pages, including; relative to the AOC, S-5, S-6, S-12 and S-16, in terms of DTSC’s regulatory role, pages S-13, S-22, S-25, S-26, S-28, S-30, and S-34 in terms of DTSC’s AOC involvement. DTSC is mentioned in about half of the pages of the 31-page Chapter 1 and DTSC is mentioned in 10 of the first 20 pages of Chapter 2 of the EIS.

Also, the statement that the Draft EIS has “morphed into a decision document” is wrong. The EIS is not a decision document. No decision is being made in the EIS. The analyses within an EIS are just one of many considerations to be used by decision-makers in making an informed subsequent decision.

The commenters are inaccurate with their statement that the DEIS is in “virtual silence about either the legally binding nature of the AOC or the existence of DTSC” and “the AOC is not even explicitly mentioned in the Introduction Section 1 as one of the requirements.” As shown above, DTSC is mentioned numerous times. The AOC and its details are discussed in Page 1-7 of Section 1. DOE is aware of the Joint Policy noted by the commenters. The commenter is mistaken in saying that all alternatives

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

AOC, DOE consents (and indeed, has no recourse to do otherwise) to DTSC regulatory authority over all aspects of the chemical and radioactive cleanup.

Bluntly, even absent the AOC, under RCRA, DOE lacks the authority to unilaterally decide how much of its chemical contamination to clean up, unless the State of California expressly cedes its authority to the federal agency entirely, which it has not done so, here or anywhere else. RCRA contains a waiver of federal immunity, so DOE must comply with it like everyone else; and RCRA authority has been delegated in California to DTSC. It is for that reason that DOE's 2003 Environmental Assessment did not even attempt to cover chemical cleanup decisions, acknowledging that that matter is within DTSC's authority. But in the DEIS, DOE says *it* will make a decision—issue a Record of Decision—about what cleanup option *it* chooses for its toxic chemical pollution. This is not a matter it gets to choose. DOE is the polluter, the regulated entity; the decision about how much of its pollution it must address rests with the regulator, DTSC, not the polluter.

A remarkable fact about the DEIS is its virtual silence about either the legally binding nature of the AOC or the existence of DTSC and its duly entitled state authority over the cleanup. In the DEIS, DOE essentially pretends it is the “decider,” free to choose to ignore the AOC at will and free to decide to leave as much of its pollution not cleaned up as it wishes. Neither is true.

For example, the AOC is not even explicitly mentioned in the Introduction Section 1.0 as one of the requirements DOE must meet, nor in the Purpose and Need for Agency Action (Section 1.1) on p. 1-1. In Chapter 9, identifying the requirements that DOE must follow, the AOC is relegated to a short reference under “Waste Management.” p. 8-3, 8-20. The AOC, of course, controls far more than waste management; it governs the entire cleanup.

Similarly, the DEIS simply ignores the fact that DOE can't choose to walk away from the AOC, that it is a contract with DTSC, and that in the AOC, DOE concedes to DTSC the power over the cleanup decisions. Additionally, DTSC's authority over the chemical cleanup pursuant to RCRA, even absent the AOC, is essentially ignored. DOE has drafted a DEIS as though the binding nature of the AOC and the authority of its regulator DTSC under the AOC and under RCRA don't exist.

A central failing of the DEIS is that it has morphed into a decision document for the central matters about how much it will cleanup, which is not DOE's to decide in the first place and something that is already done, per the AOC. The DEIS is essentially an assault on the state's authority under RCRA and pursuant to the AOC. DOE does not get to decide the very issues it has chosen to prepare the DEIS for, making it invalid.

Furthermore, even were there no AOC—and there is—and no DTSC regulatory authority over DOE—and there is—DOE would still be required to follow EPA CERCLA guidance for the cleanup of the radioactive and chemical contamination, pursuant to the 1995 DOE-EPA Joint Policy. All of the options DOE has put forward are

presented are at variance with EPA guidance. This EIS does include an alternative/ scenario consistent with the approach and process used by EPA in CERCLA cleanups (the Conservation of Natural Resources Alternative).

72-14

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

at variance with that EPA guidance, in addition to breaching both the AOC and DTSC's RCRA authority.

3. Erroneous "Purpose and Need for Action" Statement in the DEIS

In 2012, DOE, noting that "NEPA requires a statement of the purpose and need for action in every NEPA document," defined the purpose and need as follows:³⁴

DOE needs to complete cleanup of Area IV and the Northern Buffer Zone in compliance with regulations, orders and agreements, *including the 2007 Consent Order (groundwater) and the 2010 Administrative Order on Consent (soil)*. The purpose of the project is to remove the remaining structures of Area IV of the SSFL and cleanup the affected environment in a manner that is protective of the environment and the health and safety of the public and Area IV workers.

(emphasis added)

However, the DEIS as issued has changed the "purpose and need for agency action" statement to now read:

DOE needs to complete remediation of SSFL Area IV and the NBZ to comply with applicable requirements for cleanup of radiological and hazardous substances. These requirements include regulations, orders, and agreements. To this end, DOE needs to remove the remaining DOE structures in Area IV of SSFL and clean up the affected environment in Area IV and the NBZ in a manner that is protective of the environment and the health and safety of the public and workers.³⁵

The explicit purpose and need to comply with the 2007 Consent Order for cleaning up groundwater and with the 2010 AOC for cleaning up soil has been dropped. This is no mere oversight, as indeed, all alternatives presented in the DEIS abrogate the AOC requirement of cleanup to background. The 2012 commitments have been breached, and the DEIS, rather than analyzing how to carry out the AOC cleanup to background, now merely presents four alternatives to breach it. The purpose and need statement must return to the 2012 promise, and any new iteration of the DEIS must comply with both the 2012 commitments and the AOC.

³⁵ pp. S-2, 1-1.

72-14
cont'd

72-15

72-15 The specific wording of DOE's purpose and need has been refined since it was first stated in the 2007 Advance Notice of Intent, but the overall message expressed by the statement has remained consistent – DOE needs to remediate those portions of SSFL for which it is responsible in a manner that is protective of the environment and the health and safety of the public and workers. The change noted by the commenter in the statement does not change DOE's responsibility for complying with agreements, as well as with other requirements such as regulations and orders. Please see Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of assertions that none of DOE's alternatives would clean up Area IV and the NBZ in accordance with the 2010 AOC. As discussed in Chapter 2, Section 2.3.3, of this EIS DOE determined that there were technical issues with implementing a cleanup according to the 2010 AOC LUTs. As a consequence, and in keeping with its responsibilities under NEPA, DOE developed two alternatives to the Cleanup to AOC LUT Values Alternative that meet the purpose and need of being protective of the environment and the health and safety of the public and workers. These two risk-based alternatives, the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative, are presented in Chapter 2, Section 2.4, of this EIS.

C. All Soil Cleanup Alternatives Violate the AOC, DTSC RCRA Authority, and the 1995 DOE-EPA Joint Policy

We discuss each soil cleanup alternative below.

1. Alternative I – Which Leaves in Place 34-39% of the Contaminated Soil

While acknowledging in the DEIS that all alternatives breach the AOC, at other times DOE misleadingly suggests this first alternative is compliant with the AOC. It labels this option as cleanup to AOC Lookup Table (LUT) values. Yet DOE proposes to leave in place at least 480,000 cubic yards of the 1,413,000 cubic yards of soil contaminated above those limits, or 34%.³⁶ Because the DEIS says DOE also intends to assert an additional exception of up to 5% of total soil volume and leave that also in place, but hasn't included that leave-in-place volume in the totals,³⁷ this option, like all the others, can be an additional 5% higher, for a total of 39%, or 550,000 cubic yards, of the contaminated soil being left in place. As is repeatedly the case in the DEIS, there is no acknowledgment that DOE doesn't get to make that decision, that any such exceptions must comply with the AOC and must be approved by DTSC.

The AOC contains some very tightly delimited exceptions to the requirement to clean up all contamination to background.³⁸ Because DOE in the DEIS misrepresents them as it implies they allow it to leave in place more than half a million cubic yards of contaminated soil, reprinting the exceptions from the AOC here may be helpful:

³⁶ DEIS Summary, p. S-19.

³⁷ DEIS Summary, p. S-21.

³⁸ AOC, Appendix B, pp. 1-2.

72-16

72-16 The commenters are mistaken when they state that DOE acknowledges that all alternatives “breach the AOC.” The Cleanup to AOC LUT Values Alternative incorporates the technical elements of the AOC and DOE makes no claim that it “breach[es] the AOC.” The Cleanup to Revised LUT Values Alternative incorporates the technical elements of the AOC except that it substitutes RBSLs as soil cleanup standards. DOE recognized in the Draft EIS that DTSC would need to amend the AOC to allow substitution of the RBSLs as soil cleanup values. Please see the response to comment 72-1.

The commenters are inaccurate regarding their statement that the “AOC contains some very tightly delimited exceptions to the requirement to clean up all contamination to background.” The AOC exemptions are based first and foremost on DOE’s compliance with Federal, State, and local laws. The AOC, including application of the exemption process, does not affect compliance with laws. The limits to exemptions, per the AOC, are based on consultation with USFWS and determination of Native American artifacts formally recognized as cultural resources. There are no limits to volumes or acreages subject to the biological or cultural exemptions specified in the AOC. DOE did not misrepresent exemption areas and volumes in the DEIS. The areas and volumes are based on a series of meetings attended by USFWS, CDFW, and DTSC, and ongoing discussions with SHPO.

Please refer to Section 2.4, “Application of Exemptions under the 2010 Administrative Order on Consent” of this CRD for a discussion of this topic and DOE’s response. As stated in Section 2.4, DOE described proposed exemption areas in the Draft EIS and proposes a methodological approach to evaluation of chemical and radiological data to develop focused removal actions to be conducted within the proposed exemption areas with the oversight and participation of appropriate agencies. The EIS estimates of soil to be removed based on application of the exemption process are based on data available to develop the EIS and the volumes would be refined as detailed remediation plans are developed and implemented.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

SUMMARY: The end state of the site (the whole of Area IV and the Northern Buffer Zone) after cleanup will be background (i.e., at the completion of the cleanup, no contaminants will remain in the soil above local background levels), subject to any special considerations specified below.

- Clean up radioactive contaminants to local background concentrations.

Possible exceptions (*where unavoidable by other means*):

- The framework acknowledges that, where appropriate, DOE will engage in an Endangered Species Act (ESA) Section 7(a)(2) consultation with the U.S. Fish and Wildlife Service (FWS) over any species or critical habitat that may be affected by a federal action proposed to be undertaken herein on a portion of the site. Impacts to species or habitat protected under the Endangered Species Act may be considered as possible exceptions from the cleanup standard specified herein only to extent that the federal Fish and Wildlife Service, in response to a request by DOE for consultation, issues a Biological Opinion with a determination that implementation of the cleanup action would violate Section 7(a)(2) or Section 9 of the ESA, and no reasonable and prudent measures or reasonable and prudent alternatives exist that would allow for the use of the specified cleanup standard in that portion of the site.

- The acceptance and exercise of any of the following exceptions is subject to DTSC's oversight and approval, and the resulting cleanup is to be as close to local background as practicable:

- Detection limits for specific contaminants exceed the local background concentration, in which case the cleanup goal shall be the detection limits for those specific contaminants.

- Native American artifacts that are formally recognized as Cultural Resources.

- Other unforeseen circumstances but only to the extent that the cleanup cannot be achieved through technologically feasible measures. Under no circumstances shall exceptions for unforeseen circumstances be proposed in excess of five percent of the total soil cleanup volume.
(italics and underlining added³⁹)

72-16 cont'd

Response side of this page intentionally left blank.

³⁹ AOC, Appendix B, p. 1; there are identical exemptions for chemical contaminants on p. 2.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

Thus, the only biological exception in the AOC to the requirement to clean up to background is if U.S. Fish and Wildlife Service issues a Section 7 Biological Opinion with a determination that implementation of the cleanup action would violate Section 7(a)(2) or Section 9 of the ESA, and no reasonable and prudent measures or reasonable and prudent alternatives exist that would allow for the use of the specified cleanup standard in that portion of the site. The only cultural exemption is for formally recognized Native American artifacts, and DTSC must approve the exception. And the up to 5% “unforeseen circumstances” exemption also requires DTSC approval and exists only to the extent that the cleanup cannot be achieved through technologically feasible measures. Furthermore, no exception can be applied unless it is demonstrated to be unavoidable by other means and the resulting cleanup is as close to background as practicable. As shall be discussed below, none of the conditions necessary to trigger an exception has been met. In apparent recognition of this, DOE admits that this option, like all the others, is not in compliance with the AOC and for it to go forward, the AOC’s requirements would have to be altered.⁴⁰

72-16
cont'd

a. Proposal to Leave in Place 150,000 cubic yards of soil contaminated with TPHs and PAHs

DOE states that for all alternatives, it will leave in place 150,000 cubic yards of soil contaminated with Total Petroleum Hydrocarbons (TPHs) and Poly Aromatic Hydrocarbons (PAHs).⁴¹ It argues that these will be left in place to “naturally attenuate.” However, the AOC bars consideration of any leave in place alternative.⁴² The AOC expressly states, “No ‘leave in place’ alternatives will be considered.” Note that not only are leave in place alternatives prohibited from being employed, they are barred from even being considered.

72-17

DOE says natural attenuation could take up to 70 more years, whereas the AOC required cleanup in just a few years. If DOE did what it proposes, those contaminants would be left in place, available for offsite migration, for a lifetime. Given that the contamination was created as much as seventy years ago, it would thus have been not cleaned up for nearly a century and a half if DOE was able to breach the AOC this way.

72-17

The 2010 AOC allows for onsite treatment of soils (Section 2.9 Paragraph 5) and natural attenuation was included as a treatment option in the EIS for TPH-only soil at the suggestion of DTSC staff. The Draft EIS states that natural attenuation would be applied to soil with “low concentrations” of TPH’s where they are the only chemical exceeding comparison criteria. The study referenced by the commenters evaluated soil contaminants in addition to TPH and the study conclusions were based on the other contaminants. DOE is not proposing to use MNA for the chemicals that may take longer than TPH to degrade. The chemicals referred to in the comment that require 70 years degrade are complex polycyclic aromatic hydrocarbons, or PAHs, and these chemicals are not included within volume of soil designated for natural attenuation. See Chapter 2, Section 2.3.2 of this Final EIS for additional information.

But in fact the time period appears far longer. The source DOE cites for the 70 year estimate⁴³ merely refers to another source⁴⁴ for the number and correctly points out

⁴⁰ DEIS p. S-12.

⁴¹ DEIS p. S-21.

⁴² See p. 3, Appendix B, AOC. DOE tries to conflate the prohibition on “leave in place” alternatives with the prohibition on “onsite burial or landfilling of contaminated soil,” but these are separate prohibitions. DOE also appears to try to claim leaving it in place is onsite treatment, but it is of course just the opposite—no treatment at all, just leaving it there.

⁴³ CDM Smith 2015b.

⁴⁴ Nelson, et al. 2014.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

that this was based merely on a "Phase I literature search." In truth, the study relied upon (Nelson, et al. 2014) says the amount of time could be far longer, because the rates of attenuation slow dramatically after the easiest material degrades, which has already long ago occurred, and because site specific conditions of weathering also would tend to prevent degradation. The initial estimates were based on first-order approximations from the literature, but the report said site-specific studies were needed to determine likely attenuation rates at SSFL. As the Nelson, et al. study stated about the first-order estimate of ~70 years:

An important assumption in the above calculations was that the same first-order rate constant would be valid throughout the remediation period. As stated above, there are a couple of reasons this may not be a valid assumption: 1) The more easily biodegraded fractions of the hydrocarbon mixture will biodegrade first, leaving the more recalcitrant compounds towards the end, and 2) some fraction of the hydrocarbons will likely remain sequestered in the soil matrix and unavailable for biodegradation. For these reasons, longer remediation times than those calculated ... may be required at SSFL.

Nelson et al. concluded in that study, "It would be helpful to run microcosm experiments under conditions mimicking those at SSFL to get a better idea of potential biodegradation rates at SSFL."

Nelson and his team (their studies were performed under contract to DOE) followed up that Phase I literature search with actual tests for SSFL-specific conditions. Those measurements under SSFL actual soil conditions resulted in "essentially no change" in concentrations for any of the unamended samples tested.⁴⁵ Thus, the actual studies prepared for DOE do not support the claim that the TPHs at SSFL can be left to naturally attenuate. But even were the claim of 70-year attenuation periods correct—and they aren't—leaving the contamination in place for an additional 70 years would violate the AOC and pose continuing risks.

It is important to keep in mind that the DOE-funded Nelson studies were not aimed at natural attenuation but at identifying soil treatment options. The former is barred by the AOC but the latter, if it works effectively and quickly, is allowed. The Nelson studies concluded that natural attenuation wouldn't work but that more research should be conducted on possible methods of treatment. One of the failures of the DEIS is the failure to adequately address possible treatment methodologies.

The refusal to clean up these 150,000 cubic yards of contaminated soil but rather leave them in place thus violates the AOC's requirement that "no 'leave in place' alternatives will be considered, and they thus should not be considered.

b. DOE Also Intends To Avail Itself of An Additional Asserted Exception For 5%, or 70,650 Cubic Yards, of The Contaminated Soil Volume. Again Violating the AOC's Very Limited Exceptions

The AOC exception is limited to “unforeseen circumstances but only to the extent the cleanup cannot be achieved through technologically feasible measures” and requires DTSC approval. Remarkably, DOE is asserting now that it *foresees* claiming such *unforeseen* circumstances. DOE argues that deciding not to clean up contamination that is deeper than 5 feet below the surface would be among the requested unforeseen circumstances exception, even though there is nothing unforeseen about contamination being below 5 feet and that exception is limited to matters where cleanup cannot be achieved through technologically feasible measures, so it clearly doesn't apply.

Similarly, DOE's other example of not cleaning up in remote locations doesn't fit the exception, as it is neither an unforeseen circumstance nor is the cleanup not achievable by technologically feasible measures. And there is no showing that the application of the purported exception is unavoidable by other means. Finally, the AOC requires that even if an exception were granted by DTSC, the soil would still have to be cleaned up to as close to background as practicable. Instead, DOE just wants to walk away from cleaning up most or all of it. The DOE claim for “leaving in place” an additional 5% of the 1,413,000 cubic yards of contaminated soil thus violates the AOC in multiple ways.⁴⁶

c. DOE's Biological Features Exemption Claim Violates the AOC

DOE states that also for all alternatives, it will leave in place an additional 330,000 cubic yards of contaminated soil pursuant to what it implies are AOC exceptions for biological factors and cultural features.⁴⁷ However, the biological exception only occurs if the United States Fish and Wildlife Service (USFWS) issues a Biological Opinion that finds that the particular cleanup in a particular SSFL location would violate Section 7(a)(2) or Section 9 of the Endangered Species Act and no reasonable and prudent measures or reasonable and prudent alternatives exist that would allow for the use of the specified cleanup standard in that portion of the site, and the exception is unavoidable by other means.

No such USFWS Biological Opinion has been issued. The AOC exception does not apply.

And we note that the agency did issue a Biological Opinion a few years ago for EPA's intrusive radiation survey work that involved cutting back much of the vegetation

⁴⁶ The DEIS does not clearly spell out whether DOE intends to apply the 5% carve-out just for this alternative or for all. In the absence of DOE ruling it out, we here assume the 5% additional leave-in-place volume as part of the upper limit for all the DEIS cleanup alternatives.

⁴⁷ DEIS, p. S-21.

72-18

72-18

In the Draft EIS, DOE did not identify any volume of soil that would be exempted using the AOC “unforeseen circumstances” clause. This soil would be identified during soil cleanup planning and would be discussed with DTSC before application of the 5 percent exemption.

As DOE develops the soil cleanup plans, and identifies locations that pose “unforeseen circumstances,” it may propose use of this exemption as necessary to prevent damage in remote locations or to avoid areas that are too risky for workers to access. DOE may also propose use of the exemptions for soil with constituents that are above the AOC LUT values, are deeper than 5 feet below ground surface, and do not threaten groundwater. DOE would discuss those locations with DTSC before incorporating the exemption into the soil remediation plan and the soil remediation plan would be subject to DTSC approval.

72-19

72-19

The biological exemption process presented in the Draft EIS was developed jointly by DOE, USFWS, CDFW and DTSC during a series of meetings. Both USFWS and CDFW provided letters to DOE stating concurrence with the exemption process. The soil removal analysis in the Draft EIS included the results of applying the exemptions, the results of which were presented to USFWS, CDFW, and DTSC. The letter from DTSC cited by the commenters implying that DTSC was not involved in development of the exemption process is in error. DTSC staff were engaged in the development of the exemptions assumptions, process, the data, outcome of the analyses, and provided valuable input in application of the process. Appendix E, Consultations, provides the documentation on DTSC's involvement. For additional information on the exemption process, please refer to Section 2.4, “Application of Exemptions under the

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

in the area.⁴⁸ USFWS approved, indicating in part that the activity would actually be helpful to the natural species by making possible cleanup of the environmental contaminants. The Biological Opinion further indicated that soil disturbance often helps the Braunton milkvetch, a federally listed species, but in any case measures such as tagging and avoiding plants or storing seeds and reseeded thereafter could be undertaken. The Biological Opinion concluded, further, that even were there a loss of a great majority of the Braunton milkvetch at Area IV and the NBZ, “adverse effects caused by this project will not occur throughout a significant portion of the range of the species (only plants in approximately 2 percent of the range of Braunton’s milkvetch would be affected by the project).” But in any case, mitigation measures can be undertaken.

DOE is attempting to get out of remediating the damage to the environment it has caused by decades of pollution by saying it now wants to protect biological features by not cleaning up the radioactive and toxic chemicals with which it contaminated them.

Further, the DEIS asserts that the contamination is concentrated around certain facilities.⁴⁹ But the biological features were long ago scraped away by DOE to construct those facilities; it is not pristine land, even leaving aside the contamination. Somehow, after decades damaging the SSFL land with radioactivity, toxic chemicals, and intensive industrial activity, suddenly DOE now claims that it shouldn’t have to live up to its commitments to remediate the damage it has done to those very biological resources.

Perhaps in recognition that the AOC’s narrow exception has not been met, DOE has tried to confuse the issue by speaking in the DEIS in broad terms about “conserving biological resources.” But that, of course, is not the actual AOC exception.

The DEIS lists nine federally and state-listed plant species, but then goes on to admit only two of them are known to exist in Area IV and the NBZ. DEIS p. 3-63. And DOE in the DEIS has tried to conflate the AOC exception, which is limited to a USFWS Biological Opinion barring a specific aspect of the cleanup as violating ESA, into a misleading effort to get the California Department of Fish and Wildlife (CDFW) to support DOE’s efforts to avoid complying with the AOC cleanup requirements.

On September 12, 2016, DOE wrote to CDFW misleadingly asserting that the AOC had a generic exemption for protection of biological resources and “to employ an exemption, DOE requires the opinion of the California Department of Fish and Wildlife that an exemption to the AOC soil cleanup is critical for protection of the species.”⁵⁰

⁴⁸ Biological Opinion for the Santa Susana Field Laboratory Area IV Radiological Study Project, Ventura County, California [EPA Contract # EP-S7-05-05] (8-8-10-F-12), May 25, 2010.

cont'd

2010 Administrative Order on Consent” of this CRD for a discussion of the process followed for employing exemptions. As stated in Section 2.4, DOE described proposed exemption areas in the Draft EIS and recognizes the fact that the proposed exemption areas are subject to refinement as planning and coordination with appropriate agencies proceed. DOE recognizes that areas subject to the exemption process do include areas that had been severely disturbed by development and have concentrations of chemicals or radionuclides that would need to be removed to protect human health. This is due to the location of severely disturbed previously developed areas adjacent to habitat that supports endangered species or cultural resources, as explained in Section 2.4 of this CRD. DOE proposes a methodological approach to evaluation of chemical and radiological data to develop focused removal actions to be conducted within the proposed exemption areas. Throughout this process there is oversight and participation of appropriate agencies so that the impacts to sensitive biological and cultural resources (as described in the Programmatic Agreement) are minimized while ensuring that chemicals and radionuclides that pose a risk to human health are removed. The proposed exemption areas would be considered in detail during preparation of detailed remediation plans which would include a detailed point-by-point analysis and site-specific plans for remediation using risk-based criteria to protect human health and careful remediation approaches to minimize unnecessary damage to sensitive species or cultural resources.

With regard to the number of State-and federally listed species reviewed in the EIS, the EIS preparers used consultation with USFWS and CDFW to identify the species that possibly occur on a site (based on their distributions, ecological requirements) before narrowing to species known or expected to occur on the site based on review of this information and field surveys. This rationale is explained further in Chapter 3, Section 3.5.5, “Threatened, Endangered, and Rare Species,” of this Final EIS. Tables 3-6 and 3-7 list plant and animal species that are known to be present within Area IV and the NBZ or the potential for occurrence of the species in the region of influence for each species.

With regard to the discussion about Santa Susana tarplant, its status as a rare species is because it was listed as rare under a law that preceded the California Endangered Species Act (CESA). It is currently protected under CESA as if it had been listed as an endangered or threatened species under CESA. With regard to the discussion about the species growing through cracks in pavement and on portions of the SRE site that had been subjected to “interim restoration” those are observations of the authors and other scientists and it is important to point out that it is unknown whether these plants or plants noted as established in Boeing restoration sites would persist

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

DOE attached a very misleading document, purporting to show that there is no health risk whatsoever from not cleaning up the site and supposed extreme risk to the tarplant if it is. (The tarplant is not a federally listed species at all, and is not listed by the state as endangered or threatened, but is identified as rare.) Note that CDFW would have no way of knowing that the AOC exception is restricted to a specified narrow finding in a Biological Opinion by the U.S. Fish and Wildlife Service, not the CDFW, and that the standard DOE suggests is also far broader than that contained in the AOC.

Intriguingly, the DOE submission to CDFW indicates that the tarplant has thrived in formerly developed areas at SSFL where facilities were removed followed by interim restoration. It is conceded that the tarplant grows in previously disturbed areas ("including cracks in paved areas") and that "Boeing has had success at getting Santa Susana tarplant to reestablish at sites where soil has been removed as part of remediation." Area IV and the NBZ contain about 850 plants total, or about 2 per acre; it estimates an average of only about 13 plants per acre it proposes as exemption areas in Area IV. Clearly one could simply work around those few plants if one wished.

The core of the DOE assertions to CDFW is the claim that "With exceptions, these exceedances of LUT values are at a low level and do not warrant cleanup when human health and ecological receptor Risk Based Screening Levels (RBSLs) are used to determine where potential soil cleanup may occur." This statement, as will be shown in detail later, is false. DOE used human health RBSLs that are orders of magnitude higher (less protective) than the true RBSLs, and if it left the contamination in place as it proposes, the risks would far exceed human health RBSLs. And nowhere in the DEIS is there an analysis of the contamination compared to the ecological RBSLs. In fact, the cleanup standards DOE now proposes are also orders of magnitude higher than the ecological RBSLs.

In other words, in the guise of trying to protect biological features, DOE proposes to walk away from its obligation to clean up the radioactive and chemically toxic pollution with which it contaminated those features, and leave behind concentrations far above the established Risk Based Screening Levels for ecological receptors, let alone for human health.

None of this was explained to CDFW by DOE. On the day DOE issued the DEIS, DTSC's Director Barbara Lee wrote to DOE Assistant Secretary Regalbuto expressing significant dismay about DOE's misleading approach to CDFW, asserting that it was essentially violating the AOC.⁵¹ DTSC stated,

We are concerned that DOE is proposing cleanup actions inconsistent with the Administrative Order on Consent (AOC) between DOE and the Department of Toxic Substances Control (DTSC), and is basing these proposals on assumptions unsupported by needed data and analysis.

⁵¹ January 6, 2017, DTSC letter "Initial DOE Assessments Related to the Santa Susana Field Lab Cleanup."

72-19
cont'd

in these sites or would succumb to competition as stronger vegetation takes hold if the site is left undisturbed. The native rock outcrop habitat of this species on SSFL severely limits the growth of competing vegetation which, in turn, allows the tarplant to persist indefinitely. Hence, DOE acknowledges and appreciates the importance for the sustained presence of the Santa Susana tarplant of minimizing impacts to the native rock outcrop habitat.

DOE held coordination meetings with USFWS and CDFW with DTSC's participation on this project for several years and submitted a Biological Assessment to USFWS and CDFW, which initiated Section 7 Consultation under the Endangered Species Act. Appendix E, Table E-4, of this EIS provides a summary of meetings with USFWS and CDFW held by DOE to date, most of which involved participation by DTSC. In August 2018, the USFWS issued the Draft Biological Opinion relative to the AOC LUT cleanup alternative. DOE acknowledges that the areas in which the exemption process would be applied presented in the EIS are subject to refinement with the participation of USFWS, CDFW, and DTSC on the biological side and the California State Historic Preservation Officer, the federally recognized Santa Ynez Band of Chumash Indians, and non-federally recognized tribes on the cultural resources side.

The 2010 Biological Opinion on the EPA radiological survey has very limited applicability to the present project as explained in Section 2.4 of this CRD. Cleanup of SSFL to AOC LUT values would have a far greater impact on listed species than the EPA projected because the soil remediation requires removal of vegetation and soils, including the seed bank, in the treated areas, a profound and difficult to mitigate impact, whereas the EPA action that was the subject of the 2010 Biological Opinion involved no removal of soils, leaving the soil seed bank intact, and trimming or mowing of vegetation, a much less severe impact, which leaves the potential for rapid recovery of the vegetation and habitat by re-sprouting or germination from the soil seed bank. The EIS estimates of soil removal and proposed exemption areas are based on data available to develop the EIS. These estimates would be refined as remediation plans are developed and implemented.

Section 3 – Public Comments and DOE Responses

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

First, and most importantly, we note that it appears DOE is proposing cleanup approaches that fail to fully recognize the AOC provisions that apply to sensitive plant and animal species located at SSFL. These provisions allow limited exceptions to cleanup activities to safeguard protected species. As you know, DTSC is committed to implementing and enforcing the AOC. DTSC requests DOE to discontinue early consultation until we can discuss with DOE and CDFW how the requirements of the AOC apply to this process.

Second, DTSC is concerned that DOE may not have supported its initial assessments of key issues with sufficient data and analysis.

Further, it does not appear that DOE has analyzed individual, location-specific approaches to minimizing and mitigating potential impacts to the Tar Plant and other sensitive habitat and resources consistent with the AOC.

We are also concerned that this consultation has been initiated without sufficient discussion with DTSC.

72-19
cont'd

In sum, DOE is attempting to claim a biological exception for which it does not qualify. That exception is only triggered by a USFWS Section Biological Opinion finding a proposed cleanup action on part of the property to violate specified sections of the ESA, with no reasonable and prudent measures or reasonable and prudent alternatives that would allow for the use of the specified cleanup standard in that portion of the site. No such USFWS Biological Opinion exists. No such showing of the unavailability of mitigation measures has been made by DOE. Cleaning up the radioactive and toxic damage DOE did to the SSFL environment would help biological features in the long run, not harm them.

The proposed exemption areas in the DEIS include some of the most contaminated areas on the property—for example, the SRE, site of the partial meltdown, and the burnpit.⁵² These areas are the opposite of pristine natural areas, and it is troubling that DOE would attempt to claim a biological exception for which it does not qualify under the AOC as a way of avoiding cleaning up among its biggest toxic impacts.

d. Cultural Features Exemption Claim

Additionally, the DEIS asserts an exemption that it describes as for cultural features, but the AOC exception is limited to Native American *artifacts* that have been

72-20

⁵² DEIS, p. 2-23.

72-20 Please refer to Section 2.4, “Application of Exemptions under the 2010 Administrative Order on Consent” of this CRD for a discussion of this topic and DOE’s response. DOE also notes that it does not propose to exempt a “vast amount of the contamination from cleanup.” Within exemptions areas, DOE will remove any concentrations of chemical and radioactive constituents that pose a threat to human health and the environment. All three of the soil remediation action alternatives would be protective of human health.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

formally recognized. *The DEIS discloses in an appendix, however, that there are no formally recognized Native American artifacts in Area IV or the NBZ.*⁵³ Like its attempt to expand the narrow exception for a USFWS Biological Opinion to a shotgun set of claims about biological features generally, DOE similarly tries to inflate the narrow exception for formally recognized Native American artifacts to cover far broader claims not allowed under the AOC. Furthermore, this exemption is not in DOE's purview to declare; according to the AOC, DTSC must decide whether it is to be used. Again, DOE leaves out the fact that these decisions are not its to make.

A study performed by DOE for site cleanup found three small rockshelters and one bedrock mortar in Area IV, ineligible for formal recognition:

*Due to their failure to satisfy the criteria of inclusion, these four sites have been determined not eligible to the National Register of Historic Places. Based on this determination, the proposed closure and remediation program is determined to have no effect.*⁵⁴

A subsequent cultural features survey performed for the USEPA radiation survey identified some additional rockshelters and similar features and isolated small artifacts such as the mano stone, a few inches across, pictured below. These were flagged and either avoided during the survey or carefully collected and then returned to their original location, which could be done as well during the cleanup.⁵⁵

mano stone, source: DOE DEIS Ref. 465 (Corbett 2012)

What artifacts have been found – although none is formally recognized—have generally been quite small and isolated, whereby one can readily work around them or, as was done in the EPA survey, carefully collect and then return them. There is no basis, as

⁵³ Appendix F, F-16.

⁵⁴ W&S Consultants, *Class III Inventory/Phase I Archaeological Survey of the Santa Susana Field Laboratory, Area 4, Ventura County, California*, September 24, 2001 This reference is cited in the DEIS (reference 502) but the DOE link to it takes one to a statement that DOE is not making it available. Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

DOE has done, to propose exempting a vast amount of the contamination from cleanup because of isolated small artifacts, which can be fully protected while also allowing the site to be returned to its natural state before DOE polluted it.

DOE states it will include a USFWS Biological Opinion, if issued, and information on cultural exemptions in the final EIS. Similarly, DOE suggests post-DEIS cultural feature efforts to declare exceptions based on future cultural feature considerations. But that of course prevents public review and comment in the NEPA process, amounting to a game of hide the ball. DOE has had years, indeed decades, to have obtained the Biological Opinion and any necessary Native American artifacts consideration, and its delay in doing so impermissibly shields from NEPA review the basis for cleanup exemption claims. One notes that EPA was able to timely obtain its USFWS Biological Opinion and its cultural features review for its activities at Area IV and the NBZ, and that neither Opinion indicated that the activity would cause an unacceptable impact and could be readily conducted in a way that was acceptable. DOE's efforts to exempt 330,000 cubic yards of contaminated soil from cleanup for purported biological and cultural reasons violates the narrow AOC exceptions and is unsupported upon careful examination.

Thus, Alternative 1 breaches the AOC and would, despite the prohibition on "leaving in place," leave in place 34-39% of the contamination. None of the exceptions that DOE cites are currently met.

2. Alternative 2 – Leave in Place 86-91% of the Soil Contamination

DOE characterizes this alternative as using alternative Lookup Table (LUT) values, alternative to those required by the AOC. As such, it is a direct violation of the AOC. The AOC requires cleanup to LUT values established by DTSC based on

72-20
cont'd

72-21

72-21

The commenters are misrepresenting the outcome of the Cleanup to Revised LUT Values Alternative. This alternative would involve removal all radionuclides above AOC LUT values and chemicals at a concentration exceeding a one-in-a-million cancer risk and hazard index of 1. There would be no averaging of soil and following soil cleanup Area IV would have less contamination than that left at EPA CERCLA sites and most DTSC sites in California. The commenters are wrong when they say the alternative "violates" "longstanding DTSC and EPA Guidance." This alternative involves greater cleanup than would occur under both agencies' guidance. The RBSLs proposed for the alternative were taken directly from the SRAM and are approved for use at SSFL by DTSC.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

background and detection limits. It is not up to DOE to set these values; it is solely DTSC's authority, pursuant to the AOC. Once again, DOE in its DEIS is usurping the authority of its regulator, DTSC, about a matter not in DOE's purview, and attempting to adopt cleanup values that violate the AOC.

The cleanup standards DOE now puts forward in this alternative violate the AOC, the 1995 Joint Policy with EPA, and longstanding DTSC and EPA guidance.⁵⁶ DOE estimates under this option, only 192,000 of the 1,413,000 cubic yards of contaminated soil would be cleaned up (leaving 86% in place). With the additional 5% exemption they are improperly assuming, but not including in the total, that means up to 91% could avoid cleanup.⁵⁷

The alternative LUT cleanup levels DOE proposes are orders of magnitude more lax than the AOC LUT values, as can be seen by comparing the AOC LUT values and the DOE proposed alternative RBSLs in Table D-3 of the EIS.⁵⁸ The thyroid disrupter perchlorate, for example, is supposed to be cleaned up to levels of 1.63 micrograms per kilogram. That is what DOE promised to do. Now it wants to leave concentrations as high as 53,300 micrograms/kg. That is 32,700 times higher. Dioxins, an extraordinarily toxic group of chemicals (2,3,7,8-TCDD TEQ) have a LUT value of 0.912 picograms/gram under the AOC. DOE instead wants to not have to clean the dioxins up until they reach a level of 4800 — more than 5000 times higher. Acenaphthene has an AOC LUT cleanup value of 2.5 microgram/kg; DOE wants to not clean it up until the level reaches 3,230,000, more than a million times higher.

⁵⁶ See, e.g., Land Use in the CERCLA Remedy Selection Process, EPA OSWER Directive 9355.7-04, and DTSC Response to Comments on Agreements in Principle, p. 11-12.

⁵⁷ As indicated above, the DEIS is not clear about whether DOE proposes to use the 5% purported "unforeseen circumstances" additional exemption for all three alternatives. This should be clarified.

⁵⁸ DEIS Table D-3, pp. D-8-11.

72-21
cont'd

72-22

72-22 First of all, DOE does not have a perchlorate contamination issue in Area IV soil. The highest perchlorate concentration observed in soil was 683 parts per billion. The RBSL for the suburban resident (no garden) for perchlorate is 53,300 parts per billion, so the perchlorate comment is moot.

The RBSLs used in the Draft EIS are comparable to soil cleanup standards applied by DTSC throughout California. Just because a chemical value is above background, does not make the chemical toxic. Therefore the order-of-magnitude comparison is not relevant. A garden pathway was not used in the RBSLs for this EIS, as residential development with garden is not a future land use for the SSFL property based on the Grant Deeds of Conservation Easement and Agreements. The use of RBSLs that do not include the indirect garden pathway is appropriate for this future land use.

In Chapter 4, Section 4.9 of this Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that local residents may get some portion of their food from a home garden.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

Here are a few more examples:

Chemical	DOE Proposed Cleanup, Supposed Suburban Residential RBSL (mg/kg)	AOC Levels (mg/kg)	How much more of each chemical does DOE propose to leave? (Compared to AOC)
Bis(2-ethylhexyl)phthalate	173	0.061	2,836 times more
Naphthalene	14.6	0.0036	4,055 times more
2-Methylnaphthalene	162	0.0025	64,800 times more
Methylmercury	7.61	0.00005	152,200 times more
Pyrene	1650	0.0056	294,643 times more
Flouranthene	2,200	0.0052	423,076 times more
Benzo(g,h,i)perylene	1,650	0.0025	660,000 times more
Phenanthrene	16,400	0.0039	4,205,128 times more
Anthracene	16,400	0.0025	6,560,000 times more

A complete comparison of AOC LUT cleanup values for the more than one hundred toxic chemicals found to be elevated at SSFL Area IV and NBZ versus the levels DOE proposes to be permitted to leave behind is attached hereto.

DOE claims that under this alternative, it would clean up the chemical contaminants to what it purports is a risk-based standard. The standard it says it would use are Risk Based Screening Levels that it says are specified in the DTSC-approved Standardized Risk Assessment Methodology (SRAM). DOE in the DEIS claims the SRAM mandates the use of a suburban residential standard and that that is what DOE proposes to use in this alternative. Both assertions are incorrect. The SRAM does not mandate the use of the suburban residential standard as opposed to a more conservative rural residential standard. Furthermore, the RBSLs that DOE says it wants to use even for the suburban residential scenario are thousands of times less protective than the suburban residential RBSL in the SRAM.

The SRAM includes RBSLs for several scenarios, including not just the suburban but also the rural residential one. Generally, the latter would be the most protective standard, as it includes the greatest exposure. Under EPA and DTSC practice, one is to clean up to the exposure scenario that produces the greatest risk and which is allowed under current County zoning and General Plan designations.⁵⁹ As DTSC described the process⁶⁰:

⁵⁹ See, e.g., Land Use in the CERCLA Remedy Selection Process, EPA OSWER Directive 9355.7-04, and DTSC Response to Comments on Agreements in Principle, p. 11-12.

72-22
cont'd

72-23

72-23 Regarding the commenter’s statement that the “DEIS claims the SRAM mandates the use of a suburban residential standard” the Draft EIS makes no such claim. Regarding the commenter’s statement that the suburban residential scenario RBSLs used by DOE in the Draft EIS are “thousands of times less protective than the suburban residential RBSL in the SRAM”, the RBSLs used in the EIS are identical to the ones published in the SRAM. Regarding the commenter’s statement that “Under EPA and DTSC practice, one is to clean up to the exposure scenario that produces the greatest risk”, although zoning is a consideration for future land use, because zoning rules are always subject to change, the “reasonably anticipated land use” (as cited by the commenters) is the primary guiding factor. When DOE developed the Draft EIS, there were no plans for reuse of SSFL for agricultural purposes. And with the Boeing Conservation Easement, reuse of SSFL for agricultural purposes is prohibited.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

One of the primary assumptions that these calculations rely upon is the land use. The Superfund process requires the assumption to be based upon the reasonably anticipated land use. *The local government General Plan land designations and local zoning designations are the most reliable expressions of prospective land use.* OSWER Directive No. 9355.7-04, "Land Use in the CERCLA Remedy Selection Process," May 25, 1995, p. 2, 4-5. *DTSC and U.S.EPA, in implementing the Superfund process, defer to local governments' land use plans and zoning decisions, and base their cleanup level calculations on the assumption that the land will be used as the land use requirements would allow, irrespective of its current use.*

(emphasis added)

As DTSC said in 2010, its normal practice, even if there were no AOC or site-specific law, would be to require SSFL to be cleaned up to the rural residential/agricultural standard because that is what the site is zoned for and allowed under the General Plan:

Even absent SB 990 [an SSFL-specific statute], *DTSC, in implementing its cleanup authorities, would defer to local governments' land use plans and zoning decisions. In this instance, the Ventura County zoning maps specify that the site and much of the surrounding area are currently zoned as rural agricultural.* Carrying out the cleanup specified in the Agreements in Principle is consistent with both SB 990 and with local land use decisions.

(emphasis added)⁶¹

DTSC after analyzing various contaminants at SSFL, stated that such a cleanup using its standards for all sites in the state, i.e., relying on local land use designations, would result in a cleanup at SSFL essentially equal to a cleanup to background.⁶² Thus, a genuine risk-based cleanup would be the same as the AOC, whereas what DOE puts forward would leave on the order of 90% not cleaned up.

Ventura County in 2015 confirmed for DTSC that its land use designations for the property allow a wide range of residential (e.g., with gardens) and agricultural (rural residential) uses.⁶³ Thus, were there no AOC, any risk-based cleanup would have to be to the most protective of those exposure scenarios.

⁶⁴ The agricultural cleanup standards are designed to assure that, for example, cows are not grazing on grass growing in contaminated soil, so that those who drink the milk and eat the meat are not put at risk.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

Throughout the DEIS, DOE claims it is using the suburban residential RBSLs from the DTSC-approved SRAM. However, buried in a footnote, DOE concedes it isn't using even the suburban residential standard, but only one aspect of a standard, not the standard *in totum*. Specifically, DOE, for its own purposes that are not identified, avails itself of only the direct contact aspect of the standard (e.g., getting some soil on your hand), and does not include the part of the suburban residential standard that is associated with exposure from consumption from backyard fruit trees or vegetable garden.⁶⁵ The backyard garden part of the suburban residential scenario is required to be included, barring some extraordinary situation (e.g., where soil conditions prevent anything growing).⁶⁶ DOE claims it is using only the direct contact part of the suburban residential scenario and excluding the backyard garden part per the SRAM. But the SRAM doesn't say that. In fact, it requires calculation of the backyard garden part of the risk and provides RBSLs for that component of the suburban residential standard.⁶⁷ Indeed, DTSC has recently directed Boeing that the backyard garden part of the suburban residential exposure pathway must be incorporated.⁶⁸

The significance of DOE claiming it is using a suburban residential standard but in fact using a standard that excludes the key component of that standard is that the RBSLs it purports are the suburban residential RBSLs are, for many chemicals, hundreds or thousands of times less protective than the actual suburban residential RBSL from the DTSC-approved SRAM. Here are a few examples (a complete comparison table is attached hereto).

DOE Proposed Cleanup Level in EIS, Supposed Suburban Residential RBSL VS. True Suburban Residential RBSL with Garden

Chemical	DOE Proposed Cleanup Level in EIS, Supposed Suburban Residential RBSL (mg/kg)	True Suburban Residential RBSL with Garden (mg/kg)	How much more of each chemical does DOE propose to leave? (Compared to Suburban Residential RBSL with Garden)
Mercury	16.8	0.0504	333 times more
Methyl Mercury	7.61	0.00131	5809 times more
Cadmium	4.6	0.00165	2787.9 times more
Perchlorate	53.3	0.0158	3373.4 times more
Acenaphthene	3230	18.7	172.7 times more
Antimony	26.4	0.139	189.9 times more

Because a RBSL is defined as the concentration that will produce a cancer risk of one in a million or a hazard index of 1 for non-cancer risks, the right-most column above also tells one how many times above the risk goal DOE's desired standards are. In other words, DOE promised that its cleanup alternatives would leave behind a one in a million cancer risk and an acceptable risk from other health effects, but in fact its proposed standards would result in risks hundreds or thousands of times higher.

In addition to trying to adopt cleanup standards orders of magnitude higher than the promised AOC LUT values or even true suburban residential risk-based levels, DOE has used these grossly inflated RBSLs to eliminate completely from any cleanup 98 of the 116 toxic chemicals found contaminating its property – without explicitly disclosing so. Table D-3 of the DEIS gives LUT and purported RBSL values for 116 toxic chemicals, but in Table D-4, DOE shrinks the list of contaminants of concern for which there are cleanup levels under its alternative 2, “alternative LUT values,” to 18. The source from which Table D-3 is taken, CDM Smith 2017, identifies more than a hundred hazardous chemicals detected in Area IV and the NBZ at levels in excess of LUT values, i.e., contamination above background. Yet what DOE has quietly done is thrown out all chemicals that exceed LUT values but are below its purported RBSL values, which, as we have seen, are hundreds or thousands of times higher than true suburban residential RBSL values. In short, in alternative 2, DOE proposes to clean up only 18 of 116 contaminating chemicals, and for those that will be considered for cleanup, do so only if they reach levels orders of magnitude higher than the promised AOC LUT values or true suburban residential RBSLs, which includes a garden.⁶⁹

⁶⁹ We note that DOE is not even clear that it will clean up contamination that reaches the astronomical levels it purports are suburban residential RBSLs. Instead, it merely says a “cleanup decision” would be made if contamination is found over those levels.

72-23

Response side of this page intentionally left blank.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

DOE has no logical reason for the hidden exclusion of the backyard garden portion of the risk-based screening level, nor for excluding the agricultural/rural residential standards. For this alternative DOE states it would use the AOC LUT values for radionuclides but not for chemicals, with no rationale.⁷⁰ For chemicals, DOE proposes far less protective cleanup standards than required by the AOC LUT values. DOE states that for chemicals it will assume suburban residential exposures, but then excludes the garden component of the suburban residential standard. In support for this arbitrary exclusion, DOE states that Boeing wants to use the suburban residential standard without a garden for other portions of the site, citing to a letter in response to a letter by LA Supervisor Kuehl, LA City Councilmember Englander, and then-Senator Pavley to DTSC Director Lee (DOE includes the Boeing letter but not the electeds' letter to which it purportedly responds).⁷¹ But it is DTSC that decides Boeing's cleanup levels, not Boeing, and DTSC has told Boeing it cannot exclude the backyard garden part of the suburban residential standard but must include it in the total risk.⁷² And further, DTSC has said that in the establishing of cleanup levels it defers to local zoning and General Plan designations, which allow both suburban residential with a garden and agricultural/rural residential uses, as discussed above. There is thus no basis, even were it not bound by the AOC, for DOE to propose cleanup that wouldn't meet the agricultural/rural residential standard, nor the suburban residential standard with garden.

DOE, a Responsible Party (RP) under DTSC regulation, is relying on another Responsible Party's cleanup wish, when it is up to neither RP, but to the regulator. And the regulator's requirements are cleanup based on land use designations by the County, which allows agricultural/rural residential uses and also suburban residential with a garden.

DOE claims Boeing has stated that its desire is to place restrictions on the property [in perpetuity?] so it cannot be used for residences, backyard gardens, etc., but rather for open space. But DTSC and EPA procedures don't allow the Responsible Parties to avoid of cleanup obligations by declaring the property too contaminated for unrestricted use. If that were allowed, every polluter would simply do so and walk away from their obligation for cleanup. It is local land use authorities that determine what uses are allowable and thus, under regulator procedures, what cleanup standards apply.

Furthermore, DOE states in the DEIS that, despite Boeing's stated desire for the land to be open space, that couldn't be counted on, and for that reason, DOE would assume residential uses could occur and would set RBSLs accordingly. It is thus completely contradictory to assume a residential exposure scenario and then exclude a backyard garden on the grounds that Boeing says it intends to place restrictions so that it can't be used for residences or gardens. The Responsible Parties here don't get to have it both ways.

72-23

⁷⁰ DEIS, p. S-30.

⁷¹ *id.*, p. 2-13, citing letter dated December 15, 2015.

⁷² Aug 23, 2016 ltr., *supra*.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

Further, it is important to recall that a main reason for cleaning up SSFL is to protect the people who live or engage in agriculture nearby. Many of the homes have gardens; and cows graze now on contaminated grass next to and on the site. Someone drinks that milk, eats that meat. Even were SSFL restricted in its future use to non-residential or non-agricultural activity, the people living near it and subject to exposure to the migrating contamination are not.⁷³

Therefore, using cleanup standards based on suburban residential use with no garden, standards hundreds or thousands of times less protective than the true RBSLs for suburban residential with garden, puts at risk people who live nearby and who do have gardens, and all the agricultural uses. Even were there never a residence on SSFL, leaving contamination thousands of times the true suburban residential RBSL could mean that migration, even with possible reduction of concentrations,⁷⁴ could result in unacceptable exposures to the people nearby.

DOE's Alternative 2, which could leave in excess of 90% of the contamination in place, obviously violates the AOC. But even in the absence of an AOC, it also violates DTSC's procedures for risk-based cleanups, which are to rely on local government's land use designations.

Additionally, Alternative 2 violates the DOE-EPA 1995 Joint Policy requiring cleanup of all DOE sites, whether they are on the National Priority List or not, to EPA's CERCLA guidance. The relevant guidance similarly relies on local government land use designations.⁷⁵ Interestingly, the stated intentions of the Responsible Parties (i.e. the polluters) for how they would want to restrict the land to avoid more protective cleanup obligations is not one of the factors identified in EPA guidance to be considered.

⁷³ Furthermore, institutional controls cannot be relied upon when institutions can be counted on to exist for only a fraction of the time over which the toxic materials are dangerous. See, e.g., Hirsch, *50 Years of Power, 500,000 Years of Waste*, December 20, 2013, in U.S. Nuclear Regulatory Commission docket for Waste Confidence Rule and Generic EIS, NRC-2012-0246.

⁷⁴ For example, a ten-fold dilution factor would still result in hundreds of times the risk based level for residences. And there is nothing to guarantee that contaminants wouldn't concentrate offsite; e.g., where they tend to accumulate in sediments.

⁷⁵ "Land Use in the CERCLA Remedy Selection Process," EPA OSWER Directive 9355.7-04.

72-23
cont'd

72-24

72-24 The Cleanup to Revised LUT Values Alternative referred to in this comment does not violate any DTSC or EPA policy. It, in fact, goes beyond what either agency would do for cleanup of CERCLA or State-lead sites. This alternative would clean up radioactive constituents to LUT values established in accordance with the 2010 AOC (DTSC 2010) (i.e., same as the Cleanup to AOC LUT Values Alternative); however, DOE would apply risk-based screening levels (RBSLs) developed consistent with the CERCLA risk-assessment principles for chemicals.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

3. Alternative 3 – 25 Millirem/yr for Radiation, and Averaging Chemical and Radioactive Contamination Over Wide Areas, Leaving in Place 90-99% of the Contaminated Soil, Not Cleaned Up

This alternative, which would leave from 90% to as much as 99% of the contamination not cleaned up, is cynically referred to by DOE as the *Conservation of Natural Resources* alternative.⁷⁶ After polluting those natural resources for sixty years,

⁷⁶ DOE estimates in the DEIS (p. S-33, S-39) that this alternative involves cleaning up 148,000 cubic yards of soil, out of the 1,413,000 cubic yards it estimates are contaminated, thus leaving about 90% not cleaned up. The DEIS, however, indicates that this option involves the As Low As Reasonably Achievable (ALARA) principle, in which DOE will decide whether to clean up 44,000 cubic yards of soil contaminated above AOC LUT limits. It is not clear from the DEIS whether the 148,000 cubic yard estimate presumes cleanup of all, or none of the 44,000 cubic yards (i.e., whether the baseline is 104,000 cubic yards with up to 44,000 cubic yards of additional soil perhaps cleaned up pursuant to ALARA). Further complicating the matter is that DOE has included the same 44,000 cubic yard figure in two different places in the table in question, on p. S-39, making it uncertain which group of contaminated soil it is identifying for prospective ALARA analysis. In practice, ALARA rarely results in additional cleanup. If the correct estimate is 148,000 cubic yards, that represents an alternative in which 90% is not cleaned up. (Because of the unclear language in the DEIS regarding the ALARA matter, we have assumed the minimum cleaned up is the figure the DEIS reports of 148,000 cubic yards). If the 5% “unforeseen circumstances” exceptions DOE claims for Alternative 1 is also claimed for Alternative 3, that would

72-25 The commenters misrepresent the outcome of the Conservation of Natural Resources Alternative. This alternative would involve the identical type of cleanup that EPA follows for CERCLA sites and DTSC for State-lead sites. The Conservation of Natural Resource Alternative would remove all soil that presents a risk to human health and the environment.

72-25

The commenter has misinterpreted the use of ALARA in determining the volumes of soil to be removed under the Conservation of Natural Resources Alternative. The volumes of soil identified in the EIS Summary are the volumes estimated for removal under each alternative, and in the case of the Conservation of Natural Resources Alternative represent the volume of soil that would be removed with radionuclides and/or chemicals above risk-based concentration levels and determined through a CERCLA-like risk assessment process. ALARA was not used in determining the soil volumes. As to the commenter’s statement “complicating the matter is that DOE has included the same 44,000 cubic yard figure in two different places in the table in question, on p. S-39,” none of the soil categories includes soil volume estimates included in the other soil categories. The same number appearing in different categories does not represent the same soil.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

DOE purports to “protect” them by not remediating the toxic and radioactive damage it has done.

This alternative would violate the AOC, DTSC requirements, and the 1995 EPA-DOE Joint Policy. It involves cleaning up the radioactivity to a supposed dose of 25 millirem per year. That is the equivalent of a dozen unnecessary chest X-rays per year, or one a month from the moment of conception to the moment of death. EPA has long declared that dose to be “non-protective” and bars its use under its CERCLA guidance.⁷⁷

But this proposed DOE standard is even worse than it sounds at first. Because DOE in the DEIS calculates the dose based on suburban residential *without* a garden, and since the garden produces hundreds to thousands of times higher risk than the suburban residential without a garden, the true dose for the standard required suburban residential exposure scenario would be thousands of chest X-rays annually.

EPA has a Dose Compliance Calculator by which one can calculate the dose received by a member of the public in a suburban residential exposure scenario. DOE has proposed for this alternative allowing, for example, an astronomical 1200 pico-curies of strontium-90 per gram of soil (1200 pCi/g). EPA’s actual risk-based Preliminary Remediation Goal for Sr-90 is 0.0036 pCi/g, 330,000 times lower (more protective). According to the EPA Dose Compliance Calculator, the cleanup level of strontium-90 DOE is proposing for a suburban resident would produce a dose, not of 25 millirem/year, but an astounding 1540 millirem per year. That is the equivalent of 770 chest X-rays a year, about two a day from conception on, for decades. We urge that DOE not suggest this is a reasonable exposure for the public.

The situation is even worse for other radionuclides. The plutonium-239 cleanup level DOE proposes for this alternative, 640 pico-curies per gram, is 104,065 times higher than EPA’s PRG for Pu-239, which is 0.00615. EPA’s Dose Compliance Calculator estimates a dose of 4,220 millirem/year from the DOE proposed cleanup level, the equivalent of 2,110 chest X-rays per year, nearly six a day, for decades.

leave 95% not cleaned up. And if the 44,000 cubic yard figure for ALARA is the one from the furthest right column in the table on S-39, then as much as 98 or 99% of the contamination would be left in place, taking into account uncertainties of measurements and estimates. Even if Alternative 3 resulted in “only” 90% not cleaned up, that would still be an extraordinary breach of the AOC and of the necessity to protect the public health and ecological features.

⁷⁷ EPA, “Radiation Risk Assessment at CERCLA Sites: Q&A,” OSWER 9285.6-20, June 13, 2014; see p. 28. Dose is not to be used at CERCLA sites as a cleanup standard unless there is an Applicable or Relevant and Appropriate Requirement (ARAR) that is at a substantially lower dose; if there is no such ARAR (and only Maine has one), one is to not use dose and to use CERCLA’s process of aiming for a one in a million risk, which is roughly equivalent to a few hundredths of a millirem per year.

72-25

72-26

72-27

72-26 As indicated in Chapter 2, Sections 2.3 and 2.4, of this Final EIS, technical issues with implementing the 2010 AOC was one of the reasons DOE evaluated other alternatives, including the Conservation of Natural Resources Alternative referred to in this comment. DOE believes that the approach taken in developing this alternative is consistent with the approach taken by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites and is consistent with the approach taken by EPA at CERCLA sites. That is, it considers future land use and risk to human and environmental receptors. DOE notes that the Conservation of Natural Resources Alternative (both scenarios) analysis in this Final EIS results in radiological risks in the 10⁻⁵ range; this would correspond to a dose much lower than 25 millirem per year.

The dose limit can be compared to the average annual radiation dose from natural background radiation received an individual in the United States of 310 millirem per year. Please refer to Section 2.6, “Comparison of Radiation Doses,” of this CRD for further discussion of the 25 millirem per year dose limit.

72-27 The EPA dose calculator default residential exposure pathways include, among many other factors, a garden pathway that assumes 25 percent of the fruits and vegetables consumed by the resident are raised in a home garden, presumably the source of the commenter’s EPA PRGs. If the garden pathway factor is removed from the calculation, the EPA dose calculator produces comparable risk criteria (i.e., PRGs) as were used in the Draft EIS. As explained in Section 4.9 and in Appendix G of the Draft EIS, DOE used suburban residential risk-based screening levels (RBSLs) or slope factors based on the direct exposure pathways and without the indirect garden pathway to evaluate potential impacts to an onsite receptor.

In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. They permanently bind the property, regardless of who owns the land. North American Land Trust will monitor and enforce the easements. Under the restrictions of the conservation easements, the use of exposure pathways that exclude the indirect garden pathway is appropriate.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

Radiation Dose from DOE SSFL Clean-up Levels

source: EPA Dose Conversion Calculator

Radionuclide	EPA estimated dose for DOE proposed cleanup level (mrem/year)	How many CHEST X-RAYS would DOE levels be per year?
Nichel -59	5,290	2,645
Strontium-90	1,540	770
Americium -241	2,180	1,090
Plutonium -239	4,220	2,110
Thorium -232	3,330	1,665

Comparing DOE's Alternative 3 proposed cleanup levels for radioactivity for a supposed suburban residential standard against EPA's preliminary remediation goals (PRGs) for suburban residential exposure shows the extraordinary increases DOE proposes. As indicated above, DOE's strontium-90 proposed cleanup level is more than 330,000 times higher than EPA's PRG for suburban residential exposure; for plutonium-239, they are proposing a cleanup level more than 100,000 times higher than the EPA PRG.

DOE SSFL Clean-up Levels vs. EPA Preliminary Remediation Goals (PRGs)

Radionuclide	Department of Energy (DOE) Levels (pCi/g)	Environmental Protection Agency (EPA) Levels (pCi/g)	How much higher is DOE than EPA?	What's the cancer risk?
Strontium-90	1,200	0.0036	332,410	28%
Plutonium -238	700	0.00178	393,258	33%
Plutonium -239	640	0.00615	104,065	10%
Uranium -238	240	0.00176	136,364	13%

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

Using EPA's PRG calculator set to estimate cancer risk at the concentrations DOE proposes, the estimated risk for strontium-90 is 28% -- a bit more than every fourth person on average would get a cancer from the radiation exposure. That is in addition to their regular cancer risk. For plutonium-238, the additional risk is every third person getting cancer from the exposure.

EPA aims for a one in a million risk, and DOE says in the DEIS that that is what its proposed cleanup levels would produce. But that clearly is not the case. The risks associated with their proposed cleanup levels are hundreds of thousands of times higher than the promised risk level, and far outside EPA's and DTSC's acceptable risk range.

Further, (and indeed, plaintiffs find this wearying), this proposed alternative is even worse than just described. EPA guidance provides that one should not average contamination across areas for exposure scenarios such as residential where the exposure is non-random, for the obvious reason that someone can be exposed to high levels of contamination in one place even though another place is lower.⁷⁸ Yet DOE states for this alternative it will average the contamination across areas, resulting in high levels of contamination in one place not getting cleaned up.⁷⁹ So, if contamination existed in one location at the immense concentrations DOE is proposing for its cleanup standard, it still wouldn't get cleaned up, because DOE proposes averaging the contaminated soil with less contaminated soil elsewhere. This also violates the 1995 Joint Policy, as well as the AOC, which bars averaging.

DOE claims that the excess cancer risk from any of the alternatives would be trivial, one in a million (10⁻⁶).⁸⁰ The true risk would be greatly higher, because DOE is uses RBSLs that are a thousand times weaker than true suburban or rural residential RBSLs, leaves out the garden or the rural residential standard entirely, and then weakens them further by averaging elevated concentrations in one location with lower concentrations elsewhere.

To show how extraordinarily high the risks would be, note that Boeing did risk assessments for parts of Area III, which borders DOE's Area IV, and concluded that risks

⁷⁸ EPA, Radiation Risk Assessment at CERCLA Sites: Q&A, June 13, 2014, OSWER 9285.6-20.

⁷⁹ The DEIS indicates that this averaging would be over the entire NBZ, or over subareas in Area IV, which are tens of acres. See. p. 2-33, 3-108 - 3-111. The NBZ itself is 182 acres and Area IV is 290 acres. *Final Radiological Characterization of Soils Area IV and the Northern Buffer Zone Area IV, Radiological Study, Santa Susana Field Laboratory, Ventura County, California*, prepared by HGL for USEPA, December 12, 2012, p. 1-1.

⁸⁰ Elsewhere in the DEIS, DOE suggests it wouldn't clean up to its proposed RBSLs, but merely use them for making cleanup decisions, indicating it might then leave contaminants behind at up to several hundred times the RBSL. Further it indicates that when multiple contaminants are present, it would leave them not cleaned up, instead of using the "sum of the fractions" rule normally applied when there are multiple contaminants. These matters are of concern and should be clarified.

72-27
cont'd

72-28

72-29

72-28 The commenter is incorrect. Averaging of soil data is the standard means of assessing risk accepted by EPA and DTSC. Per EPA guidance (Office of Solid Waste and Emergency Response. Supplemental Guidance to EPA's Risk Assessment Guidance for Superfund: Calculating the Concentration Term. Publication 9285.7-081 [EPA 1992]), the basis for risk determination assumes a random exposure over an exposure area. The exposure area is an assumed location where exposure to the chemical in soil may occur. Risk from exposure to a chemical is then related to the arithmetic mean concentration of that chemical averaged over the entire exposure area, regardless of the current or future land use type. Because the true arithmetic mean concentration cannot be calculated with 100 percent certainty from a limited number of measurements, the EPA recommends that the upper 95th percentile confidence limit (UCL) of the arithmetic mean at each exposure point be used when calculating exposure and risk at that location. This is also consistent with DTSC Human and Ecological Risk Office guidance that states: "In cases where there is adequate characterization, the 95 percent upper confidence limit (UCL) of the arithmetic mean may be used for the exposure point concentration." Characterization of soil contaminant conditions for Area IV and the NBZ has been adequately performed. EPA's radiological characterization effort involved analysis of 3,487 soil and 55 sediment samples (HGL 2012b). DOE's chemical characterization effort entailed collection and chemical analysis of 5,854 soil samples and conducting a data gap analysis that reviewed site operations and chemical releases and assessed the adequacy of existing data to guide soil sampling. Because of this, the 95 UCL of the arithmetic mean was used in risk estimates.

72-29 The commenters are mistaken. The RBSLs used for the soil cleanup determination are those accepted by DTSC for use at the site. The risks calculated by Boeing for Area III that resulted in high rates of cancer incidence were for the garden pathway for the suburban resident. However, this issue is now moot as the Boeing Conservation Easement prevents redevelopment of its SSFL property, and growing of food on the property is prohibited.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

for the suburban residential scenario would be as high as 96 cancers produced per 100 people exposed, essentially a million times higher than DOE is claiming just on the other side of the boundary, by using its various improper weakening factors.⁸¹ Even after cleaning up to the standard DOE is proposing for Alternatives 2 and 3, suburban residential without garden, Boeing estimates remaining risks a thousand times higher than the one-in-a-million level claimed by DOE, which is far outside EPA's risk range that DOE is supposed to be following.⁸²

72-29

DOE attempts to characterize Alternative 3, which involves taking no steps to clean up the great majority of environmental damage it caused at SSFL, as "Conservation of Natural Resources." What is remarkable is that the DEIS nowhere actually compares its proposed cleanup standards to the actual Ecological Receptor Risk Based Screening Levels (EcoRBSLs), established by DTSC in the SRAM. When one does so, the results are stark: the cleanup levels proposed by DOE exceed the EcoRBSLs by orders of magnitude. In other words, in the guise of protecting natural resources, DOE proposes to leave behind, uncleaned up, toxic materials at levels far in excess of the levels considered a risk to biological species.

Here are a few examples (the more detailed analysis is in the attached spreadsheet).

DOE Proposed Cleanup Level in EIS, Supposed Suburban Residential RBSL VS. ECO RBSL

Chemical	DOE Proposed Cleanup Level in EIS, Supposed Suburban Residential RBSL (mg/kg)	ECO RBSL (mg/kg)	How much more of each chemical does DOE propose to leave? (Compared to ECO RBSL)
Mercury	16.8	0.1	168 times more
Bis(2-ethylhexyl)phthalate	173	0.32	540.6 times more
Silver	230	.99	232 times more
Perchlorate	53.3	0.5	106.6 times more
Pyrene	1,650	1.2	1375 times more
Acenaphthene	3,230	1.1	2,936 times more

4. Alternative 4 – the “No Action Alternative”

This is an alternative for analysis purposes required in NEPA. However, in this case, it is little different than Alternatives 2 and 3, which would take no action for cleanup of the great majority of the contamination.

D. Groundwater

The 2007 Consent Order requires cleanup of the chemically contaminated groundwater, with the permanent remedy in place by 2017. The 2010 AOC included radioactive contamination in groundwater to be also remediated, via the 2007 Consent Order, by the same deadline. We are now in 2017 and no permanent remedy is in place. Instead, in the DEIS, DOE now says it is considering just leaving in place the contamination and hoping for natural attenuation over time. Furthermore, the plume from SSFL has already migrated offsite. The groundwater must be cleaned up, and there is no plan put forward in the DEIS to do so.

E. Building Demolition and Disposal

The AOC covers cleanup of all soil at SSFL to local background and defines soil as including structures, debris, and anthropogenic materials.⁸³ All buildings and the debris from dismantling them are therefore covered. The cleanup to background is to a

⁸³ AOC, p.p. 4-5.

72-31

72-31 As the commenters noted in their cover letter, the No Action Alternative, which would not remove any contamination, is a NEPA requirement for an EIS and forms the basis for comparison with action alternatives. DOE disagrees with the commenter's statement that "Alternatives 2 and 3 would take no action for cleanup of the great majority of the contamination." The Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative would remove the contamination that would be a risk to human health and the environment. What would be left under the two alternatives, are low concentrations of chemicals that do not pose a risk to human health and the environment.

72-32 DOE provided a letter to DTSC on June 30, 2017 stating that the 2017 date would not be met. The Draft EIS does not state that DOE "is considering just leaving in place the contamination and hoping for natural attenuation over time." The commenters are in error with the statement "there is no plan put forward in the EIS" to cleanup groundwater. The EIS introduces several active groundwater remedies including pump and treat, soil or bedrock vapor extraction, and removal of the strontium-90 source. The commenters are referred to Chapter 2, Section 2.6 of the EIS for details on these remedies. DOE is actively discussing with DTSC the plans to remediate impacted groundwater in Area IV and the NBZ. Finally, there are no groundwater plumes that originate in Area IV that have migrated beyond the SSFL boundary.

72-33 As discussed in Chapter 2, Section 2.5, of the EIS, DOE proposes to remove all of the remaining buildings. A cleanup standard for buildings is moot as 100 percent of the materials would be removed from Area IV.

72-32

Regarding disposal of building debris, DOE's preferred alternative is to remove all 18 of the DOE structures, including foundations and subterranean structures from Area IV. Waste from the buildings within RMHF and Buildings 4019 4024 would be managed and disposed of offsite as radioactive waste. In this EIS, waste from other buildings that have a radioactive history was also assumed to be disposed of as radioactive. While waste only from Buildings 4038, 4057, 4462, and 4463 is not assumed to be radioactive, these buildings would be surveyed for the presence of radioactive material and disposed of appropriately after demolition. Any residual radioactivity that may remain in the soil near or under the DOE buildings would be addressed as part of soil remediation activities. DOE will comply with all applicable requirements for removal and disposition of building materials.

72-33

The radionuclide and chemical content on and within buildings or structures will be determined in accordance with decisions made pursuant to this Final EIS, regulatory

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

“not to exceed standard,” with averaging prohibited.⁸⁴ And all waste above background must be disposed of in a licensed low level radioactive waste (LLRW) disposal site or authorized LLRW disposal facility at a DOE site.⁸⁵

The DEIS is unclear as to whether DOE intends to comply fully with these requirements. At p. 2-46 of the DEIS, DOE asserts that “materials from buildings with a radiological history would be managed as radioactive waste for disposal purposes unless they can be suitable for free release. Free-released debris and free-released hazardous debris do not exhibit radioactivity above background levels.” However, DOE is silent on whether it would average contamination, either within a part of a building or over part of the debris, or would comply with the prohibition on averaging and the requirement for treating as contaminated any samples that exceed background. DOE is also silent as to how background for buildings will be determined. Will the values be taken from other buildings at SSFL, which could also be contaminated? Furthermore, the AOC requires EPA to set the background values.⁸⁶

Additionally, DOE states in the DEIS that it will declare as non-radioactive, and dispose of as such, all wastes from any structure that it does not know to have a “radioactive history.”⁸⁷ However, such process knowledge extending over half a century or more is quite imperfect and unreliable. Furthermore, even if buildings weren’t explicitly used for radioactive work, they were located in areas where there is radioactive contamination. Contamination clearly wasn’t limited to the interior of buildings where radioactive work was done; there were extensive releases, which is why so much soil is contaminated. There is no basis to assume that either the outsides or insides of these buildings are clean; they should be thoroughly surveyed, and only to the extent that no radioactivity above background is found, should they be allowed to be disposed of as other than LLRW.

Finally, DOE elsewhere in the DEIS (p. D-1) appears to contradict the claim at p. 2-46 that buildings will be considered “free released” only if they are free of radioactivity above background. At p. D-1, however, DOE says “For a building to be free released, it must meet the conditions of DOE Order 458.1, *Radiation Protection of the Public and Environment*, which limits doses to the public from DOE activities to either 25 millirem per year (or as low as reasonably achievable) or requires the surface contamination levels to meet the default limits expressed in DOE Order 5400.5 (same title as DOE Order

⁸⁴ “Residual concentrations “not to exceed” local background concentrations i.e., if during site survey efforts or during confirmatory sampling the levels of an constituent detected in a soil sample is above local background levels, step-outs will be taken to delineate the contamination and removed; soil above background will not be averaged with any other soil.” AOC Attachment B p. 3, ; see also Attachment C, “Confirmation Protocol ‘Not to Exceed’ Background Cleanup Standard.”

⁸⁵ AOC Attachment B p. 3.

⁸⁶ id., p. 2.

⁸⁷ DEIS, p. 2-46.

requirements, and approved procedures. The approved plans and procedures would describe the activities that DOE would perform to sample and characterize and determine appropriate handling methods for managing and disposing of demolition debris. This information was added to Appendix D, Section D.1, of this Final EIS. Footnote 1 in Appendix D was deleted in this Final EIS. Because it is DOE’s intention to remove 100% of building structures and to dispose of the materials in accordance with Federal, State, and local laws, and DOE orders, the language in the AOC regarding buildings is moot.

72-33
cont'd

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

458.1 and superseded by that Order) and U.S. Nuclear Commission [sic] Regulatory Guide 1.86, *Termination of Operating Licenses for Nuclear Reactors.*"

This statement raises a number of concerns. It would appear to contradict the commitment at p. 2-46 that only buildings and debris that exhibit no radioactivity above background will be released, as set forth in the AOC. As indicated in the discussion of Alternative 3 above, 25 millirem per year, about a dozen chest X-rays annually, has long been declared by EPA to be non-protective and not allowed by EPA guidance, which DOE has committed in the 1995 Joint Policy to follow. Similarly, under both the AOC and the Joint Policy, other agency guidance such as Reg. Guide 1.86 (which would allow release far above background and outside the EPA risk range), is also not to be employed.⁸⁸ Risks from the Reg. Guide 1.86 levels are orders of magnitude higher than the one-in-a-million risk goal and above the upper end of EPA's acceptable risk range, according to the EPA's Building PRG calculator.⁸⁹ Furthermore, Reg. Guide 1.86 is more than four decades old, was issued by the AEC (which no longer even exists), was not designed to be based on health protection but rather on what hand-held detectors in the 1960s could readily detect, and has been withdrawn by the NRC as outmoded.⁹⁰

However, the central issue is that to not clean up buildings to local background and to dispose of waste above background in other than LLRW⁹¹ sites would violate the AOC. In one part of the DEIS, DOE appears to promise to comply with those requirements, but elsewhere questions are raised about that commitment. This should be clarified, making fully clear that the AOC requirements (cleanup to background, no averaging, disposal of everything above background in an LLRW site) will be strictly followed.

Finally, the DEIS only addresses radioactively contaminated buildings in Area IV that are owned by DOE and is silent about the demolition and disposal of radioactive buildings in the area that are owned by Boeing. Efforts to dismantle those radioactive buildings and send radioactive debris from them to non-LLRW sites resulted in a preliminary injunction still in effect.⁹² The AOC covers all soil in Area IV and the NBZ.⁹³ Soil is, as indicated above, defined as including buildings and debris. DOE thus

⁸⁸ See EPA Radiation Risk Q&A, *supra*.

72-34

72-34

DOE's preferred alternative for buildings is complete removal of at least all 18 of the DOE-owned buildings. It is DOE's understanding that Boeing intends to do the same. Boeing has responsibility for removal of its structures at the SSFL, including in Area IV. Boeings actions are not subject to NEPA, but rather subject to the California Environmental Quality Act and are addressed in the Programmatic Environmental Impact Report (EIR) in preparation by DTSC. The AOC does not give DOE legal authority for the removal of Boeing-owned structures in Area IV.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

agreed to clean up all soil, as defined, in Area IV and NBZ, irrespective of who owned it or who contaminated it. Indeed, all of the contaminated land is owned by Boeing, but DOE is nonetheless responsible for its cleanup. Therefore there is no basis for the DEIS to exclude the cleanup to background of Area IV buildings and disposal of resulting debris above background at LLRW sites, no matter who might own the buildings.

72-34
cont'd

F. Failure to Consider Transportation Options

DOE has worked energetically to inflate soil volume estimates and thus the estimated number of truck trips to try to scare people near the site into supporting DOE's efforts to get out of having to clean up the contamination it created.⁹⁴ The fact that for decades vast numbers of trucks hauled immensely more dangerous material to and from the site while it operated (e.g., high level radioactive waste/highly irradiated nuclear fuel/plutonium) is ignored.

DOE arbitrarily declined to consider transportation options such as the nearby rail line, the use of conveyor systems, or the use and potential upgrade of alternative vehicular routes that would pass few houses. It did so claiming to consider such options would delay the project, because it would require study and otherwise take time.⁹⁵ But DOE has had at least fifteen years, since it first did its Environmental Assessment, to address ways of avoiding truck impacts on neighborhoods if it wished to, and its refusal over all those years to take any step to consider alternatives is not defensible.

72-35

The soil volumes used in the EIS have been independently verified and used by DTSC in its Draft Program EIR. Please see the response to comment 72-6. DOE acknowledges that there were occasional shipments of radioactive material to and from Area IV during the period of nuclear research; these past shipments, however, are irrelevant to the scope of this Final EIS which is to evaluate alternatives for remediation of Area IV and the NBZ. DTSC in its program EIR concluded that the only viable transportation alternative is hauling wastes by truck using Woolsey Canyon Road.

There are numerous routes off the site that would involve passing few if any homes.⁹⁶ None is considered in the DEIS. There are other methods of conveyance besides trucks, e.g., a conveyor system to a nearby rail line; DOE has refused to consider it.⁹⁷ There are rail lines within a mile or so of the site that could be reached without passing a single home⁹⁸; DOE refuses to consider it, and instead, its only rail option is to truck the material 60 miles to Puente Hills to a rail depot that isn't even open yet.⁹⁹

⁹⁴ See the analysis by the Southern California Federation of Scientists (SCFS) of how the volumes estimates were inflated, submitted by SCFS March 21, 2014, during the scoping proceeding. With the exception of the soil fluffing matter, all of the concerns SCFS raised continue to be a problem with the soil volume (and thus truck trip) estimates.

G. DOE Attack on the AOC It Executed

DOE raises several spurious issues in its attack on the agreement it signed. The first is that it is supposedly difficult to find clean fill that meets the LUT levels. But the data in the DEIS shows the Gillibrand fill meets all the requirements except with a minor exception for two constituents, which DOE itself says pose no risk, and where the measurements are identified as “J,” meaning there is no confidence in the concentration estimated. But in any case, as DOE concedes, the AOC says if there is any difficulty getting replacement soil that meets the LUT, DTSC and DOE will discuss it and DTSC will decide on the best fill available (which would appear readily to be the Gillibrand soil.) So that is a non-issue that doesn’t call into question the AOC, but in fact shows it has reasonable provisions that work.

Secondly, DOE disagrees with the LUT value for Total Petroleum Hydrocarbons (TPHs), saying it is hard to reliably detect TPHs at the LUT levels. But that is a decision for DTSC, which the AOC grants to DTSC, and DTSC has determined that labs can readily detect TPHs at the LUT value. If DOE can demonstrate that not to be the case, then DTSC can decide to change the LUT. DOE also asserts that some of the TPH detections may have been related to organic material not associated with SSFL pollution. But the report they cite actually indicates the organic contribution is just a few percent of the total measurement.¹⁰⁰ Again, that is a matter for their regulator, DTSC, not DOE. In any case, the TPH issue does not call into question the AOC. DOE estimates that of the 1.4 million cubic yards of contaminated soil, a total of 150,000 cubic yards has only TPHs, only PAHs, or TPHs and PAHs. Thus the soil contaminated with just TPH can’t explain 90% or more of the soil contamination at SSFL, which has other contaminants in it and must be cleaned up, irrespective of any question about TPHs.

¹⁰⁰ Nelson, DEIS reference 300; the naturally occurring material is estimated at only 5-8% of the total reading.

72-36

72-36

The comment is inaccurate. DOE identified and raised technical issues with the AOC with DTSC prior to release of the EIS and in the assessment of the AOC in the EIS. The assessment was performed in accordance with normal NEPA practice. In its comments on the Draft EIS, DTSC (Commenter 64) acknowledged several of the AOC implementation issues, particularly in relation to backfill. The Cleanup to AOC LUT Values Alternative would require up to an estimated 661,000 cubic yards of backfill soil that meets all LUT values. The analysis of the three backfill borrow sites (which includes the Gillibrand site) was presented to demonstrate how difficult this could be. DOE does not have the authority to accept backfill which does not meet the AOC LUT requirements, regardless of how small the exceedance of the LUT value. As the commenter noted, DOE would consult with DTSC and the DTSC is responsible for determining a suitable backfill source if one meeting the AOC LUT values cannot be found. DTSC is aware of the issue and DOE is awaiting their response. Please refer to Section 2.3, “Suitable Backfill Soil,” of this CRD for a discussion of the responsibilities and actions necessary to identify a suitable backfill source.

72-37

72-37

Please see the response to comment 072-17. DOE is aware that the TPH issue is one for DTSC to resolve.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

Lastly, DOE asserts it may be difficult to demonstrate compliance with the LUT values because of the potential for some false readings as above background when they aren't. But DTSC, at EPA recommendation, set LUT values based on background that were very inflated, using a rare statistical test called Upper Simultaneous Limit (USL) that produces an extremely high confidence that a reading is indeed above background. It errs, unfortunately in many people's eyes, by guaranteeing soil that isn't above background isn't cleaned up, instead of erring by guaranteeing that soil that is contaminated is cleaned up. This issue was raised during the EPA radiation survey. EPA dismissed it as a non-issue and indeed it turned out to be when the data came in. Although measurements were made for scores of radionuclides, EPA found contamination for the radionuclides as expected, and didn't find false positives to be a problem. Again, this is a matter not in DOE's jurisdiction; it agreed in the AOC that DTSC would set the LUT values. And it is not timely, since the LUT values were established by DTSC years ago and DOE had every opportunity to comment then, and didn't.

72-38

In short, DOE in 2010 proposed and committed to the cleanup to background; nothing has changed technically. All that has changed is that the top leadership of the agency has changed, and the DEIS shows DOE is now trying to avoid complying with the legally binding AOC.

72-39

H. Flawed Risk Assessment and Cost-Benefit Analysis

Because DOE used Risk Based Screening Levels that are thousands of times higher (less protective) than the true RBSLs approved by DTSC in the SRAM and by EPA in its PRG calculator, all risk estimates and the entire cost-benefit analysis are completely erroneous. By improperly averaging, leaving out nearly 90% of the toxic chemicals found at the site, failing to even analyze for the ecological RBSLs, and using the wrong human health RBSLs, all of the conclusions are without basis. Accurately performed risk estimates and cost-benefit analyses would show that the promised AOC cleanup is essential. But in any case, the risk assessment and cost-benefit analyses are irrelevant, because DOE is bound by the AOC requirement to clean up to background.

72-40

Conclusion

DOE has a clear obligation, having contaminated SSFL through its failure to follow proper environmental procedures, to clean the site up fully, as required by the AOCs; to do so by the deadlines agreed to; and to mitigate impacts such as trucks hauling away contaminated material by a careful development of alternative transportation options in an EIS. Instead, DOE has dragged its feet for years since the AOCs were issued, not only missing the deadline for completion of the cleanup, but not even beginning it. And now in a severely flawed DEIS, the federal agency flouts the authority of the California state agency charged with overseeing this important cleanup by proposing to breach the cleanup agreement it signed and instead leave the great majority of the contamination in place.

72-39
cont'd

72-38 EPA's recommendations for establishing the radionuclide soil look-up table values are contrary to the commenters' assertions. The LUT values were adjusted based on EPA's recommended uncertainty process. As described in Chapter 2, Section 2.3.3.1 of the EIS, EPA provided guidance and recommendations on how the AOC LUT values for radionuclides should be developed (HGL 2012c). EPA states that, "BTVs [Background Threshold Values] alone are neither appropriate nor recommended for use as the LUT values." EPA also stated that their field action levels (FALs), which they renamed "radiological trigger levels" (RTLs) after adding uncertainty factors to the FALs, should not be used for radionuclide LUT values. EPA stated that the RTLs were developed for EPA's radiological investigation of Area IV and, "EPA does not [EPA emphasis] recommend the use of those [RTLs] for future phases of the project," (i.e., cleanup). EPA recommends consideration of uncertainty in the decision-making process. EPA states, "For any given sample, a laboratory result that is equal to the BTV represents a range of possible true values for that sample; some of which are less than the BTV and some of which are greater than the BTV. Whether that result represents a true sample value that actually exceeds the BTV is purely a matter of chance; a decision that the BTV has been exceeded would be incorrect 50 percent of the time," (meaning a 50 percent false positive rate or that one-half the time, DOE could be remediating clean soil). EPA further states, "[e]stablishing a decision criterion, without considering the impact [of uncertainty], would result in a potential situation in which the release of uncontaminated background-level material would not be assured, but would instead be randomly determined, similar to a coin toss." EPA goes on to caution DTSC's selection of AOC LUT values: "While DTSC may select LUT values that are equal to cleanup levels, it is EPA's understanding that the extraordinarily high decision error rate for laboratory results at or near those cleanup levels [that is, background] is believed to be unacceptable." EPA states that it "recommends an adjustment to the BTVs and minimum detectable concentrations to include appropriate consideration [for uncertainty] to ensure an acceptably low decision error rate of approximately 5 percent" (HGL 2012c). The FALs used by EPA in presenting potential radionuclide contamination did not include an uncertainty factor and, thus per EPA, should not be used to determine the presence of radionuclide contamination. The FALs themselves did not become the provisional LUT values. The provisional LUT values issued by DTSC included an adjustment for uncertainty per the EPA guidelines. DTSC issued the LUT values without an opportunity for a formal comment period. During meetings with DTSC, DOE did express its concerns regarding the nature of the LUT values which are below what most laboratories can achieve.

Commenter No. 72 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Geoffrey H. Fettus, Senior Attorney, Natural Resources Defense Council; Catherine Lincoln, Executive Coordinator, Committee to Bridge the Gap

The public that resides in the area surrounding the site will be placed at continued and perpetual risk if DOE continues on this course. We call this day for extensive revision of the DEIS so that it is fully in compliance with the AOC and DOE's commitments for a complete cleanup of the contamination for which it is responsible.¹⁰¹

72-41

for contact: LANRDCCBGcomments@gmail.com

¹⁰¹ In so doing, we call attention to the resolutions passed by the Los Angeles County Board of Supervisors, the Ventura County Board of Supervisors, and the Los Angeles City Council all similarly calling on DOE to alter the DEIS so that it is fully in compliance with the AOC requirements. Copies are enclosed.

We acknowledge the technical contributions to this analysis provided by the Program on Environmental and Nuclear Policy at the University of California, Santa Cruz.

The issue of decision rate error for radionuclides also applies to chemicals. The 2010 AOC (DTSC 2010) (paragraph 1.8.3.1) specifies that the detection limits for the chemical AOC LUT values should be based on the "lowest concentrations at which an analyte can be confidently detected in a sample and its concentration can be reported with a reasonable degree of accuracy and precision." During the development of the chemical AOC LUT values, DTSC chemists were critical of the process. In a memorandum to DTSC management, the chemists stated, "[t]he Environmental Chemistry Laboratory does not recommend the process outlined in the current Draft Technical Memorandum to serve as the foundation for site characterizations and for the development of the [method reporting limit] lookup table values" (DTSC 2012a).

72-39 Refer to the responses to comments 72-2 and 72-6.

72-40 Please refer to the responses to comment 72-22. The commenters have improperly compared RBSLs with the associated land uses. The SRAM provided separate RBSLs for both the direct pathways and the indirect garden pathway. The use by DOE of only the direct pathways is consistent with the land use as open space. The commenters are also incorrect regarding how exposure point concentrations are calculated. When a risk assessment is performed, EPA Risk Assessment Guidance (EPA 1989, 1992) does allow for averaging and prescribes the use of an upper confidence limit (UCL) on the arithmetic average (UCL95) and only suggests the use of a maximum value as a screening tool. It is important to note that under any of the soil remediation alternatives, those soils with the higher levels of chemical and/or radioactive constituents, that is, those that would pose a risk to human health or the environment, would be removed. Soils that would be left on site would have lower concentrations of chemical and/or radioactive constituents (in all alternatives concentrations below levels derived from risk-based criteria). Each of the three action alternatives analyzed in this EIS would leave SSFL Area IV and the NBZ safe for their designated future land.

In response to comments, this Final EIS more explicitly addresses ecological risk receptors, such as risks to plants and animals (see Chapter 4, Section 4.5, of this Final EIS).

72-41 As described in Chapter 1, Section 1.11, of this Final EIS, DOE has made a number of revisions in response to new information and comments on the Draft EIS. The analysis in this Final EIS shows that the public residing near SSFL would not be at risk from the chemical and radioactive constituents from the remediation of Area IV and the NBZ. Following cleanup in accordance with any of the soil remediation action alternatives, any risk posed to the adjacent public would be reduced (see Chapter 2, Section 2.8 of this Final EIS).

DOE acknowledges your preference for a cleanup of the site. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

Signed: *Susan P. Gaitz*

Commenter No. 74: Pat Van Buskirk

RE: Comment on SSFL Draft Environmental Impact Statement

- 1. INSIST ON ADHERING TO THE 2010 CONTRACT
- 2. MUST BE ENFORCED !! (BO DTSC)
- 3. DO THE RESEARCH RE PEDIATRIC CANCERS
- 4. THE REPORTS BY DOE IS APPROPRIATE -
NUMBERS HAVE BEEN MANIPULATED
RE-DO IT! THE ECO FIGURES ARE ACCURATE.
- 5. MUST BE CLEANED UP IMMEDIATELY

Signed: Pat Van Buskirk

74-1

74-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," of this CRD regarding cleanup of the site, as well as necessary steps prior to continuing cleanup, and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.

74-2

74-2 The focus of DOE's current actions and the purpose of this EIS are to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Please refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD, which discusses past studies of health effects in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.

74-3

74-3 All DOE numbers have been checked for accuracy. In addition, please see Section 1.4, "Changes from the Draft SSFL Area IV EIS" of this CRD. This Final EIS includes a sensitivity analysis of the Cleanup to Administrative Order on Consent (AOC) Look-Up Table (LUT) Values Alternative that evaluates potential impacts if all areas exceeding the AOC LUT values were excavated and removed from the site (see Appendix L). Under this scenario, ecological and cultural resources would not be protected as required by applicable regulations and the AOC. Final EIS Appendix L also includes sensitivity analyses that evaluate potential impacts from constraints (e.g., budget constraints, longer-than-expected confirmation processes) that might result in soil remediation proceeding more slowly than evaluated in the proposed alternatives and scenarios

Commenter No. 77: Stephen Lotaro

RE: Comment on SSFL Draft Environmental Impact Statement

If would have been good to hear the numbers of workers who got sick/died from the contamination at the Lab. Has there been any clean-up? Why wasn't clean-up started? Why isn't it finished? You must get this done! Clean I+ up!

Signed: 

77-1

77-1

The focus of DOE's current actions and the purpose of this Final EIS are to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. The reader is referred to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD, which discusses studies of health effects on workers. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

77-2

77-2

DOE acknowledges your concern regarding removal of contamination in a time-sensitive manner and refers you to Section 2.1, "Preferences for Cleanup," of this CRD, which identifies necessary steps prior to continuing cleanup DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation at those portions of SSFL for which DOE is responsible, Area IV and the NBZ.

Commenter No. 78: R. Hopkins

RE: Comment on SSFL Draft Environmental Impact Statement

To whom it may concern.

I expect that you will honor what you / your agency have has agreed to do. I am hopeful that you will honor the Administrative Order of Consent with no further delay or penalty.

I am hopeful legal action will not be needed for your agency to comply with the order. I am hopeful compliance will not have to be enforced by Department of Toxic Substance Control! I pay federal taxes that fund your agency do what is right!

Signed:

R. Hopkins

RE: Comment on SSFL Draft Environmental Impact Statement

Although over the years we were told you had to
test ~~act~~ alternatives as required by law your agency
signed the AOC's. Now we can see what your
alternatives are & how much you will move
behind. No alternatives are protective of human health
except to cleanup to the levels in the AOC's. This
is at the top of a mountain & there is no
way to keep them below safe except to follow
the AOC's. So what you know is the way that
to do a keep the commitment you made to the
community in 2010

Signed: Marie Mason

80-1

80-1

DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," of this CRD. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). This latter use of a risk assessment approach for soil cleanup is consistent with the approach used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

Commenter No. 81: Jacob Van Buskirk

82-1

82-1

DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information. Note that there are three responsible parties (DOE, NASA, and Boeing) at SSFL who performed work and that there are environmental consequences resulting from that work. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ.

Commenter No. 83: Dawn Gray

RE: Comment on SSFL Draft Environmental Impact Statement

- None of the proposed alternatives draw up SSFL to the standards that DOE is committed to in the Agreement on Consent (AOC)
- DOE must not violate the agreement by looking at alternatives to following it (other than the baseline - nothing alternative)
- The agreement is a debt that the United States owes to the people of California, and the United States cannot give on its debt.
- DOE should consider various alternatives (p.e. HOW) to follow the AOC, including alternatives to using trucks, using alternative routes & reducing the most contaminated soil to reduce the amount of soil that must be removed.
- BEJEN - looked at Radisson 200 additional cancer deaths
- Morgan Stanley shows higher number with families of 2-5 miles because there ~~is~~ isn't anything there
- conveyor or other method could be used instead of trucks - they can be enclosed to

83-1

83-2

83-3

83-4

83-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup" of this CRD.

The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) The use of a risk assessment approach for soil cleanup is consistent with the approach used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

83-2 DOE has considered alternative methods of how to implement the 2010 AOC. As described in Chapter 2 and shown in Figure 2-1, soil over a large part of Area IV contains chemicals and/or radionuclides that exceed 2010 AOC LUT values. The only feasible way of cleaning up those soils to comply with the 2010 AOC LUT values is to remove it using earth-moving equipment. Other alternatives or methods of removing or cleaning the soil that DOE considered but dismissed from detailed evaluation are discussed in Chapter 2, Section 2.2.3 of this Final EIS. These include such alternatives as soil partitioning and soil washing or using large volumes of water to flush contaminated sediments to the bottoms of drainage channels where they would be recovered. As discussed in Section 2.2.3, these alternatives were determined to be ineffective or impractical.

As noted in Section 2.3 of this Final EIS, DOE identified technical issues with implementing the 2010 AOC with the current LUT values. To address this, DOE developed the Cleanup to Revised LUT Values Alternative that uses chemical risk-based screening levels as cleanup criteria. Development and adoption of revised cleanup levels as suggested by this alternative is a means by which the 2010 AOC could be made to be more implementable.

DOE considered four different routes for the trucks in technical analysis. (Please see Chapter 4, Section 4.8.2, of this Final EIS.) DOE also considered alternative means of removing waste from SSFL. See Section 2.9, "Options for Transportation of Waste from SSFL" of this CRD regarding the use of other methods and routes for

Commenter No. 83 (cont'd): Dawn Gray

transporting waste and soil from the site. A discussion of other transportation concepts considered but dismissed from detailed analysis is included in Chapter 2, Section 2.2.3 of this Final EIS.

Two of the soil remediation alternatives DOE evaluated reduce the amount of soil that must be removed from SSFL. These alternatives focus on identifying and removing the most contaminated soil. Under the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative, only low concentrations of chemicals and/or radionuclides would remain. Refer to Chapter 2, Sections 2.3 and 2.4 for descriptions of the soil remediation alternatives and the corresponding soil volumes that would be removed.

- 83-3 Please refer to Sections 2.7, "Offsite Impacts," and 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for discussions of contamination and illnesses within the vicinity of SSFL, including discussions of the studies of incidences of offsite cancers.
- 83-4 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

Commenter No. 84: Gayle Hickerson

RE: Comment on SSFL Draft Environmental Impact Statement

I would like the Santa Susana Field Laboratory
toes area cleaned up.

84-1

84-1

DOE acknowledges your preference for a cleanup of the SSFL. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. Note that there are three responsible parties (DOE, NASA, and Boeing) at SSFL who performed work and there are environmental consequences as a result of that work. The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ.

Signed:

Gayle Hickerson

Commenter No. 85: Milissa Osping

RE: Comment on SSFL Draft Environmental Impact Statement

There is no question on whether the site needs to be cleaned up! Yes! Clean it up to legal standards!

I was on well water below SSFL and the child I was carrying had cancer. My other two children had Alopecia and my eldest had to have baby root canal at 2 yrs. old. I have many pictures of deformed vegetables at our home garden during the time and pets died. Clean it up NOW!
Signed: Milissa Osping

85-1

85-1

DOE's cleanup will comply with applicable legal standards. As stated in Chapter 1, Section 1.1, of this EIS, DOE's purpose and need is to complete remediation of SSFL Area IV and the NBZ to comply with applicable requirements for cleanup of radiological and hazardous substances. These requirements include regulations, orders, and agreements.

85-2

85-2

DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of data on offsite contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

With respect to the timeliness of DOE's completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can continue. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record of Decision pursuant to NEPA. Additionally, in accordance with the CEQA, DTSC must complete an environmental impact report (EIR) prior to site remediation; the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (a draft of which was issued by DTSC in 2017 [DTSC 2017b]). Cleanup will continue following completion of these actions.

Yes, include my name and address on the mailing list so I can receive information on the EIS. No, do not include my name and address on the mailing list.

If you provide your name, it will appear along with your comment in the Final EIS unless you request otherwise. If you do not want your name included with your comment in the Final EIS, please check here.

Please turn in this form at the meeting or mail by March 14, 2017, to:

Ms. Stephanie Jennings, NEPA Document Manager, SSFL Area IV EIS,
U.S. Department of Energy, 4100 Guardian Street, Suite 160, Simi Valley, CA 93063

Or submit comments via our website: www.SSFLAreaIV/EIS.com

Response side of this page intentionally left blank.

Commenter No. 86 (cont'd): Anonymous

Please address my anonymous comments on the DEIS:

- DOE has violated NEPA ONCE AGAIN. Signing the AOC without doing an environmental analysis is a violation of NEPA LAW. Period. I request a chapter addressing how and why DOE chose this cleanup. SB990 was proven unconstitutional, and it appears DOE does not have the intestinal fortitude to stand up to the environmental elected officials. I thought this was DOE mission?
- I believe a thorough evaluation on the importance of the lab from a Native American perspective is needed. The DEIS should go further and ensure the special place is preserved if the risk based areas are cleaned up.
- DOE has done a miserable job communicating to the public what the site condition currently is. I only see articles and interviews from these insane activists. I want to see DOE look us in the eyes and tell us how the site is now, and what really remains.
- The land use scenarios are not a full and accurate depiction of reality. The site will be open space according to Boeing. Why was this not evaluated as a realistic alternative?
- The DEIS does not do a good job explaining the cancer perception to the surrounding communities. This needs to be expanded and articulated so the average citizen can understand.
- The cumulative effects of the cleanup are weak; they need to show the effects from the other party's cleanup on the surrounding communities.
- The SSFL is a corridor for wildlife. DOE must follow state and federal laws to protect species that are listed for both agencies.
- The background evaluation done by DTSC is inadequate. If you compare values from pristine locations around CA and America, they will be called 'contaminated'. DOE should perform a comparative evaluation with other parts of the US, and communicate the insanity of the AOC in the revision.
- Finally, I support a cleanup consistent with open space and the principles in superfund cleanup sites. I do not support the waste of taxpayer monies.

86-1

86-2

86-3

86-4

86-5

86-6

86-7

86-8

86-9

- 86-1 In 2007, DTSC issued the Consent Order for Corrective Action (2007 CO), which required DOE to complete an EIS for the cleanup of SSFL Area IV prior to relinquishing control over any portion of Area IV. DOE entered into the 2010 Agreement on Consent (AOC) under the authority granted the Department in the Atomic Energy Act (AEA). The AEA authorizes DOE to “advance the goals of restoring, protecting and enhancing environmental quality, and assuring public health and safety” (42 U.S.C. 7112(13)). The AOC also requires DOE to complete an EIS prior to initiating any cleanup activities at SSFL. Consistent with the DOE Environmental Management mission of completing the safe cleanup of the environmental legacy of nuclear energy research, DOE is preparing this current EIS to evaluate the potential impacts of the major Federal action of performing the final clean up SSFL Area IV and the NBZ. Hence, DOE is not violating NEPA by performing this EIS subsequent to signing the AOC.
- 86-2 DOE been proactive in evaluating the importance of SSFL from the Native American perspective, in particular in Area IV and the NBZ, the only areas where DOE has jurisdiction. This understanding is illustrated through 1) DOE's extensive program of consultation (please refer to Chapter 4, Section 4.11.4 and Appendix E, Consultations), 2) the inclusion of Native American perspectives (see Chapter 9, Native American Histories and Perspectives, in this Final EIS), and 3) DOE's commitment to creating a Programmatic Agreement that is compliant with NHPA Section 106.
- 86-3 DOE acknowledges your concern. There are currently no additional public meetings planned for the near future. Chapter 3 describes the affected environment in and around SSFL Area IV and the NBZ. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ.
- 86-4 In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and

Commenter No. 86 (cont'd): Anonymous

the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. This Final EIS was revised to consider the Boeing open space scenario in accordance with the restrictions in the conservation easements. The reader is referred to the various resource impact analyses presented in Chapter 4 of this Final EIS.

- 86-5** DOE acknowledges your comment and refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. Section 2.8 also discusses causes and the incidence rate of cancer. DOE also refers you to Chapter 3, Section 3.9 5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.
- 86-6** Please see Section 2.7, Offsite Impacts, of this CRD for a discussion and DOE’s response to concerns about offsite impacts. A discussion of the potential cumulative impacts on human health for the offsite public was added to Section 5.5.9 of this Final EIS.
- 86-7** DOE is following both State and Federal laws to protect biological resources, including sensitive species and their habitat.
- 86-8** DOE notes your concern about the background evaluation for constituents of concern. Chapter 2, Section 2.3.3.1, of this Final EIS, discusses the implementability of the 2010 AOC, including difficulties associated with defining and cleaning up soils to background levels.
- 86-9** DOE acknowledges your support for site remediation consistent with the principles implemented for cleanup of CERCLA sites. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information. Please also note that DOE does not own the property in Area IV or the NBZ and cannot determine the ultimate land use for the property. As discussed in Chapter 2, Section 2.2.3, of the EIS, the property owner, Boeing intends to preserve the land as open space for the public’s benefit. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site.

Commenter No. 87: Anonymous

- The proposed action appears to be precedent setting. To not perform an environmental analysis before signing such agreement appears to be a violation of NEPA. NEPA requires such analysis before signing to this AOC agreement. The EIS should explain in vast detail so the public can understand why DOE chose to sign such a terrible deal. Explain why this is a legal and needed agreement.
- The proposed action appears to not be in compliance with CA Health and Safety Code, Chapter 6.8, which requires a risk evaluation before an action.
- It appears that the \$41.5 Million given to EPA, via a CA law was a waste of taxpayers dollars. The EPA Final Tech Memo clearly articulates this site is not a radiological concern. DOE should be held accountable for signing this fraudulent agreement, clearly a waste of taxpayers dollars, and for what?
- SB990 was a terrible law, and was ruled unconstitutional. Why is this site still the only site in CA being held to such a higher standard? The EIS should explain why it is being cleaned to such a strict standard, versus the norm. The EIS is silent on this fact, government too big and not accountable.
- DOE needs to include in your analysis, realistic land use in its evaluation. The recreational user should be analyzed. The site will be open space says Boeing, no residential neighborhoods, no one living there. The recreational option would let the community know real risks, for a realistic land use.
- Why is DOE considering such a conservative land use? Explain to us taxpayers why this makes sense.
- DOE should also protect Cultural Resources and ensure the Endangered Species Act is complied with. I think DOE should also explain why it let the DTSC decide what species is exempt/protected in the EIS. It appears this is a Federal authority and the EIS should also explain this precedent setting decision, the EIS is **SILENT ON IT**. That is not acceptable, NEPA is supposed to be about informing the community.
- Lets make CA great again.

87-1

87-2

87-3

87-4

87-2
cont'd

87-5

87-6

87-1 In 2007, DTSC issued the Consent Order for Corrective Action (2007 CO), which required DOE to complete an EIS for the cleanup of SSFL Area IV prior to relinquishing control over any portion of Area IV. DOE entered into the 2010 Agreement on Consent (AOC) under the authority granted the Department in the Atomic Energy Act (AEA). The AEA authorizes DOE to “advance the goals of restoring, protecting and enhancing environmental quality, and assuring public health and safety” (42 U.S.C. 7112(13)). The AOC also requires DOE to complete an EIS prior to initiating any cleanup activities at SSFL. Consistent with the DOE Environmental Management mission of completing the safe cleanup of the environmental legacy of nuclear energy research, DOE is preparing this current EIS to evaluate the potential impacts of the major Federal action of performing the actual clean up SSFL Area IV and the NBZ. Hence, DOE is not violating NEPA by performing this EIS subsequent to signing the AOC.

87-2 The reader is referred to Final EIS Chapter 2, Sections 2.1 and 2.2 for discussions regarding the history and legality of the AOC.

DTSC did not enforce SB 990 with respect to DOE, so DOE was under no duress attributable to SB 990 when the 2010 AOC was negotiated. The 2010 AOC states that DTSC agreed that compliance with the 2010 AOC would constitute DOE compliance with applicable provisions of the California Health and Safety Code (Section 1.6), including Senate Bill 990. However, after the law was declared unconstitutional, SB 990 was no longer enforceable.

87-3 The 2010 AOC states that compliance with the Order and the 2007 Consent Order constitute compliance with all applicable provisions of Chapter 6.5 and 6.8 of Division 20 of the California Health and Safety Code.

Note also that both the Draft and this Final EIS include alternatives with cleanup levels that are based on risk. In its evaluation of environmental consequences, this Final EIS evaluates risk for each of the soil remediation alternatives. The reader is referred to the summary of impacts presented in Chapter 2, Section 2.8 and to Chapter 4, Section 4.9, “Human Health,” of this EIS.

87-4 DOE engaged EPA to conduct radiological characterization of Area IV and the NBZ pursuant to the Federal Consolidated Appropriations Act of 2008 (H.R. 2764). This study provided valuable information regarding the locations of radiological constituents in Area IV and the NBZ. As shown in Chapter 2, Figure 2–1, the locations with radiological constituents exceeding the provisional radiological LUT values are well

Commenter No. 87 (cont'd): Anonymous

delineated. The radiological characterization, along with chemical characterization of Area IV and the NBZ provide the data used by DOE in developing the three soil remediation action alternatives, all of which are protective of human health and the environment. Because of the characterization they performed, EPA was able to state, “Approximately 70 percent of soil samples with radionuclide concentrations greater than the [field action levels] are located within five Area IV Radiological Areas of Interest.”

87-5 Risk analysis scenarios are based on the most-likely future land uses. The future use of the SSFL property is that of open space, hence the EIS evaluates a recreational user scenario. The EIS also evaluates a residential scenario as a conservative risk analysis and for use in comparison to risks to a recreational user. This Final EIS was revised to consider the Boeing open space scenario in accordance with the restrictions prohibiting residential, agricultural, or commercial development or uses of the site, in the conservation easements finalized in 2017. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ.

87-6 Please refer to Section 2.3 “Application of Exemptions under the 2010 Administrative Order on Consent” of this CRD for a discussion of this topic and DOE’s response. To clarify, DTSC did not decide what species are exempt or protected in the EIS. With regard to the number of protected species reviewed in the Draft EIS, the EIS preparers used accepted professional practice to include information about threatened or endangered species (either listed federally or by California) that could possibly occur on a site (based on their distributions and ecological requirements) before narrowing to species known or expected to occur on the site based on review of this information and field surveys. The number of species identified in this Final EIS reflects the results of the Biological Opinion from the USFWS (with input from the CDFW). This process is explained further in Chapter 3, Section 3.5.5, “Threatened, Endangered, and Rare Species” of this Final EIS; the species and habitats identified for protection are discussed in Appendix B, Section B.5. Please refer to Section 2.4, “Application of Exemptions under the 2010 Administrative Order on Consent,” of this CRD, for additional information on this topic.

Tables 3-6 and 3-7 list plant and animal species that are known to be present within Area IV and the NBZ or the potential for occurrence of the species in the region of influence for each species.

Commenter No. 88: Anonymous

Please consider my comments on the DEIS DOE Mrs. Jennings,

- So DOE did some type of NEPA document and was sued for not following the law. And what does DOE do? Sign this 'cleanup to background' before performing an evaluation! This is criminal, I believe this is fraud, waste and abuse by the government. I do believe DOE had the legal right to obligate the taxpayers for so much money without any consequence. I demand that the FINAL explain in clear, plain English how it was ruled that this is ok for the taxpayer. The DEIS is woefully silent in explaining this to the community. I thought the DEIS is supposed to inform the community. This part is missing.
- DOE has used VERY conservative assumptions and does not fully evaluate the impacts to the site. The soil volumes should have a range with accepted construction cleanup numbers of -30% to +50%. The volumes should not be this precise. It gives me the impression DOE has already developed plans to complete the alternatives, instead of proposing them.
- The AOC cleanup should not be the 'proposed action'. How can DOE explain how this dang thing is terrible for the site and then make it the proposed action. This makes absolutely NO COMMON SENSE.
- Why is on site disposal not evaluated? This is a mistake and the revision should evaluate using on site disposal. The DEIS only says the AOC WILL NOT ALLOW IT. This is not a legitimate technical rationale answer to not performing an on site disposal and reducing air pollution and truck traffic.
- The clean up to background by using some point by point evaluation is legally precedent setting. I believe our President should be made aware of this decision. I request that DOE state in the revision how it has ensured this has been communicated to the President. I need the legal language to show why this is acceptable clearly in the document.
- I would like to see a comparison of other DOE sites to compare the AOC agreement versus a normal risk based cleanup using area averaging. I request DOE explain why this difference is acceptable to tax payers.

88-1

88-2

88-3

88-4

88-5

88-6

88-1 In 2007, DTSC issued the Consent Order for Corrective Action (2007 CO), which required DOE to complete an EIS for the cleanup of SSFL Area IV prior to relinquishing control over any portion of Area IV. DOE entered into the 2010 Agreement on Consent under the authority granted the Department in the Atomic Energy Act (AEA). The AEA authorizes DOE to “advance the goals of restoring, protecting and enhancing environmental quality, and assuring public health and safety” (42 U.S.C. 7112(13)). The AOC also requires DOE to complete an EIS prior to initiating any cleanup activities at SSFL. Consistent with the DOE Environmental Management mission of completing the safe cleanup of the environmental legacy of nuclear energy research, DOE is preparing this Final EIS to evaluate the potential impacts of the major Federal action of performing the final clean up SSFL Area IV and the NBZ. Hence, DOE is not violating NEPA by performing this EIS subsequent to signing the AOC.

88-2 Since the Draft EIS was prepared, DOE has independently evaluated the estimate of the soil volume associated with cleaning up to the 2010 AOC LUT values. Based on the characterization data and an improved understanding of the soil depth over uneven bedrock across Area IV and the NBZ, DOE is not as uncertain about the upper volume of soil estimate as it was at the time the Draft EIS was prepared. Nevertheless, this Final EIS retains as a conservative assumption the estimate of 881,000 cubic yards of soil that would be removed from SSFL under the Cleanup to AOC LUT Values Alternative. Similar to the Draft EIS, this Alternative would not remove 115,000 cubic yards of soil for the cultural and biological resources exemptions or 620,000 cubic yards of soil for the monitored natural attenuation of TPHs.

For further disclosure DOE has added a sensitivity analysis to assess the potential impacts of removing a larger volume of soil under the Cleanup to AOC LUT Values Alternative (see Appendix L). The sensitivity analysis evaluates impacts associated with removing 1,900,000 cubic yards of soil. This volume is based on 1,616,000 cubic yards of soil exceeding AOC LUT values (includes areas exempt to protect cultural and biological resources and for monitored natural attenuation of TPHs, times an uncertainty factor of 20 percent.

88-3 The proposed action for soil remediation presented in the Draft EIS was selected because it reflected the agreement signed between DOE and the State of California, the 2010 AOC. This Final EIS retains an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In response to public input received, and consistent with its obligations under NEPA, DOE also analyzed soil remediation

Commenter No. 88 (cont'd): Anonymous

alternatives that are based on risk to human health as well as the protection of natural resources. This latter use of a risk assessment approach for soil cleanup is consistent with the approach used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for soil cleanup of SSFL Area IV and the NBZ.

- 88-4 Onsite disposal options were eliminated from analysis in this EIS because the 2010 AOC does not allow onsite burial or landfilling (excavating and burying) of contaminated debris or soil. Boeing owns the land in Area IV and the NBZ. DOE's intent is to complete its cleanup responsibilities, then relinquish the land to Boeing's control. DOE does not want any enduring responsibility for a landfill created on site.
- 88-5 In accordance with responsibilities assigned by Congress, the Secretary of Energy and Assistant Secretary for Environmental Management are the appropriate levels within the President's administration to be informed of the analyses and decisions being made with respect to this EIS and DOE's cleanup at SSFL.
- 88-6 NEPA does not require comparison to actions at other DOE sites. DOE did compare to risk-based cleanups at two California locations; Hunters Point Naval Shipyard and McClellan AFB (see Appendix D, Section D.3, of this Final EIS).

Commenter No. 89: Anonymous

Please find my anonymous comments:

- The proposed action appears to not be in compliance with CA Health and Safety Code, Chapter 6.8, which requires a risk evaluation before an action. It needs to be explained in the Final EIS, why the AOC alternative is ignoring CA code Chapter 6.8. The public should be made aware why decisions are made.
- It appears that the signing of the AOC before performing an evaluation is a violation of FEDERAL LAW that is known as NEPA. The Final should explain why this is legal for the taxpayer footing the bill. This agreement is clearly a waste of taxpayer dollars, and for what reduction in risk to the community? Less than 1% does not justify spending an additional \$500 Million.
- The site will have a final land use of recreational, so why is DOE evaluating suburban-residence or background? This is a very conservative approach, and it is inconsistent with how EPA does superfund sites. The EIS should explain why it is being cleaned to such a strict standard, versus the norm that is used elsewhere.
- DOE agreed to the AOC without the land owner agreeing. The final needs to articulate how this is legal and withstanding any challenges. This needs to be communicated to the public how this occurred with consent from Boeing.
- My guess is that it appears Obama did this terrible deal and left it for Trump. Explain how DOE will ensure that the President is aware of the burden that has been placed on the taxpayers by DOE bureaucrats in the final EIS. This appears to a waste of tax payers money and is fraud, waste and abuse.
- DTSC is suppose to be working with DOE. The Final has to communicate how it will handle any negotiation on the AOC with DTSC. The communication to the public should not be very vague and not explain what DOE is doing. There is supposed to be transparency.
- PLEASE PLEASE PLEASE, "let's make America great again"!

89-1

89-2

89-3

89-4

89-5

89-6

89-3
cont'd

89-7

89-1 The 2010 AOC states that compliance with the Order and the 2007 Consent Order constitute compliance with all applicable provisions of Chapter 6.5 and 6.8 of Division 20 of the California Health and Safety Code.

Note also that both the Draft and this Final EIS include alternatives with cleanup levels that are based on risk. In its evaluation of environmental consequences, this Final EIS evaluates risk for each of the soil remediation alternatives. The reader is referred to the summary of impacts presented in Chapter 2, Section 2.8 and to Chapter 4, Section 4.9, "Human Health," of this EIS.

89-2 DOE entered into the 2010 Agreement on Consent under the authority granted the Department in the Atomic Energy Act (AEA). The AEA authorizes DOE to "advance the goals of restoring, protecting and enhancing environmental quality, and assuring public health and safety" (42 U.S.C. 7112(13)). Consistent with the DOE Environmental Management mission of completing the safe cleanup of the environmental legacy of nuclear energy research, DOE is preparing this current EIS to evaluate the potential impacts of the major Federal action of performing the actual cleanup of SSFL Area IV and the NBZ.

89-3 Thank you for your comment. It has been included in the Administrative Record for the EIS. As a Federal agency, DOE is required to evaluate and justify major expenditures of Federal dollars. DOE performed a cost-benefit analysis of the soil remediation alternatives as part of this EIS (see Appendix K). The results of the analysis show that the cleanup under the Cleanup to 2010 AOC LUT Values Alternative would be much more expensive and with minimal additional protection of public health and the environment compared to the other project soil remediation alternatives.

89-4 At the time the Draft EIS was developed, Boeing had stated its intent to cleanup based on a suburban resident scenario as a measure of conservatism. To be consistent, DOE included the suburban resident scenario as the basis for alternatives evaluate in the Draft EIS. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. This Final EIS added the open space scenario under its Conservation of Natural Resources Alternative.

Commenter No. 89 (cont'd): Anonymous

- 89-5 As the party responsible for the cleanup of Area IV and the NBZ, DOE entered into the 2010 Agreement on Consent under the authority granted the Department in the Atomic Energy Act (AEA). The AEA authorizes DOE to “advance the goals of restoring, protecting and enhancing environmental quality, and assuring public health and safety” (42 U.S.C. 7112(13)).
- 89-6 In accordance with responsibilities assigned by Congress, the Secretary of Energy and Deputy Assistant Secretary for Environmental Management are the appropriate levels within the President’s administration to be informed of the analyses and decisions being made with respect to this EIS and DOE’s cleanup at SSFL.
- 89-7 DOE has added additional information and clarification on the role of DTSC in Chapter 1, Section 1.4 of this Final EIS.

Commenter No. 90: William McNally and Barbara Rain

Department of Energy Comment: Re: 1959 Santa Susana Nuclear Lab (SSNL) Accident: Victim

We are writing to inform you that my wife, Barbara Lisa Rain, born December 1957 in Encino, CA resided at her family's single-family residence in Granada Hills (Yarmouth Ave.) from 1958-1976, approximately 4-5 miles north by northeast of the elevated Santa Susana Nuclear Laboratory Accident Site. At the time of the Accident, estimated to be June-July 1959, Barbara was an 18 month-old infant, probably outdoors and downwind from the nuclear reactor Site perched on a bluff overlooking the northwestern corner of the San Fernando Valley.

Between 1970-71, Barbara's father, an MD internist, noticed she had a goiter and in fact her thyroid, which is naturally supposed to turn-on at puberty, did not function. Since 99% of thyroid failures have to do with exposure to toxic and radioactive substances it is safe to conclude that Barbara, as a 1 1/2 year old infant, perhaps during the event, was outside and directly exposed to the burst of radiation. Even if she were not directly exposed, the yard grass and pavement she daily played upon was. Everything in the area had been sprinkled lightly with cancer-causing radioactivity. Infants, we now know, are the most vulnerable to radioactive exposure.

For the past 48 years Barbara has had to take thyroid medication to compensate for her non-functioning thyroid. Over the decades she has been exposed to the wide-ranging, always changing medical protocol for taking thyroid medication. From the 1970s through the 90s Barbara took 240 mg./day of natural thyroid. Since then, that dose has been reduced to 90 mg./day. Over the years, there has been an on-going campaign to eliminate natural thyroid in favor of synthetic, a cheaper material. Currently she is bureaucratically fighting her medical provider, Kaiser, over what thyroid materials are approved and which are not, i.e. natural vs. synthetic. Over the years the medical community has utilized and denied the very same treatment protocol. In a certain sense Barbara knows more from her personal experience than a young medical resident. In short, the travail over not having a functioning thyroid and its impact on her health maintenance goes on every single day. This daily hassle of compensating for a non-functioning thyroid is not something we want anyone to experience.

There should be no equivocating from the government regarding the removal of radioactive toxic materials, especially since this was in fact a government created and covered up problem, one the medical community struggles to get agreement over. Five years ago an activist concerned with the water runoff of the Santa Susana accident site into adjacent neighborhoods showed me a number of official studies done by the State and by the Feds over the radioactive toxicity (perchlorate, tritium) at the Site and its gravitational migration down into surrounding areas. There can be no moral slippage. The government (Department of Energy) and Boeing are obligated to clean up a health hazard -- if these studies are to be believed -- they created in a residential community that still exists.

Emotionally, Barbara was furious that the 1959 nuclear accident was for thirty years kept a secret from those very citizens who were exposed to the dangerous radiation. This subterfuge was malice. Now you, Dept. of Energy, have the opportunity to make sure no one else loses their thyroid over government malfeasance.

Thank you.

William McNally Barbara L Rain

DOE acknowledges your comment and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE (and its predecessor agency) has not kept the Sodium Reactor Experiment (SRE) accident secret. The accident was reported to local and National media in an August 29, 1959 news release (Atomics International 1959). The accident was also described in detail in a reactor safety textbook, *The Technology of Nuclear Reactor Safety* published in 1964 (Thompson and Beckerley 1964). These and other documents related to operation of SRE can be found at http://www.etec.energy.gov/Library/Historical_Docs.html

90-2

90-2

Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

Ms. Stephanie Jennings
NEPA Document Manager
SSFL Area IV EIS
U.S. Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 93063

**Draft Environmental Impact Statement (DEIS) for Remediation of Area IV and the Northern
Buffer Zone of the Santa Susana Field Laboratory (Draft SSFL Area IV EIS) (DOE/EIS-0402)
(SCH No.: 2017014002)**

The South Coast Air Quality Management District (SCAQMD) staff appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the Lead Agency and should be incorporated into the Final EIS.

SCAQMD's 2016 Air Quality Management Plan

Adopted on March 3, 2017, the 2016 Air Quality Management Plan (2016 AQMP) is a regional blueprint for achieving air quality standards and healthful air in the South Coast Air Basin. Built upon the progress in implementing the 2007 and 2012 AQMPs, the 2016 AQMP provides a regional perspective on air quality and lays out the challenges facing the South Coast Air Basin. The most significant air quality challenge in the Basin is to reduce an additional 45 percent reduction in nitrogen oxide (NOx) emissions in 2023 and an additional 55 percent NOx reduction beyond 2031 levels for ozone attainment. For more information on the 2016 AQMP, please visit the SCAQMD's website, at: <http://www.aqmd.gov/home/library/clean-air-plans/air-quality-mgt-plan>.

Proposed Action

The proposed action consists of the remediation of impacted soil and groundwater, the removal of existing facilities, the disposal of resulting waste, and the restoration of the affected environment in Area IV of the Santa Susana Field Laboratory (SSFL) in Ventura County. The 290-acre Area IV is bounded by the 182-acre buffer zone to the north and the 114-acre Area III to the south. Boeing is the owner of Area IV, Area III, and the northern buffer zone area, while U.S. Department of Energy ("DOE" or "Lead Agency") owns the existing buildings in Area IV and is responsible for building demolition and cleanup of soils and groundwater in Area IV. Contaminated soils and resulting waste would be hauled by trucks traversing through Woolsey Canyon Road to nearby (Buttonwillow or Westmorland facilities in California) and distant (Nevada National Security Site or U.S. Ecology in Idaho) disposal sites. The proposed action is expected to occur over a 15-year period.

Air Quality Analysis

Based on a review of Tables 4-37 and 4-38 in Chapter 4.6, *Air Quality and Climate Change*, of the DEIS, the SCAQMD staff found that the unmitigated peak NOx emissions generated by truck travelling between SSFL and the nearby disposal sites would be within a range of 47 to 70 pounds per day or 10 to 250 tons per year, and disposing at the distant disposal sites would generate 110 to 140 pounds per day or 25 to 250 tons per year of NOx emissions.

Response side of this page intentionally left blank.

Commenter No. 91 (cont'd): Lijin Sun,
South Coast Air Quality Management District

Ms. Stephanie Jennings

Page 2

April 12, 2017

The SCAQMD has developed regional air quality CEQA significance thresholds. Because the proposed construction period would occur over a length of 15 years, it more closely resembles the characteristics of project operation. Therefore, the SCAQMD staff recommends that the Lead Agency quantify the project's criteria pollutant emissions within the South Coast Air Basin and compare the results to the SCAQMD's regional operational thresholds¹ to determine the air quality impacts.

Mitigation Measure

In Chapter 6, *Measures to Minimize Impacts and Mitigation Measures*, on page 6-17 of the DEIS, the Lead Agency is committed to using green fleets which are "a fleet of trucks no more than 5 years old" for on-road trucks (see Mitigation Measure AQ-1 in Table 6-2, *Potential Mitigations*). The Lead Agency found that using green fleets would "reduce emissions from the average calendar year 2019 truck fleet by 61 percent in the South Coast Air Basin" and that "the peak annual truck emissions within the Basin would be below the emission thresholds" (see page 4-86 of the DEIS). Based on the SCAQMD staff's understanding of the description for Mitigation Measure AQ-1, the Lead Agency is committed to using 2019 model year diesel trucks during construction. As stated above, the proposed construction period would occur over a length of 15 years. Assuming that the proposed construction would begin in year 2019, the proposed construction would be completed in year 2034. As such, using 2019 model year diesel haul trucks for construction beginning from year 2025 will not meet the Mitigation Measure AQ-1 requirement, and newer diesel haul trucks will be required (see Table 1). The SCAQMD staff recommends that the Lead Agency specify which model year haul trucks will be used during construction in the Final EIS.

Table 1

Construction Years	Model Year Diesel Haul Trucks Based on the Description of Mitigation Measure AQ-1
2019-2024	2019
2025	2020 or newer
2026	2021 or newer
2027	2022 or newer
2028	2023 or newer
2029	2024 or newer
2030	2025 or newer
2031	2026 or newer
2032	2027 or newer
2033	2028 or newer
2034	2029 or newer

The SCAQMD staff commends the Lead Agency's commitment to using diesel haul trucks newer than 2010 model year. As described in the 2016 AQMP, to achieve NOx emissions reductions in a timely manner is critical to attaining the National Ambient Air Quality Standard (NAAQS) for ozone before the 2023 and 2031 deadlines. SCAQMD is committed to attain the ozone NAAQS as expeditiously as practicable. The proposed action plays a role in contributing to Basin-wide NOx emissions. The Lead Agency's commitment to using green fleets throughout the entire construction phase is consistent with the SCAQMD's commitment to NOx emissions reductions and ensures that the South Coast Air Basin is on track to attain the NAAQS.

¹ South Coast Air Quality Management District. March 2015. *SCAQMD Air Quality Significance Thresholds*. Available at: <http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf?sfvrsn=2>.

91-1

91-1

The durations of activities proposed in the SSFL Area IV EIS range from a low of 4 years for the Conservation of Natural Resources Open Space Scenario Combined Alternatives, to a high of 28 years for the Cleanup to AOC LUT Values Combined Alternatives. This Final EIS uses the following thresholds to evaluate air quality impacts from proposed DOE cleanup activities within the South Coast Air Basin: (1) an EPA Prevention of Significant Deterioration threshold for a pollutant that attains a national ambient air quality standard (NAAQS) and (2) a general conformity *de minimis* threshold for a pollutant that does not attain a NAAQS. Therefore, this approach is sensitive to the existing air quality conditions within the region and it is applicable to either construction or operational activities. This EIS also qualitatively determines whether emissions from proposed activities would produce localized impacts that would contribute to an exceedance of an ambient air quality standard. DOE considers these thresholds to be appropriate for purposes of evaluating air quality impacts from the proposed SSFL project alternatives within the South Coast Air Basin, as they are based on approved regulations.

91-2

91-2

Draft EIS Mitigation Measure AQ-1 proposed to implement a haul truck fleet where individual trucks would be no more than 5 years old during each year of cleanup activities. This measure would ensure that all project trucks would have (1) the newest or relatively new on-road emission standards and (2) a minimum level of engine deterioration and resulting degradation in emissions due to being relatively young in age. For example, in year 2019, the oldest trucks allowed in the project fleet would be model year 2014. Similarly, in year 2034, the oldest truck allowed in the fleet at that time would be model year 2029. To respond to the comment, DOE revised the wording of this initiative in this Final EIS to more clearly state the goal that individual on-road trucks within the project fleet would be no more than 5 years old during each year of cleanup activities.

Dear Stephanie Jennings:

The State Clearinghouse submitted the above named Draft EIS to selected state agencies for review. The review period closed on April 13, 2017, and no state agencies submitted comments by that date. This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act.

Please call the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process. If you have a question about the above-named project, please refer to the ten-digit State Clearinghouse number when contacting this office.

Sincerely,

Scott Morgan
Director, State Clearinghouse

Project Title Draft EIS for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory
Lead Agency U.S. Department of Energy

Type EIS Draft EIS
Description Note: Extended Review per lead

This Draft SSFL Area IV EIS analyzes the potential environmental impacts of alternatives for conducting cleanup activities in Area IV of the Santa Susana Field Laboratory and the adjoining Northern Buffer Zone, located in Ventura County, CA. Remediation is needed to clean up residual chemicals and radionuclides from historical DOE operations at the ETEC in Area IV, in compliance with regulations, orders, and agreements. The alternatives analyzed in this draft EIS involve the disposition of remaining DOE facilities and support buildings, remediation of soil and groundwater, and disposal of all resulting waste at existing licensed or permitted facilities in a manner that is protective of the environment and the health and safety of the public and workers.

Subject: Draft Environmental Impact Statement (DEIS) for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory, Ventura County, California (CEQ# 20170002)

Dear Ms. Jennings:

The U.S. Environmental Protection Agency (EPA) has reviewed the above-referenced document. Our comments are provided pursuant to the National Environmental Policy Act (NEPA), Council on Environmental Quality (CEQ) regulations (40 CFR Parts 1500-1508), and our NEPA review authority under Section 309 of the Clean Air Act.

We acknowledge the complexity of the cleanup being taken on by the Department of Energy (DOE) at the Santa Susana Field Lab (SSFL), including the fact that DOE does not own any land at SSFL, but is the owner of 18 buildings in Area IV and is responsible for building demolition and cleanup of soils and groundwater in Area IV and the Northern Buffer Zone (NBZ). Boeing owns the land within Area IV and the NBZ, as well as additional land within Area I, Area III, and the Southern Buffer Zone. Area II and part of Area I are owned by the Federal Government and administered by the National Aeronautics and Space Administration (NASA). The California Department of Toxic Substances Control (DTSC) is leading the oversight of cleanup activities.

DOE's cleanup strategy has three major components: cleanup of chemically and radiologically impacted soil; building demolition and disposal; and groundwater remediation. In 2010, DOE entered into an *Administrative Order on Consent for Remedial Action* (2010 AOC) with DTSC. The 2010 AOC requires the application of soil cleanup standards based on Look-Up Table (LUT) values, which are local background concentrations or laboratory method detection limits. DOE's proposed action, the Cleanup to the AOC LUT Values Alternative, would implement the technical requirements of the 2010 AOC. Two other soil cleanup alternatives, the Cleanup to Revised LUT Values Alternative and the Conservation of Natural Resources Alternative, would meet the cleanup objectives to be protective of the environment and the health and safety of the public and workers based on risk calculations, while avoiding some of the technical challenges and potential adverse environmental impacts associated with soil cleanup to background or method detection limits. Notwithstanding the apparent constraints of the AOC, the DEIS presents these as reasonable alternatives to the proposed action; and EPA has evaluated them as such.

Response side of this page intentionally left blank.

**Commenter No. 93 (cont'd): Kathleen Martyn Goforth, Manager,
Region IX, U.S. Environmental Protection Agency**

The DEIS does not identify a preferred alternative; therefore, we are rating all of the alternatives evaluated in the DEIS. We have rated the Building Removal Alternative, Groundwater Monitored Natural Attenuation Alternative and Groundwater Treatment Alternative as LO - Lack of Objections (see Enclosure: "Summary of EPA Rating Definitions"). We have rated all three action alternatives for the soil remediation as EC-2 - Environmental Concerns - Insufficient Information. Our concerns regarding the soil remediation alternatives are based on the project's potential impacts to air quality. The proposed heavy equipment usage and numerous truck trips on Woolsey Canyon Road and other routes, over a period of two years to greater than ten years (depending on the alternative selected), would result in significant emissions of oxides of nitrogen (NOx), and it is not clear whether the project would conform to the State Implementation Plan (SIP) to meet the national standards for air quality. We recommend that the Final Environmental Impact Statement (FEIS) discuss how DOE will ensure that the project does not interfere with the SIP, and include a draft conformity determination if a conformity determination will be needed. We also recommend that the FEIS identify DOE's preferred alternatives for soil excavation, building removal, and groundwater cleanup. The enclosed Detailed Comments elaborate on our concerns and include additional recommendations regarding contaminated soils, water resources, air quality mitigation, traffic, cumulative impacts, preservation of historic resources, and greener cleanups.

The DEIS acknowledges DOE's trust responsibilities to the Santa Ynez Band of Chumash Mission Indians, and we encourage you to continue to consult with the tribe and address their concerns about the archaeological and cultural resource investigations performed for this project. If DOE determines that any part of the Federal land is a Sacred Site or Traditional Cultural Property, we also encourage you to work proactively with the California DTSC and tribal representatives to mitigate the project's potential impacts.

The DEIS includes several references to EPA conducting verification sampling. Please clarify, in the FEIS, that EPA has no current or anticipated role in the cleanup, and any involvement in verification sampling would be contingent on future agreements and funding.

EPA appreciates the opportunity to comment on the DEIS. When the FEIS is released for public review, please send one electronic and one hard copy to the address above (mail code: ENF 4-2). If you have any questions, please contact me at [redacted] or have your staff contact Jeanne Geselbracht, the lead reviewer for this project. Jeanne can be reached at [redacted]

Sincerely,

 Kathleen Martyn Goforth, Manager
 Environmental Review Section

Enclosures: Summary of EPA Rating Definitions
 EPA's Detailed Comments

93-1

93-2

93-3

93-4

93-5

- 93-1 DOE acknowledges EPA's rating of the alternatives for groundwater remediation, building removal, and soil remediation.
- 93-2 This Final EIS includes additional information to demonstrate that the soil remediation alternatives comply with the State Implementation Plan to meet the national standards for air quality. This Final EIS demonstrates that emissions from each unmitigated soil remediation alternative, as well as from combinations of action alternatives (for soil remediation, groundwater remediation, and building demolition combined), considered in this Final EIS would remain below the applicable conformity thresholds for each analysis domain and therefore would conform to the State Implementation Plan for each of these areas. This Final EIS adopts a version of the new truck fleet proposed in Draft EIS Mitigation Measure AQ-1 as a goal to further reduce unmitigated emissions.

The methods used to estimate emissions in this Final EIS for combinations of action alternatives are presented in the EIS reference, *EIS for Remediation of Area IV and the NBZ of the SSFL - Final Air Emissions Calculation Methods* (Leidos 2018b). Emission factors and activity data used to estimate emissions for the combinations of action alternatives are presented in Attachments 1.A, 1.B, 1.CRez, and 1.C-OS.
- 93-3 DOE identifies its Preferred Alternative(s) in Chapter 2, Section 2.7 of this Final EIS.

DOE's preferred alternative for soils remediation is the Conservation of Natural Resources, Open Space Scenario. Under this alternative, DOE would remediate Area IV and the NBZ to reduce the concentrations of chemical and radioactive constituents in the soil to levels necessary to protect human health and ecological resources.

DOE's preferred alternative for building demolition is the Building Removal Alternative. Under this alternative DOE would demolish the 18 DOE-owned buildings in Area IV and transport the resulting waste off site for disposal.

DOE's preferred alternative for groundwater remediation is a combination of the Monitored Natural Attenuation Alternative and the Treatment Alternative. Monitored natural attenuation would be used for the two plumes with the lowest concentrations of TCE (Metals Clarifier plume and the RMHF plume) and for the tritium plume. Treatment of the remaining plumes would be in accordance with the results of the Corrective Measures Study. Source removal is the preferred alternative for the strontium-90 source.
- 93-4 DOE plans to continue to consult with the SHPO, the Santa Ynez Band of Chumash Indians and other non-federally recognized tribes to develop a Programmatic

**Commenter No. 93 (cont'd): Kathleen Martyn Goforth, Manager,

Chuck Thomas, Ventura County Air Pollution Control District, [redacted]
Mary Meyer, California Department of Fish and Wildlife, [redacted]
Brendon Greenaway, State Historic Preservation Office, [redacted]

Agreement to ensure that impacts to cultural resources are avoided, mitigated, or minimized. DOE will also cooperate with DTSC to mitigate impacts to cultural resources.

93-5 This Final EIS reference to verification sampling by EPA reflects the language in the 2010 AOC (Section 2.12 "Confirmation Sampling"). DOE, however, acknowledges that EPA is not a signatory to the 2010 AOC and their involvement in verification would be contingent upon future agreements and funding. This Final EIS was revised to include an acknowledgement that EPA involvement would be under arrangements similar to those previously established for radiological characterization of Area IV and the NBZ.

**Commenter No. 93 (cont'd): Kathleen Martyn Goforth, Manager,
Region IX, U.S. Environmental Protection Agency**

SUMMARY OF EPA RATING DEFINITIONS*

This rating system was developed as a means to summarize the U.S. Environmental Protection Agency's (EPA) level of concern with a proposed action. The ratings are a combination of alphabetical categories for evaluation of the environmental impacts of the proposal and numerical categories for evaluation of the adequacy of the Environmental Impact Statement (EIS).

ENVIRONMENTAL IMPACT OF THE ACTION

"LO" (Lack of Objections)

The EPA review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

"EC" (Environmental Concerns)

The EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce the environmental impact. EPA would like to work with the lead agency to reduce these impacts.

"EO" (Environmental Objections)

The EPA review has identified significant environmental impacts that should be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

"EU" (Environmentally Unsatisfactory)

The EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potentially unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the Council on Environmental Quality (CEQ).

ADEQUACY OF THE IMPACT STATEMENT

Category "1" (Adequate)

EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis or data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

Category "2" (Insufficient Information)

The draft EIS does not contain sufficient information for EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analyzed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses, or discussion should be included in the final EIS.

Category "3" (Inadequate)

EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analyzed in the draft EIS, which should be analyzed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data, analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the NEPA and/or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

*From EPA Manual 1640, Policy and Procedures for the Review of Federal Actions Impacting the Environment.

Response side of this page intentionally left blank.

Region IX, U.S. Environmental Protection Agency**

EPA DETAILED COMMENTS ON THE REMEDIATION OF AREA IV AND THE NORTHERN BUFFER ZONE OF THE SANTA SUSANA FIELD LABORATORY DRAFT ENVIRONMENTAL IMPACT STATEMENT, VENTURA COUNTY, CALIFORNIA – April 12, 2017

Air Quality

General conformity requirements are intended to ensure that actions taken by federal agencies in air quality nonattainment and maintenance areas do not interfere with the State's plans to meet the national standards for air quality. General conformity is a two-step process that begins with an assessment of applicability, per 40 CFR 93.153. If general conformity is applicable to a federal action, EPA's regulations provide several criteria by which a federal action may be demonstrated to conform to the applicable state implementation plan (*see* 40 CFR 158). In the Draft EIS, tables 4-36 and 4-38 indicate that oxides of nitrogen (NOx) would exceed the applicable *de minimis* thresholds (pgs. 4-84 – 4-89) under each of the combined action alternatives; therefore, general conformity appears to be applicable to all of these alternatives. The DEIS does not, however, include a general conformity determination.

The DEIS discusses potential mitigation measure AQ-1: the use of cleaner off-road or construction equipment and cleaner on-road trucks. This mitigation measure could reduce the emissions of priority pollutants from the project; however, as a mitigation measure that may or may not be adopted in the Record of Decision, it cannot be considered in an applicability analysis for general conformity. If measures such as AQ-1 are incorporated as elements of the project and, consequently, are non-discretionary, the emissions reduction resulting from the measures may be considered in the general conformity applicability analysis.¹

Recommendations:

- Discuss, in the FEIS, how DOE would ensure that the project does not interfere with the State's plans to meet the national standards for air quality. If a conformity determination is needed, include the draft conformity determination in the FEIS.
- Consider incorporating mitigation measure AQ-1 as a specific element of the project so the reduced emissions can be considered in the general conformity applicability analysis of 40 CFR 93.153.
- If DOE plans to use offsets to demonstrate conformity, commit in the FEIS to fully offset emissions (i.e. to zero) of any pollutants for which the projected emissions would exceed the *de minimis* thresholds, as required by 40 CFR 93.158, and begin discussions with the appropriate air quality management districts as soon as practical.

If you have any questions regarding the requirements of EPA's Conformity Rule, please consult with Tom Kelly, EPA Region 9 Air Division. He can be reached at [REDACTED]

Water Resources

Groundwater Cleanup

The DEIS describes the on-going Resource Conservation and Recovery Act (RCRA) Corrective Measures Study being developed independently from the EIS to evaluate and select groundwater treatment technologies to be applied as remedial actions. We understand that DOE plans to submit the

93-2
cont'd

93-6

93-6

The *Draft RCRA Facility Investigation Groundwater Investigation Report for Area IV* (CDM Smith 2018a) and the *Draft Area IV RCRA Corrective Measures Study* (CDM Smith 2018b) were completed after the issuance of the Draft EIS. The RCRA RI findings and results of the Corrective Measures Study (CMS) were used to inform the assessment in the EIS of the most likely groundwater remedies. DOE believes that the discussion of advantages and effectiveness of groundwater remedies is more applicable to the CMS. DOE will provide the CMS to EPA upon request. Regarding details of actions at the GWIM, multiple wells are being targeted for pumping as each

¹ General Conformity Guidance: Questions and Answers (Response to Question 29), July 13, 1994

**Commenter No. 93 (cont'd): Kathleen Martyn Goforth, Manager,
Region IX, U.S. Environmental Protection Agency**

study to DTSC sometime in 2017, prior to DOE's Record of Decision for this project. We presume that information in that study is relevant to this EIS and will be useful for purposes of disclosure and decision making.

Within the Groundwater No Action Alternative discussion, the DEIS references the currently planned SSFL-wide groundwater interim measures, which include the Former Sodium Disposal Facility (FSDF) Groundwater Interim Measure to extract trichloroethylene-contaminated groundwater (pg. 2-50). The DEIS does not show the location of the extraction well or the lateral or vertical volume of groundwater the well is intended to capture. Nor does it describe the treatment method for extracted groundwater or identify its discharge location.

We found no information in the DEIS regarding contamination of the vadose zone below the depth of soil removal; therefore, it is unclear whether the vadose zone is contaminated or may be a potential source of groundwater contamination. We note that some of the technologies considered, such as soil vapor extraction, may be capable of effectively removing vadose zone contamination, depending on the local geology.

Recommendation: Provide the following information in the FEIS:

- A description of three-dimensional groundwater flow and contaminant migration at the site;
- an expanded discussion of the site's geology relevant to contaminant migration and treatment effectiveness;
- a detailed description of contaminant source areas (e.g., test stands, evaporation ponds, landfills, leach fields, etc.) and any vadose zone contamination;
- a description of the current and predicted future interactions of groundwater and surface water in the project area, including the locations of surface seeps;
- a thorough discussion of the current groundwater interim measures that are part of the Groundwater No Action Alternative, including their energy use and effectiveness;
- a brief summary comparison of the advantages and disadvantages of each technology evaluated; and
- identification and description of DOE's preferred groundwater cleanup technology and the basis for its selection.

Waters of the U.S.

The DEIS does not provide sufficient information on the existing conditions and functions of the waters at the project site. Page 4-61 references the US Army Corps of Engineers as having final determination of compensatory mitigation required as part of the permitting process under Section 404 of the Clean Water Act.

Recommendation: Provide the following information in the FEIS:

- Description of the conditions and functions of jurisdictional waters of the U.S. at the site.
- Discussion of the human and environmental risks posed by all site water features and description of the potential for direct impacts under each alternative.
- Disclose whether the project requires a Clean Water Act Section 404 permit for discharge of dredged or fill material into waters of the U.S. Pursuant to 40 CFR 230, any permitted discharge into waters of the U.S. must be the least environmentally damaging practicable alternative (LEDPA) available to achieve the project purpose. If cleanup activities would

93-6
cont'd

93-7

93-6
cont'd

93-8

well encounters a separate bedrock fracture harboring water with VOCs. There are no discharges from this action as pumping only produces 10 to 20 gallons per month. Extracted groundwater is transported off-site for treatment. As described in Chapter 2, Section 2.7 of this Final EIS, a combination of the Monitored Natural Attenuation Alternative and the Groundwater Treatment Alternative is DOE's Preferred Alternative for groundwater remediation. Under this alternative, monitored natural attenuation would be used for the two plumes with the lowest concentrations of TCE (Metals Clarifier plume and the RMHF plume) and for the tritium plume. Treatment of the remaining plumes will be in accordance with the results of the Corrective Measures Study. Source removal is the preferred alternative for the strontium-90 source.

Additional information has been incorporated into Chapter 3, Section 3.4.3.1, regarding the operation of the Groundwater Interim Measure pumping well (RS-54) and the extent of the FSDF groundwater plume being treated with this well. The location of the FSDF treatment facility is shown in Figure 2-12 of this EIS and well RS-54 is shown in Figure 2-4 in the Final RCRA Facility Investigation (RFI) Groundwater Work Plan, Portions of Area IV under DOE Responsibility, Santa Susana Field Laboratory, Ventura County, California (CDM Smith 2015a).

93-7 Regarding the request for information on contamination within the vadose zone, the vadose zone is not the source of groundwater contamination. The primary locations with contamination are bedrock fractures and near surface groundwater found in weathered bedrock. As described in response to comment 93-6 of this CRD, DOE has performed additional groundwater investigations and reported the results in the *Draft RCRA Facility Groundwater Remedial Investigation Report, Area IV, Santa Susana Field Laboratory, Ventura County, California* (CDM Smith 2018a). Chapter 3, Section 3.4 of this Final EIS has been updated with information from the draft groundwater remedial investigation report, including the presence of documented contamination associated with some plumes in the vadose zone, a summary of the conceptual site model of three-dimensional groundwater flow and contaminant migration at the site, a reference to the detailed discussion of the site's geology, and additional statements on the impact of fine-grained units on the groundwater flow and contaminant migration. A detailed analysis of the site's geology relevant to the treatment effectiveness was addressed in the *Draft Area IV RCRA Corrective Measures Study* (CDM Smith 2018b). References to documents, primarily the *Draft RCRA Facility Groundwater Remedial Investigation Report* (CDM Smith 2018a), where detailed descriptions of contaminant source areas can be found have been added to this Final EIS. Additional descriptive information on the contaminant plumes has been added to this Final EIS based their nature and extent

Section 3 – Public Comments and DOE Responses

Commenter No. 93 (cont'd): Kathleen Martyn Goforth, Manager, Region IX, U.S. Environmental Protection Agency

result in the discharge of dredged or fill material into waters of the U.S., demonstrate in the FEIS that the alternative is the LEDPA, describe the potential environmental impacts and discuss alternatives to avoid or minimize those discharges.

93-8
cont'd

Transportation Impacts and Routes

The calculations and assumptions used to estimate traffic fatality risk associated with the various cleanup alternatives are unclear in the DEIS (pg. S-78, pg. 4-106). For example, under the Cleanup to AOC LUT Values Alternative "Truck option," which would involve 110,000 truck shipments, one traffic fatality is projected; while, under the "Truck/rail option," with 63,000 truck shipments, three traffic fatalities are projected.

93-9

Recommendation: Explain, in the FEIS, how the traffic fatality projections were calculated for each alternative, and identify the regional intermodal facility on a transportation map to better inform the route options.

93-8

Information in the DEIS regarding project truck routes focuses on the main trucking road exiting the SSFL facility, which is Woolsey Canyon Road. Little information is provided on the potential routes beyond Woolsey Canyon Road to the various potential receiving facilities. For each designated waste, multiple waste receiving facility options exist, which allows for flexibility in waste disposal planning for the project. The DEIS is incomplete in its analysis of how the various potential shipment routes could affect air emissions, traffic safety, congestion, road conditions, and noise.

93-10

Recommendations: Provide the following information in the FEIS:

- Provide maps and figures that show the general locations of each category of waste receiving facility in relation to SSFL, and the proposed routes to each facility. Ensure that all reasonably foreseeable traffic analyses, including for each route beyond Woolsey Canyon Road, are considered.
- Consider highlighting on maps and figures all school and hospital locations and other sensitive areas and show how, if possible, impacts in these areas could be minimized by using alternative routes.
- To the extent possible, based on coordination with remediation planning at NASA and Boeing, update the traffic analysis to consider the cumulative impacts.
- Consider a rideshare or carpool program for construction workers as mitigation to further reduce air and traffic impacts.

93-11

93-12

93-13

While the DEIS considers the impact of truck traffic on schools, it does not address childcare centers, preschools, parks or recreation centers in its evaluation of truck traffic impacts to children.

Recommendations:

- In the FEIS, consider childcare centers, preschools, parks and recreation centers, in addition to schools, in the evaluation of truck traffic and potential exposure to children.
- Consider providing, as mitigation, safety measures such as crossing guards, if busy intersections near schools are not currently staffed.
- Target outreach material about the construction schedule and truck routes to schools, childcare centers and residents.

93-11
cont'd

provided in the draft groundwater remedial investigation report (CDM Smith 2018a). A revised description of groundwater discharge to surface water (seeps) has been included in Chapter 3, Sections 3.3 and 3.4 of this Final EIS. A figure has been added to this Final EIS to show the current location of known seeps. The modeling of groundwater flow presented in the *Draft RCRA Facility Groundwater Remedial Investigation Report* demonstrates that offsite seeps would not be impacted by contaminants in groundwater beneath Area IV. The *Draft RCRA Facility Groundwater Remedial Investigation Report, Area IV, Santa Susana Field Laboratory, Ventura County, California* (CDM Smith 2018a) and the *Draft Area IV RCRA Corrective Measures Study* (CDM Smith 2018b) are included as references in this Final EIS and are available for review on DOE's website.

Appendix I of the EIS provides the Wetland Assessment, which has further information on the regulatory requirements and results of jurisdictional determination surveys conducted in Area IV and the NBZ. To date no permit applications have been submitted, but DOE has been consulting with the U.S. Army Corps of Engineers to ensure all the necessary permits are submitted and appropriate actions are taken. DOE has met with Corps staff on several occasions to review the wetlands assessment, but the Corps is awaiting receipt of the soil remediation plan to determine permit requirements.

The approach for calculating traffic accidents and fatalities is described in detail in Appendix H, Sections H.7 and H.10, of the EIS, and summarized in Chapter 4, Section 4.8.1. The estimated potential traffic accidents and fatalities are for transport of all radioactive and nonradioactive wastes by truck or truck/rail, and of other materials, such as backfill soil and equipment by truck. The number of truck trips would be the same under either the truck-only option or the truck/rail option. For example, Chapter 4, Table 4-49 shows the number of truck trips under the truck-only and the truck/rail options to be the same. (About 50,000 truck trips were for transporting hazardous and nonhazardous waste from the site and about 43,000 for transporting backfill/materials/supplies to the site.) The differences in accidents and fatality risk between the two options arise from the difference in total miles traveled by truck and total miles traveled by truck and by rail. The truck miles traveled and the accident incidence rates are described in Appendix H, Section H.10. Appendix H was revised to display the rail miles traveled. A label identifying the representative intermodal facility used in the analysis was added to the appropriate transportation figure in Chapter 3, Figure 3-33.

Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of transportation issues and DOE's response.

**Commenter No. 93 (cont'd): Kathleen Martyn Goforth, Manager,
Region IX, U.S. Environmental Protection Agency**

Preservation of Cultural and Biological Resources

The DEIS acknowledges the broad range of land acreage that could be designated for protection of cultural and/or biological resources. Such designations, which will affect the determination of the soil volumes to be excavated under each alternative, will be contingent upon the U.S. Fish and Wildlife Service's Biological Opinion and the outcome of consultation with the California State Historic Preservation Officer, the Santa Ynez Band of Chumash Indians, and the SSFL Sacred Sites Council (pg. 2-18).

Recommendation: Continue working closely with the approving agencies to update information on the areas to be protected for cultural and biological resources. Provide updated information in the FEIS that discloses the impacts to cultural and biological resources based on proposed soil removal volumes.

Cumulative Impacts

As the Cumulative Impacts chapter mentions, NASA and Boeing are also planning cleanup activities for soil and groundwater at their SSFL sites. The DEIS provides estimated waste volumes and truck trips for the NASA and Boeing cleanups. It is unclear, however, whether the volume estimates for these other cleanup activities are current and whether landfills and other waste receiving facilities will have space available to accept the large volumes of waste from the DOE, NASA and Boeing simultaneously.

Recommendations: To the extent possible, coordinate with NASA and Boeing regarding their remediation projects and provide the following information in the FEIS so that it contains as comprehensive a discussion of cumulative impacts as possible:

- Updated ranges of soil volumes to be disposed, intended schedules, and potential disposal facilities.
- A summary of DOE's discussions with receiving facilities regarding their respective capacities to handle the potential volumes of contaminated soil from DOE, NASA and Boeing. Consider shipment of soils to multiple facilities if this may be necessary.

Greener Cleanup

Greener Cleanup refers to an approach at remediation sites in which EPA seeks to understand the environmental footprint resulting from site activities and identify opportunities to reduce that footprint. EPA has developed Principles for Greener Cleanups,² Best Management Practices (BMPs) for greener cleanups,³ and a Methodology for quantifying the environmental footprint of a cleanup.⁴ Although the State, not EPA, is overseeing cleanup activities at SSFL, each of these resources may be of use for the activities to be undertaken there. Broadly speaking, the resources address the following aspects of a cleanup:

² see http://www.epa.gov/oswer/greenercleanups/pdfs/oswer_greenecleanup_principles.pdf

³ BMPs are listed at <http://www.cfu.in.org/greeneremediation/>

⁴ Methodology for Understanding and Reducing a Project's Environmental Footprint. U.S. EPA, February 2012 (EPA-542-R-12-002)

93-14

93-15

93-16

93-11

93-12

93-13

93-14

Chapter 3, Section 3.8.3 provides a discussion of potential disposal sites for both radiological material and hazardous chemicals. This discussion includes maps indicating the primary routes from SSFL to each of the sites. The disposal sites selected for analysis in this Final EIS are intended to be representative for analysis. Potential impacts associated with shipments of material to these sites evaluated includes information on air emissions, traffic safety, congestion, road conditions, noise, socioeconomics, environmental justice, and other potential impacts. Should alternate facilities be selected, DOE would conduct additional NEPA reviews as appropriate.

In Chapter 4, Section 4.14 of this Final EIS, DOE includes an evaluation that focuses on the local transportation routes between SSFL and the major highways (California Route 118 and U.S. Highway 101). This evaluation considered the locations of childcare centers, preschools, parks, and recreation centers. The location of these features along the transportation routes are identified in Chapter 3, Figure 3-29. DOE trucks would be a small part of the overall traffic on these local roads; local traffic loads are presented in Chapter 3, Section 3.8.2. However, DOE identified (Chapter 6 of this EIS) potential mitigation requirements to provide traffic, pedestrian, and bicycle safety and outreach to notify local schools, childcare centers, and residents of the truck routes and schedules.

Cumulative impacts on transportation and traffic were evaluated in Chapter 5, Section 5.5.8, of this Final EIS. Cumulative traffic impacts include estimated vehicle trips by DOE, NASA, and Boeing. Traffic impacts from truck trips would be limited in accordance with the Transportation Agreement between DOE, NASA, and Boeing (Boeing 2015a), that caps the maximum total number of truck shipments from SSFL at 96 per day.

Chapter 4, Section 4.8.2, of the EIS indicates that one site remediation worker per vehicle was assumed for purposes of analysis of traffic impacts, although less worker traffic would occur if workers shared rides during the commute. Carpooling among DOE, NASA, and Boeing workers is identified in Chapter 6, Table 6.1, as a minimization measure

Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a discussion of this topic and DOE's response. This EIS estimates of soil removal and areas in which the exemption process would be applied are based on data available to develop the EIS and would be refined as remediation plans are developed and implemented. This Final EIS provides updated assessments of impacts based on the Biological Opinion issued by USFWS and the Programmatic Agreement (Chapter 4, Sections 4.5. Biological Resources, and 4.11, Cultural Resources).

**Commenter No. 93 (cont'd): Kathleen Martyn Goforth, Manager,
Region IX, U.S. Environmental Protection Agency**

- Total Energy Use and Renewable Energy Use
- Air Pollutants and Greenhouse Gas Emissions
- Water Use and Impacts to Water Resources
- Materials Management and Waste Reduction
- Land Management and Ecosystems Protection

The DEIS already addresses many aspects of Greener Cleanups. These include estimated greenhouse gas emissions (for demolition and soil removal) and estimated waste generation volumes, as well as measures to be taken for fugitive dust control, stormwater management, and reuse of demolition debris. We offer the Principles, BMPs, and Methodology for use at remediation sites on a voluntary basis, but we also note that these resources may help to identify additional topics for inclusion in the FEIS, depending on the potential significance of the impact [40 CFR 1502.2(b)]. We also note that DTSC's *Advisory for Green Remediation*³ is compatible with EPA's Principles for Greener Cleanups.

Recommendation: Consider EPA and DTSC resources for Greener Cleanups and take advantage of any aspects of these resources that may be beneficial in the cleanup of the SSFL.

Future Land Use

The DEIS references a letter from Boeing stating that it will strive to keep the land as "open" space for recreational use. The DEIS does not explain how land use controls and institutional controls would be implemented to produce such an outcome.

Recommendation: Include further detail in the FEIS about Boeing's commitment and strategy for future land use at SSFL. Identify land use controls and institutional controls that are available for use to keep the site protective of human health and the environment. Compare and contrast background cleanup levels and risk-based cleanup levels with the level of guarantee Boeing can provide on the future land use of the SSFL lands.

2010 AOC

The 2010 AOC requires DOE to perform soil cleanup at the site to meet background levels or laboratory method detection limits per the LUT values, and to use backfill material that also meets these standards. It is unclear in the DEIS how the Revised LUT Values Alternative and the Conservation of Natural Resources Alternative could meet the requirements of the 2010 AOC, or what feasible mechanism exists for DOE to implement either of these alternatives.

Recommendation: Explain in the FEIS the circumstances under which the LUT Values Alternative or the Conservation of Natural Resources Alternative could be pursued, and provide supporting communication and documentation from California DTSC, if available.

³ Interim Advisory for Green Remediation, California Department of Toxic Substances Control, December 2009 <http://www.dtsc.ca.gov/OMP/upload/GRT_Draft_Advisory_20091217_ac1.pdf>

93-16
cont'd

93-17

93-18

- 93-15 The soils volumes and other cumulative impacts information presented in Chapter 5, Table 5-1, of the Draft EIS were up-to-date at the time the Draft EIS was prepared (Draft EIS references NASA 2015 and Boeing 2015b). Since the Draft EIS was released in January 2017, revised information has become available (NASA 2017b, Boeing 2017a, 2017b). Therefore, the NASA and Boeing values in Table 5-1 were updated in this Final EIS to reflect the latest information. Section 5.5.10, Waste Management, of the Draft EIS describes the potential cumulative impacts, based on the capacity of the waste facilities, on disposal facility capacity if all DOE, NASA, and Boeing remediation waste was disposed at a single facility. This section was revised in this Final EIS to reflect the revised waste volumes. Any adverse impacts on a single facility's capacity could be reduced by sending waste to multiple disposal facilities.
- 93-16 DOE is committed to using green cleanup processes to the extent feasible in all aspects of remediation. The green cleanup principles adopted by DOE to guide the development of alternatives for this Final EIS are summarized in a text box in Chapter 2, Section 2.2.2, of this EIS. Chapter 7 provides a more detailed discussion. These principles were developed in consideration of resources, including EPA's Principles for Greener Cleanups (EPA 2009), and DTSC's Interim Advisory for Green Remediation (DTSC 2009).
- 93-17 Since release of the Draft EIS, Boeing entered into a conservation easement and agreement that restricts future use of the property it owns at SSFL to open space (Ventura County 2017a, 2017b). This agreement includes Area IV and the NBZ. This Final EIS was revised to reflect the covenant, its restriction measures, and soil cleanup scenarios consistent with future use as open space (e.g., exposure to a recreational user).
- 93-18 DOE identified action alternatives for soil remediation other than the Cleanup to AOC LUT Values Alternative in response to public comment; because of issues with implementing the technical elements of the 2010 AOC; and to meet NEPA requirements to evaluate a reasonable range of alternatives. Section 6.2 of the AOC identifies the need for DOE to perform an environmental analysis of the AOC. DOE expects that, for the implementation of any alternative to be consistent with the 2010 AOC, changes to the AOC would be required. Section 8.0 of the AOC allows DOE and DTSC to agree upon changes to AOC requirements to better meet cleanup objectives. DOE expects that it will need to engage DTSC in discussions about such changes in order to implement any soil remediation alternative.

96-1

96-1

NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. In addition, as discussed in Chapter 1, Section 1.3 of this Final EIS, the U.S. District Court for the Northern District of California (Case No. No. 3:04-CV-04448-SC, May 2, 2007) issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision pursuant to NEPA. DOE recognizes that the 2010 AOC is a legally binding agreement with the DTSC and that DTSC has regulatory authority over aspects of DOE’s cleanup of Area IV and the NBZ. In accordance with the 2010 AOC, Section 7.11, “Compliance with Applicable Laws and Regulations,” all actions taken pursuant to the order by DOE will be undertaken in accordance with applicable local, State, and Federal laws and regulations. This clause recognizes that DOE must comply with NEPA, as do Sections 6.1 and 6.2 of the AOC. Section 6.1 acknowledges DOE’s obligation to prepare an EIS and ROD pursuant to a court order. Section 6.2 recognizes the need to complete an environmental review that meets the requirements of the court order. This EIS analyzes an alternative that incorporates the technical elements of the 2010 AOC, using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. (Please see Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for more information.) In response to public input received and consistent with its obligations under NEPA, DOE also analyzes two soil remediation action alternatives that are based on risk to human health as well as the protection of natural and cultural resources. This latter use of a risk assessment approach for soil cleanup is consistent with the approach used for cleanup actions at used by DOE at sites throughout the country, by DTSC at DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ.

97-1

97-1

DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup" of this CRD for additional information, including necessary steps before DOE makes a decision.

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD), as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public and workers.

Signed: 

99-1

99-1

DOE acknowledges your preference for cleanup of the SSFL. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. Note that there are three responsible parties (DOE, NASA, and Boeing) at SSFL who performed work and there are environmental consequences as a result of that work. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Each of the action alternatives evaluated is protective of the environment and the health and safety of the public.

99-2

99-2

The cleanup of SSFL Area IV and the NBZ is being performed by DOE. As a Federal agency, DOE is required to evaluate and justify major expenditures of Federal dollars. DOE performed a cost-benefit analysis of the soil remediation alternatives as part of this EIS (see Appendix K). The results of the analysis show that the cleanup under the Cleanup to 2010 AOC LUT Values Alternative would be much more expensive and with minimal additional protection of public health and the environment compared to the other project soil remediation alternatives.

Commenter No. 100: John Casselberry

RE: Comment on SSFL Draft Environmental Impact Statement

The agreement must be followed and cleaned-up to background levels. Anything less is unacceptable. The truck volumes are over-inflated. This problem has been going on for long enough. There must be no alternative to full clean-up.

100-1

DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," of this CRD. The purpose of this Final EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions at by DOE at sites throughout the US, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites.

Also, refer to Sections 2.4 "Suitable Backfill Soil" and 2.9 "Options for Transportation of Waste from SSFL," of this CRD for a discussion of the amount of material to be removed from the SSFL site and its transportation offsite. The truck volumes are based on estimates of the quantities of material exceeding the acceptance criteria for each alternative and the corresponding estimates of the volumes of soil required to replace soil removed during remediation. As stated in Section 2.3 of this Final EIS, DOE analyzed over 11,000 soil samples to determine the volume of material that exceeds AOC LUT values.

Commenter No. 101: Judy Mayer

RE: Comment on SSFL Draft Environmental Impact Statement

3/15/17

Dear Ms. Jennings,

None of the proposed alternatives to the cleanup of the Santa Susana Field Lab are to the standards that DOE committed to in the Agreement on Consent (AOC)

The agreement is a debt that the United States owes to the people of California. The United States can't question its debts.

Signed: Judy Mayer
 Semi Valley, CA

101-1

101-1

The purpose of this EIS is to evaluate alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD), as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE throughout the US, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

Commenter No. 102: Phyllis Palakow

Phyllis Palakow

102-1

102-1

Please see Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of how the Cleanup to AOC LUT Values Alternative incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities.

Commenter No. 103: Jodie Cooper

RE: Comment on SSFL Draft Environmental Impact Statement

DOE must not violate the agreement made,
by looking at alternatives to following it.

The agreement is a debt that the US owes
the people of California, Simi Valley,
and the U.S. cannot question its debts.

Signed: Jodie Cooper

103-1

103-1

DOE acknowledges your concern about complete cleanup of SSFL this is consistent with the 2010 AOC. With respect to the alternatives evaluated in the EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. As discussed in Chapter 2, Section 2.1 of this Final EIS, the Cleanup to Revised LUT Values Alternative and the Conservation of Natural Resources Alternative would help to meet cleanup objectives by being protective of the environment and health and safety of the public and workers while avoiding some of the technical challenges and potential adverse environmental impacts associated with cleanup to the 2010 AOC LUT values. These two alternatives would reduce (1) risk to the public and the environment and (2) potential impacts to visual, biological, cultural, and water resources compared to the Cleanup to AOC Look-Up Table Values Alternative. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. DOE acknowledges that implementation of any alternative would have to be approved by the DTSC. (Please refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this Ardor a discussion of soil remediation alternatives.)

Commenter No. 104: Marie Ammerman

RE: Comment on SSFL Draft Environmental Impact Statement

It is unbelievable and unforgivable that DOE has not followed the AOC already. People are still at risk of serious illness and death, and anything short of a full cleanup to background will not stop that. The citizens of Simi Valley and all districts that surround the Santa Susana Field Lab deserve to have an environment free from toxic chemicals and life-threatening radiation. This cleanup is a debt owed to the people of this area and of California. The objections to a full cleanup to background voiced by the DOE are nothing compared to the anguish of ~~parents~~ families losing loved ones to cancer or watching children struggle with birth defects, all due to poisoning from the SSFL. Get creative, find alternative truck routes, come up with other methods, but GET IT CLEANED UP TO BACKGROUND!

Signed: Marie P

104-1

104-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

104-2

104-2 DOE acknowledges your concerns and refers you to Section 2.1, "Preferences for Cleanup," of this CRD with regard to your preference for a full cleanup to background levels. Also refer to Section 2.7, "Offsite Impacts," of this CRD regarding information on contaminants from SSFL and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

104-3

104-1
cont'd

104-3 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of transportation issues and DOE's response.

Commenter No. 105: Kathleen Smith

RE: Comment on SSFL Draft Environmental Impact Statement

None of the proposed alternative cleanup SFL is the standard that DOE committed to in the Agreement on Consent.

DOE must not violate the agreement by looking at alternatives of following it

The agreement is a debt that the United States owes to the people of California, and the US cannot question its debt!

DOE should consider various alternatives for how to follow the AOC, including alternatives to using trucks, using alternate roads, and isolating the most contaminated soil to reduce the amount of soil that must be removed.

We request a cleanup to background.

Signed: Kathleen Smith

105-1

105-1 As stated in Chapter 2, Section 2.2.1 of this Final EIS, changes to the AOC would be required. Section 8.0 of the AOC allows DOE and DTSC to agree upon changes to the AOC to better meet cleanup objectives. DOE expects that it will need to engage DTSC in discussions about such changes in order to implement any soil remediation alternative. NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. Please refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

105-2

105-2 DOE has considered alternative methods of how to implement the 2010 AOC. As described in Chapter 2 and shown in Figure 2-1, soil over a large part of Area IV contains chemicals and/or radionuclides that exceed 2010 AOC LUT values. The only feasible way of cleaning up those soils to comply with the AOC LUT values is to remove it using earth moving equipment. Other alternatives or methods of removing or cleaning the soil that DOE considered but dismissed from detailed evaluation are discussed in Chapter 2, Section 2.2.3, of this EIS. These include alternatives such as soil partitioning and soil washing or using large volumes of water to flush contaminated sediments to the bottoms of drainage channels where they would be recovered. As discussed in Section 2.2.3, it is uncertain whether these alternatives would be able to meet the AOC LUT values and therefore be feasible.

As noted in Chapter 2, Section 2.3.3.1 of this Final EIS, DOE identified technical issues with implementing the 2010 AOC with the current LUT values. To address this, DOE developed alternatives that determine cleanup levels by considering risk to human health and the protection of natural resources. The use of a risk assessment to determine soil cleanup is consistent with that used for cleanup actions at other DOE

Commenter No. 105 (cont'd): Kathleen Smith

sites, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Refer to Chapter 2, Sections 2.3 and 2.4 of this Final EIS for descriptions of the soil remediation alternatives and the corresponding soil volumes that would be removed. DOE did consider four different routes for the trucks in the analysis (see Chapter 4, Section 4.8.2, of this Final EIS). DOE also considered alternative means of removing waste from SSFL. See Section 2.9, "Options for Transportation of Waste from SSFL" of this CRD regarding the use of other methods and routes for transporting waste and soil from the site. A discussion of other transportation concepts considered but dismissed from detailed analysis is included in Chapter 2, Section 2.2.3 of this Final EIS.

Commenter No. 106: C. Cole

RE: Comment on SSFL Draft Environmental Impact Statement

DOE must NOT violate the agreement on consent by looking at alternatives to following it.

We want clean-up to BACKGROUND

The agreement is a debt that the United States owes to the people of California and to question that debt is unconstitutional!

My daughters deserve to grow up in a healthy environment

Signed: C. Cole

106-1

106-1 In this EIS, DOE does not propose violating the 2010 AOC signed with its regulator, DTSC. As stated in Chapter 2, Section 2.2.1 of this Final EIS, in order for the implementation of any alternative to be consistent with the 2010 AOC, changes to the AOC would be required. Section 8.0 of the AOC allows DOE and DTSC to agree upon changes to the AOC to better meet cleanup objectives. DOE expects that it will need to engage DTSC in discussions about such changes in order to implement any soil remediation alternative. NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. Please refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

106-2

106-2 DOE acknowledges your concern about cleanup to background. DOE’s purpose in preparing the EIS is to evaluate alternatives for cleanup of those portions of SSFL for which it is responsible, Area IV and the NBZ. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information.

106-1 cont'd

106-3

106-3 DOE agrees with placing a high priority on health and safety and remains committed to protecting the health and safety of current and future users of the site and of the residents in the surrounding communities.

Commenter No. 107: Kathryn Nezhni

RE: Comment on SSFL Draft Environmental Impact Statement

This site is Superfund, Cleable & needs to be managed as such, DOB should consider various alternatives for how to follow the AOC, including alternatives to using trucks, using alternate routes & isolating the most contaminated soil to reduce the amount of soil that must be removed. A settlement agreement was signed previously & it must be implemented. There is a higher incidence of cancer w/I 2 miles of Santa Susana Field Laboratories

Signed: *Kathryn Nezhni*

107-1

107-2

107-3

107-4

107-1 As discussed in Chapter 1, Section 1.3 of the EIS, the EPA conducted a preliminary assessment/site inspection of the Energy Technology Engineering Center starting in 1989 to assess potential chemical and radiological threats to human health and the environment in an effort to determine whether further action under the CERCLA was warranted. The results of the assessment and inspection led EPA to conclude that referral to the National Priorities List, also known as the Superfund List, was not necessary (EPA 2003). EPA re-evaluated the entire SSFL site (rather than just Area IV) and, in December 2007 and released the results of a Hazard Ranking Survey performed at SSFL. Based on the evaluation, EPA recommended further assessment of all areas of SSFL under CERCLA, particularly regarding the presence of trichloroethylene (TCE) in groundwater in Areas I and II (EPA 2007a). The score exceeded the threshold for listing SSFL on the National Priorities List for cleanup under CERCLA (EPA 2007b). In January 2009, the State of California decided it would not support listing SSFL on the National Priorities List (California EPA 2009). EPA decided not to list SSFL on the National Priorities List (EPA 2003) and DTSC continued in its role as lead regulatory agency at the SSFL site.

107-2 DOE has considered alternative methods of how to implement the 2010 AOC. As described in Chapter 2 and shown in Figure 2-1, soil over a large part of Area IV contains chemicals and/or radionuclides that exceed 2010 AOC LUT values. The only feasible way of cleaning up those soils to comply with the AOC LUT values is to remove it using earth moving equipment. Other alternatives or methods of removing or cleaning the soil that DOE considered but dismissed from detailed evaluation are discussed in Chapter 2, Section 2.2.3, of this EIS. These include alternatives such as soil partitioning and soil washing or using large volumes of water to flush contaminated sediments to the bottoms of drainage channels where they would be recovered. As discussed in Section 2.2.3, these alternatives were determined to be ineffective or impractical.

As noted in Section 2.3 of this Final EIS, DOE identified technical issues with implementing the 2010 AOC with the current LUT values. To address this, DOE developed the Cleanup to Revised LUT Values Alternative that uses chemical risk-based screening levels as cleanup criteria. Development and adoption of revised cleanup levels as suggested by this alternative is a means by which the AOC could be made to be more implementable.

DOE did consider four different routes for the trucks in the analysis (see Chapter 4, Section 4.8.2, of this Final EIS). DOE also considered alternative means of removing waste from SSFL. See Section 2.9, "Options for Transportation of Waste from SSFL"

Commenter No. 107 (cont'd): Kathryn Nezhni

of this CRD regarding the use of other methods and routes for transporting waste and soil from the site. A discussion of other transportation concepts considered but dismissed from detailed analysis is included in Chapter 2, Section 2.2.3 of this Final EIS.

Two of the soil remediation alternatives DOE evaluated reduce the amount of soil that must be removed from SSFL. These alternatives focus on identifying and removing the most contaminated soil. Under the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative, only low concentrations of chemicals and/or radionuclides would remain. Refer to Chapter 2, Sections 2.3 and 2.4 of this Final EIS for descriptions of the soil remediation alternatives and the corresponding soil volumes that would be removed.

- 107-3** DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, “Preferences for Cleanup,” and Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for additional information.
- 107-4** DOE refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD which discusses the study that evaluated cancer incidence by distance from SSFL. The discussion notes the limitations of the study expressed by the authors, as well as by subsequent reviews. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 108: Lloyd Dent

RE: Comment on SSFL Draft Environmental Impact Statement

I am a 50-year resident of the San Fernando Valley and am battling 2 kinds of cancer of unexplained causes.

The Santa Susana field must be cleaned up to background levels for all of us long time residents and newcomers an especially the children

109-1

109-1

DOE acknowledges your concern about cleanup of SSFL to full background levels. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

With respect to the timeliness of DOE's completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record(s) of Decision (ROD[s]) pursuant to NEPA. Additionally, DTSC is currently preparing a program environmental impact report (Program EIR) under CEQA that applies to cleanup of the entire SSFL. The *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* was issued by DTSC in 2017 (DTSC 2017b). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

DOE acknowledges your concern about cleanup of SSFL. Please see Section 2.1, “Preferences for Cleanup,” of this CRD for additional information.

With respect to the timeliness of DOE’s completion of environmental remediation of those portions of SSFL for which it is responsible, Area IV and the NBZ, there are a number of actions that have to be completed before cleanup can begin. As discussed in Chapter 1, Section 1.3, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS (this EIS) and issued a Record(s) of Decision (ROD[s]) pursuant to NEPA. Additionally, DTSC is currently preparing a program environmental impact report (Program EIR) under CEQA that applies to cleanup of the entire SSFL. The *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* was issued by DTSC in 2017 (DTSC 2017b). DOE would begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC’s Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Commenter No. 115: Mary Platt

RE: Comment on SSFL Draft Environmental Impact Statement

None of the ^{proposed} alternatives clean up SSFL to the standards that DOE committed to in the Agreement on Consent (AOC). DOE must not violate the agreement by looking at alternatives to following it (other than the baseline do-nothing alternative). The agreement is a debt that the United States owes to the people of California and the United States cannot question its debt. DOE should consider various alternatives for how to follow the AOC, including alternatives to using trucks, using alternate routes, and isolating the most contaminated soil to reduce the amount of soil that must be removed.

Signed: Mary R. Platt

115-1

115-1

In this EIS, DOE does not propose violating the 2010 AOC signed with its regulator, DTSC. As stated in Chapter 2, Section 2.2.1 of this Final EIS, in order for the implementation of any alternative to be consistent with the 2010 AOC, changes to the AOC would be required. Section 8.0 of the AOC allows DOE and DTSC to agree upon changes to the AOC to better meet cleanup objectives. DOE expects that it will need to engage DTSC in discussions about such changes in order to implement any soil remediation alternative. NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. Please refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

115-2

115-2

DOE has considered alternative methods of how to implement the 2010 AOC. As described in Chapter 2 and shown in Figure 2-1, of this Final EIS, soil over a large part of Area IV contains chemicals and/or radionuclides that exceed 2010 AOC LUT values. The only feasible way of cleaning up those soils to comply with the AOC LUT values is to remove it using earth moving equipment. Other alternatives or methods of removing or cleaning the soil that DOE considered but dismissed from detailed evaluation are discussed in Chapter 2, Section 2.2.3, of this EIS. These include such alternatives as soil partitioning and soil washing or using large volumes of water to flush contaminated sediments to the bottoms of drainage channels where they would be recovered. As discussed in Chapter 2, Section 2.2.3, of this Final EIS, these alternatives were determined to be ineffective or impractical.

As noted in Section 2.3.3.1 of this EIS, DOE identified technical issues with implementing the 2010 AOC with the current LUT values. To address this, DOE developed the Cleanup to Revised LUT Values Alternative that uses chemical risk-based screening levels as cleanup criteria. Development and adoption of revised cleanup levels

Commenter No. 115 (cont'd): Mary Platt

as suggested by this alternative is a means by which the AOC could be made to be more implementable.

DOE did consider four different routes for the trucks in the analysis (see Chapter 4, Section 4.8.2, of this Final EIS). DOE also considered alternative means of removing waste from SSFL. See Section 2.9, "Options for Transportation of Waste from SSFL" of this CRD regarding the use of other methods and routes for transporting waste and soil from the site. A discussion of other transportation concepts considered but dismissed from detailed analysis is included in Chapter 2, Section 2.2.3 of this Final EIS.

Two of the soil remediation alternatives DOE evaluated reduce the amount of soil that must be removed from SSFL. These alternatives focus on identifying and removing the most contaminated soil. Under the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative, only low concentrations of chemicals and/or radionuclides would remain. Refer to Chapter 2, Sections 2.3 and 2.4, of this Final EIS for descriptions of the soil remediation alternatives and the corresponding soil volumes that would be removed.

Commenter No. 118: Melissa Demyan

RE: Comment on SSFL Draft Environmental Impact Statement

NONE OF THE PROPOSED ALTERNATIVES CLEAN UP SSFL TO THE STANDARDS THAT DOE COMMITTED TO IN THE AOC. THE AGREEMENT IS A DEBT THAT THE US OWES THE PEOPLE OF CALIFORNIA - SPECIFICALLY RESIDENTS OF THE VALLEY, SIMI RANCH PARK - THE USA CANNOT QUESTION ITS DEBTS!

DOE NEEDS TO CONSIDER ALTERNATIVES FOR HOW TO FOLLOW THE AOC INCLUDING ALTERNATIVES TO TRUCKS & ALTERNATIVE ROUTS. A CONVEYER BELT IS WIDELY SUPPORTED BY SIMI RESIDENTS.

LEAVING THIS SUPERFUND ELIGIBLE SITE AS A TOXIC & RADIOACTIVE HAZARD IS UNACCEPTABLE. RESIDENTS HERE - MYSELF INCLUDED - ALL KNOW SOMEONE WITH A RARE CANCER. YOUR 'E-KILLING US! CLEAN UP YOUR SHIT.

Signed: *Melissa Demyan*

118-1

118-1 Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities.

118-2

118-2 DOE has considered alternative methods of how to implement the 2010 AOC. As described in Chapter 2 and shown in Figure 2-1 of this Final EIS, soil over a large part of Area IV contains chemicals and/or radionuclides that exceed 2010 AOC LUT values. The only feasible way of cleaning up those soils to comply with the AOC LUT values is to remove it using earth moving equipment. Other alternatives or methods of removing or cleaning the soil that DOE considered but dismissed from detailed evaluation are discussed in Chapter 2, Section 2.2.3 of this Final EIS. These include alternatives such as soil partitioning and soil washing or using large volumes of water to flush contaminated sediments to the bottoms of drainage channels where they would be recovered. As discussed in Section 2.2.3, these alternatives were determined to be ineffective or impractical.

118-1 cont'd

118-3

As noted in Section 2.3.3.1 of this Final EIS, DOE identified technical issues with implementing the 2010 AOC with the current LUT values. To address this, DOE developed the Cleanup to Revised LUT Values Alternative that uses chemical risk-based screening levels as cleanup criteria. Development and adoption of revised cleanup levels as suggested by this alternative is a means by which the AOC could be made to be more implementable.

DOE did consider four different routes for the trucks in the analysis. (Please see Chapter 4, Section 4.8.2, of this Final EIS.) DOE also considered alternative means of removing waste from SSFL. See Section 2.9, "Options for Transportation of Waste from SSFL" of this CRD regarding the use of other methods and routes for transporting waste and soil from the site. A discussion of other transportation concepts considered but dismissed from detailed analysis is included in Chapter 2, Section 2.2.3 of this Final EIS.

Commenter No. 118 (cont'd): Melissa Demyan

Two of the soil remediation alternatives DOE evaluated reduce the amount of soil that must be removed from SSFL. These alternatives focus on identifying and removing the most contaminated soil. Under the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative, only low concentrations of chemicals and/or radionuclides would remain. Refer to Chapter 2, Sections 2.3 and 2.4 of this Final EIS for descriptions of the soil remediation alternatives and the corresponding soil volumes that would be removed.

118-3 DOE acknowledges your concern and refers you to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. DOE’s purpose in preparing this EIS is to evaluate alternatives for completing cleanup of those portions of SSFL for which DOE is responsible, Area IV and the NBZ.

Commenter No. 119: Barbara Miyamoto

RE: Comment on SSFL Draft Environmental Impact Statement

Please protect the planet for my grandchildren
We must work for clean water & clean air. No more
pollution!

Signed: Barbara Miyamoto

120-1 DOE acknowledges your preference for cleanup to background. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities.

120-2 Thank you for your comment. It has been included in the Administrative Record for the EIS. Please refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Commenter No. 121: Victor Cherdhuriya

RE: Comment on SSFL Draft Environmental Impact Statement

Dear Ms. Stephanie Jennings,

Please support the Santa Susana Field Lab clean-up. None of the proposed alternatives cleanup SSFL meets the standards that DOE committed to in the Agreement of Consent. DOE must not violate the agreement. The agreement is a debt that the U.S. owes to the people of California. DOE should consider various alternatives for how to fulfill the Agreement on Consent, including alternatives to using trucks & alternative routes.

Signed: Victor Cherdhuriya

121-1

121-2

121-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities.

121-2 DOE has considered alternative methods of how to implement the 2010 AOC. As described in Chapter 2 and shown in Figure 2-1 of this Final EIS, soil over a large part of Area IV contains chemicals and/or radionuclides that exceed 2010 AOC LUT values. The only feasible way of cleaning up those soils to comply with the AOC LUT values is to remove it using earth moving equipment. Other alternatives or methods of removing or cleaning the soil that DOE considered but dismissed from detailed evaluation are discussed in Chapter 2, Section 2.2.3, of this EIS. These include alternatives such as soil partitioning and soil washing or using large volumes of water to flush contaminated sediments to the bottoms of drainage channels where they would be recovered. As discussed in Chapter 2, Section 2.2.3, these alternatives were determined to be ineffective or impractical.

As noted in Section 2.3.3.1 of this Final EIS, DOE identified technical issues with implementing the 2010 AOC with the current LUT values. To address this, DOE developed the Cleanup to Revised LUT Values Alternative that uses chemical risk-based screening levels as cleanup criteria. Development and adoption of revised cleanup levels as suggested by this alternative is a means by which the AOC could be made to be more implementable.

DOE did consider four different routes for the trucks in the analysis (see Chapter 4, Section 4.8.2, of this Final EIS). DOE also considered alternative means of removing waste from SSFL. See Section 2.9, "Options for Transportation of Waste from SSFL" of this CRD regarding the use of other methods and routes for transporting waste and soil from the site. A discussion of other transportation concepts considered but dismissed from detailed analysis is included in Chapter 2, Section 2.2.3, of this Final EIS.

Two of the soil remediation alternatives DOE evaluated reduce the amount of soil that must be removed from SSFL. These alternatives focus on identifying and removing the most contaminated soil. Under the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative, only low concentrations of chemicals and/or radionuclides would remain. Refer to Chapter 2, Sections 2.3 and 2.4 for descriptions of the soil remediation alternatives and the corresponding soil volumes that would be removed.

Commenter No. 122: Taylor Altenbern

Taylor Altenbern

10th April 2017

Ms. Stephe Jennings

NEPA Document Manager
SSFL Area IV EIS
US Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 93063

Dear Ms. Jennings,

The state of contamination in which the Santa Susana Field Laboratory stands remains a great danger to that of neighboring ecosystems and communities. As someone who values the preservation of the environment, as well as the health and livelihood of all peoples, it is of great concern to me that the cleanup proposals presented by the DOE be adjusted to ensure that the incredibly toxic chemicals and cancerous radionuclides are cleaned up adequately.

The four individual cleanup plans that the DOE is proposing would neglect anywhere from 39% to 100% of the contamination, leaving communities and ecosystems at extreme risk. Of all the four alternative four cleanup plans proposed, not one of them complies with the agreement signed between DOE and DTSC in 2010. The DOE is the polluter, and therefore should by no means have the authority to regulate the amount of their own waste that they are required to clean up. The power that the DOE is attempting to withhold is crime and abuse against those who have been at risk due to their previous negligence.

The DOE's reliance on using "natural attenuation" – the naturally occurring deterioration of radiation over time – as a solution to the contamination is unacceptable. The minimum time for the radiation to deteriorate would take *at least* seventy years, dismissing the urgency of the issue and allowing the contamination to continue to leak off site and deplete the health of ecosystems and communities. The cleanup has already been delayed for over half a century, and therefore it is necessary for the contamination to be removed in a time sensitive manner. Therefore, the DOE's proposed cleanups in the EIS should reflect the urgency and necessity of the contamination at the SSFL in order to ensure the health and safety of the communities and ecosystems surrounding it.

Regards,

Taylor Altenbern

122-1

122-2

122-3

122-4

122-1 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

122-2 Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. DOE acknowledges your concern about complete cleanup of SSFL consistent with the 2010 AOC. With respect to the alternatives evaluated in the EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. As discussed in Chapter 2, Section 2.1 of this Final EIS, the Cleanup to Revised LUT Values Alternative and the Conservation of Natural Resources Alternative would help to meet cleanup objectives by being protective of the environment and health and safety of the public and workers while avoiding some of the technical challenges and potential adverse environmental impacts associated with cleanup to the 2010 AOC LUT values. These two alternatives would reduce (1) risk to the public and the environment and (2) potential impacts to visual, biological, cultural, and water resources compared to the Cleanup to AOC Look-Up Table Values Alternative. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. DOE acknowledges that implementation of any alternative would have to be approved by the DTSC.

As discussed in Chapter 1, Section 1.9.2, of this Final EIS, DTSC is currently preparing a program environmental impact report (Program EIR) under the CEQA that applies to cleanup of the entire SSFL. The *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* was issued by DTSC in 2017 (DTSC 2017b). DOE will begin cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS Record of Decision and Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

122-3 As described in Chapter 2, Section 2.6.2 of this Final EIS, tritium has a half-life of 12.5 years and the area of groundwater impacted by tritium is within one half-life (12.5 years) of meeting the drinking water standard, not the 70 years indicated

Commenter No. 122 (cont'd): Taylor Altenbern

by the commenter. On the other hand, DOE in the Draft EIS considered more active remediation measures, such as removing bedrock, for the location with the strontium-90 impacted bedrock (strontium-90 has a 29 year half-life). The locations with groundwater impacted by tritium and strontium are small, are within the site boundaries, and do not threaten off-site water supplies. At the time the Draft EIS was prepared, DOE had no preferred alternatives for cleanup. As described in Chapter 2, Section 2.7 of this Final EIS, DOE's preferred alternative for groundwater remediation is a combination of the Monitored Natural Attenuation Alternative and the Treatment Alternative. Under this alternative, monitored natural attenuation would be used for the two plumes with the lowest concentrations of TCE (Metals Clarifier plume and the RMHF plume) and for the tritium plume. Treatment of the remaining plumes will be in accordance with the results of the Corrective Measures Study. Source removal is the preferred alternative for the strontium-90 source. The selected clean-up remedies will be identified in the ROD(s).

Regarding the commenters concerns about offsite impacts, please see Section 2.7, "Offsite Impacts" of this CRD for a discussion and DOE's response.

- 122-4 DOE acknowledges your concern regarding removal of contamination in a time-sensitive manner and refers you to Section 2.1, "Preferences for Cleanup," of this CRD. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of this EIS is to evaluate alternatives for completing remediation at those portions of SSFL for which DOE is responsible, Area IV and the NBZ. All of the alternatives presented in this EIS are intended to address remediation of Area IV and the NBZ in a timely manner. Following completion of the regulatory actions identified in the response to comment 122-2, DOE's first action is expected to be removal of the 18 buildings in Area IV for which it is responsible. Soil remediation would follow building removal and continue until it was completed. Groundwater remediation would occur in parallel with building and soil remediation.

Commenter No. 123: Tyan Schreck

Ms. Stephanie Jennings
NEPA Document Manager
SSFL Area IV EIS
US Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 93063

Dear Ms. Jennings,

I am very concerned about the impacts that the contaminants located at the Santa Susana Field Laboratory will have on the environment and the physical health of the surrounding communities. If the Department of Energy is not willing to clean up to the standards that they promised in 2010, then the community and the environment will pay for their failure to do so.

The Department of Energy signed an Administrative Order on Consent in 2010 that stated that they would clean up 100% of the toxic waste that they created. The DOE later released an Environmental Impact Study that proposes to leave 39%, 91%, 99%, or 100% of the area contaminated in its four cleanup options, respectively. Every single one of these four proposed cleanups breaks the agreement that DOE made in 2010. The DOE's DEIS does not acknowledge the AOC as a legally-binding contract that they cannot break unilaterally. Because the DOE was the polluter they are not able to decide how much they need to clean up. That decision belongs to the Department of Toxic Substance Control, even if there wasn't a pre-agreed upon AOC. Also, the AOC gives the DTSC authority to determine the remediation goals for radionuclide contamination, not the DOE. With these proposed EIS's, not only is the DOE violating their own cleanup guidelines but they are also violating the guidelines created by the DTSC.

DOE believes that by cleaning up the extremely hazardous waste that they have created will cause more unnecessary harm to the environment. They also claim that by leaving the area contaminated will cause little to no harm at all to the surrounding community. These claims and beliefs could not be more false. All of the contamination poses and extreme risk to public and environmental health in every one of the DOE's proposed cleanup options. Though immediate effects may not be evident, long-term, latent effects will plague the area for decades if not centuries to come. It is ironic that the DOE is so unwilling to harm the environment now, but not when they were polluting and damaging it to begin with.

I ask that the DOE rethinks their EIS and follows the guidelines that they created in 2010 within the AOC. If they do not follow the 2010 AOC public health and the environment will be at risk for a vast amount of time. I am worried that if the DOE is not held responsible for their actions then what organization or company will be in the future?

Sincerely,
Tyan Schreck

- 123-3 DOE has taken responsibility for the cleanup of Area IV and the NBZ. DTSC has the authority to verify that future cleanup would be sufficient and to require additional cleanup by DOE if needed to meet the negotiated cleanup standards.

Commenter No. 124: Daniel Delin

Ms. Stephe Jennings
NEPA Document Manager
SSFL Area IV EIS
US Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 93063

Dear Ms. Jennings,

I am very concerned about the current situation plaguing the Santa Susana Field Laboratory site in which the DOE is refusing to clean up the contaminants that they legally agreed to. The DOE needs to be held responsible in order to protect the surrounding communities and environment.

In 2010 , the DOE signed the AOC in which they agreed to cleanup all soil contaminants above background levels at the Santa Susana Field Lab by 2017. DOE has gone back on this agreement in their Draft EIS in which they propose four alternatives which leaves either 39%, 91%, 99%, or 100% of the contamination at the site. If any of these four alternatives are approved, DOE are violating their legally-binding commitment they signed with the DTSC. As the polluters, DOE has no grounds to determine what percent can be left behind and should look to the DTSC as deciding authority. Agreeing to any of the alternatives is allowing dangerous radionuclides and toxic chemicals to remain on the site and continue to degrade the region. Despite claiming that their alternatives are protective of human health and the environment, the second proposal manipulates the standards to be up to 1,000 times less protective of human health than the current EPA standard. The third proposal leaves an amount of chemicals behind that would equivalent to getting an extra chest x ray every month of your life. Any of these options, especially on top of the chemicals already ingested by the residents, is unacceptable.

In the DEIS, DOE attempts to create doubt that the AOC is attainable. They claim that it is too difficult to find backfill soil, yet "Gillbrand" fits all but two AOC requirements, are not a hazard to human health or the environment. They also reference leaving contamination by claiming they would be exempt from redressing certain areas on the grounds of "protecting" sensitive biological or cultural resources. They fail to mention that the AOC requires the Biological Opinion from the U.S. Fish and Wildlife Service and provide no documentation of one being issued.

The DOE needs to comply with the 2010 AOC to prevent further degradation to human health and the environment. The alternatives proposed do not meet the legally-binding agreement signed by the DOE and put the whole region at continued risk to the toxic chemicals.

Sincerely,
Daniel Delin

124-1

124-2

124-3

124-4

124-1
cont'd

124-1 NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

As discussed in Chapter 1, Section 1.9.2, of this Final EIS, DTSC is currently preparing a program environmental impact report (EIR) under CEQA that applies to cleanup of the entire SSFL. The *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* was issued by DTSC in 2017 (DTSC 2017b). DOE will begin cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS Record of Decision and Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

124-2 In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. The exclusion of the indirect garden pathway is consistent with the future open space use of the site.

Commenter No. 124 (cont'd): Daniel Delin

In this Final EIS (see Chapter 2, Section 2.4), DOE has retained the Cleanup to Revised LUT Values Alternative, which uses chemical RBSLs based on a suburban residential scenario without a garden pathway for the Onsite Suburban Resident. The Final EIS also retains the Conservation of Natural Resources Alternative, but evaluates two scenarios. The Open Space Scenario is based on the future land use of Area IV and the NBZ as open space, consistent with Boeing's conservation easement and agreement (i.e., cleanup levels are based on exposure of an onsite recreational user as the receptor). The Onsite Suburban Resident Scenario is the scenario evaluated in the Draft EIS, that is, cleanup levels are based on a suburban residential scenario without a garden pathway. This latter scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space.

In Chapter 4, Section 4.9 of this Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that local residents may get some portion of their food from a home garden.

DOE chose to identify the 25 millirem per year in its risk-based alternative for clean in this EIS, consistent with the upper limit for dose-based release criteria under DOE requirements (DOE Order 458.1). The 25 millirem in a year exposure limit would represent a maximum possible dose. It did not take into account the Department's requirement to apply ALARA. DOE does not propose in the Final EIS radionuclide cleanup standards based on dose. DOE instead has conducted a risk-assessment based approach for soil remediation. DOE notes that the methodology used in the cleanup evaluation for the Conservation of Natural Resources Alternative in the final EIS results in doses that are well below the 25 millirem year upper limit and are in a range that is consistent with the CERCLA target risk range.

- 124-3** The 2010 AOC does not allow consideration of risk and requires all chemicals and radionuclides in backfill soil to be below their respective LUT values in order for the soil to be used in Area IV. DOE notes that it violates the 2010 AOC to determine that a backfill source is "close enough." As stated in the AOC, all chemicals above the LUT values are exceedances and should be remediated. Refer to Section 2.3, "Suitable Backfill Soil," of this CRD for discussion of the responsibilities and actions necessary to identify a backfill source.
- 124-4** Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a discussion of this topic and DOE's response. At the time the Draft EIS was issued, DOE had been involved in ongoing meetings

Commenter No. 124 (cont'd): Daniel Delin

with the USFWS and CDFW for several years (see Appendix E, Table E-4 of this Final EIS) and the Biological Assessment required as part of Section 7 consultation had not yet been submitted. Hence, there was no Biological Opinion from the USFWS at the time the Draft EIS was released. The USFWS has now issued a Biological Opinion (see Appendix J) for remediation of SSFL. This Final EIS reflects the results of the Biological Opinion on applying the exemption process to soil cleanup locations in Area IV and the NBZ. Overall, the Final EIS identifies 54 acres that would be treated through monitored natural attenuation (many of which otherwise would have been subject to the exemption process) and an additional 77 acres in Area IV and the NBZ in which the exemption process would be applied. Of this area, the Final EIS identifies 4 acres in which active cleanup measures would be used for the protection of biological and cultural resources. See Appendix D of this EIS for a discussion of the soil remediation volumes and area affected.

Commenter No. 126: Brad Visacki

Ms. Stephe Jennings
NEPA Document Manager
SSFL Area IV EIS
US Department of Energy
4100 Guardian St., Suite 160
Simi Valley, CA 93063

Dear Ms. Stephe Jennings,

I am concerned about the Draft Environmental Impact Statement (DEIS) the Department of Energy released for the Santa Susana Field Laboratory (SSFL), and how it will affect the environment and surrounding communities. Unless the DOE is held responsible and made to follow through with their contract with the 2010 AOC, agreeing to a full clean-up of the Santa Susana Field Lab, the community will continue to suffer from environmental consequences.

In regards to the notion that the DOE could avoid remediation due to cultural exemption, the DOE cites in the DRAFT EIS Appendix F page 16, that there are 12 archaeological resources within the Region of Influence (Area IV and the NBZ) that are proposed as culturally exempt, however the National Register of Historic Places (NRHP) has not yet evaluated any of them. I believe that until this is the case, cultural resources should not be considered as part of the DEIS for possible remediation exemptions. In the Draft SSFL Area IV EIS - References for Appendix F Hyperlink 502, the W&S Consultants state in 2001 that the

... sites were recommended as ineligible for listing in the National Register of Historic Places. However, because formal concurrence of ineligibility has not been sought from nor been given by the State Historic Preservation Officer at the California Office of Historic Preservation, in accordance with Title 36, Code of Federal Regulations, Part 800, the four sites are treated as eligible for inclusion in the NRHP until determined otherwise.

This reference, although listed as a link on the DOE's Environmental impact statement website, is not available to the public. When the link is clicked, a document is downloaded which claims that the "reference is not provided due to possible copyright restrictions." However a quick online search pulls up the document¹, the content of which provides reasons for why the DOE refuses to release this information to the public. Making the public jump through so many hoops to access this information is at best, sloppiness and laziness on DOE's part and at worst a deliberate move to avoid transparency, even though they claim they are. In summary, the exemptions listed for cultural exemption in the DEIS are a non-issue. The only reason that they are still being considered from exemption is because the NHRP has not specifically stated that they are ineligible. The DOE knows this but is making it the public's responsibility to access proper documentation that argues against the DOE's claims.

126-1

126-1 Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment. Also refer to Section 2.7, "Offsite Impacts" and Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD to gain a better understanding regarding residual contamination in Area IV and the potential for offsite impacts.

126-2

126-2 Please refer to "Application of Exemptions under the 2010 Administrative Order on Consent" (Section 2.4 of this CRD) for a discussion of this topic and DOE's response. Regarding the commenter's remarks about a document referenced in Draft EIS Appendix F (W&S Consultants 2001) and the unavailability of this document for downloading from the DOE's EIS website, the document possibly contains protected material and DOE cannot provide copies of such material. The link the commenter references only provides limited excerpts from the document; excerpts have been edited to remove information regarding locations of archeological sites.

Commenter No. 126 (cont'd): Brad Visacki

The DOE benefits from turning Area IV into "cultural property" because it would make the area ineligible for clean-up. The DOE consistently mentions the Burro Flats cave painting when talking about Area IV, even though the painting is located in Area II. They are attempting to use this as further evidence to support making Area IV into "sacred property".

The DOE is aware that none of the proposed archaeological sites in Area IV are eligible for protection, which hinders them from claiming the majority of the area as a "sacred site". However, since the NRHP has not officially determined that the proposed archaeological sites are in fact ineligible, the DOE will continue to abuse the loophole by not cleaning up the area: "W&S Consultants 2001 Class III Inventory/Phase I Archaeological Survey of the Santa Susana Field Laboratory Area 4, Ventura County, California An archaeological survey of Area IV in 2001 was the first systematic archaeological survey conducted at SSFL. This study consisted of an on-foot, intensive survey of the 290-acre Area IV. The study identified four previously unknown archaeological sites (CA-VEN-1772, -1773, -1774, and -1775). These four sites were recommended as ineligible for listing in the National Register of Historic Places." - page F-12

Even though the cultural sites were considered ineligible for listing in the National Register of Historic Places, and thus are not exempt from remediation, the DOE is clearly hoping they will be in the future: "However, because formal concurrence of ineligibility has not been sought from nor been given by the State Historic Preservation Officer at the California Office of Historic Preservation, in accordance with Title 36, Code of Federal Regulations, Part 800, the four sites are treated as eligible for inclusion in the NRHP until determined otherwise." - page F-12 It is unacceptable that the DOE is proposing areas to be exempt from remediation that have not yet and likely will never be deemed eligible for exemption. DOE should be operating with the mindset "better safe than sorry", rather than "counting our chickens before they hatch."

Even if Area IV was to be considered a sacred site, it still may not stop the cleanup process. The DOE is trying to work every angle in order to lessen the amount of responsibility they have on the site. The severity of risks involved by not cleaning up Area IV heavily outweigh the importance of scattered lithic rock, and to think any differently would support an enormous social injustice towards the residents of Simi Valley.

According to the US National Parks Service's Guidelines for Evaluating and Documenting Traditional Cultural Properties:

One more point that should be remembered in evaluating traditional cultural properties--as in evaluating any other kind of properties--is that establishing that a property is eligible for inclusion in the National Register does not necessarily mean that the property must be protected from disturbance or damage. Establishing that a property is eligible means that it must be considered in planning Federal, federally assisted, and federally licensed undertakings, but it does not mean that such an undertaking cannot be allowed to damage or destroy it. Consultation must occur in accordance with the regulations of the Advisory Council (36 CFR Part 800) to identify, and if feasible adopt, measures to protect it, but if in the final analysis the public interest demands that the property be sacrificed to the needs of the project, there is nothing in the National Historic Preservation Act that prohibits this.

126-2
cont'd

Response side of this page intentionally left blank.

Commenter No. 126 (cont'd): Brad Visacki

This principle is especially important to recognize with respect to traditional cultural properties, because such properties may be valued by a relatively small segment of a community that, on the whole, favors a project that will damage or destroy it. The fact that the community as a whole may be willing to dispense with the property in order to achieve the goals of the project does not mean that the property is not significant, but the fact that it is significant does not mean that it cannot be disturbed, or that the project must be foregone.²

The DOE has broken their agreement with the EPA to clean up the Santa Susana Field Laboratory by 2017, and instead has chosen to take advantage of a minority culture for personal benefits. By working with the Chumash Indians, the DOE can lessen the amount of land that they are responsible for cleaning up.

I urge you to consider these adjustments in the EIS, and advise that the DOE follow through with their contract to the AOC in order to clean up the Santa Susana Field Laboratory. The proper course of action is not always the easiest, and by cutting corners on the clean up, the DOE puts surround communities and future generations in harm's way.

Sincerely,

Brad Visacki

Commenter No. 127: Dallas Fuentes

Ms. Stephenie Jennings
NEPA Document Manager
SSFL Area IV EIS
US Department of Energy
4100 Guardian St. Suite 160
Simi Valley, CA 93063

Dear Ms. Jennings,

As a citizen and human being I am concerned about the Draft Environmental Impact Statement (DEIS) the DOE just released for the Santa Susana Field Laboratory. The first and most obvious concern I have is that all of the alternatives that the DEIS outlines would leave either 39% 91% or 99% contamination at the site. Any of these would violate the Administrative Order on Consent (AOC) that the DOE signed in 2010 which committed to a complete clean up.

Trying to justify these alternatives for any reason not only violates a commitment, but is completely foundless. As the DOE puts it they would prefer to rely on "natural attenuation" to clean up the contamination, in other words, they are hoping the contamination will lessen on its own over the next 70 years. This not only shows how little the DOE cares about an entire generation of people, but it is dangerously presumptuous that the contamination will remain solely on site in spite of natural weather conditions.

For example, the recent heavy rains California has seen will have washed contaminated sediment into the communities around the area. Now as we are seeing nicer weather, children will be playing outside in their backyards being exposed to these contaminants.

Even the third alternative, claiming a 99% cleanup sets a cleanup standard of 25 millirem/year which violates the 1995 DOE-EPA Joint policy stating that DOE sites must be cleaned up consistently with EPA Superfund guidance. To give perspective, 25 millirem/year is the equivalent of an unnecessary chest x-ray every month of your life, which the EPA as deemed non-protective.

Furthermore the notion that cleanup would pose unnecessary risk to the environment since contamination poses "little risk" is ludicrous. Trying not to disturb the environment is fruitless not only because it has already been disturbed, but also because it has been disturbed in such a

127-1

127-2

127-3

127-4

127-1 Nowhere in the EIS does DOE imply that it intends to rely on natural attenuation as the primary cleanup action. DOE is considering monitored natural attenuation only under those circumstances in which low concentrations of certain chemicals have been demonstrated to be attenuating. DOE acknowledges your preference for cleanup in accordance with the 2010 AOC. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. With respect to the alternatives evaluated in the EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. The Cleanup to Revised LUT Values Alternative and the Conservation of Natural Resources Alternative would help to meet cleanup objectives by being protective of the environment and health and safety of the public and workers while avoiding some of the technical challenges and potential adverse environmental impacts associated with cleanup to the 2010 AOC LUT values. These two alternatives would reduce (1) risk to the public and the environment and (2) potential impacts to visual, biological, cultural, and water resources compared to the Cleanup to AOC Look-Up Table Values Alternative. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. DOE acknowledges that implementation of any alternative would have to be approved by the DTSC. In addition, DOE is considering monitored natural attenuation only under those circumstances in which low concentrations of certain chemicals and radioactive constituents have been demonstrated to be attenuating.

127-2 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

127-3 DOE believes that the approach taken in developing this alternative is with the approach used by DOE at other DOE sites, by DTSC at other DTSC-regulated sites, and by U.S. Environmental Protection Agency (EPA) at CERCLA sites. That is, it considers future land use and risk to human and environmental receptors.

DOE chose to identify the 25 millirem per year in its risk-based alternative for clean in this EIS, consistent with the upper limit for dose-based release criteria under DOE requirements (DOE Order 458.1). The 25 millirem in a year exposure limit would

Commenter No. 127 (cont'd): Dallas Fuentes

way that places the surrounding community at risk. This is also a blatant, meaningless excuse to avoid clean up, as for the entire operation of SSFL no concern was given for the environment in the utilization of trucks to bring in hazardous loads of spent commercial nuclear fuel from around the country. Even if the DOE has decided to be concerned about the environment in this way, there are better ways to go about clean up that will mitigate the environmental impact. However, even with the concern that the cleanup processes will impact the environment, the DEIS mentions no risk evaluation that was performed to determine the impact that the radiation will have on the plant and animal life in the area.

Thank you for taking the time to read my concerns. It is my hope that the DOE will take a responsible course of action and adhere to AOC and completely clean up the Santa Susana Field Laboratory, to protect not only the environment but especially the human beings who live in the area and have a right to live a healthy, cancer-free life.

Sincerely,

Dallas Fuentes

127-4

127-1
cont'd

represent a maximum possible dose. It did not take into account the Department's requirement to apply ALARA. DOE does not propose in the Final EIS radionuclide cleanup standards based on dose. DOE instead has conducted a risk-assessment based approach for soil remediation. DOE notes that the methodology used in the cleanup evaluation for the Conservation of Natural Resources Alternative in the final EIS results in doses that are well below the 25 millirem year upper limit and are in a range that is consistent with the CERCLA target risk range. The dose limit can be compared to the average annual radiation dose from natural background radiation received an individual in the United States of about 310 millirem per year.

127-4 This Final EIS is being prepared to evaluate alternatives for completing the remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. DOE needs to remove the remaining DOE structures in Area IV of SSFL and clean up the affected environment in Area IV and the NBZ in a manner that is protective of the environment and the health and safety of the public and workers. The EIS considers alternatives to accomplish these tasks, and, consistent with NEPA requirements, each alternative addresses the potential impacts that implementing the alternative could have on several resource areas, including human health and safety, biological and cultural resources, ground and surface water resources, air quality, and traffic.

Chapter 1, Section 1.3, contains a history of the SSFL site that summarizes DOE's past activities in Area IV, including previous cleanup efforts. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. As discussed in Chapter 1, Section 1.9.2 of this Final EIS, DTSC is currently preparing a program environmental impact report (Program EIR) under CEQA that applies to cleanup of the entire SSFL. The *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* was issued by DTSC in 2017 (DTSC 2017b). DOE will begin final cleanup activities following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the

Commenter No. 127 (cont'd): Dallas Fuentes

decisions included in the DOE EIS Record of Decision and Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Potential risks to public health and safety under all proposed alternatives are evaluated in Chapter 4, Section 4.9, and Appendices G and K, of the EIS. In response to public comments on the Draft EIS, this Final EIS has been revised to more quantitatively address ecological risk receptors, such as risks to plants and animals requested by the commenter (see Section 4.5).

Commenter No. 128: Teens Against Toxins

Ms. Stephe Jennings
NEPA Document Manager
SSFL Area IV EIS
US Department of Energy
4100 Guardian St., Suite 160
Simi Valley, CA 93063

Dear Ms. Jennings,

Thank you for the opportunity to comment on the Draft Environmental Impact Statement (DEIS) for remediation of Area IV and the Northern Buffer Zone (NBZ) of the Santa Susana Field Laboratory (SSFL). The following document contains a detailed discussion of Teens Against Toxins concerns with the DEIS.

Seven years ago, the regulatory agency, the Department of Toxic Substance Control (DTSC), issued an "Administrative Order on Consent" (AOC), legally binding the Department of Energy (DOE) to cleaning up the contamination to the most protective standards. Nevertheless, the DEIS proposes four alternatives to cleaning up to the standards set by the AOC: one, that would leave up to 39% of contamination still on site, a second that would leave about 91% of the contamination still on site, a third which would leave up to 99% of the contamination in place, and finally, no cleanup whatsoever.

Teens Against Toxins has been actively raising awareness and participation in the younger generation affected by the contamination at SSFL since 2009. We have had numerous representatives from six different high schools¹ and four different middle schools² in the communities near the site.

We are an organization comprised of youth—at most we are 22 years old—even so, we understand the value of integrity. If you don't clean up after yourself, the mess doesn't simply go away. Instead, someone else faces the consequences.

This DEIS completely violates the 2010 AOC and instead looks at whether or not it should be required to clean up its mess at all. As the polluter, it is unethical for the DOE to be deciding how much contamination to remediate, especially considering they are already legally bound to the most protective standard. The people facing the consequences of exposure to this contamination cannot afford to delay.

128-1

128-1
cont'd

128-1 NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. Refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of how the Cleanup to AOC LUT Values Alternative incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background or levels based on laboratory capabilities (AOC LUT values). It also evaluates alternatives that consider risk to human health as well and protection of natural resources to determine cleanup levels. This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. As discussed in Section 2.2 of this CRD, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

Commenter No. 128 (cont'd): Teens Against Toxins

Detailed Comments on the Department of Energy's
Draft Environmental Impact Statement Issued January 2017

I. Background

SSFL is a former nuclear and rocket engine testing facility that is contaminated with radiological and chemical pollutants. The 2,850 acre site is nestled in the hills between Simi Valley and Chatsworth, but is also surrounded by the communities of Canoga Park, Woodland Hills, West Hills, Westlake Village, Agoura Hills, Oak Park, Calabasas, and Thousand Oaks.

SSFL was established in the late 1940s by the Atomic Energy Commission (AEC) as a testing facility, or "field laboratory", for nuclear reactor development work too dangerous to perform close to a populated area. Safety considerations were "subordinated to other concerns from the outset."³ The site location was ranked 5th out of 6 candidates in terms of safety of meteorological conditions, in part because of nighttime migration of potentially contaminated air into the San Fernando Valley. Nonetheless, the site was chosen as a nuclear testing site, largely due to convenient drive times from nearby universities. A reactor power limit was set to limit radioactive inventory, due to these poor site conditions, as well as the decision to forgo a containment structure in favor of discretion during the Cold War. Only a decade later this protection was disregarded, when the AEC built the Sodium Reactor Experiment (SRE) with power twenty times the limit.

Had the site remained remote, perhaps the sloppy safety practices and waste produced by operations would not have been an issue. However, in the decades following the establishment of SSFL, the population mushroomed around the area. Currently, over half a million people reside within ten miles of the site. As SSFL sits on a hill, the contamination that was created throughout the site's operational years has been migrating into the surrounding neighborhoods every time there are heavy rains, winds or fires. A study by the UCLA School of Public Health found elevated cancer death rates among both the nuclear and rocket workers from exposures to these toxic materials⁴. Another study by UCLA found that the rocket testing had led to offsite exposures to hazardous chemicals by the neighboring population at levels exceeding EPA standards⁵. A study performed for the federal Agency for Toxic Substances and Disease Registry found elevated cancer rates in the offsite population associated with proximity to SSFL⁶.

The site was home to ten nuclear reactors, half a dozen critical facilities, a plutonium fuel fabrication facility, and a "hot lab" for decladding and disassembling irradiated nuclear fuel shipped in from around the AEC/DOE national nuclear complex as an initial step for reprocessing. SSFL was mainly used for the development and testing of liquid-propellant rocket

128-2

128-3

128-2 Please refer to Section 2.7, "Offsite Impacts," of this CRD for a discussion of concerns about offsite impacts and DOE's response. As described in Section 2.7, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

128-3 DOE acknowledges your concern and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

DOE acknowledges that there are chemical and radioactive constituents above background levels in parts of that portion of SSFL for which it is responsible, Area IV and the NBZ. Note that rocket testing was not conducted in the areas of the site for which DOE is responsible. DOE's purpose in preparing this EIS is to evaluate alternatives for completing cleanup of those portions of SSFL for which it is responsible. All of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment.

Commenter No. 128 (cont'd): Teens Against Toxins

engines for the US space program from 1949 to 2006 and the operation of a US government-sponsored liquid metals research center from 1966 to 1998. Nuclear reactors were active from 1953 to 1980.

In 1959, the SRE reactor, with twenty times the permissible power limit for a reactor facility so close to residences, experienced a partial nuclear meltdown, in which thirteen out of forty-three fuel rods melted. Unable to initially find the cause of the power excursion coming from the reactor, the workers inexplicably resumed operations only a couple of hours after shutting it down. The SRE operated for an entire week and a half more, with clear indicators that it wasn't properly functioning (e.g. off-scale radioactivity readings), until being finally shut down. A report by an eyewitness, John Pace, indicates that the reactor room became so radioactive that the large equipment door had to be kept open to vent radioactivity from the room to the outdoors⁷.

While partial nuclear meltdown of the SRE is the most notorious incident, numerous other accidents, releases, and spills occurred. In 1964, a SNAP reactor suffered damage to 80% of its fuel. In 1969 another reactor suffered similar fuel damage. There were numerous nuclear fires in and around the Hot Lab. For decades, radioactively and chemically contaminated reactor components covered with sodium were disposed of in open pits (the sodium "burn pit"). Sodium combusts when it reacts with air and explodes when it comes into contact with water. Workers reportedly shot at barrels of waste to ignite them and let them burn out in open air in the pits.

In addition, tens of thousands of rocket tests were conducted at SSFL, resulting in significant chemical contamination. A \$41.5 million study, conducted by EPA in 2012, found 500 hits of "concentrations of radioactive materials exceeding background levels" and "man-made radionuclides were found in 423 of the 500 samples"⁸. As previously mentioned, contamination from SSFL has not stayed on site. One example, trichloroethylene (TCE), is detected in groundwater onsite the most and at the highest concentrations⁹. According to NASA¹⁰, "TCE had been used in large quantities by the USAF and NASA to clean liquid-fueled rocket engines both before and after each test." There is strong evidence that even short-term TCE exposure causes kidney and liver cancer, as well as harmful effects on the nervous, respiratory, and immune systems. TCE was found in drinking water wells onsite that were shut down only after workers were exposed to levels above state and federal limits¹¹. TCE also migrated to wells nearby the field lab and was discovered at concentrations 134x the maximum contaminant level deemed safe by the EPA¹².

¹² Katner, Adrienne, Potential for Offsite Exposures Associated with Contaminants from SSFL, PowerPoint presentation, 18 June 2014.

128-4

128-4 The scope of this EIS is limited to cleanup of DOE's portions of SSFL for which it is responsible, Area IV and the NBZ. DOE was not involved in rocket engine testing; contamination resulting from the testing is being addressed by NASA and Boeing. DOE's groundwater contamination remains within the boundaries of Area IV and the NBZ. Boeing and NASA cleanup activities are only considered as part of cumulative impacts (Chapter 5 of this Final EIS). Cleanup of the entire SSFL, including Boeing, NASA, and DOE activities, is being evaluated by the DTSC; in the *Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* was issued by DTSC in 2017 (DTSC 2017b).

Regarding EPA's soil findings, EPA concluded that "Approximately 70 percent of soil samples with radionuclide concentrations greater than the [field action levels] are located within five Area IV Radiological Areas of Interest." With regard to the commenter's reiteration of the EPA statement of "man-made radionuclides were found in 423 of the 500 samples," EPA also stated in their radiological study that exceedance of their field action levels "do not necessarily represent locations of contamination." (Please see the EPA report *Final Characterization of Soils, Area IV and the NBZ, Area IV Radiological Study*, page 4-1 [HGL 2012b]). Also, please refer to Section 2.7, "Offsite Impacts," of this CRD for a discussion of this topic and DOE's response.

Commenter No. 128 (cont'd): Teens Against Toxins

In 2010, the agency responsible for overseeing the cleanup, the California Department of Toxic Substances Control (DTSC), signed Administrative Orders on Consent (AOC) with NASA and the DOE to cleanup their portions of the site to background levels of contamination – meaning all detectable contamination they created would be cleaned up. The key components of the AOC are: that it is a legally-binding contract (DOE cannot unilaterally decide not to comply with any part of it), that all places where contamination exceeds soil (including structures) above background will be remediated (no averaging of contamination concentrations across large areas), and “leave in place” cleanup methods are prohibited.

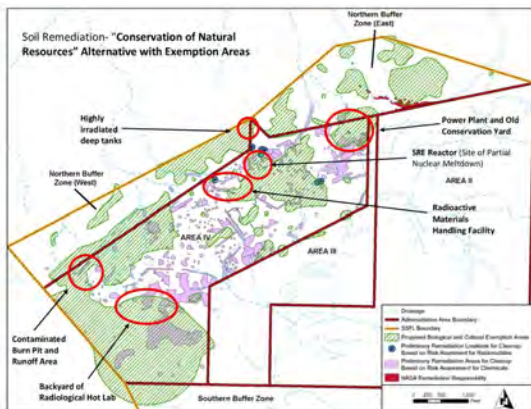

In 2012, DOE issued a notice “Public Participation in the Development of Alternatives to be Considered in the Santa Susana Field Laboratory Area IV Environmental Impact Statement.” In it DOE acknowledged that DTSC was the regulator and had the regulatory authority over the cleanup, that DOE was obligated to carry out the AOC requirement to clean up to background, and that the EIS would be limited to alternative ways to achieve that cleanup standard. Instead, the DEIS is looking at *whether* to cleanup the contamination it is responsible for, rather than *how* to abide by the commitments they made.

II. Debunking the Myth that “Conservation of Natural Resources” Alternative is Protective of Human Health and the Environment

The “Conservation of Natural Resources” is a misleading title, in that it doesn’t actually help protect the natural resources. According to pg. S-37 of the DEIS, the Conservation of Natural Resources alternative is “the alternative with the least soil removed.”

When subtracting the total amount of soil removed under this alternative from the 1.4 million of cubic yards of contaminated soil, including an additional exemption of 5% of the soil volume remediation DOE would likely take advantage of¹³, this leaves 99% of the contaminated soil onsite.

The graphic to the left shows you how little chemical (purple) and

¹³ DEIS pg S-21.

128-1
cont'd

128-5

128-5 For further discussion of the volumes of soil to be excavated and the volumes left behind, refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. Therefore, SSFL Area IV and the NBZ are not “heavily contaminated.” The exemption areas identify locations where added precautions to soil clean up may be applied to protect biological and cultural resources. The exemption areas are not totally exempt from cleanup actions; rather if there is contamination within those exemption areas that poses a risk to human health or the environment, it would be subject to a carefully planned and focused cleanup (intended to result in minimum disturbance) to reduce concentrations to below human health and ecological risk-based limits.

Commenter No. 128 (cont'd): Teens Against Toxins

radiological (navy dots) contamination in the soil would be remediated under the "Conservation of Natural Resources" Alternative. At most, the map of the graphic only depicts 10% of the chemicals and radionuclide contamination DOE is required to clean up under the AOC.

As you can see, all of the red circles on the map highlight areas that are historically heavily contaminated (e.g. the SRE Reactor and Radioactive Materials Handling Facility)¹⁴ and are depicted as having the most amounts of radiological contamination in the graphic. The green-striped shaded regions, representing the soil that DOE would be exempt from cleaning up due to biological or cultural resources, have been imposed in those areas.

Under the "Conservation of Natural Resources" Alternative, contaminated areas like the following would **not** be remediated:

- The SRE Reactor site, where a partial nuclear meltdown occurred in 1959
- The power plant and Old Conservation Yard, where barrels of chemical and radioactive waste were disposed of
- The contaminated burn pit, where barrels of chemical and radioactive waste were discarded, burned and left exposed to the elements (and its highly contaminated runoff area)
- The backyard of the radiological Hot Lab, where fires raged in the early 2000's
- The Radiological Materials Handling Facility, where all the radiologically impacted materials were to be sent before being disposed of
- Highly irradiated deep tanks in the hills above the SRE reactor site

It is preposterous that the DOE claim areas like the SRE reactor site and power plant area as biological resources (they are simply concrete and remaining structures) or cultural resources (they are not Native American). With the implementation of the "Conservation of Natural Resources" Alternative, the most dangerous places on site would be left untouched. This is unacceptable and as none of these biological and cultural resource exemption areas have been approved, it is morally reprehensible for the DOE to assume they can excuse themselves from the most hazardous part of their mess.

The DOE is claiming that:

"Impacts on vegetation and wildlife habitat and biota would be reduced because the remediated acreage (about 32 acres) would be less than that under the Cleanup to AOC LUT Values Alternative. Impacts would be slightly less than those under the Cleanup to Revised LUT Values Alternative (32 acres vs. 40 acres). The smaller area affected by remediation would increase the feasibility

¹⁴ "The majority of the soil samples containing concentrations exceeding background were found in the surface soil at locations previously suspected of having contamination, such as the Radioactive Materials Handling Facility and the former Sodium Reactor Experiment". EPA Radiological Characterization Study Results Fact Sheet, December 2012, pg. 2.

128-6

128-7

128-6 Commenters have inferred that exemption areas would be treated as untouchable and would not be subject to any cleanup. This is not the case. Rather, the areas in which the exemption process would be applied are established to protect certain biological and cultural resources, but as indicated in Chapter 2, Section 2.3.2, of this EIS, if levels of constituents in these areas pose a risk to human health and the environment, as determined using risk-based screening levels (RBSLs), DOE would remove them through carefully planned, focused removals that would result in minimum disturbance. Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD, for a discussion of this topic.

128-7 Please see the response to comment 128-6. Exemptions for biological and cultural resources are provided for in the 2010 AOC; the AOC also requires that "actions taken pursuant to this Order by DOE shall be undertaken in accordance with applicable local, State, and Federal laws and regulations." At the time the Draft EIS was issued, DOE had been involved in ongoing meetings with the USFWS, DFW, and others for several years (see Appendix E, Table E-4 of this Final EIS) and had conducted multiple biological resource field surveys. Based on the AOC and consistent with applicable local, State, and Federal laws and regulations, DOE has identified areas in Area IV and the NBZ that contain federally-listed or State-listed species, other sensitive species, and critical or sensitive habitats that warrant protection. Interactions with USFWS and CDFW have continued since the publication of the Draft EIS and the areas in which the exemption process would be applied has been revised, consistent with the information included in a Biological Assessment required as part of the Endangered Species Act Section 7 consultation. There was no Biological Opinion from the USFWS at the time the Draft EIS was released. The USFWS has now issued a Biological Opinion (see Appendix J) for remediation of SSFL. This Final EIS reflects the results the ongoing interactions with the USFWS and CDFW, as well as the Biological Opinion, in identifying those areas in which the exemption process would be applied.

With regard to the number of protected species reviewed in the Draft EIS, the EIS preparers used accepted professional practice to include information about threatened or endangered species (either listed federally or by California) that could possibly occur on a site (based on their distributions and ecological requirements) before narrowing to species known or expected to occur on the site based on review of this information and field surveys. The number of species identified in this Final EIS reflects the results of the Biological Opinion from the USFWS (with input from the CDFW). This process is explained further in Chapter 3, Section 3.5.5, "Threatened, Endangered, and Rare Species" of this Final EIS; the species and habitats identified for protection

Commenter No. 128 (cont'd): Teens Against Toxins

of restoration, and there would be more undisturbed habitat between remediated portions of the site, facilitating recolonization by native plant and wildlife species and beneficial soil organisms.”

pg S-49

The argument that there would be a more negative impact to the environment by cleaning up the toxic mess than leaving it there to continue to damage the health of local residents, plants, and animals is preposterous. The environment would not be devastated by cleaning it up—it was ruined the moment it became contaminated. The best hope for the natural resources onsite is to leave the land as close to its original state as possible (cleaning up to background levels of contamination), so that it may heal and restore itself without toxic chemicals and radionuclides present in the soil and groundwater.

128-8

The Lack of a Basis for Remedial Exemptions Due to Biological Resources

In the 2010 AOC it was stated that the entire site must be cleaned up to local background levels. It allowed a very narrow exception to be considered only to the extent that the U.S. Fish and Wildlife Service, “issues a Biological Opinion with a determination that implementation of the cleanup action would violate Section 7(a)(2) or Section 9 of the ESA, and no reasonable and prudent measures or reasonable and prudent alternatives exist that would allow for the use of the specified cleanup standard in that portion of the site.”¹⁵

There has, however, been no such Biological Opinion from the U.S. Fish and Wildlife Service. The exemption does not apply. Indeed, the US Fish and Wildlife Service did issue a Biological Opinion¹⁶ several years ago to EPA for its preparatory work for the cleanup, which was to involve cutting down much of the vegetation so a radiation survey could be done. It concluded no problem; mitigation measures could be done, and that indeed, the cleanup of the contamination was critical for protecting biological resources.

128-7 cont'd

The DOE DEIS, however, says that they are not going clean up anything in any of their self-declared biological exemption areas. The AOC says that if biological resources are identified mitigation measures are to be taken, not that DOE could avoid cleanup altogether.

The only two plants found in Area IV and the NBZ are Braunton’s milk-vetch which is federally listed as endangered, and the Santa Susana tarplant, which is state listed as rare. In the DOE DEIS they claim that there are 12 additional plant species that may exempt them from remediation, but this is nothing more than a weak excuse to not clean up those areas. Of these 12 plants, none of them have actually been observed on the site, and many of them are neither federally listed as endangered nor threatened. In terms of animals, there are none that are both

¹⁵ *Administrative Order on Consent*, December 2010, pg. 45.

¹⁶ United States Department of Interior, Fish and Wildlife Service. *Biological Opinion for the Santa Susana Field Laboratory Area IV Radiological Study Project, Ventura County*. 25 May, 2010.

are discussed in Appendix B, Section B.5. Please refer to Section 2.4, “Application of Exemptions under the 2010 Administrative Order on Consent,” of this CRD, for additional information on this topic.

The National Historic Preservation Act (NHPA) Section 106 Programmatic Agreement (PA) will address protection measures for cultural resources during cleanup activities. This PA is being developed in consultation with the SHPO and other consulting parties, including the federally-recognized Santa Ynez Band of Chumash and non-federally recognized tribes, and DTSC. For this EIS, DOE defines cultural resources for the purposes of impact analysis broadly to encompass definitions of cultural resources in NEPA and the CEQ NEPA implementing regulations, historic properties as defined in the National Historic Preservation Act (NHPA) Section 106 regulations, and cultural resources in the AOC (see Chapter 3, Section 3.11.1, including the text box titled “Types of Cultural Resources”).

128-8

DOE acknowledges your preference for cleanup in accordance with the 2010 AOC. Please refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent” of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. With respect to the alternatives evaluated in the EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Two alternatives, the Cleanup to Revised LUT Values Alternative and the Conservation of Natural Resources Alternative, would help to meet cleanup objectives by being protective of the environment and health and safety of the public and workers while avoiding some of the technical challenges and potential adverse environmental impacts associated with cleanup to the 2010 AOC LUT values. These two alternatives would reduce (1) risk to the public and the environment and (2) potential impacts to visual, biological, cultural, and water resources compared to the Cleanup to AOC Look-Up Table Values Alternative. The comparative analysis of these alternatives allows the public and the DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. DOE acknowledges that implementation of any alternative would have to be approved by the DTSC.

Also refer to Section 2.7, “Offsite Impacts” and Section 2.10, “Public Perceptions about Waste and Contamination in Area IV” of this CRD to gain a better understanding regarding residual contamination in Area IV and the potential for offsite impacts.

Commenter No. 128 (cont'd): Teens Against Toxins

federally listed and have been found on the site. Of all the 7 animals mentioned on the DOE DEIS 5 have a 'low' potential of occurrence and 2 are 'not expected' to occur on the site at all.

The Lack of a Basis for Remedial Exemptions Due to Cultural Resources

Under the 2010 AOC, only federally-recognized Native American artifacts would trigger area exemption from remediation. There are no recognized cultural artifacts in Area IV and the NBZ that would exempt DOE from cleaning up¹⁷.

How Finding Adequate Backfill Soil is Non-Issue

The DOE claims that finding replacement soil for what they excavate that meets the AOC LUT values would be too difficult. They state that the "chances of finding acceptable backfill soil are better under the Cleanup to Revised LUT Values Alternative or Conservation of Natural Resources Alternative because the assumed requirements for concentrations of chemicals in the backfill soil would be less stringent."¹⁸

However, the DEIS shows that "Gillibrand" fill meets all requirements, with the minor exception of two constituents that exceed the LUT values. The DOE itself says these constituents and the exceedance rates are not a risk for human health or the environment¹⁹. Furthermore, the AOC states that if a source of backfill soil could not meet all the AOC LUT values, the DTSC and DOE would enter into consultation over the matter and the DTSC would determine the best available fill. In other words, DOE has no authority nor valid justification in trying to claim for themselves that there are no viable backfill sources. DTSC will make the decision on which backfill soil would be best to use, which would appear to be Gillibrand. There is therefore no issue with finding a suitable fill under the AOC, and the DOE's argument is a non-issue.

The Problems with the Risk-Based Cleanup Standards Proposed

The DOE claims on pg. S-33 of the DEIS to be using "the hypothetical onsite suburban residential exposure scenario (using the direct pathways)" for the risk assessment, but actually disclose in a footnote on pg. S-31 that they left out the garden component of that scenario. The garden component is required to be included in order to achieve the most accurate risk estimates and protective cleanup standards in that it is responsible for 99 to 99.9% of the dose. In other words, they low-ball the dose by a factor of 100-1000 or so.

Furthermore, DOE is proposing to average concentrations across larger areas, which may lead to "hotspots" being overlooked and unsafe levels of contaminants being left unremediated:

¹⁷ <http://www.ssfllareaveis.com/comment.aspx>

¹⁸ DEIS pg. S-100.

¹⁹ DEIS pg. D-45.

128-7
cont'd

128-9

128-10

128-11

128-9 The 2010 AOC requires all chemicals and radionuclides in backfill soil to be below their respective LUT values in order for the soil to be used in Area IV. Final EIS Appendix D, Section D.6.2 presents soils test results for the Gillibrand facility in Simi Valley. These data show that soil samples would exceed LUT values for antimony, anthracene, and phenanthrene and the EIS states in Section D.6.2 that none of these results is at a level that would pose a risk to human health or the environment. Per the 2010 AOC, "If an onsite or offsite source of backfill soils that achieves all Look-Up Table values cannot be reasonably found, then DTSC, DOE and EPA shall enter a consultation process and DTSC shall determine the best available source of backfill." DOE will continue to work with the DTSC to identify a source of backfill prior to initiation of soil remediation activities. Refer to Section 2.3, "Suitable Backfill Soil" of this CRD for discussion of the responsibilities and actions necessary to identify a backfill source, including interactions with DTSC.

128-10 In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. They permanently bind the property, regardless of who owns the land. North American Land Trust will monitor and enforce the easement. The use of RBSELS that do not include the indirect garden pathway is appropriate for this future land use.

A garden pathway has been included for the offsite suburban resident for which an evaluation has been added in this final EIS in response to public comments.

128-11 EPA does area average its residential risk assessments. EPA guidance: *Supplemental Guidance to Risk Assessment Guidance for Superfund: Calculating the Concentration Term*. Publication 9285.7-081 [EPA 1992]), states the basis for risk determination assumes a random exposure over an exposure area. The exposure area is an assumed location where exposure to the chemical in soil may occur. Risk from exposure to a chemical is then related to the arithmetic mean concentration of that chemical averaged over the entire exposure area, regardless of the current or future land use type. Because the true arithmetic mean concentration cannot be calculated with 100 percent certainty from a limited number of measurements, the EPA recommends that the upper 95th percentile confidence limit of the arithmetic mean at each exposure point be used when calculating exposure and risk at that location (EPA Office of Solid Waste and Emergency Response.) This is also consistent with DTSC Human and Ecological Risk

Section 3 – Public Comments and DOE Responses

Commenter No. 128 (cont'd): Teens Against Toxins

Cleanup based on risk assessments for individual units accounts for the receptor's exposure to an **average** concentration in the unit in contrast to the point-by-point evaluation of the Cleanup to AOC LUT Values...where each sample must meet the LUT values for each constituent. (pg S-33)

Contrary to DOE's claims, EPA guidance says you are not to average when the scenario is residential or any other scenario where the exposure cannot be expected to be random. Averaging amounts of contamination over a general area dilutes the total concentration of contamination, in that readings of concentrations of contamination in hotspot areas will be diluted by readings of less contamination nearby. This proposal violates the AOC in that averaging would lower the total amount of contamination needing to be cleaned up and excuse the DOE from cleaning up each individual spot where there is contamination to a non-hazardous level. This also violates the 1995 DOE-EPA Joint Policy that all DOE sites must be cleaned up consistent with EPA Superfund guidance²⁰.

According to the DEIS, "chemically impacted soil would be removed to achieve a cancer incidence risk of 1 chance in 1 million and a hazard index of 1; radiologically impacted soil would be removed to ALARA levels below the dose rate of 25 millirem per year."²¹ As demonstrated in the chart to the right, we ran EPA's dose compliance calculator for a residential scenario, using soil as the medium, and all of the calculator's default parameters, except for the concentrations of the constituents. Instead, we replaced the default concentrations with site-specific

128-12

Office guidance that states: "In cases where there is adequate characterization, the 95 percent upper confidence limit (UCL) of the arithmetic mean may be used for the exposure point concentration."

To perform the risk assessment for the Conservation of Natural Resources Alternative, DOE used 10,000 square meter or about 2.5 acres as the exposure area. In conducting a cleanup under a standard risk assessment, locations with higher concentrations, the commenter's hotspots, are located first and targeted for cleanup. Averaging of the remaining soil is then performed to assess the post cleanup risk. Cleanup continues until the post cleanup risks are less than the risk-based cleanup criteria. The map produced by DOE (Figure S-5 in this EIS) illustrated where any chemical or radionuclide may exceed a LUT value; however, exceeding a LUT value is not necessarily evidence of contamination and if present, that the chemical or radionuclide poses a risk to a future user. Use of risk-based criteria for cleanup decisions is protective of the health and safety of the public.

Regarding the 1994 DOE-EPA Joint Policy, please see the response to comment 128-13.

128-12 The differences between the values the commenter derives from the EPA dose calculator and the values presented in the EIS are a direct result of the default parameters in the EPA dose calculator including the indirect garden pathway. Please see the response to comment 128-10.

DOE chose to identify the 25 millirem per year in its risk-based alternative for clean in this EIS, consistent with the upper limit for dose-based release criteria under DOE requirements (DOE Order 458.1). The 25 millirem in a year exposure limit would represent a maximum possible dose. It did not take into account the Department's requirement to apply ALARA. DOE does not propose in the Final EIS radionuclide cleanup standards based on dose. DOE instead has conducted a risk-assessment based approach for soil remediation. DOE notes that the methodology used in the cleanup evaluation for the Conservation of Natural Resources Alternative in the final EIS results in doses that are well below the 25 millirem year upper limit and are in a range that is consistent with the CERCLA target risk range.

²⁰ DOE & EPA, *Policy on Decommissioning DOE Facilities Under CERCLA*, 22 May 1995.

²¹ DEIS pg. S-36.

Commenter No. 128 (cont'd): Teens Against Toxins

values that the DOE claims yield a dose of 25 mrem/yr²². The EPA calculator's dose estimates were far above the 25 mrem/yr limit—in some cases hundreds of times higher. The final column of the chart puts the doses in the context of annual chest x-rays. If the DOE went ahead with the proposed risk-based cleanup, they would be forcing the surrounding communities to be receiving a dose equivalent of getting thousands of unnecessary chest x-rays each year.

128-12
cont'd

The 25 mrem/yr standard also violates the 1995 DOE-EPA Joint Policy that all DOE sites must be cleaned up consistent with EPA Superfund guidance, which has declared 25 millirem as non-protective.

128-13

III. Transportation and Waste Disposal

The DEIS only looks at four route options for the transport of contaminated soil and waste to disposal facilities. The offsite disposal routes are presented in the context of "traffic increases" in Table 5-7 in the DEIS. The DOE is attempting to paint the of transportation and offsite disposal of contamination as cumbersome and potentially more hazardous to human health than if they were to leave the contamination onsite. All four route options go through numerous residential neighborhoods. The first two routes go from the site entrance to State Route 118 north of the site, while the second two routes go from the site entrance to the US 101 freeway. In both cases, the target destination is Puente Hills Intermodal Facility, a train station 60 miles from SSFL that isn't even operational yet.

Transportation methods besides trucking soil to rail lines were not considered because "such a large infrastructure project would unreasonably delay initiation of the project relative to the availability of other options." Considering how the DOE committed to cleaning up the site by 2017, and a cleanup has yet to begin, this no longer a valid excuse. For example, if it wished to the DOE could look into transportation that involved little to no trucks such as conveyor system to a nearby rail line. There are rail lines within a mile of the site that could be reached without passing through a single home, and transporting the contaminated soil by train would be more beneficial to the environment in terms of reduced greenhouse gas emissions and probability of accident. Hauling nuclear and chemical soil contamination 60 miles to Puente Hills should not be considered as the best option.

128-14

In August of 2014, after NASA similarly attempted to utilize the truck traffic as a scare tactic, a SSFL Transportation Options Task Force produced an 18-paged detailed report of not only viable alternate truck routes, which avoided residences, but also practical alternate methods of removal and transportation of waste²³. The Task Force formed shortly after NASA released its final EIS in March 2014. If a team of half-a-dozen community advocate organization representatives and local residents can compile in only a matter of months, what DOE had 7 years to do and *still* claims it would take too long to do a thorough job, one can only assume the DOE is intentionally stalling to scare residents into not wanting a cleanup because they think it

²² Table G-24 on pg. G-93 of the DEIS

²³ *Preliminary Overview of Alternative Transportation Options for SSFL Cleanup*, 7 August 2014.

128-13 The 1995 DOE-EPA Joint Policy creates a framework for the conduct of decommissioning of DOE facilities and provides guidance to EPA Regions and DOE Operations Offices on the use of CERCLA response authority to decommission such facilities. However, it only ensures compliance with CERCLA requirements for remedy selection at National Priorities List facilities. Since SSFL is not on the National Priorities List, CERCLA requirements for the selection of a remedy do not apply to it. However, note that this EIS does include an alternative/scenario consistent with the approach and process used by EPA in CERCLA cleanups. DOE chose to identify the 25 millirem per year in its risk-based alternative for clean in this EIS, consistent with the upper limit for dose-based release criteria under DOE requirements (DOE Order 458.1). The 25 millirem in a year exposure limit would represent a maximum possible dose. It did not take into account the Department's requirement to apply ALARA. DOE does not propose in the Final EIS radionuclide cleanup standards based on dose. DOE instead has conducted a risk-assessment based approach for soil remediation. DOE notes that the methodology used in the cleanup evaluation for the Conservation of Natural Resources Alternative in the final EIS results in doses that are well below the 25 millirem year upper limit and are in a range that is consistent with the CERCLA target risk range.

128-14 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of transportation issues and DOE's response. In accordance with NEPA, the EIS evaluates the potential impacts on a variety of resource areas, including traffic, human health, cultural and biological resources, socioeconomics, and environmental justice. Results of the analyses allow a comparison of potential impacts across all evaluated resource areas as well as the tradeoffs between the alternatives. DOE's intent is not to portray the transportation and offsite disposal of contamination as cumbersome, nor to represent the conditions as potentially more hazardous to human health than if the contamination was left onsite. Additionally, DOE did not intentionally try to alarm residents into not wanting a cleanup because they think it would be more dangerous to remove the contamination than leave it there. But it is true that the more soil that is removed from the site, the larger the transportation effort (i.e., a larger number of truck trips) that would be required. Leaving more soil, and consequently low concentrations of chemicals and/or radionuclides on site, reduces the number of truck trips from the site. The EIS shows that the transportation risks are very small; Chapter 4, Section 4.8.1 and Appendix H of the EIS provide details of the transportation risk analysis.

Commenter No. 128 (cont'd): Teens Against Toxins

would be more dangerous to remove the contamination than leave it there. If the opposition to an AOC-compliant cleanup's main concern is contaminated soil being driven by their home, then they will be happy to know that DOE is able to provide an array of plausible solutions, whether it be conveyor systems or routes to trains that don't pass by homes.

128-14

IV. Benzene as a Case Study for Elevated Risk to Human Health Posed by the Proposed Cleanup Alternatives

While there may never be any way to directly correlate the contamination from SSFL with the clusters of pediatric and adult cancers in the surrounding communities, it is utterly shocking to our community that the polluters, DOE included, are not taking a "better safe than sorry" approach to the impacts of the contamination and their cleanups on human health.

According to page 1409 of the Standardized Risk Assessment Methodology Revision 2 Addendum (SRAM), Benzene has historically been found in soil, soil vapor, surface water, permanent sediment, and groundwater at SSFL. Benzene is classified as the most dangerous type of carcinogen- Class A "human carcinogen" in the risk assessment that was done for chemicals of potential concern²⁴. According to cancer.gov, "having a parent who was exposed to certain chemicals...such as Benzene...increases the risk for Langerhans Cell Histiocytosis (LCH)."

Grant was only six months old and living in Northridge when he was diagnosed with Langerhans Cell Histiocytosis (LCH); he had a strange lesion on his chest that was continuing to slowly grow and the doctors finally diagnosed his disease via biopsy.

LCH is an immune disorder that affects the white blood cells, like leukemia, and is considered an atypical blood cancer.

Grant's parents were told by doctors that the odds of Grant having LCH at his age are about 1 in 2,000,000. Neither of his parents have a history of cancer. During her pregnancy, Grant's mother ate organic food, did not take any medications, and did everything she could to have a healthy pregnancy.

Grant's parents were living in Northridge while pregnant, about 10 miles from the SSFL. Neither she nor Grant's father had any other known

Commenter No. 128 (cont'd): Teens Against Toxins

exposures to the other chemicals linked to LCH. Grant's parents know of at least one other case of LCH in the San Fernando Valley; the odds of there being two cases of this disease in such a close area are extremely rare.

According to Table 4.1 on pg 80 of the Site Safety and Health Plan Area IV Radiological Study²⁵, the highest concentration of Benzene historically detected in surface and groundwater at SSFL is 500 µg/L. That is 100x the limit. While the DOE currently has no preferred alternative for groundwater remediation in the DEIS, they have two proposals:

1. Under the "Groundwater Natural Attenuation and Monitoring Alternative" there would be no removal or treatment of ground water and at most they would monitor for 50 years. In most cases, they claim 20 years would be sufficient for monitoring the different plumes of contaminated groundwater²⁶.
2. Under the "Groundwater Treatment Alternative" only 4 of the 7 plumes would actually be treated. The DOE is claiming that two of the plumes would not be amenable to treatment and a third would naturally attenuate to meet the maximum contamination limit set by the USEPA by 2025²⁷. In terms of treatment for volatile organic compounds (benzene's classification) the DOE is proposing soil vapor extraction (SVE). They would basically be pulling contaminated vapor through the subsurface into wells using a vacuum pump placed at the top of the well. DOE claims 5 years of pumping would be sufficient²⁸. There is sampling data from the Resource Conservation and Recovery Act Groundwater Work Plan²⁹ that shows benzene concentrations that are right at the 5 ppb limit in/near two of the plumes that would not be cleaned up. Benzene was also reported in concentrations above its limit in wells offsite in 2007³⁰.

In terms of soil contamination, under the Cleanup to Revised AOC LUT Values alternative and the Conservation of Natural Resources alternative, Benzene would not be cleaned up at all. This is because under the proposed revised LUT values, DOE is attempting to exclude any contaminant that is found in less than 2.5% of the soil samples is excluded from the list of chemicals to be cleaned up.

According to Table 3.13 on pg 61 of the Chemical Data Summary Report³¹, 17 of the 1610 samples collected to test for Benzene had "hits", or concentrations above background. None of the 1610 samples contained Benzene in concentrations above the 115 µg/kg limit DOE is proposing. Because the DOE limit is so high, less than 2.5% of samples would be considered contaminated by the proposed standards, meaning, DOE would be exempt

128-15

128-16

Since the publication of the Draft EIS, DTSC has published, in September of 2017, the *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (DTSC 2017b), which includes a draft transportation study. The transportation related conclusions of the EIR are summarized in Chapter 2, Section 2.2.4, of this EIS. Please note that this DTSC EIR included the truck route proposed in this EIS (Woolsey Canyon Road) in their environmentally superior alternative. This method of transportation was identified by the DTSC Draft EIR as the least environmentally impactful while being the most technically feasible (Appendix J of the DTSC EIR).

As described in Appendix D of this EIS, for purposes of analysis under the truck/ rail transportation option, the Puente Hills Intermodal Facility in City of Industry, California (about 50 60 miles from SSFL), was used as the representative facility for the transfer point where wastes would be placed on railcars for delivery to appropriate disposal facilities. In selecting this facility as a representative facility for purposes of analysis, there was no intent to preclude other locations that could be used or developed for intermodal transfer of SSFL material to trains. However, any location to be used for intermodal transfer would need to be assessed for suitability.

128-15 The benzene data reported in the comment is not representative of the current condition of Area IV groundwater. The highest concentration of benzene reported from Area IV groundwater is 15 micrograms per liter, measured in 1993 from a sample collected in monitoring well RS-54. Benzene rapidly degrades in groundwater and is no longer observed at concentrations above the maximum contaminant levels of 5 micrograms per liter. Benzene was not detected in any of the monitoring wells sampled for benzene in the 2016 groundwater remedial investigation. RS-54 was last sampled for benzene in 2017 and benzene was not detected at the 5 micrograms per liter AOC LUT value (based on the multi-lab reporting limit).

For the plumes that would be remediated, soil vapor extraction, described in Chapter 2, Section 2.6.3 of this Final EIS is one of the most commonly used technologies for removing volatile organic compounds, such as benzene, from subsurface soils. During soil vapor extraction, the air stream is treated to remove the volatiles and they are not released into air.

As discussed in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith

Commenter No. 128 (cont'd): Teens Against Toxins

from remediating any Benzene at all under the alternatives that would utilize the revised AOC LUT values.

The LUT value set in the AOC is 5 µg/kg. DOE used a limit 23x less protective for their RBSL of 115 µg/kg. This RBSL is 32x less protective than the RBSL value they should have been using, which incorporates exposure through having a backyard garden (0.0036 µg/kg)³². The ecological receptor risk-based screening limit (EcoRBSL), or the limit determined safe for the plants and wildlife, is 0.31 µg/kg³³. The RBSL DOE is proposing to use as a cleanup standard is 371x less protective than that. How can the DOE be claiming that the risk-based cleanup standards are conserving the natural resources of SSFL when they would be exposing living organisms to concentrations of Benzene hundreds of times higher than the limits EPA deems safe for living organisms?

V. Inflated Background Values for Arsenic

Despite the fact that no average concentrations above 10 mg/kg were found at the sampled sub-sections of Area IV and the NBZ, the background concentration of arsenic was cited as 46 mg/kg³⁴. Historically, background comparison levels for arsenic have been determined to be 15 mg/kg³⁵ and even as low as 12 mg/kg³⁶.

The 2010 AOC DOE signed with DTSC names DTSC as the authority when it comes to determining remediation goals for chemicals. In 2012, when developing chemical LUT values for the pollutants to use as cleanup standards that would be compliant with the 2010 AOC, the DTSC relied on background threshold values (BVT). BVT's were determined by finding the highest detectable concentration of chemicals in nearby soil, which was as similar as possible to the soil found at SSFL. The highest possible BVT for SSFL was determined to be 39.7 mg/kg³⁷.

All of a sudden, in 2013, the DTSC lists the AOC LUT value as 46 mg/kg, with no further explanation as to how that value was derived from a 39.7 mg/kg BVT. In 2014, in a *Comparative Analysis of Background vs. Risk-based Cleanup Scenarios for the Soils at SSFL*, the BVT is listed as 39.7 mg/kg while the LUT value is given as 46 mg/kg.

As previously mentioned, the LUT value for arsenic in the DEIS is 46 mg/kg. According to the DOE, this value is "the lower of the background threshold value [BVT] for soil or the method detection limit"³⁸. How did the DOE pick 46 mg/kg as their background concentration

2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

128-16 As stated by the commenter only 17 of 1610 samples collected for benzene had detections above background. No background screening value was used for benzene; that is, no detections were eliminated based on a benzene background value. Therefore, there were 17 of 1610 samples in which benzene was detected. That is a 1.06 percent detection rate which is in the range of the expected false positives for detection. Therefore, presence of benzene was considered by DOE to be not substantiated. This substantiation of the presence of benzene had nothing to do with setting the revised AOC LUT values for the Cleanup to Revised LUT Values Alternative which are based on risk criteria and the proposed future use of the property. See the response to comment 128-10 for an explanation of why DOE did not include an indirect garden pathway.

128-17

128-17 In this EIS, DOE uses AOC LUT values established by DTSC. In June of 2013, DTSC provided the *Chemical Look-Up Table LUT Technical Memorandum, Santa Susana Field Laboratory, Ventura County, California* that listed the AOC LUT value for arsenic as 46 milligrams per kilogram derived from the background threshold value (BTV) of 39.7 milligrams per kilogram. As discussed in its memorandum, the LUT values were calculated by DTSC based on the greater (not lower) of the BTV or the DTSC background study method reporting limit (in the case of arsenic the BTV), plus a measurement uncertainty. This added uncertainty accounts for the difference between the BTV value of 39.7 milligrams per kilogram and the LUT value of 46 milligrams per kilogram.

Commenter No. 128 (cont'd): Teens Against Toxins

for arsenic, when they claim to be picking the smaller of two values, one of which was 39.7 mg/kg (the BVT)?

128-17

VI. Lack of Transparency and Hindrance of Public Input

The DEIS can be downloaded from and the public can submit their comments through a website generated by the DOE (www.ssflareaiveis.com). It was promptly discovered that three dozen of the documents referenced in the DEIS are inaccessible through the hyperlinks the DOE provided on the website. As shown in Figure 1, the hyperlinks lead to a PDF that stated the reference was withheld (most often) due to copyright restrictions. It is intolerable that the DOE is using references in their DEIS that are not being made available to the public for review.

Figure 1- January 26, 2017

Figure 2- February 28, 2017

Maintenance was scheduled and performed for the website on January 24, 2017. Only a couple of the "reference not provided" pages that were there instead of the reference documents were updated to include working links to the reference documents themselves. Beginning the day of the scheduled maintenance (1/24) numerous complaints were submitted to the DOE in reference to the "missing" reference documents for the DEIS. The complaints were submitted to an email address, ssfl_doe_eis@emcbc.doe.gov, that had appeared to have been generated for the specific purpose of commenting on the DEIS (figure 1). Even as recently as January 26, 2017 (2 days after the site maintenance), the "reference not provided" pages that are linked to the reference document hyperlinks displayed the email address (figure 3). However, by January 31,

Name	Date modified	Type
583_Hardlerode+2015	1/26/2017 3:07 PM	Adobe Acrobat D...
572_Schultz+and+Griffin+2001_Practical...	1/26/2017 3:05 PM	Adobe Acrobat D...

Figure 3- Timestamp for Figure 1

2017, the email address had been disconnected (figure 4). The "reference not provided" pages no longer display it as a means to contact the DOE (figure 2).

128-18

DOE apologizes for the problems encountered contacting DOE for references. For those references that were not appropriate to post on the SSFL Area IV EIS website (e.g., sensitive cultural resource information, copyrighted information) there was a note with an email address when one clicked on the reference. The email address was not intended to be used for the submission of EIS comments, although members of the public began to attempt to send comments through that email address. The email address was then disabled to avoid confusion. On the SSFL Area IV EIS website, the note hyperlinked to references not appropriate for posting on the EIS website was changed providing a U.S. mail address and a phone number to request a copy of sensitive references that were unavailable on the EIS website.

Commenter No. 128 (cont'd): Teens Against Toxins

The community was overjoyed that we had found a means to effectively communicate and submit our concerns about and suggestions for the DEIS. Since the beginning of the public comment period for the DEIS, the community has been emailing Stephie Jennings (the NEPA Document Manager for DOE and contact person for the DEIS) asking why the DOE is not accepting comments submitted by email, when it is the most appropriate and sustainable form of communicating available in our modern society. The DOE has contested that the other ways to submit comments are sufficient for public input on the DEIS, even though the public has been blatantly dissatisfied.

128-19

128-19 Considering public comments on the Draft EIS is an important step in the EIS process. DOE provided multiple means for submitting public comment. Comments could have been submitted directly via the SSFL Area IV EIS website. In response to comments about issues with submitting public comments on the EIS website, early during the public comment period DOE expanded the capacity of the website to accept longer public comments and added the ability to upload entire documents. Members of the public were also invited to attend the public hearings in Simi Valley on February 18, 2017 and Van Nuys on February 21, 2017 to make comments orally or submit paper copies. DOE also accepted public comments by U.S. mail. Regardless of the submission method, DOE considered all comments equally when developing this Final EIS.

RE: Comments on the Draft Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory (DOE/EIS-0402) (SSFL), Ventura County, California

Dear M. Jennings,

On behalf of the Resource Conservation District of the Santa Monica Mountains (RCDSMM), thank you for the opportunity to submit comments on the Draft Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone of the SSFL (DEIS). The RCDSMM is a non-regulatory, locally-led Special District of the State of California that fosters the conservation and enhancement of local natural resources through research, watershed and community-based planning, education and on-the-ground restoration, demonstration, landscape-infrastructure and architectural design projects. The RCDSMM is uniquely chartered by Division 9 of the CA Natural Resources Code to be responsive to the needs of our community, public and private land stewards alike. RCDSMM's expertise is in the specific resource conservation issues of the Wildland-Agricultural-Urban interface. RCDSMM is uniquely positioned to liaise between public/private landowners and regulatory/enforcement officials and agencies toward achieving sustainable communities and resource conserving land use approaches.

As a non-regulatory reviewing and resource agency in the Santa Monica Mountains, as well as portions of the Simi Hills, including the subject property and the Bell Canyon and Chatsworth Reservoir areas, the RCDSMM is actively involved in monitoring resources and local restoration efforts in the area. We prepared the 2011 *Upper Bell Creek Subwatershed Plan* for the Bell Creek Headwaters Council of Bell Canyon, the majority of which subwatershed is SSFL land. Since completion of that plan, RCD staff have continued study of the SSFL property, watersheds, and adjacent lands, including submission of a Conceptual Area Protection Plan (CAPP) of the critical Habitat linkage lands immediately adjacent to SSFL in the Simi Hills for the California Department of Fish and Wildlife, and with three semesters of upper level undergraduate and graduate level architectural design studio courses at Woodbury University. We acknowledge and

Response side of this page intentionally left blank.

**Commenter No. 129 (cont'd): Clark Stevens, Executive Director,
Resource Conservation District of the Santa Monica Mountains**

appreciate the cooperative involvement of the various land stewards and stewardship groups, including DOE, who have given their time in support of those various study efforts. Our work has also included assistance in the preparation of documentation for the sites application to the National Register of Historic Places as a Cultural Landscape, and in the planning and design of post-remediation interpretive and educational approaches at SSFL.

Please note that RCDSMM places human health as the highest priority consideration, and recognizes that reduction of contaminants to safe levels must be achieved according to measurable standards.

Bioregional Context

The relatively undivided and sparsely developed Simi Hills and Santa Susana Mountains (SHSSM) are of great importance to the people and land managers of the region, as they represent the core areas of a primary habitat linkage that provides the Santa Monica Mountains (SMM) with the source of its sustainable biodiversity. However, the connectivity between core habitat areas in the SMM, Simi Hills (SH), Santa Susana Mountains (SSM) and the Los Padres National Forest (LPNF) has been severely degraded by intrusive "fingers" of development, fenced off freeways and railroads, etc. Mitigation for these environmental impacts that occurred prior to the California Environmental Quality Act has been the primary driver for 20 years of wildlife corridor studies, the most recent being the South Coast Missing Linkages Project (<http://www.scwildlands.org/projects/scml.aspx>). It is important to note that a habitat linkage is more than a "wildlife migration corridor", but is rather a contiguous area connecting significant habitat patches (sources or sinks) within which species can feed, breed and adapt over time to changes in the ecosystem, and through which genetic diversity can flow over generations to maintain species health and viability. As such, the definition of "corridors" is only part of the consideration of ecological importance of the Subject Property and SSFL. The SSFL is the heart of the habitat linkage that is most critical to maintaining the ecological health of the entire Santa Monica Mountains ecosystem, as well as the Simi Hills ecosystem it currently anchors.

The areas that are the subject of this DEIS include the very top of three watersheds- that of the Los Angeles River, Malibu Creek, and Arroyo Simi. As such, the impacts of the soil removal proposed by the DEIS alternatives must be understood in this context. To excavate up to 130 acres of these combined watersheds, removing all of the soil and replacing with backfill amounting to less than 2/3s of what was removed- as currently proposed in the AOC Look-Up Table Alternative must necessarily result in alteration of the surface hydrology. Downstream impacts to the miles of Oak Riparian woodlands downstream have not been adequately studied, but replacement of a positively draining surface with a non-draining concavity will certainly be problematic for the local hydrological cycle, those impacts increasing with the amount of excavation and removal

www.rcdsmm.org

129-1

- 129-1 The alternatives and mitigation and minimization measures under consideration in this Final EIS have been configured to control the rate of runoff from the site to more closely match existing runoff rates and limit the potential for increases in erosion from the site or downstream. See Final EIS Chapter 6 for a presentation of mitigation and minimization measures that would promote drainage and erosion control. For example, Minimization Measure 3-1 (Surface Water – Permits and Plans) states that the proposed Erosion Control Plan (ECP) will include design features that replicate the natural site drainage patterns to the extent possible, with minimal constructed features to allow for long-term erosion control and successful revegetation. The proposed Revegetation and Habitat Restoration Plan (Minimization Measure 5-4) will have connectivity to and will supplement the ECP. As a result, the controlled drainage of the site during and following precipitation events is not expected to change habitat conditions downstream of the project area.

**Commenter No. 129 (cont'd): Clark Stevens, Executive Director,
Resource Conservation District of the Santa Monica Mountains**

proposed.

Integrated Cultural and Natural Resources

In our letter of comment at the Feasibility stage of the Rim of the Valley Special Resources study, the RCDSMM noted "some important resources that are not yet designated National Historic Landmarks" and commented that:

"As rare as this convergence of aspirations from widely separated eras and cultures, is the opportunity to interpret Native American cultural resources within the largely intact ecological systems that supported their activity and sourced their cosmology. It is a contemporary mistake to compartmentalize the physical characteristics of an historic cultural site from its spiritual and cultural significance. The oak woodlands, the horizontal and sectional geometry of the exposed rock formations and the converging valleys all contributed to the inevitability of this site as the Chumash place of solstice observation, of the human effort to support the cause of Coyote in his yearly contest with Raven to bring the sun back from its journey south and diminishing day-life. The "artifacts" of the human hand ought not be separated from the "artifact" of the ecosystem and spaces that directed the hands and supported the ceremony. To remove the soil and the ecosystems is to remove the Sacred Landscape identified here by the federally recognized Santa Ynez Band of Chumash Indians in support of all the historic tribes with standing in this Traditional Landscape."

Comments Specific to the DEIS

Our numbered comments below are the result of an analysis of the very thorough DEIS, and developed within our core competencies as a resource monitoring and habitat restoration organization:

1. Summary

1.1 - Restoration ecology, and the current state of restoration science and technology is such that there are very real and permanent choices being made when native habitats and their soils are removed, particularly those specialized upland soils as those found within Oak Woodlands or Native Grasslands. Despite what agreements might otherwise stipulate, **Land remediated predominantly by soil removal to the level of "non-detect" (likely to bedrock level) cannot be returned to a native state.** Indeed, many ecotypes, once removed along with their historic and evolved soils are not restorable; we have, for example, no examples of successful Oak Woodland restoration. (Los Angeles County Oak Woodland Conservation Management Plan 2011).

1.2 - We appreciate that the DOE has investigated alternatives that consider risk-based approaches to contaminant (and therefore habitat and soil) removal, and acknowledge many of the likely impacts that we will reiterate in our comments herein. However, **the document does not evaluate a risk-based alternative based entirely on an Open Space future land use,** which would be the least impactful of natural resources, by legal definition safe for that intended use under current state law, and so therefore a "reasonable alternative" under the definition provided in the DEIS. **The Boeing Company has stated that they intend to leave the**

www.rcdsmm.org

|| 129-1
cont'd

|| 129-2

|| 129-3

129-2 DOE agrees with how difficult and uncertain it is to restore habitats after several feet of soil have been removed and makes the point about how important the exemption area concept is by proposing focused soil removals of only areas posing a tangible risk to human health and ecological resources. Furthermore, the Final EIS presents measures that would avoid, minimize, rectify, reduce, eliminate, or compensate for potential adverse impacts on the environment. Minimization measures are inclusive of methods, procedures and protocols, design features, and best management practices aimed at reducing the environmental impact of project activities. Final EIS Chapter 6, Section 6.1, includes a range of minimization measures, including those that reduce footprint and protect the environment. In particular, Minimization Measure 5-3 (Biological Resources –Trees) states that DOE would develop a Tree Management and Preservation Plan that would provide information necessary to avoid or minimize impacts to oak woodlands.

129-3 In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. This Final EIS was revised to evaluate the open space land use scenario.

**Commenter No. 129 (cont'd): Clark Stevens, Executive Director,
Resource Conservation District of the Santa Monica Mountains**

property as protected open space. Should that commitment come to pass and be accommodated by public ownership or similar permanent protections, **we urge the DOE to be prepared for such an outcome by developing an alternative that evaluates this Open Space level of risk-based remediation.**

129-3
cont'd

2. Regional Ecological Context

2.1 - The open space of the Simi Hills contains our best remaining habitat linkage between the Santa Monica Mountains, the Santa Susana Mountains, and core wild lands of the Los Padres National Forest/Sierra Madre Mountains.

2.2 - Without that linkage, the genetic viability of a wide range of diverse species is greatly diminished; in the case of the Santa Monica Mountains population of Pumas, **without at least one new breeding individual using this linkage into the Santa Monica Mountains every two years, the local population has a nearly 100% chance of extinction in the next 50 years.** (2016, Riley, et al, Findings of the Royal Society B)

2.3 - the SSFL lands of which DOE is a part are the largest block of habitat remaining between the proposed 101 crossing and the existing 118 crossing, and **cover approximately 75% of the width of the Wildlife Habitat Linkage** as mapped by the *Missing Linkages* project, and **more than 25% of the remaining private land without residential development in that Habitat Linkage** between the proposed 101 Wildlife Crossing Improvements Project (overpass and underpass) and the existing 118 freeway wildlife tunnel. (see illustration above). As such, its continued functionality is of critical importance particularly in the next few decades, if we are to maintain our current level of regional biodiversity and avoid local extinctions.

Response side of this page intentionally left blank.

**Commenter No. 129 (cont'd): Clark Stevens, Executive Director,
Resource Conservation District of the Santa Monica Mountains**

2.4 - The area currently known as the SSFL, also becoming known as Sky Valley (Chumash: stawayok 'I'alaipay), is a storied, beautiful, culturally unparalleled and ecologically critical landscape.

3. Risk-Based Alternatives- Open Space Land Use Alternative needed

3.1 - Though not provided within the DEIS, other analyses have shown that the majority of the habitat, soil and subsoil materials that would require removal in the risk-based standards of current state law for Open Space use would occur largely in areas of developed, paved, compacted, and or heavily graded lands. Much of that land that is not otherwise covered by former and current buildings, paving or compacted non-vegetated areas, is now covered by non-native and ruderal (mixed native/non-native) habitats on disturbed soils. In addition, **the total volume of soil removal under the Open Space risk-based approach of the current law would be exponentially reduced**, therefore much reducing the total time of active remediation and fragmentation of Habitat and disruption of Wildlife Linkage functionality.

3.2 - The habitat to be removed under "Suburban Residential" or "AOC Look-Up Tables" (background) standards expands greatly into critical ecotypes, the loss of which is proposed for a critical time span for determining the ultimate genetic viability of local species.

3.3 - **The dominant remediation technique proposed in the DEIS is soil removal.** Given that many of the contaminants (including naturally occurring varieties) move relatively quickly through soils, much of this soil and subsoil removal will be taken completely to the sandstone bedrock below

3.4 - **Habitat restoration requires soil.** Even with soil, restoration is not always possible. There are no existing examples of successful Coast Live Oak woodland restorations, for example. Backfill of poor suitability can lead to long term weed management requirements, putting adjacent high quality habitat at risk for degradation

3.5 - **Backfill is not soil.** The DEIS accurately notes the problems associated with imported backfill, and that material must be located that meets the standards of the alternatives. The source of such compliant backfill for any alternative is not identified in the DEIS. What additional, off-site ecological damage would be caused in the collection of this material?

3.6 - A "background" level as defined under current administrative agreements would by definition come from areas that are free of human-deposited contaminants; that is, from undeveloped open space such as one might find in a protected natural area like a local, state or federal park space, or otherwise undeveloped private land covered in native habitat. Therefore, **the environmental impact of both removal and replacement would in fact be two-fold, first involving the destruction of a native habitat and soil bank at this site, then the destruction of the soil bank and habitat at the "donor" site.**

3.7 - We understand that should no replacement backfill meeting the AOC standards be available, that replacement material with less stringent standards may be allowed as

www.rcdsmm.org

129-4

129-4 DOE recognizes that much of the soil that would require removal under a risk-based approach for an open space land use would occur in the more developed areas of Area IV. The impacts on native habitat and plants and animals from soil removal in these developed areas would be less than similar soil removals in undeveloped areas and may even result in a net beneficial impact after restoration.

129-5

DOE acknowledges that an acceptable source of backfill that meets the LUT values has not been identified and notes the importance of a backfill soil that would support native plant communities. As described in Chapter 2, Section 2.4, of the Final EIS, backfill soils that meet the higher concentration limits under the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resource Alternative should be easier to locate, although it still could be a challenge to identify backfill with similar physical, chemical, and microbial characteristics that could support re-establishment of native vegetation. DOE agrees that there should not be any removal of soil in Area IV without an adequate source of backfill identified. DOE plans to identify a source of backfill in the Soil Remedial Action Implementation Plan that must be approved by the DTSC prior to initiation of soil remediation activities. Refer to Section 2.3, "Suitable Backfill Soil," of this CRD for discussion of the responsibilities and actions necessary to identify a backfill source. Because no source for backfill has been identified at this time, the need to evaluate impacts at source locations has not been determined. Once DOE and DTSC identify a location (or multiple locations) that would be an acceptable source of backfill material, DOE would evaluate whether additional NEPA analysis is required.

129-5

**Commenter No. 129 (cont'd): Clark Stevens, Executive Director,
Resource Conservation District of the Santa Monica Mountains**

replacement soil. In that case, **we recommend that the existing habitat meeting those decreased standards not be removed in the first place, and lost functionally at least for years, if not decades, if not permanently.**

3.8 - In such cases where replacement material can not be located, and where critical habitats such as Oak Woodlands, Native Grassland, Freshwater Marsh, and Venturan Sage Scrub, we recommend remediation by in-situ and longer horizon treatment techniques.

4. Critical Ecological and Cultural Resources- Proposed Exemption Areas

4.1 – While we acknowledge and appreciate the identification of proposed exemption areas, many of the areas proposed for habitat, soil, and sub-soil removal at the DOE sites and throughout SSFL are of the most critical variety- including wetlands, riparian forests, and oak woodlands.

4.2 - The modern (rocket-age) and pre-modern (middle period Chumash) cultural resources of SSFL include numerous sites eligible for the National Historic Register, and one complex already on the NHR, the Burro Flats Painted Cave. Due to the security provided at the site since the 1950's, the Chumash cultural and ethno-astronomical sites exist largely the same ecological context in which they were created. Much of that context located on the DOE land that would be destroyed to a greater or lesser extent depending on the remediation approach selected. By comparison **most Southern California Native American cultural sites exist in completely urbanized or otherwise altered contexts, making SSFL an unparalleled cultural and educational resource in the greater Los Angeles metropolitan region.**

4.3 - Dr. Edwin Krupp, Director of the Griffith Park Observatory, and who theorized and then identified the summer solstice shadow events near the NRHP-listed Burro Flats Painted Cave site wrote that the site "comprises the only place on earth where our modern world heritage in space converges with the prehistoric reach for the sky.... For that reason, **the place is irreplaceably significant in the history of space exploration, ... in the history of California, in American history, and in the history of the world.**"

4.4 - While being considered in pieces at this stage of the environmental process, **the DOE, NASA, and Boeing administered areas of SSFL collectively are a cultural and ecological singularity**, and will be ultimately evaluated as such in the final analyses.

4.5 - **Therefore we appreciate that the DOE has identified some of these critical resources, and proposed Biological and Cultural Exemption Areas.** While it needs to be clarified if these areas would be permanently exempted from soil removal activities and associated permanent ecological impacts, this is a promising acknowledgment of these irreplaceable resources. **We have identified however critical Coast Live Oak Woodlands, a freshwater marsh complex, and rare native grassland that should also be added to the exempted/protected areas.** These are in the eastern portion of the site, and while the total area proposed for habitat and soil removal shown in the "Conservation of Natural Resources Alternative" is minimal in these areas, they should nonetheless be protected by similar exemptions. They are located upstream of, and adjacent to other critical cultural and ecological resources off-site in Areas III that would be negatively impacted by soil removal in these areas.

129-5
cont'd

129-6

129-6
cont'd

129-6 The exemption areas identify locations where added precautions to soil clean up may be applied to protect biological and cultural resources. However, the exemption areas are not exempt from cleanup actions. As indicated in Chapter 2, Section 2.3.2 of this EIS, if levels of constituents in these areas pose a risk to human health and the environment, as determined using risk-based screening levels (RBSLs), DOE would remove them through carefully planned, focused removals that would result in minimum disturbance. Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent" of this CRD for a discussion of this topic.

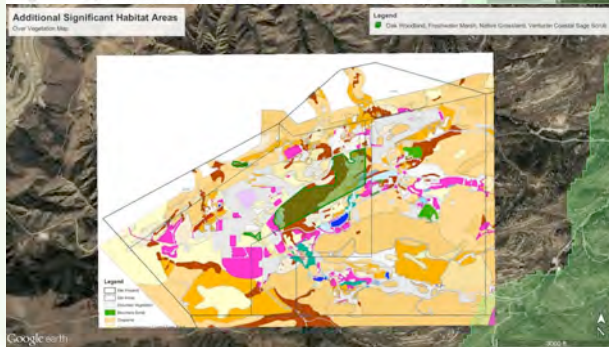

DOE recognizes that wetlands, riparian forests, and oak woodlands have critical value to biological resources. Coast Live Oak Woodlands and freshwater marsh habitats have been included in the exemption process approved by USFWS and CDFW. The coast live oak woodlands, freshwater marsh complex, and rare native grassland habitats identified in the comment as existing in the eastern portion of Area IV have been included in the Final EIS exemption areas.

Exemptions for biological and cultural resources are provided for in the 2010 AOC; the AOC also requires that "actions taken pursuant to this Order by DOE shall be undertaken in accordance with applicable local, State, and Federal laws and regulations." At the time the Draft EIS was issued, DOE had been involved in ongoing meetings with the USFWS, DFW, and others for several years (see Appendix E, Table E-4 of this Final EIS) and had conducted multiple biological resource field surveys. Based on the AOC and consistent with applicable local, State, and Federal laws and regulations, DOE has identified areas in Area IV and the NBZ that contain federally listed or State-listed species, other sensitive species, and critical or sensitive habitats that warrant protection. Interactions with USFWS and CDFW have continued since the publication of the Draft EIS and the areas in which the exemption process would be applied has been revised, consistent with the information included in a Biological Assessment required as part of the Endangered Species Act Section 7 consultation. The USFWS has now issued a Biological Opinion (see Appendix J) for remediation of SSFL. This Final EIS reflects the results the ongoing interactions with the USFWS and CDFW, as well as the Biological Opinion, in identifying those areas in which the exemption process would be applied.

Resource Conservation District of the Santa Monica Mountains**

4.6 - "background" level contaminant removal standards, or any increased risk-based remediation alternatives beyond that required for the "open space" use will add years of active excavation by heavy machinery to the remediation process, creating an ongoing impediment to wildlife use that is of critical importance to the functioning of our best remaining habitat linkage, at the very time that we are seeking to rescue at least one SMMts species from local genetic extinction by adding connectivity from the the SMMts through this very site to, and from, our genetic source material wilderness areas to the North.

4.7 - Land that is stripped of the cultural and natural resources will not support wildlife use, nor will it educate and inspire visitors. For this reason the National Park Service in its comment on the NASA DEIS noted that **land left in such conditions may not meet the standard of culturally and ecologically significant American lands that are required for administration by the National Park Service.** Other Open Space/Natural Resource management entities have similar missions, leaving the ultimate caretaking of the site in question.

4.8 - **Soil removal beyond that required by the risk-based values for Open Space** uses, to that of residential or beyond, **increases exponentially the footprint of habitat loss and fragmentation**- and indeed, the risk that such residential development will in fact occur, since in those scenarios, residential standards will have been met, and ecological impediments to development will have been removed.

5. Recommendations and Conclusion:

5.1 - Therefore, since "background" level approaches lead to conditions that are in fact

129-7 DOE evaluated alternatives to the proposed cleanup to 2010 AOC LUT values that would involve less excavation and soil removal and therefore fewer potential impacts on biological and cultural resources. These alternatives (the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative) recognized Boeing's stated future use of its property as open space. In the Draft EIS, the cleanup levels for these two alternatives were based on risk to a suburban resident without a garden, which would also be protective of a recreational user. In this Final EIS, consistent with Boeing formalizing the commitment of this land to open space with the Grant Deeds of Conservation Easement and Agreement that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. (In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements [conservation easements] with Ventura County [Ventura County 2017a, 2017b]. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site). DOE added a scenario under the Conservation of Natural Resources Alternative that establishes cleanup levels based on risks to a recreational user and ecological (flora and fauna) receptors (while retaining the scenario addressing a residential user without the garden pathway).

129-7

129-7
cont'd

129-8

129-8 DOE acknowledges your support for remediation in accordance with risk-based legal standards for open space and that the closest alternative to this recommended approach is the Conservation of Natural Resources Alternative. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

**Committer No. 129 (cont'd): Clark Stevens, Executive Director,
Resource Conservation District of the Santa Monica Mountains**

technically un-restorable despite "agreements" to do so, we recommend that the least intrusive approach to remediation that complies with existing risk-based legal standards for Open Space be utilized. At this point, the "Conservation of Natural Resources" alternative is closest to that recommended approach, but **we urge the DOE and the rest of the SSFL land stewards to develop a new Alternative that addresses the stated intention of the landowner, the best outcome for ecological sustainability in the long term, and the generally acknowledged public interest in seeing this property preserved as Open Space.** The AOC standards and resulting remediation requirements were agreed to years ago without prior evaluation of the resulting extent of soil removal that would otherwise not be required under the law. The true spatial extent and ecological impacts are just now being publicly mapped and evaluated for the first time with this DEIS. Such agreements made without benefit of this information should be re-evaluated, as they represent decisions made on behalf of the public without knowledge of the actual implications to the public's resources. We cannot both require standards that result in widespread soil removal and expect a return to the native state of the habitat. We are in fact faced with making decisions that will result in more or less acreage of habitat lost, and at a more or less permanent level, based on the total amount of soil footprint lost.

5.2 - For more than 50 years The RCDSMM has been directed by a board of local volunteers and driven by a mission to assist both public and private landowners in voluntary natural resource conservation. Many of those decades of work have included habitat restoration. We have seen the science of restoration evolve, have contributed to the scientific literature on the subject, and understand the potential and limitations of restoration science. Rather than applying a blanket standard to the entire site, then averaging the results, **we urge the DOE and other stewards at SSFL to evaluate the remediation in a site-specific approach**, allowing for the greatest amount of contaminant removal in areas where the existing resources are already highly degraded, and decreasing to the least impactful risk-based standard for Open Space or "exemption" in those areas that are most critical for ongoing habitat function and connectivity, and those that are most difficult an slow to restore.

5.3 - Finally, we urge the current stewards and regulators of this unique and storied landscape to take the long view, and revisit remediation approaches that allow for time-frames longer than those currently proposed. The abundant and unprecedented artifacts of this landscape remain from the culture that left them here many hundreds of years ago, in much the same ecological context in which they were created. **In kind, we ask that the DOE consider approaches and time frames that look at least beyond this generation in order to retain the cultural resources, the old stories, the ecological resources, and companion species that have been left to our care.**

Respectfully submitted,

Clark Stevens, Architect

129-9

129-10

129-9 Comment noted. Regarding impacts to biological exemption areas please see the response to comment 129-6. The exemption process and controls that will be used to minimize impacts to biological resources are described in the USFW Biological Opinion (see Appendix J of this EIS).

129-10 Comment noted. As described in the responses to your comments and in Chapter 2 of this EIS, DOE is considering clean up approaches, including use of the biological resources and cultural resource exemption processes that would minimize unnecessary impacts to the distinct cultural and ecological resources in Area IV and the NBZ. As described in this Final EIS Chapter 6, "Measures to Minimize Impacts and Mitigation Measures," DOE presents measures that would avoid, minimize, rectify, reduce, eliminate, or compensate for potential adverse impacts on the environment, including ecological and cultural resources.

Please note that DOE does not own the property in Area IV or the NBZ and cannot determine the ultimate land use for the property. As discussed in Chapter 1, Section 1.5, of this Final EIS, the property owner, Boeing, intends to preserve the land as open space for the public's benefit. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site.

Ms. Stephie Jennings
NEPA Document Manager
SSFL Area IV EIS
US Department of Energy
4100 Guardian St., Suite 160
Simi Valley, CA 93063

RE: Measures To Mitigate Impacts To Braunton's Milk-Vetch And Santa Susana Tarplant Related To Soil Cleanup In SSFL Area IV And NBZ

Dear Ms. Jennings,

We have reviewed the Draft Environmental Impact Statement (DEIS) for remediation Area IV and the Northern Buffer Zone (NBZ) of the Santa Susana Field Laboratory (SSFL) prepared by the U.S. Department of Energy (DOE), and supporting documents related to impacts to Braunton's milk-vetch (*Astragalus brauntonii*) and Santa Susana tarplant (*Deinandra minthornii*) from cleanup of the soil to background levels in Area IV and the NBZ, including the placement of backfill soil and re-contouring. Both plants are California endemics and occur with California sage scrub and chaparral vegetation communities at SSFL.

The requirements for cleanup of the contaminated soil are set forth in the 2010 DOE and California Department of Toxic Substance Control (DTSC) Administrative Order on Consent (AOC). There is a narrow exemption in the AOC for biological exemption if the United States Fish and Wildlife Service (USFWS) issues a Biological Opinion that finds that the particular cleanup in a particular SSFL location would violate Section 7(a)(2) or Section 9 of the Endangered Species Act and no reasonable and prudent measures or reasonable and prudent alternatives exist that would allow for the use of the specified cleanup standard in that portion of the site, and the exception is unavoidable by other means. USFWS has not made this finding.

In our professional opinion, the unavoidable impacts for these species related to soil cleanup to background levels as agreed to in the 2010 AOC can be reasonably mitigated with a combination of specific conservation, restoration, and management measures. This opinion is based on the available reports for these two species, the existing examples of successful restoration activities of the species at other SSFL sites, and our own experience successfully restoring habitat of sensitive species in southern California.

130-1

130-2

130-1 As stated in Chapter 2, Section 2.3, of the Draft EIS, DOE described proposed exemption areas in the Draft EIS and recognizes the fact that the proposed exemption areas are subject to refinement as planning and coordination with appropriate agencies proceed. Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a discussion of this topic and DOE's response. At the time the Draft EIS was issued, DOE had been involved in ongoing meetings with the USFWS and CDFW for several years (see Appendix E, Table E-4 of this EIS) and the Biological Assessment required as part of Section 7 consultation had not yet been submitted. Hence, there was no Biological Opinion from the USFWS at the time the Draft EIS was released. The USFWS subsequently issued its Biological Opinion, a copy of which is included as Appendix J of this EIS. This Final EIS reflects the results of the Biological Opinion on the exemptions areas in Area IV and the NBZ.

130-2 The need to prepare restoration plans well in advance as emphasized in your comment is consistent with and supported by the analysis in the EIS. DOE's has incorporated Measures to Minimize Impacts and Mitigation Measures for biological resources. As presented in Final EIS Chapter 6, Section 6.1, Minimization Measure 5-4 (Biological Resources -Revegetation and Habitat Restoration Plan), would be developed prior to initiation of ground disturbance or correction activities. Furthermore, Minimization Measure 5-7 (Biological Resources – Special Status species, including vascular and non-vascular plants) would include techniques to avoid and to minimize impacts to Braunton's milk-vetch and other sensitive plant species, such as the and Santa Susana tarplant. As described in response to comment 130-1, the USFWS has issued its Biological Opinion, a copy of which is included as Appendix J of this EIS. This Final EIS reflects the results of the Biological Opinion.

Commenter No. 130 (cont'd): Travis Brooks, Restoration Ecologist,

LAND IQ

There are estimated to be about 850 Santa Susana tarplants in Area IV and NBZ total (SAIC 2009 as cited in DOE 2016), a small fraction of the estimated population of over 13,500 at SSFL, which is one of 30 locations known in the CNDDDB in Ventura and Los Angeles counties (DOE 2016). The preferred substrate for the persistent populations of tarplant in Area IV and NBZ are sandstone outcrops and thin sandy soils, some of which will not be included in the footprint of the AOC soil cleanup areas; hence, impacts to many of the plants may be avoided altogether. The tarplant occurring in the developed area is often located in areas such as cracked pavement that mimics crevices in the naturally occurring sandstone outcrops. The seed source for the plants in the developed area is likely the sandstone outcrop population.

Braunton's milk-vetch is known from 16 remaining populations in the southwestern Transverse Ranges (eastern Santa Monica Mountains, east end Simi Hills, south base San Gabriel Mountains) and northern Peninsular Ranges (northwest side Santa Ana Mountains) within Los Angeles, Orange, and Ventura Counties (USFWS 2009). The milk-vetch is often found growing in disturbed areas, especially in carbonate soils areas, and is an early successional disturbance follower. Less than 1.8 percent of Braunton's milk-vetch critical habitat throughout its range potentially occurs within cleanup areas in Area IV and NBZ (USFWS 2010). Known populations of the milk-vetch are concentrated on the western portion of Area IV on two hills with calcareous soils derived from the Santa Susana formation, primarily in the Gaviota rocky sandy loam soil type (DEIS 2017).

Nothing in the record related to these two species indicates that there is reason to believe that restoration is not a viable method of mitigation. It is imperative, however, to prepare comprehensive restoration plans in advance of the actual start of soil cleanup at SSFL so that all aspects of the plans will be afforded the time necessary to achieve success. Depending on the actual soil cleanup plan and timeline, a phased approach for restoration for each species at the site would be preferable. Such an approach would provide data from the first implementation to refine methods in the later phases.

The following outline presents reasonable and specific, but not necessarily exhaustive, techniques and approaches for mitigating the unavoidable impacts to these populations by seed collection and conservation, plant propagation, and re-introduction of both seeds and plants to the site post cleanup. Key to the mitigation of the sensitive plant species is the overall revegetation of the site with appropriate native vegetation.

Seed Collection and Conservation

Before soil cleanup activity, viable seed should be collected from both sensitive plant species that occur in Area IV and NBZ, as well as adjacent populations that occur within SSFL and adjoining contiguous properties. Seed collection need not be limited to the footprint of the soil cleanup impact areas. Seed should be collected over multiple years, with at least one year in average to above average rainfall year conditions in order to maximize both the size of the seed collection and the genetic diversity of the collection across years. Seed outside of the project area could be collected within the limits of applicable natural resource agency collection permits (e.g.

**130-2
cont'd**

Response side of this page intentionally left blank.

Commenter No. 130 (cont'd): Travis Brooks, Restoration Ecologist,**LAND IQ**

collecting only a small percentage of available seed from each population). Specific methods to increase collections can be implemented. For example, since Branton's milk-vetch is a disturbance follower, if there are not enough plants to collect from, then it may be necessary to crush or mow vegetation in suitable soils for the species (e.g. carbonate limestone soils) where there is likely a soil seed bank to open up the canopy and provide mechanical scarification to promote germination from the hard seed coat. This practice can be limited to scheduled cleanup areas where the soil will be removed to limit unnecessary disturbance to areas that would remain. Seed collected from the milk-vetch should occur at least in the second growing year following germination, to maximize the potential of seed collection.

A portion of the seed from both species should be deposited in a conservation collection at an authorized seed repository, such as Rancho Santa Ana Botanic Garden (RSABG), which has experience with both species, and the remainder should be cleaned, tested for viability (germination and purity), and properly stored for future nursery propagation when the cleanup areas are ready for re-introduction. The amount of pure live seed deposited in the conservation collection should be determined in consultation with the seed repository and responsible natural resource agencies. An established off-site nursery experienced with the germination and propagation of sensitive species should be selected for growing container plants and seed bulking one generation from the wild collected seed.

Propagation and Re-Introduction

Both plant species have been successfully propagated in a nursery setting. Therefore, it may be prudent to grow plants for the purpose of planting back on the site.

Branton's milk-vetch has been propagated by seed coat scarification techniques and germinated on calcareous soils in a nursery with 80 percent or more survivorship by Fotheringham and Keeley (1998) under various watering regimes in full sun, including 60 percent survivorship under a high watering regime on clay soil derived from volcanic parent material. Therefore, it seems likely that restoration using a temporary irrigation system may aid seed germination on soils other than just calcareous soils. And, RSABG has collected and germinated milk-vetch with a 100 percent success rate. Plants can produce hundreds of seeds when mature, beginning in the second year, and once successfully transplanted will multiply the contribution to the soil seedbank of the restored area of the long lived seed, estimated to have seed banks existing between 15 to 95 years (USFWS 2009).

Branton's milk-vetch has been observed in Area IV in Gaviota rocky sandy loam soils (DEIS 2017), which are weathered from sedimentary parent material and classified in the Entisol Soil Order. Entisols develop in unconsolidated parent material and because they are relatively "young soils," or rather when weathering processes are slow (e.g. in arid or semi-arid environments), there are usually no soil horizons except for an A horizon. Backfilled soil in the cleanup areas will mimic these conditions of young soils with poorly developed soil horizons and low organic material. The most likely source of backfill soil, the Gillibrand site, primarily consists of loamy soils that have weathered from sedimentary parent material (NRCS 2017). While the milk-vetch

Response side of this page intentionally left blank.

Commenter No. 130 (cont'd): Travis Brooks, Restoration Ecologist,

LAND IQ

can establish on very shallow soils (<21 cm deep), they are more common on deeper soils (Fotheringham and Keeley 1998), and as such, the re-contoured Gillibrand backfill material is not expected to be limiting to the milk-vetch. In fact, high levels of bare ground and open canopy, combined with a lower nutrient environment, will favor the life history characteristics of this nitrogen-fixing pioneer legume species. Although milk-vetch may be most readily established from seed, nursery grown material also can be transplanted into suitable areas, either in disturbed areas with or without backfill soils, using a temporary irrigation system. Thus, both strategies can be employed to establish this species.

Other potential restoration methods include identification of soil arbuscular mycorrhizal (AM) fungi by off-site soil research prior to transplantation to determine if specific AM fungi are associated with either the milk-vetch or the tarplant. Over 80 percent of terrestrial plant species form associations with AM fungi. We routinely use annual tarplants within the genus *Deinandra* to increase AM fungi at revegetation sites because this genus of plants is easily colonized. It is likely that Santa Susana tarplant also would form the beneficial symbiosis with AM fungi. AM fungi could be propagated for inclusion in soil amendments for seeding the site and/or for the nursery production of container plants.

Santa Susana tarplant has already been readily collected and nursery grown for re-introduction on SSFL (DOE 2016) and in other mitigation projects (e.g. see Fiedler 1991). The tarplant can be bulked one generation in the nursery to increase the amount of seed available for seeding back into the site. Tarplant can be seeded in adjacent un-disturbed sandstone outcrops without readily available source populations to seed them, disturbed shallow (approximately <21 cm) sandstone derived soils, and in select backfill soils that are determined to potential tarplant habitat.

Potential Management Actions for Rare Plants

Over time, the native vegetation in the revegetation areas will develop closed canopies between perennial shrub species in suitable sites in the cleanup area. There may remain microsites that preclude the development of a closed canopy, but most of the area is expected to increase in shrub canopy cover. Increasing canopy cover will result in reduced germination of Braunton's milk-vetch. If it is determined by agency consultation that the milk-vetch population requires larger growing populations to increase additions to the long-lived soil seed bank, then an adaptive management plan could be developed to artificially disturb the sites to increase canopy cover and hence bare ground to stimulate germination of known seed bank populations within the revegetated area. Alternatively, if access is provided to the SSFL after remediation is complete, then milk-vetch populations could be planned to occur along trails or access roads, which will be subject to trail maintenance, maintaining a more open canopy that is conducive to milk-vetch plant growth.

Two types of populations are expected, microsites with certain conditions that favor the fairly regular germination and growth of plants; and those areas where the population exists as part of the seed bank, which will be expressed following a future disturbance, such as fire or grazing.

Response side of this page intentionally left blank.

Commenter No. 130 (cont'd): Travis Brooks, Restoration Ecologist,
LAND IQ

General Revegetation of the Soil Cleanup Areas

General revegetation of the cleanup areas with appropriate native plant species will improve the overall quality of the restored and adjacent sensitive plant species habitat. Revegetation of the cleanup area with native plants would also increase the frequency of visitation by pollinators from the immediately adjacent habitat where both sensitive plant species produce viable seed. Regardless, Area IV and NBZ are not isolated from adjacent habitat that is frequented by pollinators, including on SSFL, and will not prohibit pollinators from finding the restored sensitive plant species.

A comprehensive restoration plan will include methods to select soil for backfilling at the site. Following soil cleanup, bare areas and the re-contoured backfill should be restored with appropriate native habitats based on the constructed soil conditions, aspect and landscape position in order to stabilize the soils. Habitat restoration of the cleanup areas in Area IV and NBZ would buffer the existing and restored sensitive plant populations at the site. In our experience, a defined, well-managed restoration plan and implementation can successfully reestablish native habitat over time that supports not only sensitive plants and plant communities but also wildlife.

Properly managed restoration will prevent the establishment of invasive weed species on the bare backfill soil and provide ecological integrity to the site. In order to prevent competition in the virgin backfill material from invasive species that already exist on site, such as fountain grass (*Pennisetum setaceum*), should be eradicated from Area IV and NBZ, as well as any adjoining potential source populations, prior the general native habitat restoration and the re-introduction of the sensitive species.

Note, backfill soil should be selected that is weed free, and could potentially include soil salvage from native areas scheduled for development. If the backfill soil contains weed seed material, then before installing native seed material, a weed management program must be performed successfully to ensure that the near-surface weed seed is effectively managed prior to seeding. With natural rainfall, multiple years of grow-and-kill may be required to deplete the near surface soil weed seed bank in the backfill. Horticultural visual observations of weed germination rates in the growing season prior to control, in any year with an average to above average rainfall winter season, should be used to determine the status of weed management at the site prior to seeding. Failure to adequately control the weed seed bank prior to seeding may result in unnecessary and significant costs for weed maintenance post-seeding.

Plant lists for revegetation should consist of early successional and seral shrub species typical of the surrounding chaparral and California sage vegetation communities. In our experience, revegetation would be best achieved by seeding the site where possible, as it is more cost effective and establishes higher quality and diverse plant communities than container planting-focused methods. Relying on seeding, rather than using container planting, will ensure the native plant species will develop in their preferred microclimate within the revegetation and restoration areas.

Response side of this page intentionally left blank.

Commenter No. 130 (cont'd): Travis Brooks, Restoration Ecologist,

LAND IQ

The diverse seed mix should be designed to mimic the native habitat's response to a natural or historic disturbance regime (e.g. fire or grazing pressure from a large mammal) developing over time from fast germinating and growing annuals to shrubs. Relying upon natural rainfall for establishment, a subshrub dominated community, typical of a local mature California sage scrub vegetation community is expected to establish in approximately five to seven years. The exact timing of the development of the subshrub canopy will depend on each year's growing conditions, which are predominately determined by rainfall events, temperature and humidity in the winter and spring.

Not only will the use of a diverse seed mix promote the development of appropriate native habitat in the revegetated areas, but will provided sufficient native flowering annual and perennial plants to attract pollinators to areas that are selected for seeding and/or transplantation of the two sensitive plant species, Braunton's milk-vetch and Santa Susana tarplant. A recent Boeing-funded study to test revegetation methods at SSFL found more pollinators using areas seeded with a more diverse native seed mix (Galea and Wojcik 2017).

The seed mix should be sufficiently diverse and installed at sufficient pure live seed rates to ensure successful establishment. The timing and technique of seeding is important for success and to avoid the need for re-seeding areas. All seeding must be accomplished in the early fall before onset of winter rains. Therefore, to have enough seed for the project, seed collection for general revegetation must be implemented for several years within the local bioregion in similar habitats, but not restricted unnecessarily to the populations within Area IV and the NBZ. Widening the collection area will increase the potential for increasing the genetic diversity and fitness of the seed mix, as well as allowing for the collection of a sufficiently diverse species mix of early successional species that may not all be immediately available within the project area, since the site was last disturbed in the 2005 Topanga wildfire.

A number of seeding methods are available for the varied conditions over the site. Each seeding method has been successfully used to establish and restore native habitat. In the backfill areas, imprint seeding may be most appropriate, depending on the final topography. In the adjacent disturbed areas without significant soil disturbance and no backfill soil placement, drill seeding or hydroseeding methods may work best, depending on the depth of the soil. The point is that there are many alternative methods that can be employed to seed restoration sites such as the SSFL.

Natural rainfall is sufficient to establish the seed mix over multiple growing season but may require up to ten years to achieve a target seral subshrub community composition and cover. The development of longer-lived perennial species typical of the surrounding chaparral vegetation communities will likely take at least five to 10 years based on the results of other restoration projects in southern California. It will be necessary to manage the site for weeds following seeding of the general revegetation areas, with maintenance weeding expected in the first three years. An adaptive monitoring and management program should be used to determine if weeding

Response side of this page intentionally left blank.

Commenter No. 130 (cont'd): Travis Brooks, Restoration Ecologist,

LAND IQ

events are necessary to prevent the establishment of invasive weeds or significant cover of non-native plants within any portion of the site.

It should be noted that no herbicide should be used in the first growing season following seeding and only targeted applications of herbicide should be used in following years; hand weeding and weeding methods that do not disturb the soil surface or native seedlings are required when seeding with native species (e.g. no weed eaters or mowers).

Discrete nodes of select transplanted material, as discussed previously for sensitive species, have been used in successful restoration projects, but these container plants generally require irrigation using a temporary above-ground irrigation system. After the transplanted material has successfully established in a irrigated node (e.g. following one year from the end of winter rains to the beginning of the following winter rain season, or as needed), the irrigation should be turned off in subsequent years to allow the native vegetation to develop with natural rainfall

In summary, with comprehensive restoration plans in place in advance of soil cleanup of Area IV and NBZ, we have a high level of confidence that the unavoidable impacts to Braunton's milk-vetch and Santa Susana tarplant from cleanup to AOC standards can be mitigated to a less than significant level.

Land IQ has been retained by the Committee to Bridge the Gap to review the mitigation potential of Braunton's milk-vetch and Santa Susana tarplant in the Area IV and NBZ cleanup areas.

Respectfully,

Travis Brooks

Firm Description

Land IQ has a multi-disciplinary team of ecologists and biologists, environmental planners, soil scientists, agronomists, remote sensing and GIS specialists with offices in Sacramento and Los Angeles. Our Los Angeles Office (formerly known as Earthworks Restoration, Inc. and NewFields AER, LLC) is expert in native plant ecology, habitat assessment and restoration, management of conservation lands for habitat value, biological resource monitoring and environmental and mitigation planning. We have a depth of experience in revegetation and reclamation of drastically disturbed landscapes, detailed habitat evaluation, soil mapping, and exotic species assessment and management. We have managed, prepared resource management plans and restored habitat over more than 15,000 acres and on dozens of projects in Ventura, Los Angeles, Orange and San Diego Counties. Our expertise includes knowledge and planning for native plant seed collection, storage and use as an effective and cost saving method for habitat restoration.

Mr. Travis Brooks, Restoration Ecologist for Land IQ, has over sixteen years of experience in restoring habitat in southern California, including for sensitive species, and graduate studies in Ecology and Evolutionary Biology at the University of California, Los Angeles (PhD Candidate 2010). His recent and on-going projects include the following:

- Development of Best Management Practices for Grassland and Forbland Habitat Restoration, including for Quino Checkerspot Butterfly (*Euphydryas editha quino*, federally endangered) habitat and Otay Tarplant (*Deinandra conjugens*, federally threatened and state endangered) habitat, for the San Diego Association of Governments (SANDAG).
- Update of the Habitat Restoration Plan for the Central/Coastal Orange County NCCP/HCP Habitat Reserve (more than 37,000 acres) for the Natural Communities Coalition.
- Brooks, T. M. Griswold, B. V. Brown, J. P. Dines, K. L. Garrett, M. Ordeñana, G. B. Pauly, T. Longcore, and K. Sloniowski. Chapter 5: Habitat Enhancement Opportunities. Pp. 5-1 to 5-16 in *Water Supply and Habitat Resiliency for a Future Los Angeles River: Site-Specific Natural Enhancement Opportunities Informed by River Flow and Watershed-Wide Action: Los Feliz to Taylor Yard*. The Honorable Rick Perry
Secretary
U.S. Department of Energy
Forrestal Building, Room 7B138
1000 Independence Avenue SW
Washington, DC 20585-0001

Dear Secretary Perry:

I write to comment on the U.S. Department of Energy Draft Environmental Impact Statement (DEIS) for the clean-up of the Santa Susana Field Laboratory (SSFL).

As you know, the SSFL is located along the Los Angeles/Ventura County border. Initially far from population centers, SSFL was the site of rocket engine testing and nuclear experimentation. It is undisputed that toxic chemicals were used, spilled, and negligently dumped at SSFL. Additionally, in the early 1950s, an uncontained sodium reactor at the SSFL experienced a partial nuclear meltdown.

A full clean-up of the SSFL is of critical importance to me, as well as to my constituents. The 2007 Consent Order and 2010 Administrative Order on Consent (AOC) were entered into with the State of California to ensure a full clean-up is performed by the responsible parties and it is my expectation that DOE will not only live up to its responsibilities under the AOC, but that no alternatives or exemptions inconsistent with the AOC will be pursued by DOE.

It is imperative that we get this right so that we eliminate the significant health and safety risks for people who will continue to live nearby, and those who will be using the site in future years. Any clean-up less than to background levels will leave both radioactive and chemical contamination in place regardless of the end use of the property.

Please ensure that these comments be entered into the public record.

Sincerely,

JULIA BROWNLEY
Member of Congress

The Honorable Matt Rodriguez, Secretary, California Environmental Protection Agency

PRINTED ON RECYCLED PAPER

131-1

131-1 DOE acknowledges your concern about complete cleanup of SSFL consistent with the 2007 Consent Order and the 2010 AOC. It is DOE's mission to remediate sites to ensure that they are protective of human health and the environment. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

With respect to the alternatives evaluated in this Final EIS, NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. In addition, as discussed in Chapter 1, Section 1.3 of this EIS, the U.S. District Court for the Northern District of California issued an order that permanently enjoins DOE from transferring possession or otherwise relinquishing control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision pursuant to NEPA. Section 6.2 of the AOC recognizes that, absent relief from the court's order, an environmental review that meets the requirements of the Court order (i.e., a Final Environmental Impact Statement and Record of Decision) would be required, as well as any necessary modifications of the AOC. Also, in accordance with the 2010 AOC, Section 7.11, "Compliance with Applicable Laws and Regulations," all actions taken by DOE pursuant to the order will be undertaken in accordance with applicable local, State, and Federal laws and regulations. Accordingly, under this section as well, DOE must comply with NEPA.

This EIS analyzed an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In response to public input since the 2010 AOC was signed, this EIS also analyzed alternatives that determine cleanup levels by considering risk to human health, ecological risks, and the protection of natural resources. This use of a risk assessment approach for soil clean up, is consistent with that used by DOE throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment. Note that DTSC is preparing an environmental impact report under CEQA that also analyzes alternatives for the cleanup of Area IV and the NBZ, as well as those portions

**Commenter No. 131 (cont'd): Congresswoman Julia Brownley,
Member of Congress, House of Representatives**

of SSFL which are the responsibilities of NASA and Boeing. The *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* was issued by DTSC in September of 2017 (DTSC 2017b).

Much of the contamination that previously existed at SSFL Area IV and the NBZ has been removed. Over the operation history of the site, there have been 272 numbered structures in Area IV. As the missions for the buildings ended, they were decontaminated and removed. Today only 22 structures, 18 DOE-owned and 4 Boeing-owned, remain within Area IV. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. As described in Section 2.7, “Offsite Impacts” of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA’s soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC’s review of the data (included as part of DTSC’s broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act (Also see Chapter 3, Figure 3–19 of this EIS).

Commenter No. 132: Maria Caine

Ms. Stephe Jennings
NEPA Document Manager
SSFL Area IV EIS
US Dept. of Energy
4100 Guardian St., Suite 160
Simi Valley, CA 93063

Ms. Jennings,

I am outraged and extremely disappointed that DOE has released this draft Environmental Impact Statement (EIS). In 2010, DOE set an amazing precedent for environmental cleanup by signing the Administrative Order on Consent (AOC) and committing to a full cleanup of the Santa Susana Field Laboratory. Now, you are going back on all of that progress by failing to keep your promise on time and taking it even further by lying and proposing alternatives in your draft EIS that you do not have the authority to make. Your proposals in the DEIS are not only detrimental to human and environmental health, but they are illegal, as the binding contract you signed in 2010 states you must cleanup to the AOC Look Up Table (LUT) values. In 2012, DOE acknowledged this in its notice of "Public Participation in the Development of Alternatives to be considered in the Santa Susana Field Laboratory Area IV Environmental Impact Statement," when it promised only to consider ways on how to achieve this cleanup, not whether or not to do so. The draft EIS is flawed in that it 1) violates the AOC by proposing alternatives to AOC LUT values, 2) claims exemptions outlined in the AOC that do not actually apply to the site, 3) grossly overestimates the amount of soil that would need to be taken from the site in an attempt to scare locals into supporting their illegal alternatives, 4) falsely claims soil would be difficult to replace as there are no AOC compliant fills when in fact, there are, and 5) proposes an alternative to leave groundwater contamination at the site for over a century.

The AOC LUT values were set and agreed upon when the contract was signed in 2010. These values are the standards to which SSFL is to be cleaned up. In the draft EIS, DOE proposes new values for chemical cleanup in appendices D, G, and J. When comparing the draft EIS proposed values with the LUT values, 42 chemicals have new cleanup proposals that are

132-1

132-2

132-1 Evaluating alternatives for remediation of SSFL Area IV and the NBZ does not violate the 2010 AOC. NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. This EIS evaluates alternatives for completing remediation of those portions of SSFL for which DOE is responsible. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Sections 2.2, "Compliance with the 2010 Administrative Order on Consent"). The risk-based approach is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

Regarding exemptions under the 2010 AOC, see Chapter 2, Section 2.3, of this Final EIS, as well as Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD.

The volumes in the Draft EIS have a sound engineering basis. DOE used the GIS (geographic information system) database for Area IV to identify on a point-by-point basis, any sample location that had an exceedance of a LUT value (radionuclides published by DTSC on January 30, 2013 [DTSC 2013a] and chemicals on June 11, 2013 [DTSC 2013b]). The GIS system was then used to mark the locations of exceedances, map the extent of exceedance, develop areas and depth of exceedances, and then the calculation of the soil volume exceeding the LUT values. The volumes were independently reviewed by a separate team that validated the calculations. Since the Draft EIS was prepared, DOE has independently checked the estimate of the soil volume associated with cleaning up to the 2010 AOC LUT values.

Refer to Section 2.3, "Suitable Backfill Soil," of this CRD for information on how the soil volume was estimated and discussion of issues related to acquiring acceptable backfill soil.

Regarding remediation of groundwater and risks associated with monitored natural attenuation, refer to Chapter 2, Figure 2-11 of this Final EIS, which shows the extent of the groundwater plumes in Area IV and the NBZ. Also as stated in Chapter 3,

Commenter No. 132 (cont'd): Maria Caine

over 100 times greater than those in the LUT. Of those 42 chemicals, 30 are over 1,000 times greater. Of those 30, 20 are over 10,000 times greater. Of those 20, 16 are over 100,000 times greater. Of those 16, 7 are over 1,000,000 times greater. DOE justifies these unreasonably high values by claiming they are safe, suburban residential values taken from the Standardized Risk Assessment Methodology (SRAM). In truth, these values are for suburban residences without garden, and are far more lax than would be allowed if the DOE could use risk values from the SRAM. To make matters worse, the EIS states in chapter 2, page 2-31 that "If any one of the constituents were to exceed its respective revised LUT value, DOE would make a decision to remediate the area represented by the sample" (emphasis added). Again, the DOE cannot and should not be using any values, other than those from the AOC LUT. Furthermore, DOE attempts to justify its alternative LUT values by claiming other sites in California, such as the McClellan Air Force Base, are using similar standards. This however, is not entirely accurate. While it is true that the cleanup standards employed at McClellan and the DOE alternative values are both risk based, McClellan clearly acknowledges that it is being cleaned up to Industrial/Commercial standards. DOE claims its RBSL based alternatives are for suburban residential use, and yet the site it compares itself to would ban and residential use or any high risk uses such as daycares, hospitals, or schools for people under the age of 18 under its cleanup standards.

DOE also attempts to avoid cleanup by claiming biological and cultural exemptions only technically allowed by the AOC. It is true that the AOC gives DOE some room to work around federally recognized endangered species and historical artifacts, but as of the release of this DEIS no areas on the site qualify for these exemptions. There are no federally recognized artifacts on area four, and only two plants (the Braunton Milk Vetch and the Santa Susana Tarplant) are on the federal or state endangered species list. For land to actually qualify for an exemption, the US Fish and Wildlife Services (USFWS) must issue a formal Biological Opinion on what areas should be exempt from remediation. No such Biological Opinion exists. If such a report did exist it would only mean that mitigations measures must be taken, not that DOE could choose to take no action.

132-2
cont'd

132-3

Section 3.4.3, of this EIS, the monitoring well network established for Area IV and the NBZ demonstrates that the contaminants have not moved laterally off of DOE-administered areas of Area IV and the NBZ. Sections 3.4 and 4.4 of this Final EIS includes additional information on groundwater that indicates that these plumes do not pose an offsite risk if allowed to naturally attenuate.

132-2 In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. The use of RBSLS that do not include the indirect garden pathway is appropriate for this future land use.

In this Final EIS (see Chapter 2, Section 2.4), DOE has retained the Cleanup to Revised LUT Values Alternative, which uses chemical RBSLS based on an Onsite Suburban Residential scenario without a garden pathway. The Final EIS also retains the Conservation of Natural Resources Alternative, but evaluates two scenarios. The Open Space Scenario is based on the future land use of Area IV and the NBZ as open space, consistent with Boeing's conservation easement and agreement (i.e., cleanup levels are based on exposure of an onsite recreational user as the receptor). The Onsite Suburban Resident Scenario is the scenario evaluated in the Draft EIS, that is, cleanup levels are based on a suburban residential scenario without a garden pathway. This latter scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space.

In Chapter 4, Section 4.9 of this Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that local residents may get some portion of their food from a home garden.

132-3 Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a discussion of this topic and DOE's response. Exemptions for biological and cultural resources are provided for in the 2010 AOC. At the time the Draft EIS was issued, DOE had been involved in ongoing meetings with the USFWS and CDFW for several years (see Appendix E, Table E-4 of this EIS) and the Biological Assessment required as part of Section 7 consultation had not

Commenter No. 132 (cont'd): Maria Caine

In a shameful attempt to scare locals out of supporting cleanup, DOE focuses much of its time on presentations and posters that greatly inflate the number of truck trips that would be needed to cleanup the site. If you attend any DOE public meeting, they will tell you all about how the trucks full of soil contaminated with dangerous chemicals and radioactivity will pass right through your neighborhood. What DOE fails to mention is that they didn't consider any alternatives to this method. There are routes that don't pass through as many residential areas. There are covered conveyor systems that can move soil easily to a local train station to be shipped away. These alternatives are both practical, and simple, with companies willing to assist in the construction of such conveyors a short internet search away (I was able to find three by googling, covered conveyor). There is no reason for the local community around SSFL to have to live in fear of a full cleanup. The only thing they should be concerned about is the amount of contamination left behind and the health of their families should DOE get out of doing the full cleanup like they promised.

Lastly, DOE falsely claims the contaminated soil they take away would be difficult to replace as there are no acceptable fills when in fact, there are. They claim in chapter 2, page 2-22, that, after an initial evaluation of three off-SSFL sources of soil for backfill and two bags of soil from home improvement stores, none met the requirements of the 2010 AOC. However, in appendix D page D-45, DOE admits that *Gillibrand* soil exceeds LUT values for only three chemicals, and then follows this statement by saying "none of these results is at a level that would pose a risk to human health." Furthermore, these three chemicals were *estimated* to be at a higher level than the AOC LUT values, they were not actually found to be so (Table D-8). Most importantly, the AOC acknowledges that, if a suitable fill that meets all LUT values cannot be found, DTSC will address the backfill requirements. So it is not up to DOE, in any way, to say that cleanup cannot be completed because they cannot find a suitable soil fill. This decision lies with DTSC and, as DOE admits, *Gillibrand* is a perfectly acceptable fill for human health and the environment.

As for its groundwater treatment alternatives, DOE has proposed two options, one of which is "monitored natural attenuation." The difference between its monitored natural

132-4

132-5

132-6

132-4

yet been submitted. Hence, there was no Biological Opinion from the USFWS at the time the Draft EIS was released. The USFWS has now issued a Biological Opinion (see Appendix J) for remediation of SSFL. This Final EIS reflects the results of the Biological Opinion on the application of the exemption process in Area IV and the NBZ. Additionally through formal and informal consultation with the State Historic Preservation Officer, the federally recognized Santa Ynez Band of Chumash Indians, and non-federally recognized tribes, DOE has also identified areas in which it proposes to apply the exemption process for protection of cultural resources. This process is described in Final EIS Chapter 2, Section 2.3. The application of cultural resource exemptions requires the approval of the DTSC.

Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of the transportation topic and DOE's response. Please also refer to Section 2.1, "Preferences for Cleanup," of this CRD regarding your concern about a full cleanup of the site.

DOE's intent is not to generate opposition to the SSFL cleanup or to scare locals out of supporting cleanup, but it is true that the more soil that is removed to remediate the site, the larger the transportation effort (i.e., a larger number of truck trips) required. The analyses in this EIS were performed to evaluate the potential impacts associated with the various alternatives for cleanup of SSFL. In accordance with NEPA, the EIS evaluates the potential impacts on a variety of resource areas, including traffic, human health, cultural and biological resources, socioeconomics, and environmental justice. Results of the analyses allow a comparison of potential impacts across all evaluated resource areas as well as the tradeoffs between the alternatives. In the case of soil remediation, leaving more soil, and consequently low concentrations of chemicals and/or radionuclides on site, reduces the number of truck trips from the site. Conversely, removing the soil with low concentrations of chemicals and/or radionuclides, results in more truck trips from the site. The EIS shows that the transportation risks are very small; Chapter 4, Section 4.8.1 and Appendix H of the EIS provide details of the transportation risk analysis.

132-5

The 2010 AOC requires all chemicals and radionuclides in backfill soil to be below their respective LUT values in order for the soil to be used in Area IV. As stated by the commenter, EIS Appendix D, Section D.6.2 presents soils test results for the Gillibrand facility in Simi Valley. These data show that soil samples would exceed LUT values for antimony, anthracene, and phenanthrene and the EIS states in Section D.6.2 that none of these results is at a level that would pose a risk to human health or the environment. Per the 2010 AOC, "If an onsite or offsite source of backfill soils that achieves all

Commenter No. 132 (cont'd): Maria Caine

attenuation alternative and the no action alternative is the installation of a few additional monitoring wells to monitor the rate at which chemicals present in the water attenuate. Relying on natural attenuation is just a fancy way for DOE to get out of cleaning up their mess. One of the contaminants DOE plans to monitor for is strontium-90, which DOE admits on page S-47 of the EIS summary would take over 100 years.

I urge DOE to redo this EIS, and to properly follow the terms from the contract it signed in 2010. Everyday, people are being poisoned by the contamination left behind at SSFL, and DOE has the power and responsibility to change this. Please, follow through with your promise, set an example for other responsible parties, and cleanup the field lab.

Sincerely,
Maria Caine

132-6
cont'd

132-1
cont'd

132-7

Look-Up Table values cannot be reasonably found, then DTSC, DOE and EPA shall enter a consultation process and DTSC shall determine the best available source of backfill.” DOE will continue to work with the DTSC to identify a source of backfill prior to initiation of soil remediation activities. Refer to Section 2.3, “Suitable Backfill Soil,” of this CRD for discussion of the responsibilities and actions necessary to identify a backfill source, including interactions with DTSC.

132-6 As described in Chapter 2, Section 2.6 of the Draft EIS, for the Groundwater Treatment Alternative DOE looked at a range of groundwater treatment technologies, not just monitored natural attenuation and no action. This range included pump and treat of contaminated groundwater, soil vapor extraction to remove sources, and excavation and removal of the strontium-90 source. The *Draft Area IV RCRA Corrective Measures Study* (CDM Smith 2018b) was completed after the issuance of the Draft EIS. The text of this Final EIS was revised to incorporate information from this study that is relevant to groundwater treatment technologies for Area IV. As described in Chapter 2, Section 2.7 of this Final EIS, DOE’s preferred alternative for groundwater remediation is a combination of the Monitored Natural Attenuation Alternative and the Treatment Alternative. Under this alternative, monitored natural attenuation would be used for the two plumes with the lowest concentrations of TCE (Metals Clarifier plume and the RMHF plume) and for the tritium plume. Treatment of the remaining plumes will be in accordance with the results of the Corrective Measures Study. Source removal is the preferred alternative for the strontium-90 source.

132-7 Please see Section 2.7, “Offsite Impacts,” of this CRD for a discussion of concerns about offsite impacts. DOE agrees with placing a high priority on health and safety and remains committed to protecting the health and safety of current and future users of the site and of the residents in the surrounding communities.

Commenter No. 133: Kaitlyn Del Valle

Ms. Stephanie Jennings, NEPA Documents
Manager SSFL Area IV EIS
U.S. Department of Energy
4100 Guardian Street, Suite 160
Simi Valley CA 93060

January 31, 2017

Dear Ms. Jennings:

Thank you for allowing me to comment on the Area IV EIS Draft. I have helped various environmental groups around the local area work on staying informed on any pollution or environmental issues relevant to the residents. Many people living around the Santa Susana Field Laboratory have been habitants of the San Fernando Valley for over 50 years. This area was once a large cattle farm as well as numerous orange orchards and many of the families have had ancestors pass down their current properties to them. Our interest in the Santa Susana Field Laboratory Cleanup is to ensure that future descendants can continue living comfortably in a healthy environment.

SSFL has the largest amount of contaminated material in one location in the state of California. This contamination has been in place for over five decades, consistently spreading via air and water towards residents of the surrounding neighborhoods and beyond. These toxic materials have been known to cause serious health issues to anyone exposed to them. Some of these issues include thyroid cancer and many more serious illnesses.

Originally, all agencies engaged in testing at the Santa Susana Field Laboratory agreed to the terms that they would all clean up any contaminated material 100% (including any background contaminants) with the State of California. DOE has been resistant to cleaning up their portion of the contamination in Area IV and has continually postponed the cleanup. This EIS is to examine the current state of Area IV and ensure that the surrounding habitats are not negatively affected by the past, present, and future actions being taken there.

This DEIS is very concerning to the local residents. If DOE will uphold their side of the agreement they made in 2010 to provide the most protective cleanup of the site—to background. The DEIS violates the 2010 Administrative Order on Consent (AOC) with every single one of its proposed cleanup alternatives. The AOC forbids “leave in place” cleanup methods, which the DOE is proposing, and the cleanup that was supposed to be finished by this year (2017) hasn’t even begun.

I strongly encourage DOE to keep to their 2010 agreement with the State of California on the cleanup of Area IV. This full cleanup to background will ensure that there is no more harm done to the residents living nearby as well as the local habitats found in the surround areas.

Sincerely,

Kaitlyn Del Valle

133-1

133-1 Please see Section 2.7, “Offsite Impacts,” of this CRD for a discussion and DOE’s response to concerns about offsite impacts.

133-2

133-2 Thank you for your comment. It has been included in the Administrative Record for the EIS. Please refer to Section 2.8, “Cancer and Other Illnesses Near SSFL,” of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

133-3

133-3 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, “Preferences for Cleanup,” of this CRD.

Section 6.1 of the AOC recognizes DOE’s legal responsibility to prepare an EIS. With respect to the alternatives evaluated in this Final EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. The EIS analyzed an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In response to public input since the 2010 AOC was signed, the EIS also analyzed alternatives that determine cleanup levels by considering risk to human health and the environment and the protection of cultural and natural resources. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ.

Commenter No. 134: Erin Devitt

Ms. Stephanie Jennings
 NEPA Document Manager
 U.S. Department of Energy
 4100 Guardian Street, Suite 160
 Simi Valley, CA 93063

Dear Ms. Jennings:

I appreciate the opportunity to provide a comment to the Department of Energy in response to its draft Environmental Impact Statement (EIS) for the cleanup of Area IV and the northern buffer zone of the Santa Susana Field Laboratory (SSFL).

The Department of Energy engaged in extensive nuclear reactor development work that caused radioactive contamination of the site. This contamination was caused by nine nuclear accidents and the dumping of radioactive materials, among other sources, including a well-known partial nuclear meltdown. Other contamination includes heavy metals, solvents, PCBs, and perchlorate. The contamination is found in soil, structures, groundwater, and surface water. This contamination was caused by decades of bad practices ignoring environmental consequences. This site is one of the most severely contaminated sites in America and is next to one of the most highly populated areas in the world. The consequences of letting this contamination go on for so long are severe and must be addressed immediately.

In March 2003, the DOE issued an Environmental Assessment (EA) instead of conducting a full EIS. The DOE found no significant impact in their EA and planned not to clean up the site. This was a mistake, and luckily the DOE was told to conduct a true EIS, as 500 hits of radioactive contamination above background were found in Area IV and the NBZ by a multi-million dollar study conducted by the EPA in 2012. Now under the Administrative Orders of Consent (AOC), entered into by NASA and DOE with the state of California, NASA and DOE are required to cleanup the site to background. These organizations now must fill the requirements of the legally-binding contract they signed.

The draft EIS contains several issues that should be amended. The main issue is that the DOE is looking at *whether* to cleanup their full mess, like they agreed, instead of honoring their commitment to a cleanup to background. There must be more health studies done about the workers at the site and the residents of the surrounding areas. The greater area already has reported higher levels of specific cancers, such as thyroid cancer. There is also statistically significant data to support pediatric cancer clusters in the surrounding area. Multiple children have lost their eyes and lives as a result of this cancer. Residents justly feel unsafe about living in the area. They suffer from multiple sources of contamination including in the air and in their water. Studies done by UCLA have concluded that there are higher cancer rates among nuclear workers at the site as well. There should be continued compensation for the suffering caused to residents and workers due to the contamination.

Most of the EIS is concerned with transporting the hazardous materials with trucks and is trying to paint the removal of the contamination as scarier and potentially more harmful than the contamination itself. This should not be the focus of the EIS. There have been trucks coming

134-1

134-2

134-3

134-4

134-5

- 134-1 DOE acknowledges that past activities at SSFL resulted in chemical and radiological releases that impacted soils, buildings, and groundwater; and intends to complete remediation of SSFL Area IV and the NBZ in compliance with applicable requirements (including regulations, orders, and agreements) for cleanup of radioactive and hazardous substances. Chapter 1, Section 1.3, contains a brief history of activities at SSFL, including previous cleanup efforts, and describes the radiological and chemical characterization studies performed for Area IV and the NBZ. Additional information about the activities of DOE and its predecessor agency, the Atomic Energy Commission, at Area IV at SSFL can be found at <http://www.etec.energy.gov/>. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. This Final EIS is being prepared in accordance with NEPA to evaluate alternatives for completing the remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. The EIS will inform Federal decisions about remediation of contaminated soil and groundwater, building demolition, restoration of the impacted environment, and disposal of chemical and radioactive waste.
- 134-2 DOE prepared the EA in order to cleanup Area IV, not to avoid cleaning it up. The analysis in the EA was challenged and DOE is under court order from the U.S. District Court for the Northern District of California (Case No. 3:04-CV-04448-SC, May 2, 2007) to prepare an EIS. DOE may not transfer possession or otherwise relinquish control over any portion of Area IV until DOE has completed an EIS and issued a Record of Decision.
- 134-3 DOE acknowledges your support for cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information. The purpose of the EIS is to evaluate alternatives for completing remediation at those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

Commenter No. 134 (cont'd): Erin Devitt

and going to the site for decades. Instead the focus should be the environmental damage that was already caused and specifically how it's going to be cleaned up. The EIS should also discuss the impacts that not cleaning up the site would have. It would be a grave mistake to ignore this problem any longer and should be addressed in this manner.

The EIS should go into more detail about the groundwater contamination. This is likely what will have the most effect on surrounding residents. More specific identification and extent of contamination is necessary.

Furthermore, pollution has been occurring for decades and should be addressed as such. The DOE should attempt to cleanup the area so that it is as close to its original condition as possible. They should take full responsibility for the contamination and the effects it has had on the surrounding community. A failure to amend the EIS in these ways will result in an incomplete cleanup that will not comply with the AOC.

Sincerely,

Erin Devitt

134-6

134-7

134-3

- 134-4 DOE acknowledges your concerns and refers you to Section 2.7, "Offsite Impacts," of this CRD regarding your concern about dispersion of contamination from SSFL, as well as Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. Section 2.8 discusses the UCLA study referred to in the comment. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. One of the studies, by the University of Southern California Cancer Surveillance Program, reviewed the incidence of retinoblastoma in children in Los Angeles and Ventura Counties (CSP 2007). The study's authors concluded that the incidence of retinoblastoma among children under age 5 residing in the area around SSFL between 1988 and 2005 was slightly, although statistically not significantly, higher than expected based on incidence statewide. The establishment and funding of additional epidemiological studies are beyond the scope of this EIS.
- 134-5 Irrespective of past operations at Area IV, DOE needs to complete remediation of SSFL Area IV and the NBZ. DOE needs to remove the remaining DOE structures in Area IV of SSFL and clean up the affected environment in Area IV and the NBZ in a manner that is protective of the environment and the health and safety of the public and workers. The EIS considers alternatives to accomplish these tasks, and, consistent with NEPA requirements, each alternative addresses the potential impacts that implementing the alternative could have on several resource areas, including traffic and transportation impacts, human health and safety, biological and cultural resources, ground and surface water resources, and air quality.
- 134-6 DOE acknowledges your concern regarding cleanup of the site and refers you to Section 2.1, "Preferences for Cleanup," of this CRD for further discussion of this topic of interest and DOE's response DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. The purpose of the EIS is to evaluate alternatives for completing remediation at those portions of SSFL for which DOE

Commenter No. 134 (cont'd): Erin Devitt

is responsible, Area IV and the NBZ. It evaluates separate sets of alternatives for the three components of the cleanup project: soil remediation, building demolition, and groundwater remediation. The No Action Alternatives for soil remediation, building demolition, and groundwater remediation address the environmental impacts of not cleaning up the site).

- 134-7 DOE has performed additional groundwater investigations and reported the results in the *Draft RCRA Facility Groundwater Remedial Investigation Report, Area IV, Santa Susana Field Laboratory, Ventura County, California* (CDM Smith 2018a). Chapter 3, Section 3.4 of this Final EIS was updated with information from the draft groundwater remedial investigation report, including more information on the magnitude and extent of groundwater contamination in Area IV and the NBZ. The report is included as a reference for this Final EIS and is available for review on DOE's website. Also, please refer to the Topic of Interest, "Offsite Impacts" (Section 2.7 of this CRD) for a discussion of this topic and DOE's response.

Commenter No. 135: Ed Dudasik

From:
Ed Dudasik

Mar. 11, 2017

As a comment on the Draft EIS, I did not see consideration of alternative soil transport options such as the options described below. Please evaluate the options described below for feasibility, and, if feasible, update the EIS to incorporate these soil transport options:

First suggested alternative soil removal method:

This alternative method of removing the contaminated soil would greatly reduce or eliminate the impact of the SSFL soil removal on residents in West Hills, Simi, or Chatsworth. This alternative might actually result in lower total project cost:

- Construct a service tunnel, starting at a point in the northern area of the SSFL site. The tunnel would slope downward toward the north, and extend north about 1.5 miles to the existing railroad tracks. There is an existing railroad siding, near the point where Santa Ana Pass Road crosses the tracks. Or, any location near the existing rail tracks could be used. The service tunnel cross-section could be only 6 feet diameter. That is, a micro-tunnel.
 - At the point where the service tunnel meets the railroad tracks, in Simi Valley, a vertical shaft could be used to move soil containers up to the level of the railroad tracks. Containers could then be raised vertically & loaded onto flatcars on a railroad siding.
 - Back up at the main SSFL site, upgrade the roads on the site so trucks can transport the contaminated dirt north to the entrance of the service tunnel.
 - Load the contaminated dirt into shallow bins that can both fit through the service tunnel, and, can be crane-loaded onto rail cars at the railroad siding.
 - Transport the bins from the dig sites to the service tunnel entrance, then through the service tunnel, then crane-lift (or elevator) to waiting rail cars.
 - The dirt-filled, sealed bins could be transported via rail to the final soil deposit site. The bins would then need to be unloaded and recycled.
- At the SSFL site, mining engineers and tunneling consultants could advise on the best service tunnel location, tunnel size, construction method, shoring, tunnel flooding protection, throughput optimization, etc. Also, consulting is needed on the best

135-1

135-1 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

Commenter No. 135 (cont'd): Ed Dudasik

technology to use for transport of the dirt at SSFL (electric-powered mining shuttle cars? Conveyor system? Rail-mounted tramway?)

The dirt and rock removed during service tunnel construction might be usable as backfill at the SSFL site. At the end of the project, the service tunnel could be sealed off, and the access points restored to a natural state.

Second suggested alternative soil removal method:

This suggested alternative method is to use a surface-installed conveyor system, to transport soil over the top of the mountains between the SSFL site and the existing railroad siding in Simi Valley that is located about 500 feet east of the old Simi Valley Train Terminal.

The surface-installed conveyor could be either a roller-bed type conveyor, or a tramway-type conveyor.

If a roller-bed type conveyor is used, a bridge would be needed over the Santa Suzana Pass Road. And easements would be required to run the conveyor over the private property at the north end of the conveyor.

If a tramway-type conveyor is used, the tramway could be a series of small tram cars suspended from a cable system that runs over the mountaintops and then down the side of the mountain to get to the railroad siding at Simi Valley. Towers to support the tram system would be needed, but would probably not require building a new bridge.

Third suggested alternative soil removal method:

This suggested alternative method is to use mix the soil with water, creating a slurry that could then be piped out through a pipeline that would run over the mountains, or, through a tunnel, to get to the railroad siding. Slurries are currently used to move soil in the construction of micro-tunnels, such as tunnels for sewers. A slurry mix of 50% water and 50% soil would result in twice as much material to be removed by train, so this would be more expensive, but the lower cost of a pipeline, instead of a conveyor, might offset the higher slurry handling cost.

*The physician and health advocate voice for a world free from nuclear threats
and a safe, healthy environment for all communities.*

April 13, 2017

Ms. Stephanie Jennings
NEPA Document Manager SSFL Area IV EIS
U.S. Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 93063

Re: Comments on DOE's Draft DEIS for the Santa Susana Field Laboratory

Dear Ms. Jennings:

Physicians for Social Responsibility-Los Angeles (PSR-LA) is a physicians' organization dedicated to protecting public health from nuclear and environmental threats. We have been involved in efforts to clean up the Santa Susana Field Laboratory (SSFL) for over thirty years. In the late 1980s, PSR-LA joined with community members and other advocates to stop nuclear work at the site and to urge that radiological and chemical contamination be remediated in a manner that is fully protective of public health.

Decades of nuclear and aerospace activities, accidents, spills and releases have left SSFL highly contaminated with dangerous radionuclides including cesium-137, strontium-90, plutonium-239/240 and tritium and numerous hazardous chemicals. These toxic materials can cause cancers and leukemias, developmental disorders, genetic disorders, neurological disorders, immune system disorders, and more.

An extensive, multi-year epidemiological study by the UCLA School of Public Health found significant increases in death rates among the most exposed workers from cancers of the lung, lymph, and blood systems. A study for the U.S. Agency for Toxic Substances and Disease Registry (ASTDR), Professor Hal Morgenstern found rates for key cancers in members of the nearby public increased the closer the person lived to SSFL. In another study for ASTDR, Professor Yoram Cohen found evidence of toxic exposures to the offsite population in excess of EPA standards.

In addition, studies by cancer registries found elevated rates of bladder cancer associated with proximity to SSFL. A cluster of retinoblastoma cases, a rare eye cancer affecting young children, was identified within an area in the community that was downwind of the site. And the Public Health Institute's 2012 California Breast Cancer Mapping Project found that the rate of breast cancer is higher in Thousand Oaks, Simi Valley, Oak Park and Moorpark than in almost any other place in the state. Most recently, rare pediatric cancers have been identified by families who live near SSFL, causing tremendous concern.

PSR-LA | 617 S. Olive St. Ste. 200, Los Angeles, CA 90014 | phone 213-689-9170 | fax 213-689-9199 | email info@psr-la.org | www.psr-la.org

136-1 DOE disagrees with the assertion that Area IV and the NBZ are highly contaminated with radionuclides and chemicals. EPA did not confirm such during its radiological study of Area IV, only nine samples exceeded soil cleanup standards in effect at the time previous cleanup activities had been performed (HGL 2011). The soil chemical study conducted under DTSC's oversight (MWH 2007) identified localized areas with chemical contamination, but most locations exceeding LUT values did not contain chemicals above risk-based levels. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. In addition, as described in Section 2.7, "Offsite Impacts," of this CRD, there is no evidence of major amounts of contamination leaving Area IV. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007) Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act. DOE acknowledges your concern about cancer and other illnesses in the public and SSFL workers. Please refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

136-1

**Commenter No. 136 (cont'd): Denise Duffield, Associate Director,
Physicians for Social Responsibility Los Angeles (PSR LA)**

SSFL contamination migrates offsite. There have been over a hundred exceedances of pollution standards in runoff from the site reported to the LA Regional Water Quality Control Board. A TCE plume extends offsite. Perchlorate has been found in numerous wells in Simi Valley and in Dayton Creek in Dayton Canyon. Strontium-90 was found in Runkle Canyon. Other contamination has been found at Brandeis-Bardin and at Sage Ranch, where hundreds of cubic yards of toxic soil contaminated with antimony and asbestos were removed.

136-2

Given the harmful health impacts of SSFL contamination and multiple exposure pathways offsite, PSR-LA strongly supports the Administrative Order on Consent (AOC) that the Department of Energy (DOE) reached with the California Department of Toxic Substances Control (DTSC) in 2010 to cleanup to background levels of contamination.

136-3

Three years ago, PSR-LA submitted comments to DOE on its Public Scoping plan for the SSFL Environmental Impact Statement (EIS.) Our comments identified key issues to ensure that DOE's EIS would be compliant with the AOC. Over 400 members of the public also submitted comments asking DOE to ensure its EIS did not breach the AOC. (Figures provided in DOE's Final Scoping Summary Report are incorrect. The matter will be addressed further in these comments.)

136-4

Unfortunately, these comments were summarily ignored - every one of the proposed alternatives in DOE's DEIS violates the AOC and leaves high volumes of contamination on site. DOE instead produced an inaccurate and misleading EIS for SSFL that includes alternatives that leave between 34-99% of the nuclear and chemical contamination not cleaned up. DOE's DEIS also does not address health impacts of the contaminants at SSFL and offsite migration.

DOE's refusal to incorporate public scoping comments urging AOC compliance into its EIS is unfortunately not a surprise, given DOE's multiple efforts to frustrate public participation in the SSFL cleanup and lack of transparency.

All alternatives in DOE'S DEIS violate the AOC and pose risks to public health.

DOE has made repeated statements that it is committed to the AOC, including a public statement by SSFL Project Director John Jones at the February 5, 2014 SSFL Work Group meeting in which he called the AOC cleanup "the right thing to do," and more recent a statement he made to the *Ventura County Star* on February 18, 2017:

But in an interview with *The Star*, John Jones, director of the department's Energy Technology Engineering Center, said the agency's "proposed action is the AOC, which is to clean up to background." In layman's terms, "to background" means to restore the site to the condition it was in before the contamination occurred.

"I don't understand how (critics) make those statements," he said. "It's just sad when I hear that. We would like to sit them down and kind of make sure they understand it. But all three actionable (plans) are protective of human health and the environment. It's what we do at the department's Office of Environmental Management."

136-5

136-2 As described in Section 2.7, "Offsite Impacts," of this CRD, there is no evidence of major amounts of soil or groundwater contamination leaving Area IV. The contaminant migration assertions in the comment apply to releases from Areas I and II (NASA and Boeing have responsibility for the cleanup of these areas). As indicated in Chapter 3, Section 3.4.3, of this EIS the monitoring well network established for Area IV and the NBZ demonstrates that the contaminants have not moved laterally off of DOE-administered areas of Area IV and the NBZ (Groundwater plumes extend from Area IV into the NBZ but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.) The scope of this Final EIS is limited to cleanup of DOE's portions of SSFL Area IV and the NBZ. Issues related to NASA and Boeing's activities in Areas I and II, are outside the scope of this EIS and are only considered as part of cumulative impacts. (Please see Chapter 5 of the EIS.) Cleanup of the entire SSFL, including Boeing, NASA, and DOE activities, is being evaluated by the DTSC; a *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (Draft Program EIR) issued by DTSC in 2017 (DTSC 2017b).

The statement regarding violation of surface water discharge limits is general and without any detail regarding sources from Area IV. As discussed in Section 2.7, "Offsite Impacts," of this CRD, in recent years there have been few exceedances of permit limits at the outfalls associated with Area IV.

136-3 DOE acknowledges your concern about the health effects of contamination and your support for the 2010 AOC. It is DOE's mission to cleanup contamination at SSFL to levels that are protective of human health and the environment. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

136-4 DOE has changed Chapter 1, Section 1.10.2 of this Final the EIS to reflect the corrected number of commenters that provided scoping comments, acknowledging the information contained in this comment. DOE refers the commenter to the CEQ statement that commenting is not a form of voting on an alternative (CEQ 2007). Similarly, the number of comments received stating a preference for including or excluding material from this Final EIS does not dictate the scope of DOE's analysis.

DOE acknowledges your preference for meeting the EIS to be compliant with the 2010 AOC. The "Cleanup to AOC Look-Up Table Values Alternative" incorporates all of the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels determined by laboratory capabilities. None of the alternatives would leave "high volumes of contamination" within Area IV. Although the alternatives would leave differing volumes of soil, the soil would contain

**Commenter No. 136 (cont'd): Denise Duffield, Associate Director,
Physicians for Social Responsibility Los Angeles (PSR LA)**

Jones' statement begs credulity at every level. If DOE were concerned with protecting public health, it would have cleaned up SSFL decades ago. Not one alternative in its DEIS meets the AOC and all pose risks to human health. DOE's DEIS repeated states that it has no preference for which cleanup alternative is selected, and concedes that modification of the AOC is necessary in order for any alternative to be consistent with it. Further, the collective experience of communities impacted by contaminated DOE sites throughout the country is that DOE's Office of Environmental Management decidedly does not work to protect public health, as Jones states, but rather it works to avoid cleaning up dangerous contamination however it can. At SSFL, the tactics that DOE has employed to avoid cleanup are particularly egregious.

DOE's bias toward avoiding cleaning up SSFL is present throughout the DEIS and was vividly apparent at the public hearings it held on February 18 and 21, 2017. DOE chose to characterize the entire cleanup options in terms of trucks required to remove the contaminated soil, outraging many community members. Comments made at both meetings supported the AOC by a 3 to 1 ratio. DOE's "Table S-4 Remediation Soil Quantities and Truck Traffic by Alternative" angered the community, but does make it easy- however inadvertently - to calculate exactly how much contamination each alternative leaves behind.

The "Cleanup to AOC LUT Values Alternative" that DOE claims is compliant with the AOC in fact excludes 480,000 cubic yards of soil that DOE states is contaminated, which DOE estimates is 1,413,000 cubic yards. DOE preemptively exempt 330,000 cubic yards as *potentially* subject to proposed biological and cultural exemptions per the 2010 AOC, and another 150,000 cubic yards as PAH-contaminated soil *potentially* subject to natural attenuation. DOE deducts this total of 480,000 cubic yards, leaving 933,000 cubic yards - meaning about 34% will not get cleaned up. DOE also states that up to 5% of total soil volume may also be exempted, so up to 39% of contaminated soil could not be cleaned up in this option.

The justifications DOE puts forth for preemptively excluding this 480,000 cubic yards are invalid. According to the AOC, the biological and cultural exception can be considered only if the U.S. Fish and Wildlife Service, "issues a Biological Opinion with a determination that implementation of the cleanup action would violate Section 7(a)(2) or Section 9 of the ESA, and no reasonable and prudent measures or reasonable and prudent alternatives exist that would allow for the use of the specified cleanup standard in that portion of the site." But no such Biological Opinion was issued. Natural attenuation is also a specious argument for not cleaning up. DOE estimates that it could take 70 years for Total Petroleum Hydrocarbons or TPHs to attenuate, but cites a report that refers to another report which states that it could be longer if at all.

DOE's "Cleanup to Revised LUT Values Alternative" would cleanup just 192,000 of the 1,413,000 cubic yards of contaminated soil, leave between 86% in place or 91% if the 5% exemption is employed. DOE claims that this option utilizes suburban residential standards, but it has manipulated that standard to be 100 - 1,000 times more lax than the true EPA suburban residential standard. This most certainly is not protective of health. DOE had no business including any risk-based estimates, because the AOC agreement is to clean up to background. Even so, EPA guidance states that the cleanup standard should be derived from local zoning, which at SSFL is agricultural.

136-5
cont'd

136-6

136-7

136-8

136-9

concentrations similar to those EPA would leave at CERCLA sites and DTSC would leave at sites in California. DOE did consider public scoping comments in developing the Draft EIS. DOE considered all comments, not just those of select groups. While your stated preference includes meeting the technical elements of the AOC, some commenters requested that DOE evaluate a risk-based alternative in the EIS. The EIS analyzed alternatives that would help to meet cleanup objectives by being protective of the environment and health and safety of the public and workers while avoiding some of the technical challenges and potential adverse environmental impacts associated with cleanup to the 2010 AOC LUT values. The Cleanup to Revised LUT Values Alternative and the Conservation of Natural Resources Alternative would reduce (1) risk to the public and the environment and (2) the potential of impacting visual, biological, cultural, and water resources compared to the Cleanup to AOC Look-Up Table Values Alternative. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. For further discussion please refer to Sections 2.1, "Preferences for Cleanup," and 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.

Addressing comments regarding evaluation of health impacts, in this Final EIS, DOE has added quantitative analysis of potential impacts of each soil remediation alternative on onsite and offsite receptors (refer to Chapter 4, Section 4.9 of this EIS). The analysis shows that impacts to a hypothetical onsite resident or recreational user following remediation would be within the risk range of 1 in 10,000 to 1 in 1 million. Impacts on offsite receptors during remediation would be orders of magnitude below the 1 in 1 million risk range.

136-5

The commenter is incorrect in the statement that "Not one alternative in its DEIS meets the AOC and all pose risks to human health." The Cleanup to AOC LUT Alternative incorporates technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. The Revised LUT Alternative incorporates the technical elements with the exception that soil risk-based screening levels (RBSLs) for chemicals are substituted for background values. All action alternatives would remove soil above risk-based levels. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions

**Commenter No. 136 (cont'd): Denise Duffield, Associate Director,
Physicians for Social Responsibility Los Angeles (PSR LA)**

DOE names its weakest alternative the “Natural Resources Conservation Alternative” in an obvious attempt to greenwash an option that would clean up only 148,000 cubic yards of the 1,413,000 cubic yards of contaminated soil, leaving between 91-99% not cleaned up. DOE proposes a standard of 25 millirem per year, which is emphatically not protective of public health per EPA Superfund guidance. This is the equivalent of a medically unnecessary chest X-ray every month of one’s life. The option also involves averaging contaminated areas with cleaner ones, rather than cleaning up anything over the cleanup level, which is also barred by EPA guidance.

136-9
cont'd

It bears mentioning again here that the radiological and chemical contaminants that DOE wants to walk away from are extremely hazardous, capable of migrating and causing cancers and other illnesses to the offsite population and future site visitors as well. The communities near SSFL have already endured decades of potential exposure to SSFL contamination – it is simply unconscionable for DOE to attempt to sentence them to decades more.

136-10

DOE attempts to prevent and frustrate public participation, especially from community members and organizations who support the AOC cleanup commitments

DOE’s DEIS states that it considered comments received during the 2014 public scoping period, during which it states that it received 1,272 comments from 309 commenters. The Final Scoping Summary report claims that of 309 commenters, 222 were emailed comments and notes that of these 125 were “form”. But the number of commenters was at least twice that many – PSR-LA solicited comments from our members and provided technical assistance to four other organizations to help them collect comments from their members, resulting in 427 comments. These comments were submitted to DOE at the email address it provided for comments, SSFL_DOE_EIS@emcbc.doe.gov. Please find attached both Excel files of the exported user information for the comments, and PDF documents compiling those comments.

136-4
cont'd

Why did DOE not include over 200 commenters who advocated for compliance with the AOC during its public scoping? We find the omission highly suspect given DOE’s ongoing and demonstrable efforts to stifle public participation from those who support the AOC agreements. DOE’s DEIS says that it developed alternatives for the EIS based in part on scoping comments. It apparently chose selectively, ignoring the vast majority who demanded DOE uphold the AOC and giving undue weight to the much smaller number who oppose it. DOE also does not tabulate how many comments demanded it comply with the AOC, which it should do with in its response to comments for its DEIS.

DOE aggressively worked to suppress participation from AOC supporters for its DEIS, providing only a comment form on its website with an 8,000 character limit. When PSR-LA asked DOE for an email address so that we could send more technical comments and supporting materials, DOE responded that we should submit comments in writing to via standard postal mail to Stephanie Jennings. PSR-LA protested again, this time copying representatives of Congresswoman Brownley, stating that it was unfair for DOE to ask the public to review thousands of pages yet only respond with few words on a web form and no attachments. DOE responded by changing the web form to allow for uploaded documents, but again refused to provide an email address. (A copy of this email exchange is attached.)

136-11

by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Based on the future land use of this area as open space, the constituents that would be left on site are not “dangerous” as the commenter suggests. Each of the action alternatives evaluated would be protective of the health and safety of the public and the environment.

DOE’s overall message regarding the SSFL has remained consistent – DOE needs to remediate those portions of SSFL for which it is responsible in a manner that is protective of the environment and the health and safety of the public and workers. The statements noted by the commenter do not change DOE’s responsibility for complying with agreements, as well as with other requirements such as regulations and orders. DOE’s understanding of the implementability of a cleanup in accordance with the 2010 AOC has evolved since 2012. As discussed in Chapter 2, Section 2.3, of this Final EIS, DOE determined that there were technical issues with implementing a cleanup according to the 2010 AOC. As a consequence, and in keeping with its responsibilities under the NEPA, DOE developed two alternatives to the Cleanup to AOC LUT Values Alternative that meet the purpose and need of being protective of the environment and the health and safety of the public and workers. These two risk-based alternatives, the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative, are presented in Chapter 2, Section 2.4 of this EIS.

136-6

Please refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD for a description of how the Cleanup to AOC LUT Values Alternative incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background or levels based on laboratory capabilities (AOC LUT values). Contaminants in the soil that would not be removed based on exemption and natural attenuation considerations would be at levels below human health and ecological risk-based levels based on the same risk assessment processes used by EPA at CERCLA sites and DTSC at sites throughout California. In the EIS, DOE has not proposed leaving 5 percent of the soil volume, but acknowledges that there is a provision in the 2010 AOC that allows, with DTSC oversight and approval, exemptions for unforeseen circumstances, but only to the extent that the cleanup cannot be achieved through technologically feasible measures.

136-7

DOE notes that the process developed for application of the exemptions was undertaken to comply with the AOC and to comply with Federal and State law, as required by the AOC. The application of the exemption process was based on several years of ongoing discussions with USFWS and CDFWS, with DTSCs involvement (see Appendix E, Table E-4 of this EIS). USFWS and CDFW provided in letters to

**Commenter No. 136 (cont'd): Denise Duffield, Associate Director,
Physicians for Social Responsibility Los Angeles (PSR LA)**

DOE's lack of transparency was on display again, when community members noticed that its DEIS referred to dozens of missing documents. The website stated that in order to review documents (which it claims it did not post due copyright issues,) the public should contact DOE via email at SSFL_DOE_EIS@emcbe.doe.gov. This is the same email address it used to accept scoping documents in 2014. Complaints about the missing documents were sent to the email address that DOE provided, and the email address was disabled and all mention of it removed from DOE's website. This action prevented the public from being able to view the missing documents or contact DOE via email.

136-12

What possible reason could DOE have for trying to frustrate public participation except to prevent the public – which overwhelming supports the AOCs as demonstrated in the 3,700 comments received in support of them, with only a handful opposed - from weighing in? DOE should do whatever it can to make public participation on the clean up of radiological and chemical contamination from one of the most contaminated sites in California as easy as possible, not more difficult. People who live near SSFL and are most impacted by its contamination have a right to be heard. DOE should not be putting up roadblocks for them at every turn in the public comment process.

136-4
cont'd

Given DOE's decades of resistance to cleaning up SSFL, its efforts to stymie participation from cleanup supporters, and resulting loss of public confidence, PSR-LA has again obtained comments from our members and provided assistance to other groups for DOE's DEIS, using the DOE email address for Stephanie Jennings. If it is permissible to send physical mail to Ms. Jennings it must be permissible to send email comments to her as well. Because DOE has been so obstructive regarding comment submission, we are also mailing in copies of all the emails sent. PSR-LA demands a proper tabulation in DOE's response to comments for both the number of commenters and nature of their comments.

DOE also refused a request for members of the public to be able to present some slides with their testimony at the DEIS public hearings in February, stating that request was inconsistent with DOE's public notices related to the hearing process. Yet DOE's notices related to the hearing did not mention any prohibition regarding the use of slides with testimony. PSR-LA responded that there was no good rationale for declining except to impede critiques of DOE's breach of the AOC. (A copy of this email exchange is also attached.)

136-13

DOE has attempted to abrogate its cleanup commitments by secretly funding a front group to lobby against the AOC cleanup agreements.

Perhaps the most egregious example of DOE's attempts to unduly influence the amount and nature of public participation in the SSFL cleanup is its decision to secretly fund an "astroturf" or fake community group to lobby against the cleanup. Several members of the group, the SSFL CAG, have ties to the responsible parties, including one who is currently a consultant to DOE. In 2015, DOE gave the SSFL CAG a \$34,100 grant. CAG meeting minutes confirm that the donor requested anonymity, and that its leadership was so tight-lipped about the donor's identity that one CAG member resigned. According to public statements made by the group's Chair, the secrecy was requested in order to avoid scrutiny from Senator Barbara Boxer. Boxer is a

136-14

DOE their concurrence with the exemption process. Following issuance of the Draft EIS, USFWS provided its Biological Opinion stating the importance of following the exemption process for protection of endangered species. Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a discussion of this topic and DOE's response.

136-8 The 2010 AOC allows for onsite treatment of soils and natural attenuation was included as a treatment option at the suggestion of DTSC staff. The Draft EIS states that natural attenuation would be applied to soil with "low concentrations" of TPH's where they are the only chemical exceeding their LUT values. DOE is not considering natural attenuation for chemicals such as complex polycyclic aromatic hydrocarbons with a much longer time frame for degradation. Simpler polycyclic aromatic hydrocarbons, while not considered for treatment by natural attenuation in this Final EIS, may be amenable to natural attenuation and would be evaluated on a location-by-location basis during development of soil remediation plans. See Chapter 2, Section 2.3.2, of this EIS for additional information.

136-9 For discussion of the estimated volumes of soil to be excavated, refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD. Refer to Section 2.1, "Preferences for Cleanup", of this CRD, for a description of why DOE considered alternatives to the Cleanup to AOC LUT Values Alternative. The RBSL concentrations used in the Draft EIS were not manipulated and were taken directly from the DTSC approved Standard Risk Assessment Manual (SRAM) developed for use at SSFL. They are consistent to what EPA would use at similar CERCLA sites. Risk assessments are developed using a most likely future use consideration. Zoning is one criterion used in identifying future land use, but it is not the overriding consideration. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NIBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site, and firmly establishes the basis for establishing cleanup levels based on use of the land as open space.

The Conservation of Natural Resources Alternative would result in the removal of all soil containing chemicals and radionuclides at concentrations posing a risk to human health and the environment in excess of levels requiring remediation. The soil not excavated would be similar to soil that EPA would not excavate at CERCLA sites or

**Commenter No. 136 (cont'd): Denise Duffield, Associate Director,
Physicians for Social Responsibility Los Angeles (PSR LA)**

longtime cleanup supporter who was instrumental in securing the AOC agreement.

DOE made this decision during the same time period that it reneged on its contract to fund the independently-administrated Community Involvement Fund (CIF) of the New Mexico Community Foundation (NMCF), which was established to increase public participation of communities near contaminated DOE sites throughout the country. DOE was supposed to stay out of funding decisions. According to the contract, "DOE-EM will ensure that the program is not viewed as a surrogate for DOE's own preferences, and that long-term DOE-EM decisions are based on input from individuals and/or groups who are most likely to be affected by those decisions."

In 2013, PSR-LA received a \$23,000 CIF grant to help it revive the SSFL Work Group, the long-standing public participation vehicle that had been previously funded by the EPA, and was declined support from DTSC. DOE reluctantly participated in the first meeting but made it clear it would not participate in further Work Group meetings. In 2014, DOE tried to pressure CIF against funding PSR-LA's reapplication. CIF resisted DOE's pressure and funded PSR-LA. Shortly thereafter, DOE broke its contract with CIF, causing over a dozen groups near DOE sites through the U.S. to lose vital funding for their public participation programs.

When the CAG finally revealed that DOE was its secret benefactor in August 2016, PSR-LA wrote to DOE Secretary Monica Regalbuto about the matter and asked for information regarding the nature of the grant and a copy of the grant contract. DOE's Frank Marcinowski responded only with a link to a search request on the USASpending.gov website confirming the grant. (See attached email exchange.) DOE refused to disclose information about its grant to the SSFL CAG, yet according to public statements by CAG members, DOE revealed information to the CAG about PSR-LA's CIF grant and budget! This outrageous conduct from DOE demonstrates both its hostility toward those who support the AOC cleanup agreement and its weighted preference for those who oppose it.

DOE's lack of transparency has enabled the CAG to misrepresent itself as an impartial, genuine community organization. Though the CAG revealed its DOE funding in one of its sparsely attended meetings, it does not otherwise publically disclose the source of its funding. CAG members have also worked to influence local neighborhood councils and elected officials to oppose full cleanup, never disclosing that they have been paid to do so by one of the parties responsible for polluting the site. It is not a surprise that the DOE-funded SSFL CAG has now submitted comments on DOE's DEIS that recommend the weakest cleanup alternative in DOE's DEIS, the "Conservation of Natural Resources" alternative that leaves up to 99% of the contamination on site.

DOE must not give undue attention to comments opposing the cleanup, however hard DOE and its CAG have worked to solicit them. DOE must not ignore or dismiss comments on its DEIS from those who want it to fully cleanup the contamination and uphold the AOC, including hundreds of local residents, elected officials, the Ventura and Los Angeles counties, and the City of Los Angeles. These commenters are, after all, only asking DOE to keep its own commitment that it made when it signed the AOC. DOE should revise its EIS to be fully compliant with the AOC, so that all contamination is cleaned up and communities near SSFL can rest assured that

136-14
cont'd

136-15

136-16

DTSC at comparable sites in California. DOE chose to identify the 25 millirem per year in its risk-based alternative for cleanup in this EIS, consistent with the upper limit for dose-based release criteria under DOE requirements (DOE Order 458.1). DOE notes that the Conservation of Natural Resources Alternative (both scenarios) analysis in this Final EIS is a risk-based analysis and results in radiological risks in the 10⁻⁵ range; this would correspond to a dose much lower than 25 millirem per year. Please refer to Section 2.6, "Comparison of Radiation Doses," of this CRD for further discussion of the 25 millirem per year dose-based release criteria.

136-10 Please see Section 2.7, "Offsite Impacts," of this CRD, for a discussion of concerns about offsite impacts and DOE's response. As described in Section 2.7, there is no evidence of major amounts of Area IV contamination leaving SSFL (HGL 2012b; DTSC 2017a). The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007) Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act. (see Chapter 3, Figure 3-19 of this EIS). Please refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

136-11 Thank you for the feedback on the Draft EIS. Considering public comments on the Draft EIS is an important step in the EIS process. DOE provided multiple means for public comment. Comments could have been submitted directly via the website. In response to comments about the comment size limitations of the website, early during the public comment period DOE expanded the capacity of the website to accept longer comments and added the ability to upload entire documents. Members of the public were also invited to attend the public hearings in Simi Valley on February 18, 2017 and Van Nuys on February 21, 2017 to make comments orally or submit paper copies. DOE also accepted comments by U.S. mail. Regardless of the submission method, DOE considered all comments equally when developing this Final EIS.

**Commenter No. 136 (cont'd): Denise Duffield, Associate Director,
Physicians for Social Responsibility Los Angeles (PSR LA)**

they will no longer be exposed to its harmful radiological and chemical contaminants.

Sincerely,

Denise Duffield
Associate Director

|| 136-16

136-12 DOE apologizes for the problems encountered contacting DOE for references. For those references that were not appropriate to post on the SSFL Area IV EIS website (e.g., sensitive cultural resource information, copyrighted information) there was a note with contact information so a person interested in these documents could contact and coordinate with DOE to review them. On the SSFL Area IV EIS website, the note initially providing an email address was changed to provide a U.S. mail address and a phone number for questions regarding sensitive references. The email address was not intended for EIS comments, although members of the public began to attempt to send comments through that email address. The email address was then disabled to avoid confusion.

DOE recognizes that obtaining these references was more difficult than downloading the majority of the references, but DOE is legally required to protect copyrighted materials, sensitive cultural resource information, and any materials protected by client-attorney privilege. DOE notes that it received no inquiries requesting coordination so that the documents could be reviewed.

136-13 DOE's intent at the public hearings was to give all stakeholders equal time to orally present their concerns to DOE. Slide presentations were not allowed during the oral comment periods at the public hearings in order to give all commenters equal time; however presentations could be submitted by providing a printout of the presentation at the public hearing or by U.S. mail, or by uploading the presentation on the comment website.

136-14 While the comment is not on the scope or content of this Final EIS the following information is being provided.

DOE has funded a number of stakeholder groups, including Teens Against Toxins, the SSFL Advisory Panel, Physicians for Social Responsibility, the Rocketdyne Cleanup Coalition, Committee to Bridge the Gap, and the SSFL CAG. The SSFL CAG is an independent group, created under the State of California Health and Safety Code, approved by the DTSC and formed under guidance from the Udall Foundation, an independent Federal agency focused on environmental stewardship. The SSFL CAG began operating in 2013. The grant to the CAG was funded through local project funds in an effort to support community engagement. DOE posted notification of the grant in September 2015 on USASpending.gov, an official website disclosing grants, loans and other financial assistance awards. Information on the SSFL CAG grant can be found here: <http://go.usa.gov/xWp7e>. DOE does not direct grantees on publicizing the receipt or source of grants. It was at the discretion of the CAG whether to publicize the grant.

Hi Debbie,

Thank you for making that change. However, in the interest of maximizing public participation, I still find it unacceptable for DOE to not provide a simple email address for public comments. The web form not only creates an additional challenge for people to submit comments, it is also a serious impediment to accountability and transparency. Further, many longtime residents who live near SSFL and wish to weigh in are older, not terribly web proficient. An email address is by far the simplest for them.

What possible reason could DOE have for not providing an email address as it has in the past?

Denise

On Mon, Jan 9, 2017 at 12:32 PM, Kramer, Debbie wrote

Thank you for your suggestion, Denise. We have changed the EIS website: www.ssflarealveis.com to allow folks to upload documents and or attachments. If a commenter has a comment longer than 8000 characters, they can divide that comment into 2 parts, or upload the document to the website, mail it, or bring a written copy to one of the hearings.

We look forward to receiving all public comments.

Regards,

Debbie

Subject: Re: Question regarding comments on DOE SSFL DEIS

Debbie,

It is totally unacceptable for DOE not to provide an email address to submit comments on the draft EIS. It puts a significant additional burden on groups and individuals who want to submit more detailed comments and back-up documentation which are not possible to send via a web form. DOE previously, and all of the other agencies, have always allowed email comments. To not do so also contradicts DOE's supposed goals of being environmentally-friendly. It is not fair for DOE to upload hundreds upon hundreds of pages and attachments, electronically, for the public to review - but ask the public to only respond with a limited number of characters and no attachments electronically. Surely DOE is aware that this is a considerable obstacle to meaningful public participation.

Please provide an email address for submitting public comment on DOE's Draft EIS.

Denise

DOE's Office of Environmental Management started the Community Involvement Fund (CIF) to increase public involvement in the environmental management decision-making process and assist stakeholder groups with analyzing environmental management plans and proposals. The CIF operated from late 2010 until September 2015, and distributed a total of \$1.6 million through 46 grants to 23 recipients around the country, including groups involved in observing SSFL cleanup preparation. These included:

- \$46,800 in 2011 to the Committee to Bridge the Gap.
- \$55,000 in 2012 to the SSFL Advisory Panel, partnering with the Committee to Bridge the Gap. The SSFL Advisory Panel is not related to the SSFL CAG.
- \$23,000 in 2013 to Physicians for Social Responsibility – Los Angeles, partnering with the Rocketdyne Cleanup Coalition, Teens Against Toxins and Committee to Bridge the Gap.
- \$20,000 in 2014 to Physicians for Social Responsibility – Los Angeles, partnering with Teens Against Toxins and the SSFL Work Group, which is not related to the SSFL CAG.

136-15 DOE values the input of all those who commented on the Draft EIS and DOE considered all comments equally when developing this Final EIS. DOE has not solicited comments opposing cleanup of Area IV and the NBZ.

136-16 Please see the response to comment 136-4. DOE acknowledges your support for cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information, including necessary steps prior to continuing cleanup. As described in Section 2.7, "Offsite Impacts" of this CRD, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007) Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act. As described in Chapter 3, Section 3.4.3, of this EIS, the monitoring well network established for Area IV and the NBZ demonstrates that the contaminants have not moved laterally off of DOE-administered areas of Area IV and the NBZ (groundwater plumes extend from Area IV into the NBZ but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act).

Subject: Question regarding comments on DOE SSFL DEIS

Hello Debbie,

Is there an email address that we can send our comments to? Physicians for Social Responsibility-Los Angeles - and other organizations I'm sure - would like to submit comments more technical in nature in a letter with some additional documentation.

That is not possible to do via a comment form such as DOE has provided.

Please let us know which email address we can use to submit longer comments.

Thank you,
Denise

Subject: Re: Question re: Saturday SSFL hearing
To: "Jennings, Stephanie"

Stephie,

That is disappointing, yet seems part and parcel of DOE's efforts to frustrate the public's ability to meaningfully participate in the SSFL cleanup and DEIS comment process. There is not a word in DOE's notices related to the hearing process that prohibits the use of slides with one's testimony.

We are not asking for anything that others should not also have the opportunity for. There seems no good rationale for declining except to impede critiques of DOE's breach of the AOC.

I presume DOE will present its own PowerPoint on Saturday, giving to DOE, the entity breaking its cleanup obligations, a right not accorded to the public, for whom the public hearing is supposedly being held.

Denise

On Thu, Feb 16, 2017 at 1:26 PM, Jennings, Stephanie wrote:

Denise:

Your request is inconsistent with our notices related to the hearing process. In fairness to everyone who will be attending the hearing, we will not make an exception by allowing anyone to present slides.

If you would like to submit your slides as part of your comments, you are more than welcome to do that by uploading those slides to the website, or submitting hard copy either at the meeting, or via the U.S. mail.

Thanks for your understanding,

Stephie

Subject: Inadequate and evasive response to DOE secret funding of SSFL CAG
To: "Marcinowski, Frank"
Cc: Marie Mason, Dawn Kowalski, Holly Huff

[Redacted]

Dear Mr. Marcinowski and Dr. Regalbuto,

This response that you forwarded to me and other community members does not come close to answering our questions.

DOE's possible posting of the CAG grant in Sept. 2015 (we have no way to verify when it was posted) on a web site that no one looks at, that contains no details on what the grant is actually for, what grant funds are to be expended on, is not in any way sufficiently transparent to the public, community members near SSFL, or elected officials who represent areas near SSFL.

Nor does it answer why the DOE explicitly asked the CAG to keep the gift anonymous, as repeatedly documented in CAG minutes and recordings of the CAG meetings.

Nor does it answer why the DOE is funding a group that explicitly opposes the cleanup agreement that it has signed and said it will uphold.

Nor have you provided a copy of the grant proposal or contract as requested. This is a government grant paid for by taxpayer money, the public and especially those living near SSFL have a right to see the grant proposal and grant contract.

You also have not answered why DOE claimed it had no funds to fulfill its commitment to the independently-administered New Mexico Community Foundation Community Involvement Fund, but clearly has plenty of money to give to a group of its choosing that is fighting the SSFL cleanup.

Below are the questions in my original email to Dr. Regalbuto. Please answer them as soon as possible.

Questions for the Department of Energy

1. Did DOE, as reflected in the CAG's minutes, suggest to the SSFL CAG to form a non-profit foundation so that it could provide funding to the CAG?
2. When did DOE begin discussing funding the CAG? When did it actually make the contribution, and what was the amount of the gift? Has there been more than one?

Response side of this page intentionally left blank.

**Commenter No. 136 (cont'd): Denise Duffield, Associate Director,
Physicians for Social Responsibility Los Angeles (PSR LA)**

3. What is the stated purpose of the grant? What will/have grant funds be expended on?
 4. Under what category of funding was this grant made? Was it made from the DOE Office of Environmental Management, the same office that reneged on its commitment to NMCF?
 5. CAG member Alec Uzemek repeatedly stated that the grant had "no strings." Does the DOE grant have any restrictions? Is lobbying prohibited? Is the CAG required to submit a report on its activities? Will it be invited to reapply for funding again this year?
 6. Why did DOE request that its gift to the CAG be anonymous? Did the DOE tell the CAG, as expressed by Alec Uzemek, verbally or in writing, that it wanted its gift secret, at least for a time, because it wanted to avoid repercussions from Senator Barbara Boxer?
 7. How does the DOE reconcile public statements that it will uphold the AOC at the same time that it is funding a group that overtly works to destroy the AOC?
 8. Did DOE's animosity toward the Santa Susana cleanup agreement, and its displeasure at CIF funding PSR-LA and the SSFL Work Group, cause it to cancel the last year of its funding to NMCF, and thus cost over a dozen community groups throughout the United States to lose funding?
 9. Did DOE consult with elected officials historically concerned about SSFL cleanup as to whether the grant should be given to the CAG and whether it was a legitimate group representing the community? Why did DOE ignore the opposition to the CAG expressed, in writing, by the electeds?
 10. Why did DOE not publicly solicit grant applications instead of secretly arranging to give the money to the CAG? Why did DOE not solicit a grant application from the longstanding SSFL Work Group established by the electeds, which supports the cleanup agreements DOE is supposedly sworn to uphold? Given that very few people attend CAG meetings, and the Work Group meetings are often standing-room only, why did DOE secretly fund the CAG, without a competitive grant application process, and not solicit an application from SSFL the Work Group?
- Again, in addition, I request that DOE provide a copy of the SSFL CAG Foundation's grant application or proposal to DOE, as well as the DOE-SSFL CAG grant contract or agreement, immediately.

On Aug 29, 2016, at 12:57 PM, Denise Duffield wrote:

Dear Assistant Energy Secretary for Environmental Management Regalbuto:

I was shocked to learn recently that DOE has been funding a front group that is lobbying for the breach of DOE's cleanup agreement for the Santa Susana Field Laboratory (SSFL) - and that DOE had apparently requested that the funding be kept secret so that Senator Barbara Boxer wouldn't learn of it. I write today to both apprise you of this troubling situation and to request further information and documents related to DOE's decision to fund the SSFL CAG.

The SSFL CAG is a small but highly controversial group that is lobbying against the cleanup agreement (Administrative Order on Consent, or AOC) for SSFL signed by both DOE and the state regulatory agency overseeing the cleanup, the Department of Toxic Substances Control (DTSC). For example, one CAG flyer reads, "Why the AOC Cleanup at SSFL is Bad for Our Community" ([here](#).) "The AOC Cleanup: More Harm Than Good?" reads another ([here](#).) The CAG routinely propagates false information about SSFL's contamination, health impacts, and cleanup. A CAG - Community Advisory Group - should represent the community. However, the SSFL CAG does not even remotely represent the community, which understands that SSFL is contaminated with dangerous radionuclides and chemicals and needs to be fully remediated per the current DOE cleanup agreement. The CAG is a classic "astroturf" (i.e., fake grassroots) group dominated by people with ties to the parties responsible for the contamination at SSFL.

The public has been demanding to know for a long time how the CAG was funded and how it spends those funds. The CAG has refused to disclose that information, which is troubling for an entity that claims to be public. The community has suspected that the money comes from one or more of the entities that polluted the site and that is trying to

Response side of this page intentionally left blank.

**Commenter No. 136 (cont'd): Denise Duffield, Associate Director,
Physicians for Social Responsibility Los Angeles (PSR LA)**

get out of its cleanup obligations, and that that is why the CAG wouldn't disclose the funding source or sources. Now it appears that that is indeed the case. For one of the Responsible Parties, DOE, to be funding a group that is trying to help DOE avoid its cleanup obligations, and asking for DOE's identity as the source of the funds to be long kept secret, would be nothing short of scandalous.

The DOE SSFL cleanup agreement (AOC) was proposed by former DOE Secretary Dr. Steven Chu and Assistant Secretary for Environmental Management (DOE-EM), Dr. Inez Triay. It was signed by DOE and DTSC in December 2010. The AOC stipulates that Area IV and the Northern Buffer Zone at SSFL are to be cleaned up to background. In February 2014, at a meeting of the SSFL Work Group, DOE SSFL Project Director John Jones told the audience of community members, elected officials, and media that the DOE was committed to upholding the AOC agreement (see video [here](#).)

Since then, the community has seen an erosion of DOE's stated commitment, including a Public Scoping plan which included numerous options that would violate the AOC (such as keeping waste on site), accompanied by a report grossly exaggerating soil removal estimates (see statement by the Southern California Federation of Scientists [here](#).) In addition, the AOC explicitly defines soils as including structures (see page five of AOC [here](#)), which are to be cleaned up to background and all wastes to go to licensed low level radioactive waste disposal sites, yet DOE is now taking the position that it can demolish nuclear structures at SSFL at will, using far less protective standards, and dispose of their radioactive wastes anywhere. The DOE has also apparently told the CAG that it is contemplating trying to modify the AOC to be required to perform much less cleanup than it had promised in order to save money (see CAG July 20, 2016 minutes [here](#).)

And now, we have learned that the DOE has been funding the CAG. The DOE is abundantly aware that the CAG openly, actively, and vigorously works to break the AOC cleanup agreement that DOE signed. DOE's funding of the SSFL CAG is therefore an alarming and direct assault on the AOC itself. It also makes clear that the CAG is an agent of one of the parties responsible for the pollution at the site and which is trying desperately to get out of its obligation to clean up all the radioactive and toxic mess that it made. The CAG regularly lobbies elected officials to try to persuade them to push to weaken the cleanup—an activity outside the scope of a regular community advisory group. It is very troubling for DOE, responsible for the contamination and sworn to uphold a cleanup agreement to clean it all up, to be secretly funding a group that lobbies elected officials to support DOE breaking its agreement.

We are also deeply disturbed by the secrecy surrounding DOE's grant to the SSFL CAG. The CAG first announced that it was to receive \$32,000 in funding at an August 2015 meeting, in which it stated that the donor wished to remain anonymous in order to avoid Senator Barbara Boxer, a longtime SSFL cleanup supporter, learning of the funding and taking action thereon. (See video of CAG meeting [here](#).) Only now, a year later, near the end of Senator Boxer's esteemed Senate career, has the CAG apparently been given permission to reveal that the identity of its funder is the DOE. It is outrageous and unconscionable for a government agency to make a financial contribution to any organization and request that the funding be kept secret, for any reason, let alone for the purpose of evading the attention of a United States Senator who would likely object to what it was doing. The CAG's August 2015 minutes ([here](#)) make it clear that the anonymity, which lasted a full year, was at the donor's request.

Physicians for Social Responsibility Los Angeles (PSR LA)**

Further, the DOE funded the CAG during the same year that it broke its commitment and revoked funding for the final year of a five-year commitment to the New Mexico Community Foundation (NMCF)-administered Community Involvement Fund (CIF), which funds independent groups in impacted communities near contaminated DOE sites throughout the country. The DOE's agreement with NMCF states, "By utilizing a cooperative agreement with an independent entity to distribute grant funds to qualified organizations representing the interests of the public, DOE-EM will ensure that the program is not viewed as a surrogate for DOE's own preferences, and that long-term DOE-EM decisions are based on input from individuals and/or groups who are most likely to be affected by those decisions."

In other words, DOE was supposed to stay out of the grant selection process to assure that groups funded were independent of DOE. However, the DOE weighed in heavily against a re-application submitted by Physicians for Social Responsibility-Los Angeles (PSR-LA) for the SSFL Work Group, the longstanding advisory group established a quarter of a century ago by the electeds and which represents the main mechanism for the community to learn about and provide feedback on the cleanup and hold the agencies accountable. In August 2013 we applied for and received a \$23,000 CIF grant. We re-applied in August 2014, but learned that DOE was pressuring CIF to deny the grant, which violated its commitment to keep hands-off the selection process. To its credit, in November 2014, the NMCF awarded the second grant of \$20,000 (and did not fund the SSFL CAG, which had also applied for the funding.)

Very shortly thereafter, the DOE reneged on the final \$300,000 it had pledged to NMCF, impacting not just PSR-LA and the SSFL Work Group but over a dozen communities nationwide. NMCF sent a message to its grantees on March 16, 2015 stating, "Earlier this year, representatives of the Department of Energy (DOE) advised New Mexico Community Foundation (NMCF) that the foundation would receive only partial funding for the CIF grant program in 2015. Last month, we were informed that NMCF would only be funded a small portion of the overall budget request solely for administrative oversight of the current 2014-15 grant cycle, and no funding would be allocated to go towards new grant-making. Adding to our confusion and concern, the decision-making process associated with the 2015 CIF appropriation has not been clearly communicated, nor have we been given a clear indication of the reasons for the reduction in funding."

We cannot say with certainty that DOE revoked funding to the NMCF due to its decision to fund the SSFL Work Group despite the inappropriate pressure by DOE. But, we must point this out as a strong possibility in light of the timing and DOE actions described herein. The CIF grant enabled the return of the trusted public participation vehicle, the SSFL Work Group, which attracted capacity crowds who were able to learn about the contamination that would be left on site if the cleanup agreements were not upheld. DOE had participated in the SSFL Work Group since its inception, but has now stopped attending virtually any public meeting where it could be held to account for its actions. Regardless of DOE's motivation to abrogate its agreement with NMCF, it is very troubling that the DOE made this decision while simultaneously funding an organization that opposes a cleanup agreement that the DOE has been strongly signaling it wants to break. DOE broke its commitment to provide its funding for community groups near contaminated sites through an independent mechanism and hands-off procedures that assured DOE would not do precisely what it has now done—fund a front group to lobby on DOE's behalf to get out of its cleanup obligations.

**Commenter No. 136 (cont'd): Denise Duffield, Associate Director,
Physicians for Social Responsibility Los Angeles (PSR LA)**

It is difficult to overstate just what is at stake for communities near SSFL right now. Decades of nuclear and aerospace activities at SSFL have left a legacy of dangerous nuclear and chemical contamination that continues to migrate from the site to offsite populations. Federal studies have shown an increase in cancers associated with proximity to the site. In 2010, after decades of attempts to achieve full cleanup, the historic AOCs were signed. As a result, \$41.5 million dollars were spent for a US EPA survey that identified background radiation and found nearly 500 samples, in just one area of SSFL, that were above background, in some cases dramatically so. The community eagerly anticipated full cleanup, which the AOC stipulated would be complete by 2017.

We are now just months away from 2017, but cleanup has yet to begin. Indeed, DOE's draft EIS - which a court ordered a decade ago and was due to be published years ago - is not yet released. Community members have feared that DOE's EIS would be a full-bodied attack on the very cleanup agreement DOE had sworn to carry out, and wondered if the EIS was being delayed so as to not come out until after Senator Boxer leaves office and can no longer take action to insist DOE live up to the promises made. This suspicion has only increased given the timing of the announcement that DOE is the CAG's secret benefactor, and that the reason for the secrecy was to avoid attention from Boxer. The community is appalled and angry, and deserves to know the full details of DOE's arrangement with the SSFL CAG.

Below please find background information and documentation on these matters, followed by a series of pressing questions. I request that DOE provide answers to the questions, as well as a copy of the SSFL CAG Foundation's grant application/proposal to the DOE and its DOE grant/contract, as well as any grant report, immediately. If there has been more than one grant to the CAG, provide information about each. The community has the right to know about the intent, character, and tactics of the agency that holds their potential health and well being in its hands. And elected officials, many of whom have been lobbied by the CAG to weaken the cleanup, must be informed about financial contributions that DOE is making to this group to influence them and help it break out the cleanup agreements. DOE funding a front group to lobby elected officials to push them to support DOE breaking its cleanup agreements would be an outrage.

Background and Documentation

The SSFL CAG was formed in 2012 over the objections of longtime community members and local elected officials. (See community petition [here](#) and letter from elected officials Julia Brownley, Fran Pavley, Shelia Kuehl, Linda Parks, and Greig Smith opposing formation of the CAG and supporting instead the longstanding SSFL Work Group [here](#).) The CAG is widely perceived as a front group for the polluters that does not represent the interests of the community, because it opposes the cleanup agreements that are overwhelmingly supported by the community. All but a handful of the 3,700 comments submitted on the AOC were in favor of the agreement. Last year over 1,600 signed a petition urging that the cleanup agreements be upheld. (See petition [here](#).) Yet every member of the CAG opposes the AOCs, despite the requirements that a CAG represent the range of community perspectives.

The CAG's leadership is composed of individuals who are former employees or contractors of the parties responsible for cleaning up the site (Boeing, DOE, and

NASA). Alec Uzemek worked for Boeing's predecessor, North American Aviation, at its then-headquarters in Downey for which the Santa Susana site was the field lab. Brian Sujata was Boeing's project manager for SSFL cleanup, while Boeing was DOE's contractor for the cleanup. Ross Berman worked for both Tetra Tech and CH2M Hill, contractors for the responsible parties. And Abe Weitzberg was an official at SSFL, in charge of safety for the SNAP reactors, one of which experienced 80% fuel damage in an accident. Weitzberg remains a consultant for the DOE.

Since its founding, the SSFL CAG has undertaken a multi-faceted campaign aimed at undoing the SSFL cleanup agreements. This includes exaggerating cleanup soil volumes and truck traffic and claiming that the cleanup will harm the site's natural environment and Native American artifacts (which are in fact protected by the AOC.) The CAG also attempts to minimize the contamination at SSFL and health impacts. Last year, CAG member and former SSFL official Weitzberg launched an effort to have the Agency for Toxic Substances and Disease Registry (ATSDR) refute prior health studies and weigh in against the cleanup. In the process, he maligned the authors of those studies, who expressed their objections in an article published in the *Ventura County Star* [here](#). The CAG has also made a habit of regularly and publicly disparaging longtime community members and cleanup advocates. Whereas meetings of the longstanding SSFL Work Group are packed with concerned members of the public and representatives of elected officials, very few attend CAG meetings. The last meeting had only half a dozen CAG members and a roughly equal number of the public, most of whom were critics of the CAG's biases and actions.

On August 19, 2015, CAG member Alec Uzemek announced at an SSFL CAG meeting that the CAG would be receiving a \$32,000 - \$35,000 donation from a donor who wished to be anonymous. The minutes from the meeting (which can be viewed [here](#)) state that the CAG established a non-profit foundation, "...in response to the gift from a donor who wishes to remain anonymous." The CAG leadership was so secretive about the donor's identity that it refused to inform the full CAG membership, causing one CAG member to resign, as reflected in the minutes. "As a result of the fact that the donor is anonymous, Elizabeth Harris has resigned from the CAG..." At the meeting, Uzemek repeatedly said that the donation had "no strings," and of the gift said, "Why is it anonymous at this point? Because everything we do is politically charged. We have people out there who make phone calls. And if you're the executive of a corporation and you get a call from Barbara Boxer, I'm quite sure that that's going to have an impact on it. But, we don't want that." (See video [here](#).)

In December 2015 and in May 2016, cleanup advocates and community members complained to the DTSC Independent Review Panel (IRP), established by the California legislature to investigate DTSC's many failings, about the CAG's anonymous funding and conduct (see paragraphs 4 -6 on page 2 of the IRP's May 12, 2016 minutes [here](#).)

Finally, at an SSFL CAG meeting on August 17, 2016, nearly a year after announcing the funding and the donor's request that its identity be kept secret so as to keep Senator Boxer in the dark, Uzemek announced, "DOE will be coming out with a quarterly report, probably in two or three weeks. And it will have a list of grants on the last page. And DOE is the one that made the grant for us. They are the one who supplied the funding. So, the question's been answered." A recording of Uzemek's statement can be viewed [here](#).

Physicians for Social Responsibility Los Angeles (PSR LA)**

The SSFL CAG's tax returns, which can be viewed [here](#), show that the organization received \$38,600 in 2015.

Questions for the Department of Energy

1. Did DOE, as reflected in the CAG's minutes, suggest to the SSFL CAG to form a non-profit foundation so that it could provide funding to the CAG?
2. When did DOE begin discussing funding the CAG? When did it actually make the contribution, and what was the amount of the gift? Has there been more than one?
3. What is the stated purpose of the grant? What will/have grant funds be expended on?
4. Under what category of funding was this grant made? Was it made from the DOE Office of Environmental Management, the same office that renegeed on its commitment to NMCF?
5. CAG member Alec Uzameck repeatedly stated that the grant had "no strings." Does the DOE grant have any restrictions? Is lobbying prohibited? Is the CAG required to submit a report on its activities? Will it be invited to reapply for funding again this year?
6. Why did DOE request that its gift to the CAG be anonymous? Did the DOE tell the CAG, as expressed by Alec Uzameck, verbally or in writing, that it wanted its gift secret, at least for a time, because it wanted to avoid repercussions from Senator Barbara Boxer?
7. How does the DOE reconcile public statements that it will uphold the AOC at the same time that it is funding a group that overtly works to destroy the AOC?
8. Did DOE's animosity toward the Santa Susana cleanup agreement, and its displeasure at CIF funding PSR-LA and the SSFL Work Group, cause it to cancel the last year of its funding to NMCF, and thus cost over a dozen community groups throughout the United States to lose funding?
9. Did DOE consult with elected officials historically concerned about SSFL cleanup as to whether the grant should be given to the CAG and whether it was a legitimate group representing the community? Why did DOE ignore the opposition to the CAG expressed, in writing, by the electeds?
10. Why did DOE not publicly solicit grant applications instead of secretly arranging to give the money to the CAG? Why did DOE not solicit a grant application from the longstanding SSFL Work Group established by the electeds, which supports the cleanup agreements DOE is supposedly sworn to uphold? Given that very few people attend CAG meetings, and the Work Group meetings are often standing-room only, why did DOE secretly fund the CAG, without a competitive grant application process, and not solicit an application from SSFL the Work Group?

Again, in addition, I request that DOE provide a copy of the SSFL CAG Foundation's grant application or proposal to DOE, as well as the DOE-SSFL CAG grant contract or agreement, immediately.

Commenter No. 137: Michael N. Feuer, Los Angeles City Attorney; Mitchell Englander, City of Los Angeles Councilmember; Sheila Kuehl, Los Angeles County Supervisor; Steve Bennett and Linda Parks, Ventura County Supervisors

April 12, 2017

Ms. Stephanie Jennings
NEPA Document Manager, SSFL Area IV EIS
U.S. Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 93063

Dear Ms. Jennings:

Thank you for the opportunity to comment on the U.S. Department of Energy's (DOE) Draft Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory (DOE/EIS-0402), which DOE issued in January 2017. As you know, we have been waiting since August of 2007 for the preparation of this environmental document.

We are concerned and disappointed that after years of delay, DOE has chosen to prepare a Draft EIS in which every remediation option presented fails to comply with the previously agreed upon cleanup standards in the 2010 Administrative Order on Consent (AOC) with the Department of Toxic Substances Control. In that AOC, DOE agreed to perform a full clean-up of the Santa Susana Field Lab site to stringent local background levels. The purpose of the EIS, consistent with DOE's own previous scoping document, is to evaluate the environmental effects of that cleanup and to evaluate alternatives for meeting the AOC cleanup standards. Instead, DOE has chosen to abandon the AOC and prepare a Draft EIS on remediation options that will leave much of the contamination in place.

137-1

The most protective remediation option in the Draft EIS, Option 1, proposes to leave 34% or more of the contamination on site – over half a million cubic yards– harming the environment and exposing future users of the site and those offsite in the vicinity to unacceptable risk of future cancers and other ailments. Option 1 is not, as the Draft EIS suggests, AOC-compliant. Under the AOC, no "leave in place" alternatives will be considered. The even more untenable remediation Options 2 and 3 discussed in the Draft EIS propose to leave 86-90% or more of the contamination on site, respectively.

The Draft EIS also makes no attempt to study alternate conveyance of contaminated soil and debris from the site, ignoring local community input regarding additional traffic and street damage. This flawed and incomplete consideration of transportation options relies on inflated truck trip estimates, and provides the basis for the document's assumption that a much less stringent clean-up standard must be accepted at the site – one that puts the environment, the public, and future generations at risk.

137-2

We reject the proposed remediation options in the Draft EIS. To accept any of them would in our view violate the AOC cleanup standards and condemn this and future generations to an unacceptable risk of

137-1 cont'd

137-1 The Draft EIS and this Final EIS include an alternative that incorporates the technical elements of the AOC. Please refer to Section 2.2 of this CRD, "Compliance with the 2010 Administrative Order on Consent," for a discussion of how the Cleanup to AOC LUT [Look-Up Table] Values Alternative incorporates the technical requirements of the 2010 AOC using AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. Soil that DOE proposes to leave on site through application of AOC exemptions or for monitored natural attenuation would be at concentrations that fall within the EPA target risk range; these soils would be identified in a soil remediation plan that DOE would submit to DTSC for approval.

The AOC contemplates in-situ treatment of soils. Monitored natural attenuation was included in the EIS at the suggestion of DTSC staff. Section 2.9 of the AOC states that the DOE soil remediation plan to be submitted to DTSC for approval describe, "Any areas proposed for in situ or onsite treatment to achieve cleanup goals..." Additionally, DTSC in its *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (DTSC 2017b) included the potential for in-situ treatment as a viable option for soil cleanup.

137-2 The commenters are incorrect that "The Draft EIS makes no attempt to study alternative conveyance of contaminated soil and debris from the site" and DOE disagrees with the assertion that the EIS includes inflated truck trip estimates. In both the Draft and Final EISs, DOE used geographic information system analysis of the extensive soil sampling data to quantify the volume of soil that exceeds the DTSC-established LUT values. The EIS reflects the number of trucks trips that would be required to transport the estimated volume of excavated soil. Several options to convey soil from the site were discussed in Draft EIS Chapter 2, Section 2.2.3. Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of the transportation topic and DOE's response. Alternative transportation methods (alternative conveyances) were considered in this EIS; all were dismissed by DOE from detailed study. The reasons for their dismissal from further study are provided in Chapter 2, Section 2.2.3, of this Final EIS. This Final EIS (see Chapter 2, Section 2.2.4) also includes a summary of the DTSC transportation analysis that is included in the *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* (DTSC 2017b). DTSC concluded that, "transporting soil by truck via Woolsey Canyon Road was the most technically feasible and least environmentally impactful option..." DOE concurs with DTSC's conclusion.

Commenter No. 137 (cont'd): Michael N. Feuer, Los Angeles City Attorney; Mitchell Englander, City of Los Angeles Councilmember; Sheila Kuehl, Los Angeles County Supervisor; Steve Bennett and Linda Parks, Ventura County Supervisors

cancers and other ailments from contamination from the site. We encourage you to do the only right thing – honor your previous commitment and study alternatives of how to clean this site to the 2010 AOC's local background levels.

Commenter No. 138: Matt Ruhland

Ms. Stephe Jennings
NEPA Document Manager
SSFL Area IV EIS
US Dept. of Energy
4100 Guardian St., Suite 160
Simi Valley, CA 93063

Dear Ms. Jennings,

For the last decade, my family and I have lived in the area surrounding the Santa Susana test site, and I am amazed that I have only recently learned about the extent of the dangerous chemical and radiological contamination that has been sitting on our doorstep. Beyond that, I am appalled by how blatantly the Department of Energy has been shirking its responsibility to clean up its own mess. As a result of this negligence, radioactive and chemical contaminants from the test site have been traveling into the vulnerable households of families and children surrounding the site for decades.

The community has spoken out about this issue countless times, for decades, and with incredible passion and resilience. In December of 2010, the Department of Energy entered into an agreement (AOC) with the state regulatory agency, the DTSC, whereby the Santa Susana Field Laboratory would be cleaned up completely to background. In other words, the DOE is legally responsible for removing all detectable contamination from the site and returning it to the condition it was in before any pollution occurred. The cleanup set in 2010 is clearly what the public desires, as during the AOC public comment period, 2,000 comments were received in support of the document and only 20 in opposition. Within this 2010 agreement, the Department of Energy promised that the entirety of the cleanup would be complete by 2017. Currently, in the early months of 2017, no substantial cleanup effort has begun. DOE has blatantly missed its deadline but is currently facing zero penalties.

138-1

138-2

138-1 Please see Section 2.7, “Offsite Impacts,” of this CRD for a discussion and DOE’s response to concerns about offsite impacts.

138-2 There has been a lot of cleanup performed in Area IV. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, “Public Perceptions about Waste and Contamination in Area IV,” of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ.

In this EIS, DOE does not propose to breach the 2010 AOC signed with its regulator, DTSC. However, NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. To meet this obligation this EIS evaluates alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels (refer to Section 2.2, “Compliance with the 2010 Administrative Order on Consent,” of this CRD). This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC other DTSC-regulated sites, and by EPA at CERCLA sites. As discussed in Section 2.2, the alternatives evaluated do leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

Commenter No. 138 (cont'd): Matt Ruhland

Recently, the DOE issued its Draft Environmental Impact Statement (DEIS). In this new statement, the DOE breaks the commitments it made in the AOC as well as the past promises it made about any future EIS. The Department of Energy promised that any cleanup alternative proposed in a future EIS would be solely limited to the use of different technologies to achieve its same AOC obligations. According to the AOC agreement DOE signed in 2010, there are several key requirements surrounding the cleanup. First and foremost, the agreement is legally binding and the DOE cannot unilaterally choose to violate any part of the agreement, as they are doing with the current draft EIS. Secondly, the cleanup of soil must be to background (all detectable contamination removed). Finally and critically, the agreement stipulates that no "leave in place alternatives will be considered." Every option this EIS puts forward would leave in place large amounts of contamination, despite the explicit prohibition against that in the AOC. The first option that DOE presents would leave in place as much as 39% of the contamination. The second option would leave in place as much as 91%, and the third option would leave in place as much as 99%.

As a community member with family and friends deeply affected by the sluggish Santa Susana cleanup process, I was infuriated by what I heard from the DOE representatives at the public comment hearing hosted by DOE on February 18th in Simi Valley. The main point of contention between the DOE and cleanup activists is whether the alternative cleanup standards being proposed in the draft Environmental Impact Statement are protective of human health and the environment. In their official presentation, the DOE spokespeople misrepresented, and in some cases lied, about the impacts of their proposed cleanup alternatives. For example, in a statement given to the VC Star by DOE representative John Jones, he claims that "all three actionable (plans) are protective of human health and the environment." By actually reading the cleanup standard value tables presented in the EIS, however, it is clear that this statement is

138-2
cont'd

138-3

138-3 As explained in the Draft EIS, DOE used suburban residential risk-based screening levels (RBSLs) or risk slope factors based on the direct exposure pathways and without the indirect garden pathway to evaluate potential impacts to an onsite receptor. Scenarios are based on the most-likely future land use. As stated below, Boeing has entered into agreements that will limit the future land use to open space.

In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. DOE included the residential scenario as a conservative risk analysis, not because there will be residential reuse of the property in the future.

In this Final EIS (see Chapter 2, Section 2.4), DOE has retained the Cleanup to Revised LUT Values Alternative, which uses chemical RBSLs based on an Onsite Suburban Residential Scenario without a garden pathway. The Final EIS also retains the Conservation of Natural Resources Alternative, but evaluates two scenarios. The Open Space Scenario is based on the future land use of Area IV and the NBZ as open space, consistent with Boeing's conservation easement and agreement (i.e., cleanup levels are based on exposure of an onsite recreational user as the receptor). The Onsite Suburban Resident Scenario is the scenario evaluated in the Draft EIS, that is, cleanup levels are based on a suburban residential scenario without a garden pathway. This latter scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space.

With regard to the specific example of strontium-90, the risk identified by the commenter includes the indirect garden pathway and is apparently based on the output of the EPA dose calculator. This dose calculator produces the same risk slope factors (PRGs) as were used in the Draft EIS when the indirect garden pathway is not included in the model. Given the future use of the site as open space, the indirect garden pathway is not applicable and the risk-based concentration of strontium-90 identified in the EIS is protective of public health.

In Chapter 4, Section 4.9 of this Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that local residents may get some portion of their food from a home garden.

Commenter No. 138 (cont'd): Matt Ruhland

false. One of the three cleanup alternatives proposes a standard of 1200 pico-curies per gram of radioactive strontium-90 left after cleanup. This is 330,000 times higher than the suburban residential standard outlined by the EPA that the DOE promised to follow. The EPA standard is based on a one in a million cancer risk estimate, so the 330,000 times higher standard proposed in the EIS is associated with a one in three cancer risk. This is in no way protective of human health, and this is only one example of DOE's deceit.

How can the public trust the claim that the DOE is protecting them, when it has consistently lacked integrity and transparency when engaging with the public? At every turn, it seems as though the DOE is attempting to quell public outcry through dubious means.

An incredibly frustrating aspect of the February 18th meeting was the ridiculous time schedule that the DOE refused to change, despite many objections from the community. The supposed objective of the meeting was to solicit feedback from the community regarding the draft EIS. It appeared, however, that the DOE was trying very hard to suppress such feedback. The Department strictly enforced a 180 second time limit on verbal comments and cut off many community members that were trying to voice their concerns. There was almost an hour of unused time at the end of the meeting and still they refused to let anyone finish or expand upon their comments. The DOE used a projector during their presentation, yet refused to allow community members to use it to display additional content to accompany their comments. Nowhere on the public hearing announcements did it prohibit members of the public from presenting slides. They were refusing to give the people the same opportunity as the government. All-in-all, the entirety of the meeting rang of insincerity.

Not only is the DOE attempting to stifle public verbal testimony, but also the electronic comments as well. The public has asked numerous times for email comments to be accepted, as that is the most practical and effective way of communicating in this day and age. However,

**138-3
cont'd**

138-4

138-4

DOE's time limit on oral comments at the public meetings was set to allow all stakeholders equal time to present their comments. All members of the public who registered to comment were allowed to present their comments. Restrictions on slide presentations during the oral comment periods at the public hearings were also intended to give all commenters equal time. Slide presentations could be submitted by providing a printout of the presentation at the public hearing or by U.S. mail, or by uploading the presentation on the comment website. The intent was not to quell public comment; multiple means of submitting comments were available. These methods included the website, U.S. mail, providing oral comments during the public meetings or to the court reporter before the public hearings commenced, and providing a written comments at the public hearings. DOE apologizes for the confusion over the email address. The email address was previously created for scoping comments, not for receiving public comments on the Draft EIS. The email address was discontinued when DOE realized stakeholders had begun to use it for submitting public comments on the Draft EIS. In order to better track comments, DOE determined the website was the best method for electronic comments. Regardless of the submission method, DOE considered all comments equally when developing this Final EIS.

Commenter No. 138 (cont'd): Matt Ruhland

the DOE has refused, and even went so far as to delete the email address they had generated specifically for the DEIS and presented as a means to contact the DOE with questions and concerns. Beyond restricting email comments, the DOE is limiting the size of comments and file attachments submitted through the website

If the DOE were genuinely interested in having public input, they wouldn't be so resistant to receiving it. DOE promised a full cleanup. DOE has now broken that promise. Not only that, it has now worked very hard to frustrate the public's right to criticize that breach of its commitments. This is not how to behave if, as you say, you have nothing to hide.

Sincerely,

Matt Ruhland

Commenter No. 139: Devyn Gortner
Teens Against Toxins

This testimony was given on 2/21/17 at the Public Comment Hearing and is being submitted in writing so that the full comment may be on public record.

My name is Devyn Gortner and I grew up less than 5 miles from the site. I am the founder of Teens Against Toxins and am here today, as I have been for nearly a decade, to speak on behalf of the younger community near SSFL. I wish I could play on repeat what Grace and Ryan shared with you, but instead I'll take my background as an environmental and nuclear policy researcher to debunk the claim that the clean ups proposed in the DEIS are protective of human health.

DOE claims their risk-based cleanup option would allow a 25 millirem per year exposure. That is the equivalent of a chest x-ray per month, for a year, for decades.

But the actual number is far higher. Please bear with me, I promise what I'm about to share is simple math.

To calculate its estimated risks to human health, DOE claims to have used the suburban residential scenario, but actually left out the garden component of that scenario, which is required to be included. In fact, the DOE's risk estimates low-ball the dose by a factor of at least 100-1000.

For comparison, if you run EPA's dose compliance calculator for the same scenario DOE used, but include the backyard garden component as required, and look at the amount of strontium-90 that would yield a dose of 25 mrem, which is the DOE proposed standard, you would be looking at 19.4 pCi/g. But DOE is proposing a standard of 1200 pico-curies per gram of strontium-90. Thus, DOE's Option 3 would

139-1

139-1 There is no regulatory requirement set at the national (EPA) and state (DTSC) levels that require incorporation of a garden scenario when considering future risk. Scenarios are based on the most-likely future land use. The future use of the SSFL property is that of open space. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. DOE used the residential scenario as a conservative risk analysis, not because there will be residential reuse of the property in the future.

In this Final EIS (see Chapter 2, Section 2.4), DOE has retained the Cleanup to Revised LUT Values Alternative, which uses chemical RBSLs based on a suburban residential scenario without a garden pathway. The Final EIS also retains the Conservation of Natural Resources Alternative, but evaluates two scenarios. The Open Space Scenario is based on the future land use of Area IV and the NBZ as open space, consistent with Boeing's conservation easement and agreement (i.e., cleanup levels are based on exposure of an onsite recreational user as the receptor). The Suburban Resident Scenario is the scenario evaluated in the Draft EIS, that is, cleanup levels are based on a suburban residential scenario without a garden pathway. This latter scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space.

In Chapter 4, Section 4.9 of this Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that local residents may get some portion of their food from a home garden.

When a risk assessment is performed, EPA Risk Assessment Guidance (EPA 1989) does allow for some averaging and prescribes the use of an upper confidence limit (UCL) on the arithmetic average (UCL95) and only suggests the use of a maximum value as a screening tool. It is important to note that under any of the soil remediation alternatives, those soils with the higher levels of chemical and/or radioactive constituents, that is, those that would pose a risk to human health or the environment, would be removed. Soils that would be left on site would have lower concentrations of chemical and/or radioactive constituents. Each of the three action alternatives analyzed in this EIS would leave SSFL Area IV and the NBZ safe for their designated future land.

Commenter No. 139 (cont'd): Devyn Gortner
Teens Against Toxins

produce not a chest X-ray a month, but 62 X-rays a month, or 744 per year, for decades. Children like Grace and Ryan, pregnant women, families would be exposed at huge levels.

And remember that DOE's proposed standard is based on dose and concentrations averaged over a wide area, meaning the contaminated places are diluted by averaging with lower readings half a mile away. So the actual exposure could be not 744 X-rays a year, but even in the thousands. My family has a history of heart problems and so we are familiar with chest xrays- and even our doctor recommends no more than 1 per year. The thought of being forced to get thousands per year is infuriating.

I said it on Saturday and I'll say it again. You promised me you would protect me, my family and my community. You promised 6 years ago you would clean up the mess you made so that it would be like you never made it in the first place. The community has debunked every single one of your excuses as to why you cannot keep this promise. Maybe we will never have definitive proof that the exact contamination you left created the cancer that plagues Grace and Ryan and dozens of other children. But even the slightest chance it could be linked should be more than enough to act and act NOW. Better safe than sorry. It rained today, washing more and more of the contamination down into the neighborhoods below the site. Tomorrow it will be sunny and the children will go back to playing in their yards. Your move.

139-1
cont'd

139-2

139-3

DOE chose to identify the 25 millirem per year in its risk-based alternative for clean in this EIS, consistent with the upper limit for dose-based release criteria under DOE requirements (DOE Order 458.1). The 25 millirem in a year exposure limit would represent a maximum possible dose. It did not take into account the Department's requirement to apply ALARA. DOE does not propose in the Final EIS radionuclide cleanup standards based on dose. DOE instead has conducted a risk-assessment based approach for soil remediation. DOE notes that the methodology used in the cleanup evaluation for the Conservation of Natural Resources Alternative in the final EIS results in doses that are well below the 25 millirem year upper limit and are in a range that is consistent with the CERCLA target risk range.

139-2 This EIS evaluates alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health and protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

139-3 DOE acknowledges your concerns and refers you to Section 2.7, "Offsite Impacts," of this CRD regarding your concern about dispersion of contamination from SSFL, as well as Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

Ms. Stephanie Jennings
NEPA Document Manager
SSFL Area IV EIS
U.S. Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 93063

RE: DOE/EIS-0402, Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory

Dear Ms. Jennings

The Trust for Public Land has reviewed the Department of Energy’s DEIS for Area IV and the Northern Buffer Zone (“NBZ”) of the Santa Susana Field Laboratory (“SSFL”) and writes to support the Conservation of Natural Resources Alternative. In balancing several factors, including the planned use of the area as open space and impact to the natural environment and native species, the Conservation of Natural Resources Alternative offers cleanup of harmful contaminants without unnecessary excavation. The Trust for Public Land also urges careful examination of the Cleanup to AOC Look-Up Table Values Alternative because it is overly disruptive of the natural environment.

140-1

140-2

SSFL is surrounded by land that is mostly undeveloped, including the Upper Las Virgenes Canyon Open Space Preserve to the south and west, and the Sage Ranch, parkland that runs along the northeastern boundary of the property. The American Jewish University Brandeis-Bardin Campus is also located to the north and is largely open space. The Conservation of Natural Resources Alternative allows for the property to continue as a critical wildlife corridor. Located on approximately 2,850 acres in the Simi Hills, SSFL is a part of a unique wildlife corridor that unites the Sierra Madre Ranges of the Los Padres National Forest to the Santa Monica Mountains and the Pacific Ocean, known as the Santa Monica-Sierra Madre Connection according to the *South Coast Missing Linkages Project*, an interagency analysis of wildlife corridors. Several mammal species have been known to travel through Area IV and the NBZ, including bobcat, coyote, mountain lion, and deer. It is also a corridor for at least one threatened bird species and has been assessed as a suitable habitat for several threatened, rare, or endangered bird species. The Cleanup to AOC Look-Up Table Values Alternative would destroy the topographical character of the land, and further, the ten plus years required to complete the planned excavations would render the area inaccessible to these animals and could potentially permanently close the area to migration. The Conservation of Natural Resources Alternative also allows Area IV and the NBZ to continue functioning as a habitat for unique and diverse vegetation as well as a critical plant dispersal corridor. Several different plant communities populate the site, including oak and walnut woodlands, chaparral, and grasslands. Sandstone outcrops are scattered throughout the area and support a distinct vegetation

140-2 cont'd

140-1 DOE acknowledges your support for the Conservation of Natural Resources Alternative. Please refer to Section 2.1, “Preferences for Cleanup,” of this CRD for further discussion of this topic

140-2 Chapter 2, Table 2-9, summarizes the impacts of each soil remediation alternative, and provides a means to compare and contrast the alternatives. Chapter 5, Section 5.5.5 of the EIS acknowledges that potential cumulative impacts from reasonably foreseeable actions in the ROI in combination with the proposed actions at SSFL by the DOE could affect regional wildlife movements (wildlife corridors). Under all soil remediation alternatives, including the Cleanup to AOC LUT Values Alternative, the amount of land disturbed at a given time would be variable. Remediation would be done in stages, with certain areas being excavated, others backfilled and showing signs of recovery from revegetation, and still others being undisturbed. It is a presumption in the EIS that revegetation will be successful. DOE notes that because the area would be remediated in stages, it is not correct to picture the entire 150 acres disturbed and 881,000 cubic yards removed all at the same time. While DOE agrees that disturbance of 150 acres across the site would be disruptive to the existing visual and natural setting, DOE is confident that a successful backfill, contouring, and revegetation effort could restore the site to a natural-looking state. DOE would backfill areas of removed soil and bedrock (an estimated 75 percent replacement) and to recreate the contours of the current land surface to the extent possible; this effort would prevent the formation of any large pits.

Commenter No. 140 (cont'd): Tori Kjer, Los Angeles Program Director,
The Trust for Public Land

community. Additionally, the property contains at least two endangered or rare plant species and is a delicate area still in the process of regenerating due to the 2005 Topanga Fire and other disturbances. Changes in the topography and soils would affect plant dispersal patterns and could ensure that unique native vegetation never fully reestablishes itself.

We encourage careful consideration of the level of disruption to native plant vegetation and the general topography of the area proposed under the Cleanup to AOC Look-Up Table Values Alternative. If unnecessarily invasive techniques are used they could forever change the character of this unique ecosystem. An estimated 933,000 cubic yards of soil would be removed as nearly all of the soil in Area IV and the NBZ contains at least one contaminant exceeding background levels. Moreover, this alternative requires that replacement soil meet the same low threshold for contaminant levels as the soil removed. Soils meeting this threshold are not typically available, an issue that is highlighted but not resolved in the DEIS. Embarking on such an aggressive cleanup strategy could lead to permanent and irreversible disruption of the land and its natural systems. Additionally, the excavations planned under the Cleanup to AOC Look-Up Table Values Alternative would leave an enormous carbon footprint. Approximately 116,000 total truck roundtrips over 10 years would be required to complete the cleanup according to this plan, with an additional 62,500 roundtrips for cars or light-duty trucks due to worker commutes. This would result in a release of up to 84,000 metric tons of greenhouse gas emissions.

Given Area IV and the NBZ's important role as a wildlife and plant dispersal corridor and the planned long-term use of the land as open space, The Trust for Public Land encourages consideration of the Conservation of Natural Resources Alternative. When considered alongside the other alternatives presented in the DEIS, the Conservation of Natural Resources Alternative appears the most tailored to the sensitive needs of the SSFL site and would ensure protection of the natural ecosystem of the area, one that is critical to maintaining connectivity within the greater Santa Monica-Sierra Madre Connection as a whole.

Sincerely,

Tori Kjer
Los Angeles Program Director
The Trust for Public Land

Commenter No. 141: Albert Knight

THE BURRO FLATS BURRO PICTOGRAPH

by Albert Knight

February 13, 2017

Many people that study "rock art" (I am speaking of prehistoric rock art here) sometimes try to determine what the art means; that is, try to determine what "statement" the artist was attempting to make. Any efforts towards interpretation, however, are fraught with peril, for how can someone from one culture successfully interpret symbols used by a completely different culture? I myself, therefore, rarely try to explain the meaning of rock art images; better, I think, to simply enjoy what I am looking at, and to limit myself to a description (to the degree possible) of what I am seeing, although I do admit that it is great fun to speculate about possible meanings. OK, but how about trying to interpret symbols from one's own culture? Hmmmmm . . .

I have a specific example of *historic rock art* in mind here, and this specific example is important, I think, because it is located in an area that may be "negatively impacted" by on-going efforts to clean-up a considerable amount of both real and perceived "industrial pollution." The clean-up, in fact, if allowed to proceed to the fullest extent proposed, will completely destroy a large beautiful natural area in the eastern Simi Hills (note: this clean-up effort is beyond the scope of this paper- those that are interested are advised to do an on-line search for the *Santa Susana Field Laboratory*, and to examine the various links that discuss the Field Laboratory and the on-going and proposed clean-up). The point of this paper then, is that the I believe that it is possible that if this specific historic rock art is "properly" interpreted, that interpretation may help insure that the site, and the area where the site is located, will not be severely impacted by the clean-up.

In any case, the specific example of historic rock art that is discussed here depicts what I now believe to be a painting of a burro. This burro painting (and seven other paintings, that are not discussed here) is/are found in a small rock shelter close-by the geographical feature known as *Burro Flats*. This site has been previously described in a report by the author- *The Burro Flats Burro Pictograph Site, 56-001772 (2016a)*. The current paper will not attempt to repeat all of the information provided in the 2016 paper. Briefly, the earliest written reference to Burro Flats is a 1888 "Map of the Lands of Rancho Simi," where the *Portrero del Burro* is shown as being located in Subdivision A. The earliest known depiction of the burro painting itself is a sketch by a Mr. Walter Brinkop, from 1914; Brinkop subsequently commented on his sketches in a note to the Southwest Indian Museum, in 1920. Burro Flats and the surrounding area eventually became part of what was briefly known as *Sky Valley Ranch (1939-1954)*; the ranch families (the Silvernale's and the Hall's) were aware of the existence of the burro paintings (Knight 2017, in process). The burro painting and the associated paintings were first examined in detail by local rock art expert Mike Kuhn, beginning in 1983. The burro painting (and the site in general) was formally recorded by the CRM firm W&S, in 2001. The author was made aware of the existence of the site by Dr. Edwin Krupp, the Director of Los Angeles Griffith's Observatory, in the early 1990; the author visited the site for the first time in 2012.

A natural-light photograph of the burro painting, by the author (2012), can be seen in Figure 1. A natural-light photograph, and a photo-enhancement of the same picture, by Devlin

141-1

141-1

DOE recognizes the cultural importance of the Burro Flats Burro Pictograph (CA-VEN-1772) and considers it eligible for listing on the National Register of Historic Places. The National Historic Preservation Act (NHPA) Section 106 Programmatic Agreement (being developed in consultation with the SHPO and other consulting parties, including the federally recognized Santa Ynez Band of Chumash Indians and non-federally recognized tribes, and DTSC) addresses protection measures during cleanup activities.

Commenter No. 141 (cont'd): Albert Knight

Gandy (2016), can be seen in Figure 2. A photograph of a burro (courtesy of Bing), for the purposed of comparison, can be seen in Figure 3.

Figure 1

Figure 2

Response side of this page intentionally left blank.

Commenter No. 141 (cont'd): Albert Knight

Figure 3

The painting, when the author first heard of it, was described as a "lavender horse," and also, as a "pink horse." But after seeing photographs of the painting, it occurred to me that the very short legs indicated that the animal was not a horse, but was another kind of equine. And the obvious close-association of the painting with Burro Flats, quickly led to the conclusion that the painting actually depicts a burro. At this point, it is necessary to digress for a moment, and admit that I quickly realized that I do not know a great deal about burros. Although both of my parents were born and raised on ranches, and I was introduced to horses at an early age, I had never been around any other types of equines, including burros (note: burros, donkeys, and asses are different terms for the same highly variable species of animal, *Equus asinus*). And the only burro (donkey, ass) symbolism that I knew anything about is the donkey that represents the Democratic Party. This, I note, came about because during the presidential campaign of 1828, Andrew Jackson's detractors referred to and caricatured him as an "jackass" (among other things), and Jackson, being a son of the soil, took this as a compliment and used a donkey as a PR symbol; some years later, the Democratic Party adopted the donkey as the party mascot.

In any event, having decided that the equine depicted at Burro Flats was a burro, and not a horse, I went about my business. The subject occasionally came up in conversation, and those (very few) people that I discussed the subject with were not entirely in agreement about my burro vs. horse interpretation: maybe yes, maybe no. They pointed out that in the painting, the head is very small, relative to the over-all size of the animal, and the neck too long and thick (to be an accurate depiction- compare Figures 1 and 2 with Figure 3). The paint along the belly is dripping down, etc.; perhaps these faults, and the short legs, indicated nothing more than the artist was no Leonardo.

Response side of this page intentionally left blank.

Commenter No. 141 (cont'd): Albert Knight

And then, I read John P. Harrington's Reel #106 notes on the Fernandeno, which were recorded in 1914-1917. Specific important comments by Juan Menendez, the grandson of Odon Chihuya, the principal grantee of *Rancho El Escorpion*, and the son of Espiritu Chihuya Leonis (one of Odon's daughters), include: "Menendez knows a rock about 2 miles upstream from Charlie Bell's house where the footprints of our savior and a burro are to be seen in a rock" (1986:37, 106-152:4:20), "Here in El Escorpion the informants have visited a place where on a big flat rock are a child's tracks, also the tracks of a burrito" (1986:37, 106-220:2:1), and, importantly, "Menendez says that when El Senor first came to this earth the earth was not yet dry, and these are his tracks" (1986:37, 106-220:2:2); the English translation of the Spanish "*El Senior*," is "*God*." Menendez, as Odon's grandson and as Espiritu's son, was in the chiefly line of the west San Fernando Valley Native American/mixed race community, and his comments are therefore pertinent and important.

From these comments we can see that in modern English, Menendez- the son of chiefs- told Harrington that "After the world was created, and while the earth was still damp, God, our savior, and a little burro visited (what was thereafter known as Burro Flats) and left their tracks." In my 2016 paper, I stated that: "... given the Burro Flats-specific information that Juan Menendez provided to Harrington, it seems likely that the attribution of the geographical name 'Burro Flats' derives from that very special animal, who was a participant at the Nativity." I noted that everyone has seen a nativity scene where a burro gazes down upon *our savior*, and concluded by saying that "It is true that no burro (ass, donkey) is mentioned in the Bible, where the Nativity is described in the Gospels of Luke and of Matthew, or in the Koran, where the Nativity is discussed in Sura 19, Maryam, or Mary the Mother of Jesus (Parrinder 1995:75-82)" ... This very special burro, however, has often been included in Christian nativity scenes (see Figure 4, by Botticelli) "since before the middle ages- a tradition that continues today." In other words, the import of what Menendez told Harrington is that the name Burro Flats, and the painting of the burro at Burro Flats, are indicators of divinity: i.e. the name and the painting indicate that Burro Flats is a sacred place.

Figure 4

Commenter No. 141 (cont'd): Albert Knight

Then, one day, I happened to open my copy of *Those Were the Vaqueros - The Collected Works of Arnold R. Rojas* (note: Rojas was the historian of everything Vaquero related, in south-central California), and there, at the very beginning of that excellent history, were Rojas' comments on and complements to the burro (Rojas 1974:3-6). When we see his comments, it is immediately clear what an important animal the burro was and in many places still is. As for California history, as Rojas says, had it not been for the burro, there would have been no story. Rojas says: "Though their master may have never thought to eulogize them, the real heroes of the migrations into California from Sonora were the lowly burros. . . . It is difficult to see how the people who came in early days could have made the journey . . . without the patient little animal the paisano could most readily afford . . . many rich mines in the deserts of the west would never have been discovered had not the early-day prospector found at hand a noble animal *which fools, in the depths of their ignorance, have made the symbol of stupidity*" (emphasis by the author).

Rojas continues: "Ask any old paisano who knows him and he will tell you the burro is the smartest and bravest of all animals. Put him against the largest and strongest horse and the proudest charger will turn and flee from the onslaught of the lowly jackass. He will, in a fight with a grizzly bear, give a better account of himself than any other animal, battling with a ferocity that belies his melancholy bray, gentle nature, and great trusting eyes . . . The old men would smile with pleasure and were eloquent when asked to enumerate the virtues of the faithful and staunch companion of their boyhood. 'Si,' they would say, 'the burro is brave. He is the only domestic animal besides the dog who will fight to the bitter end and never quit. The dread puma will run away from a rain of kicks dealt by this sturdy battler . . .' Burros are put in a herd of horses to protect the foals. The proud stallion may prance about his mares and fight others away in jealousy, but it will be the undersized alien in the band who will keep his head when the horses are in panic, and fight the wolves away from the colts. A burro or mule will kill a wolf."

After rediscovering the comments on burros by Rojas, I decided to pursue the subject further, and I discovered quite a bit more interesting information, only a small part of which I will repeat here (but see Brookshier 1974). The reader will note, especially, that my quick re-reading of Luke and Mathew (and the Koran, no doubt) were inadequate.

According to Brookshier: An average adult burro weighs ca. 600 lbs., about 1/2 that of a horse, and is ca. 45" tall, at the withers- about 3/4 the size of a horse (many burros are even smaller). The horse's legs and tail are longer, but despite their differences in size, the head of the burro is only slightly smaller than that of a horse, so that for those used to seeing horses, but not burros, the burro's head looks too big. On the other hand, the ears of a burro are some 10 inches long, while those of a horse are only 5-6 inches long, so that the burro can hear better; the burro can also see better, and "rarely, if ever, is a burro bitten by a rattlesnake . . ."

Burros can be gray, black, brown, white, or some combination thereof. White burros were, and in some places still are, considered to be special, sometimes even sacred. A burro's temperature is 99-degrees, the closest of any domesticated animal to man. A well-cared for burro may live 40 to 50 years- a lifespan of twice or more than that of a horse. Like Rojas, Brookshier says that "Burros have distinctive 'personality,' as well as physical, traits . . . A burro in a pasture with other grazing animals- cattle, horses, or sheep- will almost invariably be the first to detect the approach of a stranger . . . burros therefore make good sentinels or guards. The burro is also courageous, he is not afraid when a dog or wolf enters the pasture but, on the contrary, often chases the invader away. This is especially true of a mother burro . . . she is fearless in her duty. Female burros make good mothers, are very proud of their babies, and will fight a mountain lion to protect them" (1974:14). Many of those that know them say that the burro is more intelligent than the horse. "Burros thrive

Response side of this page intentionally left blank.

Commenter No. 141 (cont'd): Albert Knight

on attention and affection . . . and they make good pets. The larger ones present some problems . . . when they are permitted into the house." Brookshier advises people to not let their burro to sit on a couch or a chair- they will break it down (1974-15-16).

Brookshier states that historically, burros have been mentioned in both positive and negative contexts, for 1000's of years, and that they are mentioned by all of the early Middle Eastern civilizations, back to *The Epic of Gilgamesh*, the oldest book in the world. He notes that, "One concordance of the Bible lists 153 references to the burro; no other animal is referred to so often. Genesis leads with 18 references; Exodus follows with 12." The Jews took good care of their burros and "Jewish law prescribed that both the ass and the ox were to rest on the seventh day, like their owners (Exodus 23:12)" (1974:91). Of all of the animals mentioned in the Bible, only the serpent in the Garden of Eden and Balaam's ass speak. Without going into the entire story, we note that when she was beaten by her master for pausing on the trail, Balaam's ass "defended herself by saying that she had seen an angel of the Lord" (Numbers 22:28, 22:30) . . . "According to Jewish tradition, Balaam's ass . . . was carefully nourished and kept in a secluded place, for she was destined to play a special role in Jewish history; she was to carry the long-awaited Messiah, who would go forth to rule the earth" (1974:93). Also, "According to legend, there were other burros who spoke in human tongue, among them a burro owned by the Queen of Sheba; and the burro of Bethpage who carried Jesus into Jerusalem" (1974:95).

The further history of the burro, as recounted by Brookshier, is extensive, and interesting, but beyond the scope of the point being made here. What we need to consider here are Brookshier's comments from his pages 93 and 95; in particular his comments about "Balaam's ass," and "the burro of Bethpage," for it is these specific burros who spoke, and that are directly associated with the Jewish Messiah, whom Christians equate with Christ (but Jews do not). In fact, it appears that the painting of the burro at Burro Flats represent either Balaam's ass, who ". . . was to carry the long-awaited Messiah," (and who, in Christian mythology, carried the pregnant Mary to Bethlehem), or perhaps the burro of Bethpage, who ". . . carried Jesus into Jerusalem."

This is not to suggest that the person that named Burro Flats and/or painted the burro at Burro Flats was aware of all of these nuances- certainly not. But the general subject was part of the catholic culture that person came from. For people that were familiar with burros in their own lives, the burros mentioned in the Bible would have created a connection that most of cannot appreciate today.

In any event, we can say that burros are, at the very least, very special and important to people all over the world, and this has been the case for 1000's of years. And that situation was the case in the Simi Hills, some 200 years ago. We have seen that Judeo-Christian religious tradition frequently mention burros in general, and also mentions some very specific burros, who are associated with divinity. And one of these burros, as Juan Menendez told JP Harrington in 1917, visited Sky Valley with *El Senor*, with *our savior*, only a little while after the land was separated from the waters (Genesis 1:9, etc.). It therefore seems to be the case that the name Burro Flats, and the burro painting that is located there, are metaphors for divinity, and that Burro Flats was considered to be a sacred place. In other words, "Burro Flats" is a word-avoidance circumlocution, so that the speaker can avoid saying the word "God," as that was considered to be impolite, in times past. The burro painting and the place-name *Burro Flats*, are therefore allusions for *El Senor*/our savior. And given this, it is the author's opinion that the Burro Flats Burro Pictograph site was a historic Catholic shrine, which was visited by members of the local Native American/mixed race community.

141-1
cont'd

Response side of this page intentionally left blank.

Commenter No. 141 (cont'd): Albert Knight

I also note that the near-by Burro Flats Painted Cave, which is listed on the National Register of Historic Places, was a sacred place for the Chumash people and their neighbors for 100s, if not 1000s, of years (Knight 2012, 2016a, 2016b, 2017), and it seems likely (to the author) that the Burro Flats Burro Pictograph site represents a historic continuation of a very long-standing Native American tradition, abet with a historic-catholic aspect. Again, I point all of this out because I do not want to see the Burro Flats area needlessly destroyed by an over-zealous, un-necessary, clean-up: Burro Flats is a sacred place and has been so-recognized for 1000s of years- it should be given the respect and the protection that it deserves.

And, finally, Figure 5 shows the author's wife Mary, visiting with some burros at Oatman, Arizona, where a dozen or so are allowed (yeah, encouraged) to wander through town, for the amusement of the tourists.

Commenter No. 142: Scott Kovac
Nuclear Watch New Mexico

April 13, 2017

Ms. Stephanie Jennings
NEPA Document Manager
SSFL Area IV EIS
U.S. Department of Energy
4100 Guardian Street, Suite 160
Simi Valley, CA 93063

Re: Comments on the Department of Energy's Draft Environmental Impact Statement (DEIS) for the Santa Susana Field Laboratory

Dear Ms. Jennings:

Nuclear Watch New Mexico seeks to promote safety and environmental protection at nuclear facilities; mission diversification away from nuclear weapons programs; greater accountability and cleanup in the nation-wide nuclear weapons complex; and consistent U.S. leadership toward a world free of nuclear weapons.

The long-delayed cleanup of the Santa Susana Field Laboratory (SSFL) is a familiar story to us. It goes like this: DOE operations release dangerous nuclear and chemical contamination into the environment, impacting both workers and neighboring communities. DOE minimizes the contamination and its impact on health, and drags its feet for decades on cleanup. DOE signs cleanup agreements that it does not keep, and DOE sites remain contaminated.

Troubling issues regarding the SSFL cleanup were brought to our attention in August 2016, when we learned that while DOE broke its contract to fund the Community Involvement Fund of the New Mexico Community Foundation, it simultaneously funded a front group that lobbies against the SSFL cleanup. Funding from CIF was critical to several ANA groups, who were appalled by DOE's conduct in the matter. Now more fully informed about the SSFL cleanup, we are pleased to submit comments on DOE's DEIS for the site.

SSFL was the site of nuclear activities that have left a legacy of contamination. SSFL once housed 10 nuclear reactors, one of which had a partial meltdown in 1959, and two others suffered accidents as well. A "Hot Lab" to cut up irradiated fuel from around the country was also sited at SSFL, as well as plutonium and uranium-carbide fuel fabrication facilities and a sodium burn pit used for open-air burning of contaminated reactor components. SSFL's soil, groundwater, and surface water are contaminated, and this contamination has migrated off-site putting nearby communities at risk. Federal studies indicate elevated cancers among both workers and off-site populations near SSFL.

In 2010, DOE finally signed an Administrative Order on Consent (AOC) with the California Department of Toxic Substances Control to clean up its operational area at SSFL to background levels of contamination. In 2012, DOE issued a notice entitled, "Public Participation in the Development of Alternatives to be considered in the Santa Susana Field Laboratory Area IV Environmental Impact Statement." In it, DOE stated that it was committed to the AOC and that its

142-2

The mission of DOE is to ensure America's security and prosperity by addressing its energy, environmental, and nuclear challenges through transformative science and technology solutions. Additional information can be found at <https://energy.gov>. As the largest environmental cleanup program in the world, DOE's Office of Environmental Management has been charged with the responsibility of cleaning up 107 sites across the country. To date, the Office of Environmental Management has made substantial progress in nearly every area of nuclear waste cleanup and completed cleanup at 91 of these sites. Additional information can be found at <https://energy.gov/em/office-environmental-management>. DOE conducted historic operations under the laws and regulations applicable at the time.

While the comment is not on the scope or content of this Final EIS the following information is being provided.

DOE has funded a number of stakeholder groups, including Teens Against Toxins, the SSFL Advisory Panel, Physicians for Social Responsibility, the Rocketdyne Cleanup Coalition, Committee to Bridge the Gap and the SSFL CAG. The SSFL CAG is an independent group, created under the State of California Health and Safety Code, approved by the DTSC and formed under guidance from the Udall Foundation, an

Commenter No. 142 (cont'd): Scott Kovac
Nuclear Watch New Mexico

EIS would be limited to an examination of alternate ways to achieve the AOC cleanup standard. In 2014, DOE stated that its DEIS would be completed later that year, and projected that it would meet the 2017 deadline stipulated in the AOC for the cleanup to be complete.

Unfortunately, the cleanup has yet to begin. DOE's DEIS was just released at the beginning of this year, and not one of the four alternatives proposed in it comply with the AOC cleanup agreement.

Despite the AOC barring leave in place options, DOE's first alternative proposes not cleaning up 480,000 cubic yards of contaminated soil, which DOE preemptively excludes citing potential exemptions that do not meet the narrow exemptions permitted in the AOC. The second alternative proposes to leave in place up to a million cubic yards of contaminated soil by using a suburban residential risk-based cleanup that omits the required backyard garden component of a residential cleanup level. The third alternative proposes to not clean up as much as 99% of the contaminated soil, allowing radioactivity levels hundreds of thousands of times higher than the U.S. Environmental Protection Agency's preliminary remediation goals. The fourth alternative proposes no cleanup at all.

DOE's DEIS also does not acknowledge that DOE does not have the authority to make the decisions about how much contamination gets cleaned up. For chemicals, under the Resource Conservation and Recovery Act, that decision is made by DOE's regulator, the DTSC. For radiological contaminants, DTSC is also the regulator as stipulated in the AOC.

Nuclear Watch New Mexico recommends that DOE revise its EIS to be fully compliant with the AOC cleanup agreement that it signed, and that it proceed to do so without delay. Communities living near SSFL have waited too long for the promised cleanup to occur.

Sincerely,

Scott Kovac

independent Federal agency focused on environmental stewardship. The SSFL CAG began operating in 2013. The grant to the CAG was funded through local project funds in an effort to support community engagement. DOE posted notification of the grant in September 2015 on USASpending.gov, an official website disclosing grants, loans and other financial assistance awards.

DOE's Office of Environmental Management started the Community Involvement Fund (CIF) to increase public involvement in the environmental management decision-making process and assist stakeholder groups with analyzing environmental management plans and proposals. The CIF operated from late 2010 until September 2015, and distributed a total of \$1.6 million through 46 grants to 23 recipients around the country, including groups involved in observing SSFL cleanup preparation. These included:

- \$46,800 in 2011 to the Committee to Bridge the Gap.
- \$55,000 in 2012 to the SSFL Advisory Panel, partnering with the Committee to Bridge the Gap. The SSFL Advisory Board is not related to the SSFL CAG.
- \$23,000 in 2013 to Physicians for Social Responsibility – Los Angeles, partnering with the Rocketdyne Cleanup Coalition, Teens Against Toxins and Committee to Bridge the Gap.
- \$20,000 in 2014 to Physicians for Social Responsibility – Los Angeles, partnering with Teens Against Toxins and the SSFL Work Group, which is not related to the SSFL CAG.

- 142-3 Please refer to Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts. As described in Section 2.7, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act. Please refer to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have

Commenter No. 142 (cont'd): Scott Kovac
Nuclear Watch New Mexico

examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

142-4 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

142-5 DOE recognizes DTSC's authority with respect to the AOC and the Resource Conservation and Recovery Act. In order for cleanup to begin, DTSC first needs to complete its Environmental Impact Report developed under the California Environmental Quality Act (the Draft Program *Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* was issued by DTSC in 2017 [DTSC 2017b]) and issue its findings.

As discussed in Chapter 1, Section 1.9.2, of this Final EIS, DTSC is currently preparing a program environmental impact report (EIR) under CEQA that applies to cleanup of the entire SSFL; the *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* was issued by DTSC in 2017 (DTSC 2017b). DTSC will issue a Notice of Determination for the program EIR identifying the selected remedial actions.

The Area IV and NBZ site cleanup activities covered by this Final EIS would begin following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition.

Commenter No. 143: Anonymous

I implore the U.S. Department of Energy "DOE" to fully cleanup the SSFL site contamination as the DOE agreed to, and signed, in the 2010 Administrative Order on Consent "AOC". It is not all right for the DOE to renege on the AOC agreement by changing the terms and compromising the health and well-being of residents, and may I say many future generations, in all nearby communities. The site must be cleaned up fully and completely to remove all detectable contamination!

The 4 EIS proposals presented by the DOE are NOT in compliance with the 2010 signed AOC. To leave ANY of the detectable contamination in place allows for the contamination to adversely affect and impact communities that are nearby.

In 1994 when my husband and I married, we moved into our home on Appleton Road in Simi Valley. We are in close proximity to the SSFL when the wind radius is taken into account, and we live just down the street from Runkle Canyon. We have 2 sons. Three years ago one son was diagnosed with a chronic thyroid condition at the age of 15. I am extremely worried about him. There are contaminants at the site that are known to cause thyroid health issues. When the rocket engines were being tested, we would hear the extremely loud rumble of the rocket engines, and at those times, our windows would rattle and shake.

The name "Simi" means windy, and Simi Valley is a windy city. Hazardous contaminants at the SSFL can easily blow in the wind in any direction. Hazardous contaminants can easily run downhill from the SSFL when it rains. To leave any detectable contaminants at the SSFL would absolutely be the wrong action to take.

There are some who want to preserve, in place, the rocket engine test stands and the Chumash Indian paintings that are on the grounds of the SSFL. I am not one of them. If that is done, the DOE would not be removing the detectable contaminants under and around those test stands and the Indian paintings. That is not acceptable! People presently living, and future generations to come, are immeasurably more valuable than the rocket engine test stands and the Chumash paintings. Make replica stands and put those replicas somewhere else to be viewed. Have a government photographer photograph the Chumash paintings to preserve what those paintings look like before they are removed from the site. I recognize that the rocket engine test stands and the Chumash paintings are a part of history. I surely hope though that the DOE does not take the position that the rocket engine test stands and Chumash paintings are more important and valuable than human lives!!

The DOE needs to concentrate on how it is going to completely cleanup the detectable contaminants at the SSFL rather than on how much of the site's contaminants it is going to cleanup or whether it will do any cleanup!

The DOE must abide by the AOC to cleanup ALL detectable contamination. It is the U.S. Federal government's duty to protect its citizens. It is the U.S. federal government that was involved with the SSFL nuclear site as well as the testing of the rocket engines. With the nuclear meltdown of many years ago, it is the U.S. federal government DOE that has the responsibility to clean it up. It has been way too many years already that residents in the surrounding communities have been exposed to the hazardous contaminants. Cleanup should have been done long ago. It still needs to be done!

To those in the DOE who have decision power regarding the cleanup of the SSFL site, I ask "If you lived close by the SSFL site, would you want yourself and your family and generations that follow to be continually exposed to hazardous contaminants that can cause horrific health conditions?"

143-1

143-2

143-3

143-2
cont'd

143-1
cont'd

143-3
cont'd

143-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," of this CRD. In this EIS, DOE does not propose to breach the 2010 AOC signed with its regulator, DTSC. However, NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. To meet this obligation this EIS evaluates alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup levels. (Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.) This latter use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

143-2 DOE acknowledges your concerns and refers you to Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties.

However, as indicated in Chapter 1, Section 1.3, there are three responsible parties (DOE, NASA, and Boeing) at SSFL who performed work and there are environmental consequences as a result of this work. Each of the three parties is responsible to remediate the areas where its work was performed. The test stands and most of the Chumash paintings referred to in the comment are not within Area IV or the NBZ where DOE has cleanup responsibility. Regarding the exemption areas proposed by DOE in this EIS, if there is contamination in those areas that poses a risk to human health or the environment, it would be subject to a carefully planned and focused cleanup; please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD.

143-3 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

Commenter No. 143 (cont'd): Anonymous

To do nothing in the way of cleanup or only partially cleanup the SSFL site is absolutely NOT acceptable. All detectable contamination must be removed as per the 2010 AOC which was agreed to and signed by the U.S. Department of Energy!!

Commenter No. 144: Dr. Sheldon C. Plotkin
Southern California Federation of Scientists

This testimony was interrupted because it exceeded the minimal time limit for public comment. This document is being submitted so that the full statement may be on the record.

Testimony of Dr. Sheldon C. Plotkin
Southern California Federation of Scientists
Hearing on the DOE Draft EIS for Santa Susana Cleanup
February 18, 2017

I am Dr. Sheldon C. Plotkin and am appearing here on behalf of the Southern California Federation of Scientists, which has been involved for nearly forty years in trying to get the Department of Energy to take responsibility for the contamination it created at Santa Susana and clean it up. We are deeply concerned that DOE has once again demonstrated that its word cannot be trusted and that it has now broken the legally binding cleanup agreement it signed in 2010.

DOE and its predecessor agency, the Atomic Energy Commission, historically acted as if they were above the environmental laws of the country that apply to everyone else. They consistently broke fundamental rules about protecting the environment, ending up polluting soil, water and air at scores of nuclear facilities around the country.

At Santa Susana, elementary safety rules were ignored. Four different reactors suffered accidents. In 1959, one reactor released radioactivity. A few months later, a different reactor suffered a partial meltdown in which a third of the fuel experienced melting. Essential safety rules were simply ignored. In that case, after an accident in which power ran out of control exponentially, and they could barely shut the reactor down, they inexplicably started it up again a couple of hours later without having been able to identify the cause of the problem. They ran for another ten days or so, in the face of clear evidence of a failing reactor, with radiation readings so high that they went off scale; in other words, radiation levels higher than the monitors could record. Radioactive material was intentionally released into the environment for weeks. And then true to pattern, they lied about the accident and tried to cover it up.

In 1964 another reactor had a very similar accident, where they pushed it to keep running for a year in the face of clear evidence that the fuel was failing. 80% of the fuel was damaged. A few years later sloppy safety practices led to another accident, where again they kept running it for many months with failing fuel, leading to a third of the core being damaged.

There were radioactive fires at the "hot lab" where highly irradiated nuclear fuel was disassembled. And for decades they illegally burned radioactive and toxic chemical wastes in open burn pits, with the contamination released into the air over Simi Valley and polluted water dumped over the hillside to a children's camp.

DOE failed to follow protective procedures and failed to tell the truth. This is DOE's long history throughout the country. After SSFL was closed down, there were hopes there might

144-1

144-2

144-3

144-1
cont'd

144-1 DOE has not announced that it intends to break the 2010 AOC. NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

144-2 DOE conducted historic operations under the laws and regulations applicable at the time. DOE's Office of Environmental Management has been charged with the responsibility of cleaning up 107 sites across the country. To date, the Office of Environmental Management has made substantial progress in nearly every area of nuclear waste cleanup and completed cleanup at 91 of these sites. Additional information can be found at <https://energy.gov/em/office-environmental-management>.

144-3 As indicated in Chapter 1 of this EIS, DOE acknowledges that past activities at SSFL resulted in chemical and radiological releases that impacted soils, buildings, and groundwater. Chapter 1, Section 1.3, contains a brief history of activities at SSFL and describes the radiological and chemical characterization studies performed for Area IV and the NBZ. Additional information about the activities of DOE and its predecessor agency, the Atomic Energy Commission, at Area IV at SSFL can be found at <http://www.etec.energy.gov/>. Chapter 3, Sections 3.9.5 and 3.9.6, of the EIS contain information about accidents at Area IV, including the 1959 SRE accident, which was the only accident that caused a measureable release of radioactive material. At the time of the accident it was estimated that the accident resulted in the release (over a 2-month period) of about 28 curies of radioactive noble gases such as krypton-85, in low, controlled concentrations that met Federal requirements. Additional information about the 1959 SRE accident can be found at http://www.etec.energy.gov/Operations/Major_Operations/SRE_Accident.html. With respect to the

**Commenter No. 144 (cont'd): Dr. Sheldon C. Plotkin,
Southern California Federation of Scientists**

be a change in attitude and DOE would act responsibly and honestly to clean the site up. But it dragged its feet for decades. Finally, in 2010, it signed a legally binding agreement with California for a full cleanup. But today, DOE has announced it intends to break that agreement and instead of cleaning up all the contamination, as required by the agreement, proposes four options, each of which violates the AOC. One option would leave in place 39% of the contamination, a second would leave 91%, a third would leave 99%, and the last would leave it none of it cleaned up.

This is unacceptable. DOE contaminated the site. DOE promised to clean up all the contamination. DOE must live up to its cleanup obligations and carry out the cleanup agreement to the letter, with no more games, no more false statements, and no more breach of the public trust.

144-1
cont'd

statements regarding burning radioactive and chemical waste in open pits, the Former Sodium Disposal Facility was used from 1956 to 1978 to clean alkali metals (sodium and potassium/sodium mixtures) from metallic components and other materials, and also received chemical waste and radionuclides. The facility was remediated during the 1990s and released for unrestricted use (i.e., declared clean) in 1998 by the California Department of Health Services (now California Department of Public Health). Additional information can be found at http://www.etec.energy.gov/Operations/Support_Ops/FSDF.html. With respect to the statements regarding polluted water being dumped over a hillside, studies have addressed whether radiological and chemical contaminants were present on the properties north of SSFL, including studies issued in 1992, 1994, and 1995 (see http://www.etec.energy.gov/Environmental_and_Health/Brandeis_Bardin.html). These studies led to cleanup activities on part of the American Jewish University Brandeis Bardin property, and purchase by Boeing of what is termed the Northern Buffer Zone. These areas were incorporated into the SSFL site (DTSC 2017a). In May 2017, DTSC published its review of chemical and radiological data from the investigations that had been performed to date. From its review, DTSC concluded that: (1) levels of radionuclides on the Brandeis Bardin Campus appear to be within the natural background range; (2) levels of chemicals and radionuclides at the Brandeis Bardin Campus do not pose a threat to human health; (3) contamination at SSFL does not pose a threat to Brandeis Bardin Campus users; and (4) the Brandeis Bardin Campus is safe for use by campers, visitors, students, faculty, administrators, and staff (DTSC 2017a). DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. In addition, please see Section 2.7, "Offsite Impacts," of this CRD for a discussion of this topic and DOE's response. This Final EIS is being prepared in accordance with NEPA to evaluate alternatives for completing the remediation of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. This EIS will inform DOE decisions about remediation of contaminated soil and groundwater, building demolition, restoration of the impacted environment, and disposal of chemical and radioactive waste.

RE: DEIS for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory

Dear Stephanie Jennings:

Representing California Native Plant Society, I participated in the Community Meetings on alternatives for this DEIS. I was in the "Orange" Group, which provided an alternative that was more restrictive in some ways than what is labeled "Conservation of Natural Resources" in that less soil was to be removed and, if there were any clean buildings or building materials, that they be used to construct a museum and visitor center because of the long and very interesting cultural and historical uses of the Santa Susana Field Lab site. I also testified at the Van Nuys public hearing on the DEIS.

Further comments from reviewing the Draft Environmental Impact Statement (DEIS) for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory (SSFL):

1) CNPS does not support the restrictions on levels of contaminants in the 2010 AOC or the Revised LUT values, though the revised LUT values are somewhat less restrictive. At the present time, measuring equipment and chemical tests used on field soil samples are not capable of the accuracy and repeatability required by the AOC and LUT tables. Please use toxicity tables provided by EPA or the State of California Department of Public Health. Only the most highly contaminated soil should be removed from the site.

2) The presence of strontium in the fractured bedrock is a serious problem. However, due to the very active geology in the Simi Hills and San Fernando Valley, using grout to enclose the strontium in the bedrock seems doomed to failure. In this case, removal of the bedrock in that one location may be a more permanent solution. Not having to dig it out every few years will allow native habitat to establish there, perhaps a marsh or watering hole for wildlife if the remaining bedrock is sound.

3) At the public hearing, I mentioned that CalRecycle, which regulates solid waste for the state of California, was about to order that green waste, wood waste, food waste, and other materials CalRecycle defined as "organic" would no longer be accepted at landfills in California. Instead, this "organic" waste could be mulched, chipped and ground, composted or converted through anaerobic digestion into energy. There are many problems to be resolved to make this work, but, for DOE, it means you might have to send your green waste out of state or process it on site. I suggest that DOE consider using chopped up green waste as a ground cover to control dust and use the chipped and ground material (which is more powdery) in the nursery as part of a composting facility. That way you recycle the local green waste and wood waste into ground cover or soil amendment. Having a nursery on site was mentioned in Chapter 6 (page 6-7) as part of the restoration of native plants and native plant habitat in areas that have been highly disturbed.

CNPS Comments on DOE DEIS 4/13/2017, page 1

145-1

145-2

145-3

- 145-1 DOE acknowledges your opposition to the Cleanup to AOC LUT Values and Cleanup to Revised LUT Values Alternatives, and your preference for removal of only the most highly contaminated soil. Please refer to Section 2.1, "Preferences for Cleanup," of this CRD, for further discussion of this topic.
- 145-2 DOE recognizes your preference for the removal of bedrock containing strontium-90 rather than options, such as using grout, to contain the strontium-90 within the bedrock. As described in Chapter 2, Section 2.6.3 of this Final EIS, removal of the subsurface bedrock impacted by strontium-90 is one alternative considered in this EIS. (Grouting of the bedrock containing strontium-90 is not being considered as a remedy, as there is no realistic mechanism of injecting grout into solid bedrock.) If this alternative is chosen and implemented, the resulting excavation would need to be backfilled. For purposes of analysis in this EIS, DOE has estimated that 2,300 cubic yards of backfill soil would be needed to fill this excavation. The *Draft RCRA Facility Investigation Groundwater Investigation Report for Area IV, Santa Susana Field Laboratory, Ventura County, California* (CDM Smith 2018a) and *Draft Area IV RCRA Corrective Measures Study* (CDM Smith 2018b) were completed after the issuance of the Draft EIS. This Final EIS includes revised text; Chapter 2, Section 2.6 and Chapter 4, Section 4.4.3.3; to incorporate relevant information and the findings of the remedy evaluations.
- 145-3 DOE will not speculate regarding new regulations, but will comply with all applicable regulations, including any new regulations that may be enacted.
- 145-4 The Conservation of Natural Resources Alternative focuses soil cleanup on the

**Commenter No. 145 (cont'd): Betsey Landis, Vice President,
Los Angeles/Santa Monica Mountains Chapter,
California Native Plant Society**

4) CNPS supports focused soil removal actions in order to minimize soil loss and habitat disturbance. The DEIS maps clearly show that contaminants are concentrated in relatively small areas, many associated with buildings or leach fields near buildings. The Conservation of Natural Resources alternative is not focused enough and calls for the removal of too much soil.

145-4

5) From the maps in the DEIS, it appears that Braunton's milkvetch (*Astragalus brauntonii*), Santa Susana tarweed (*Deinandra minthornii*) and other listed native plant species will be protected if only focused soil removal is done. Having a botanist on site harvesting native plant seeds, growing them in a nursery for replanting them as areas on site become available is an excellent action plan.

145-5

6) CNPS is concerned about having years of heavy traffic on Woolsey Canyon Road, not to mention Valley Circle. Woolsey Canyon Road winds steeply down the side of Woolsey Canyon, which is a natural wooded canyon. Any heavy truck going off the road there is liable to create a major high-hazard, possibly fiery accident that will be a tragedy, not only for the driver, but for the canyon native habitat. I have noticed that the years of drought have caused areas of the pavement on Woolsey Canyon to pull apart. The road needs repair, perhaps a new roadbed, before this project goes forward with moving thousands of tons of soil offsite.

145-6

7) CNPS supports the use of natural attenuation, the use of bioswales in filtering stormwater, the use of native plants in a multitude of locations to stabilize slopes and restore cleared areas. The number of native habitats listed is large because of the highly diverse topography of Santa Susana Field Lab. By collecting seeds from every area, the onsite nursery should have native plants for each focused clean-up area.

145-7

8) In Chapter 7, there is a Table on Green and Sustainable Remediation, Best Management Practices. It has lines discussing the use of "plants" compatible with the location or drought-tolerant. Please correct that section to read "native plants" and elsewhere when "plants" are mentioned as part of Best Management Practices. Santa Susana Lab is not urban. The site is a beautifully rich confluence of many native species of plants and wildlife. That should be recognized and celebrated throughout this EIS.

145-8

That is your Best Management Practice.

Sincerely,

Betsey Landis
Vice President
Los Angeles / Santa Monica Mountains Chapter
California Native Plant Society

locations in Area IV where concentrations of soil contaminants posing human health or ecological risks exist. This alternative only removes soil that has been determined to pose a threat to human health or the environment. The process that will be used for soil removal is one that has been developed through discussions with USFWS and CDFW, and USFWS incorporated it into its Biological Opinion. It results in the removal of between 38,000 and 52,000 cubic yards of soil affecting 9 to 10 acres (versus 881,000 cubic yards affecting 150 acres in the Cleanup to AOC LUT Values Alternative). In all of these areas, at least one contaminant can be found in concentrations exceeding risk-based cleanup criteria. It is similar to the type of soil cleanup conducted by EPA nationwide. Regardless of the alternative implemented by DOE, DOE would use measures that would protect and minimize impacts to endangered and protected species. The process and controls that will be used to minimize impacts to federally protected T&E species are described in the U.S. Fish and Wildlife Biological Opinion (see Appendix J of this EIS). The purpose of biological exemption areas is to minimize impacts to resources within these areas. Therefore, if there were no chemicals or radioactive constituents within these areas that posed a risk to public health or the environment, the areas would not be disturbed and the impacts would be zero. However, if levels of constituents in these areas pose a risk to human health and the environment, as determined using risk-based screening levels (RBSLs), DOE would remove them through carefully planned, focused removals that would minimize impacts.

145-5

Protecting sensitive plants, including Braunton's milkvetch (*Astragalus brauntonii*) and Santa Susana tarweed (*Deinandra minthornii*), emphasized in your comment is integral to the exemption process worked out with USFWS and described in the EIS. The protection of sensitive plants is the intent of the identification of biological exemption areas and the focused removal of soils within these areas. As indicated in Chapter 6 of this EIS among the minimization measure (Minimization Measure 5-6 [Biological Resources – Special Status species, including Braunton's milk-vetch, Santa Susana tarplant, and non-vascular plants]) to reduce the impacts to affected species/habitats DOE would consider, when feasible, the harvesting, growing and replanting of native seeds.

145-6

DOE acknowledges that increased truck traffic on Woolsey Canyon Road would result in an increased risk of traffic accidents which could be harmful to people or property, and increased potential for damage to road pavement due to passage of heavy trucks. Chapter 3, Section 3.8.2.1, of the EIS acknowledges that the pavement of Woolsey Canyon Road is showing signs of age and brittleness indicating that the pavement

Commenter No. 145 (cont'd): Betsey Landis, Vice President,
Los Angeles/Santa Monica Mountains Chapter,
California Native Plant Society

is near the end of its useful life. The potential for damage to pavement on roads in the SSFL area is evaluated in Chapter 4, Section 4.8.2, of the EIS. Also refer to the response to comment 162-6.

- 145-7 DOE notes your support for natural attenuation, the bioswales for filtering stormwater, and native plants to stabilize slopes and restore cleared areas. As stated in response to comment 145-5, when feasible native plant seeds will be harvested, grown and replanted.
- 145-8 Thank you for your comment. The recommended change was incorporated in this Final EIS. In Table 7-1, the qualifier “native” preceding “plants” is added in the column “Applicability to Area IV Cleanup Activities” where appropriate. It is not added in the first column because this language is taken from the ASTM Best Management Practices.

Subject: Comments of The Boeing Company on the Draft Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone

Dear Ms. Jennings:

The Boeing Company (Boeing) appreciates the opportunity to submit these comments on the Draft Environmental Impact Statement (Draft EIS) for the Remediation of Area IV and the Northern Buffer Zone (NBZ) of the Santa Susana Field Laboratory (SSFL) prepared by the U.S. Department of Energy (DOE) pursuant to the National Environmental Policy Act (NEPA).

Boeing supports a responsible cleanup of the SSFL that fully protects people, wildlife, habitat and cultural resources for the future use of this invaluable property as undeveloped open space. As the property owner of 2,400 acres of the SSFL, including Area IV and the Northern Buffer Zone, Boeing appreciates that the Draft EIS acknowledges there are alternative approaches to remediating Area IV and the Northern Buffer Zone that will be protective of human health and the environment, shorten the cleanup schedule, reduce impacts to adjacent communities, and limit damage to Santa Susana's unique biological and cultural resources.

NEPA provides the framework for evaluating how DOE's proposed action can best be accomplished at the SSFL site. As the landowner, Boeing plans to permanently preserve the property as open space and to impose legal restrictions on the property to bar any future development, including residential or agricultural use. Recreation is thus the only future use of the property, and a risk-based cleanup alternative that considers protection of the recreational user is necessary for reasoned and considered decision-making. With regard to the current alternatives, the Draft EIS unequivocally finds that the Cleanup to LUT Values alternative would result in significant environmental impacts on and degradation of the ecological values of the site with no appreciable benefit to human health.

146-1

146-1

DOE acknowledges your support for a risk-based cleanup alternative. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

**Commenter No. 146 (cont'd): Steven L. Shestag,
Director, Environment, Health & Safety, Boeing**

Ms. Stephanie Jennings
SS0417001
Page 2 of 32

Boeing therefore urges DOE to develop and select a preferred alternative that achieves the purpose and need to protect human health and the environment, uses standard EPA risk assessment methodologies and protocols that are applied elsewhere in the State of California, minimizes cleanup-related impacts to the local community, fully takes into consideration how best to protect and preserve the unique biological and cultural resources at the site, and results in the fewest environmental impacts.

I. INTRODUCTION AND SUMMARY OF COMMENTS

Boeing supports DOE's effort to conduct a comprehensive NEPA evaluation of potential environmental impacts of its future cleanup activities at the SSFL: The purpose of NEPA is to help the public and public agency decision-makers to better understand the purpose and need for a government action, to ensure that the significant environmental impacts of the action are analyzed, and to set forth reasonable alternatives for achieving the purpose and need that will reduce significant impacts. *Lands Council v. McNair*, 629 F.3d 1070, 1075 (9th Cir. 2010) ("NEPA's purpose is twofold: (1) ensure that agencies carefully consider information about significant environmental impacts, and (2) guarantee that relevant information is available to the public."); 40 Code of Federal Regulations (CFR) Section 1502.13. To these ends, NEPA requires that an EIS "provide full and fair discussion of significant environmental impacts" and "inform decisionmakers and the public of the reasonable alternatives which would avoid or minimize adverse impacts or enhance the quality of the human environment." (40 CFR Section 1502.1.) NEPA also requires that an EIS evaluate a range of alternatives to achieve the purpose and need of the proposed action and to provide a basis for comparing the benefits of each alternative in light of its environmental impacts. (40 CFR Sections 1502.13, 1502.14.)

Boeing appreciates that DOE has taken these NEPA obligations seriously in preparing the Draft EIS.

The Draft EIS accurately reflects that the SSFL is an cultural and ecological treasure and that those resources must be considered when evaluating alternatives for cleanup: With unique natural scenic beauty and significant, virtually untouched areas, the SSFL represents a critical core ecological area in a region that has experienced extensive urban development and has a great need for preservation of intact, undeveloped, natural habitat. In particular, the SSFL is home to a number of special status species, numerous plant communities and native plant species. This includes at least 138 species of birds, as well as amphibians and terrestrial wildlife, along with bats, snakes and other wildlife, not to mention the mountain lion which requires large unbroken tracts of land to support its home range.

146-1
cont'd

146-2

146-2 Thank you for your comment. For further discussion, refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD.

146-3

146-3 Thank you for your comment. DOE agrees that protection of cultural and ecological resources at SSFL is an important consideration when evaluating alternatives for cleanup:

Commenter No. 146 (cont'd): Steven L. Shestak,
Director, Environment, Health & Safety, Boeing

Ms. Stephanie Jennings
SS0417001
Page 3 of 32

Mountain Lion at SSFL Watering Guzzler (August 27, 2014)

The open space values of the site, in addition to the resource values, are also based on the site's key role as part of a rare and vital wildlife corridor in Southern California. In addition to mountain lions, other large mammals such as coyotes, bobcats and bears traverse the site and neighboring properties. The SSFL is the single largest parcel in Ventura County and vicinity linking vital wildlife habitat corridors, and is identified as critical connectivity habitat in certain local policies and pending legislation.¹ (See Draft EIS, page 3-5, and discussion of Rim of the Valley, and Figure 3-3.) The function of the SSFL as a key link in a wildlife corridor is evident from the fact that the property is situated between large contiguous areas of open space both to the north and to the south:

**146-3
cont'd**

¹ The SSFL is being considered as part of efforts to adjust the boundary of the Santa Monica Mountains National Recreation Area to include the Rim of the Valley Corridor, and has been identified for inclusion in the Ventura County Wildlife Corridor Zoning Overlay.

Commenter No. 146 (cont'd): Steven L. Shestak,
Director, Environment, Health & Safety, Boeing

Ms. Stephanie Jennings
SS0417001
Page 4 of 32

(Draft EIS, p. 3-167.)

The SSFL property also contains important cultural resources, including a large number of Native American archaeological sites of a possible sacred nature. Some of these archaeological areas may date from thousands of years ago, include cultural areas undisturbed by modern development, and afford a rare opportunity to conserve and study relatively pristine archaeologically significant areas.

Photographs of SSFL's Area IV and the surrounding vicinity depict the natural beauty of the site and demonstrate how SSFL open space links to the adjacent wildlife habitats as a part of a larger contiguous area.

Photograph of Area IV (February 28, 2017)

Photograph of Area IV and Northern Buffer Zone (March 2, 2017)

As protected, undeveloped open space, the SSFL would be a magnet for birders, rock climbers, and day hikers. Boeing's plan is for the property to be managed to protect these open space, recreational, and cultural values against residential or agricultural uses, while expanding community, academic and environmental group access to the site.

Boeing appreciates the special attention DOE has given to these biological and cultural resources areas in the Draft EIS, both by identifying specific exemption areas under the 2010 Administrative Order on Consent between DOE and the California Department of Toxic Substances Control (DTSC) (2010 AOC), and by identifying and evaluating cleanup alternatives that are fully protective of future human users but minimize harmful impacts and protect these important resources.

The Draft EIS appropriately recognizes that Boeing will permanently preserve the land as open space and will legally restrict the property to prevent future development, including residential or agricultural uses: The Draft EIS correctly states that Boeing has committed to preserving the SSFL as undeveloped open space, allowing the site to be preserved for its ecological and cultural values and providing public access to the site. (Draft EIS, p. S-6.) There will never be any homes, gardens, or any agricultural use on the property.²

The Draft EIS properly identifies the purpose and need as remediation of the site in a manner that is protective of human health and the environment, and risk-based alternatives are legally required in the EIS and must be considered by DOE in selecting the final remedy: An EIS is required to have a statement of purpose and need to explain why the proposed action is being pursued and to provide a basis for selecting among alternatives. An agency cannot define the purpose and need of a project in unreasonably narrow terms to avoid evaluating a range of reasonable alternatives. The Draft EIS properly identifies the purpose and need as remediation of the site in a manner that is protective of human health and the environment.

Under NEPA, the legitimacy of the purpose and need is reviewed based on the statutory context of the proposed action. Here, the purpose and need is consistent with the environmental laws and regulations that underlie the entire SSFL remediation project: Resource Conservation and Recovery Act (RCRA), Comprehensive Emergency Response and Compensation Act (CERCLA), and their California analogs, Hazardous Waste Control Law (HWCL) and Hazardous Substances Account Act (HSAA). The purpose of these laws is clear: protect human health and the environment.

Furthermore, these laws require that remediation be based on a realistic assessment of risks to human health and the environment that would result from the reasonably foreseeable future land use. As stated in the Draft EIS: "Most cleanups are based on a risk assessment that follows EPA guidance." (Draft EIS, p. 2-24.) Thus, DOE properly considered risk-based alternatives in the Draft EIS to meet the purpose and need, which consisted of a risk-based alternative using a residential receptor. In addition, however, given that the appropriate legal reference point for the protection of human health and the environment is the reasonably foreseeable future use of the property and given Boeing's commitment to preserve the property as open space, DOE should also evaluate an alternative that assesses risk based on a recreational user.

² While the Draft EIS evaluates a risk-based alternative based on a residential receptor, Boeing will impose legal restrictions to ensure there will never be any such residential use of the property.

146-3
cont'd

146-4

146-4 Thank you for your comment. It has been included in the Administrative Record for this EIS.

146-5

146-5 DOE is not aware of any requirement that "risk-based alternatives are legally required" in an EIS. Nonetheless, DOE agrees that the EIS properly identifies its purpose and need. Additionally, as discussed in Chapter 2, Section 2.3.3.1, of this EIS, DOE determined that there were technical issues with implementing a cleanup according to the 2010 AOC, and therefore, in keeping with its responsibilities under NEPA, DOE developed two alternatives that meet the purpose and need. These two risk-based alternatives, the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative, are presented in Chapter 2, Section 2.4 of this EIS.

146-6

146-6 In this Final EIS (see Chapter 2, Section 2.4), DOE has retained the Cleanup to Revised LUT Values Alternative, which uses chemical RBSLs based on a suburban residential scenario without a garden pathway. The Final EIS also retains the Conservation of Natural Resources Alternative, but evaluates two scenarios. The Open Space Scenario is based on the future land use of Area IV and the NBZ as open space, consistent with Boeing's conservation easement and agreement (i.e., cleanup levels are based on exposure of an onsite recreational user as the receptor). The Suburban Resident Scenario is the scenario evaluated in the Draft EIS, that is, cleanup levels are based on a suburban residential scenario without a garden pathway. This latter scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space.

**Commenter No. 146 (cont'd): Steven L. Shestag,
Director, Environment, Health & Safety, Boeing**

Ms. Stephanie Jennings
SS0417001
Page 7 of 32

The Draft EIS unequivocally finds that the Cleanup to AOC LUT Values alternative would result in significant environmental impacts, but with no appreciable benefit to human health compared to the other alternatives: As legally required and consistent with the overarching purposes of NEPA, the Draft EIS describes the potentially significant environmental impacts associated with each of the alternatives to provide a basis for comparing the benefits of each in light of its environmental impacts. The Draft EIS also provides a detailed analysis of the technical challenges in implementing an AOC LUT cleanup, including indefensible cleanup values, false positives resulting in the remediation of clean soil, and the inability to find backfill soil that could meet AOC LUT values and/or support reestablishment of native vegetation. These technical challenges appropriately led DOE to evaluate other action alternatives.

The significant environmental impacts of the Cleanup to AOC LUT Values alternative would be devastating. This alternative would profoundly disturb natural resources and ecosystems, wildlife habitat and wildlife corridors, and damage for decades – and perhaps permanently – these important environmental resources. The activities that would cause this impact include removal of vegetation from 51 acres of “relatively undisturbed native habitats” where “it is unlikely that restoration and revegetation would result in habitat functionally equivalent to preexisting native vegetation.” (Draft EIS, p. 4-57.) Importantly, the Draft EIS concludes that the Cleanup to AOC LUT Values alternatives results in no appreciable benefit to human health compared to the other less destructive alternatives. (Draft EIS, p. S-97 (Cleanup to AOC LUT Values alternative results in “minimal reduction in human health risk”).)

This clear and straightforward communication of the comparable benefits and environmental impacts of alternatives is precisely the purpose of NEPA: making sure that decision-makers and the public clearly understand the implications of the choice among alternatives.

Preferred Alternative: NEPA mandates that the EIS provide decision-makers and the public with information on the relative risks and benefits associated with a cleanup that seeks both to ensure protection of human health and protection of the significant natural resource values at the site. For all of the reasons described above and as further explained in this letter, Boeing cannot support the Cleanup to AOC LUT Values alternative. **We urge DOE to develop and select a preferred alternative that achieves the purpose and need to protect human health and the environment, applies standard EPA risk assessment methodologies and protocols, minimizes impacts to the local community, fully takes into consideration how best to protect and preserve the unique biological and cultural resources at the site, and results in the fewest environmental impacts.**

Ms. Stephanie Jennings
SS0417001
Page 8 of 32

II. THE 2007 CONSENT ORDER FOR CORRECTIVE ACTION AND 2010 AOC ESTABLISH REMEDIAL ACTION REQUIREMENTS, INCLUDING CEQA AND NEPA COMPLIANCE, AND COMPELS A COMPREHENSIVE EVALUATION OF ALTERNATIVES

In 2007, DOE, Boeing and NASA entered into a comprehensive Consent Order for Corrective Action (2007 Consent Order) with DTSC that requires a site-wide investigation and protective cleanup of soil and groundwater based on standard state and federal practices for risk assessment. The 2010 AOC bypassed the normal investigative process and imposed additional requirements for DOE's cleanup of soils at the SSFL, while specifically identifying exemptions from these requirements for areas with biological and cultural resources.

As noted in the Draft EIS, SSFL cleanup activities will be evaluated in environmental documents prepared under NEPA, including this Draft EIS, as well as pursuant to the California Environmental Quality Act (CEQA). DTSC is in the process of preparing a facility-wide Environmental Impact Report (EIR) under CEQA as contemplated in the 2007 Consent Order.

Section 6.0 of the 2010 AOC explicitly acknowledges DOE's obligation to comply with NEPA, including the preparation of an EIS. As required by NEPA, DOE properly evaluated alternatives that do not rely solely on the AOC, recognizing that NEPA's requirements cannot be limited by the 2010 AOC. *Simmons v. United States Army Corps of Engineers*, 120 F.3d 664, 670 (7th Cir. 1997) (contract between city and water district with condition to meet environmental requirements cannot limit NEPA's mandate to evaluate alternatives). "The public interest in the environment cannot be limited by private agreements." *Id.*³

Moreover, the Draft EIS notes that some of the alternatives might require modifications to the 2010 AOC.⁴ The fact that the 2010 AOC sets out a proposed cleanup level cannot override NEPA's requirement that an EIS evaluate reasonable alternatives to that proposed action which would meet the purpose and need while minimizing environmental impacts. Indeed, as noted above, the 2010 AOC specifically acknowledges the requirement to comply with NEPA (and CEQA), and could not potentially eliminate the evaluation of alternatives unless the 2010 AOC itself had been reviewed under NEPA and CEQA before it was executed, and that never occurred. NEPA requires that an EIS include evaluation of reasonable alternatives, even if they conflict with lawfully established requirements.⁵ (40 CFR Section 1502.14(c).) NEPA has few limits when it comes to evaluating

³ While the 2010 AOC is fashioned in the nature of an enforcement order, the document is clearly a contractual agreement between DOE and DTSC because no state or federal law mandates the cleanup requirements set forth in the 2010 AOC, and required state and federal processes were not followed to determine the proposed final soils remedy. Furthermore, the state cannot *mandate* "more stringent cleanup procedures, not generally applicable within the state, to a particular site where the federal government undertook to clean up nuclear contamination." *Boeing vs. Movassaghi*, 768 F.3d 832 (9th Cir. 2014).

⁴ Section 8.0 anticipates that the 2010 AOC "may be modified by the mutual agreement of the parties."

⁵ *Recommendations for the Preparation of Environmental Assessments and Environmental Impact Statements* (2nd Ed., 2004), U.S. Department of Energy, Environment, Safety and Health Office of NEPA Policy and Compliance. ("Address reasonable alternatives that are outside DOE's

reasonable alternatives. In short, the 2010 AOC cannot serve as a basis for refusing to evaluate an alternative.

III. DOE PROPERLY DEFINED THE PURPOSE AND NEED OF THE EIS AS ENSURING PROTECTION OF HUMAN HEALTH AND THE ENVIRONMENT, REQUIRING AN EVALUATION OF RISK-BASED ALTERNATIVES

An EIS is required to have a statement of purpose and need to explain why the proposed action is being pursued and to provide a basis for selecting among alternatives. (40 CFR Sections 1502.13, 1502.14.) Given that the purpose and need dictates the range of reasonable alternatives, "an agency cannot define the purpose and need of a project in unreasonably narrow terms." *League of Wilderness Defenders-Blue Mts. Biodiversity Project v. United States Forest Serv.*, 689 F.3d 1060, 1069 (9th Cir. 2012). "In assessing the reasonableness of a purpose and need specified in an EIS, we must consider the statutory context of the federal action." *League of Wilderness*, p. 1070; see also *Westlands Water Dist. v. U.S. Dep't of Interior*, 376 F.3d 853, 866 (9th Cir. 2004) ("[T]he statutory objectives of the project serve as a guide by which to determine the reasonableness of objectives outlined in an EIS.").

In this case, the proposed action is primarily based in the mandates of the federal Resource Conservation and Recovery Act ("RCRA"), 42 U.S.C. section 6901 *et seq.*, and its California analog, the Hazardous Waste Control Law ("HWCL"), Health and Safety Code section 25100 *et seq.* The action is also directed by the 2010 AOC between DOE and DTSC, which is based in part on DOE's authority under the federal Comprehensive Emergency Response and Compensation Act ("CERCLA"), 42 U.S.C. section 9601 *et seq.*, and California's authority under the Hazardous Substances Account Act ("HSAA"), Health and Safety Code section 25300 *et seq.* Because the impetus for DOE's proposed action is the 2007 Consent Order and the 2010 AOC, the objectives of applicable California law which underlie those agreements are of key importance. But because these state laws are implemented in coordination with their federal counterparts, both RCRA and CERCLA – as well as the extensive and long-standing guidance developed to implement remedial action under those statutes – are of central importance to the purpose and need of the action subject to analysis in this EIS.

The purpose of the HWCL is, *inter alia*, to "protect public health and the environment *and to conserve natural resources*." Health and Safety Code section 25101(a) (emphasis added). Orders for corrective action issued under the HWCL are premised upon "a substantial hazard to human health or the environment."⁶ The purpose of the HSAA, similarly, is to address sites that "pose a threat to the

jurisdiction, even if they conflict with lawfully established requirements (e.g., an alternative that could be reasonable if an existing law could be amended or if a regulatory agency granted a waiver.)"

⁶ Health and Safety Code section 25187.1(a)(1). RCRA similarly provides that regulating hazardous waste is essential to avoid "substantial risks to human health and the environment" (42 U.S.C. § 6901(b)(5)), and provides that its central objective is to "promote the protection of health and the environment." 42 U.S.C. § 6902(a).

public health or the environment.” Health and Safety Code section 25301(a). A remedial action plan prepared under the HSAA must consider “health and safety risks posed by the conditions at the site” and the “effect . . . upon . . . contaminated, polluted, or threatened resources.”⁷

Based on this regulatory background, DOE therefore correctly identified the purpose and need of its action as guided by the objective of achieving protection of human health and the environment while minimizing impacts on natural resources:

“1.1 Purpose and Need for Agency Action

DOE needs to complete remediation of SSFL Area IV and the NBZ to comply with applicable requirements for cleanup of radiological and hazardous substances. These requirements include regulations, orders, and agreements. To this end, DOE needs to remove the remaining DOE structures in Area IV of SSFL and clean up the affected environment in Area IV and the NBZ in a manner that is protective of the environment and the health and safety of the public and workers.”

(Draft EIS, p. 1-1.)

Using this purpose and need, DOE appropriately developed screening criteria and balancing criteria (that incorporate RCRA standards) to identify the alternatives to be evaluated in the Draft EIS. Specifically, the main screening criteria in the Draft EIS are: 1) Regulatory Compliance; 2) Protect Public and Worker Health and Safety; 3) Effectiveness; and 4) Ease of Implementation. (Draft EIS, p. 2-6.) As stated in the Draft EIS, “[t]he screening criteria were developed to ensure the proposed alternatives would meet the purpose and need” (Draft EIS, p. 2-6.) DOE also identifies balancing criteria which include “principles for cleanup in a manner that is as environmentally sensitive as possible.” (Draft EIS, p. 2-6.) The balancing criteria are: 1) Protect the Environment; 2) Protect Native American Interests; 3) Cost; 4) Community Acceptance; 5) Return to Natural State; 6) Minimize Transportation Impacts; and 7) Preference for Onsite Treatment of Soils. (Draft EIS, p. 2-6.)⁸

⁷ Health and Safety Code section 25356.1(d)(1)-(2). CERCLA similarly provides that the agency shall “select a remedial action that is protective of human health and the environment.” 42 U.S.C. § 9621(b)(1). EPA’s “hazard ranking system” for purposes of determining whether a site is placed on the National Priority List must assess “the relative degree of risk to human health and the environment” posed by the site. 42 U.S.C. § 9605(e)(1). CERCLA also provides for liability for damage to natural resources. 42 U.S.C. § 9607(f).

⁸ RCRA’s three performance standards for final remedies (as opposed to interim remedies) are: 1) Protect human health and the environment based on reasonably foreseeable land uses; 2) Achieve media cleanup objectives, including media cleanup levels, points of compliance and remediation time frames; and 3) Remediate the sources of releases. RCRA’s seven balancing/evaluation criteria are: 1) Long-term effectiveness; 2) Toxicity, mobility and volume reduction; 3) Short-term effectiveness; 4) Implementability; 5) Cost; 6) Community acceptance; and 7) State acceptance (emphasis added). See, e.g., 61 Fed. Reg. 19,4932, 19,448-452, (May 1, 1996); EPA, Final Remedy Selection for Results-Based RCRA Corrective Action (Mar. 2000), <https://www.epa.gov/sites/production/files/2016-01/documents/select.pdf>; EPA, RCRA Corrective Action Training – Selecting and Approving a Protective Remedy, at 18-19 (Nov. 2009), <https://www.epa.gov/sites/production/files/2016-04/documents/mod7.pdf>.

In this context, DOE acted to fulfill NEPA's mandate that an EIS "[r]igorously explore and objectively evaluate all reasonable alternatives" (40 CFR Section 1502.14.) CEQ regulations emphasize that the alternatives section is the heart of an EIS, and that NEPA requires that an EIS include an evaluation of reasonable alternatives to avoid or reduce potentially significant environmental impacts while meeting the purpose and need:

"The purpose of an environmental impact statement is to serve as an action-forcing device . . . It shall provide full and fair discussion of significant environmental impacts and shall inform decisionmakers and the public of the reasonable alternatives which would avoid or minimize adverse impacts or enhance the quality of the human environment."

(40 CFR Section 1502.1.)

IV. DOE APPROPRIATELY INCLUDED RISK-BASED ALTERNATIVES THAT WOULD REDUCE ADVERSE IMPACTS WHILE MEETING THE PURPOSE AND NEED

As described above, the Draft EIS acknowledges the substantial environmental harms that would result from performing the AOC LUT cleanup. DOE has taken its NEPA obligations seriously and properly included risk-based alternatives in the Draft EIS, which would not only reduce the significant adverse environmental effects from the Cleanup to AOC LUT Values alternative, but also meet the purpose and need – to clean up the affected environment in a manner that is protective of human health and the environment.⁹ "The additional action alternatives would meet the cleanup objectives to be protective of the environment and the health and safety of the public and workers while avoiding some of the technical challenges and potential adverse environmental impacts associated with cleanup to the 2010 AOC LUT values." (Draft EIS, p. S-1.)

V. THE EIS SHOULD INCLUDE A RISK-BASED ALTERNATIVE USING A RECREATIONAL USER

DOE decided not to examine an alternative based on an undeveloped open space land use assumption that evaluates the risk to a recreational user. (Draft EIS, p. S-18, Chapter 2.2.3 (Table 2-1) and

Appendix C, Table C-1). DOE states that its basis for not evaluating the recreational user scenario is to be "consistent with Boeing's basis for analysis." As noted in the Draft EIS, Boeing intends to preserve SSFL property as undeveloped open space, and has evaluated residential, recreational and

⁹ DTSC officials have testified under oath that there is no technical, scientific or environmental basis to single out the SSFL for more stringent cleanup procedures than apply to other contaminated sites in California. (Plaintiff The Boeing Company's Statement of Uncontroverted Facts and Conclusions of Law. Uncontroverted Fact 105, p. 56 (deposition testimony quoted in Statement; see, e.g., Brausch Deposition: ("Q. Can you identify any reason to conclude that the SSFL site should be cleaned up to a stricter standard than would be required under generally applicable State law? ... A. ... No.")), *The Boeing Company v. Movassaghi*, 768 F.3d 832 (9th Cir. 2014), filed February 28, 2011 in U.S. District Court, Central District of California, Case No. CV 10-04839-JFW.)

146-7

146-7 Refer to Section 2.1, "Preferences for Cleanup," of this CRD, for a description of why DOE considered alternatives to the Cleanup to AOC LUT Values Alternative.

146-8

146-8 In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. This Final EIS was revised to reflect Boeing's conservation easements, its restriction measures, and adding a soil cleanup scenario under the Conservation of Natural Resources Alternative consistent with use as open space (e.g., exposure to a recreational user).

ecological receptors in its technical analyses to date, even though the property will never be used for residential purposes.¹⁰

Both the U.S. Environmental Protection Agency (EPA) and DTSC guidance require remediation that is based on risks to human health and the environment in recognition of the reasonably foreseeable future land use. Response action criteria under the HSAA must include an assessment of risks to human health and the environment “for both current land use conditions and reasonably foreseeable future land use conditions at the site.” Health and Safety Code section 25356.1.5(d). Several EPA Directives articulate that CERCLA remedial actions, as well as corrective action under RCRA, should be based on risks that would attend the reasonably foreseeable future land use.¹¹ In the RCRA context in particular, for instance, EPA has repeatedly affirmed that future land use should guide development of remedial goals.¹² DTSC guidance similarly echoes the requirements of the Health and Safety Code, requiring consideration of reasonably foreseeable future land use in establishing cleanup objectives.¹³ The very court that considered SSFL cleanup standards referenced this requirement in determining the validity of a statute presumptively setting a different cleanup standard.¹⁴

146-8

DOE also correctly references the reasonably foreseeable future use of the site as undeveloped open space. To better reflect applicable law, DOE should consider that the appropriate legal reference point for the protection of human health is the reasonably foreseeable future use of the property, i.e., a recreator, a change which would more appropriately inform the scope and reasonableness of the alternatives considered. Indeed, Boeing's RFI reports submitted to DTSC have considered both residential and recreational users along with ecological receptors with this same purpose in mind.

Given NEPA's requirements and these statutory and regulatory mandates, an open space alternative should be considered using risk-based levels for recreational and ecological receptors.

VI. THE DRAFT EIS UNEQUIVOCALLY SHOWS THAT THE CLEANUP TO AOC LUT VALUES ALTERNATIVE WOULD CAUSE UNACCEPTABLE IMPACTS TO NATURAL AND CULTURAL RESOURCES

NEPA requires an analysis of alternatives that may potentially reduce the environmental consequences of a proposed action. The Ninth Circuit Court of Appeals recently summarized these well-established NEPA requirements:

"An EIS must 'provide full and fair discussion of significant environmental impacts and shall inform decisionmakers and the public of the reasonable alternatives which would avoid or minimize adverse impacts or enhance the quality of the human environment.' We review an EIS 'to ensure that the agency has taken a 'hard look' at the potential environmental consequences of [a] proposed action.'"

Backcountry Against Dumps v. Jewell, 2017 U.S. App. LEXIS 218, at *6, 2017 WL 56300 (9th Cir. Cal. Jan. 5, 2017).

DOE has taken a "hard look" at the environmental consequences of the Cleanup to AOC LUT Values alternative and the results of the analysis, as set forth in the Draft EIS, amply support DOE's decision to consider other alternatives that would reduce those impacts.

In particular, the Draft EIS recognizes that the SSFL is an ecological and cultural treasure that would be significantly impacted by implementation of the Cleanup to AOC LUT Values alternative. This conclusion is expressed in multiple locations in the Draft EIS, including in Section 4.5.1.2.1, which states in pertinent part:

footnote referring to Health & Safety Code section 25356.1.5(d) and some of the EPA guidance discussed above.

146-8
cont'd

146-9 146-9

As indicted in the comment, DOE evaluated alternatives to the proposed cleanup to 2010 AOC LUT values that would involve less excavation and soil removal and therefore fewer potential impacts on biological and cultural resources. These alternatives (the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative) recognized Boeing's stated future use of its property as open space. The cleanup levels for these two alternatives were based on risk to a suburban resident without a garden, which would also be protective of a recreational user. In its impact analysis, DOE did consider impacts to both a recreational user and a suburban resident without a garden. In this Final EIS, consistent with Boeing formalizing the commitment of this land to open space. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. DOE added a scenario under the Conservation of Natural Resources Alternative that establishes cleanup levels based on risks to a recreational user and ecological receptors.

Commenter No. 146 (cont'd): Steven L. Shestag,
Director, Environment, Health & Safety, Boeing

Ms. Stephanie Jennings
SS0417001
Page 14 of 32

About 130 acres of vegetation and wildlife habitat would be removed outside the proposed exemption areas, about 28 percent of the total habitat in Area IV and the NBZ.... Where chemicals or radionuclides above AOC LUT values extend from the surface downward, there would be no opportunity to conserve the valuable uppermost soil layers or seedbank for later replacement as part of site restoration and revegetation. As discussed in Section 4.2.1.2, sources of backfill that meet AOC LUT values have not been identified. . . . Removal of existing vegetation and topsoil would increase the difficulty of re-establishing native plant species and reduce or eliminate the value of the habitat for most wildlife species during the process of re-establishing native vegetation and wildlife habitat. . . . Loss of habitat due to remediation would reduce wildlife species populations in the affected area and the local vicinity depending on the home range of the species. In addition, there would be mortality among less mobile species, which would be reduced by relocating individuals of sensitive species (e.g., coast horned lizard, a California Species of Special Concern) encountered during pre- construction surveys.

To summarize, this alternative would result in removal of vegetation and wildlife habitat over about 130 acres outside of the proposed exemption areas and an unquantified additional acreage within the proposed exemption areas, causing mortality and disturbance of wildlife within and adjacent to the affected area. The profound soil disturbance caused by remediation will require special measures to accomplish restoration of a self-sustaining native vegetation cover and sources of suitable clean soil for backfill where soil has been removed have not been identified. If backfill is substantially different than that originally present, it may not support vegetation similar to that present before development of Area IV. With implementation of habitat restoration and revegetation measures, as well as measures to reduce or avoid impacts on wildlife as described in Chapter 6, impacts would be reduced, but would remain substantial given the degree of habitat loss.

(Draft EIS, p. 4-38 - 4-39, emphasis added.)

The Cleanup to AOC LUT Values Alternative is also predicted to have significant impacts on traditional cultural resources, including impacts from disturbing the natural contours of the land and replacing it with unfamiliar topography, impacts from changes to the setting of the traditional cultural resource resulting from 10 years of soil removal across 130 acres, and impacts from potential vandalism by introducing more people to the area. (Draft EIS, p. 4-167 - 4-168.) Table 4-75 summarizes the potentially significant impacts to traditional cultural resources that could occur if the cleanup activities are not designed to ensure protection:

During 10 years of soil removal, adverse impacts on the integrity of traditional cultural resources are possible from changes in setting, augmented site access during remediation, disturbance of landscape (130 acres), and potential discovery of unanticipated archaeological sites.

(Draft EIS, p. 4-166.)

 Page 15 of 32

In fact, as noted in the Draft EIS, “[t]he Santa Ynez Band of Chumash Indians, a federally recognized tribe, has designated the entire SSFL as a Native American sacred site (referred to herein as the Santa Susana Sacred Site) and believes that the site is eligible for inclusion on the NRHP as a traditional cultural property.” (Draft EIS, p. 3-141.) In its draft nomination form for recognition of the SSFL as a Traditional Cultural Landscape,¹⁵ the Santa Ynez Band of Chumash Indians made the following statement:

All of those who have had the opportunity to visit agree that the Burro Flats Painted Cave and the surrounding Santa Susana Field Laboratory (where numerous Native American sites are now known to exist) are part of a large and important Traditional Cultural Landscape. Today, many indigenous people consider the Burro Flats Painted Cave to be a very important shrine site, and feel strongly that it and the surrounding area are important to their culture. It is for this reason that the Elder’s Council of the Santa Ynez Band of Chumash Indians has requested that the entire former Santa Susana Field Lab be described as the Santa Susana Sacred Sites and Traditional Cultural Property, by the State of California.

The Draft EIS affords protection to these biological and cultural resources through the identification of the exemption areas allowed under the 2010 AOC which are to be “protected under any of the soil remediation alternatives.” (Draft EIS, p. 2-18.) The Draft EIS explains the remediation process for these areas:

DOE would not take action in any of these areas unless it is demonstrated that levels of chemical or radioactive constituents in the soil pose a risk to human health or the environment, as determined using risk-based screening levels (RBSLs) from the SRAM (MWS 2014).

(Draft EIS, p. 2-18.) Boeing supports DOE’s efforts to protect these important resources.

However, for purposes of NEPA, the potential impacts from disturbance to biological or cultural resources in the 2010 AOC exemption areas are currently unknown, but could also be significant. The 2010 AOC biological and cultural exemption areas total 220 acres, of which 101 acres contain chemical or radioactive materials exceeding AOC LUT values. The amount of disturbance has not yet been determined and will be based on the results of consultations with DTSC, U.S. Fish and Wildlife Service, California Department of Fish and Wildlife, State Historic Preservation Officer (SHPO) and the SSFL Sacred Sites Council. (Draft EIS, pp. 4-57 – 4-58.) As such, the Draft EIS excludes these areas in evaluating impacts to biological and cultural resources under all of the soil

¹⁵ The Draft EIS includes the following information on Traditional Cultural Properties: “*Traditional cultural properties* are resources that are associated with the cultural practices or beliefs of a living community, that link the community to its past and are ‘important in maintaining the continuing cultural identity of the community’, and that are eligible for or are listed on the NRHP (DOI 1998). Most traditional cultural resources or sacred sites in the SSFL region are associated with Native Americans. Traditional cultural properties or resources may also be associated with other traditional lifeways, such as agriculture. Traditional cultural properties can include archaeological resources, locations of pre-contact or post contact events, sacred areas, sources of raw materials used in the manufacture of tools and/or sacred objects, certain plants, traditional hunting and gathering areas, or landscapes (NPS 1998).” (Draft EIS, p. 3-135.)

146-9

Page 16 of 32

remediation alternatives. (Draft EIS, p. 2-18.) However, up to an additional 101 acres containing important biological or cultural resources could be disturbed depending on how the 2010 AOC exemption areas are interpreted by regulatory authorities.

These conclusions of the Draft EIS regarding impacts to biological and cultural resources speak for themselves. They also underscore the importance of thoroughly evaluating a reasonable range of alternatives, including alternatives that accurately reflect the actual future use of the property as open space and that provide for a soil cleanup using a risk based approach that evaluates a recreational as well as a residential receptor.

VII. DOE IDENTIFIES TECHNICAL CHALLENGES IN IMPLEMENTING THE 2010 AOC, WARRANTING CAREFUL CONSIDERATION BY DOE OF ITS FEASIBILITY

The Draft EIS acknowledges that the 2010 AOC provides an atypical and unprecedented approach to cleanups:

"Background concentrations and minimum detection limits are lower than what is typically used as a standard for soil cleanup. Most cleanups are based on a risk assessment that follows EPA guidance.

...
Therefore, meeting the 2010 AOC LUT values would require an unprecedented approach and effort."

(Draft EIS, p. 2-24-2-25.)

Since the 2010 AOC was entered into, DOE has had the opportunity to further consider the practical effects of implementing its provisions, and DOE has identified several critical technical issues. As explained in the Draft EIS, the Cleanup to AOC LUT Values approach, which was established without following state or EPA regulations or guidance, creates decision rate errors, and the "acceptable" error rate of five percent, when compounded over 132 constituents, results in a "much greater chance that DOE would be remediating clean soil, not contaminated soil." (Draft EIS, p. 2-26.)

Equally troubling is DOE's conclusion that it would likely not be able to find backfill soil that would meet the AOC LUT values. DOE performed testing of both off-SSFL soil and for comparison, bags of soil purchased from home improvement stores, and found neither met the AOC LUT values.¹⁶

¹⁶ Boeing also evaluated soil samples from seven public park and open space areas located 3 to 25 miles from the SSFL, and 13 of the 30 constituents detected in samples collected in one or more of the parks or open space failed to meet the AOC LUT values. (See Regional Map, Offsite Soil Sampling in Parks and Open Space Areas, Santa Susana Field Laboratory and Detected Chemical Results from Offsite Park and Open Spaces, attached to this letter as Attachment A.) In addition, when comparing California and other national data on soil background results from other studies to the AOC LUT values, 89% of the background levels exceeded the AOC LUT values. (See Published Background Values vs. Area IV AOC Lookup Table Values, Santa Susana Field Laboratory, attached to this letter as Attachment B.) This data further demonstrates that

146-9
cont'd

146-10 146-10 Please refer to DOE's response to comment 146-7.

146-11 146-11 DOE agrees that there should not be any removal of soil in Area IV without an adequate source of backfill identified. Per the 2010 AOC, "If an onsite or offsite source of backfill soils that achieves all Look-Up Table values cannot be reasonably found, then DTSC, DOE and EPA shall enter a consultation process and DTSC shall determine the best available source of backfill." DOE will continue to work with the DTSC to identify a source of backfill meeting the 2010 AOC criteria prior to initiation of soil remediation activities.

Commenter No. 146 (cont'd): Steven L. Shestak,
Director, Environment, Health & Safety, Boeing

Ms. Stephanie Jennings
 SS0417001
 Page 17 of 32

(Draft EIS, p. S-24.)

Furthermore, even if soils meeting AOC LUT values could be found, the removal of native soils (including soils that do not present a risk to human health or the environment) would degrade the ecological values of the site because it would not be possible to find acceptable replacement soils that could support the native vegetation. The Draft EIS explains: "If a soil were found that could meet the AOC LUT values, there is also concern that the soil would not be comparable to the physical, chemical, and microbial characteristics of existing soil, making it difficult to re-establish native vegetation in Area IV and the NBZ." (Draft EIS, p. 2-28.)

DOE proposes to engage in a consultation process with DTSC to "determine the best available source of backfill." (Draft EIS, p. 2-28.) Given the need to locate at least 733,000 cubic yards of soil to backfill the massive excavated areas created under an AOC LUT cleanup, the inability to find acceptable replacement soils would have devastating consequences to habitat. The EIS should include a mitigation measure for any AOC LUT cleanup that, prior to the commencement of any remediation activities, DOE and DTSC confirm the availability of sources of replacement soils and confirm that those soils would support replacement of native vegetation. Consistent with standard practices, it would be unacceptable to have excavated areas that would not be properly backfilled due to the lack of soil meeting AOC LUT values.¹⁷

VIII. THE SCOPE OF A CLEANUP TO AOC LUT VALUES COULD BE MORE SEVERE AND ENVIRONMENTAL IMPACTS COULD BE FAR WORSE THAN THOSE IDENTIFIED IN DRAFT EIS

The numerous adverse impacts resulting from the Cleanup to AOC LUT Values alternative are based on certain estimates regarding the scope of activities for that alternative, as well as assumptions regarding the environmental setting and affected environment. For example, the Draft EIS states: "[T]he volume of soil that may not meet the AOC LUT values could range from 1,000,000 cubic yards to 2,500,000 cubic yards." (Summary, p. S-19.) Even though the amount of soil that would need to be cleaned up under the Cleanup to AOC LUT Values alternative could be up to 2,500,000 cubic yards, the Draft EIS uses 1,413,000 as the estimated volume of soil not meeting AOC LUT values, and also deducts 330,000 cubic yards from that estimate for the biological and cultural exemption areas. The 2010 AOC also contemplates the removal of contaminated materials emanating from Area IV or the Northern Buffer Zone, including those transported along the drainages, e.g. leading into and found in Silvernale Pond, but the Draft EIS does not include those soil volumes in its estimates.

Therefore, if the amount of soil not meeting AOC LUT values is on the high side of the range, and if the biological and cultural exemption areas require substantial removal of soil (using risk-based levels

the 2010 AOC cleanup cannot, and should not, be implemented.

¹⁷ Consideration of this factor must include the impact of possible backfill requirements on the NASA and Boeing clean-up efforts at the SSFL.

146-11
 cont'd

146-12 In this Final EIS, DOE has included a sensitivity analysis to assess the potential impacts of a larger volume of soil under the Cleanup to AOC LUT Values Alternative. Since the Draft EIS was prepared, DOE has independently checked the estimate of the soil volume associated with cleaning up to the 2010 AOC LUT values. Based on the characterization data and an improved understanding of the soil depth over bedrock across Area IV, DOE is not as uncertain about the upper limit of the soil volume estimate as it was at the time the Draft EIS was prepared. (See Final EIS Section 2.3 and Appendix D, Section D.6.) Consequently, the sensitivity analysis evaluates impacts associated with removing 1,900,000 cubic yards of soil. This volume is based on 1,616,000 cubic yards of soil, which includes volumes of soil associated with areas exempt to protect cultural and biological resources (115,000 cubic yards) and areas proposed for monitored natural attenuation of TPH (620,000 cubic yards), plus an uncertainty factor of 20 percent.

146-12

146-13

146-12
 cont'd

146-13 The commenter is correct that the current volume estimates do not include DOE cleanup actions in Area III. Silvernale Pond was used primarily as a catch basin for rocket engine quench water, generated from areas other than Area IV. All three of the SSFL responsible parties (Boeing, DOE, and NASA) have contributed to the contamination in the Silvernale Pond. Boeing has informed DOE that it will not allow soil cleanup to AOC LUT values on Boeing property in Area III. Therefore, DOE is assuming that cleanup to risk-based standards will be conducted in agreement with the landowner.

**Commenter No. 146 (cont'd): Steven L. Shestak,
Director, Environment, Health & Safety, Boeing**

Ms. Stephanie Jennings
SS0417001
Page 18 of 32

as proposed¹⁸), the volume of soil to be removed from the SSFL site could be substantially higher, possibly double the amount evaluated in the Draft EIS.

The adverse effects of removing over 2,000,000 cubic yards of soil from Area IV and the Northern Buffer Zone would be even more pronounced than the unacceptable impacts that the Draft EIS found when using a mid-range estimate of soil not meeting AOC LUT values. They would be severe and irreversible. The cleanup activities could take 25 years or more, and the majority of Area IV, the Northern Buffer Zone and adjacent drainages could be excavated, with almost certain permanent devastation to the native vegetation, wildlife habitat and wildlife corridors, along with greater mortality to wildlife. The Draft EIS already acknowledges the potential permanent damage from excavating 130 acres, and with over 2,000,000 cubic yards of soil removal, the remediation footprint could expand another 101 acres (the exemption area acreage with soil that exceeds AOC LUT values), and the possibility for a successful restoration program becomes even more remote. And, of course, this would also mean that large trucks would be on community streets for decades and the greenhouse gas emissions would be over double the current estimates in the Draft EIS.

Boeing is concerned that the Draft EIS may underestimate the adverse effects associated with a Cleanup to AOC LUT Values. **Prior to selecting any alternative, DOE should give full consideration to the possibility that the AOC LUT Values cleanup would be far worse than described in the Draft EIS, which further emphasizes the need to include and consider risk-based alternatives.**

IX. IMPLEMENTATION OF ANY RISK-BASED CLEANUP SHOULD UTILIZE STANDARD EPA RISK ASSESSMENT METHODOLOGIES AND PROTOCOLS

In the Draft EIS, DOE identified two additional action alternatives which incorporate certain risk-based practices, using a residential receptor. ¹⁹ (Draft EIS, pp. 2-31, 2-33). The Revised LUT Values alternative modifies the chemical LUT values based on risk-based screening levels (using point by point cleanup decisions), but the LUT values for radiological constituents would remain the same. (Draft EIS, p. 2-31.) For the Conservation of Natural Resources alternative, the cleanup would be based on a risk assessment for chemicals and a dose analysis (DOE standard of 25 millirem per year) for radionuclides. (Draft EIS, p. 2-33.) Boeing appreciates the technical complexities in developing risk-based alternatives, and **DOE should use standard EPA risk assessment methodologies and protocols for any risk-based cleanup.**

¹⁸ The Draft EIS states that remediation in the proposed exemption areas under the AOC LUT Values, AOC Revised LUT Values, and Conservation of Natural Resources Alternatives would be minimized by use of focused removal actions. Draft EIS p. 2-59. DOE would not take action in the proposed exemption areas unless soil chemical or radionuclide levels pose a risk to human health and the environment. Draft EIS p. 4-38. However, the amount of disturbance in these areas has not yet been determined.

¹⁹ DOE properly excluded the indirect garden pathway from the risk-based analysis because Boeing intends to preserve the property as open space and there will never be any homes or gardens there. (Draft EIS, p. S-18, footnote to Table S-1.)

146-12
cont'd

146-14

146-14 As the commenter notes, the two alternatives to the Cleanup to AOC LUT Values Alternative that DOE has evaluated two alternatives that use two different approaches. The Cleanup to Revised LUT Values Alternative is intended to maintain most of the elements of the Cleanup to AOC LUT Values Alternative. What it changes are the cleanup levels for chemicals, establishing levels based on risk which also makes them more technically viable. DOE's Conservation of Natural Resources Alternative largely follows standard EPA risk -assessment protocols, with exceptions made to accommodate other factors (e.g., DOE's dose-based methodology for cleanup of radioactively contaminated soil, the current version of the Standardized Risk Assessment Methodology developed for SSFL (MWH 2014).

Page 19 of 32

X. PREFERRED ALTERNATIVE

DOE is required to identify a preferred alternative in its preparation of the final EIS, "unless another law prohibits the expression of such a preference." (40 CFR Section 1502.14(f).) For all of the reasons set forth in this letter, Boeing urges DOE to develop and select as its preferred alternative, an alternative that achieves the purpose and need to protect human health and the environment, uses standard EPA risk assessment methodologies and protocols, minimizes impacts to the local community, fully takes into consideration how best to protect and preserve the unique biological and cultural resources at the site, and results in the fewest environmental impacts.

146-15 146-15 Please refer to DOE's response to comment 146-1.

XI. BOEING'S ADDITIONAL COMMENTS ON DRAFT EIS BY RESOURCE AREA

A. Biological Resources

1. DOE Considers Direct and Indirect Impacts to Threatened, Endangered and Rare Species Protected under Federal and State Law, and Properly Identified Biological Exemption Areas to be Protected for All Alternatives

In evaluating potential impacts to biological resources, DOE appropriately considers potential impacts to vegetation and wildlife habitats, aquatic and wetland habitats, and rare, threatened and endangered species under State and federal law, primarily in Area IV and the Northern Buffer Zone, but extending beyond those boundaries in certain instances. (Draft EIS, p. 3-46.) This analysis allowed DOE to identify biological areas that would be exempt from the 2010 AOC's soil cleanup requirements, and that would be protected under any of the soil remediation alternatives. DOE is in the process of preparing a site-wide Biological Assessment (with Boeing's input), which will allow DOE, Boeing and NASA to coordinate its efforts to protect these important resources across the entire SSFL site. Importantly, separate and apart from the 2010 AOC, NEPA (and CEQA) require the evaluation of potential impacts to biological resources resulting from the proposed action or project. Thus, whether these biological areas are known as "exemption" areas or merely areas that contain sensitive biological resources, any impacts to these areas must be fully evaluated under NEPA. Boeing supports DOE's efforts to capture the breadth of biological resources in the Draft EIS, to assess the potential impacts to those resources, and to develop a framework for moving forward in the process with regulatory agencies and stakeholders.

146-16 146-16 Please refer to DOE's response to comment 146-3.

2. DOE Should Consider Potentially Adverse Impacts to 2010 AOC Exemption Areas and Areas Outside Area IV and The Northern Buffer Zone

The 220 acres that comprise the 2010 AOC exemption areas have been eliminated from consideration in the Draft EIS. The preliminary estimate of soil in these exemptions areas is 330,000 cubic yards, based on a footprint of up to 101 acres, which is the acreage which may exceed AOC LUT values.

146-17 146-17 Thank you for your comment. The figures specifically show DOE's area of responsibility. The figures reflect the most current biological data available for Area IV and the NBZ.

(Draft EIS, pp. 2-18, 4-57.) The Draft EIS acknowledges that an "unquantified" amount of acreage within the exemption areas would be disturbed:

Commenter No. 146 (cont'd): Steven L. Shestak,
Director, Environment, Health & Safety, Boeing

Ms. Stephanie Jennings
SS0417001
Page 20 of 32

"To summarize, this alternative would result in removal of vegetation and wildlife habitat over about 130 acres outside of the proposed exemption areas and *an unquantified additional acreage within the proposed exemption areas*, causing mortality and disturbance of wildlife within and adjacent to the affected area."

(Draft EIS, p. 4-59, emphasis added.) The Draft EIS indicates that the total area to be disturbed will be determined in consultation with various federal and State agencies, and the potential impacts to biological resources associated with this additional disturbance should be described and disclosed in conjunction with this process.

The Draft EIS states that the "ROI [Region of Influence] for biological resources encompasses areas that could be directly or indirectly impacted by the proposed activities, including Area IV and the NBZ." (Draft EIS, p. 3-46.) In describing drainages, the Draft EIS states:

"A total of 13,100 linear feet covering 0.62 acres of riverine water of the U.S. were mapped in Area IV and the NBZ (see Appendix J). Some of these drainages proceed down gradient from Area IV into Area III, then Area II. Stormwater runoff from the upland developed area is currently diverted at the stormwater treatment outfalls and routed via aboveground HDPE pipelines to Silvernale Pond in Area III for treatment before being released into the Bell Canyon watershed."

(Draft EIS, p. 3-62.) While the Draft EIS intends to evaluate biological resources outside Area IV and the Northern Buffer Zone, some diagrams in the Draft EIS show incomplete depictions of these resources and thus, it is not clear that they were fully considered. For example, Figure 3-21 depicts Silvernale Pond, but the drainages are shown as terminating at the boundary between Area IV and Area III, and does not show the linkage to Silvernale. Similarly, the Draft EIS states that "Figure 3-21 shows wetlands, vernal pools, jurisdictional waters, ponds, and NPDES outfalls in Area IV and the NBZ, or in other SSFL areas but important to the proposed activities." (Draft EIS, p. 3-60.) But, Figure 3-21 depicts only some of these features in Areas II and III, and the omission of the other features, e.g., jurisdictional waters, implies they do not exist.

In addition, based on biological assessments of the SSFL as a whole, including Area IV and the Northern Buffer Zone, other wildlife species should also be considered, including 138 bird species (not just 64 species noted in the Draft EIS) including the great horned owl, as well as the legless lizard and other California species of special concern, along with a flock of year-round resident western meadowlarks known to visit the Area IV grasslands. The Draft EIS's analysis of Santa Susana tarplant is based on 850 individual plants in Area IV, but the SSFL site has more than 12,000 individual plants which could represent the highest occurrence of the species anywhere. Limiting the proposed action's impacts to 850 plants could understate the impacts in the larger context of this tarplant population.

The biodiversity of the SSFL site is incredibly rich and DOE should ensure that potentially adverse impacts to all known biological resources are considered in the EIS.

3. DOE Should More Fully Evaluate the Impacts of the Cleanup to AOC LUT Values on the Larger Wildlife Corridor

Section 3.1.1.1 of the DEIS recognizes that:

“SSFL sits within a rare and vital wildlife corridor connecting the Sierra Madre Ranges of the Los Padres National Forest to the Santa Monica Mountains and the Pacific Ocean. Termed the Santa Monica - Sierra Madre Connection and comprising approximately 125,000 acres, the corridor consists of sandstone cliffs, oak woodlands, and scrub and meadows, with valley and mountain vistas. Several formally designated open space areas are located within close proximity to SSFL and are a part of this unique corridor.”

(Draft EIS, p. 3-3.)

This Section recognizes that the site is being considered as part of the proposed Rim of the Valley Act (H.R. 5467), in order to be added to the Santa Monica Mountains National Recreation Area, because of the property’s ecological values. The Draft EIS should also recognize a parallel effort by Ventura County to enhance the natural wildlife corridor that currently exists. The Board considered the following background information in evaluating a Wildlife Corridor Overlay Zone that would include the SSFL:

“The ability for wildlife to cross between large natural land masses is critical to their survival. Some species, including mountain lions in the Santa Monica Mountains, are essentially on an island of nature surrounded by freeways, roads and urban development that limit their ability to roam. This constriction of movement threatens wildlife by reducing genetic diversity and increasing incidents of roadkill. Establishing safe passage along existing wildlife corridors can make the difference as to whether species continue or decline in our region.”²⁰

²⁰ “Background Information: Wildlife Corridor Overlay Zone, Board of Supervisors Agenda, January 24, 2017.” Ventura County Board of Supervisors, Supervisor Linda Parks.

146-18

146-18 Additional information about mountain lion sightings at SSFL was added to this Final EIS, Chapter 3, Section 3.5.5. Updates have been made to the Ventura County Locally Important species which are addressed in Chapter 3, Table 3-7, of this Final EIS.

Additional information about the Rim of the Valley Corridor Special Resources Study was added to this Final EIS, Chapter 3, Section 3.1.1. DOE believes that the actions, including the implementation of exemption areas, and precautions (see Chapter 6 for minimization and mitigation actions) being taken as part of the site remediation of Area IV and the NBZ are consistent with the purposes of this initiative.

Commenter No. 146 (cont'd): Steven L. Shestak,
Director, Environment, Health & Safety, Boeing

SS0417001
Page 22 of 32

Mountain lions are indeed active at the SSFL, as shown in this recent nighttime photograph of an adult mountain lion and two cubs.

Mountain Lion and Two Cubs at SSFL Watering Guzzler (January 31, 2017)

The Draft EIS analyzes some of the Environmental Consequences of the Cleanup to AOC LUT Alternative in Chapter 4 of the EIS. The summary from the Draft EIS, previously quoted above in Section VI, highlights the severity and permanency of the consequences to biological resources:

To summarize, this alternative would result in removal of vegetation and wildlife habitat over about 130 acres outside of the proposed exemption areas and an unquantified additional acreage within the proposed exemption areas, causing mortality and disturbance of wildlife within and adjacent to the affected area. The profound soil disturbance caused by remediation will require special measures to accomplish restoration of a self-sustaining native vegetation cover and sources of suitable clean soil for backfill where soil has been removed have not been identified. If backfill is substantially different than that originally present, it may not support vegetation similar to that present before development of Area IV. With implementation of habitat restoration and revegetation measures, as well as

Director, Environment, Health & Safety, Boeing**

Ms. Stephanie Jennings
SS0417001
Page 23 of 32

measures to reduce or avoid impacts on wildlife as described in Chapter 6, impacts would be reduced, but would remain substantial given the degree of habitat loss and the length of time required to restore vegetation, habitat function, and wildlife population.

(Draft EIS, p. 4-39.)

The impacts detailed in the Draft EIS are unquestionably substantial. As the Draft EIS notes, permanent uprooting of native plants and soil will severely damage plant communities and disrupt animal behaviors, including essential behaviors such as feeding and, consequently, breeding. Such a disruption is part of the classic definition of a "take" under the Endangered Species Act (ESA). The status of the mountain lions, bobcats, bears, deer and other large mammals under the ESA is not the issue here, as the impact to these animals is a significant (but avoidable) impact that needs to be considered in the NEPA process.

Boeing urges DOE to devote more study and analysis to the long term impacts that the Cleanup to AOC LUT Values alternative would have on biological resources. Moreover, in considering the impact of the Cleanup to AOC LUT Values alternative, DOE should consider the purposes of both the Rim of the Valley initiative and the County's Wildlife Corridor Overlay Zone, and the negative impacts of this alternative on those Federal and local land use planning efforts.

4. The EIS Should Acknowledge That the Impact of Wildlife Mortality on Roads Would Be Reduced with Fewer Truck Shipments

One often over-looked issue in evaluating impacts to biological resources is the potential for killing of wildlife on roads. The Draft EIS identifies this issue in the Cumulative Impact Analysis: "Additionally, the truck trips would increase the potential for adverse effects from animal-vehicle collisions on wildlife." (Draft EIS, p. 5-15.) However, this potential impact should also be factored in as a part of the proposed action, as the Cleanup to AOC LUT Values alternative will require over 110,000 truck shipments, likely resulting in substantial road kills of native animals, particularly special-status reptiles. (Draft EIS, p. 4-103, Table 4-48.) While some roads identified for truck transportation are heavily travelled, Woolsey Canyon, the main access road to the SSFL is located in a sparsely developed area; with 10 or more years of heavy truck traffic, the impacts to native animals traversing the area could be substantial and must be carefully analyzed and taken into account when selecting a preferred alternative. Fewer truck trips under risk-based alternatives would reduce this impact dramatically.

B. Land Resources

The Land Resources section of the Draft EIS includes an analysis of potential impacts to Land Use, Recreation, Infrastructure, and Aesthetics and Visual Quality. The Draft EIS concludes that the impacts to Land Use for all soil action alternatives are consistent with Boeing's intent to preserve the property as undeveloped open space and that the impacts to Aesthetics and Visual Quality would be beneficial.

146-18
cont'd

146-19

146-19

The impacts on wildlife due to vehicle collisions on roads have been incorporated under each alternative in Chapter 4, Section 4.5, of this Final EIS.

146-20

146-20

Please refer to DOE's responses to comments 146-8 and 146-9. Whereas any remediation activities would result in disruption of the current natural setting and the more extensive the remediation, the more disruption, the land use would remain open space under any of the soil action alternatives. However, DOE revised this Final EIS to acknowledge that greater disruption has the potential for extended time frames for impacts to the Aesthetic and Visual Quality of Area IV and the NBZ.

Commenter No. 146 (cont'd): Steven L. Shestak,
Director, Environment, Health & Safety, Boeing

Ms. Stephanie Jennings
SS0417001
Page 24 of 32

With respect to Land Use, the SSFL property is designated as Open Space in Ventura County's General Plan. In the General Plan, Open Space is defined to include unimproved land which is designated on a local, regional or State open-space plan as: "Open space for the preservation of natural resources . . . Open space for outdoor recreation . . ." (Ventura County General Plan – Goals, Policies and Programs (10-20-15 edition) ("General Plan"), pp. 56-57.) The General Plan goals for Open Space land include:

- Preserve for the benefit of all the County's residents the continued wise use of the County's renewable and nonrenewable resources by limiting the encroachment into such areas of uses which would unduly and prematurely hamper or preclude the use or appreciation of such resources.
- Retain open space lands in a relatively undeveloped state so as to preserve the maximum number of future land use options.
- Retain open space lands for outdoor recreational activities, parks, trails and for scenic lands.

(General Plan, p. 58.) The policies to implement these Open Space goals include:

- Open Space should include areas of land or water which are set aside for the preservation of natural resources, including, but not limited to, areas required for the preservation of plant and animal life, including habitat for fish and wildlife species; areas required for ecologic and other scientific study purposes; rivers, streams, bays, and estuaries; and coastal beaches, lakeshores, banks of rivers and streams, and important watershed lands.
- Open Space should also include areas within which recreational activities can be pursued, including, but not limited to, areas of outstanding scenic, historic, and cultural value; areas particularly suited for park and recreation purposes, including access to lakeshores, beaches, and rivers and streams; and areas which serve as links between major recreation and open space reservations, including utility easements, banks of rivers and streams, trails, and scenic highway corridors.

(General Plan, pp. 59-60.) As set forth in Ventura County's General Plan, the Open Space designation includes the preservation of undeveloped property for the benefit of natural resources and for recreational activities. Given the substantial and potentially permanent impacts to natural resources from the Cleanup to AOC LUT Values alternative, DOE should consider whether the AOC LUT approach is consistent with this Open Space designation and Boeing's intent to preserve the land as undeveloped open space.

Under the Building No Action alternative, the Draft EIS's analysis of Land Use should note that this alternative is not consistent with Boeing's intent to preserve the property as undeveloped open space.

146-20
cont'd

146-21

146-21 The No Action Alternative is presented as the baseline or existing conditions at the site. Section 4.1.1.1 of this Final EIS was changed to address this comment.

Commenter No. 146 (cont'd): Steven L. Shestag,
Director, Environment, Health & Safety, Boeing

Ms. Stephanie Jennings
 SS0417001
 Page 25 of 32

The Land Resources section of the Draft EIS also evaluates Recreation primarily from the perspective of whether transportation impacts from the remediation activities would impede access to existing recreation areas. The Analysis Considerations listed in Table 4-3 for Recreation include: "Impediment on future development of recreation facilities." (Draft EIS, p. 4-6.) While Boeing appreciates that Area IV and the Northern Buffer Zone are not currently open to the public for recreational purposes, one of Boeing's primary objectives for the SSFL property is to ensure that it is protected for recreational purposes. **Given that Cleanup to AOC LUT Values alternative is estimated to take at least 12 years to complete, the EIS should acknowledge that this lengthy delay constitutes an impediment to the future development of recreational facilities at the SSFL.**

With respect to Aesthetics and Visual Quality, the Draft EIS characterizes the site as "urban industrial" or "those areas consisting of or bordered by urban and industrial land use within the foreground distance zone." (Draft EIS, Appendix B, p. B-4.) Potential impacts to views are quantified based on a sensitivity level analysis and a visual resource assessment. (Draft EIS, Appendix B, p. B-3.) Based on the fact that the property is not accessible or visible to the public, the Draft EIS concludes that the public sensitivity level is "no sensitivity." (Draft EIS, p. 4-7.) "No Sensitivity" is defined as follows: "The views are not public, or there are no indications of public concern over or interest in scenic/visual resources impacts on the affected area." (Draft EIS, Appendix B, p. B-6.)

In evaluating the Cleanup to AOC LUT Values alternative, the Draft EIS recognizes that there would be impacts during the 10 years of soil removal, but "long term improvements to aesthetics and visual quality from returning Area IV to a stabilized, revegetated state." (Draft EIS, p. 4-9.) The Draft EIS compares the soil cleanup and use of heavy equipment, which has an "industrial appearance," to the "urban industrial" visual character of the site. (Draft EIS, p. 4-12.) The Draft EIS concludes that the impacts from the three viewing points would be "beneficial." (Draft EIS, Table 4-6, p. 4-12.) The Draft EIS does not provide any "before and after" viewing point simulations (in contrast to the Building Removal alternative, where "before and after" simulations were provided.)

The photographs provided at the beginning of this letter show Area IV and the surrounding vicinity. An AOC LUT cleanup would destroy, perhaps permanently, the natural habitat and beauty of the site.

The Draft EIS provides the following rationale for concluding that the impact of the Cleanup to AOC LUT Values would be beneficial:

"Although soil cleanup would alter the existing aesthetic and visual quality of Area IV by disturbing native vegetation, stabilization and revegetation of the affected areas would introduce new, long-term surface texture and color in areas that were previously barren. New vegetation alone would not likely be sufficiently beneficial to improve the visual modification class rating of the viewing point and associated areas – that is, the view would consist of open space crossed by roads before and after remediation. However, new vegetation would still benefit the aesthetics and visual quality of the area and would not cause an adverse effect."

(Draft EIS, p. 4-12.)

146-22

146-22 The text of this Final EIS was revised to indicate that the availability of Boeing's SSFL property for the purposes intended in the land use covenant are directly affected by the duration of remediation activities.

146-23

146-23 Under all soil remediation alternatives, including the Cleanup to AOC LUT Values Alternative, the amount of land disturbed at a given time would be variable. Remediation would be done in stages, with certain areas being excavated, others backfilled and showing signs of recovery from revegetation, and still others being undisturbed. It is a presumption in the EIS that revegetation will be successful. As stated in Table 6-1, DOE would prepare a site-specific Revegetation and Habitat Restoration Plan that would address all revegetation efforts associated with soil disturbances. Among the requirements of this plan would be "Seed mixes will include only species native to the site and will be collected from onsite source." DOE notes that because the area would be remediated in stages, it is not correct to picture the entire 150 acres disturbed and 881,000 cubic yards removed all at the same time. While DOE agrees that disturbance of 150 acres across the site would be disruptive to the existing visual and natural setting, DOE is confident that a successful backfill, contouring, and revegetation effort could restore the site to a natural-looking state. With respect to protecting cultural values of SSFL, DOE will comply with NHPA and take measures in accordance with the Section 106 National Historic Preservation Act (NHPA)

Commenter No. 146 (cont'd): Steven L. Shestak,
Director, Environment, Health & Safety, Boeing

Ms. Stephanie Jennings
SS0417001
Page 26 of 32

Given the “profound soil disturbance” anticipated with the Cleanup to AOC LUT Values, along with the uncertainty for successful habitat restoration, it is difficult to imagine how the impacts to Aesthetics and Visual Quality could be beneficial. The viewing points of the existing site, while they certainly include industrial buildings, show that Area IV is substantially green space, and not merely “open space crossed by roads.” (Draft EIS, pp. 3-13 – 3-14, Figures 3-6, 3-7 and 3-8.) While revegetation may marginally improve a ravaged landscape, the visual quality of the site would be devastated by 130 acres of disturbance (not including the biological and cultural exemption areas) that most likely would not be revegetated with native plants. Thus, the post-remediation visual quality could never be the same as the visual quality of the site currently, with its unique environmental beauty, despite the smattering of existing industrial buildings or roads. Viewing point simulations of the 130 acres of disturbance, along with the removal of at least 933,000 cubic yards of soil, could be prepared to demonstrate the undoubtedly severe effects of the Cleanup to AOC LUT Values alternative.

Finally, the characterization of the site as “No Sensitivity” seems to be inconsistent with future use of the property as open space, inconsistent with the Native Americans’ belief that the SSFL is a sacred site and a traditional cultural property, inconsistent with multitude of stakeholders interested in preserving the site’s unique natural resources, and inconsistent with Boeing’s own interest in preserving and enhancing the visual quality of its property.

C. Surface Water

The Draft EIS concludes that the existing onsite NPDES stormwater control and outfall monitoring system, in combination with mitigation measures and other BMPs, will ensure that the Cleanup to AOC LUT Values alternative will not result in adverse impacts to surface water quality or to stormwater runoff quantity and velocity. (Draft EIS, p. 4-40.) Given the enormous amount of soil to be removed over 130 acres, the likelihood of increased runoff and NPDES permit exceedences would be high, despite the implementation of BMPs and proposed mitigation measures. Documented use of BMPs, including post-fire vegetation reports, indicate that these BMPs (e.g., straw bales, silt fencing) may not be effective in meeting inordinately stringent discharge standards.

Further, Mitigation Measure SW-1 prohibits excavation of soils to bedrock and backfill activities for six months of the year (December to May), which would extend considerably the 12-year cleanup schedule. (Draft EIS, p. 6-17.) The impacts of this extended schedule should be evaluated in the EIS. Also, this prohibition could potentially interfere with revegetation efforts as the prohibition covers much of the rainy season for this region.

Moreover, Mitigation Measure SW-2, contemplates the installation of additional stormwater retention structures (such as catch basins or retention basins). DOE should include in its analysis the additional time required to secure any grading permits and to satisfy other regulatory requirements. **In addition, DOE should consider what other mitigation measures it may need to implement to ensure that no adverse impacts to surface water quality or to stormwater runoff quantity and velocity would occur.**

146-23
cont'd

146-24

146-25

146-24
cont'd

Programmatic Agreement (an agreement being developed in consultation with the SHPO and other consulting parties, including the federally recognized Santa Ynez Band of Chumash Indians and non-federally recognized tribes, and DTSC) to protect cultural resources, regardless of the alternative selected. The entire effort would be undertaken in consultation with biologists and Native Americans to address negative impacts to the extent practical and in accordance with the NHPA Section 106 Programmatic Agreement and the Biological Opinion.

146-24 DOE has added information to this Final EIS in Chapter 4, Section 4.3.1 regarding the Stormwater Pollution Prevention Plan (SWPPP) that will be developed for soil remediation actions. The SWPPP will incorporate all appropriate runoff control measures recommended by the Stormwater Expert Panel. In addition, as was noted in Chapter 4, Section 4.3.1, the excavation actions included in the alternatives that would remove soil to the underlying bedrock and backfill to initiate revegetation in drainage areas leading offsite would be limited by Mitigation Measure SW-1, to only occur in periods outside of the December through May. stormwater season to avoid any increases in runoff volume and velocity potentially created by increases in impervious surfaces on site with the exposure of areas of currently covered bedrock. As required by 10 CFR 1021.331, following completion of the Record(s) of Decision (ROD[s]) for this Final EIS, DOE will prepare a Mitigation Action Plan that addresses mitigation commitments expressed in the ROD(s), including those that are necessary to prevent movement of contaminants during soil remediation. The Mitigation Action Plan will explain how the corresponding mitigation measures, designed to mitigate adverse environmental impacts associated with the course of action directed by the ROD(s), will be planned and implemented. This will include the process necessary to implement any additional stormwater control mechanisms potentially required under Mitigation Measure SW-2 in the event that the best management practices required under the SWPPP and the construction scheduling requirements in Mitigation Measure SW-1 would not limit runoff rates and volumes to the design capacities of the existing NPDES stormwater control system.

146-25 Based on annual soil volume limits and funding limits, DOE would most likely schedule soil remediation outside of the areas limited by Mitigation Measure SW-1: Excavation of soil to bedrock and backfill in drainage areas leading offsite during the period December to May would not be performed. As a result, implementation of Mitigation Measure SW-1 is unlikely to increase the total project schedule. Chapter 4, Section 4.3.1 of this Final EIS was revised to clarify that, only soil excavation and backfilling activities in drainage areas leading offsite would be restricted during the rainy season and that

Page 27 of 32

The Draft EIS assumes that the NPDES monitoring system will remain in place during and after soil remediation, which under the Cleanup to AOC LUT Values alternative, could be 10 years after soil remediation activities have started. As acknowledged in the Draft EIS, Boeing's remediation activities are not expected to take that long, and ongoing responsibility for the NPDES system will need to be considered. Also, the Draft EIS acknowledges that in the long-term, the need for monitoring surface water runoff from the site would be reduced. (Draft EIS, p. 4-40.) Thus, at some point, the BMPs at Outfalls 3, 4, 5, 6 and 7 should be removed, and the EIS should consider including an evaluation of removing these BMPs, including any contaminated materials located at these outfalls.

D. Cultural Resources

The Draft EIS recognizes the significant impacts of the Cleanup to AOC LUT Values alternative on traditional cultural resources, including impacts to topography and setting resulting from 10 years of soil removal across 130 acres. (Draft EIS, p. 4-167 – 4-168.) However, the Draft EIS concludes that no adverse impacts to archaeological cultural resources would occur because 1) DOE identified all known archaeological resources based on an extended phase 1 testing program; and 2) these archaeological resources are located in the 2010 AOC exemption areas where no AOC LUT excavation would occur. (Draft EIS, p. 4-167.) The Draft EIS does not, but should, consider the potential impacts to archaeological resources such as rock shelters from the dust generated by adjacent remediation activities and vibrations from heavy equipment used in such activities. The Draft EIS also indicates that the 2010 AOC exemption areas would be remediated using a risk assessment approach and thus, some work in these areas will be performed, but it is unknown whether that work will impact archeological resources. The amount of disturbance to the 2010 AOC exemption areas has not yet been determined and will be based on the results of consultations with DTSC, U.S. Fish and Wildlife Service, California Department of Fish and Wildlife, State Historic Preservation Officer (SHPO) and the SSFL Sacred Sites Council. (Draft EIS, pp. 4-57 – 4-58.) The 2010 AOC biological and cultural exemption areas total 220 acres, of which 101 acres contain chemical or radioactive materials exceeding AOC LUT values, and thus, up to an additional 101 acres containing important archaeological resources could be disturbed depending on how the 2010 AOC exemption areas are interpreted by regulatory authorities.

While the Draft EIS evaluates the potential impacts to traditional cultural properties, it does not evaluate whether any of Area IV or larger portions of the SSFL site are eligible for designation as a historic district under the National Historic Preservation Act. "Historic property means any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places maintained by the Secretary of the Interior." (36 CFR Section 800.16(1)(1). A "historic conservation district" is defined in the NHPA as follows:

§ 300305. In this division, the term "historic conservation district" means an area that contains—
(1) historic property; (2) buildings having similar or related architectural characteristics; (3) cultural cohesiveness; or (4) any combination of features described in paragraphs (1) to (3).

146-26

revegetation efforts would not be restricted to these dry months. DOE would schedule these actions to take advantage of the rainy season to establish vegetation in the period of December through May.

146-26 During soil remediation, DOE will implement efforts to protect and maintain storm water controls, including those already constructed by Boeing. However, because Boeing is the permittee with the State of California for the existing structures, DOE believes that the completion of Boeing's soil remediation activities would not eliminate the need to maintain storm water controls under its existing stormwater permit and Boeing, as the property owner, will have to continue to maintain these controls.

146-27

146-27 Because air quality impact analysis and noise and vibration impact analysis presented in Chapter 4, Sections 4.6 and 4.7, respectively, show that there would be no substantial impacts overall from cleanup activities, their impacts on archaeological sites was not discussed in Chapter 4, Section 4.11. In some cases, a no impact finding is based on there being no impact at all, and in other instances it is based on implementation of best management practices and mitigations, as described in Chapter 6, Sections 6.1 and 6.2. The air quality analysis concludes that although activities at SSFL would generate fugitive dust, it is expected that implementation of DOE's protective measures during cleanup activities would result in there not being substantial air quality impacts at any location. For vibrations, vibration from cleanup activities outside of the cultural exclusion areas, including machinery operation, is not projected to be great enough to cause impacts to archaeological resources. Cultural resources impact analyses were revised to clarify that DOE is aware of the potential for previously unidentified archaeological sites in areas where cleanup activities would occur, including in the vicinity of known sites, and that DOE has procedures in place if such cultural resources are encountered. Some cleanup may occur in exemption areas if necessary to protect human health and the environment. These circumstances will be outlined in the detailed Soil Remedial Action Implementation Plan. To address unevaluated sites (inadvertent discoveries), DOE has committed to protecting both known and unknown cultural resources (as broadly defined for the purposes of this EIS in Chapter 3, Section 3.11.1), including the Traditional Cultural Property in Area IV and the NBZ, and is preparing an NHPA Section 106 Programmatic Agreement. This agreement, being developed in consultation with the SHPO and other consulting parties, including the federally recognized Santa Ynez Band of Chumash Indians and non-federally recognized tribes, and DTSC, will establish standard operating procedures for DOE to address cultural resource issues, including impact mitigation measures. The NHPA Section 106 Programmatic Agreement will establish procedures for making eligibility

146-28

Page 28 of 32

Under Section 106 and its implementing regulations, federal agencies are required to consider whether its actions will have any adverse effects to "historic properties." (36 CFR Section 800.5.) **DOE should consider whether any of Area IV or larger portions of the SSFL might be eligible as a historic district, and consider the potential adverse impacts of the Cleanup to AOC LUT Values on that district.**

E. Air Quality

The EIS acknowledges that estimated emissions from the Cleanup to AOC LUT Values alternative are two to six times higher than the estimated emissions for the Cleanup to Revised LUT Values alternative, and three to eight times higher than the Conservation of Natural Resources alternative. (Draft EIS, p. 4-78, Table 4-31.) These total emissions, however, are not further explored or considered, and instead, the EIS focuses only on peak annual emissions and daily emissions: "[T]he main focus of the analysis in this subsection is on comparison of emissions against annual emission thresholds and daily ambient air quality standards rather than total emissions." (Draft EIS, p. 4-80, fn. 12.) While peak annual and daily emissions are important factors to be considered, **the EIS should also further evaluate the impacts of 10 to 12 years of air emissions generated by the Cleanup to AOC LUT Values alternative, particularly nitrogen oxides (NOx) and Particulate Matter (PM 2.5 and PM10.**

Moreover, the EIS reports a peculiar and incongruous conclusion for peak annual NOx emissions in South Coast Air Basin, stating that peak annual NOx emissions for the Cleanup to AOC LUT Values alternative is *less than* the NOx emissions for the Cleanup to Revised LUT Values or the Conservation of Natural Resources alternative (5.7 tons compared to 8.7 tons, for the nearby disposal site). (Draft EIS, p. 4-84.) A similar conclusion is reported for the peak daily NOx emissions where the "largest daily emissions" are reported for the Cleanup to Revised LUT Values and Conservation of Natural Resources alternatives (nearby disposal site). (Draft EIS, p. 4-85.) For domains outside Ventura County and South Coast Air Basin, the Cleanup to AOC LUT Values alternative has a smaller amount of peak annual NOx emissions than the other two alternatives for both disposal site scenarios (2.7 tons compared to 12 tons for the nearby disposal site, and 14 tons compared to 51 tons for the distant disposal site). The EIS does not provide, either in the text or in an appendix, an explanation for this disparity.

The thresholds used in the EIS for potential impacts to air quality are based on the EPA's Prevention of Significant Deterioration threshold. (Draft EIS, p. 4-75.) However, given the goal of integrating the requirements of both NEPA and CEQA into the environmental analysis, DOE should consider utilizing the thresholds set forth in the CEQA Guidelines (Appendix G), and the air quality thresholds mandated by Ventura County Air Pollution Control District and the South Coast Air Quality Management District. For example, the NOx threshold in Ventura County is 25 pounds per day, and the peak daily emissions for NOx are reported to be 44-46 pounds per day, in excess of the threshold.²¹ The thresholds for air quality set forth in Appendix G of the CEQA Guidelines include the following question: "Would the project . . . [e]xpose sensitive receptors to substantial pollutant concentrations?"

²¹ Ventura County Air Quality Assessment Guidelines (October 2003), p. 3-2.

146-30

146-31

determinations on unevaluated sites, as needed, and inadvertent discoveries, along with procedures to assess effects and resolve adverse effects if they are determined eligible for the NRHP.

146-28 Chapter 3, Section 3.11.2.3.4 discusses the status of SSFL as a historic district based primarily on the archaeological and traditional resources there. However, because the existing environment does not currently include a defined historic district, Chapter 4, Section 4.11 did not address impacts to one. DOE, NASA, and Boeing continue to work together to determine if the cultural resources at SSFL embody the characteristics necessary to constitute a NRHP-eligible historic district, in addition to the existing designation as a sacred site. The boundaries and components of a potential district would cross jurisdictional lines at SSFL, but might not include the entire SSFL. For this reason, it was not specifically described in the Draft EIS. However, the status of the potential historic district is updated in Section 3.11.2.3.4 of this Final EIS.

146-29 Comment noted. The presentation of the magnitudes and durations of total emissions generated by each soil remediation alternative in Chapter 4, Section 4.6.1 of this EIS provides the long-term context and intensity of each alternative. In response to this comment, this Final EIS includes text in Chapter 4, Section 4.6.4 that explains how long the annual and daily emissions would occur from each soil remediation alternative.

146-30 The conclusions cited in the comment are correct. After summarizing the emission estimates for the South Coast Air Basin, the Draft EIS stated in the first sentence of page 4-85 "The variation in emissions between the near and distant disposal site scenarios reflects, for each combination of action alternatives, the transport of different quantities of different types of waste to different disposal sites, and the lengths of the truck routes within or through the South Coast Air Basin may differ depending on the disposal site scenario. This explanation also would apply to emissions generated within the domain "Outside of Ventura County and the South Coast Air Basin."

More specifically, the Draft EIS proposed that during the peak year of activities, all three soil remediation alternatives excavated and transported the same volume of soil. The Cleanup to Revised LUT Values and Conservation of Natural Resources Alternatives proposed excavation of about 5 times the volume of soils in categories 4-6 versus the AOC LUT Values Alternative during the peak year. Seventy-nine percent of the soils excavated under the Cleanup to AOC LUT Values Alternative would have been categories 1-2 soils. Within the South Coast Air Basin, the distances travelled by haul trucks to nearby disposal facilities for these soils are longer compared to soils in categories 1-2. Likewise, within the domain outside of Ventura County and the South

 Page 29 of 32

While the EIS acknowledged the importance of sensitive receptors and the impact of air emissions in Section 3.6.1.2.4 (Affected Environment), the EIS does not appear to conduct an analysis of potential impacts to sensitive receptors, e.g., localized emissions, and such an analysis should be performed.

XII. CUMULATIVE IMPACTS

The Cumulative Impacts Section of the Draft EIS also recognizes that, in connection with other reasonably foreseeable past, present, and future actions in the "region of influence" (ROI), implementation of the Cleanup to AOC LUT Values alternative would cause long-term loss of endangered, threatened, rare, and otherwise sensitive plant and animal species and loss of habitat:

"The major potential cumulative impacts associated with reasonably foreseeable actions in the ROI in combination with DOE's proposed actions at Area IV and the NBZ include the following:

- Vegetation clearing and soil removal could cause long-term loss of individuals and habitat of federally or state-listed endangered, threatened, rare, and otherwise sensitive plant and animal species from:
 - loss of habitat and mortality of individuals of species unable to escape the construction zone;
 - temporary loss of habitat due to animals avoiding activities, noise, and dust generated by humans and equipment during remediation (behavioral avoidance);
 - wildlife displaced from their habitat by construction activity may become more susceptible to predation and intra-species competition and less able to obtain adequate food and cover;
 - diminished reproduction of nearby wildlife (such as nest failures) due to the activities, noise, and dust generated by humans and equipment during remediation; and/or
 - possible effects on regional wildlife movements (wildlife corridors) as a result of behavioral avoidance of the activity and cumulative loss of plant cover.
- Lack of sources of soil matching onsite soil types and meeting LUT values in sufficient quantities to be used as backfill to replace removed soil may result in substitution of soils that may not support native vegetation, including rare plant species. Additionally, depending on the source and characteristics of the soil, imported soils used as backfill may lead to infestations by invasive species, with consequent impacts on nearby plants and animals.
- Loss or degradation of habitat could be caused by the spread of invasive species or soil pathogens promoted by extensive disturbed areas (creating open habitat for invasive species establishment) and the spreading of propagules (seed, plant parts capable of rooting) or pathogenic soil micro-organisms (e.g., oak root fungus) transported in soil or mud by movement of humans, vehicles, and equipment from site to site.
- Loss or degradation of adjacent habitat could be caused by erosion, sedimentation, turbidity, or dust deposition as a result of excavation and earthmoving activities.

146-31
cont'd

Coast Air Basin, the distances travelled by haul trucks to nearby/distant disposal facilities for soils in categories 4-6 are both substantially longer compared to soils in categories 1-2. Therefore, the Cleanup to Revised LUT Values and Conservation of Natural Resources Alternatives would have produced greater peak annual and daily miles travelled by haul trucks and corresponding higher air emissions compared to the Cleanup to AOC LUT Values Alternative within the (1) South Coast Air Basin under the nearby disposal facilities scenario and (2) domain Outside of Ventura County and the South Coast Air Basin under the nearby/distant disposal facilities scenario.

Due to the revisions to the descriptions of soil remediation alternatives in the Final EIS, both the Cleanup to AOC LUT Values and Revised Cleanup to LUT Values Alternatives would remove the same amounts of soils in a peak year and therefore would generate equal amounts of emissions during this period. Chapter 4, Section 4.6.1 of this Final EIS is revised to explain how annual emissions generated by the soil remediation alternatives are dependent on the types of remediated soils and the associated disposal locations for these soils. In the Final SSFL Area IV EIS air emissions calculation document (Leidos 2018b), Table 1.A-12 (Total On-Road Vehicle Activity Data for Soil Remediation Cleanup to AOC LUT Values - SSFL Area IV EIS) also presents the round trip distances travelled by haul trucks between the SSFL and proposed disposal facilities for each soil category and analysis domain.

146-31 This EIS uses the following thresholds to evaluate air quality impacts from proposed DOE cleanup activities within each analysis domain: (1) an EPA Prevention of Significant Deterioration (PSD) threshold for areas that attain a national ambient air quality standard (NAAQS) and (2) a general conformity *de minimis* threshold for areas that do not attain a NAAQS. Therefore, this approach is sensitive to the existing air quality conditions within each domain. This EIS also qualitatively determines whether emissions from proposed activities would produce localized impacts that would contribute to an exceedance of an ambient air quality standard DOE considers these thresholds to be appropriate for purposes of evaluating air quality impacts from the proposed SSFL project alternatives to all analysis domains, as they are based on approved regulations. Regarding sensitive receptors, this Final EIS includes analyses of the potential for emissions from the proposed cleanup activities to impact sensitive receptors within each analysis domain; sensitive receptors would not be exposed to substantial pollutant concentrations (see Final EIS Chapter 4; Sections, 4.6.4.1, 4.6.4.2, and 4.6.4.3).

Director, Environment, Health & Safety, Boeing

Ms. Stephanie Jennings
SS0417001
Page 30 of 32

- Beneficial cumulative impacts to biological resources could result from returning land to a more natural state after building removal and removal of radionuclides and other hazardous constituents during soil and groundwater cleanup.

At SSFL, the combined soil excavation activities of DOE, NASA, and Boeing would cause profound disturbance (removal of vegetation and soils) over a minimum of 226 acres and a maximum of 405 acres (see Table 5-2), compared to a minimum of 32 acres and a maximum of 130 acres for DOE alone. Proposed 2010 AOC (DTSC 2010a) exemption areas would protect most sensitive plant species and unique habitats, including designated critical habitat, on Area IV and the NBZ. On NASA and Boeing properties, acreages that would be impacted by remediation include some localized and unique habitats, as well as formerly widespread and common habitats that have been greatly reduced as a result of urban and suburban expansion in the surrounding valleys, foothills, and canyons. These losses would increase the importance of remaining habitat and open space on SSFL and its vicinity for wildlife and plants. The effects of vegetation and soil removal could result in long-term impacts due to the time and intense effort needed to restore the habitat."

(Draft EIS, p. 5-14, emphasis added.)

The Draft EIS should consider the magnitude of the cumulative effect of all activities to be performed to remediate the SSFL site in examining the serious consequences of DOE's proposed action. Under NEPA, a "cumulative impact" is "the impact of the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions . . ." (40 CFR Section 1508.7; see also *Klamath-Siskiyou Wildlands Ctr. v. BLM*, 387 F.3d 989, 999 (9th Cir. 2004).) When all SSFL activities are combined, the environmental impacts can be staggering, driven in large measure by the AOC LUT cleanups by both DOE and NASA. DOE's "incremental" contribution to these impacts under its Cleanup to AOC LUT Values is considerable. These cumulative environmental effects demonstrate how critical it is for each of the responsible parties to perform remediation activities in a manner that is protective of human health and the environment and that reduces significant environmental impacts.

Attached to this letter as Attachment C is an updated summary of Boeing's proposed activities at the site, including information that may not have been previously available to DOE prior to the preparation of this Draft EIS. Boeing previously provided this technical information to DTSC in May 2016 or earlier, and requests that DOE utilize this updated information for its analysis in the EIS.

XIII. MINIMIZING AND MITIGATION MEASURES

The Draft EIS identifies several measures to minimize adverse environmental impacts based primarily on applicable federal laws and regulations as well as the implementation of "green cleanup" principles. (Draft EIS, p. 6-1.) DOE notes that "[m]any of the listed minimization measures were developed in conjunction with the California Department of Toxic Substances Control, the National Aeronautics and Space Administration (NASA), and The Boeing Company (Boeing) for the proposed remediation of the entire SSFL." (Draft EIS, p. 6-2.) In addition to these minimization measures,

146-32

146-32

The cumulative impacts of all the activities that are required to remediate the SSFL site have been updated in this Final EIS to use the latest information available for DOE, NASA, and Boeing. Remediation activities will be performed in a manner that is protective of human health and the environment and that reduces significant environmental impacts to the extent possible.

146-33

146-33

The soils volumes and other cumulative impacts information presented in Chapter 5, Table 5-1, of the Draft EIS were up-to-date at the time the Draft EIS was prepared (see references to NASA 2015 and Boeing 2015b). Since the Draft EIS was released in January 2017, revised information has become available (NASA 2017b; Boeing 2017a, 2017b). Therefore, the NASA and Boeing values in Table 5-1 were updated in this Final EIS to reflect the latest information.

146-34

146-34

Thank you for your comment. It has been added to the Administrative Record for the EIS.

Page 31 of 32

the Draft EIS identifies select potential mitigation measures to address the adverse effects identified for Surface Water, Biological Resources, Air Quality and Climate, Transportation/Traffic and Cultural Resources. (Draft EIS, p. 6-17.)

DOE acknowledges that these measures may change as the EIS process continues and as further consultation occurs on both biological and cultural resources with relevant authorities. Also, DOE has stated: “[T]his EIS has been prepared in a manner intended to provide a bridge to the DTSC program EIR.” (Draft EIS, p. 4-4.) Boeing anticipates that the minimizing and mitigation measures set forth in this Draft EIS will be coordinated with the mitigation measures to be prepared as a part of DTSC’s EIR. Boeing has identified any specific technical concerns regarding the minimizing and mitigation measures in the Table attached to this letter, and looks forward to continuing to work with DOE and NASA to ensure that all minimizing and mitigation measures are feasible so they may be properly implemented.

XIV. TABLE OF DETAILED COMMENTS TO SPECIFIC TEXT IN THE DRAFT EIS AND APPENDICES

Boeing has prepared detailed comments to specific text in the Draft EIS and the Appendices, which we have organized in a Table, attached to this letter as Attachment D.

XV. CONCLUSION

Boeing respectfully requests DOE’s consideration of its comments on the Draft EIS. Our comments are submitted to support DOE’s effort to perform a comprehensive NEPA evaluation of its action, and in particular, to support DOE’s efforts to evaluate risk-based alternatives for soil cleanup that protect human health and reduce adverse environmental impacts on this unique and valuable resource. This risk-based and less impactful approach is legally required given the statutory and regulatory context. In addition, because Boeing has committed to preserve the site as undeveloped open space, an alternative based on a recreational user should be evaluated in addition to an alternative based on the residential receptor. We hope that as DOE continues the NEPA process, DOE fulfills the intent and requirements of NEPA by developing and selecting a preferred alternative that achieves the purpose and need to protect human health and the environment, uses standard EPA risk assessment methodologies and protocols, minimizes cleanup-related impacts to the local community, fully takes into consideration how best to protect and preserve the unique biological and cultural resources at the site, and results in the fewest environmental impacts.

Again, Boeing appreciates the opportunity to submit these comments to DOE. We look forward to continuing to work cooperatively to ensure consistency in the environmental analyses for the cleanup activities at the SSFL.

146-34
cont'd

146-35

146-35 In accordance with NEPA and CEQ, DOE implementing regulations, this EIS evaluated a No Action Alternative and three soil remediation action alternatives for conducting cleanup activities in Area IV and the NBZ. As discussed in Chapter 2, Section 2.3.3, of the EIS, due to the technical issues with implementing the 2010 AOC, in addition to the Cleanup to AOC Look-Up Table Values Alternative, DOE evaluated action alternatives that would leave Area IV and the NBZ in a state that was protective of human health and the environment. These two risk-based alternatives, the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative, are presented in Section 2.4 of this EIS. Under the Conservation of Natural Resources Alternative, DOE included two scenarios that are based on potential impacts on 1) a recreational user (the Open Space Scenario) and 2) a suburban residential user without the garden pathway (Suburban Resident Scenario). DOE will complete contamination removal and site remediation based on the decisions made pursuant to this Final EIS and in accordance with regulatory requirements. DOE recognizes that the regulatory requirements include DTSC’s authority with respect to the AOC and the Resource Conservation and Recovery Act. In order for cleanup to begin, DTSC first needs to complete its Environmental Impact Report developed under the California Environmental Quality Act (the Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California was issued by DTSC in 2017 [DTSC 2017b]) and issue its findings. It must also approve the soil and groundwater cleanup plans developed by DOE. The potential environmental impacts presented in this EIS, along with public and agency input, cost, policy, and other factors, will be considered by DOE in selecting alternatives for soil remediation, building demolition, and groundwater remediation for implementation.

Total Constituents where BG > LUTV^{*}: 24
Total Constituents Evaluated: 27
Percentage of Constituents > LUTV^{*}: 89%

* Totals/percentages include constituents where either the Maximum California Benchmark Soils, 99th percentile for California Air Force Bases, or Western US Ambient Dioxin background concentrations exceed the Area IV LUTV.

Notes:

1. Regional background for 2,3,7,8-TCDD TEQ (dioxins/furans) range from 1 to 6 pg/g (USEPA 2000, 2001) which exceeds the Area IV Look-Up Table Value (LUTV) of 0.912 ppt.
2. Yellow highlight and bold indicates a constituent where the maximum regional background value exceeds the DTSC Area IV LUTV.

Acronyms:

BG = Background mg/kg = milligrams per kilogram pg/g = picograms/gram
DTSC = Department of Toxic Substances Control n.a. = not available USEPA = United States Environmental Protection Agency
LUTV = Look-Up Table Value

Attachment C
Data for Cumulative Impacts Analysis of SSFL Remediation for DOE EIS –
Boeing Remediation Project Estimates, April 2017

	<i>Boeing</i>
Land disturbed (acres)	
– Area Disturbed for Soil Removal	17 - 46
– Area Disturbed for Building Removal	3
Employment (persons)	
– Onsite Employees	100
– Truck Drivers - Truck drivers for occasional deliveries or pickups are not included in long-term employment	Assume 16 to 32 truck drivers when 96 truck trips are split between NASA, Boeing and DOE.
Resources used	
– Backfill for Soil Excavation (cubic yards)	50,000 to 88,300 (a)
– Backfill for Building and Bedrock Removal (cubic yards)	1,300
Resources used	
– Water (gallons/day)	20,000 (c)
Waste generated (cubic yards)	
– Soil Excavation	150,000 to 265,000 (b)
– Building Removal	112,000 (d)
– Bedrock Excavation	None expected
Truck trips	
– Soil Disposal	9,800 to 17,300 (e)
– Bedrock Disposal	None expected
– Backfill Delivery	3,300 to 5,800 (f)
– Demolition Debris	1,000 (g)
– Other deliveries	400
Totals	14,500 to 24,500

Boeing = The Boeing Company;

- (a) Estimates assume that approximately 33% of excavated soil volume will be needed as backfill obtained from other sources to supplement surrounding soils used as backfill to restore the soil remediation area. Range of backfill volume provided to represent the range of Boeing excavation volumes.
- (b) Estimated in situ soil excavation volume for cleanup to protect hypothetical future resident and ecological receptors for DOE EIS planning. Range includes other risk assessment factors and contingency for additional soil volume removal during implementation.
- (c) Water use estimated based on generalized data regarding water use for prior soil removal activities at SSFL and comparable information for other MWH/Stantec soil remediation projects.
- (d) Building debris cubic yard volume based on 1.5 cy per ton to maintain consistency with soil volume estimates. Actual debris volume will be dependent on type of material.
- (e) Estimates assume 1.5 cy per ton of soil, and 23 tons per truck average. Range in number of trucks provided to represent range in Boeing soil volumes.
- (f) Trucking estimates for backfill delivery provided for conservative planning estimates. To minimize truck trips, Boeing plans to use the trucks that bring clean backfill to the site from offsite sources for subsequent off-haul of contaminated soil. Also, Boeing may use onsite sources of backfill. In both of these cases, the truck trips estimated here would be minimized or eliminated.
- (g) Trucking estimate for building debris removal based on an average truck volume of 17 ey based on prior Boeing demolition projects.

Director, Environment, Health & Safety, Boeing**

ATTACHMENT D: TABLE OF DETAILED COMMENTS TO SPECIFIC TEXT IN THE DRAFT EIS AND APPENDICES

Page No.	Section	Comments
LAND RESOURCES		
3-8	3.1 - Land Resources	Please update this section to reflect the correct status of the natural gas lines as inactive and abandoned in place by Southern California Gas Company.
3-9	3.1.1.2 Infrastructure	Please update Figure 3-4, Santa Susana Field Laboratory Electrical Distribution System, to include all utility poles at the SSFL.
4-9	4.1-Land Resources	Table 4-5 Land Resources impacts under the Soil Remediation Alternatives states that there will be 10 years of soil removal under the Cleanup to LUT. This number appears low, particularly if some soil excavation and restoration activities will not occur thru the months of December – May (Chapter 6, Table 6-2) to mitigate potential surface water impacts. Please confirm that the 12 year estimate provided elsewhere in the Draft EIS includes 10 years of soil removal, and that these estimates include potential down time related to surface water mitigation measures. In addition, we request DOE provide a comprehensive schedule and impact analysis that includes the entirety of soil that may require excavation and offsite transport of (1) the baseline 933,000 cubic yards of soil, (2) the 330,000 cubic yards proposed for cultural or biological exemptions, (3) the 150,000 cubic yards of soil assumed for natural attenuation, and (4) the remaining additional cubic yards of soil that represent the high end of the estimate (2.5 Million cubic yards).
	4.1.1 Soil Remediation Alternatives Table 4.5	
GEOLOGY AND SOILS		
5-24	5.10 – Alternatives	Consider that it may take longer than six weeks as currently noted in the Draft EIS for U.S. EPA and DTSC to complete the verification process of collecting confirmatory samples following soil removal.
	5.10.2.2 Cleanup to AOC Look-Up Table Values Alternative	
2-56	2.8 - Summary of Potential Environmental Consequences	The Draft EIS states in Section 2.8: "Under all soil remediation action alternatives, no adverse impacts on bedrock geologic resources are expected."
4-36	4.2. Geology and Soil	The Draft EIS then states in Section 4.2.4: "Excavation of 1,050 cubic yards of subsurface bedrock is assumed under action alternative combinations that include the Groundwater Treatment Alternative (such as the High Impact Combination). Excavation of this bedrock would have minimal potential adverse impacts on bedrock geologic resources."

D-1

146-36

146-36 The text of this Final EIS was revised to address this comment.

146-37

146-37 Please refer to DOE's response to comment 146-25.

146-38

146-38 Please refer to DOE's response to comment 146-12. In this Final EIS, DOE has included a sensitivity analysis to assess the potential impacts of remediating a larger volume of soil under the Cleanup to AOC LUT Values Alternative. A comprehensive schedule does not exist for the implementation of this scenario, but it would be based on the transport of excavated materials by 16 truck trips per day, the same assumption used in the baseline analysis of Chapter 4. The duration of the cleanup activities would be expected to increase proportionally to the amount of soil being removed.

146-39 DOE acknowledges the verification process could take longer and that any delay by EPA and DTSC to confirm that analytical data meets AOC LUT values could impact soil remediation and restoration schedules. This Final EIS includes language acknowledging that this is one factor that could affect the remediation schedule.

146-40

146-40 By "no adverse impacts on bedrock geologic resources" DOE was indicating that surficial (exposed bedrock) would not be impacted during surface soil removals. The 1,050 cubic yards of bedrock relates to subsurface bedrock impacted by strontium 90 removed to protect groundwater. The text of this Final EIS was revised for clarity.

Commenter No. 146 (cont'd): Steven L. Shestak,
Director, Environment, Health & Safety, Boeing

Page No.	Section	Comments
	4.2.4 Geology and Soil Impacts under All Action Alternative Combinations	Please explain this apparent contradiction, and also consider whether scraping marks on bedrock from heavy equipment similar to that which had been observed in other areas of the Site during other remediation activities, e.g., the Interim Source Removal Action performed under the oversight of the Regional Water Quality Control Board, Los Angeles Region, may occur. Please also explain whether the proposed bedrock excavation has been factored into the analysis of potential impacts to sensitive species that grow from bedrock cracks, e.g., the Santa Susana tarplant.
3-17	3.2 - Geology and Soils Figure 3-10	Figure 3-10, Geologic Map of Area IV and the Northern Buffer Zone, does not use the most recent fault and fine grained unit information. It appears that the 2009 Groundwater Remedial Investigation report features are presented on this Figure. Please update this information.
3-21	3.2 - Geology and Soils 3.2.5. Extent of Soil and Bedrock with Concentrations of Chemicals and Radionuclides Exceeding Look-Up Table Values	We suggest that the reference to bedrock with concentrations exceeding Look-up Table (LUT) Values in the title of these two sections (3.2.5 and 3.2.5.4) be removed, or separate sections be prepared, as the sections do not address bedrock. Also, unweathered bedrock is not a media within the scope of the AOC, so the LUT values do not apply.
3-29	3.2.5.4 Areas of Soil and Bedrock with Concentrations of Chemicals and Radionuclides Exceeding Look-Up Table Values	
3-22	3.2 - Geology and Soils	The Draft EIS states: "Production of rocket engine fuels and igniters in Area IV also contributed to releases of chemicals to the environment". This information is not accurate. Historical site operational information does not indicate that rocket engine fuels or igniters were produced in Area IV; although Building 4373, the Systems for Nuclear Auxiliary Power (SNAP) Critical Facility, was designed as a solid propellant mixing facility, there is no evidence that it was ever used for this purpose or for testing or production of rocket engine fuels. (<i>Historical Site Assessment of Area IV, Santa Susana Field Laboratory</i> (Sapere, 2005); <i>Final Technical Memorandum, Subarea 5D, Historical Site Assessment, Santa Susana Field Laboratory Site, Area IV Radiological Study</i> (HydroGeologic, 2012). There are detections of perchlorate (a high-energy chemical used in igniters and flares) in soil and groundwater near the Former Sodium Disposal Facility (FSDF), and at other locations in soil within Area IV. Although perchlorate may have been released in Area IV, its operational use is not documented. Please revise this statement.

D-2

146-41

146-41 The Interim Source Removal Action bedrock excavations were performed by Boeing. Chapter 6, Section 6.1 has been revised to indicate that, DOE, during soil removals, will take measures to minimize impacts to adjacent bedrock. DOE has no plans to excavate surficial bedrock or cracks. The only bedrock proposed for excavation (see Chapter 2, Section 2.6.3 of this Final EIS) is below the ground surface where vegetation does not grow into it. Therefore, the proposed bedrock excavation activities would not affect any sensitive species in bedrock cracks, such as the Santa Susana tarplant.

146-42

146-42 DOE used the description of the SSFL fault networks that was available when the Draft EIS was prepared. DOE is aware that since the release of the Draft EIS, Boeing has updated its description of the faults and the description of fine-grained units within Area IV. Chapter 3, Section 3.2 of this Final EIS was revised to incorporate the most recent description of the geology of Area IV and the NBZ that has been accepted by DTSC.

146-43

146-43 Chapter 3, Section 3.2.5 of this Final EIS was corrected. The soil AOC LUT values do not apply to bedrock.

146-44

146-44 This Final EIS was revised to remove the reference to rocket fuel development in Area IV.

**Commenter No. 146 (cont'd): Steven L. Shestak,
Director, Environment, Health & Safety, Boeing**

Page No.	Section	Comments
3-28		The Draft EIS states: "The former 17th Street Pond was a man-made pond that received drainage from the Process Development Unit." Please correct this statement to include other operational releases that contributed to discharges received by the former 17 th Street Pond. This pond was a man-made feature that received stormwater runoff and operational releases from up-gradient facilities in the central portion of Area IV including several RFI sites and adjacent buildings. These included the Process Development Unit (PDU), the Radioactive Materials Handling Facility (RMHF), the SNAP Environmental Test Facility (SETF), the Sodium Component Test Installation (SCTI), the Sodium Component Test Laboratory (SCTL), and various other operational buildings within the central portion of Area IV (e.g., Buildings 4007, 4008, 4011, 4010, and 4093).
3-22	3.2 - Geology and Soils 3.2.5.1 Sources of Chemicals and Radionuclides	Please revise the description of the Area IV Former Sodium Disposal Facility (burn pit) to state that the disposal of radionuclides in this facility was inadvertent.
6-4	6.2 - Potential Mitigation Measures Table 6-1 Measures to Minimize Impacts of Demolition and Remediation Activities	Item 2-4, Soil backfilling. Given the difficulty of finding soil that meets AOC LUT Values, we suggest that the verification process associated with any backfill should occur prior to any excavation work. Otherwise, mitigation measures should be identified to protect against potential impacts associated with semi-permanent, wide and deep excavations, e.g., rain accumulation, wildlife accidents. Also, the mitigation measure may need to be revised for alternatives other than the Cleanup to AOC LUT Values alternative. Item 2-5, Stockpiling and staging. We suggest that DOE address the practical aspects of stockpiling and staging soils in addition to addressing erosion, landslides, and disturbance of habitat.
6-5		Item 2-8, Post-remediation Monitoring. Please revise this measure to clarify that periodic sampling to assess soil concentrations following the natural degradation process applies only to soils impacted with TPH.
SURFACE WATER		
6-17	6.2 - Potential Mitigation Measures Table 6-2 Potential Mitigations	Item SW-2. Consider modifying this mitigation as follows (deletions shown as strikeouts and additions shown in bold): "... runoff studies observations indicate the NPDES that the landowner's (Boeing's) sitewide stormwater control system design capacity would be exceeded"

146-45

146-45 The commenter is correct that the Process Development Unit (PDU), although the largest facility upgradient of the former 17th Street Pond, is not the only source for pond contamination. Chapter 3, Section 3.2.5.3 of this Final EIS was revised to address this comment.

146-46

146-46 Chapter 3, Section 3.2.5.1 of this Final EIS was revised to note that the disposal of radionuclides in the Area IV Former Sodium Disposal Facility (burn pit) was inadvertent.

146-47

146-47 DOE acknowledges the comment regarding the verification process for backfill. DOE would not initiate soil removal until a source of backfill approved by DTSC has been identified. DOE's Proposed Action includes measures to control water ponding and conditions that could trap wildlife. This would include the installation of temporary fencing around any steep-faced excavations.

146-48

146-48 The practicality of stockpiling and staging soils will be addressed in the Soils and Remedial Action Implementation Plan (SRAIP). The SRAIP will include the Soils Remedial Design that will detail the technical and operational plans for soil remediation within Area IV and the NBZ. This EIS evaluates impacts resulting from the implementation of the remedial alternatives.

146-49

146-49 Chapter 6, Table 6-1, of this Final EIS, was revised to clarify that periodic sampling to assess soil concentrations following the natural degradation process applies only to soils impacted with TPH.

146-50

146-50 Chapter 6, Table 6-2 Mitigation Measure SW-2 of this Final EIS was revised as suggested in this comment.

Commenter No. 146 (cont'd): Steven L. Shestak,
Director, Environment, Health & Safety, Boeing

Page No.	Section	Comments
GROUNDWATER RESOURCES		
	S.10-Alternatives	Regarding the evaluation of groundwater remediation alternatives generally, consider whether the following items should be further evaluated in the EIS: 1) Chemical and/or radiological impacts to vadose (or unsaturated) zone bedrock (identified in the 2007 Consent Order as part of the Chatsworth Formation Operable Unit), 2) Groundwater as a receptor of chemical transport from soil, and 3) Inclusion of all chemicals with exceedances of groundwater screening criteria that fall within the broader plume boundary, for each plume shown in Figure S-9.
	S.10.4 Groundwater Remediation Alternatives	
	2.6 Groundwater Remediation Alternatives	Also, the number of monitoring wells, constituents to monitor, and duration of monitoring may be understated. We suggest that the evaluation of groundwater remediation alternatives consider some treatment and/or containment in source areas along with a monitored natural attenuation (MNA) remedy since this may be required.
S-47	S.10.4.3 Groundwater Monitored Natural Attenuation Alternative	For MNA alternative, consider that abiotic reactions with naturally-occurring minerals also degrade some contaminants that include chlorinated ethane, in addition to dilution and dispersion in groundwater. Please provide the basis for the estimated duration of 10-50 years for MNA.
S-48	S.10.4.4 Groundwater Treatment Alternative	Consider whether Sr-90 will be addressed by lowering the phreatic surface or if doing so will only prevent its occurrence from being detected in the saturated zone, as it will remain bound to solid surfaces.
S-64	Table S-9	In Table S-9 Land Resources/Groundwater Treatment, the estimated duration of five years for the treatment system appears short given diffusion-controlled hydrogeologic and contaminant transport conditions, and the basis for the estimate is not provided in the Draft EIS.
2-46	2.6 Groundwater Remediation Alternatives	Please note that responsibility as between DOE and Boeing for the groundwater plumes in Area IV have not yet been determined so it is premature to state that the groundwater remediation in portions of Area IV will involve Boeing addressing groundwater "plumes" for which it is responsible in an integrated effort with DOE. Suggest replacing "plumes" with "plume(s)."
2-50 2-51	2.6.1.2 Groundwater Monitored Natural Attenuation Alternative	The basis for the degradation rates for the plumes until constituents are below MCLs is not provided in the EIS. (The reference document provided (CDM Smith 2015a) does not contain this information.) It is unclear why the same 20 year estimate is provided for two plumes where one plume has twice the concentration of TCE of the other.
2-53		It appears that well abandonment, a process that involves drilling equipment and materials disposal, has been not been addressed in the discussion of alternatives.

D-4

146-51

146-52

146-53

146-54

146-55

146-56

146-57

146-58

146-59

146-51 These items were considered during development of the *Draft RCRA Facility Investigation Groundwater Investigation Report for Area IV Ventura County, California* (CDM Smith 2018a) and *Draft Area IV RCRA Corrective Measures Study* (CDM Smith 2018b). The text of this Final EIS was revised to incorporate relevant information from these reports and the findings of the remedy evaluations."

146-52 As described in Final EIS Chapter 2, Section 2.6, this EIS considers treatment, containment, and monitored natural attenuation as potential groundwater remedies.

146-53 Chapter 2, Section 2.6.2, of this Final EIS, was revised to note this additional potential contaminant decay mechanism.

146-54 The Area IV Groundwater RFI Report, which is the basis for the evaluation of groundwater data, has been revised to address the assessment of plume degradation timing. A summary of that assessment has been incorporated into this Final EIS (Chapter 2, Section 2.6.2).

146-55 A *Draft Area IV RCRA Corrective Measures Study* (CDM Smith 2018b) was developed independently from this EIS; the study evaluated the corrective action technologies and alternatives to be applied as remedial actions. Appropriately, the comment was addressed in the Corrective Measure Study in which groundwater remediation technologies relevant to Area IV are assessed. The analysis in this EIS is the evaluation of the impact of implementing these alternative technologies. Within the EIS, DOE provides an assessment of the impacts of implementing the technologies.

146-56 As noted in Appendix D, Section D.6.5, of this Final EIS the operational period of pump and treat systems assumed for the EIS analysis (5 years) was based on historical experience with the outcomes of pump and treat actions at Area IV. (Appendix D provides the results of the pump and treat activities within Area IV.) As noted in Chapter 2, Section 2.6.3, of this Final EIS pump and treat activities would continue until the cleanup goal is met. DOE has performed additional groundwater investigations and reported the results in the *Draft RCRA Facility Groundwater Remedial Investigation Report, Area IV, Santa Susana Field Laboratory, Ventura County, California* (CDM Smith 2018a). Information from the groundwater remedial investigation was used in the *Draft Area IV RCRA Corrective Measures Study* (CDM Smith 2018b) to more fully evaluate groundwater treatment options.

146-57 DOE disagrees. In its *Groundwater RI Report* (MWH 2017), Boeing has accepted responsibility for certain groundwater issues in Area IV. Additionally, the 2007 Consent Order identifies Boeing's responsibilities in this area.

**Commenter No. 146 (cont'd): Steven L. Shestak,
Director, Environment, Health & Safety, Boeing**

Page No.	Section	Comments
3-38	3.4 - Groundwater Resources 3.4.1 Groundwater Zones	Please note that it is estimated that most groundwater flow in the unsaturated zone is through the rock matrix and only about one-fifth of the flow is through the fracture network in the competent rock. (<i>Site-Wide Groundwater Remedial Investigation Report, Santa Susana Field Laboratory</i> (MWH, 2009); <i>Conceptual Model for the Migration and Fate of Contaminants at the Santa Susana Field Laboratory</i> (Cherry, et. al., 2009).
3-40-41	3.4.2.1 Former Sodium Disposal Facility Trichloroethylene Plume	The EIS does not indicate that in addition to TCE, 1,1,1-TCA in perched groundwater and 1,1-DCE and CCl ₄ in CFOU groundwater are present in this plume.
BIOLOGICAL RESOURCES		
1-20	1.9 - Public Involvement	<i>Rana aurora draytonii</i> has changed to <i>Rana draytonii</i> .
3-58	3.5 - Biological Resources 3.5.3.2 Grasslands (Native and Nonnative)	The Draft EIS states: "Common reptile species include western whiptail lizard (<i>Aspidoscelis [Cnemidophorus] tigris</i>), side-blotched lizard (<i>Uta stansburiana</i>), and western fence lizard (<i>Sceloporus occidentalis</i>)." Coastal western whiptail was previously on the CDFW Special Animals list, and has now been upgraded to a California Species of Special Concern (similar to coast horned lizard in the next paragraph). The Draft EIS also states: "Two reptiles that are known to occur throughout SSFL, including Area IV and the NBZ, in open areas with little vegetation are the silvery legless lizard (<i>Anniella pulchra pulchra</i>) and coast horned lizard (<i>Phrynosoma coronatum blainvillii</i>); these two species are considered California species of special concern." Consider adding the following language to this section: "Legless lizard is also known, and has been observed at SSFL beneath oak tree duff, and in ephemeral drainages." In addition, there are other California species of special concern that have been observed at SSFL that may be expected to occur within annual grassland and other habitats. Certain first callouts of plants and wildlife are provided with their non-federal special-status designations for informational purposes (e.g., mariposa lilies), while others don't receive this text (e.g., ringtail and golden eagle). For consistency, consider providing any special-status designation for all of the species at their first callout.
3-58 and onward, possibly earlier		
3-59	3.5 - Biological Resources	The Draft EIS states: "Honey bees (<i>Apis mellifera</i>) were observed to have large combs among the rocks on Area IV and the NBZ at several locations (SAIC 2009a)." Consider referencing the Galea et al. (2016) study of pollinators on the Santa Susana tarplant, which included plots within Area IV, and identified the fact that multiple native bees (not just European honey bees) were also observed foraging on Santa Susana tarplant.

146-62

146-63

146-64

146-65

146-66

- 146-58 The *Draft Area IV RCRA Corrective Measures Study* (CDM Smith 2018b) was completed after the issuance of the Draft EIS. The text of this Final EIS was revised to incorporate the findings of the remedy evaluations and clarify the MNA durations for the groundwater contamination plumes. Note that in Chapter 4, Table 4-22, of this Final EIS the monitoring timeframes for the two plumes referred to in the comment have slightly different durations. The timeframe for the plume with the higher concentration is listed as more than 20 years, while the timeframe for the plume with the lower concentration is listed as about 20 years. While similar these descriptions of the timeframes reflect that the higher concentration plume would be monitored for a longer time.
- 146-59 Chapter 2, Section 2.6, of this Final EIS was revised to include the potential for well abandonment following groundwater remedy completion.
- 146-60 Thank you for the information on groundwater flow. In addition, DOE has performed additional groundwater investigations and reported the results in the *Draft RCRA Facility Groundwater Remedial Investigation Report, Area IV, Santa Susana Field Laboratory, Ventura County, California* (CDM Smith 2018a). Chapter 3, Section 3.4 of this Final EIS was updated to include new information on groundwater flow in Area IV and the NBZ. The reports cited in this updated section are included as references for this Final EIS and are available for review on DOE's website.
- 146-61 Chapter 3, Section 3.4.3.1 of this Final EIS was revised to include 1, 1, 1-TCA and 1, 1-DCE in the description of contaminants in the Former Sodium Disposal Facility (FSDF) groundwater. Regarding carbon tetrachloride (CCl₄), DOE disagrees. Carbon tetrachloride has never been detected in any of the more than 250 groundwater samples collected at the facility. Carbon tetrachloride is associated with well RD-21 which is adjacent to the Empire State Atomic Development Agency (ESADA) site (about 800 feet south of the FSDF) and part of a different location of impacted groundwater.
- 146-62 The scientific name for California red-legged frog was updated.
- 146-63 The text in this Final EIS was revised accordingly.
- 146-64 The text in this Final EIS was revised accordingly.
- 146-65 The special-status designation is now provided for all species at their first callout in this Final EIS.
- 146-66 The text in this Final EIS was revised to state that multiple native bees were observed foraging on Santa Susana tarplant.

Commenter No. 146 (cont'd): Steven L. Shestak,
Director, Environment, Health & Safety, Boeing

Page No.	Section	Comments
3-68	3.5 - Biological Resources Table 3-8 Federally and State-Listed Animal Species that May Occur in Area IV and the Northern Buffer Zone	The Draft EIS states: "Subsequent protocol surveys conducted during 2010, 2011, and 2012 encompassing suitable habitat on Area IV and the NBZ (Griffith Wildlife Biology 2010, 2011, 2012) revealed no California gnatcatchers on site, nor have gnatcatchers been observed during other surveys of Area IV and the NBZ. Based on this information and current conditions, this species may be an occasional visitor; however, it appears unlikely that this species would breed in Area IV." Consider adding the following reference to this section: "Forde (2014) also had similar findings from protocol surveys performed in portions of Area I, III and SBZ on behalf of Boeing."
3-71	3.5 - Biological Resources	The Draft EIS states: "Subsequently, protocol surveys encompassing Area IV and the NBZ were conducted during 2010, 2011, and 2012 in support of EPA vegetation clearing and gamma scanning activities (Griffith Wildlife Biology 2010, 2011, 2012) and did not reveal any coastal California gnatcatchers, nor have coastal California gnatcatchers been observed during other surveys of Area IV and the NBZ. Consider adding the following reference to this section: "Forde (2014) also had similar findings from protocol surveys performed in portions of Area I, III and SBZ on behalf of Boeing."
4-57	4.5 - Biological Resources Table 4-26	In Table 4-26 Vegetation and Habitat Removed (acres and percent of total) by Soil Remediation Action Alternative, the column containing % Total for the Cleanup to Revised LUT Values appears to be in error. None of the percentages correlate to the acreage in each cell divided by the acreage in the Total Habitat column.
5-16	5.5 - Results of the Cumulative Impact Analysis	The Draft EIS states: "It (Santa Susana tarplant) has the potential to be directly affected by DOE, NASA, and Boeing remediation activities, but the degree to which it would be directly affected by remediation activities is probably low because most individuals grow in small fissures in sandstone outcrops that would generally not be removed or otherwise directly affected as part of remediation because of their location outside of areas affected by chemicals or radionuclides." In Area I, a substantial number of tarplants are growing in previously disturbed areas where asphalt or buildings have been removed and nearby plants have provided a seed source for 100s of plants to germinate. If these areas need remediation too, then the potential for tarplant mortalities may increase cumulatively for all of SSFL.

146-67

146-67 Text and references were added to this Final EIS, as suggested.

146-68

146-68 Thank you for your comment. Table 4-26 in this Final EIS was revised accordingly.

146-69

146-69 Thank you for your comment. Updates to Chapter 5, Section 5.5.5, of this Final EIS, have been made accordingly.

Commenter No. 146 (cont'd): Steven L. Shestak,
Director, Environment, Health & Safety, Boeing

Page No.	Section	Comments
6-6	6.2 - Potential Mitigation Measures Table 6-1 Measures to Minimize Impacts of Demolition and Remediation Activities	Item 5-1, General biology, fourth bullet. Consider whether "at all times" should be further clarified as constant monitoring is not typically required. Item 5-1 and 5-4. Consider the following changes, noted in bold: Item 5-1, General biology, fourth bullet. Consider replacing "At least 7 days before" with " Prior to " to allow the potential to access the work area in less than 7 days. Item 5-4, Revegetation and habitat restoration. Consider identifying the measure associated with the Weed Management Plan: "Weed Management Plan (Item 5-9)."
6-7		Item 5-4, Revegetation and habitat restoration, third bullet. Consider deleting or modifying the following language: "(a minimum of two growing seasons prior to the initial need for post-remediation revegetation)." Some plantings may be root-bound, and only one season would be needed.
6-8		Item 5-4, Revegetation and habitat restoration, fifth bullet. Consider deleting or modifying "Weed-free" in the beginning of the sentence. Backfill soils onsite would likely contain a certain amount of non-native annual grasses.
6-9		Item 5-6, Protect wildlife during construction, first bullet. Consider adding the bolded language to the second sentence: "Special attention will be paid by project personnel to vehicles that have been sitting overnight and any excavated areas that have been left unattended for more than 1 hour." This language would allow project work crews to address these issues.
		Item 5-7, Special-status species, including Braunton's milkvetch. Consider modifying the buffer distances in first and fourth bullets to 100 feet, consistent with standard practices, and adding the following bolded language to the fifth bullet to clarify that this work is part of the Revegetation and Habitat Restoration Plan: "and implemented as part of the RHRP ".
6-10		Item 5-8, Special-status species, vernal pools and vernal rock pools. Consider modifying the buffer distances in first and second bullets to 250 feet, consistent with standard practices. Item 5-9, Weeds. Consider dry-truck cleaning measures (rumble strips, brushing) instead of power-washing and consider deleting the following sentences: "While washing wheeled vehicles, the front wheels will be turned lock-to-lock to allow for exposure of surfaces that may hold soil or weed seeds to ensure complete removal of foreign soil and seeds" and "For areas where vegetation and soil are removed and salvaged, treatment of the area to be disturbed will be implemented to kill weeds and limit weed seed production at least one full growing season prior to initiating any activity, with the objectives of (1) preventing weeds from spreading out of the disturbance area and (2) removing weed sources from salvaged topsoil."

Director, Environment, Health & Safety, Boeing**

Page No.	Section	Comments
Page C-13	Appendix C- Alternatives Development	Consider replacing asphalt roads with gravel roads to enhance the natural condition of the area. In addition, consider use of areas where roads have been removed to allow for active or passive restoration of larger swaths of vegetation.
	Appendix G - Human Health Appendix J - Cost Benefit Analysis	Boeing suggests that DOE evaluate potential hazards to ecological receptors in Area IV and the NBZ, in accordance with standard risk assessment practice for protection of the environment, and that Appendices G and J be modified to account for these additional evaluations.
NOISE		
4-93, 4-94	Section 4.7 Noise Section 4.7.1.2 Cleanup to AOC LUT Values Alternative	The Draft EIS indicates that noise levels along Woolsey Canyon Road would increase from 1.5 dBA to 3.5 dBA (increasing from 55.7 dBA to 57.2dBA through 59.2 dBA) depending on the number of trips, but also acknowledges that "individual SSFL truck by-pass events generate maximum roadside noise levels between 80 and 95 dBA, with the loudest noise levels associated with engine braking." Using time-averaged noise levels seems to minimize substantial noise impacts, particularly along Woolsey Canyon Road where the trucks would be braking continuously given the steep grade of the road, and particularly for the Cleanup to AOC LUT Values alternative, where the trucks would be traveling for at least 10 years. In addition, the draft EIS concludes that the noise level will not increase more than 3.5 dBA along all roads where the noise levels would remain below 65dBA, and would increase by no more than 0.6 dBA along roads where baseline noise levels exceed 65 dBA. This conclusion may underestimate the increase in noise levels resulting from the use of Jake brakes on trucks traveling on Woolsey Canyon Road. The impact of potential disturbances by trucks traveling up at night or during early morning hours so as to be ready to commence construction work during daylight hours also is not discussed.
TRAFFIC AND TRANSPORTATION		
S-37	S.10 - Alternatives	The Draft EIS notes that DOE, NASA and Boeing will be simultaneously cleaning up their respective portions of the SSFL and that the three entities have agreed to divide up the maximum number of 96 truck round trips at SSFL each workday. It states: "In this EIS, DOE assumes that it would be allotted 32 truck round trips daily for the first two years of the project and an average of 48 round trips daily thereafter. Even if DOE were allotted as many as 96 round trips daily, the average rate would be 48 round trips, with occasional surges to accommodate periods of higher activity (e.g., to expedite cleanup)." Please clarify whether the average rate of 48 truck round trips daily includes the first two years of the project or applies only to subsequent years.

D-8

146-71

146-71 The scope of DOE's current plans and this EIS include 18 DOE-owned buildings, but do not include other man-made features (e.g., roads) in Area IV. DOE will continue to coordinate with Boeing and North American Land Trust on the remaining manmade structures in Area IV. That coordination would include integrating active or passive restoration of roadways with other restoration efforts, as appropriate.

146-72

146-72 Section 4.5.1.4 of this Final EIS includes revised text that incorporates soil cleanup based on ecological risk considerations into the Conservation of Natural Resources Alternative. In some locations within Area IV, the results of the human health and ecological risk assessments determined that soil cleanup was primarily based on ecological considerations.

146-73

146-73 As described in Chapter 4, Section 4.7, this EIS makes use of the time-averaged (over a 24-hour period) noise metric community noise equivalent level (CNEL) in accordance with the *L.A. CEQA Thresholds Guide* (LA 2006). Time-averaged metrics such as CNEL do not communicate the noise level at any particular time. However, they have been shown to be useful as predictors of public reaction to a complex and time-varying noise environment. The metric CNEL is widely used within the State of California to quantify transportation noise levels and a similar time-averaged noise level metric is used in other States for the same purpose. Although calculated CNEL would not exceed thresholds established by the *L.A. CEQA Thresholds Guide*, this does not imply that individual SSFL truck pass-by event noise would not be loud and/or annoying. Chapter 4, Section 4.7 of this EIS describes the measured sound level of pass-by events, the potential maximum number of events per day, and the duration of the noise (i.e., the length of the project). Use of the noise metric CNEL in combination with other descriptive information ensures that the SSFL EIS provides a complete description of the intensity, frequency, and duration of noise. SSFL trucks currently use Jake brakes, technically known as "engine braking", on Woolsey Canyon Road, and their use would continue, to the extent that it is necessary to prevent brakes overheating, under all alternatives. Chapter 3, Section 3.7 and Chapter 4, Section 4.7 of this Final EIS acknowledge ongoing and potential future engine braking noise. Because SSFL truck noise would be expected to be of some concern, DOE has identified two minimization measures in Chapter 6, Table 6-1 that would limit noise impacts. DOE would require trucks to limit the use of engine compression braking on Woolsey Canyon Road and in neighborhoods to the extent practicable, consistent with the safe operation of heavy-duty trucks, and to be equipped with properly operating mufflers. Approximately two-thirds of the roughly 2.4 mile length of Woolsey Canyon Road is not immediately adjacent to residential development. Although SSFL truck drivers would continue to exercise judgment in deciding when engine braking is absolutely

Director, Environment, Health & Safety, Boeing**

Page No.	Section	Comments
5-78	S.11 - Summary of Potential Environmental Consequences S.11.2 Potential Environmental Consequences of Combined Action Alternatives	The Draft EIS states: "The largest traffic accident risks from transporting all radioactive waste, all nonradioactive waste, and all material (backfill, equipment, and supplies) would occur under the High Impact Combination. Under the truck option, considering shipment of all radioactive and nonradioactive waste and material, the number of traffic-related fatalities is estimated to be about 1 (calculated value of 0.84). Under the truck/rail option, the number of transportation-related fatalities is estimated to be about 3 (calculated value of 2.9)."
4-117	Section 4.8.1.4 Transportation Impacts under All Action Alternative Combinations Section 4.8.1.5 Impact Threshold Analysis Table 4-53	The Draft EIS does not identify a threshold for transportation related fatalities, but any fatality is likely unacceptable. The likelihood of 1 to 3 traffic fatalities identified for the Cleanup to AOC LUT Values alternative (High Impact Combination) stands in stark contrast to the estimated traffic fatalities for the Low Impact Combination (0.25 for truck method, 0.32 for truck/rail), using the Conservation of Natural Resources alternative. The Cleanup to AOC LUT Values alternative provides no appreciable benefit to human health at SSFL, but its transportation related activities will result in more fatalities than the other alternatives. This serious impact should be properly weighed in selecting the preferred alternative.
2-37	2.4 - Additional Soil Remediation Action Alternatives	The Draft EIS states: "The section of roadway nearest SSFL over which all traffic to and from SSFL would pass is a 2.5-mile-long, two-lane road (Woolsey Canyon Road)". The EIS should ensure that the environmental analysis reflects that there are miles of other two-lane roads along the transportation routes to the freeway.
H-47, H- 51	Appendix H Evaluation of Transportation and Transportation Impacts Table H-18 Table H-20	The traffic analysis for the project calculates the capacities for the relevant roadways, including a peak hour factor (K-factor) (Table H-18 Generalized Daily Service Volumes for Urban Freeway Facilities), and appears to evaluate impacts based on whether the percentage increase of average daily traffic and the percent of road capacity. See Appendix H, p. H-51, Table H-20 Percent Increase in Average Daily Traffic in the SSFL Vicinity under Each Action Alternative. The EIS should consider evaluating the traffic impacts based on the transportation methodologies in the jurisdictions where the roadways are located, e.g., Ventura County or City of Los Angeles, including their thresholds for determining significant traffic impacts.
HUMAN HEALTH		
S-97, S-100, S-101	S.12 - Conclusions	Estimated Risk of Alternatives and Comparison to Background Risk: The EIS should consider calculating Incremental risk on a comparison of background to site risk on an individual constituent basis, not by subtracting total background risk from total site risk. Also, any negative values resulting from this calculation for each constituent should be set to 'zero.'

146-76

146-77

146-78

146-74

146-79

necessary to maintain safety, it is expected that engine braking along the portion of the road that is adjacent to residences could be minimized without drivers experiencing any substantial fading (i.e., becoming less effective after heavy use) of the service brake system. Properly operating mufflers are extremely important in determining the noise levels generated when engine braking is employed. Although engine braking generates a staccato sound that is still recognizable when muffled, the intensity of the sound is greatly reduced by a properly operating muffler relative to trucks whose mufflers have been removed. This Final EIS models a maximum use scenario in which the largest number of trucks permitted under the Transportation Agreement (i.e., 96 round trips per day) occurs. Days on which the maximum number of trips would occur would be relatively rare. Although noise levels along Woolsey Canyon Road could increase by as much as 3.5 dB from 55.7 (existing) to 59.2 dBA CNEL on a hypothetical day in which the maximum number of truck trips occurs (see Chapter 4, Table 4-43), most days would involve fewer truck trips and lower time-averaged noise levels. Federal Highway Administration-approved algorithms for calculation of CNEL do not account specifically for noise generated by engine braking. However, to exceed the calculated CNEL in noise-sensitive locations on a particular day, drivers would have to frequently employ engine braking along residential stretches of the road (despite being instructed to limit this if possible) and the maximum number of trips per day would need to occur. Because this confluence of factors is unlikely, the calculated CNEL for the hypothetical 96-round trip day listed in Chapter 4, Table 4-43 is expected to be a reasonable estimate of the highest CNEL that would be experienced in noise-sensitive locations along Woolsey Canyon Road.

As described in Chapter 4, Section 4.7.1.2, of this EIS, no truck trips would occur during hours for which a noise penalty would be applied during the calculation of CNEL. In Chapter 4, Section 4.7, this EIS defines those hours as being between 7:00 p.m. and 7:00 a.m. Because all SSFL truck trips, including trips to pre-position trucks for hauling, would occur between 7:00 a.m. and 7:00 p.m., there would not be noise disturbances caused by trucks traveling at night (i.e., after 7:00 p.m.) or in the early morning (i.e., before 7:00 a.m.).

The calculation and interpretation of time-averaged CNEL is discussed in the response to comment 146-74. The response to comment 146-74 also includes discussion of noise impacts and noise minimization measures associated with engine braking (also known as "Jake braking").

As stated in Section S.10, of this EIS, an average rate of 16 heavy-duty truck round trips applies for the duration of remediation activities.

Commenter No. 146 (cont'd): Steven L. Shestak,
Director, Environment, Health & Safety, Boeing

Page No.	Section	Comments
4-129	5.4.9 - Human Health	The discussion of receptors in the "No Action" alternative considers the residential receptor under the assumption that there will be a "loss of control" on the land use, e.g., land restrictions preventing residential use, in 100 years. This is an unlikely scenario that should not be considered.
4-132	4.9 - Human Health	The Draft EIS states that Risk Based Screening Levels (RBSLs) and Preliminary Remediation Goals (PRGs) were used to develop slope factors. Suggest restating to indicate that cancer slope factors and non-cancer toxicity values used to develop RBSLs/PRGs are subject to uncertainty.
4-132	4.9 - Human Health 4.9.2—Soil Remediation Alternatives	The text describing Table 4-60 Human Health Impacts under the Soil Remediation Alternatives, refers to EPA RBSLs. This reference should be to EPA Regional Screening Levels ("RSLs").
4-132	Table 4-60	The qualitative discussion of relative human health risks presented in Table 4-60 should include quantitative estimates of risk for reference.
4-133		Please clarify: for the Residential and Recreational receptors, does the term "toxicity impacts" mean "non-cancer hazard indices (HIs)"? We suggest a global revision in this section and the overall document to refer to "non-cancer hazards" rather than "toxicity impacts", or using "non-cancer" instead of "toxic" (e.g., see p. 4-135).
4-133	4.9 - Human Health 4.9.2—Soil Remediation Alternatives	In the discussion comparing residual incremental risk to background conditions, please clarify what background parameter is being referenced (e.g., upper confidence limit (UCL), upper tolerance limit (UTL), upper specification limit (USL), look up table (LUT)).
4-134	Tables 4-60 and 4-61	
4-136		Please refer to Boeing comment above for 5.12 Conclusions, Estimated Risk of Alternatives and Comparison to Background Risk, regarding calculations of incremental risk
	Appendix G – Human Health	The EIS includes two different risk assessment evaluations, which use different procedures/parameters resulting in different estimated risks and hazards for the DOE's risk-based alternatives. Boeing suggests DOE use standard risk assessment procedures for all risk-based evaluations presented in the EIS to provide accurate and comparable estimates of potential human health risk assessment.
	Appendix J – Cost Benefit Analysis	Boeing also suggests that DOE evaluate potential hazards to ecological receptors in Area IV and the NBZ, in accordance with standard risk assessment practice for protection of the environment, and that Appendices G and J be modified to account for these additional evaluations.

146-80

146-81

146-82

146-83

146-84

146-85

146-86

146-87

146-76 The estimated numbers of traffic fatalities are based on State-level accident rates and the related miles (or kilometers) travelled. Therefore, they do not represent actual fatalities, but the risk or likelihood of fatalities occurring as a function of the total transportation distance. As indicated in Chapter 4, Table 4-53 of this EIS, the largest risk results from transporting hazardous and nonhazardous wastes from SSFL to out-of-State disposal facilities. These shipments could occur by a combination of truck or truck/rail transport. The differences in the estimated fatalities for truck and truck/rail transport of these wastes are noted in the table notes to Table 4-53. As indicated, the difference in traffic fatalities between the two transport options (truck and truck/rail) is primarily due to transport of nonhazardous waste over a longer distance under the truck/rail option than that under the truck option, for which transport would be to a location within the State of California. As indicated by the commenter, this EIS identifies and provides the various transportation risks associated with each alternative. DOE agrees with the commenter that these risk values are important inputs that should be considered as part of the overall decision-making process.

146-77 Chapter 3, Section 3.8, of the EIS provides a summary of the characteristics of the principal roads in the SSFL vicinity, including those that may be used for transporting waste from SSFL to nearby freeways. This summary includes general descriptions (e.g., the number of lanes, the presence of sharp curves or lack of road shoulders), a qualitative description of the pavement condition, speed limits, and the average daily traffic on the roads. This information was considered as part of the qualitative and quantitative analysis within the EIS of the traffic impacts associated with the EIS alternatives.

146-78 As reported in Chapter 4, Section 4.8.2, and Appendix H, Section H-13, for the final EIS DOE performed a detailed analysis of traffic flow quality for selected SSFL-area intersections and road segments considering DOE traffic associated with remediation activities and operational factors such as control delay, LOS, and V/C ratios. In Chapter 5, Section 5.5.8.2, of the final EIS, DOE performed a similar analysis to analyze cumulative traffic impacts by DOE, NASA, and Boeing. Section 4.8.2, Section H.13, and Section 5.5.8.2 of the Final EIS were revised to document the changes in LOS ratings and V/C ratios that could potentially occur on affected road segments in the SSFL vicinity. The potential changes in V/C ratios were assessed against the thresholds for impact significance as listed in the L.A. CEQA Thresholds Guide (LA 2006).

Keying from the Transportation Feasibility Analysis included as Appendix J to DTSC's draft Program EIR (DTSC 2017b), the detailed analysis was performed using the procedures contained in the Highway Capacity Manual issued by the Transportation Research Board (TRB 2010). The analysis addresses four intersections and four road

WASTE MANAGEMENT		
3-96	3.8 - Transportation/Traffic 3.8.3 Non-Local Offsite Transportation to Waste Management Facilities Table 3-19	We suggest adding a column in Table 3-19 Representative Waste Management Facilities, for license-exempt radioactive material (low activity radioactive waste). License-exempt radioactive material is accepted at a number of facilities, including US Ecology, Grandview, Idaho, which is included in this Table as a representative waste disposal facility outside California.
3-123 Table 3-27	3.10 - Waste Management 3.10.3 Facilities for Receipt of Waste Table 3-27	We suggest adding "license-exempt radioactive material" to the categories of waste to Table 3-27 Categories of Solid Waste Expected to be Generated during Area IV Remediation Activities.
3-130	Table 3-31	Please update the description of the Clean Harbors facility in Aragonite, Utah to state that this facility is permitted to accept license-exempt radioactive material, which is also described as low-activity radioactive waste, and naturally occurring radioactive material (NORM).
3-131	Table 3-31	Please update Table 3-31 Candidate Hazardous Waste Facilities, to reflect that the following disposal sites also accept license-exempt radioactive material: Clean Harbors Grassy Mountain, Utah, Clean Harbors Aragonite, Utah, Clean Harbors Dear Trail, Colorado and US Ecology, Richland, Washington (the non-low level radioactive waste (LLRW) facility).
DEMOLITION ACTIVITIES		
S-42 Section S.10.3.1	5.10 - Alternatives 2.5 - Building Demolition Alternatives 2.5.2 - Building Removal Alternative	As the property owner of Area IV, Boeing will work with DOE to further define the scope of proposed demolition activities related to underground utilities, asphalt surfaces, and obsolete roadways.
2-46	6.2 - Potential Mitigation Measures Table 6-1 Measures to Minimize Impacts of Demolition and Remediation Activities	Item 1-1, Aesthetics. As noted above, Boeing will work with DOE to determine which roads will remain in Area IV and not be removed as part of the proposed demolition activities.
S-43	S.10 - Alternatives Section S.10.3.3 Building Removal Alternative	Please clarify if the "main staging area within the north-central portion of Area IV, near Building 4024" refers to the remaining Boeing-owned Building 4005 concrete pad. If this is the case, then DOE will need to find a different location because Boeing plans to remove this feature as part of the Boeing demolition program.

146-88

146-89

146-90

segments in the SSFL area, including the unsignalized intersection of Woolsey Canyon Road with Valley Circle Boulevard and segments of Woolsey Canyon Road and Valley Circle Boulevard in the vicinity of this intersection. The analysis was performed by comparing the projected traffic levels potentially attributable to DOE activities against baseline conditions in 2018, assuming 16 or as many as 32 daily heavy-duty truck round trips plus worker commutes. For cumulative impacts, DOE assumed 96 heavy-duty truck trips. DOE also analyzed traffic conditions in future years assuming the projected traffic levels attributable to DOE activities were added to future traffic levels in the SSFL area assuming a 1 percent traffic growth rate until the year 2032. This 1 percent traffic growth rate is independent of traffic attributable to DOE activities. The assumptions of 2018 baseline conditions, a 1 percent traffic growth rate, and a cutoff of the analysis in 2032 are the same as those in DTSC's 2017 Transportation Feasibility Analysis (Appendix J to DTSC 2017b).

The results for traffic potentially attributable to DOE activities and for cumulative traffic conditions represent worst-case scenarios for each of the four evaluated routes between SSFL and major highways. This is because 100 percent of SSFL traffic was assumed to use a single route. In reality, other than Woolsey Canyon Road, traffic volumes on roads in the SSFL area could be reduced by using a combination of routes which would diffuse traffic impacts over the road system. In addition, potential congestion at the intersection of Valley Circle Boulevard and Woolsey Canyon Road may be mitigated through installation of traffic signals.

146-79 DOE has shown total risk (including background) in the risk tables and has separately shown the background risk. The Incremental Risk is calculated as the difference between those two. Calculating incremental risk on a comparison of background to site risk on an individual constituent basis and summing for the total, as suggested by the commenter, provides the same result as subtracting total background risk from total site risk as the methodology used in this EIS unless negative incremental values are set to zero. For the Final EIS, The screening of contaminants of potential concern against background has now been performed for each subarea in the Final EIS. This resulted in the removal of most of the contaminants with negative incremental differences between site and background values.

146-80 DOE agrees that the Boeing Grant Deeds of Conservation Easement and Agreements (conservation easements) with North American Land Trust and recorded with Ventura County in 2017 (Ventura County 2017a, 2017b) provides administrative controls making this an unlikely scenario. Regardless, a suburban resident (without garden) scenario has been retained to provide a conservative analysis for comparison with the open space scenario.

Commenter No. 146 (cont'd): Steven L. Shestak,
Director, Environment, Health & Safety, Boeing

Page No.	Section	Comments
2-43	2.5 - Building Demolition Alternatives 2.5.2 Building Removal Alternative	CEQA review may or may not be required for Boeing's planned removal of remaining buildings (four structures) in Area IV. Please revise the fifth sentence of the fourth paragraph to state that the timing of Boeing's demolition activities is currently unknown.
2-78 2-79 2-103	2.8 - Summary of Potential Environmental Consequences 4.5 - Biological Resources	We suggest revising the discussion of the potential adverse impacts on the Santa Susana Tarplant to note that such impacts could occur if there are established individuals within asphalt parking lots (e.g., growing in cracks) and in or on on gunitite basins and slopes at the time of demolition, in addition to being established next to buildings. As a general comment, it appears that asphalt removal may not have been fully evaluated as part of demolition activities. Consider additional evaluation of the potential for areas where paving has been removed as additional habitat for vegetation.
4-64	Section 4.5.2 Building Demolition Alternatives	
5-5	5.5 - Results of the Cumulative Impacts Analysis	
2-103	2.8 - Summary of Potential Environmental Consequences	We suggest revising the following sentence to include the bolded language: "Native species of birds and bats that roost or nest in the buildings, if present , would lose these sites when the buildings are removed."
3-59 4-67	3.5 - Biological Resources Section 3.5.3.4 Disturbed Sites Habitat 4.5 - Biological Resources	Consider identifying appropriate deterrence measures during demolition activities, given the finding that existing buildings provide space for roosting or nesting for barn and cliff swallows, owls, and bats, and incidental observations of nesting by native bird species such as the American kestrel, house finches, and most likely raptors.
SCOPE OF CLEANUP		
2-19 Figure 2-1	2.3 - Initial Soil Remediation Alternatives	The 2010 AOC contemplates the removal of contaminated materials emanating from Area IV or the Northern Buffer Zone (NBZ), including those transported along the drainages. The Draft EIS should include these soil volumes in its estimates. Very little contamination contiguous to and emanating from Area IV is shown on Figure 2-1, particularly related to migration onto Area III. Several areas have soil sample results with radiological and/or chemical exceedances of risk-based screening levels and these areas should be addressed in DOE's soil volume estimates. These areas include: Silvernale pond and the drainage leading to and from Silvernale pond; drainages leaving Area IV south, west, and north of the Systems Test Laboratory IV (STL-IV) site; and drainages leaving Area IV east and west of the Environmental Effects Laboratory (EEL).

146-91

146-92

146-93

146-94

146-95

146-96

In this Final EIS (see Chapter 2, Section 2.4), DOE has retained the Cleanup to Revised LUT Values Alternative, which uses chemical RBSLs based on a suburban residential scenario without a garden pathway. The Final EIS also retains the Conservation of Natural Resources Alternative, but evaluates two scenarios. The Open Space Scenario is based on the future land use of Area IV and the NBZ as open space, consistent with Boeing's conservation easements (i.e., cleanup levels are based on exposure of an onsite recreational user as the receptor). The Suburban Resident Scenario is the scenario evaluated in the Draft EIS, that is, cleanup levels are based on a suburban residential scenario without a garden pathway. This latter scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space.

In Chapter 4, Section 4.9 of this Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that local residents may get some portion of their food from a home garden.

146-81 Uncertainty in the assumptions is discussed in Chapter 4, Section 4.9.1.2.3 in this Final EIS. The language was clarified to state that there is uncertainty in both cancer slope factors and non-cancer toxicity values.

146-82 The text in this Final EIS was corrected.

146-83 In response to comments, DOE has added a quantitative evaluation of onsite impacts for all alternatives. The results of the analyses are included in Chapter 4, Section 4.9 of this Final EIS.

146-84 Yes, the term toxicity impacts was used to mean non-cancer impacts as measured by the hazard indices. This clarification has been added in this Final EIS.

146-85 As stated in Chapter 4, Section 4.9.2 and in Appendix G, Section G.2.2.2 of the draft EIS, a UCL95 value was used for subtraction of background. However, for the final EIS, no background subtraction was performed. Background UCL95 impacts are presented for both total background and COC contributions to background.

146-86 The methods used in Appendix G and Appendix K of the Draft EIS differed due to the treatment of sample data for the subareas and exposure units, but both were judged to be highly conservative. Using the full data sets, screening of contaminants of potential concern against background has been performed for each subarea and exposure unit for use in both sections of this Final EIS. Also, UCL95 values have now been calculated for both subareas and exposure units using the actual measured values for radionuclides and using the Kaplan Meyer method for treatment of non-detects for chemicals in this Final EIS.

Director, Environment, Health & Safety, Boeing**

Page No.	Section	Comments
3-60 and 3-61	3.5 - Biological Resources Figure 3-21 Wetlands, Vernal Pools, Ponds and Jurisdictional Waters of the U.S.	Figure 3-21 is described as depicts some, but not all features in Area III, e.g., Silvernale Pond in Area III, but not the drainage leading into the pond. This Figure is described as showing "wetlands, vernal pools, jurisdictional waters, ponds, and NPDES outfalls in Area IV and the NBZ, or in other SSFL areas but important to the proposed activities." While features outside Area IV and the NBZ have not been formally delineated, since Silvernale Pond is depicted on this Figure, the drainage leading to Silvernale Pond should also be shown, as this drainage and Silvernale Pond are affected by the proposed activities. Drainages that extend beyond the borders of Area IV and the NBZ should also be shown on this Figure.
4-52 Section 4.5	4.5 - Biological Resources	The Draft EIS states: " The Region of Influence (ROI) identified for biological resources is described as encompassing areas that could be directly or indirectly impacted by remediation activities, including Area IV, the NBZ, and downslope areas that could be affected by runoff by Area IV or the NBZ, or by accelerated erosion or sedimentation." This definition excludes those downslope areas within Area III, such as the drainage that leads to Silvernale Pond. The ROI should be expanded to include these additional areas with contiguous contamination emanating from Area IV.
4-59	4.5 - Biological Resources Figure 4-6 Wetlands and Waters of the U.S. under the Cleanup AOC LUT Values Alternative	Figure 4-6 is described in the Draft EIS as depicting "areas projected for remediation under the Cleanup to AOC LUT Values Alternative, as well as the locations of aquatic features, including wetlands, potential jurisdictional Waters of the U.S., and other drainage features." This map should be revised to depict those contiguous areas outside of Area IV that have contamination emanating from Area IV.
REGULATIONS AND OTHER REQUIREMENTS		
	8.0 – Laws, Regulations and Other Requirements	DOE's access to Area IV and the Northern Buffer Zone to conduct environmental investigation, remediation, building decontamination, decommissioning, and demolition activities is governed by the terms of the Access Agreement between DOE and Boeing dated December 20, 2013. Please include a reference to this document in the EIS.
8-24	8.2 - Applicable Permits Table 8-3 Potentially Required Permits or Approvals for Implementation of Alternatives in this EIS	We suggest adding the following permits to Table 8-3 Potentially Required Permits or Approvals for Implementation of Alternatives in this EIS: -U. S. Army Corp of Engineers—Clean Water Act Section 404 permit -California Department of Fish and Wildlife—Streambed Alteration Agreement -Los Angeles Regional Quality Control Board—Section 401 Water Quality Certification -Ventura County—Oak Tree Permit

146-97

146-98

146-99

146-87 Please refer to DOE's responses to comment 146-9 and 146-72.

146-88 The cited table was not revised in accordance with the recommendation, because low-activity LLW (also called exempt waste), which may be disposed of under NRC or Agreement State regulation at facilities other than those licensed under 10 CFR Part 61 or compatible Agreement State regulation, is a subset of the general definition of LLW which is provided in the textbox in Chapter 3, Section 3.10. Statements in Table 3-30 of the Final EIS (Table 3-31 of the Draft EIS) regarding acceptance of waste at the identified Clean Harbors sites are consistent with information provided by Clean Harbors personnel.

The Aragonite facility is an incinerator rather than a landfill. As stated in Table 3-30, the Clean Harbors Buttonwillow, California, landfill and Dear Trail, Colorado, landfill can accept NORM (naturally-occurring radioactive material) and/or TENORM (technology enhanced naturally-occurring radioactive material) waste. The U.S. Ecology hazardous waste facility at Richland, WA, is not specifically identified in Table 3-31. A footnote was added to the discussion in Chapter 3, Section 3.10.3, to note that some hazardous or nonhazardous facilities may accept NORM, TENORM, or low-activity radioactive waste (also called exempt waste) pursuant to 10 CFR 20.2002 or a compatible Agreement State regulation.

146-89 The scope of DOE's demolition activities as described in this EIS is the 18 buildings in Area IV owned by DOE and adjacent parking lots. DOE will continue to coordinate with Boeing on the remaining manmade structures in Area IV.

146-90 The staging area referred to is adjacent to Building 4024; it is across B Street from where the Building 4005 concrete pad is located. This Final EIS was revised to clarify that the area is adjacent to Building 4024.

146-91 The text in this Final EIS was revised as suggested.

146-92 The text in this Final EIS was revised accordingly.

146-93 Please refer to DOE's response to comment 146-90. Any areas remediated by DOE would undergo restoration as described in Chapter 4, Section 4.5 of this EIS; DOE does not believe additional analysis of these areas would meaningfully change the results of this EIS.

146-94 The text in this Final EIS was revised accordingly.

Re: Draft Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory

Dear Ms. Jennings:

Los Angeles Audubon Society has been a voice for birds and conservation in Los Angeles for 107 years. Our mission is to promote the study and protection of birds, other wildlife, and their habitats. We have over 3,500 members and supporters, most of whom live in Los Angeles. Our founding principles include a commitment to fostering "a proper conservation of our native birds, other animals, wild flowers, trees, shrubs, soil and water." It is in this context that we offer comments on the proposed plans for remediation of the significant contamination at Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory.

As is established in the Draft Environmental Impact Statement (DEIS), the Santa Susana Field Laboratory is the site of both radioactive and chemical contamination as a result of a long history of industrial and governmental use. State and federal agencies, including the Department of Energy (DOE), committed in 2010 to a cleanup of the site to background levels of contamination. Astoundingly, all options included in the DEIS would breach that agreement and not achieve the standard to which the DOE committed. Instead, the options considered would leave up to 39%, 91%, or 99% of the contamination in place at the site.

Los Angeles Audubon Society has previously stated its opposition to an approach that does not clean up this contaminated site as agreed upon:

Los Angeles Audubon opposes this approach and endorses cleanup to the standards agreed upon in 2010. It would be unacceptable to leave radioactive and chemical contamination on a site that might be used for birding and other recreation. We recognize that a cleanup to background standards would itself result in environmental impacts, but once completed, the site can be actively restored and even without active

Los Angeles Audubon Society P.O. Box 931057 Los Angeles, California 90093-1057
Established 1910 www.losangelesaudubon.org

147-1

147-1 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," of this CRD. Under NEPA, DOE has an obligation to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. To meet this obligation this EIS evaluates alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup levels (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. As discussed in Section 2.2, the alternatives evaluated do leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

**Commenter No. 147 (cont'd): Travis Longcore, Catherine Rich,
Margot Griswold, Los Angeles Audubon Society**

restoration the site would continue to function as a crucial linkage for wildlife. Santa Susana Field Laboratory presents an extraordinary circumstance; the contamination at the site is an environmental disaster that must be remedied before moving forward with any other use (Los Angeles Audubon Society Board of Directors, September 25, 2016).

We have reviewed the elements of the DEIS and find that it is conceptually flawed in several ways.

First, the only biological impacts (to non-human species) that the DEIS evaluates are those that would result from the remediation actions themselves. The DEIS does not provide an assessment of the impacts on wildlife of the contamination that would be left on site.

Second, the DEIS does not make use of ecological Risk-Based Screening Levels (RBSLs) that establish harm from contaminants to species other than humans. Ecological RBSLs are an essential part of a complete analysis. Ecological RBSLs have been calculated for the site, as defined in the Standardized Risk Assessment Methodology approved by the Department of Toxic Substances Control (DTSC), but they have not been used in the DEIS. We note that the cleanup standards now proposed by the DOE would allow many of the contaminants at SSFL to remain at levels that are far higher than the established ecological RBSLs. Specifically, the DOE proposes to leave contaminants in place at SSFL at levels hundreds or thousands of times higher than deemed an acceptable risk for wildlife.

Third, the exposure pathways used for the assessment do not include indirect exposures, e.g., from consuming food from a backyard garden (p. S-31, footnote 22). As a result, the proposed allowable contamination levels are not those established for the specified land use (suburban residential) but are several orders of magnitude higher. It is disingenuous for the DEIS to purport to clean to suburban residential standards and then arbitrarily ignore a key pathway of exposure in suburban residential settings, resulting in leaving behind concentrations of contaminants thousands of times higher than the default Environmental Protection Agency (EPA) and DTSC suburban residential standards.

Fourth, under EPA guidance, exposure calculations should not be based on an approach that averages the amount of a contaminant over an area unless the way that receptors will be exposed is truly random. The EPA has indicated that residential scenarios, among others, are unlikely to be random. Yet, the DEIS averages exposure estimates at large spatial blocks (100 acres) even though neither people nor wildlife would use these areas in random spatial patterns. The implication is that the average exposure can be made to look smaller if a small, concentrated location of contamination is averaged in with large surrounding areas that have lower contamination. But what if a future trail or wildlife observation area were to be located by the concentrated contamination site? Then exposures would be much higher than predicted by the improper approach used in the DEIS.

Fifth, the DEIS does not consider the off-site impacts on people or other species of the contamination that would remain under various scenarios. As is evident from the history of water quality violations from runoff originating on the project site, contaminants are moved off site through normal hydrogeomorphological and biological processes. Movement of these

147-1
cont'd

147-2

147-3

147-4

147-5

147-2 The EIS was revised to reflect cleanup levels for the Cleanup to Revised LUT Values Alternative and Conservation of Natural Resources Alternative that are based on human health risk as well as ecological risk. The results of this analysis are presented in Chapter 4, Section 4.5. Inclusion of this analysis provides for a more quantitatively address ecological risk receptors under the alternatives.

147-3 As explained in the Draft EIS, DOE used suburban residential risk-based screening levels (RBSLs) or risk slope factors based on the direct exposure pathways and without the indirect garden pathway to evaluate potential impacts to an onsite receptor. DOE chose to analyze the residential scenario because at the time of writing the Draft EIS, the land owner, Boeing had stated that the residential scenario was the basis for its risk analyses

Since publication of the Draft EIS, The Boeing Company (Boeing) and North American Land Trust in 2017 recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. Risk assessments are based on the most-likely future land use scenario. Residential development involving backyard gardens is not being considered as a future scenario for Area IV.

In this Final EIS (see Chapter 2, Section 2.4), DOE has retained the Cleanup to Revised LUT Values Alternative, which uses chemical RBSLs based on an Onsite Suburban Residential Scenario without a garden pathway. The Final EIS also retains the Conservation of Natural Resources Alternative, but evaluates two scenarios. The Open Space Scenario is based on the future land use of Area IV and the NBZ as open space, consistent with Boeing's conservation easement and agreement (i.e., cleanup levels are based on exposure of an onsite recreational user as the receptor). The Onsite Suburban Resident Scenario is the scenario evaluated in the Draft EIS, that is, cleanup levels are based on a suburban residential scenario without a garden pathway. This latter scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space.

In Chapter 4, Section 4.9 of this Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that local residents may get some portion of their food from a home garden.

**Commenter No. 147 (cont'd): Travis Longcore, Catherine Rich,
Margot Griswold, Los Angeles Audubon Society**

contaminants over time would likely result in impacts to sensitive receptors off site and these impacts should be evaluated in the DEIS.

Los Angeles Audubon Society recognizes that implementing the full cleanup that was promised by the DOE would have temporary impacts on the environment, but shares the view expressed by the U.S. Fish and Wildlife Service in its previous Section 7 consultation regarding this site that those impacts are acceptable in the interest of properly remediating the land. The potential impacts of a full remediation to background levels are the consequence of past industrial actions and not a new impact to be avoided. If anything, the impacts of the cleanup on biological resources should be mitigated by the polluters through additional compensatory mitigation above and beyond the restoration of the site following the cleanup.

Finally, we object to the DOE calling the project alternative that would leave the most contamination on the site the "Conservation of Natural Resources" alternative. To the contrary, this framing hides that the landowners have been working assiduously to cultivate members of the conservation community to carry their message for them, promising a natural open space if they are allowed to avoid their cleanup responsibilities. As a conservation organization, we reject the notion that this alternative conserves natural resources, especially given that the DEIS does not even use the ecological RBLSs, which would certainly not allow leaving up to 99% of the contamination on the site.

We urge that the DEIS be revised so that all options considered are fully consistent with the legally binding cleanup agreement entered into in 2010, which is not the case in the current document.

Sincerely,

Travis Longcore, Ph.D.
Conservation Chair

Catherine Rich, J.D., M.A.
Conservation Co-Chair

Margot Griswold, Ph.D.
President

|| 147-5

|| 147-6

|| 147-7

|| 147-1
cont'd

147-4 While cleanup may be performed on a point-by-point basis, assessments are intended to model more real-world exposure situations. When a risk assessment is performed, EPA Risk Assessment Guidance (EPA 1989) prescribes the use of an upper confidence limit (UCL) on the arithmetic average (UCL95) and suggests the use of a maximum value only as a screening tool as follows:

“Still, in other instances, the assessor may wish to use the maximum concentration from a medium as the exposure concentration for a given pathway as a screening approach to place an upper bound on exposure. In these cases it is important to remember that if a screening level approach suggests a potential health concern, the estimates of exposure should be modified to reflect more probable exposure conditions. In those instances where it is appropriate to group sampling data from a particular medium, calculate for each exposure medium and each chemical the 95 percent upper confidence limit on the arithmetic average chemical concentration.”

Therefore, DOE has appropriately used a UCL95 (or a median when warranted) for calculating risk and toxicity impacts.

The risk assessments conducted for cost benefit analysis for each alternative documented in Appendix K of the Draft EIS were conducted based on a 10,000 square meter (approximately 2.5 acres) exposure units for specific high-impact areas. The size of 2.5 acres for exposure units for averaging data was considered appropriate based on the future use of the site as open space. In addition, for the risk-based alternatives, areas with individual results greater than 10 times the selected remediation level will be targeted for remediation as hot spots.

147-5 All of the soil remediation action alternatives addressed in the EIS would involve removal of contaminated soil and is protective of the health and safety of the public and the environment. Exceeding a look-table value for a chemical or radionuclide does not mean that the chemical or radionuclide is present at dangerous levels. This includes potential runoff following soil remediation.

In response to comments on the Draft EIS, DOE has added an offsite human health impact assessment by modeling of potential releases of wind-blown dust to an offsite receptor during and after remediation for all alternatives. The results of the modeling are included in Chapter 4, Section 4.9 of this Final EIS. Please see Section 2.7, “Offsite Impacts,” of this CRD for a discussion and DOE’s response to concerns about offsite impacts. As described in Section 2.7, there is no evidence of any significant concentrations of Area IV contamination leaving SSFL. The commenter is referred

**Commenter No. 147 (cont'd): Travis Longcore, Catherine Rich,
Margot Griswold, Los Angeles Audubon Society**

to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

- 147-6 Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD regarding the inapplicability of the previous Biological Opinion (EPA 2010a) to the proposed remediation of Area IV and the NBZ. DOE would implement compensatory measures for Area IV and the NBZ consistent with the USFWS Biological Opinion (see Appendix J) for remediation of SSFL and in compliance with Ventura County Tree Protection Regulations in the Non-Coastal Zoning Ordinance. Proposed methods to resolve adverse effects through avoiding, minimizing or mitigating them, are described in Chapter 6.
- 147-7 The Conservation of Natural Resources Alternative does not leave "most" of the contamination at Area IV. The alternative focuses on where contamination exists and targets those locations for cleanup. Following soil cleanup, Area IV will be safe for use by recreationists and ecological receptors. This alternative "conserves" natural resources because it does not unnecessarily damage or destroy natural areas containing little or no contamination.

Commenter No. 148: Marie Mason, Dawn Kowalski,
Rocketdyne Cleanup Coalition

April 13, 2017

Ms. Stephanie Jennings
 NEPA Document Manager SSFL Area IV EIS
 U.S. Department of Energy
 4100 Guardian Street, Suite 160
 Simi Valley, CA 93063

Dear Ms. Jennings:

The Rocketdyne Cleanup Coalition (RCC) is pleased to submit comments on the Department of Energy's (DOE) Draft Environmental Impact Statement (DEIS) for the cleanup of the Santa Susana Field Laboratory (SSFL).

RCC is a community-based alliance that was formed in 1989 to prevent the re-licensing of nuclear work at Rocketdyne (now SSFL). Once we learned about the partial nuclear meltdown and other accidents that were long kept from the public, we were concerned that continued nuclear work at the site would bring additional harm to the health of our communities. Together with other key people and organizations, we helped bring an end to nuclear activities at SSFL.

Many of us live right below the site, so we turned our focus to making sure that all of SSFL's nuclear and chemical contamination was cleaned up. After two decades of fighting, in 2010 we thought we might finally have a full cleanup when both NASA and the DOE signed an Administrative Order on Consent (AOC) with the California Department of Toxic Substance Control (DTSC) which required a cleanup to background levels of contamination. It seemed almost too good to be true, and sure enough, it wasn't long until DOE made it clear that it wanted out of the agreement.

In 2014, weeks after telling the community at an SSFL Work Group meeting that DOE was committed to upholding the AOC, DOE issued a public scoping notice for its EIS that violated the AOC by considering "on-site containment" and "on-site disposal" of contaminants which are barred in the AOC. At the time, DOE also told the community that its draft EIS would be done in 2014 and finalized in 2015. But DOE delayed publishing the DEIS until January 2017, which we suspect it because DOE knew that key elected officials who supported the AOC like Senator Barbara Boxer would no longer be in office. The AOC also stipulates that the cleanup was to be completed in 2017, but of course it hasn't even begun.

It is therefore unfortunately not a surprise to us that DOE's DEIS proposes to break the legally binding commitments of the AOC and leave large amounts of radioactive and toxic chemical contamination in place, where it can continue to migrate and harm our community. DOE proposes four alternatives that would leave up to 39%, 91%, 99% or 100% of the contamination not cleaned up.

148-1

148-1 Please see Section 2.1, "Preferences for Cleanup," of this CRD. There has been a lot of cleanup performed in Area IV. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). As discussed in Chapter 1, Section 1.3, of this EIS, most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ.

DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. As the commenter notes, in 2010, DOE signed the AOC. However, under NEPA, DOE has a legal obligation to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. To meet this obligation this EIS evaluates alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. As described in Chapter 2, Section 2.3.3.1, of this EIS, there are issues with implementing the technical elements of the AOC. These issues, the adverse effects of a massive excavation of Area IV, stakeholder input, and DOE's responsibility under NEPA regulations to "identify and assess the reasonable alternatives to proposed actions that will avoid or minimize adverse effects" resulted in DOE identifying and evaluating additional alternatives that met its purpose and need (Please see Chapter 1, Section 1.1.) It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup levels (refer to Sections 2.2, "Compliance with the 2010 Administrative Order on Consent," and 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD). The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated would be protective of the health and safety of the public and the environment. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

Commenter No. 148 (cont'd): Marie Mason, Dawn Kowalski,
Rocketdyne Cleanup Coalition

On top of proposing to violate the AOC and leave SSFL contaminated, DOE's DEIS omits critical information that the public needs to know in order to make informed comments. DOE omits the accidents and sloppy practices that lead to SSFL being so badly contaminated. Over the decades, SSFL housed 10 nuclear reactors, a "Hot Lab" to cut up irradiated reactor fuel from around the country, plutonium and uranium-carbide fuel fabrication facilities, and a sodium burn pit in which open-air burning of contaminated reactor components took place. One of the reactors, the Sodium Reactor Experiment, experienced a partial nuclear meltdown in 1959. Two other reactors experienced accidents with fuel damage as well. These activities left a legacy of contamination from dangerous radionuclides and toxic chemicals, which can cause cancer and other illnesses. Federal studies indicate increased cancers among workers and in the offsite population.

We are particularly saddened to see what appears to be a new pediatric cancer cluster near SSFL. It was only a few years ago that mothers of children with retinoblastoma were meeting each other at Children's Hospital and discovering that they lived near each other, and near SSFL. Now more families are discovering that their child's rare cancers are not so rare in the neighborhoods near SSFL. Of course we cannot say definitely that these cancers are related to SSFL contamination but we do know that the contaminants at SSFL are capable of causing these kinds of cancers. If SSFL was cleaned up years ago as it should have been, at the very least these families would not have to worry about SSFL on top of everything else they have to endure.

But DOE is now proposing that most of the contamination not be cleaned up, meaning families will continue to be at risk. That is unconscionable.

DOE claims that the National Environmental Policy Act (NEPA) requires it to do an EIS that examines alternative cleanup plans that would breach the AOC it signed, but that is not true. In 2010, both NASA and DOE signed an Administrative Order on Consent (AOC) with the California Department of Toxic Substances Control (DTSC) to clean up SSFL to background levels of contamination. In 2011, NASA proposed an EIS that would look at other options, claiming – as DOE is doing now – that the National Environmental Protection Act (NEPA) required it to look at alternatives that breached the AOC. But the Council for Environmental Quality disagreed, directing that since NASA must comply with the AOC, it need not consider alternatives that breach it, just as DOE must comply now. DTSC also directed NASA that its EIS was to be limited to looking at various ways to achieve the required cleanup to background, not whether or not to fulfill the requirements of the AOC.

In 2012, DOE understood this requirement. Indeed, it issued a notice "Public Participation in the Development of Alternatives to be considered in the Santa Susana Field Laboratory Area IV Environmental Impact Statement" that acknowledged it was obligated to carry out the AOC requirement to cleanup to background, and committed that the EIS would be limited to alternative ways to achieve that cleanup standard – not whether to live up to the AOC requirements. But now, DOE has broken that promise. Now DOE has alternatives that could leave almost all of the contamination on site, where it can continue to run down the hill into our communities year after year.

DOE, as the polluter, doesn't have the authority to decide how much of the mess that it made is going to get cleaned up. Even if there were no AOC, the decision rests with DTSC for the chemicals under the Resource Conservation and Recovery Act. For radioactivity, DTSC has authority per the AOC. In 2012, DOE recognized that DTSC was the regulator and decision-maker about how much contamination it must clean up. But now in DOE's DEIS, DTSC is barely mentioned. In fact, DOE's DEIS portrays the decisions as to how much of contamination gets cleaned up as being up to DOE, when clearly, it is not. The DTSC will be preparing its own Environmental Impact Report for the entire SSFL

148-4

148-5

148-6

- 148-2 Chapter 1, Section 1.3 of this Final EIS discusses the history of activities at SSFL. DOE and its contractors assigned unique identification numbers to 272 structures in Area IV that were used during its operational period (Sapere 2005). Most of these structures have been removed during prior cleanup activities. Much of the chemical and radioactive material in soil and buildings was cleaned up to the standards established at the time the cleanup was performed (i.e., 1980s and 1990s). Today the major structures remaining in Area IV are 22 buildings (18 owned by DOE and 4 owned by Boeing). Please also refer to Section 2.10, "Public Perceptions about Waste and Contamination in Area IV," of this CRD for more information about the current state of facilities and contamination in SSFL Area IV and the NBZ. DOE's current focus is to complete the cleanup of those portions of SSFL, Area IV and the NBZ, for which DOE is responsible. Please see Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for discussions of concerns about offsite impacts.
- 148-3 DOE acknowledges your concern and refers you to Section 2.7, "Offsite Impacts," and Section 2.8, "Cancer and Other Illnesses Near SSFL," of this CRD for further discussion of contamination and illnesses in the vicinity of SSFL. DOE also refers you to Chapter 3, Section 3.9.5, of this Final EIS which summarizes a number of studies that have examined the potential for health effects on the public and workers related to historical activities at SSFL, as well as cancer incidence and mortality rates for the United States, California, and Ventura and Los Angeles Counties. One of these studies, by the University of Southern California Cancer Surveillance Program, reviewed the incidence of retinoblastoma in children in Los Angeles and Ventura Counties (CSP 2007). The study authors concluded that the incidence of retinoblastoma among children under age 5 residing in the area around SSFL between 1988 and 2005 was slightly, although statistically not significantly, higher than expected based on incidence statewide. Section 3.9.5 also summarizes the published health studies for workers at SSFL, as well as cancer mortality and incidence rates for the United States, California, and Los Angeles and Ventura Counties.
- 148-4 DOE has a legal obligation in an EIS to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. The Draft EIS analyzed an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In response to public input since the 2010 AOC was signed, the Draft EIS also analyzed alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup

Commenter No. 148 (cont'd): Marie Mason, Dawn Kowalski,
Rocketdyne Cleanup Coalition

site later this year, which will also be open to public comment. And we are prepared to demand that DTSC use its authority to enforce the AOC and ensure that SSFL is fully cleaned up.

148-6
cont'd

DOE claims that a protective cleanup poses undue harm to the environment, but that the contamination poses little risk, framing the entire cleanup in terms of trucks instead of how much contamination will be left behind. SSFL contamination poses a very significant risk to public health in all DOE's options - risks that far outweigh environmental concerns, which can be mitigated. Most of the cleanup is occurring in areas that are already disturbed by DOE activities. DOE was not concerned about the environment when it was polluting the land so badly, nor about trucks when they were driving up to SSFL every day bringing hazardous loads of spent commercial nuclear fuel from around the country.

148-7

DOE is hyping the issue of trucks as a way to scare the community into opposing the cleanup agreement. DOE failed to consider routes for the transportation of contaminated soil that avoid neighborhoods. DOE did not examine alternative truck routes as well as the railroad station less than a quarter mile north of the site that is able to ship out contaminated soil. The rail spurs are accessible by routes that do not pass by any residences and less than a mile away from DOE's Simi Valley office. But DOE only considered trucking the contaminated soil to a railroad line 60 miles away. DOE also didn't consider covered conveyor systems that could reduce trucks dramatically.

148-8

DOE's first proposed cleanup option claims to use the AOC's lookup tables, but proposes exempting nearly half a million cubic yards of contaminated soil and to leave it in place instead, which violates the AOC. DOE states that this option entails cleaning up 933,000 cubic yards, but the DEIS states that the total soil contaminated is 1,413,000 cubic yards, an astronomically larger number. DOE justifies the exemption on its hope that the contamination might lessen on its own 70 years from now and on potential exemptions that in fact violate the AOC's very limited exemptions.

148-9

Indeed, the DOE states numerous times in the DEIS their desire to defer to "natural attenuation" which they say would take at least 70 years. This is concerning, because it would mean that contamination would have remained on site for more than a century from the time it was created, constantly leaking off site, infiltrating the soil, water and potentially people in the community below. Leaving the site contaminated for most of the rest of the century also raises serious questions about future use, given talk of converting the remediated site into a park, which couldn't happen with the left-in-place pollution.

148-10

148-11

The excuse of a biological exemption doesn't hold up either. The AOC exemption requires a Biological Opinion from the U.S. Fish and Wildlife Service stating that no other reasonable and prudent measures exist to achieve the desired cleanup. There has not been such a Biological Opinion issued, and if there had been, mitigation measures are to be taken, not avoiding the cleanup altogether. The U.S. Fish and Wildlife Service did issue a Biological Opinion several years ago to EPA for its preparatory work for the cleanup, concluding mitigation measures could be done and that the cleanup was critical for protecting biological resources. The only two plants actually found in Area IV and the NBZ are Braunton's milk-vech which is federally listed as endangered, and the Santa Susana tarplant, which is state listed as rare. DOE's DEIS claims that there are 12 additional plant species that may exempt them from remediation, but of these 12 plants, none have actually been observed on the site, and many of them are neither federally listed as endangered nor threatened. In terms of animals, there are none that are both federally listed and have been found on the site. Of all the 7 animals mentioned on the DOE DEIS, 5 have a "low" potential of occurrence and 2 are "not expected" to occur on the site at all.

148-12

DOE's argument that there would be a more negative impact to the environment by cleaning up the toxic mess than leaving it there to continue to damage the health of local residents, plants, and animals is preposterous. The environment would not be harmed by cleaning it up—it was damaged the moment

148-13

levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for further discussion of this topic.

148-5 DOE recognizes DTSC's authority over cleanup of SSFL under the 2010 AOC and under California hazardous waste management programs including RCRA. Please see Final EIS Chapter 8, Section 8.1.9 for discussions of the regulations and orders that promulgate this authority. In addition, Chapter 1, Section 1.9.2 of this Final EIS discusses DTSC's process to regulate cleanup of the entire SSFL via CEQA and preparation of a program environmental impact report (EIR). The *Draft Program Environmental Impact Report for the Santa Susana Field Laboratory, Ventura County, California* issued by DTSC in 2017 (DTSC 2017). The Area IV and NBZ site cleanup activities covered by this Final EIS would begin following completion of the following regulatory actions: (1) DTSC issues a Notice of Determination for the Program EIR identifying the selected remedial actions, (2) DOE and DTSC conform the decisions included in the DOE EIS ROD(s) and DTSC's Program EIR Notice of Determination, (3) DTSC approves soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC, and (4) DTSC approval of DOE-prepared RCRA closure plans for building demolition. DTSC does not have authority over demolition of non-regulated buildings but will perform oversight of debris disposal relative to the appropriate facility.

148-6 Thank you for your comment. It has been included in the Administrative Record for the EIS.

148-7 The analyses for the Conservation of Natural Resources Alternative in the EIS show that soil cleanup performed in the manner that EPA does under CERCLA and DTSC throughout California would be protective of human health and the environment. A soil cleanup that would first remove soil posing a risk to human health and the environment but leave soil with lower concentrations would protect the environment by not disturbing soil that poses a minimum risk. The purpose of the EIS is to evaluate alternatives for completing remediation at those portions of SSFL for which DOE is responsible, Area IV and the NBZ. Consistent with NEPA requirements, the potential impacts that implementing each alternative could have on several resource areas, including human health and safety, biological and cultural resources, ground and surface water resources, air quality, and traffic, are evaluated.

Commenter No. 148 (cont'd): Marie Mason, Dawn Kowalski,
Rocketdyne Cleanup Coalition

DOE contaminated it. The best hope for the natural resources onsite is to leave the land as close to its original state as possible (cleaning up to background levels of contamination), so that it may heal and restore itself without toxic chemicals and radionuclides present in the soil and groundwater. In order to protect the biological resources of SSFL, DOE must complete a full clean up as specified in the AOC.

148-13
cont'd

DOE is also creating cultural exemptions as a way to get out of cleaning up certain portions of the site, but there are no registered Cultural Artifacts in Area IV and the NBZ that would exempt DOE from cleaning up.

148-14

DOE claims that it's second option, the "Revised AOC LUT values" are suburban residential standards, but it has manipulated that standard to be 100 – 1,000 times more relaxed than the true EPA suburban residential standard. DOE achieved this by excluding "indirect" pathways of exposure, such as ingestion of produce from a home garden, thus also eliminating 99.99% of the total dose and drastically lowering the associated risk. Yet even without the AOC requirement for cleanup to background, a suburban residential standard would be insufficient—longstanding EPA guidance says that DOE should rely on local zoning for setting the cleanup standard, which at SSFL is agricultural which would be sufficiently protective. DOE ignores that requirement. If suburban residential is to be used, as DOE claims, it needs to be the true standard, not one hundreds of times weaker.

148-15

It is important for us to emphasize that the end of the site is irrelevant to the cleanup. Boeing has said it will restrict its property for open space, but recreational cleanup standards and the one that DOE proposes its second alternative leave tremendous contamination on site that will continue to migrate and impact us. Others may visit or hike in the area once in a while, but we live near the site 24-7. The site has to be fully cleaned up to ensure that we and our neighbors are protected.

148-16

DOE's third option is to clean up to a standard of 25 millirem per year, the equivalent of a medically unnecessary chest X-ray every month of one's life! This also violates the 1995 DOE-EPA Joint Policy that all DOE sites must be cleaned up consistent with EPA Superfund guidance, which has declared 25 millirem to be non-protective. Because this option also involves averaging contaminated areas with cleaner ones, rather than cleaning up anything over the cleanup level (which is also barred by EPA guidance), the exposure will be closer to the equivalent of hundreds of unnecessary chest X-rays every month of your life. That is simply unacceptable!

148-17

DOE's DEIS repeatedly states that it does not have a preference of alternatives, but it clearly wants to break the AOC and leave SSFL contaminated, regardless of what impact that has on us and surrounding communities. DOE has made its bias clear through its efforts to impede participation from members of the public who want the AOC cleanup agreement upheld, while contributing significant financial resources to a group that opposes it. The DOE admits that it gave the SSFL CAG \$34,100 as part of a three year renewable grant, but has refused to release the grant application, agreement, or any terms of the grant.

148-18

DOE has also refused to provide an email address to which DEIS comments may be sent, and even went so far as to delete the email address they had generated specifically for the DEIS, and presented as a means to contact the DOE on the matter. DOE also refused to allow community members to present slides as part of their testimony, claiming that such a request contradicted the hearing notice. The public hearing announcement does not prohibit members of the public from presenting slides.

148-19

Rocketdyne Cleanup Coalitions asks that DOE keep its commitment to clean up all of the contamination at SSFL by upholding the AOC to the letter. We will be the ones most impacted if DOE breaks the

148-1
cont'd

148-8 Please refer to Section 2.9, "Options for Transportation of Waste from SSFL," of this CRD for a discussion of this topic and DOE's response.

DOE's intent is not to generate opposition to the SSFL cleanup or to scare the community out of supporting cleanup, but it is true that the more soil that is removed to clean up the site, the larger the transportation effort (i.e., a larger number of truck trips) required. The analyses in this Final EIS were performed to evaluate the potential impacts associated with the various alternatives for cleanup of SSFL. Results of the analyses allow a comparison of potential impacts, in this case transportation impacts, and tradeoffs between the alternatives. In the case of soil remediation, leaving more soil, and consequently low concentrations of chemicals and/or radionuclides on site, reduces the number of truck trips from the site. Conversely, removing the soil with low concentrations of chemicals and/or radionuclides, results in more truck trips from the site. The EIS shows that the transportation risks under all action alternatives would be small; Chapter 4, Section 4.8.1 and Appendix H of the EIS provide details of the transportation risk analysis.

148-9 Under the soil cleanup to the AOC LUT Alternative, the 735,000 cubic yards difference between the soil to be removed and the total soil contaminated is based on areas exempt to protect cultural and biological resources (115,000 cubic yards) and areas proposed for monitored natural attenuation of low concentrations of total petroleum hydrocarbons (TPHs) (620,000 cubic yards). See Chapter 2, Section 2.3.2 of this Final EIS for additional information. While DOE acknowledges that DTSC would have to approve the biological and cultural exemptions, DOE will not violate Federal, State, or local laws during the conduct of the Area IV soil cleanup. DOE also acknowledges that any onsite treatment method, such as Monitored Natural Attenuation (MNA) for concentrations of TPH that do not threaten groundwater quality, would have to be approved first by the DTSC before MNA would be used. For additional discussion of this issue, refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," and Section 2.4. "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD.

148-10 The 2010 AOC allows for onsite treatment of soils and natural attenuation was included as a treatment option in the EIS at the suggestion of DTSC staff. As stated in the Final EIS Chapter 2, Section 2.3.2, monitored natural attenuation would be applied to soil with TPH (620,000 cubic yards) where they are the only chemical exceeding LUT values and do not threaten groundwater quality. See Appendix D of this Final EIS for additional information. The soil referenced to take up to 70 years for the contaminant to degrade contains complex polycyclic aromatic hydrocarbons (PAH),

Commenter No. 148 (cont'd): Marie Mason, Dawn Kowalski,
Rocketdyne Cleanup Coalition

agreement and leaves toxic contamination on site, and therefore urge DOE to do what is said it would do and clean up all detectable contamination at SSFL.

Sincerely,

Marie Mason and Dawn Kowalski
 Co-Founders, Rocketdyne Cleanup Coalition

|| **148-1**
cont'd

not simpler TPH molecules. As part of the soil cleanup analysis in the Final EIS, DOE is not proposing to leave PAH contaminated soil in place that could pose a risk to human health and the environment. Soils containing high concentrations of TPH would be removed by DOE. Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts. As described in Section 2.7, there is no evidence of major amounts of Area IV contamination leaving SSFL. The commenter is referred to EPA's soil and sediment report findings (HGL 2012b, 2012d), the results of the soil chemical investigations conducted by DOE jointly with DTSC (CDM Smith 2017), DTSC's review of the data (included as part of DTSC's broader review of sampling and characterization efforts [DTSC 2017a]), and other studies such as an off-site investigation conducted in 2007 by MWH (MWH 2007). Groundwater plumes extend from Area IV into the NBZ, but these contaminants do not extend offsite at concentrations above what is allowed under the Safe Drinking Water Act.

148-11 DOE is not proposing to leave in Area IV any soil at concentrations that could pose a risk to human health and the environment. All such soil would be removed. What may be left within Area IV would be soil at similar concentrations to that left at EPA Cy ERCLA sites and DTSC soil cleanup sites in California.

Risk-based alternatives establish cleanup levels based on an assumed future use of the site. In 2017, The Boeing Company (Boeing) and North American Land Trust recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. In addition to the alternatives evaluated in the Draft EIS, this Final EIS includes risk-based scenario based on use of the land as open space. All of the action alternatives and scenarios analyzed in this Final EIS would leave the property safe for use as open space (park land).

148-12 Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD for a discussion of this topic and DOE's response. The soil exemption process was developed jointly with USFWS, CDFWS, and DTSC staff. USFWS issued their Biological Opinion in August 2018 and CDFWS provided a letter of concurrence with the exemption process in December 2017. As noted in Section 2.4 of this CRD, the 2010 Biological Opinion has very limited applicability to the present project with regard to impacts on Braunton's milk-vetch and its critical habitat. The Cleanup to AOC LUT Values Alternative would have a far greater impact

Commenter No. 148 (cont'd): Marie Mason, Dawn Kowalski,
Rocketdyne Cleanup Coalition

on Braunton's milk-vetch and its critical habitat compared to the EPA project because soil remediation requires removal of vegetation and soils, including the seed bank, which is a profound and difficult impact to mitigate. However, the EPA action that was the subject of the 2010 Biological Opinion involved no removal of soils, which leaves the potential for rapid recovery of the vegetation and habitat by re-sprouting or germination from the soil seed bank. At the time the Draft EIS was issued, DOE had been involved in ongoing meetings with the USFWS and CDFW for several years (see Appendix E, Table E-4 of this EIS) and the Biological Assessment required as part of Section 7 consultation had not yet been submitted. Hence, there was no Biological Opinion from the USFWS at the time the Draft EIS was released. The proposed exemption areas for biological resources presented in the Draft and Final EIS were determined through consultation with USFWS as part of the USFWS Biological Opinion, (Appendix J of this Final EIS), and with CDFW and DTSC staff. The proposed exemption areas include areas identified in the Biological Opinion for protection under the Federal ESA, as well as areas identified by DOE for protecting sensitive species and sensitive habitat consistent with State laws and regulations and local ordinances. This Final EIS reflects the results of the Biological Opinion on the definition of exemptions areas in Area IV and the NBZ.

With regard to the number of protected species reviewed in the Draft EIS, the commenter's characterization of the species is correct. However, the EIS preparers used accepted professional practice to include information about threatened or endangered species (either listed federally or by California) that could possibly occur on the SSFL property (based on their distributions and ecological requirements) before narrowing to species known or expected to occur on the site based on review of this information and field surveys. The number of species identified in this Final EIS reflects the results of the Biological Opinion from the USFWS and input from the CDFW and DTSC as discussed in the preceding paragraph. This process is explained further in Chapter 3, Section 3.5.5, "Threatened, Endangered, and Rare Species" of this Final EIS; the species and habitats identified for protection are discussed in Section 3.5 and Appendix B, Section B.5. Please refer to Section 2.4, "Application of Exemptions under the 2010 Administrative Order on Consent," of this CRD, for additional information on this topic. Tables 3-6 and 3-7 list plant and animal species that are known to be present within Area IV and the NBZ. The Tables also describe the potential for the species to be found at SSFL, particularly locations where soil removal could occur.

- 148-13** Under NEPA, DOE has a legal obligation to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. The evaluations must include an assessment of potential impacts,

**Commenter No. 148 (cont'd): Marie Mason, Dawn Kowalski,
Rocketdyne Cleanup Coalition**

those deemed positive and negative, from implementing the alternatives. A thorough evaluation of the potential impacts on site biological resources is presented in Chapter 4, Section 4.5, of this Final EIS. That evaluation indicates that alternatives that remove larger amounts of soil would be more difficult to restore given specific soil requirements of native plants, which would also affect the animal populations reliant on the plant community. A complete understanding of the impacts is necessary for all involved parties to make an informed decision.

- 148-14** Exemptions for cultural resources are provided for in the 2010 AOC and would be based on the presence of cultural resources, as defined in Final EIS Chapter 3, Section 3.11.1. DOE is obligated to protect National Register of Historic Places (NRHP)-eligible cultural resources by resolving adverse effects by avoiding, minimizing or mitigating them. Although at this time no archaeological sites in Area IV or the NBZ have been listed on the NRHP, numerous sites are considered eligible for listing on the NRHP, which confers the same status as an actual listing (refer to 36 CFR 800.16(l)(2)). Please refer to Section 2.4, “Application of Exemptions under the 2010 Administrative Order on Consent,” of this CRD for a discussion of the process that will be used to determine exemptions.
- 148-15** As explained in the Draft EIS, DOE used suburban residential risk-based screening levels (RBSLs) or risk slope factors based on the direct exposure pathways and without the indirect garden pathway to evaluate potential impacts to an onsite receptor. This scenario was used because Boeing, the landowner, had indicated that it would be cleaning up to a residential without garden scenario. Since publication of the Draft EIS, The Boeing Company (Boeing) and North American Land Trust, in 2017, recorded two Grant Deeds of Conservation Easement and Agreements (conservation easements) with Ventura County (Ventura County 2017a, 2017b) that permanently preserve as open space nearly 2,453 acres of land that Boeing owns at SSFL, including Area IV and the NBZ. The conservation easements are legally enforceable documents that, among other restrictions, forever prohibit residential, agricultural, or commercial development or uses of the site. These conservation easements impose restrictions beyond those in county zoning and planning documents.

In this Final EIS (see Chapter 2, Section 2.4), DOE has retained the Cleanup to Revised LUT Values Alternative, which uses chemical RBSLs based on a suburban residential scenario without a garden pathway. The Final EIS also retains the Conservation of Natural Resources Alternative, but evaluates two scenarios. The Open Space Scenario is based on the future land use of Area IV and the NBZ as open space, consistent with Boeing’s conservation easement and agreement (i.e., cleanup levels are based

Commenter No. 148 (cont'd): Marie Mason, Dawn Kowalski,
Rocketdyne Cleanup Coalition

on exposure of an onsite recreational user as the receptor). The Suburban Resident Scenario is the scenario evaluated in the Draft EIS, that is, cleanup levels are based on a suburban residential scenario without a garden pathway. This latter scenario is conservative (i.e., more protective) of human health in terms of the intended use of the land as open space.

In Chapter 4, Section 4.9 of this Final EIS, DOE has included an assessment of potential impacts to an offsite suburban resident; this analysis does include the indirect garden pathway, recognizing that local residents may get some portion of their food from a home garden.

- 148-16** DOE disagrees with the statement that “the end of the site is irrelevant to the cleanup”. “End state” is a primary factor considered by EPA and California DTSC in establishing cleanup criteria. The data and analyses in this Final EIS indicate that all of the action alternatives evaluated for cleanup of Area IV and the NBZ are protective of the health and safety of the public and the environment. None of the alternatives would leave “tremendous contamination” within Area IV. Please see Section 2.7, “Offsite Impacts,” of this CRD for discussions of concerns about offsite impacts.
- 148-17** The commenter is mistaken that the 1995 DOE-EPA Joint Policy creates a framework for the conduct of decommissioning of all DOE facilities. It only ensures compliance with CERCLA requirements for remedy selection at National Priorities List facilities. Since SSFL is not on the National Priorities List, would not have been applicable. However, note that this EIS does include an alternative/scenario consistent with the approach and process used by EPA in CERCLA cleanups.
- 148-18** While the comment is not on the scope or content of this Final EIS the following information is being provided.

DOE has funded a number of stakeholder groups, including Teens Against Toxins, the SSFL Advisory Panel, Physicians for Social Responsibility, the Rocketdyne Cleanup Coalition, Committee to Bridge the Gap and the SSFL CAG. The SSFL CAG is an independent group, created under the State of California Health and Safety Code, approved by the DTSC and formed under guidance from the Udall Foundation, an independent Federal agency focused on environmental stewardship. The SSFL CAG began operating in 2013. The grant to the CAG was funded through local project funds in an effort to support community engagement. DOE posted notification of the grant in September 2015 on USASpending.gov, an official website disclosing grants, loans and other financial assistance awards. Information on the SSFL CAG grant can be found here: <http://go.usa.gov/xWpte>.

Commenter No. 148 (cont'd): Marie Mason, Dawn Kowalski,
Rocketdyne Cleanup Coalition

DOE's Office of Environmental Management started the Community Involvement Fund (CIF) to increase public involvement in the environmental management decision-making process and assist stakeholder groups with analyzing environmental management plans and proposals. The CIF operated from late 2010 until September 2015 and distributed a total of \$1.6 million through 46 grants to 23 recipients around the country, including groups involved in observing SSFL cleanup preparation. These included:

- \$46,800 in 2011 to the Committee to Bridge the Gap.
- \$55,000 in 2012 to the SSFL Advisory Panel, partnering with the Committee to Bridge the Gap. The SSFL Advisory Panel is not related to the SSFL CAG.
- \$23,000 in 2013 to Physicians for Social Responsibility – Los Angeles, partnering with the Rocketdyne Cleanup Coalition, Teens Against Toxins and Committee to Bridge the Gap.
- \$20,000 in 2014 to Physicians for Social Responsibility – Los Angeles, partnering with Teens Against Toxins and the SSFL Work Group, which is not related to the SSFL CAG.

148-19 Considering public comments on the Draft EIS is an important step in the EIS process. DOE provided multiple means for public comment. Comments could have been submitted directly via the website. In response to comments about the website, early during the public comment period DOE expanded the capacity of the website to accept longer comments and added the ability to upload entire documents. Members of the public were also invited to attend the public hearings in Simi Valley on February 18, 2017 and Van Nuys on February 21, 2017 to make comments orally or submit paper copies. DOE also accepted comments by U.S. mail. Regardless of the submission method, DOE considered all comments equally when developing this Final EIS. With respect to PowerPoint presentations during the public hearings, slide presentations by commenters were not allowed during the oral comment periods at the public hearings in order to give all commenters equal time; however, presentations could be submitted by providing a printout of the presentation at the public hearing or by U.S. mail, or by uploading the presentation on the comment website.

Ms. Stephanie Jennings
NEPA Document Manager, SSFL, Area IV EIS
U. S. Department of Energy
4100 Guardian Street
Simi Valley, CA 93063

Comments on: *Draft Environmental Impact Statement for Remediation of Area IV and the Northern Buffer Zone of the Santa Susana Field Laboratory (Draft SSFL Area IV EIS) (DOE/EIS-0402)*

Dear Ms. Jennings,

I submit the following comments on the Draft Area IV EIS as a community stakeholder, living approximately four miles from the former Santa Susana Field Laboratory. Although I am a director of the Santa Susana Mountain Park Association and a member of the SSFL Community Advisory Group, the statements below are my personal comments and do not represent any organization.

Quality of the Draft Area IV EIS document:

I commend the preparers of the DEIS for the high quality of the document itself. It is a well-written document: carefully worded, well-organized, and competently reasoned. The document is a straightforwardly understandable and discussible platform for community consideration of the many complex issues entailed by the remediation of Area IV.

Presentation of multiple alternatives for soil remediation:

It is satisfying to see that DOE's EIS is faithful to the intent of both NEPA and CEQA laws by defining and evaluating reasonable soil remediation alternatives in addition to the "No Action" and "AOC Look-Up Table Values" alternatives. The EIS is correct to put forward two additional alternatives that also strive to safeguard the health of humans, wildlife and the environment. Drawing the distinction between a "Proposed Action" (AOC Cleanup) and a "Preferred Alternative" (yet to be decided) aids the public in comprehending and discussing the complex situation of remediation of Area IV.

I support "Conservation of Natural Resources" as Preferred Alternative for Soil Remediation:

The soils of Area IV must be cleaned up. "No Action" is not a responsible alternative. Likewise, the "AOC Look-Up Table Values" alternative must be ruled out because it presents unresolvable technical dilemmas, runs the risk of redistributing contaminants through transport activities, and entails excessive truck traffic through surrounding communities. The health risk projection for the "Conservation of Natural Resources" alternative falls within the USEPA acceptable target cancer risk range. The "Conservation of Natural Resources" alternative thereby protects human health, and does so at less cost and in less time than other alternatives. The "Conservation of Natural Resources" alternative balances multiple complex variables and is the best real-world choice for "Preferred Alternative."

Sincerely,

Tom Nachtrab

149-1

149-1 Thank you for your comment.

149-2

149-2 Thank you for your comment. It has been included in the Administrative Record for the EIS.

149-3

149-3 DOE acknowledges your support for the Conservation of Natural Resources Alternative. Please see Section 2.1, "Preferences for Cleanup," of this CRD for additional information.

Commenter No. 150: Joshua Osborne

Ms. Stephanie Jennings
 NEPA Document Manager
 SSFL Area IV EIS
 US Dept. of Energy
 4100 Guardian St., Suite 160
 Simi Valley, CA 93063

Ms. Jennings,

As a concerned member of the community, it upsets me deeply that the alternatives listed within the Draft Environmental Impact Statement are in direct contention with the commitments in both the 2007 Consent Order for Corrective Action (COCA) and the 2010 Administrative Order on Consent (AOC). I understand that as an agency you are required to submit an Environmental Impact Statement before remediation begins, but options that are in direct violation of legally binding documents are not to be entertained. Not only does such blatant disregard for previous commitments jeopardize the Department's integrity, but it also degrades the public's trust in the competency of the Department to complete tasks. Record of your current devious tactics will severely hinder the Department's ability to make any sort of negotiations or deals in the future.

The Department of Energy has promised no less than two times in legally binding documents that they would clean the contamination to the fullest: all the way to the safest background levels. These documents include the 2007 COCA and the 2010 AOC. It is outrageous that, despite their legal commitments, DOE seems to be seriously considering actions that operate in direct violation of sections 1.8.2-1.8.2.3 of the 2010 AOC. These sections explicitly state *only* onsite treatment or removal of contaminated soils will be considered and bars any other options. Section 1.8.2.2 says "'Cleanup to Background Levels" does not include "leave in place" alternatives.' and section 1.8.2.3 continues "'Cleanup to Background Levels" does not include onsite burial or landfilling of contaminated soils.' Considerations leaving 34%, 86%, or 94% of the contamination present on-site is absolutely irresponsible. These are the rough percentages of cleanup estimations on the three main proposals in the draft EIS, but there is a rather deceitful provision that allows an extra 5% of the contaminations in any situation, moving the percentages of contamination left onsite to 39%, 91%, and 99% respectively. This is absolutely outrageous and downright despicable. The contamination has been left for over half of a century and leaving it for the proposed 70 *additional* years in the hopes the problem of contamination rids of itself is not only daft, but also sends a clear message to the community that the DOE doesn't care about them.

150-1

150-1 As the commenter implies, NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. To meet this obligation this EIS evaluates alternatives for completing remediation of those portions of SSFL for which DOE is responsible, Area IV and the NBZ. It evaluates a soil remediation alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities, as well as alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup levels (refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD). As discussed in Section 2.2, the alternatives evaluated do leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives allows the public and DOE decision-makers to understand the trade-offs associated with options for cleanup of Area IV and the NBZ. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment. The No Action Alternative is included because it is required under NEPA and provides a basis for comparison with the action alternatives.

Commenter No. 150 (cont'd): Joshua Osborne

In 2010, when both NASA and DOE signed the AOC with the DTSC, they agreed to clean up SSFL to background levels of contamination. In fact, in 2011, NASA made claims in their respective EIS that were similar to those DOE are now making: that the National Environmental Protection Act (NEPA) requires the agency to look at alternatives that would violate the AOC. However, after NASA introduced their EIS, the Council for Environmental Quality (CEQ) decreed that NASA *must comply with the AOC* and it was “unnecessary to consider alternative cleanups that would breach [the AOC].” The Department of Toxic Substances Control echoed CEQ’s decision by directing NASA to look at *how* to cleanup to the standards set in the AOC, rather than *whether* to clean up to them.

As recently as 2012, DOE seemed to respect the CEQ’s decision, when they issued a notice of “Public Participation in the Development of Alternatives to be considered in the Santa Susana Field Laboratory Area IV Environmental Impact Statement” that acknowledged it was obligated to carry out the AOC requirement to cleanup to background, and that the EIS would be limited to ways to achieve that cleanup standard.

DOE, NASA, and Boeing all stand legally responsible for the pollution on-site and subsequently have no right to decide what they should clean and how much they should clean of their own mess. It should also be noted that the COCA clearly states that hazardous materials and contaminants can and have migrated offsite, in Sections 2.11 and 2.12, before continuing that all respondents (DOE, NASA, and Boeing) must abide by DTSC workplans. Even if there were no AOC, the cleanup decision *still* rests with DTSC for the chemicals under the Resource Conservation and Recovery Act. In 2012, DOE’s scoping summary of SSFL acknowledged that DTSC was the regulator and decision-maker regarding how much contamination DOE must clean up. Despite this, the Department of Energy’s Draft Environmental Impact Statement barely accredits DTSC at all. The DOE is totally usurping DTSC’s rightful and legal authority.

It is distasteful and downright absurd that DOE would be given the opportunity to decide how much contamination is worth cleaning up as DOE stands, alongside NASA and the Boeing Company, as the polluters. DOE must be held accountable for the damage it has caused to the environment and to the people of the community.

Sincerely,
Joshua Osborne

150-2

150-2 NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to “rigorously explore and objectively evaluate reasonable alternatives” (40 CFR 1502.14) to meet the purpose and need for agency action. The Draft EIS analyzed an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or to levels based on laboratory capabilities. In response to public input since the 2010 AOC was signed, the Draft EIS also analyzed alternatives that consider risk to human health as well as the protection of natural resources to determine cleanup levels. The use of a risk assessment approach for soil cleanup is consistent with that used for cleanup actions by DOE at sites throughout the United States, by DTSC at other DTSC-regulated sites, and by EPA at CERCLA sites. The comparative analysis of these alternatives the public and DOE decision-makers to understand the trade-offs associated with the various options for cleanup of SSFL Area IV and the NBZ.

150-3

150-3 DOE recognizes DTSC’s authority with respect to the AOC and the Resource Conservation and Recovery Act. DOE recognizes that DTSC needs to approve soils and groundwater cleanup plans prepared by the DOE in accordance with their regulatory authority provided in the AOC and DOE-prepared RCRA closure plans for building demolition.

Commenter No. 151: Matt Ruhland

This testimony was interrupted because it exceeded the minimal time limit for public comment. This document is being submitted so that the full statement may be on the record.

My name is Matt Ruhland and I grew up in Camarillo, only just recently learning about the Santa Susana Field Laboratory. In 2010 the DOE solemnly entered into an agreement with the state regulatory agency, the DTSC, whereby the site would be cleaned up to background; in other words, remove all the detectable contamination and return it to the condition it was in before DOE contaminated it. After two rounds of opportunity for public comment, in which more than 3000 comments were received, of which all but a handful were strongly in favor, DTSC and DOE executed the AOC in December, 2010.

There are several key components of the AOC. (1) It is legally binding; DOE cannot unilaterally choose not to comply with any part of it. (2) Cleanup of soil shall be to background. (3) And critically, no "leave in place alternatives will be considered."

In 2012, DOE issued a notice "Public Participation in the Development of Alternatives to be Considered in the Santa Susana Field Laboratory Area IV Environmental Impact Statement." In it DOE acknowledged that DTSC was the regulator and had the regulatory authority over the cleanup, that DOE was obligated to carry out the AOC requirement to clean up to background, and that the EIS would be limited to alternative ways to achieve that cleanup standard.

A few weeks ago, DOE issued its DEIS. And in it, DOE broke its commitments in the AOC and its past promises about any EIS. Every option it puts forward would leave in place large amounts of contamination, despite the explicit prohibition against that in the AOC. Option 1 would leave in place 39% of the contamination; Option 2 would

151-1

151-1 NEPA requires Federal agencies that propose major actions that could possibly significantly affect the human environment to prepare EISs. In developing an EIS, Federal agencies are required to "rigorously explore and objectively evaluate reasonable alternatives" (40 CFR 1502.14) to meet the purpose and need for agency action. In this EIS, DOE does not propose breaking the 2010 AOC signed with its regulator, DTSC. As stated in Chapter 2, Section 2.2.1 of this Final EIS, in order for the implementation of any alternative to be consistent with the 2010 AOC, changes to the AOC would be required. Section 8.0 of the AOC allows DOE and DTSC to agree upon changes to the AOC to better meet cleanup objectives. DOE expects that it will need to engage DTSC in discussions about such changes in order to implement any soil remediation alternative in order for the implementation of any alternative to be consistent with the 2010 AOC, changes to the AOC would be required. Please refer to Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for a discussion of soil remediation alternatives, including an alternative that incorporates the technical elements of the 2010 AOC using the AOC LUT values as the basis for a cleanup to background levels or levels based on laboratory capabilities. As discussed in Section 2.2, the alternatives evaluated leave different quantities of soil with low concentrations of chemical and radioactive constituents on site. Based on these concentrations and on the future land use of this area as open space, these constituents are not dangerous to onsite or offsite receptors. Each of the action alternatives evaluated is protective of the health and safety of the public and the environment.

Commenter No. 151 (cont'd): Matt Ruhland

leave in place 91%; Option 3 would leave in place 99%; and Option 4 would leave 100%. Furthermore, DOE also has broken its prior commitments that any EIS would be limited to different technologies to live up to its AOC obligations to clean up all the contamination, not whether to do so.

The DOE has lacked integrity and transparency when engaging with the public. Not only is it limiting the size of comments and file attachments submitted through the website, but we are only allowed 180 seconds to speak at these meetings. Even yesterday, DOE prohibited the public testifying today from presenting slides on the information we want to highlight in the DEIS, just as they did. We were denied, on the premise that contradicts the hearing notice. Nowhere on their public hearing announcements does it prohibit members of the public from presenting slides. So what they mean is, it would be unfair to give the people the same opportunity as the government. The public has asked numerous times for email comments to be accepted, as that is the most practical and effective way of communicating now-a-days. However, the DOE has refused, and even went so far as to delete the email address they had generated specifically for the DEIS, and presented as a means to contact the DOE.

If the DOE were genuinely interested in having public input, they wouldn't be so resistant to receiving it. DOE promised a full cleanup. DOE has now broken that promise, with an EIS filled with misrepresentations. And now it has worked very hard to frustrate the public's right to criticize that breach of commitments. This is not how to behave if, as you say, you have nothing to hide.

151-1
cont'd

151-2

151-2 Thank you for the feedback on the Draft EIS. Considering public comments on the Draft EIS is an important step in the EIS process. DOE's time limit on oral comments at the public meetings was set to allow all stakeholders equal time to present their comments. The intent was not to quell public comment; multiple means of submitting comments were available. These methods included the website, U.S. mail, providing oral comments during the public meetings or to the court reporter before the public hearings commenced, and providing a written transcript at the public hearings. In response to comments about the website, early during the public comment period DOE expanded the capacity of the website to accept longer comments and added the ability to upload entire documents. Regardless of the submission method, DOE considered all comments equally when developing this Final EIS. The purpose of the public hearings was to allow stakeholders to make comments on the Draft EIS. PowerPoint presentations were not allowed during the oral comment periods at the public hearings in order to give all commenters equal time; however PowerPoint presentations could be submitted by providing a printout of the presentation at the public hearing or by U.S. mail, or by uploading the presentation on the comment website.

Commenter No. 152: Manny Ruiz

Ms. Stephe Jennings
NEPA Document Manager
SSFL Area IV EIS
US Dept. of Energy
4100 Guardian St., Suite 160
Simi Valley, CA 93063

Dear Ms. Jennings,

In the DEIS, the DOE claims that there are 150,000 cubic yards of soil where petroleum hydrocarbons (TPH) and polycyclic aromatic hydrocarbons (PAHs), as the only contaminants, make the soil amenable for remediation via natural attenuation. They claim it will take up to 15 years for the PAHs and 70 years for the TPH to biodegrade below AOC background levels (DEIS, s-21). In other words, the DOE wants to set aside 150,000 cubic yards of soil contaminated with extremely harmful substances and do nothing to prevent them from weathering into the surrounding area of the SSFL for decades.

The 15 and 70 year time frame is cited from the engineering and construction firm CDM Smith, who give a range of 0.42 to 69 years for TPH natural attenuation and 5 to 15 years for PAH natural attenuation (CDM Smith 2015b, 3-11). CDM Smith however, derived at those numbers not through their own means, but by citing a team of researchers at the Cal Poly College of Engineering in San Luis Obispo. Led by Professor Yarrow M. Nelson and his team of graduates, the Nelson studies are the main bodies of research behind the rates of natural attenuation for TPH and PAH cited in the DEIS. However, it is clear why the DOE indirectly cited the numbers of the Nelson studies through the CDM Smith report and did not cite the Nelson studies directly. By citing CDM Smith, and not the Nelson studies directly, the DOE allow themselves some wiggle room to remain operating in a shade of grey. The Nelson studies concluded that natural attenuation, though potentially effective in theory, would not be the solution to the decontamination problem in the SSFL. Something the CDM Smith report, and the DEIS failed to report. After reviewing the Nelson 2014 study for the *Feasibility of Natural Attenuation in the Soil of the Santa Susana Field Laboratory*, there are several major assumptions that the researchers made that make the theoretical natural attenuation rates for TPH and PAHs cited in the DEIS a perfect example of the inappropriate use of misinformation by the DOE.

It is important to point out that Yarrow M. Nelson and his Cal Poly SLO team acknowledge that without data from soil samples at the Santa Susana Field Laboratory requires a

152-1

152-1

The TPH chemicals at the concentrations that are targeted for monitored natural attenuation are not “extremely harmful” as the commenter alleges. The commenter is correct in noting that the soil treatability study (Nelson et al. 2014, 2015a-d) concluded that some of the heavier PAH compounds are difficult to degrade; but, PAH chemicals are not the target for natural attenuation. Rather they are collocated in soil with PCBs and metals, and would be the target for soil removal. (Simple polycyclic aromatic hydrocarbons may be amenable to natural attenuation, if they are the only contaminant and would be evaluated on a location-by-location basis during development of soil remediation plans.) The EIS states that monitored natural attenuation would be considered for “low concentrations” of TPH chemicals in soils containing only petroleum contamination. Chapter 2, Section 2.3.2 of this Final EIS for additional information. In no circumstance would DOE consider natural attenuation for a location with soil containing chemicals that pose a risk to human health or the environment. Finally, the AOC does not prohibit the use of natural attenuation as a soil treatment option. The AOC, in Section 2.6 and 2.9, specifically allows for the use of onsite treatment measures, of which natural attenuation is one. As stated in the EIS, such onsite treatment would have to be approved by DTSC. DOE would be required to provide a Soils Remedial Action Implementation Plan that would provide sufficient information to demonstrate that natural attenuation would effectively achieve cleanup goals.

Commenter No. 152 (cont'd): Manny Ruiz

great degree of forecasting that render their calculations appropriate for “illustration purposes” at best (Nelson 2014, 22). Without running actual microcosm experiments with soil samples from the SSFL, the researchers came up with concentrations of TPH that range from 860 to 82,000 ppm to illustrate the amount of time it might take soil with TPH concentrations within that range to naturally attenuate. Any calculations computed from the hypothetical concentration range cannot be applicable to the SSFL’s site specific natural attenuation rates. Regardless, the researchers come up with a first-order rate of decay from the hypothetical concentration range and calculated that it takes up to 69 years for TPH to naturally attenuate to the target level of 5.7 ppm (Nelson 2014, 22). Furthermore, the researchers from Cal Poly made the assumption that the kinetic rate of decay would remain first-order throughout, they assumed that the rate at which the TPH reacts would be constant, but that is not the case. They go on to list a couple reasons why forecasting a first-order rate is incorrect. First, the fractions of TPH that biodegrade more easily will biodegrade first and leave behind the more recalcitrant compounds (Nelson 2014, 22). Second, some of the TPH will remain sequestered in the soil and be unable to biodegrade at all. Now, what both of these facts suggest is that since the soil of the SSFL has been contaminated for decades, it is very possible that the TPH compounds that are amenable to natural attenuation, have already biodegraded, and what is now polluting the SSFL soils, are the TPH compounds that do not, or cannot naturally attenuate without more active remediation processes.

Despite the Cal Poly researchers cautioning the DOE to take the calculations from their 2014 study lightly until more data is collected, the DOE completely rejected what they had to say and only presented the results from their calculations in the DEIS. However, the researchers did suggest ways to generate more accurate results. At the time this 2014 study was published to the DOE, the researchers were working on companion microcosm experiments to lend some much needed factual chemistry to their study. In 2015, several more reports on the SSFL were published to the DOE and are hence known as the Nelson studies. Collectively, they give a crystal clear conclusion on why natural attenuation is not a solution that works.

In 2015, Professor Yarrow M. Nelson and his Cal Poly team conducted a series of site-specific experiments to follow up the forecasting of their 2014 study. Before those studies were conducted however, questions were raised regarding the extent to which the presence of NOM

152-1
cont'd

Response side of this page intentionally left blank.

Commenter No. 152 (cont'd): Manny Ruiz

was making the concentration of TPH in the soil appear to be higher. Therefore the researchers conducted a detailed analysis using mass spectroscopy to identify how much NOM was contributing to TPH and they found that NOM only attributed to a mere 3 to 8% of the TPH concentration in the soil (Nelson 2015d, 11). In order to make accurate predictions on the biodegradation rates for TPH and PAHs in the SSFL soil under current conditions, 9 soil samples were collected and treated using a varying array of techniques (Nelson 2015c, 73). Of the 9 soil samples, 3 of them were left unamended and studied to test the natural attenuation rate of TPH without any intervention. This mimics what will happen in the 150,000 cubic yards of soil proposed by the DOE to be set aside and left untouched. The results from the microcosm experiments concluded that the soil samples biostimulated with nitrogen and phosphorus fertilizer showed significant biodegradation. The 3 soil samples left unamended however, showed little to no biodegradation at all (Nelson 2015c, 74).

The biodegradation for PAH was even less promising. The study concluded that the lack of biodegradation is due to the fact that mostly polyaromatic hydrocarbons with compounds containing 4-6 aromatic rings are left in the soil and these tend to be the PAH compounds that are the most difficult to biodegrade (Nelson 2015c, 76). This tells us that the lighter PAHs that will biodegrade have almost certainly already done so, and what is now left will not be biodegrading on its own. Furthermore the Nelson studies concluded that as PAHs are absorbed by the soil, biodegradation becomes even more difficult through unamended and amended techniques, because as the bioavailability of the compounds are reduced, it is less probable that they will react with decomposers in their environment (Nelson 2015c, 74). This is exactly the reason why the 2010 AOC explicitly specified that a "leave in place" option is prohibited.

After testing biodegradation rates under the specific factors at play in the SSFL, the TPH and PAHs in the SSFL soil will not biodegrade to the target levels of 5.7 ppm. The proposal of the DOE in the DEIS to set aside 150,000 cubic yards and do nothing, is not a solution that will work. The Nelson studies have concluded that the TPH and PAHs that are left in the soil, will not biodegrade and therefore will not be removed from the soil unless physically excavated or treated with nitrogen and phosphorus fertilizer or other amended techniques. If the rest of the claims the DOE has made in the DEIS are as blatantly ill conceived as this, it will not take much

**152-1

152-2

152-2

DOE acknowledges your comment. It has been added to the Administrative Record for the EIS.

Commenter No. 152 (cont'd): Manny Ruiz

to bring their plan to get out of the 2010 AOC cleanup agreement to an end. Anyone who reads through the DEIS and the attached references will see examples where the DOE has deliberately cherry picked which version of the truth is convenient to include in the DEIS.

However, when reading through the DEIS, it is often easy to get so caught up in every minor detail of every proposal and forget the reason why it is important that the DOE abide by the agreement it made to clean the SSFL. What is contaminating the SSFL is the byproduct of decades of accumulating radioactive and toxic substances. To illustrate the severity of the hazards contaminating the SSFL, one of the 10 nuclear reactors housed in the SSFL partially melted down. The Chernobyl incident in Ukraine is an example of what happens to life following a nuclear meltdown. Even though the meltdown in SSFL was only partial, it was enough to release countless radioactive particles into the environment. This has been allowed to leach into the soil, groundwater, and surrounding community for decades. It will not stop contaminating local territory until it is thoroughly decontaminated and cleaned.

The SSFL should have been cleaned by this year, but the DOE has postponed the cleanup. 2017 has already brought enough rain to allow the radioactive chemicals and toxic substances to runoff into the neighboring environment. Some of it eventually finds its way into residential areas where families are affected. And a lot of it will make its way into the ocean and affect all aspects of marine life. Every day the SSFL is allowed to be contaminated is another day that people and wildlife are at risk of being exposed to the harmful effects of the contaminants. The DOE must abide by the 2010 AOC, not simply because they are legally obliged to do so, but because their refusal to do otherwise is directly affecting the livelihood of countless communities.

Sincerely,

Manny Ruiz

152-3

152-3 Please see Section 2.7, "Offsite Impacts," of this CRD for a discussion and DOE's response to concerns about offsite impacts.

152-4

152-4 DOE acknowledges your preference for a cleanup in accordance with the 2010 AOC. Please see Section 2.1, "Preferences for Cleanup," and Section 2.2, "Compliance with the 2010 Administrative Order on Consent," of this CRD for additional information.

Commenter No. 153: Jason Saxelby

THIS IS WHAT I LIVE WITH EVERY DAY.

1. **I have tested positive for the HLA-B27 gene.**
2. Daily Memory loss, recall issues, confusion and dyslexia. Simple things like where a particular letter is on a keyboard. Names, common names of items. Where things are that have a normal storage location. How to do things, such as put on coffee. I turn light switches on thinking it is off, I have severe trouble remembering my bank pin number, I usually can not remember my own address. I set 4 alarms to remind me to pick up my daughter from school. Extreme issues with recall. Very irritating at times. Causing stuttering and or long hesitations as well as frequent inability to complete a sentence at all.
3. Daily anxiety, particularly in the mornings and evenings but lasts throughout the day.
4. Daily numb or tingling lips and tongue. Only in the center of the lips, section about ½" to ¾" wide and only the very tip of the tongue.
5. Daily random dizziness. Always at least some dizziness with periods of extreme dizziness. With or without medications. Has definitely increased since I started blood pressure medications.
6. Daily fatigue. Extremely exhausted all the time. Regardless of getting sleep or rest, which I do NOT get.
7. Daily loss of sleep. Most nights can only sleep 1 to 4 hours. On really rare occasion when heavily medicated I can get up to 6 hours or so. Sleep Dr. ordered CPAP, but insurance would not cover. Still don't have it or have I tried to use one. If I were to sleep more than 4 hours it causes severe back pain in the mid section around the primary scoliosis pain area.
8. Daily itching. Every day itching around the head, face, upper torso, shoulders and lower legs. Itchy areas feel raw or with a stinging sensation. Skin gets red, dry, bumpy and very irritated. Kind of driving me nuts.
9. Daily and constant body jumping, twitching, trimmers or shaking. Uncontrolled and unwanted body twitching or trimmers. Even while sedated body continues to jump or twitch to the point that it took 10 attempts for 6 successful MRI's in the past couple years. Some trimmers are severally painful. Especially in neck, upper back and shoulders.
10. Daily Constant headache. Both sides of head, down back of neck, into upper back and across to shoulders. These can be debilitating. This is one of the most severe pains in my body. In November 2015 I had radio frequency ablation on both left and right C-3 through C-6. This had reduced the daily severity on some days, but headaches are back now.
11. Daily both eyes feel like there is something such as fuzz or a hair in them almost all the time. This is a constant issue and rarely feels ok. There is such irritation that it is obstructing my vision and making it blurry almost all the time.
12. Daily both eyes, vision is very blurry and continues to get worse. Glasses barely help with reading, but even with glasses it is really hard to focus on anything small or even medium in size. Reading glasses have gone up from 1.25 to 2.75 in the last year and now 2.75 is not enough. Can not find stronger reading glasses.
13. Right eye gets small bumps under and around it which are irritating and becoming worse.
14. Daily Both eyes really sensitive to light. Not always the same. Bright light causes immediate headache.
15. Hearing loss. 50% both ears in the high range. Audiologist confirmed 50% loss in high range and I believe it is getting worse.
16. Daily Both ears, constant ringing. So loud at times it keeps me up or wakes me at night. Can not hear normal conversations, tv, radio, etc. So I prefer to be alone, so I don't have to try and communicate.
17. Daily right ear has pain and a loud crackling noise. Extremely loud if I yawn or move my jaw with severe pain when it crackles.
18. Daily Jaw is grinding on the right side. This is worse in the mornings but does happen throughout the day.
19. Daily Jaw on the left side has bad pain. Radiates down my neck and up into my cheek bone.
20. Daily Constant neck ache. Rear of neck down top of back on both sides of spine and spreading into shoulders. Frequently painful or difficult to turn head in either direction without flaring a headache.
21. Daily Pressure tenderness. As far as I can tell this is on the whole body. Examples, can not wear a ring, watch or necklace. Shoes must always be very loose with no pressure on top of feet. Waistline has pain just to keep pants from falling. This always hurts 24/7. Tops of feet are the worse.
22. Daily Upper back pain. Both sides of spine from neck to a point about 8" to 10" down. Frequently swells out with large long lumps.
23. Daily I have scoliosis which causes extreme mid back pain. Middle section of back, both sides of spine. Sometimes swells out up to 1 ½". Very painful and irritating. If in bed more than 3 to 3 ½ hours pain becomes extremely severe. This never stops hurting and is becoming worse. Excruciating to even take a breath most days.

24. Shoulders. Both shoulder joints grind at times and most days severe pain but always aching. Severe pain if I walk to much using my cane or crutches. Right shoulder is typically the worse, but lately the left is, both very limited in raising them without severe pain. Recently diagnosed as bilateral subacromial bursitis and tendonitis, possible arthritis that may need to be removed, possible tears in the cuffs and both shoulders have impingements and degenerative disease. Received injection on 11/03/15. It helped a lot for quite a while. Received a second set of injections in July 2016. These injections caused additional pain and no relief at all. Dr's assistant stated to me, the "Dr did not think they would help", due to all the issues in the shoulders.
25. Daily Elbows ache. Always tender. Sometimes lock and have to snap them back loose. Severe pain when this happens. Tender all the time to even rest on a couch cushion, pillow or table top.
26. Daily Muscle pains both forearms. This is a daily pain and is even soar to the touch.
27. Daily Muscle pains both biceps. This is a daily pain and is usually even soar to the touch.
28. Daily wrists ache. Daily issue and is very painful in the joints all the time. Pain is no radiating from my palm up through my wrist and from the back of my hand up into my forearm.
29. Daily left hand, main knuckles very painful with swelling, pain radiates up arm.
30. Daily right hand, main knuckles very painful with swelling, pain radiates up arm.
31. Fingers both hands extremely achy and swollen everyday. Having a lot of difficulty gripping my cane or crutches. Mornings are the worse, fingers swollen to the point I can not hold a cup of coffee and to the point it is difficult to even wipe my butt.
32. Daily Low back, excruciating pain all the time. Muscular and skeletal pain on both left and right sides. Bone pain throughout the area. I have had fusion at L5—S1. This can be one of the most severe pains in my body and it is there everyday 24/7. Extremely tender to the touch.
33. Shortness of breath. This is a daily thing and usually much more severe at night. Just can not catch my breath.
34. Random chest pain. Not crushing like heart problems. It is an ache in the dead center of the chest.
35. Daily Stomach issues. Diarrhea, constant cramping, lots of pain, very uncomfortable. GI Dr. performed an EDG and colonoscopy. Diagnosed with Barretts Esophagus, Hiatus Hernia, Gastritis, Diverticulosis of large intestine and first degree hemorrhoids.
36. Daily severe Acid reflux and it happens constantly.
Daily lower abdominal extreme pain. Recent CT scan identified Malignant Neoplasm of Posterior Wall of Urinary Bladder (Cancer). Treatment is ongoing.
37. Daily Sciatica from tail bone down right leg constantly. Pain levels do vary throughout the day. Daily pain, extremely debilitating to the point I can not take a step and at times causes me to fall.
38. Daily Sciatica down the left leg is intermittent. Pain comes and goes and increases and decreases. This has been increasing lately and is really becoming a severe issue.
39. Daily Right hip in constant pain. Over the past 6 to 10 months this has continued to get worse.
40. Left hip pain is intermittent. Over the past 6 months this has continued to get worse.
41. Daily Muscle pains on the top and the bottom of both thighs. This is a constant daily pain and is soar to the touch. Feels like wooden spoons stabbed into the muscles and tweaking them around.
42. Daily Muscle pains in both calves. Same pain as the thighs. This is a constant daily pain and is soar to the touch.
43. Daily Right knee, severely aches most of the time with occasional swelling. Knee buckles and occasionally causes me to fall. Bursa sacs were ruptured and removed in this knee as well.
44. Left knee, severe aches with occasional swelling and is becoming worse. Knee buckles and occasionally causes me to fall. Pain levels becoming more severe and consistently there.
45. Both ankles, pain worsening rapidly. Left ankle at times locks, when locked pain can be severe, now a daily issue. Right ankle is a constant severe ache. Both seem to be getting rapidly worse.
46. Daily Heel pain in both heels. **CONSTANT PAIN. This pain is excruciating daily and is hands down the worse pain I endure on a daily basis.** This is absolutely the worse pain in my body. It hurts no matter what. Standing, sitting, elevated feet, lying down, nothing helps to reduce pain. It feels like my heel bones were smashed with a hammer, repeatedly all the time, day and night. PLEASE STOP THIS PAIN. I have requested amputation of both feet. Doctors refuse and tell me, even if they were amputated the pain would remain.

- 47. Daily Foot pain in both feet and throughout the entire foot. Pain and swelling does radiate up into the ankle and up the calve. The foot pain is out of control. It literally feels like my feet have been crushed in some horrible machine accident, all day, all night, everyday without any break of such extreme broken bone pains. With any walking, standing, sitting and my feet touching the floor at all or even laying down and my feet touching a mattress, the pain is literally unbearable. It feels like I have broken bones throughout my feet and nothing eases the pain. I am at the point to do anything to make this pain end. I am open to amputation to stop this pain. Additionally feet feel as if they are frozen all the time, however not to the touch, the actual feeling is in my feet. Pain is worsening, with this recent cold weather setting in, the pain is getting even worse, which I did not believe was even possible. Both feet have severe pain and is completely unbearable.
