This resource is already listed on the NRHP and the CRHR. It was nominated in the 1980s under Criterion D (similar to CRHR Criterion 4) for its ability to provide information important to the prehistory of the Mojave Desert. At this site, thousands of petroglyph elements are found on scattered outcrops, talus, and float boulders at the inflection of the bajada and the mountain face. The bajada is dissected by one major and several minor arroyos. Within an alcove in the largest arroyo is a small spring that was the focus of prehistoric Native American activity. Present-day vegetation is part of the creosote bush scrub plant community. Also present at the site is a midden deposit with ceramics, lithics, and ground stone. Portions of at least eighteen prehistoric trails and a prehistoric camp site with sleeping circles are also present. Historic-period

features noted at the site include an access road associated with nearby mining activities and historic cross-country automobile travel.

The significance of the site has been primarily associated with the petroglyphs. Present here are at least 2,141 boulders with over 3,360 rock art panels and at least 7,500 individual design elements, forming the largest concentration of petroglyphs in the region. No other recorded site within the region approaches the density, number, and aesthetic value of the petroglyphs found within the immediate area of McCoy Spring. Two important styles are represented at the site, the Great Basin Abstract style and the Colorado Desert Representational style (Hedges 1973). Also important is the presence of a midden at this site. Stratified trash deposits are rare in the region, and, as a result, each one of them holds the potential of yielding unique information on the prehistory of the California Desert. At the time of the nomination, the site integrity was good and vandalism was minimal. Protection of the site has been aided by the erection of a fence in the 1970s and an aluminum barrier across the road and major wash to prevent vehicle access to the petroglyphs. In the 1990s the historic district was the subject of a Master's thesis (McCarthy 1993) including additional survey and recording of rock art, trail segments, and associated sites. This report contains one of the most definitive analyses of prehistoric settlement patterns for the region. It determined that McCoy Spring was the focus of prehistoric activity for the entire region.

Staff proposes that McCoy Spring National Register District may be eligible for listing on the NRHP under Criterion A as well as under Criterion D. Under Criterion A, a resource is eligible if it is associated with "events that have made a significant contribution to the broad patterns of our history". In the context of a Native American site where its importance is not recorded in written form, National Register Bulletin 38 (NPS 1998, pp. 12–13) makes it clear that the word "our" refers to the group that finds the property significant and "history" includes both traditional oral and written history. Important events can include specific events, or repetitive trends. Places referred to in Native American oral histories and creation stories, therefore, are potentially eligible. Applying Criterion A to McCoy Spring, this place has clearly been an important place for hundreds if not thousands of years. Native American groups in the surrounding area consistently mention that springs, petroglyph sites, and trails are of special importance to their communities. McCoy Spring may be one of these places and may be impacted by the construction and operation of GSEP.

C.3.5.1.3.8.6. Built-Environment Resource Evaluations

To staff it appears that two linear built-environment resources in the proposed GSEP built-environment APE may be impacted by the project. These resources include a historic-period road and a historic-period electric transmission line. Descriptions and evaluations of the NRHP and CRHR eligibility of the two resources are presented below. The historian for the applicant recorded these two resources but did not provide any recommendations regarding their eligibility for listing on the NRHP or CRHR (Farmer et al. 2009, app. F).

Wiley's Well Road

Wiley's Well Road is a historic-period road that consists of both an unimproved dirt two-track owned and maintained by the BLM and a 40-foot-wide, two-lane paved road

owned and maintained by Riverside County. Transportation infrastructure associated with this road appears to include Wiley's Well, the I-10 overcrossing, Wiley's Well rest area, and possibly McCoy Spring. The road intersects with the proposed GSEP linear facilities corridor in two places, south of I-10 and near the Wiley's Well rest area. The paved portion of the road begins at Wiley's Well rest area, on the north side of I-10, and crosses I-10 heading south to Chuckwalla State Prison. The unimproved portion of the road extends north from Wiley's Well rest area between the Palen and McCoy Mountains in the direction of McCoy Spring and the abandoned mining town of Midland. A number of roads intersect near the Midland ghost town site, and the route of the road beyond this area is unclear. South of the Chuckwalla State Prison, the unimproved section of the road continues for 9 miles until it intersects with the old Bradshaw Trail. This is the location of Wiley's Well, which is currently a BLM campground and rock-hounding site. The road continues south through BLM land towards the Salton Sea.

Wiley's Well Road appears on historic maps in the 1930s after improvements were made to U.S. Highway 60-70, which it intersects. During this period, Wiley's Well Road was an unimproved dirt and gravel road. Historic maps indicate that by 1951 Wiley's Well Road had been improved and was a graded dirt road for the first five miles south of Highway 60-70 and continued southerly as an unimproved road. The road was improved when it was extended north, past Highway 60-70, to connect with roads that traversed the Palen and McCoy Mountains in the direction of McCoy Spring and the mining town of Midland. Improvements were again made to Wiley's Well Road in 1969 when part of the alignment of Highway 60-70 became I-10 when that freeway was constructed. Wiley's Well overcrossing was constructed over both eastbound and westbound lanes of I-10, and a portion of Wiley's Well Road was paved; the remainder was left as a dirt road. In 1987, Wiley's Well Road was again improved when Chuckwalla State Prison was constructed. The prison can be accessed from Wiley's Well Road and is to the southwest of the Wiley's Well Road interchange with I-10. The alignment of Wiley's Well Road has remained the same over time (Farmer et al. 2009, app. F).

Wiley's Well Road is associated with three historic migrations tied to mining discoveries in southern California and nearby parts of Arizona. First, this road is important as an offshoot of the Bradshaw Trail. This was an overland stage route pioneered by William Bradshaw in 1862 connecting San Bernardino, via San Gorgonio Pass, Palm Springs, and the north shore of the Salton Sea, eventually reaching the Colorado River near Blythe. This route followed traditional Indian trails and was used between 1862 and 1877 to transport miners and other passengers to the gold fields at La Paz (Ehrenberg), Arizona. A second mining boom in the Blythe area began in 1907. Wiley's Well Road was named for A. P. Wiley, storekeeper and postmaster in Palo Verde (just south of Blythe). Wiley financed miners prospecting in the area and in 1907 financed an expansion of the well first established 1896 by a stagecoach company using the Bradshaw Trail. The well was used by cattle ranchers, prospectors, and early automobile travelers until the rapidly falling water table made the water difficult to access and too salty to drink (Farmer et al. 2009, app. F). Around this same time, gypsum was found in the McCoy Mountains. A mining town, Midland, was established here. From 1925 to the 1960s, Midland was a company town owned by the U.S. Gypsum Co. The company harvested vast amounts of gypsum from the area. At its peak, the town had a population of approximately 1,000. The improvements to Wiley's

Well Road in the 1940s and 1950s appear to extend the road past McCoy Spring to Midland.

Based on the information above, staff concludes that Wiley's Well Road is associated with important historic trends in regional community and economic development. There appear to be two periods of significance. The first period is 1862 to 1877, when the road was associated with the Bradshaw Trail and the gold mines in La Paz, Arizona. The second period of significance was between 1907 and the 1960s when the road was a transportation corridor to the gypsum mines of Midland. During both of these periods the road was an unimproved, dirt two-track road crossing a relatively empty and forbidding desert. As such, staff suggests that the paved sections of Wiley's Well road and their associations with the rest area, I-10, and Chuckwalla State Prison do not retain integrity of setting, integrity of feeling, or integrity of association. However, the unimproved sections of Wiley's Well Road do appear to retain integrity of the rural desert two-track road, and are therefore eligible for listing on the NRHP under Criterion A and the CRHR under Criterion 1.

Wiley's Well Road does not appear to be eligible for listing on the NRHP or the CRHR under any other criteria. Although the well was named after A. P. Wiley and the road after the well, the road gets its main significance from its association with the Bradshaw Trail and the mining boom in La Paz, rather than an association with this individual. Therefore, the road does not appear to be eligible for listing on the NRHP under Criterion B and the CRHR under Criterion 2. According to the documentation provided by the historian for the applicant, both the unimproved dirt and paved portions of the road were built using standard construction techniques. Therefore the road does not appear to embody a distinctive type, period, or method of construction, and is not eligible for listing in the NRHP under Criterion C and the CRHR under Criterion 3. Finally, the road and its associated transportation infrastructure are also not eligible for the NRHP under Criterion D or for the CRHR under Criterion 4 because they do not appear to contain important scientific data related to our history.

Blythe-Eagle Mountain Transmission Line

The 161-kV Blythe-Eagle Mountain Transmission Line runs 52.1 miles from Blythe-Eagle Mountain Substation to Dunes Substation in Blythe. It was built in the 1950s using H-frame wood poles, some of which were replaced in 2002. This linear resource intersects with the proposed linear facilities corridor where the transmission line cuts diagonally to the north avoiding the Wiley's Well rest area.

The present electrical transmission line system operates in the 220–500-kV range. These lines move bulk power into and around the system to high-voltage substations in the area, where the power is converted down to sub-transmission levels of 115–33 kV. Before 1913, the highest voltage lines in the Los Angeles area were operated in the 10–75-kV range. Some of the earliest distribution lines were built to serve rural communities. During the 1930s any circuits built were those that extended lines previously constructed in the 1920s. Many of these lines focused on following railroad spur lines and existing distribution lines to growing communities. During the late 1920s, the Colorado River Valley, where the study area is located, was provided with electricity by Southern Sierras Power and its subsidiaries. With the end of WW II, a boom in

population occurred throughout the state. New industries and new residents came to California, including thousands of military men and their families. As populations grew, more utility customers were added, prompting Southern California Edison and other electrical companies to expand their services. This growth meant that more lines were constructed and extended. In the 1950s, when the Blythe-Eagle Mountain transmission line was constructed, Blythe had a large population, due to its fertile agricultural lands and the advent of the railroad and the automobile, which brought new residents to the area. In 1940 the population of Blythe was approximately 2,350, and by 1950 the population was over 4,000 (Farmer et al. 2009, app. F).

Generally speaking, electrical transmission and distribution facilities, as a mature technology, by themselves rarely meet the eligibility criteria for NRHP listing quoted above. Typically, those that are evaluated NRHP-eligible achieve that status by way of their association with other historically significant facilities (that is, eligible under Criterion A). Borrowed from telegraph transmission technology, wood-pole support structures such as those used in the 161-kV Blythe-Eagle Mountain Transmission Line have been used for electrical transmission or distribution lines from the outset, and the technology has changed very little. The common and non-distinctive nature of wood-pole transmission or distribution line structures disqualify them as potentially NRHP-eligible under Criterion C, being purely functional and utilitarian in use and common in appearance. A wood-pole transmission or distribution line could, however, be significant under Criterion A and/or Criterion B by way of an association with a significant facility (Taylor 2005).

Staff concludes that the 161-kV Blythe-Eagle Mountain Transmission Line is not eligible for inclusion in the NRHP or the CRHR. Evaluated under Criterion A/1, this linear resource is not associated with events that have made a significant contribution to broad patterns in our history. Rather it represents a common trend within the context of residential development of the United States after World War II. Research did not indicate that this transmission line was associated with any historically significant persons, and so it does not appear to be eligible under Criterion B2. Under Criterion C/3, this transmission line does not embody a distinctive type, period, or method of construction. Instead, it represents a fairly standardized type and construction method shared with telegraph lines. This resource is also not eligible under CriterionD/4 because it is unlikely to yield information important to history.

C.3.5.1.3.8.7. Summary of NRHP- and CRHR-Eligible Cultural Resources for the Genesis Solar Energy Project

Staff recommends four cultural resources presently in the GSEP site footprint and linear facilities corridor as eligible for listing on the NRHP and the CRHR. These resources are, consequently, historical resources for the purposes of CEQA. These resources are the DTC/C-AMA Cultural Landscape (Historic District), the PTN Cultural Landscape, archaeological site CA-Riv-9072 (which is also a contributor to the PTN Cultural Landscape), and built-environment resource Wiley's Well Road. However, the eligible portion of the Wiley's Well Road is not within the built-environment APE, and is therefore not expected to be impacted. In addition, there is currently one cultural resource, McCoy Spring, which is already listed on the NRHP and the CRHR. This resource is also a contributor to the PTN Cultural Landscape. Assessments of the

character of the impacts of the proposed project on these resources, and a preview of possible mitigation measures for GSEP impacts to these resources is presented below.

There are presently 14 further resources in the proposed GSEP site footprint and linear facilities corridor that staff assumes are eligible for listing in the NRHP and the CRHR for the purpose of the present siting case. These resources include 7 prehistoric sites, 6 historical archaeological sites, and the historic-period component of 1 multi-component site. Two of the prehistoric sites may be contributing elements to the PTN Cultural Landscape (see Cultural Resources Table 6). The historical archaeological sites may be contributing elements to the newly defined Desert Training Center California-Arizona Maneuver Area Cultural Landscape (Historic District). By benefit of the above assumption, these resources are historical resources under CEQA, and the consideration of the character of the impacts of the proposed project on them is a requisite part of the present analysis. Some aspects of a potential program to mitigate those impacts are presented below.

C.3.5.2. Assessment and Mitigation of Impacts

Staff's assessment of the impacts/effects on cultural resources of an action (the proposed project), including direct, indirect, and cumulative impacts, was discussed above, as "Assessing Action Effects," under "Methodology and Thresholds for Determining Environmental Consequences." Staff's determination of appropriate mitigation of significant impacts/effects is also discussed above, as "Resolving Significant Effects," under "Methodology and Thresholds for Determining Environmental Consequences."

C.3.5.2.1. Construction

Under "approach 3," all project-related direct, indirect, and cumulative construction impacts to known cultural resources located in the APEs that the Energy Commission staff and the BLM archaeologist did not determine to be ineligible for either the NRHP or the CRHR will be assumed to be significant. Similarly, staff also assumes that all direct, indirect, and cumulative construction impacts to yet-to-be-discovered cultural resources are significant. Staff recommends that these impacts be avoided or mitigated by means of data recovery, with specific modes of data recovery detailed in a programmatic agreement (PA), to be negotiated and signed by the BLM, the State Historic Preservation Officer, the Energy Commission, any Native American tribes or groups who opt to sign, and, possibly, the applicant.

This approach applies to all cultural resources inside the project's "impact block," entailing the full extent of the project's below-grade impacts (inclusive of all foundations and trenches) and above-grade impacts (inclusive of all above-ground facilities), and delimiting both the project's physical impacts to surficial and buried cultural resources and perceptual impacts to the settings of built-environment and ethnographic resources.

Staff asked NextEra to provide graphical representations of their potential "impact block," and received two figures showing the anticipated disturbance below ground and

the anticipated aboveground intrusion into the flat landscape. From these (TTEC 2010c, Sheets 1-6), staff concludes that:

- General cutting and filling would disturb the overall GSEP plant site to a maximum depth of 2 feet.
- In the solar array fields, GSEP collector foundation excavations would cause ground disturbance down to an unspecified depth, and the collectors would intrude into the flat landscape to a maximum height of 25 feet.
- In the power blocks, GSEP equipment foundation excavations would cause ground disturbance down to a maximum depth of 25 feet, and the equipment would intrude into the flat landscape to a maximum height of 75 feet.
- Along the linear facilities corridor, GSEP natural gas pipeline trench excavations would cause ground disturbance down to a maximum depth of 10 feet. The transmission line supports would cause ground disturbance down to a depth of 15 feet and create an intrusion into the flat landscape to a maximum height of 75 feet.

From this, staff has determined that all archaeological resources, recommended and/or assumed register-eligible, known and possibly yet to be discovered during construction, and located within the GSEP's impact block, would be significantly impacted and adversely affected by the GSEP's construction. In addition, staff has determined that all ethnographic resources, determined and/or assumed register-eligible, known and possibly yet to be discovered during construction, and located within the GSEP's impact block, would be significantly impacted and adversely affected by the GSEP's construction.

In contrast, staff found that the integrity of setting and integrity of feeling of all known built-environment resources, recommended register-eligible and located within the GSEP's impact block, would not be significantly impacted and adversely affected by the erection of the GSEP.

C.3.5.2.1.1. Applicant's Recommended Mitigation Measures

Tetra Tech provided recommendations for mitigation in their revised survey report (Farmer et al. 2009, p.88). They found that only one of the newly identified archaeological sites within the GSEP APEs was potentially eligible for the NRHP. They recommend that a test excavation program be conducted at prehistoric site CA-Riv-9072 in order to mitigate potential adverse affects to this site. If the site should prove to have extensive buried deposits they recommend that the project could be redesigned to avoid the site or that suitable data recovery measures could be taken. Further details of these data recovery measures were not provided.

C.3.5.2.1.2. BLM and CEC Required Resolution of Significant Effects

As noted above, the resolution of the significant effects of the GSEP would be set forth in a PA. The process through which the PA is created is under the management of the BLM Palm Springs Field Office, which has recently initiated it with an invitation to the national Advisory Council on Historical Preservation and to the State Historic Preservation Officer for California to consult. The BLM will also invite the Energy Commission, all concerned Native Americans, and, possibly, NextEra, to consult in the

drafting of the PA for the GSEP. Specific mitigation measures for the eligible and assumed-eligible cultural resources will be developed through the PA consultation process, so what staff presents below are some general ideas of what mitigation measures could eventually be included in the PA. The list below is neither complete nor exhaustive.

C.3.5.2.1.3. Possible Mitigation for Cultural Landscapes

PTN Cultural Landscape

Staff has assumed an eligible PTN Cultural Landscape exists in and around the GSEP APEs, the impacts to which must be mitigated. Potential mitigation could entail further research to determine the district boundaries and to specify the contributing resources. A GIS database would be especially useful in this regard. Another possibility would be to prevent possible vandalism of contributing elements within the BLM Palen-McCoy Wilderness by constructing a fence along the southern boundary of the Wilderness preventing vehicle traffic from entering the area. The cultural landscape extends beyond the boundaries and impacts of the GSEP, and its definition and management must encompass the remaining BLM-managed land where the landscape exists. A possible first step to managing the resource may be to formally nominate the PTN for listing on the NRHP as a cultural landscape.

DTC/C-AMA Cultural Landscape

The DTC/C-AMA is a designated California Historical Landmark (# 985). The DTC/C-AMA was nominated for listing in the NRHP in 1980, but the nomination did not adequately justify its eligibility, and it was not listed. Staff has assumed an eligible DTC/C-AMA Cultural Landscape (Historic District) exists in and around the GSEP APEs, the impacts to which must be mitigated. Potential mitigation for GSEP impacts to the DTC/C-AMA Cultural Landscape could entail further research to determine the district boundaries and to specify the contributing resources. The DTC/C-AMA Cultural Landscape extends beyond the boundaries and impacts of the GSEP, and its definition and management must encompass the remaining BLM-managed land where the landscape exists. A possible first step to managing the resource may be to re-nominate the DTC/C-AMA as a cultural landscape (historic district). The author of a recent and much-consulted study of the DTC/C-AMA (Bischoff 2000), Matt C. Bischoff, has proposed that approach (Bischoff 2009).

C.3.5.2.1.4. Possible Mitigation for Impacts to McCoy Spring National Register District, an Ethnographic Resource

Construction-related activities associated with GSEP have the potential to cause significant impacts to McCoy Spring National Register District. Staff expects these to be indirect impacts. Although McCoy Spring is approximately five miles from the nearest portion of the GSEP linear facilities corridor, the resource will be directly accessible from the planned GSEP staging area at Wiley's Well Rest Area. The proposed project will involve an average of 650 employees for 37 months (GSEP 2009a, p. 3-26). Traffic and off-road exploration of the areas surrounding the project site will undoubtedly increase. Improved accessibility often results in vandalism. Vandalism at an archaeological site whose significance is tied to NRHP Criteria D represents the partial loss of information that it is in the public interest to preserve.

Potential mitigation for vandalism impacts to the McCoy Spring National Register District could entail the development of an active monitoring program by a specialist in the prehistoric rock art of California. An additional protective measure might include the erection of a fence along the Palen-McCoy Wilderness boundary, preventing motorized vehicle access.

As discussed above, McCoy Spring may be a traditional cultural property (TCP). Building the proposed GSEP plant at the foot of the McCoy Mountains may have a significant adverse affect on the integrity of association, setting, and feeling of this resource. These impacts may be visual in nature or may cause damage that can only be determined by an expert in the behavior, beliefs, and knowledge germane to understanding the property's cultural significance. Only members of the community that value the resource culturally and/or spiritually can determine impacts and suggest possible mitigation. During the consultation with Native Americans that is part of the development process for the GSEP Programmatic Agreement, possible impacts to McCoy Spring would be considered from the perspective of Native Americans, and mitigation measures for these impacts could possibly be devised, based on recommendations by Native Americans. But significant unavoidable impacts that cannot be fully mitigated may be possible. A final determination on this issue would be in the Programmatic Agreement, included in the SSA/FEIS, along with mitigation measures, if any.

Cultural resources staff is not qualified to evaluate a site to determine if it is a TCP. Neither can staff determine impacts to the resource or suggest possible mitigation. However, one way to establish contact with groups or individuals who are qualified to make these determinations is to have an ethnographer formally evaluate McCoy Spring for its eligibility for listing on the NRHP under Criteria A, as a possible TCP.

C.3.5.2.1.5. Possible Mitigation Measures for Impacts to Individual Resources

C.3.5.2.1.5.1. Possible Mitigation for Impacts to Prehistoric Archaeological Sites

Construction activity on the main GSEP plant site and the proposed linear alignments is expected to cause the destruction of eight prehistoric-to-historic-period Native American archaeological sites. One of these sites, CA-Riv-9072, was identified as potentially eligible for inclusion in the NRHP and the CRHR by Tetra Tech. Energy Commission and BLM staff concur with this determination.

This site is expected to be partially destroyed by the proposed GSEP construction. Only a small portion of the 300 acres comprising CA-Riv-9072 is within the GSEP site footprint. This is the northeastern corner, a triangular-shaped piece measuring approximately 400 m long by 200 m wide. This part of the site is expected to be completely destroyed by GSEP construction during site grading, grubbing, and top-soil removal. The remainder of the site can probably be avoided by GSEP construction activities. In addition the preliminary design of the storm drainage system has an outlet near or within the site that may result in impacts from erosion. Finally, the remainder of the site contains artifacts that are of interest to the general public which are in danger of removal particularly during construction activities but also during operation. The potential destruction of this site as a result of the construction of the proposed project

would cause a substantial adverse change in the significance of a historical resource, and would therefore have a significant effect on the environment.

Potential mitigation to reduce the expected impacts listed above could entail a combination of data recovery for the portion of the site within the project footprint, and avoidance for the remainder of the site.

GSEP construction activity is also expected to destroy an additional seven prehistoric sites. Staff had insufficient information to make a determination on the NRHP or CRHR eligibility of these seven resources and so is assuming eligibility for both registers for them. Data insufficiencies included inconsistent or incongruous field recording and site form completion omissions. Also, many recorded artifacts were not analyzed for chronological and economic evidence, or, if they were, the information was not included in the site forms. Entry A13, “Site Interpretation” on the DPR 523A site forms, was consistently left blank. As a result some of the most important information about the archaeological sites was often missing from the forms.

Impacts to these resources would have to be avoided or mitigated by means of data recovery. Potential mitigation measures could entail in-field analysis of artifacts and limited excavation to determine the horizontal and vertical extent of the site. A system such as the California Office of Historic Preservation’s recordation program for small lithic scatters (CARIDAP) would be appropriate for some of these sites.

C.3.5.2.1.5.2. Possible Mitigation for Impacts to Historical Archaeological Sites

Construction activity on the main GSEP plant site and the proposed linear alignments is expected to cause the destruction of seven historic-period archaeological sites. Staff determined that these sites were not individually eligible for inclusion in the NRHP and the CRHR. However, if these sites were associated with the DTC/C-AMA Cultural Landscape, they would be eligible as contributing elements. Staff had insufficient information to be certain about this relationship.

Data insufficiencies included site form recording inconsistencies between recorders, seeming incongruities in the co-occurrence of certain can types, and the lack of discussion of possible military uses of some artifacts. As a result staff was concerned as to whether dateable can and bottle traits were correctly identified in the field. Misidentification could have resulted in sites that may date to the DTC/C-AMA era (1942-1944) being incorrectly interpreted as dating to the mid-twentieth century. Misidentification would also result in multi-component sites with some cans ostensibly dating to the mid twentieth-century and some to the DTC/C-AMA era having incorrect artifact counts if all the cans actually date to the DTC/C-AMA era. These uncertainties could contribute to problems in correctly determining contributors to an assumed-eligible DTC/C-AMA cultural landscape in two ways. First, it could result in not considering sites that could be contributors. Second, it could result in incorrect counts of artifacts and the subsequent disqualification of contributing elements when the basis for determination of contributors is the number of artifacts representing the period of significance.

Given these concerns, staff assumed that all historic period sites were eligible for listing on both the NRHP and CRHR for the purposes of the present siting case. The potential

destruction of these seven sites as a result of the construction of the proposed project would cause a substantial adverse change in the significance of what here is assumed to be a historical resource, and would therefore have a significant effect on the environment. As such, these impacts, if unavoidable, must be mitigated.

Potential mitigation for these impacts could include historic research in combination with in-field artifact analysis. Most archaeologists have little experience with World War II-era military artifacts, and so consulting with an expert would probably be useful.

C.3.5.2.1.5.3. Possible Mitigation for Impacts to Built-Environment Resources

C.3.5.2.1.5.3.1. Wiley's Well Road

No significant direct construction impacts to the eligible portions of Wiley's Well Road are presently confirmed. However, the GSEP linear facilities corridor has recently been redesigned. Possible project impacts to Wiley's Well Road need to be re-evaluated in the context of the new linear facilities corridor alignment. If the construction of the newly proposed GSEP linear facilities corridor would cause a substantial adverse change in the significance of Wiley's Well Road, then these impacts will need to be mitigated to less-than-significant levels. The details of these mitigation plans will be provided in the PA.

C.3.5.2.1.5.4. Possible Mitigation Measures for the Discovery of Buried Archaeological Deposits During Construction

Staff commonly recommends a set of standard measures providing for the contingency of discovering archaeological resources during construction and related activities. These measures usually include the following:

- Measure-1 requires a Cultural Resources Specialist (CRS) to be retained and available during construction-related excavations to evaluate any discovered buried resources and, if necessary, to conduct data recovery as mitigation for the project's unavoidable impacts on them.
- Measure-2 requires the project owner to provide the CRS with all relevant cultural resources information and maps.
- Measure-3 requires the CRS to write and submit to the Energy Commission Compliance Project Manager (CPM) a Cultural Resources Monitoring and Mitigation Plan (CRMMP).
- Measure-4 requires the CRS to write and submit to the CPM a final report on all cultural resources monitoring and mitigation activities.
- Measure-5 requires the project owner to train workers to recognize cultural resources and instruct them to halt construction if cultural resources are discovered.
- Measure-6 prescribes the monitoring, by an archaeologist and, possibly, by a Native American, intended to identify buried archaeological deposits.
- Measure-7 requires the project owner to halt ground-disturbing activities in the area of an archaeological discovery and to fund data recovery, if the discovery is evaluated as CRHR-eligible.

In Measure-6, staff commonly specifies the parts of a project site where ground disturbance must be monitored by an archaeologist and, possibly also, by a Native American. For GSEP construction, it is likely that staff would minimally recommend archaeological and Native American monitoring during grading and grubbing as potential buried cultural resources are expected within 2 feet of the present ground surface (TTEC 2010e).

C.3.5.2.2. Operation

During operation of the proposed project, if a leak should develop in the gas or water pipelines supplying the plant, repair of the buried utility could require the excavation of a large hole. Such repairs could impact previously unknown subsurface archaeological resources in areas unaffected by the original excavation. The PA will include provisions to mitigate impacts to unknown archaeological resources found during repairs that are made during the operation of the plant on the extant facility.

C.3.5.2.3. Project Closure and Decommissioning

Cultural resources within the proposed GSEP site footprint and linear facilities corridor are most likely present within the first 2 feet below the current ground surface (see "Present Process Geomorphology" and "Results of Geoarchaeological Investigations" subsections, above).The construction of GSEP is expected to destroy all known and unknown cultural resources within the site footprint and most of the linear facilities corridor. Therefore the closure and decommissioning of the proposed project is unlikely to cause additional impacts to known or previously unknown cultural resources. However, sites within the linear facilities corridor and near the boundary of the proposed project footprint may still exist after GSEP construction and associated archaeological data recovery. These sites may be impacted by activities associated with project closure and decommissioning.

Potential mitigation of these impacts could include active avoidance measures or monitoring.

C.3.6 CUMULATIVE IMPACTS

The data compilation for the cumulative analysis is ongoing, and that analysis will be included in the SSA/FEIS.

C.3.7. ALTERNATIVES

Genesis Solar, LLC, evaluated a range of ideas for potential renewable projects in Southern California in terms of location, linear facility routes, and design. It was particularly important to develop a project where the solar insolation values were high, the environmental impacts were low, at least 1,800 acres of contiguous land could be used, the land slope was less than three percent, and transmission lines were located within 25 miles of the solar electric generating facility (GSEP 2009a).

Taking into consideration the above requirements, Energy Commission staff experienced in analyzing power project alternatives devised five location/design alternatives for the GSEP, the cultural resources impacts of which were examined for this analysis:

- Reduced Acreage Alternative
- Dry Cooling Alternative
- No-Project/No-Action Alternative #1
- No-Project/No-Action Alternative #2
- No-Project/No-Action Alternative #3

In this subsection these alternatives are examined from the perspective of cultural resources, concluding with a comparison of alternatives and a recommendation of the alternative with the least impact. In terms of cultural resources within all evaluated project areas, it is assumed that any ground disturbance is likely to destroy the resources present there.

C.3.7.1. Reduced Acreage Alternative

The Reduced Acreage Alternative would essentially be Unit 1 of the proposed project, including a 125-MW solar facility located within the boundaries of the proposed project as defined by NextEra. This alternative is analyzed for two major reasons: (1) it eliminates about 50 percent of the proposed site footprint so all impacts are reduced, and (2) by eliminating the eastern solar field, it would reduce the water required for wet cooling by 50 percent. The boundaries of the Reduced Acreage Alternative are shown in Alternatives Figure 1.

C.3.7.1.1. Setting and Existing Conditions

This alternative is located entirely within the boundaries of the proposed project, so all of the aspects of the setting and existing conditions as set out above are also pertinent to this alternative except the project description. The project description for this alternative simply eliminates the eastern 125-MW solar field and relocates the gas yard approximately 1.75 miles northwest of its present location. As a result, the environmental setting consists of the western portion of the proposed project, as well as the area affected by the linear project components.

C.3.7.1.2. Assessment of Impacts and Discussion of Mitigation

Cultural resource surveys completed by the applicant identified 20 cultural resources within the Reduced Acreage Alternative site footprint (Cultural Resources Table 8). These cultural resources include 14 prehistoric Native American sites, 3 historic artifact scatters, 2 built environment resources, and 1 possible ethnographic resource.

As stipulated under “approach 3,” Energy Commission staff and the BLM archaeologist would assume that all known cultural resources located in the APEs and subject to project effects, are NRHP and CRHR eligible.

Staff would make recommendations that the impacts of this alternative on cultural resources would have to be avoided or mitigated by means of data recovery, with specific modes of data recovery detailed in a programmatic agreement (PA), to be negotiated and signed by the BLM, the State Historic Preservation Officer, the Energy Commission, any Native American tribes or groups who opt to sign, and, possibly, the applicant.

CULTURAL RESOURCES Table 8
Known Cultural Resources Located within the Reduced Acreage Alternative

Resource Type and Designation	Resource Description [type, size, age, data absences]	When Found	Period/ Era	Information Source
Prehistoric Archaeological Resources				
CA-Riv-9047 (P33-17431)	Lithic Scatter: Debitage (n=5)	New	Prehistoric	Farmer et al. 2009

C.3.7.1.3. CEQA Level of Significance of Impacts

Staff would assume that all construction impacts, direct, indirect, and cumulative, to all eligible and staff-assumed-eligible cultural resources located in the APEs of this alternative would be significant and adverse under "approach 3."

The Reduced Acreage Alternative would result in significant direct impacts to 7 archaeological resources (Cultural Resources Table 8). Five of these resources are prehistoric Native American artifact scatters. One, CA-Riv-9072, is considered eligible for listing on the NRHP and the CRHR. Four other sites are assumed eligible for listing on the NRHP and the CRHR for the purposes of this siting case. Two of the three historic artifact scatters are also considered eligible for listing on the NRHP and the CRHR as potential contributing elements in the DTC/C-AMA Cultural Landscape. One of the built environment resources, Wiley's Well Road, is eligible for listing on the NRHP and the CRHR, but does not appear to be subject to any impacts. Finally, the Reduced Acreage Alternative has the potential to cause direct or indirect impacts to the McCoy Spring National Register District. As discussed previously, McCoy Spring may be a TCP. It needs to be evaluated before the potential impacts to this resource can be determined.

Assessments of the character of the impacts of the proposed project on these resources and a proposal for a program to mitigate those impacts to less-than-significant will be part of the PA. As the Reduced Acreage Alternative would impact approximately half of the resources that the GSEP would impact, staff considers the impacts of the Reduced Acreage Alternative to be moderately reduced when compared with the proposed project. However, the Reduced Acreage Alternative has the identical potential for causing significant impacts that cannot be mitigated to the possible TCP, McCoy Spring. As such, staff considers the impacts to McCoy Spring of the Reduced Acreage Alternative to be equal to those of the proposed project.

CULTURAL RESOURCES Table 9
NRHP and/or CRHR-Eligible Known Cultural Resources for Which Avoidance or Mitigation of Project Impacts Would Be Required

Resource Type, Designation	Resource Description (type, size, age)	NRHP/ CRHR Eligibility
Prehistoric Archaeological		
CA-Riv-9072	Temporary Camp: 300 acres, features, 1000s artifacts. Potential contributor to the PTN Cultural Landscape.	Eligible
CA-Riv-9084	Temporary Camp: Debitage (n=21), ground stone, and an olivella shell bead.	Assumed Eligible
CA-Riv-9220	Artifact Scatter: Debitage (n=92), metate fragment, projectile point tip, Cottonwood projectile point.	Assumed Eligible
CA-Riv-9223	Artifact Scatter: Debitage (n=16).	Assumed Eligible
CA-Riv-9227	Artifact Scatter: Debitage (n=3); brownware sherds (n=14), marine shell fragment. Potential contributor to the PTN Cultural Landscape.	Assumed Eligible
Ethnographic		
	McCoy Spring National Historic District: largest petroglyph site in Mojave Desert, midden, multiple trails. Potential contributor to the PTN Cultural Landscape.	Listed on both
Historical Archaeological		
CA-Riv-9214H	Refuse Scatter: Approximately 10 cans. Potential contributor to the DTC/C-AMA Cultural Landscape.	Assumed Eligible
CA-Riv-9228H	Refuse Scatter: 10 cans, bottle base (1938-1951), bottle base (1916-1931), razor blade, glass fragments. Potential contributor to the DTC/C-AMA Cultural Landscape.	Assume Eligible
Built-Environment		
No Number	Blythe-Eagle Mountain Transmission Line	Not Eligible
No Number	Wiley's Well Road	Eligible

C.3.7.2.1. Dry-Cooling Alternative

This subsection identifies the potential impacts of using air-cooled condenser (ACC) systems rather than the wet-cooling towers proposed by NextEra for the Genesis project. It is assumed that the ACC systems would be located where the cooling towers

are currently proposed for each of the two 125-MW power blocks, as illustrated in Alternatives Figure 2 (see Section B.3). This alternative is analyzed because it would reduce the amount of water required for steam turbine cooling from 822 acre-feet per year to 66 acre-feet per year. This reduction in water use would reduce impacts to water supplies and biological resources.

Approximately 18 ACC fans would be required for each of the two solar fields. The 18 fans, or ACC's, would operate when the ambient temperature is above 50 degrees Fahrenheit. When the temperature is below 50 degrees Fahrenheit, only 10 of the fans would be used (GSEP 2009f). The 18 ACC fans described in the GSEP cooling study would have a length of approximately 279 feet, a width of approximately 127 feet, and a height of 98 feet (GSEP 2009f). However, based on the ACC preliminary designs for nearby solar thermal projects in similar ambient temperatures, an additional 11,690 square feet could be required for siting of the fans and the fans would be up to 120 feet in height. In addition to the ACC fans, NextEra would use a small Wet Surface Air Cooler when needed to provide auxiliary cooling during extremely hot days (GSEP 2009f).

C.3.7.2.2. Setting and Existing Conditions

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates the use of wet-cooling towers and incorporates the use of air-cooled condensers (ACC) in the same location. As a result, the APEs would be the same as for the proposed project.

C.3.7.2.3. Assessment of Impacts and Discussion of Mitigation

In the Dry-Cooling Alternative, the ACC units would be located in the same place as the proposed cooling towers in an area that would be graded for construction parking and construction trailers. No additional ground disturbance would be necessary for the use of the ACC units. As such, no additional impacts to known and unknown cultural resources would be expected other than the impacts identified for the proposed project.

However, the ACC units would be approximately 98-120 feet tall. This would be more than twice as tall as any other GSEP structure (GSEP 2009a). As such, the ACC units would be slightly more visible than any other GSEP structure, depending on the viewing distance, so could increase visual impacts to TCPs or other archaeological sites. Given the distance from which these sites would generally be viewed, this additional height is not expected to create a more severe impact to cultural resources.

As stipulated under "approach 3," Energy Commission staff and the BLM archaeologist would assume that all known cultural resources located in the APEs and subject to project effects, are historically significant.

Staff would make recommendations that the impacts of this alternative on cultural resources would have to be avoided or mitigated by means of data recovery, with specific modes of data recovery detailed in a programmatic agreement (PA), to be negotiated and signed by the BLM, the State Historic Preservation Officer, the Energy Commission, any Native American tribes or groups who opt to sign, and, possibly, the applicant.

C.3.7.2.4. CEQA Level of Significance of Impacts

No new impacts to archaeological sites would be created by the Dry-Cooling Alternative. However, this alternative has the potential to cause increased visual impacts to possible TCP McCoy Spring because the dry-cooling tower is significantly taller than the wet-cooling tower. As such, staff considers the impacts to McCoy Spring to be somewhat increased when compared to the proposed project.

Staff would assume that all construction impacts, direct, indirect, and cumulative, to all eligible and staff-assumed-eligible cultural resources located in the APEs of the Dry-Cooling Alternative would be significant and adverse under "approach 3." Staff also assumes that the impacts to archaeological resources would be reduced to a less-than-significant level by the implementation of CUL-1 and the PA. During the consultation with Native Americans that is part of the development process for the GSEP PA, possible impacts to McCoy Spring would be considered from the perspective of Native Americans, and mitigation measures for these impacts could possibly be devised, based on recommendations by Native Americans. But significant unavoidable impacts to ethnographic resources (including TCPs) that cannot be fully mitigated may be possible. A final determination on this issue would be in the PA, included in the SSA/FEIS along with mitigation measures, if any.

C.3.7.3 No Project/No Action Alternative

The No Project Alternative under CEQA defines the scenario that would exist if the proposed project were not constructed. If the No Project Alternative were selected, the construction and operational impacts of the project would not occur. Crucially for cultural resources, the grading of the site would not take place. Further, this alternative would eliminate contributions to cumulative impacts to cultural resources in Riverside County and in the Mojave Desert as a whole. However, either solar or natural gas powered projects are reasonably expected to be constructed in the project vicinity in the foreseeable future.

Under NEPA, the No Action Alternative is used as a benchmark of existing conditions by which the public and decision makers can compare the environmental effects of the proposed action and the alternatives. Like the No Project Alternative described above, under the No Action Alternative, the impacts of GSEP would not occur.

BLM is considering two separate actions, whether to approve a plan amendment and whether to approve the proposed project or an alternative. The three No Project/No Action Alternatives are evaluated in this subsection.

C.3.7.3.1. No Project/No Action Alternative #1

Under this alternative, the proposed project would not be approved by the CEC and BLM, and BLM would not amend the CDCA Plan. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because the CDCA Plan would not be amended and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site and no new ground disturbance. As a result, no loss or degradations to cultural resources from construction or operation of the proposed project would occur. However, the land on which the project is proposed would become available to other uses that are consistent with BLM's land use plan, including another solar project requiring a land-use plan amendment. In addition, in the absence of this project, other renewable energy projects may be constructed to meet state and federal mandates, and those projects would have similar impacts in other locations. Staff considers impacts to cultural resources to be substantially reduced when compared with the proposed project.

C.3.7.3.2. No Project/No Action Alternative #2

Under this alternative, the proposed project would not be approved by the CEC and BLM, and BLM would amend the CDCA Land Use Plan of 1980, as amended, to allow for other solar projects on the site. As a result, it is possible that another solar energy project could be constructed on the project site.

Because the CDCA Plan would be amended, it is possible that the site would be developed with a different solar technology. As a result, ground disturbance would result from the construction and operation of the solar technology and would likely result in a loss or degradation to cultural resources. Different solar technologies require different amounts of grading and maintenance; however, it is expected that all solar technologies require some grading and ground disturbance. As such, this No Project/No Action Alternative could result in impacts to cultural resources similar to the impacts of the proposed project. Staff considers impacts to cultural resources to be substantially reduced when compared with the proposed project.

C.3.7.3.3. No Project/No Action Alternative #3

Under this alternative, the proposed project would not be approved by the CEC and BLM, and BLM would amend the CDCA Plan to make the proposed site unavailable for future solar development. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because the CDCA Plan would be amended to make the area unavailable for future solar development, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site and no corresponding land disturbance. As a result, the cultural resources of the site are not expected to change noticeably from existing conditions and, as such, this No Project/No Action Alternative would not result in impacts to cultural resources. However, in the absence of this project, other renewable energy projects may be constructed to meet state and federal mandates, and those projects would have similar impacts in other locations. Staff considers impacts to cultural resources to be substantially reduced when compared with the proposed Project.

C.3.7.4. Comparison of Alternatives and Recommendation of Least Impact CR Alternative

This subsection compares the effects on cultural resources by the proposed project and the five alternatives identified above, according to the requirements of NEPA, Section 106, and CEQA. Both CEQA and NEPA require analysis of a "reasonable range" of alternatives to the proposed Project. Various alternatives were considered during preparation of this Staff Assessment/EIS. Under NEPA, an EIS must devote "substantial treatment" to a reasonable range of alternatives considered in detail, including the proposed action, so that reviewers may evaluate the comparative merits (40 CFR 1502.14[b]). Accordingly, this SA/EIS co-equally analyzed the proposed action and two other alternatives that meet most of the proposed project objectives along with three variations of the combined No-Action (NEPA)/No-Project (CEQA) Alternative, which are described fully in the Alternatives section. This level of analysis is included to provide sufficient information and meaningful detail about the environmental effects of each alternative so that informed decision-making about cultural resources can occur. The alternatives that were carried through the analysis of impacts to cultural resources were the proposed project, the Reduced Acreage Alternative, the Dry-Cooling Alternative, and three No Project/No Action Alternatives.

As discussed above, the proposed project would result in significant direct impacts to 14 archaeological resources that can be mitigated to less-than-significant by the implementation of CUL-1 and the PA. However, impacts to ethnographic resources (including TCPs) may result in significant unavoidable impacts that cannot be fully mitigated.

The Reduced Acreage Alternative would result in significant direct impacts to 7 archaeological resources that can be mitigated to less-than-significant by following the measures outlined in the PA. As approximately half of the resources would be directly impacted, staff considers these impacts to be moderately reduced when compared with the proposed project. However, this alternative has the identical potential for causing significant unavoidable impacts to the possible TCP, McCoy Spring. As such, staff considers the impacts to McCoy Spring to be equal to the proposed project.

The Dry-Cooling Alternative would result in significant direct impacts to same 15 cultural resources as in the proposed project. These impacts can be mitigated to less-than-significant by following the measures outlined in the PA. This alternative has the potential to cause increased indirect visual impacts to possible TCP McCoy Spring because the dry-cooling tower is significantly taller than the wet-cooling tower. As such, staff considers the impacts to McCoy Spring to be somewhat increased when compared to the proposed project.

The No-Action/No-Project Alternative #1 would result in no significant direct or indirect impacts to any cultural resources. However, in the reasonably foreseeable future the GSEP site footprint and linear facilities corridor is likely to be developed for other projects, resulting in potential impacts to cultural resources. These impacts would vary depending on the kind of development proposed and the locations they propose to build. Staff considers impacts to cultural resources to be substantially reduced when compared with the proposed project.

Like Alternative #2, the No-Action/No-Project Alternative #2 would result in no significant direct or indirect impacts to any cultural resources. However, in the reasonably foreseeable future the site footprint is likely to be developed for other solar projects, resulting in similar potential impacts to cultural resources as the proposed project. Staff considers impacts to cultural resources to be substantially reduced when compared with the proposed project.

The No-Action/No-Project Alternative #3 would result in no significant direct or indirect impacts to any cultural resources. The CDCA Plan amendment would make the land unavailable for future solar development, avoiding the kinds of impacts associated with solar plants. However, other kinds of development at this site seem reasonably foreseeable. This development has the potential to have similar or even greater impacts to cultural resources, depending on the kind of development and the locations chosen. Staff considers impacts to cultural resources to be substantially reduced when compared with the proposed project.

Staff concludes that the alternative with the least impact to cultural resources is the No-Action/No-Project Alternative, followed by the Reduced Acreage Alternative. The alternative with the most impact to cultural resources is potentially the Dry-Cooling Alternative, depending on the results of consultation with Native American groups regarding the McCoy Spring TCP.

C.3.8. NOTEWORTHY PUBLIC BENEFITS

Significant direct physical impacts to cultural resources often result in the complete destruction of the resource. Mitigation of these impacts frequently involves the collection of information (data recovery). This analysis and interpretation of the data collected through archaeology teaches us about the lives of historic people. This knowledge of American history enriches the lives of the general public. Therefore, although an important resource is lost forever, some of the information about that resource is retained. This allows us to argue that these significant impacts can be mitigated to a less-than-significant level. Although mitigation measures can reduce most individual site impacts to less-than-significant levels, archaeological excavation and analysis cannot recover all the scientific values of a site.

Therefore, data collection does not always provide a public benefit. As an inherently destructive science, archaeology must walk a fine line between destruction and preservation. Some questions about ancient people can only be answered through excavation, which results in the destruction of the site excavated. But archaeological techniques improve rapidly, increasing the amount of information we might gather dramatically. Portions of sites must be preserved so they can be analyzed using these future, as-yet undeveloped, techniques. No professionally agreed-upon limits for this balance between destruction and preservation exist. Archaeologists consider the proportion of certain site types that still exist when determining the cumulative effects and possible public benefits of a project. If only a few such sites still exist undisturbed, then their destruction would be considered a significant impact that cannot be mitigated to less-than-significant levels.

In the case of the proposed GSEP, very little is known about the prehistory of the Mojave Desert. Even less is known in this specific area of the Mojave-Colorado desert interface area. All that we know comes from mainly surface manifestations of localized sites. Little to nothing has been done regarding the relationships between local sites, trails, quarries, and now ephemeral bodies of water (i.e. Lake Cahuilla, Ford Dry Lake, Palen Dry Lake) and the springs and oases along the I-10 corridor. Data recovery associated with the proposed project or its alternatives has the potential to contribute to our knowledge of the ancient peoples who lived near Ford Dry Lake. As such, data recovery may provide some public benefits in the form of information.

C.3.9. PROPOSED CONDITIONS OF CERTIFICATION/MITIGATION MEASURES

At this time, staff is recommending only one condition of certification for the GSEP:

CUL-1 The project owner shall comply with all the terms and requirements of the Genesis Solar Energy Project Cultural Resources Programmatic Agreement.

C.3.10. COMPLIANCE WITH LORS

If the possible set of seven discovery measures (above), **CUL-1**, and the programmatic agreement (above) are properly implemented, the proposed GSEP would result in a less-than-significant impact on known and newly found archaeological resources. However, impacts to ethnographic resources (including TCPs) may result in significant unavoidable impacts that cannot be fully mitigated.

Nonetheless, the project would be in compliance with the applicable state laws, ordinances, regulations, and standards listed in Cultural Resources Table 1.

The County of Riverside's General Plan has language promoting the general county-wide preservation of cultural resources. The programmatic agreement requires specific actions not just to promote but to effect historic preservation and mitigate impacts to all cultural resources in order to ensure NEPA and CEQA compliance. Consequently, if GSEP implements these conditions, its actions would be consistent with the general historic preservation goals of the County of Riverside.

C.3.11. CONCLUSIONS AND RECOMMENDATIONS

Staff concludes that the proposed GSEP would have a significant direct impact on 14 historically significant archaeological resources and possible significant unavoidable impacts on 1 ethnographic resource. These resources include 8 prehistoric to historic-period Native American archaeological sites; 2 prehistoric sites that are potential contributing elements to the Prehistoric Trail Networks Cultural Landscape; 7 sites that are potential contributing elements to a historic district, the Desert Training Center California-Arizona Maneuver Area (DTC/C-AMA) Cultural Landscape; and the ethnographic resource McCoy Spring National Register District.

The Reduced Acreage Alternative would have a significant direct impact on 7 of the 14 historically significant archaeological resources listed above and a significant indirect impact on 1 ethnographic resource. These resources include 5 prehistoric to historic-

period Native American archaeological sites; these include 2 prehistoric sites that are potential contributing elements to the Prehistoric Trail Network Cultural Landscape; 2 historic-period sites that are potential contributing elements to the DTC/C-AMA Cultural Landscape; and McCoy Spring National Register District.

The Dry-Cooling Alternative would have a significant direct and indirect impacts on the same 15 cultural resources listed above. However, indirect impacts on McCoy Spring National Register District may be potentially greater as a result of the increased height of the dry-cooling tower.

The three variations of the No Project/No Action Alternative would not impact any cultural resources. However, No Project/No Action Alternative #3 where the BLM would make the proposed site unavailable for future solar development has the potential for the least future impacts to cultural resources.

Staff recommends that the alternative that has the least impact on cultural resources is No Project/No Action Alternative followed by the Reduced Acreage Alternative. The proposed project and the Dry-Cooling Alternative have nearly identical impacts to cultural resources. If the possible set of seven discovery measures (above), **CUL-1**, and the programmatic agreement (above) are properly implemented, the proposed GSEP would result in a less-than-significant impact on known and newly found archaeological resources, including the Prehistoric Trail Network and DTC/C-AMA Cultural Landscapes.

However, the impacts to possible TCP McCoy Spring National Register District have not yet been determined. These impacts may cause damage that can only be determined by an expert in the behavior, beliefs, and knowledge germane to understanding the property's cultural significance. Only members of the community that value the resource culturally and/or spiritually can determine impacts and suggest possible mitigation. During the consultation with Native Americans that is part of the development process for the GSEP PA, possible impacts to McCoy Spring would be considered from the perspective of Native Americans, and mitigation measures for these impacts could possibly be devised, based on recommendations by Native Americans. But significant unavoidable impacts that cannot be fully mitigated may be possible. A final determination on this issue would be in the PA included in the SSA/FEIS, along with mitigation measures, if any.

Campbell 1931—Campbell, E. W. C., "An Archaeological Survey of the Twenty-nine Palms Region," *Southwest Museum Papers*, vol. 7, pp. 1–93.

Campbell 1936—Campbell, E. W. C., "Archaeological Problems in the Southern California Deserts," *American Antiquity*, vol. 1, no. 4., pp. 295–300.

Campbell et al. 1937—Campbell, E. W. C., W. H. Campbell, E. Antevs, C. A. Amsden, J. A. Barbieri, and F. D. Bode. The Archeology of Pleistocene Lake Mohave. *Southwest Museum Papers 11*. Los Angeles, California: Southwest Museum
.

Campbell and Campbell 1935—Campbell, E. C., and W. H. Campbell. The Pinto Basin Site. *Southwest Museum Papers 9*. Highland Park, California: Southwest Museum.

CARE 2009a—CAlifornians for Renewable Energy/A. Acosta Figueroa (tn:54562) CARE Comments on NOI to Prepare Environmental Review of the Genesis Solar Energy Project. Submitted to CEC Docket Unit, 12/23/09.

Castetter and Bell 1951—Castetter, E. F. and W. H. Bell, *Yuman Indian Agriculture, Primitive Subsistence on the Lower Colorado and Gila Rivers*, Albuquerque, New Mexico: University of New Mexico Press.

Castillo 1978—Castillo, E.D. "The Impact of Euro-American Exploration and Settlement," in *Handbook of North American Indians*, Vol. 8. R.F. Heizer, ed., pp. 99–127. Washington, D.C.: Smithsonian Institution.

CEC 2009a—California Energy Commission/M. Jones (tn:53504) Data Adequacy Recommendation. Submitted to CEC Docket Unit, 9/30/2009.

CEC 2009c—California Energy Commission/M. Jones (tn: 53942) Revised Data Adequacy Recommendation. Submitted to CEC Docket Unit, 10/26/2009.

CEC 2009f—California Energy Commission/M. Monasmith (tn:54391) Data Requests, Set1B (#228-292). Submitted to CEC Docket Unit, 12/10/2009.

Cleland 2005—Cleland, J. H., "The Sacred and the Mundane: Cultural Landscape Concepts and Archaeological Interpretation in the Colorado District," *Proceedings of the Society for California Archaeology* vol. 40, pp. 131-136.

Cleland 2007—Cleland, J.H., "Ethnographic Trail Systems as Large-Scale Cultural Landscapes: Preservation and Management Issues". *Proceedings of the Twenty-ninth Annual Meeting of the Alliance for Historic Landscape Preservation*, C. Goetcheus and E. MacDonald, eds., pp. 41–55.

Cleland and Apple 2003—Cleland, J.H., and R.M. Apple, A View Across the Cultural Landscape of the Lower Colorado Desert. EDAE, Inc., San Diego.

Cordell 1997—Cordell, L., *Archaeology of the Southwest*. New York: Academic Press, Inc., 1997.

Crabtree 1980—Crabtree, R.H., "Chapter III—Archaeology," in *A Cultural Resources Overview of the Colorado Desert Planning Units*, Von Till Warren et al. eds., pp. 25–54. Prepared for the U.S. Department of the Interior, Bureau of Land Management. Eastern Information Center, University of California, Riverside, Report No. RI-1211.

Davis 1961—Davis, J.T., *Trade Routes and Economic Exchange Among the Indians of California*. University of California Archaeological Survey Reports No. 54, Berkeley.

Davis and Winslow 1965—Davis, E.L., and S. Winslow, "Giant Grand Figures of the Prehistoric Desert," *American Philosophical Society,* vol. 109, pp. 8-21.

Dillon 2002—Dillon, B. D., California Paleoindians: Lack of Evidence, or Evidence of Lack?, in *Essays in California Archaeology: A Memorial to Franklin Fenenga*, W. J. Wallace and F. A. Riddell, eds., pp. 110–128. Contributions of the University of California Archaeological Research Facility, no. 60.

Dorn et al. 1992—Dorn, R. I., P. B. Clarkson, M. F. Nobbs, L. L. Loendorf, and D. S. Whitley, "New Approach to Radiocarbon Dating of Organic Matter Encapsulated by Rock Varnish, with Examples from Archeology and Geomorphology," *Annals of the Association of American Geographers*, vol. 82, pp. 36–151.

Drucker 1937—Drucker, P., "Culture Element Distributions: V. Southern California," *University of California Anthropological Records*, vol. 1, no. 1, pp. 1–52.

Earle 2005—Earle, D., "The Mojave River and the Central Mojave Desert: Native Settlement, Travel, and Exchange in the Eighteenth and Nineteenth Centuries," *Journal of California and Great Basin Anthropology*, vol. 25, no. 1, pp. 1–38.

Eerkens 2003b—Eerkens, J. W., "Residential Mobility and Pottery Use in the Western Great Basin," *Current Anthropology*, vol. 44, no. 65, pp. 728–738.

Eerkens 2004—Eerkens, J. W., "Privatization, Small-Seed Intensification, and the Origins of Pottery in the Western Great Basin," *American Antiquity*, vol. 69, no. 4, pp. 653–670.

Eerkins et al. 1999—Eerkins, J. W., H. Neff, and M. D. Glascock, "Early Pottery from Sunga'va and its Implications for the Development of Ceramic Technology in Owens Valley, California," *Journal of California and Great Basin Anthropology*, vol. 21, pp. 275–285.

Erlandson et al. 2007—Eerkens, J. W., J. S. Rosenthal, D. C. Young, and J. King, "Early Holocene Landscape Archaeology in the Coso Basin, Northwestern Mojave Desert, California," *North American Archaeologist*, vol. 28, no. 2, pp. 87–112.

Ezzo and Altschul 1993—Ezzo, J. A., and J. H. Altschul, "An Archaeological Survey of Pilot Knob, Imperial County, California: A Class III Cultural Resources Survey and Evaluation," in *Glyphs and Quarries of the Lower Colorado River Valley*, J. A. Ezzo and J. H. Altschul, eds. SRI Technical Series No. 44(4). Tucson, Arizona: Statistical Research Inc.

Farmer et al. 2009—Farmer, R., F. E. Budinger, Jr., J. Fogerty, J. Farrell, and M. Carper. Class II and Class III Cultural Resources Inventories for the Proposed Genesis Solar Energy Project, Riverside County, California. Report submitted to the Bureau of Land Management, North Palm Springs. Submitted to CEC Docket Unit, 8/31/2009.

Fitzgerald et al. 2005—Fitzgerald, R. T., T. L. Jones, and A. Schroth, "Ancient Long-Distance Trade in Western North American: New AMS Radiocarbon Dates from Southern California." *Journal of Archaeological Science*, vol. 32, pp. 423–434.

Ford 1983—Ford, R. J., “Inter-Indian Exchange in the Southwest,” in *Handbook of North American Indians*, vol. 10, pp. 711–742. W. C. Sturtevant, ed. Washington, D. C.: Smithsonian Institution.

Forde 1931—Forde, C. D. “Ethnography of the Yuma Indians,” *University of California Publications in American Archaeology and Ethnology*, vol. 28, no. 4, pp. 83–278.

Fowler 1995—Fowler, C. S., “Some Notes on Ethnographic Subsistence Systems in Mojavean Environments in the Great Basin,” *Journal of Ethnobiology,* vol. 15, no. 1, pp. 99–117.

Gallegos et al. 1980—Gallegos, D., J. Cook, E. L. Davis, G. Lowe, F. Norris, and J. Thesken, *Cultural Resources Inventory of the Central Mojave and Colorado Desert Regions, California*. Cultural Resources Publications, Bureau of Land Management.

Gifford 1918—Gifford, E. W., “Clans and Moieties in Southern California,” *University of California Publications in Archaeology and Ethnology*, vol. 14, no. 2, pp. 55–219.

Gilreath 2007—Gilreath, A. J., “Rock Art in the Golden State: Pictographs and Petroglyphs, Portable and Panoramic,” in, *California Prehistory: Colonization, Culutre, and Complexity*, pp. 273–289, T.L. Jones, and K. Klar, eds. Lanham, Md: Academic Press.

Golla 2007—Golla, V., “Linguistic Prehistory,” in *California Prehistory: Colonization, Culture, and Complexity*, pp. 71–82, T. L. Jones and K. A. Klar, eds. Lanham, Md: Academic Press.

Graf and Schmitt 2007—Graf, K. E. and D. N. Schmitt (editors), *Paleoindian or Paleoarchaic? Great Basin Human Ecology at the Pleistocene/Holocene Transition.* Salt Lake City: The University of Utah Press.

Gregory 2005—Gregory, C., “Introduction: A View Across the Cultural Landscape of the Lower Colorado Desert,” *Proceedings of the Society for California Archaeology*, vol. 40, pp. 79–82.

Griset 1986—Griset, S. (ed.), “Pottery of the Great Basin and Adjacent Areas,” *Anthropological Papers No. 111*, University of Utah, Salt Lake City.

GSEP 2009a—Genesis Solar Energy Project (tn: 53083). Application for Certification for the Genesis Solar Energy Project. Submitted to CEC Docket Unit, 8/31/09.

Harner 1953—Harner, M. J., “Gravel Pictographs of the Lower Colorado River Region,” *University of California Archaeological Survey Reports*, vol. 20, pp. 1–29.

Harwell and Kelly 1983—Harwell, H. O. and M. C. S. Kelly. “Maricopa,” in *Handbook of North American Indians*, vol. 10, pp. 71–85, A. Ortiz, ed. Washington, D.C.: Smithsonian Institution.

Hedges 1973—Hedges, K., “Rock Art in Southern California,” *Pacific Coast Archaeological Society Quarterly*, vol. 9, no. 4, pp. 1–28.

Hedges 2005—Hedges, K., “Rock Art Sites at Palo Verde Point,” *Proceedings of the Society for California Archaeology*, vol. 40, pp. 95–105.

Heizer 1978—Heizer, R. F., “Trade and Trails,” in *Handbook of North American Indians*, vol. 8, pp. 690–693. W.C. Sturtevant, ed. Washington D.C.: Smithsonian Institution.

Hooper 1920—Hooper, L., “The Cahuilla Indians,” *University of California Publications in American Archaeology and Ethnology*, vol. 16, no. 6, pp. 315–380.

Hughes 1986—Hughes, R. E., “Trace Element Composition of Obsidian Butte, Imperial County, California,” *Bulletin Southern California Academy of Sciences*, vol. 85, no. 1, pp. 33–45.

Hughes and True 1983—Hughes, R. E., and D. L. True, ”Perspectives on the Distribution of Obsidians in San Diego County,” *North American Archaeologist*, vol. 6, pp. 325–339.

Jackson 2009—Jackson, M., Sr., Quechan Indian Tribe’s Comments on Programmatic Impact Statement for Solar Energy Development. Copy received by BLM Palm Springs Office. Submitted to CEC Docket Unit, 09/18/09.

James 1960—James, H. C., *The Cahuilla Indians: The Men Called Master*. Los Angeles, Calif.: Westernlore Press.

Johnson 1985—Johnson, B., “Earth Figures of the Lower Colorado and Gila River Desert: A Functional Analysis,” Phoenix: Arizona Archaeological Society.

Johnson 2003—Johnson, B., “Geoglyphs Associated with the Xam Kwatan Trail in the Palo Verde Point Area, South of Blythe, California,” in *A View Across the Cultural Landscape of the Lower Colorado Desert: Cultural Resource Investigations for the North Baja Pipeline Project*, J.H. Cleland and RM. Apple, eds. Prepared for Tetra Tech FW, Santa Ana, California and North Baja Pipelines LLC, Portland Oregon.

Johnson 1980—Johnson, F. J., “Two Southern California Trade Trails,” *Journal of California and Great Basin Anthropology*, vol. 2, pp. 88–96.

Johnson 1965—Johnson, F. J., *The Serrano Indians of Southern California*. Banning, Calif.: Malki Museum Press.

Johnson and Johnstone 1957—Johnson, F. J. and P. H. Johnstone, “An Indian Trail Complex of the Central Colorado Desert: A Preliminary Survey,” *Reports of the University of California Archaeological Survey*, vol. 37, pp. 22–41.

Kelly 1934—Kelly, I. T. “Southern Paiute Bands,” *American Anthropologist*, vol. 36, no. 4, pp. 548–560.

Kelly 1936— Kelly, I. T., “Chemehuevi Shamanism,” in *Essays in Anthropology, Presented to A. L. Kroeber in Celebration of his Sixtieth Birthday*, pp. 129–142. Berkeley, Calif.: University of California Press.

Kelly 1964—Kelly, I. T., Southern Paiute Ethnography, *Anthropological Papers*, no. 69 (Glen Canyon Series no. 21), University of Utah, Salt Lake City.

Kelly 1997—Kelly, R. L., “Late Holocene Great Basin Prehistory,” *Journal of World Prehistory*, vol. 11, no. 1, pp. 1-49.

Kelly and Fowler 1986—Kelly, I. T. and C. S. Fowler, “Southern Paiute,” in *Handbook of North American Indians*, vol. 11, pp. 368–397. W. C. Sturtevant, ed. Washington, D. C.: Smithsonian Institution.

Koerper and Hedges 1996—Koerper, H. C., and K. Hedges “Patayan Anthropomorphic Figurines from an Orange County Site,” *Journal of California and Great Basin Anthropology*, vol. 18, no. 2, pp. 204–220.

Kroeber 1908—Kroeber, A. L., “Ethnography of the Cahuilla Indians,” *University of California Publications in American Archaeology and Ethnology*, vol. 8, no. 2, pp. 29–68.

Kroeber 1925—Kroeber, A. L., *Handbook of the Indians of California*, Bulletin 78. Washington, D. C., Bureau of American Ethnology, 1925; also, New York: Dover Publications.

Laird 1974a—Laird, C. “Chemehuevi Religious Beliefs and Practices,” *Journal of California Anthropology*, vol. 1, no. 1, pp. 19–25.

Laird 1974b—Laird, C., “The Buffalo in Chemehuevi Folklore,” *Journal of California Anthropology*, vol. 1, no. 2, pp. 220–224.

Laird 1975a—Laird, C., “Two Chemehuevi Teaching Myths,” *Journal of California Anthropology*, vol. 2, no. 1, pp. 18–24.

Laird 1975b—Laird, C., “Duck Magic (Poem),” *Journal of California Anthropology*, vol. 2, no. 2, p. 147.

Laird 1976—Laird, C., *The Chemehuevis*. Banning, Calif.: Malki Museum Press, 1976.

Laird 1977a—Laird, C., “Intimation of Unity,” *Journal of California Anthropology*, vol. 4, no. 1, pp. 50–54.

Laird 1977b—Laird, C., “Chemehuevi Myth as Social Commentary,” *Journal of California Anthropology*, vol. 4, no. 2, pp. 191–195.

Laird 1977c—Laird, C., “Behavioral Patterns in Chemehuevi Myths,” in *Flowers of the Wind: Papers on Ritual, Myth, and Symbolism in California and the Southwest*, pp. 97–103, T. C. Blackburn, ed. Anthropological Papers, no. 8. Socorro, N.M.: Ballena Press, 1977.

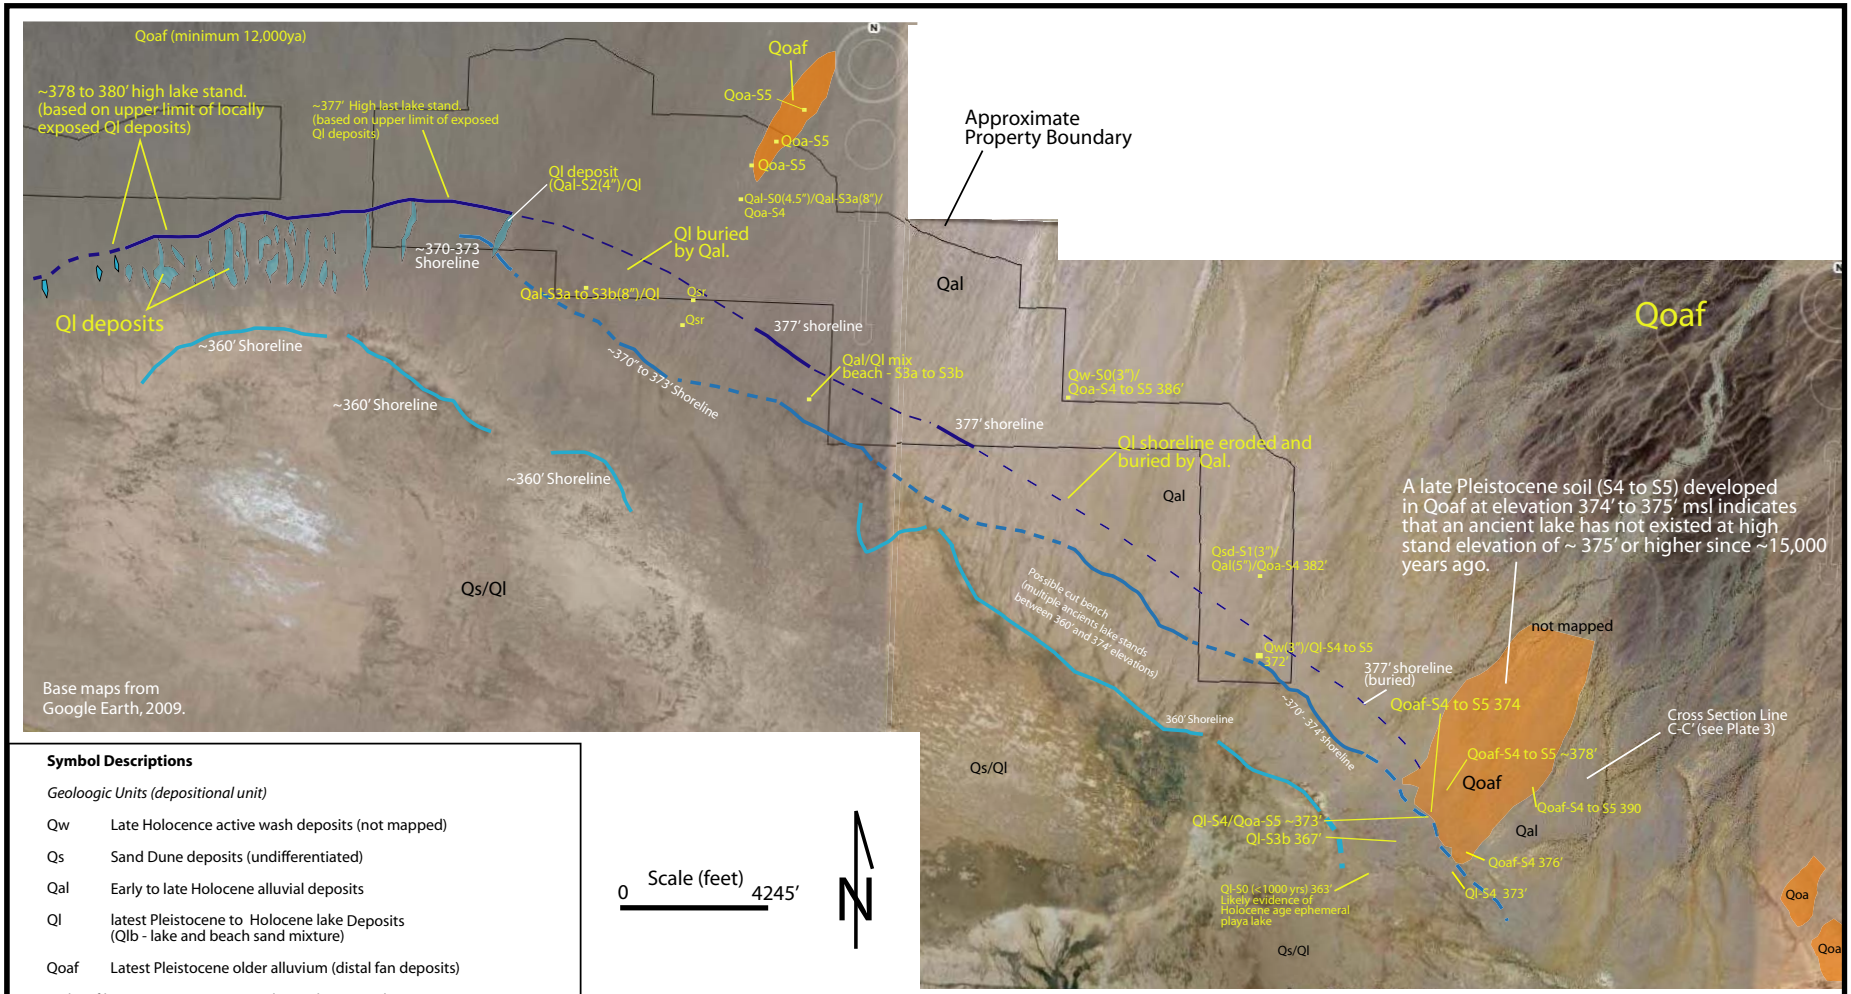
L. GLOSSARY

CULTURAL RESOURCES LIST AND GLOSSARY

GENESIS Solar Energy Project

ACC	Air-Cooled Condenser
Act	Warren-Alquist Act of 1974
AD	After the Birth of Christ
ACEC	BLM Area of Critical Environmental Concern
AFC	Application for Certification
APE	Area of Potential Effects
BEPTL	Blythe Energy Project Transmission Line
BC	Before the Birth of Christ
BLM	Bureau of Land Management
cal	Radiocarbon (C14) dates that have been calibrated to compensate for fluctuating levels of atmospheric C14. Calibrated C14 dates correspond to calendar years. Calibrated dates are expressed as cal AD or cal BC, where "cal" indicates "calendar years" or "calibrated years."
CARE	Californians for Renewable Energy
CA-Riv-#	Archaeological site numbers assigned by a CHRIS Information Center
CCS	Cryptocrystalline Silicate (rocks such as flint, chert, chalcedony, or jasper that contain a high percentage of silica [SiO2], the primary compound that composes quartz.)
CDCA	California Desert Conservation Area, a land use planning unit defined by the BLM in 1980
CEQA	California Environmental Quality Act
CHRIS	California Historical Resources Information System
Conditions	California Energy Commission Conditions of Certification



CRHR	California Register of Historical Resources
Criterion/a	The criteria for listing in the CRHR (1-4) or NRHP (A-D), if met a resource can be considered historically significant
CRM	Cultural Resources Monitor
DEIS	Draft Environmental Impact Statement
DPR 523	Department of Parks and Recreation cultural resources inventory form
DTC/C-AMA	World War II Desert Training Center/California-Arizona Maneuver Area
EIC	Eastern Information System, CHRIS, Department of Anthropology, University of California, Riverside
Eligible	A cultural resource need only be determined eligible for listing on the CRHR or the NRHP, using the criteria listed above, in order to be determined culturally significant
FAR	Fire-affected rock
Gen-Tie	Generation-tie, an intersection of two power transmission lines
GPS	Global Positioning System, a U.S. space-based global navigation satellite system
GSEP	proposed project, Genesis Solar Energy Project
Historical resource	A cultural resource that is historically significant and eligible for listing in the CRHR
Historic property	Federal language for all cultural resources that are historically significant and eligible for listing on the NRHP
I-10	Interstate 10
Integrity	The ability of a cultural resource to communicate its significance
kV	Kilovolts, 1000 volts
LORS	laws, ordinances, regulations, and standards
MLD	Most Likely Descendent, a term used to refer to who

	must be contacted when a an unmarked human skeleton is found
MOA	Memorandum of Agreement
MW	Megawatts
NAGPRA	Native American Graves Protection and Repatriation Act
NAHC	Native American Heritage Commission of California
NECO	Northern and Eastern Colorado Desert Coordinated Management, a multi-agency planning effort for the Sonoran Desert in California, amends the CDCA
NEPA	National Environmental Policy Act
NHPA	National Historic Preservation Act
NRHP	National Register of Historic Places
ORBA	Off-Road Business Association
PA	Programmatic Agreement
Potentially eligible	A cultural resource that may be determined eligible for listing on the CRHR or NRHP after further archaeological study
Project Area of Analysis	The project site (see below) plus what additional areas staff defines for each project that are necessary for the analysis of the cultural resources that the project may impact.
Project Site	The bounded area(s) identified by the applicant as the area(s) within which they propose to build the project.
Section 106	Section 106 of the National Historic Preservation Act of 1966 requires Federal agencies to take into account the effects of their undertakings on historic properties, and afford the Advisory Council on Historic Preservation a reasonable opportunity to comment. The historic preservation review process is outlined in the regulations entitled "Protection of Historic Properties" (36 CFR Part 800).
SHPO	State Historic Preservation Officer

Significant	In order to be eligible for listing on the NRHP a cultural resource must be evaluated using the four criteria to determine if the resource is significant
SLF	Sacred Lands File at the NAHC
Staff	Energy Commission cultural resources technical staff
SA	Staff Assessment
SSA/FEIS	Staff Supplemental Assessment/Final Environmental Impact Statement
TCP	Traditional Cultural Property, as described in the regulations for Section 106 of the NHPA, can be a site, structure, district, landscape, or natural feature that has traditional cultural significance, that is, significance based in the role the property plays in a community's historically rooted beliefs, customs, and practices.

CULTURAL RESOURCES - FIGURE 1

Genesis Solar Energy Project - Geomorphic Ancient Lake Shoreline Evaluation Map with Limited Geology, Ford Dry Lake, California

Symbol Descriptions

Geologic Units (depositional unit)

Qw	Late Holocence active wash deposits (not mapped)
Qs	Sand Dune deposits (undifferentiated)
Qal	Early to late Holocene alluvial deposits
Ql	latest Pleistocene to Holocene lake Deposits (Qlb - lake and beach sand mixture)
Qoaf	Latest Pleistocene older alluvium (distal fan deposits)

Soil Profile Designations (Stratigraphy) and Estimated Ages

S0	No soil profile observed (<1 Kya)
S1	1 to 3 ky
S2	3 to 5 ky
S3a	5 to 8 ky
S3b	8 to 12ky
S4	12 to 20ky
S5	20 or older

Nomenclature of Geologic Deposit and Soils

Qal-S2/Qoa-S4 = 3 to 5ky age soil formed in unit Qal, which overlies Quaternary Older alluvium with a soil profile with minimum age of 12 to 20 ky.

Note: All elevations utilized acquired by evaluating Google Earth.

C.4 – HAZARDOUS MATERIALS MANAGEMENT

Testimony of Alvin Greenberg, Ph.D.

C.4.1 SUMMARY OF CONCLUSIONS

U.S. Bureau of Land Management (BLM) and Energy Commission staff (hereafter jointly referred to as staff) evaluated the proposed Genesis Solar Energy Project (GSEP) in terms of hazardous materials use. Staff's analysis indicates that with implementation of staff's proposed mitigation measures, hazardous materials use at the site would not present a significant impact to the public. With adoption of the proposed conditions of certification, the proposed project will comply with all applicable laws, ordinances, regulations, and standards. Energy Commission staff proposes conditions of certification to address safe handling of hazardous materials, use of HTF, transportation of hazardous materials, and site security.

C.4.2 INTRODUCTION

The purpose of this Hazardous Materials Management analysis is to determine if the proposed GSEP has the potential to cause significant impacts on the public as a result of the use, handling, storage, or transportation of hazardous materials at the proposed site. If significant adverse impacts on the public are identified, Energy Commission staff must also evaluate the potential for facility design alternatives and additional mitigation measures to reduce those impacts to the extent feasible.

This analysis does not address the potential exposure of workers to hazardous materials used at the proposed facility. Employers must inform employees of hazards associated with their work and provide them with special protective equipment and training to reduce the potential for health impacts associated with the handling of hazardous materials. The **WORKER SAFETY AND FIRE PROTECTION** section of this document describes applicable requirements for the protection of workers from these risks.

For this analysis, staff examines plausible potential loss of containment incidents (spills) for the hazardous materials to be used at the proposed facility. The worst case plausible event, regardless of cause, is considered, and analyzed to see whether the risk to local populations is significant. Hazardous material handling and usage procedures are designed to reduce the likelihood of a spill, to reduce its potential size, and to prevent or reduce the potential migration of a spill off site to the extent that there won't be significant off-site impacts. These measures look at potential direct contact from runoff of spills, air-borne plume concentrations, and the potential for spills to mix with runoff water and be carried offsite. Generally, staff seeks to confirm that the applicant has proposed secondary containment basins for containing liquids, and that volatile chemicals would have a restricted exposure to the atmosphere after capture.

Various hazardous materials including mineral and lubricating oils, cleaning detergents, water treatment chemicals, heat transfer fluid (HTF), and welding gasses will be present at the proposed GSEP project. Although the GSEP project will not use natural gas for energy production, natural gas would be supplied to the site for the auxiliary boilers. The

project would connect to a Southern California Edison supply line via a new 6-mile pipeline (GSEP 2009a, Section 3.4.6). The GSEP project would also require the transportation of hazardous materials to the facility. This document addresses all potential impacts associated with the use and handling of hazardous materials.

C.4.3 METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

Staff reviewed and assessed the potential for the transportation, handling, and use of hazardous materials to impact the surrounding community. All chemicals were evaluated. Staff's analysis addresses the potential impacts on all members of the population including the young, the elderly, and people with existing medical conditions that may make them more sensitive to the adverse effects of hazardous materials. In order to accomplish this goal, staff utilized the most current public health exposure levels (both acute and chronic) that are established to protect the public from the effects of an accidental chemical release.

In order to assess the potential for released hazardous materials to travel off site and affect the public, staff analyzed several aspects of the proposed use of these materials at the facility. Staff recognizes that some hazardous materials must be used at power plants. Therefore, staff conducted its analysis by examining the choice and amount of chemicals to be used, the manner in which the applicant will use the chemicals, the manner by which they will be transported to the facility and transferred to facility storage tanks, and the way the applicant plans to store the materials on site.

Staff reviewed the applicant's proposed engineering and administrative controls concerning hazardous materials usage. Engineering controls are the physical or mechanical systems, such as storage tanks or automatic shut-off valves, that can prevent the spill of hazardous material from occurring, or which can either limit the spill to a small amount or confine it to a small area. Administrative controls are the rules and procedures that workers at the facility must follow that will help to prevent accidents or to keep them small if they do occur. Both engineering and administrative controls can act as methods of prevention or as methods of response and minimization. In both cases, the goal is to prevent a spill from moving off site and causing harm to the public.

Staff reviewed and evaluated the applicant's proposed use of hazardous materials as described by the applicant (GSEP 2009a, Section 5.12). Staff's assessment followed the five steps listed below.

- Step 1: Staff reviewed the chemicals and the amounts proposed for on-site use as listed in Table 5.12-1 of the AFC (GSEP 2009a) and determined the need and appropriateness of their use.
- Step 2: Those chemicals proposed for use in small amounts or whose physical state is such that there is virtually no chance that a spill would migrate off site and impact the public were removed from further assessment.
- Step 3: Measures proposed by the applicant to prevent spills were reviewed and evaluated. These included engineering controls such as automatic shut-off valves

and different-sized transfer-hose couplings and administrative controls such as worker training and safety management programs.

- Step 4: Measures proposed by the applicant to respond to accidents were reviewed and evaluated. These measures also included engineering controls such as catchment basins and methods to keep vapors from spreading and administrative controls such as training emergency response crews.
- Step 5: Staff analyzed the theoretical impacts on the public of a worst-case spill of hazardous materials, as reduced by the mitigation measures proposed by the applicant. When mitigation methods proposed by the applicant are sufficient, no further mitigation is recommended. If the proposed mitigation is not sufficient to reduce the potential for adverse impacts to an insignificant level, staff will propose additional prevention and response controls until the potential for causing harm to the public is reduced to an insignificant level. It is only at this point that staff can recommend that the facility be allowed to use hazardous materials.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

The following federal, state, and local laws and policies apply to the protection of public health and hazardous materials management. Staff's analysis examines the project's compliance with these requirements.

Hazardous Materials Management Table 1
Laws, Ordinances, Regulations, and Standards

Applicable Law	Description
Federal	
The Superfund Amendments and Reauthorization Act of 1986 (42 USC §9601 et seq.)	Contains the Emergency Planning and Community Right To Know Act (also known as SARA Title III).
The Clean Air Act (CAA) of 1990 (42 USC 7401 et seq. as amended)	Established a nationwide emergency planning and response program and imposed reporting requirements for businesses that store, handle, or produce significant quantities of extremely hazardous materials.
The CAA section on risk management plans (42 USC §112(r)	Requires states to implement a comprehensive system informing local agencies and the public when a significant quantity of such materials is stored or handled at a facility. The requirements of both SARA Title III and the CAA are reflected in the California Health and Safety Code, section 25531, et seq.
49 CFR 172.800	The U.S. Department of Transportation (DOT) requirement that suppliers of hazardous materials prepare and implement security plans.
49 CFR Part 1572, Subparts A and B	Requires suppliers of hazardous materials to ensure that all their hazardous materials drivers are in compliance with personnel background security checks.
The Clean Water Act (CWA) (40 CFR 112)	Aims to prevent the discharge or threat of discharge of oil into navigable waters or adjoining shorelines. Requires a written spill prevention, control, and countermeasures (SPCC) plan to be prepared for facilities that store oil that could leak into navigable waters.
Title 49, Code of Federal Regulations, Part 190	Outlines gas pipeline safety program procedures.
Title 49, Code of Federal Regulations, Part 191	Addresses transportation of natural and other gas by pipeline: annual reports, incident reports, and safety-related condition reports. Requires operators of pipeline systems to notify the DOT of any reportable incident by telephone and then submit a written report within 30 days.

Applicable Law	Description
Title 49, Code of Federal Regulations, Part 192	Addresses transportation of natural and other gas by pipeline and minimum federal safety standards, specifies minimum safety requirements for pipelines including material selection, design requirements, and corrosion protection. The safety requirements for pipeline construction vary according to the population density and land use that characterize the surrounding land. This part also contains regulations governing pipeline construction (which must be followed for Class 2 and Class 3 pipelines) and the requirements for preparing a pipeline integrity management program.
Federal Register (6 CFR Part 27) interim final rule	A regulation of the U.S. Department of Homeland Security that requires facilities that use or store certain hazardous materials to submit information to the department so that a vulnerability assessment can be conducted to determine what certain specified security measures shall be implemented.
State	
Title 8, California Code of Regulations, section 5189	Requires facility owners to develop and implement effective safety management plans that ensure that large quantities of hazardous materials are handled safely. While such requirements primarily provide for the protection of workers, they also indirectly improve public safety and are coordinated with the Risk Management Plan (RMP) process.
California Health and Safety Code, section 41700	Requires that “No person shall discharge from any source whatsoever such quantities of air contaminants or other material which causes injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health, or safety of any such persons or the public, or which cause, or have a natural tendency to cause injury or damage to business or property.”
California Safe Drinking Water and Toxic Enforcement Act (Proposition 65)	Prevents certain chemicals that cause cancer and reproductive toxicity from being discharged into sources of drinking water.
Hazardous Material Business Plan, Cal HSC Sections 25500 to 25541; 19 CCR Sections 2720 to 2734	Requires the submittal of a chemical inventory and planning and reporting for management of hazardous materials.
Hazardous Substance	Requires listing and implementation of specified control measures for management of hazardous substances.

Applicable Law	Description
Information and Training Act, 8 CCR Section 339; Section 3200 et seq., 5139 et seq., and 5160 et seq.	
California HSC Sections 25270 through 25270.13	Requires the preparation of a Spill Prevention, Control, and Countermeasures (SPCC) Plan if 10,000 gallons or more of petroleum is stored on-site. The above regulations would also require the immediate reporting of a spill or release of 42 gallons or more to the California Office of Emergency Services and the Certified Unified Program Authority (CUPA).
Process Safety Management: Title 8 CCR Section 5189	Requires facility owners to develop and implement effective process safety management plans when toxic, reactive, flammable, or explosive chemicals are maintained on site in quantities that exceed regulatory thresholds
Local	
Riverside County Fire Code, Riverside County Code Chapter 8.32: Ordinance No. 787	Adopts the California Fire Code, 2007 Edition, with some of its appendices, into Riverside County regulations.
Disclosure of Hazardous Materials and the Formulation of Business Emergency Plans: Riverside County Ordinance 651	Requires disclosure where businesses handle hazardous materials and requires the development of response plans; designates Riverside County Department of Environmental Health as responsible for administration and enforcement of local codes.

The Certified Unified Program Agency (CUPA) with the responsibility to review the Hazardous Materials Business Plan (HMBP) is the Riverside County Environmental Health Department (RCEHD). With regard to seismic safety issues, the site is located in a Seismic Zone 4. Construction and design of buildings and vessels storing hazardous materials will meet the appropriate seismic requirements of the 2007 California Building Code (GSEP 2009a, Section 5.12.2.3).

C.4.4 PROPOSED PROJECT

C.4.4.1 SETTING AND EXISTING CONDITIONS

Several factors associated with the area in which a project is to be located affect the potential for an accidental release of a hazardous material that could cause public health impacts. These include:

- local meteorology;
- terrain characteristics; and
- location of population centers and sensitive receptors relative to the project.

Meteorological Conditions

Meteorological conditions, including wind speed, wind direction, and air temperature, affect both the extent to which accidentally released hazardous materials would be dispersed into the air and the direction in which they would be transported. This affects the potential magnitude and extent of public exposure to such materials, as well as their associated health risks. When wind speeds are low and the atmosphere stable, dispersion is severely reduced but can lead to increased localized public exposure.

Recorded wind speeds and ambient air temperatures are described in the Air Quality section (5.2.1.3) and Appendix B.2 of the Application for Certification (GSEP 2009a).

Terrain Characteristics

The location of elevated terrain is often an important factor in assessing potential exposure. An emission plume resulting from an accidental release may impact high elevations before impacting lower elevations. The topography of the site is essentially flat (about 370 to 400 feet above sea level). Elevated terrain can be found at about 5-6 miles north and northwest of the site boundary where the Palen and McCoy mountains begin (GSEP 2009a, Sections 3.3 and Figure 3.2-1).

Location of Exposed Populations and Sensitive Receptors

The general population includes many sensitive subgroups that may be at greater risk from exposure to emitted pollutants. These sensitive subgroups include the very young, the elderly, and those with existing illnesses. In addition, the location of the population in the area surrounding a project site may have a major bearing on health risk. Sensitive receptors in the project vicinity are listed in Table 5.15-1 of the AFC. There are no sensitive receptors within a 6-mile radius of the project site, and there are no residences or other public receptors within a 4-mile radius of the site (GSEP 2009a, Section 5.15.1). The Chuckwalla Valley and Ironwood State Prisons are located about nine miles south and the nearest schools or medical facilities are in Blythe, about 25 miles away (GSEP 2009a, 5.12.1.1).

C.4.4.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Small Quantity Hazardous Materials

In conducting the analysis, staff determined in Steps 1 and 2 that some hazardous materials, although present at the proposed facility, pose a minimal potential for off-site impacts since they will be stored in a solid form or in smaller quantities, have low mobility, or have low levels of toxicity. These hazardous materials, which were eliminated from further consideration, are briefly discussed below.

During the construction phase of the project, hazardous materials proposed for use include paint, solvents, gasoline, diesel fuel, motor oil, lubricants, and welding gases (GSEP 2009a, Section 5.12.2.2). No acutely toxic hazardous materials will be used on site during construction, and none of these materials pose significant potential for off-site impacts as a result of the quantities on site, their relative toxicity, their physical state, and/or their environmental mobility. Any impact of spills or other releases of these materials will be limited to the site because of the small quantities involved, their infrequent use (and therefore reduced chances of release), and/or the temporary containment berms used by contractors. Petroleum hydrocarbon-based motor fuels, mineral oil, lube oil, and diesel fuel are all very low volatility and represent limited off-site hazards even in larger quantities.

During operations, hazardous chemicals such as cleaning agents, water treatment chemicals, welding gasses, oils, activated carbon, and other various chemicals (see **HAZARDOUS MATERIALS APPENDIX A** for a list of chemicals proposed to be used and stored at GSEP during operations) would be used and stored in relatively small amounts and represent limited off-site hazards because of their small quantities, low volatility, and/or low toxicity. The project will be limited to using, storing, and transporting only those hazardous materials listed in Appendix A of this section as per staff's proposed condition **HAZ-1**.

After removing from consideration those chemicals that pose no risk of off-site impact in Steps 1 and 2, staff continued with Steps 3, 4, and 5 to review the remaining hazardous materials: natural gas and Therminol VP-1^{TM}.

Large Quantity Hazardous Materials

Natural Gas

Natural gas poses a fire and/or possible explosion risk because of its flammability. Natural gas is composed of mostly methane, but also contains ethane, propane, nitrogen, butane, isobutene, and isopentane. It is colorless, odorless, tasteless and lighter than air. Natural gas can cause asphyxiation when methane is 90% in concentration. Methane is flammable when mixed in air at concentrations of 5-14%, which is also the detonation range. Natural gas, therefore, poses a risk of fire and/or possible explosion if a release occurs under certain specific conditions. However, it should be noted that, due to its tendency to disperse rapidly (Lees 1998), natural gas is less likely to cause explosions than many other fuel gases such as propane or liquefied petroleum gas, but can explode under certain confined conditions (as demonstrated by the recent natural gas detonation in Belgium in July 2004).

Natural gas at the proposed facility would be used to fuel the auxiliary boilers. It will not be stored on-site but delivered by Southern California Edison via a new 6-mile pipeline that would connect to an existing main north of I-10 (GSEP 2009a, Section 3.4.6). The risk of a fire and/or explosion on site can be reduced to insignificant levels through adherence to applicable codes and the development and implementation of effective safety management practices. The National Fire Protection Association (NFPA) code 85A requires both the use of double-block and bleed valves for gas shut off and automated combustion controls. These measures will significantly reduce the likelihood of an explosion in gas-fired equipment. The safety management plan proposed by the applicant would address the handling and use of natural gas, and would significantly reduce the potential for equipment failure because of either improper maintenance or human error.

The natural gas pipeline must be designed to meet the appropriate level of California Public Utilities Commission (CPUC) General Order 112 standards and 49 CFR 192 standards. CPUC General Order 112-E, Section 125.1 requires that at least 30 days prior to the construction of a new pipeline, the owner must file a report with the commission that will include a route map for the pipeline. The natural gas pipeline must be constructed and operated in accordance with the Federal Department of Transportation (DOT) regulations, Title 49, Code of Federal Regulations (CFR), Parts 190, 191, and 192 (see Table 1 LORS). Staff concludes that existing LORS are sufficient to ensure minimal risks of pipeline failure.

Therminol VP-1

Therminol VP1 is the heat transfer fluid (HTF) that will be used in the solar panels to collect solar heat and transfer it in order to generate steam to run the steam turbines. Therminol is a mixture of 73.5% diphenyl ether and 26.5% biphenyl, and is a solid at temperatures below ~54 °F. Therminol can therefore be expected to remain liquid if a spill occurs. While the risk of off-site migration is minimal, Therminol is highly flammable and fires have occurred at other solar generating stations that use it. Approximately 2,000,000 gallons of HTF will be stored at the GSEP contained in the pipes and heat exchanger. Isolation valves would be placed throughout the HTF piping system designed to automatically block off sections of the piping in which a loss of pressure is detected (GSEP 2009a, Section 5.12.2.3).

Staff has assessed the properties of Therminol, and reviewed the record of its use at Solar Electric Generating Stations 8 and 9 at Harper Lake, California. Past leaks, spills, and fires involving this HTF were examined and discussed. It appears that the placement of additional isolation valves in the HTF pipe loops throughout the solar array would add significantly to the safety and operational integrity of the entire system by allowing a loop to be closed if a leak develops in a ball joint, flex-hose, or pipe, instead of closing off the entire HTF system and shutting down the plant. In order to ensure that HTF leaks do not pose a significant risk, staff proposes Condition of Certification **HAZ-4,** which would require the project owner to install a sufficient number of isolation valves that can be either manually or remotely activated.

Mitigation

Staff believes that this project's use of hazardous materials poses no significant risk but only if mitigation measures are used. These mitigation measures are discussed in this section. The potential for accidents resulting in the release of hazardous materials is greatly reduced by the implementation of a Safety Management Program, which includes both engineering and administrative controls. Elements of facility controls and the safety management plan are summarized below.

Engineering Controls

Engineering controls help to prevent accidents and releases (spills) from moving off site and affecting communities by incorporating engineering safety design criteria in the design of the project. The engineered safety features proposed by the applicant for use at the GSEP project include:

- Storage of small quantity hazardous materials in original, properly labeled containers;
- construction of secondary containment areas surrounding each of the bulk hazardous materials storage areas designed to contain accidental releases that might happen during storage or delivery plus the volume of rainfall associated with a 25-year, 24-hour storm;
- physical separation of stored chemicals in isolated containment areas in order to prevent accidental mixing of incompatible materials, which could result in the evolution and release of toxic gases or fumes;
- installation of a fire protection system for hazardous materials storage areas; and
- continuous monitoring of HTF piping system by plant staff and by automatic pressure sensors designed to trigger isolation valves if a leak is detected.

Administrative Controls

Administrative controls also help prevent accidents and releases (spills) from moving off site and affecting neighboring communities by establishing worker training programs, process safety management programs, and complying with all applicable health and safety laws, ordinances, and standards.

A worker health and safety program will be prepared by the applicant and include (but not be limited to) the following elements (see the **WORKER SAFETY AND FIRE PROTECTION** section for specific regulatory requirements):

- worker training regarding chemical hazards, health and safety issues, and hazard communication;
- procedures to ensure the proper use of personal protective equipment;
- safety operating procedures for the operation and maintenance of systems utilizing hazardous materials;
- fire safety and prevention; and
- emergency response actions including facility evacuation, hazardous material spill clean-up, and fire prevention.

At the facility, the project owner will be required to designate an individual with the responsibility and authority to ensure a safe and healthful work place. The project health and safety official will oversee the health and safety program and have the authority to halt any action or modify any work practice to protect the workers, facility, and the surrounding community in the event of a violation of the health and safety program.

Staff's proposed Condition of Certification **HAZ-1** ensures that no hazardous material would be used at the facility except as listed in Tables 5.12-1 of the AFC (GSEP 2009a), which have been reviewed by staff to determined the need and appropriateness of their use. **HAZ-1** also requires changes to the allowed list of hazardous materials and their maximum amounts to be approved by the Compliance Project Manager. Only those that are needed and appropriate would be allowed to be used. If staff feels that a safer alternative chemical can be used, staff would recommend or require its use, depending upon the impacts posed.

Additional administrative controls are required by Conditions of Certification **HAZ-2**: preparation of a Hazardous Materials Business Plan, a Process Safety Management Plan, and a Spill Prevention, Control, and Countermeasure Plan) and **HAZ-3** (development of a Safety Management Plan).

On-Site Spill Response

In order to address the issue of spill response, the facility will prepare and implement an emergency response plan that includes information on hazardous materials contingency and emergency response procedures, spill containment and prevention systems, personnel training, spill notification, on-site spill containment, and prevention equipment and capabilities, as well as other elements. Emergency procedures will be established which include evacuation, spill cleanup, hazard prevention, and emergency response.

The presence of oil in a quantity greater than 1,320 gallons might invoke a requirement to prepare a Spill Prevention Control and Countermeasures (SPCC) Plan. The quantity of oil contained in any one of the planned 230/500 kV transformers would be in excess of the minimum quantity that requires such a plan. However, there are no known waters of the State or of the United States and thus staff's position is that no SPCC Plan is required by 40 CFR 112. However, pursuant to California HSC Sections 25270 through 25270.13, the GSEP will be required to prepare a SPCC because it will store 10,000 gallons or more of petroleum on-site. The above regulations would also require the immediate reporting of a spill or release of 42 gallons or more to the California Office of Emergency Services and the Certified Unified Program Authority (CUPA).

Plant personnel would be trained as a hazardous materials response team which would be the first responder to hazardous materials incidents. In the event of a large incident involving hazardous materials, backup support would be provided by the Riverside County Fire Department which has a hazmat response unit capable of handling any incident at the proposed GSEP and would respond in about 1.5-2 hours (GSEP 2009a, Section 5.12.3.2 and RCFD 2010).

Transportation of Hazardous Materials

Various containerized and bulk hazardous materials would be transported to the facility via truck. The applicant estimated that about 15 deliveries of hazardous materials would be required per month during operations (GSEP 2009a, Section 5.11.2.3). In addition, about 2 million gallons of HTF would be transported to the site before construction is complete, requiring roughly 330 deliveries (assuming about 6,000 gallons per tanker). While many types of hazardous materials will be transported to the site, staff believes that transport of HTF poses the predominant risk associated with hazardous materials transport. It should be noted that previous modeling of spills involving much larger quantities of more toxic materials such as aqueous and anhydrous ammonia (two hazardous materials that *would not* be used, stored, or transported to the proposed GSEP) has demonstrated that significant airborne concentrations would only occur at short distances from the spill.

Staff reviewed the applicant's proposed transportation routes for hazardous materials delivery. Trucks would travel on I-10 to the project site via a new access road of short distance. (GSEP 2009a, Section 5.12.2.3). Staff finds that the hazardous materials transportation associated with this project would not significantly increase the risks associated with regional hazardous materials transportation. Furthermore, staff believes it is appropriate to rely upon the extensive regulatory program that applies to the shipment of hazardous materials on California highways to ensure safe handling in general transportation (see Federal Hazardous Materials Transportation Law 49 USC §5101 et seq, DOT regulations 49 CFR subpart H, §172–700, and California Department of Motor Vehicles (DMV) regulations on hazardous cargo). These regulations also address the issue of driver competence.

Staff therefore believes that the risk of exposure to significant concentrations of HTF during transportation to the facility is insignificant because of the remote possibility that an accidental release of a sufficient quantity could be dangerous to the public. The transportation of similar volumes of hazardous materials on the nation's highways is neither unique nor infrequent. Based on the environmental mobility, toxicity, the quantities at the site, and frequency of delivery, it is staff's opinion that HTF poses the predominate risk associated with both use and hazardous materials transportation. Staff concludes that the risk associated with the transportation of other hazardous materials to the site would not increase the risk of overall impact significantly above that associated with HTF transportation alone.

Seismic Issues

It is possible that an earthquake could cause the failure of hazardous materials storage tanks and/or solar field piping. An earthquake could also cause failure of the secondary containment system (berms and dikes), as well as the failure of electrically controlled valves and pumps. The failure of all of these preventive control measures might then result in leaks of chemicals that may cause fires or impact the environment. The applicant stated that the piping in the solar array will be constructed to be flexible and to allow movement (necessary to accommodate thermal expansion). The piping will be attached with ball joints and won't be fixed to a rigid structure; therefore reducing the likelihood of failure during an earthquake (GSEP 2009a, Section 5.12.2.3).

Information obtained after the January 1994 Northridge earthquake showed that some damage was caused both to several large storage tanks and to smaller tanks associated with the water treatment system of a cogeneration facility. The tanks with the greatest damage, including seam leakage, were older tanks, while the newer tanks sustained displacements and failures of attached lines. Staff reviewed the impacts of the February 2001 Nisqually earthquake near Olympia, Washington, a state with similar seismic design codes as California. No hazardous materials storage tanks failed as a result of that earthquake. Staff also conducted an analysis of the codes and standards which should be followed when designing and building storage tanks and containment areas to withstand a large earthquake. Staff notes that the proposed facility will be designed and constructed to the standards of the 2007 California Building Code for Seismic Risk Zone 4 (GSEP 2009a, Section 5.12.2.3). Therefore, on the basis of what occurred in Northridge with older tanks and the lack of failures during the Nisqually earthquake (with newer tanks), staff determined that tank failures during seismic events are not probable and do not represent a significant risk to the public.

Site Security

GSEP proposes to use hazardous materials in sufficient quantities that special site security measures should be developed and implemented to prevent unauthorized access. The North American Electric Reliability Corporation (NERC) published *Security Guidelines for the Electricity Sector* in 2002 (NERC 2002), and the U.S. Department of Energy published a draft *Vulnerability Assessment Methodology for Electric Power Infrastructure* in 2002 (DOE 2002). The energy generation sector is one of 14 areas of critical Infrastructure listed by the U.S. Department of Homeland Security. On April 9, 2007, the U.S Department of Homeland Security published, in the Federal Register (6 CFR Part 27), an Interim Final Rule requiring facilities that use or store certain hazardous materials to conduct vulnerability assessments and implement certain specified security measures. This rule was implemented with the publication of Appendix A, the list of chemicals, on November 2, 2007. The GSEP will not use or store any chemicals above the threshold levels and therefore the CFATS regulation will not apply and the project owner will not need to submit a “Top Screen” assessment to the DHS. However, staff believes that all power plants under the jurisdiction of the Energy Commission should implement a minimum level of security consistent with the guidelines listed here.

In order to ensure that this facility (or a shipment of hazardous material) is not the target of unauthorized access, staff’s proposed conditions of certification **HAZ-5** and **HAZ-6** address both construction security and operations security plans. These plans would require the implementation of site security measures that are consistent with both the above-referenced documents and Energy Commission guidelines.

The goal of these conditions of certification is to provide the minimum level of security for power plants needed to protect California’s electrical infrastructure from malicious mischief, vandalism, or domestic/foreign terrorist attacks. The level of security needed for this power plant is dependent upon the threat imposed, the likelihood of an adversarial attack, the likelihood of success in causing a catastrophic event, and the severity of consequences of that event.

In order to determine the level of security, the Energy Commission staff used an internal vulnerability assessment decision matrix modeled after the U.S. Department of Justice Chemical Vulnerability Assessment Methodology (July 2002), the NERC 2002 guidelines, the U.S. Department of Energy VAM-CF model, and U.S. Department of Homeland Security regulations published in the Federal Register (Interim Final Rule 6 CFR Part 27). Staff determined that the GSEP would fall into the "low vulnerability" category, so staff proposes that certain security measures be implemented but does not propose that the project owner conduct its own vulnerability assessment.

These security measures include perimeter fencing and breach detectors, possibly guards, alarms, site access procedures for employees and vendors, site personnel background checks, and law enforcement contact in the event of a security breach. Site access for vendors would be strictly controlled. Consistent with current state and federal regulations governing the transport of hazardous materials, hazardous materials vendors would have to maintain their transport vehicle fleets and employ only drivers who are properly licensed and trained. The project owner would be required, through its contractual language with vendors, to ensure that vendors supplying hazardous materials strictly adhere to the U.S. DOT requirements that hazardous materials vendors prepare and implement security plans per 49 CFR 172.800 and ensure that all hazardous materials drivers are in compliance with personnel background security checks per 49 CFR Part 1572, Subparts A and B. The compliance project manager (CPM) may authorize modifications to these measures, or may require additional measures in response to additional guidance provided by the U.S. Department of Homeland Security, the U.S. Department of Energy, or NERC, after consultation with appropriate law enforcement agencies and the applicant.

Closure and Decommissioning Impacts and Mitigation

Closure of the proposed GSEP (temporary or permanent) would follow a facility closure plan prepared by the applicant and designed to minimize public health and environmental impacts. Decommissioning procedures would be consistent with all applicable LORS and would include monitoring of hazardous materials storage vessels, safe cessation of processes which use hazardous materials, disposal of hazardous materials and hazardous wastes, and documentation of practices and inventory (GSEP 2009a, Section 5.12.2.4). Staff expects that impacts from the closure and decommissioning process would represent a fraction of the impacts associated with the construction or operation of the proposed GSEP. Therefore based on staff's analysis for the construction and operation phases of this project, staff concludes that hazardous materials-related impacts from closure and decommissioning of the GSEP would be insignificant.

C.4.4.3 CEQA LEVEL OF SIGNIFICANCE

Staff's analysis of impacts associated with the storage, use, and handling of hazardous materials at the proposed GSEP has determined that impacts would be below the level of significance if staff's proposed Conditions of Certification are adopted.

C.4.5 REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would essentially be Unit 1 of the proposed project, including a 125 MW solar facility located within the boundaries of the proposed project as defined by NextEra. This alternative is analyzed for two major reasons: (1) it eliminates about 50 percent of the proposed project area so impacts are reduced, and (2) by eliminating the eastern solar field, which is located on flowing desert washes, it would reduce impacts to the sand dune and playa areas and to the Mojave Fringe-toed Lizard habitat. The alternative would also reduce impacts to wildlife movement by reducing obstruction of the Palen wash and would maintain, thru both fluvial and Aeolian processes, the dune and sandy habitats. The boundaries of the Reduced Acreage Alternative are shown in **Alternatives Figure 1**.

C.4.5.1 SETTING AND EXISTING CONDITIONS

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates effects to the eastern 125 MW solar field and relocates the gas yard approximately 1.75 miles northwest of its present location. As a result, the environmental setting consists of the western portion of the proposed project, as well as the area affected by the linear project components.

C.4.5.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Potential impacts associated with hazardous materials use during construction and operation of the Reduced Acreage Alternative would likely be reduced compared to those estimated for the GSEP as proposed due to the smaller quantities of hazardous materials required. However, staff's analysis has determined that no significant impacts are expected from the storage and use of hazardous materials at the GSEP as proposed. Therefore staff concludes that with respect to hazardous materials handling, the Reduced Acreage Alternative is not preferable over the project as proposed.

C.4.5.3 CEQA LEVEL OF SIGNIFICANCE

The CEQA level of significance for hazardous materials management would not change with the Reduced Acreage Alternative, as both the project as proposed and the Reduced Acreage Alternative would have impacts below the level of significance. The same conditions of certification would be required for the Reduced Acreage Alternative and the project as proposed.

C.4.6 DRY COOLING ALTERNATIVE

This section identifies the potential impacts of using air-cooled condenser (ACC) systems rather than the cooling towers proposed by NextEra for the Genesis project. It is assumed that the ACC systems would be located where the cooling towers are currently proposed for each of the two 125 MW power block, as illustrated in **Alternatives Figure 2** (see Section B.3).

Approximately 18 ACC fans would be required for each of the two solar fields. The 18 fans, or ACC's, would operate when the ambient temperature is above 50 degrees Fahrenheit. When the temperature is below 50 degrees Fahrenheit, only 10 of the fans

would be used (GSEP 2009f). The 18 ACC fans described in the GSEP cooling study would have a length of approximately 279 feet, a width of approximately 127 feet, and a height of 98 feet (GSEP 2009f). However, based on the ACC preliminary designs for nearby solar thermal projects in similar ambient temperatures, an additional 11,690 square feet could be required for siting of the fans and the fans would be up to 120 feet in height. In addition to the ACC fans, NextEra would use a small Wet Surface Air Cooler when needed to provide auxiliary cooling during extremely hot days (GSEP 2009f). This alternative is analyzed because it would reduce the amount of water required for steam turbine cooling from 822 acre-feet per year (AFY) to 66 AFY. This reduction in water use would reduce impacts to water and biological resources and require the same but a lesser amount of cooling water treatment chemicals.

C.4.6.1 Setting and Existing Conditions

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates the use of wet-cooling towers and incorporated the use of air-cooled condensers (ACC) in the same location. As a result, the environmental setting would be the same as for the proposed project.

C.4.6.2 Assessment of Impacts and Discussion of Mitigation

The majority of the hazardous materials use with the Dry Cooling Alternative, including the quantities handled during transportation and disposal, would be the same as those of the proposed project. However, some hazardous materials would be eliminated because they are required specifically for the wet-cooling system, such as sodium hypochlorite used in the cooling tower biological control to control algae growth. Additionally, because the use of water would be reduced from 822 AFY to approximately 66 AFY per 125 MW power block, the use of water treatment chemicals described in Table 5.12-1 of the AFC would also be reduced. As such, hazardous materials usage is expected to decrease with the use of the Dry Cooling Alternative.

C.4.6.3 CEQA Level of Significance

No new impacts related to hazardous materials would be created with use of ACCs in place of cooling towers, and some project impacts would be reduced. The overall impacts of the project with dry cooling would be similar to those of the proposed project since both would have less than significant impacts resulting form the use of hazardous materials.

C.4.7 NO PROJECT/NO ACTION ALTERNATIVE

There are three No Project/No Action Alternatives evaluated in this section, as follows:

C.4.7.1 NO ACTION ON PROPOSED PROJECT APPLICATION AND ON CDCA LAND USE PLAN AMENDMENT

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and BLM would not amend the CDCA Plan. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, no hazardous materials would be used and no impacts related to the use of hazardous material would occur. However, the land on which the project is proposed would become available to other uses that are consistent with BLM's land use plan, including another solar project requiring a land use plan amendment. In addition, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

C.4.7.2 NO ACTION ON PROPOSED PROJECT APPLICATION AND AMEND THE CDCA LAN USE PLAN TO MAKE THE AREA AVAILABLE FOR FUTURE SOLAR DEVELOPMENT

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and BLM would amend the CDCA Land Use Plan of 1980, as amended, to allow for other solar projects on the site. As a result, it is possible that another solar energy project could be constructed on the project site.

Because the CDCA Plan would be amended, it is possible that the site would be developed with a different solar technology. As a result, construction and operation of the solar technology would likely result in use of hazardous materials. Different solar technologies require the use of different hazardous materials; however, it is expected that all solar technologies would require the use of hazardous materials. As such, this No Project/No Action Alternative could result impacts to hazardous material handling similar to under the proposed project.

C.4.7.3 NO ACTION ON PROPOSED PROJECT APPLICATION AND AMEND THE CDCA LAND USE PLAN TO MAKE THE AREA UNAVAILABLE FOR FUTURE SOLAR DEVELOPMENT

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and the BLM would amend the CDCA Plan to make the proposed site unavailable for future solar development. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because the CDCA Plan would be amended to make the area unavailable for future solar development, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site and no use of hazardous materials. As a result, this No Project/No Action Alternative would not result in impacts from the use of hazardous materials. However, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

C.4.8 CUMULATIVE IMPACTS

Section B.3, Cumulative Scenario, provides detailed information on the potential cumulative solar and other development projects in the project area. Together, these projects comprise the cumulative scenario which forms the basis of the cumulative impact analysis for the proposed project. In summary, these projects are:

- Renewable energy projects on BLM, State, and private lands, as shown on **Cumulative Figure 1** and in **Cumulative Tables 1A and 1B.** Although not all of those projects are expected to complete the environmental review processes, or be funded and constructed, the list is indicative of the large number of renewable projects currently proposed in California.
- Foreseeable future projects in the immediate area as shown on **Cumulative Impacts Figure 2, I-10 Corridor Existing and Future/Foreseeable Projects, and Cumulative Tables 2 and 3**. Table 2 presents existing projects in this area and Table 3 presents future foreseeable projects in the I-10 Corridor Area. Both tables indicate project name and project type, its location and its status.

These projects are defined within a geographic area that has been identified by the CEC and BLM as covering an area large enough to provide a reasonable basis for evaluating cumulative impacts for all resource elements or environmental parameters. Most of these projects have, are, or will be required to undergo their own independent environmental review under CEQA and/or NEPA. Even if the cumulative projects described in Section B.3 have not yet completed the required environmental processes, they were considered in the cumulative impacts analyses in this SA/DPA/DEIS.

C.4.8.1 GEOGRAPHIC SCOPE OF ANALYSIS

The geographic area considered for cumulative impacts on Hazardous Materials Management is only within the project boundaries.

C.4.8.2 EFFECTS OF PAST AND PRESENT PROJECTS

For this analysis, there are no projects or developments in the area or region that use, store, and/or transport hazardous materials that staff has found to have an impact on the region. The use of hazardous materials is neither frequent nor concentrated in this area. Two power plants that store, use, and transport hazardous materials in the area, the Blythe Power Plants I and II, are not considered by staff to have an impact on the area.

Staff analyzed the potential for hazardous materials cumulative impacts at many other power plant projects. A significant cumulative hazardous materials impact is defined as the simultaneous uncontrolled release of hazardous materials from multiple locations in a form (gas or liquid) that could cause a significant impact where the release of one hazardous material alone would not cause a significant impact. Existing locations that use or store gaseous or liquid hazardous materials, or locations where such facilities might likely be built, were both considered. Staff believes that while cumulative impacts are theoretically possible, they are not probable because of the many safeguards implemented to both prevent and control an uncontrolled release. The chances of one uncontrolled release occurring are remote. The chance of two or more occurring simultaneously, with resulting airborne plumes

mingling to create a significant impact, are even more remote. Staff believes the risk to the public is insignificant.

The applicant will develop and implement a hazardous materials handling program for the GSEP independent of any other projects considered for potential cumulative impacts. Staff believes that the facility, as proposed by the applicant and with the additional mitigation measures proposed by staff, poses a minimal risk of accidental release that could result in off-site impacts. It is unlikely that an accidental release that has very low probability of occurrence (about one in one million per year) would independently occur at this site and another facility at the same time. Therefore, staff concludes that the facility would not contribute to a significant hazardous materials-related cumulative impact.

C.4.8.3 EFFECTS OF REASONABLY FORESEEABLE FUTURE PROJECTS

Hazardous Materials Management at the proposed project are also not expected to be affected by any reasonably foreseeable future projects, including the proposed Blythe and Palen solar projects proposed for the I-10 corridor. The reasons for staff's position are described above.

Contribution of the Genesis Solar Energy Project to Cumulative Impacts

Construction. The construction of GSEP is not expected to result in short term adverse impacts related to hazardous materials use. It is expected that some of the cumulative projects described above which are not yet built may be under construction the same time as the GSEP, however, short term impacts related to Hazardous Materials Management during construction of those cumulative projects are not expected to occur.

Operation. The operation of the GSEP is not expected to result in long term adverse impacts related to Hazardous Materials Management even though it is expected that some of the cumulative projects described above may be operational at the same time as the GSEP.

Decommissioning. The decommissioning of the GSEP is not expected to result in adverse impacts related to Hazardous Materials Management. It is unlikely that the construction or decommissioning of any of the cumulative projects would occur concurrently with the decommissioning of this project, because the decommissioning is not expected to occur for approximately 40 years. As a result, it is not expected that significant impacts related to Hazardous Materials Management during decommissioning of the GSEP generated by the cumulative projects will occur.

C.4.8.4 OVERALL CONCLUSION

The potential for off-site impacts resulting from hazardous materials use at the GSEP is insignificant due to the nature of the materials used and the engineering and administrative controls that would be implemented to prevent and control accidental releases of hazardous materials. Because of this determination, and the additional fact that there are no existing or future foreseeable facilities in the immediate proximity (less than 1 mile) using large amounts of hazardous chemicals, there is little (if any)

possibility that vapor plumes would mingle (combine) to produce an airborne concentration that would present a significant risk should an accidental release occur.

C.4.9 COMPLIANCE WITH LORS

Staff concludes that construction and operation of the GSEP project would be in compliance with all applicable laws, ordinances, regulations, and standards (LORS) regarding long-term and short-term project impacts in the area of hazardous materials management.

C.4.10 NOTEWORTHY PUBLIC BENEFITS

The construction and operation of a solar power plant such as the proposed GSEP requires in general smaller quantities of hazardous materials and materials that are less dangerous to the public than a natural-gas fired power plant. Building solar power plants to supply the required energy in California therefore benefits the public by reducing the risks otherwise associated with the use and transport of large quantities of more hazardous materials such as aqueous or anhydrous ammonia.

C.4.10 PROPOSED CONDITIONS OF CERTIFICATION/MITIGATION MEASURES

HAZ-1 The project owner shall not use any hazardous materials not listed in Appendix A, below, or in greater quantities or strengths than those identified by chemical name in Appendix A, below, unless approved in advance by the Compliance Project Manager (CPM).

Verification: The project owner shall provide to the CPM, in the Annual Compliance Report, a list of hazardous materials contained at the facility.

HAZ-2 The project owner shall concurrently provide a Hazardous Materials Business Plan (HMBP), a Spill Prevention, Control, and Countermeasure Plan (SPCC), and a Process Safety Management Plan (PSMP) to the Riverside County Environmental Health Department (RCEHD) and the CPM for review. After receiving comments from the RCEHD and the CPM, the project owner shall reflect all recommendations in the final documents. Copies of the final HMBP shall then be provided to the RCEHD for information and to the CPM for approval.

Verification: At least 60 days prior to receiving any hazardous material on the site for commissioning or operations, the project owner shall provide a copy of a final Hazardous Materials Business Plan, a Spill Prevention, Control, and Countermeasure Plan, and a Process Safety Management Plan to the CPM for approval.

HAZ-3 The project owner shall develop and implement a Safety Management Plan for the delivery and handling of liquid and gaseous hazardous materials. The plan shall include procedures, protective equipment requirements, training and a checklist. It shall also include a section describing all measures to be implemented to prevent mixing of incompatible hazardous materials. This

plan shall be applicable during construction, commissioning, and operation of the power plant.

Verification: At least sixty (60) days prior to the delivery of any liquid or gaseous hazardous material to the facility, the project owner shall provide a Safety Management Plan as described above to the CPM for review and approval.

HAZ-4 The project owner shall place an adequate number of isolation valves in the Heat transfer Fluid (HTF) pipe loops so as to be able to isolate a solar panel loop in the event of a leak of fluid. These valves shall be actuated manually and remotely. The engineering design drawings showing the number, location, and type of isolation valves shall be provided to the CPM for review and approval prior to the commencement of the solar array construction.

Verification: At least sixty (60) days prior to the commencement of solar array construction, the project owner shall provide the design drawings as described above to the CPM for review and approval.

HAZ-5 Prior to commencing construction, a site-specific Construction Site Security Plan for the construction phase shall be prepared and made available to the CPM for review and approval. The Construction Security Plan shall include the following:

1. perimeter security consisting of fencing enclosing the construction area;
2. security guards;
3. site access control consisting of a check-in procedure or tag system for construction personnel and visitors;
4. written standard procedures for employees, contractors and vendors when encountering suspicious objects or packages on site or off site;
5. protocol for contacting law enforcement and the CPM in the event of suspicious activity or emergency; and
6. evacuation procedures.

Verification: At least thirty (30) days prior to commencing construction, the project owner shall notify the CPM that a site-specific Construction Security Plan is available for review and approval.

HAZ-6 The project owner shall also prepare a site-specific security plan for the commissioning and operational phases that will be available to the CPM for review and approval. The project owner shall implement site security measures that address physical site security and hazardous materials storage. The level of security to be implemented shall not be less than that described below (as per NERC 2002).

The Operation Security Plan shall include the following:

1. permanent full perimeter fence or wall, at least eight feet high and topped with barbed wire or the equivalent;

2. main entrance security gate, either hand operated or motorized;

3. evacuation procedures;

4. protocol for contacting law enforcement and the CPM in the event of suspicious activity or emergency;

5. written standard procedures for employees, contractors, and vendors when encountering suspicious objects or packages on site or off site;

   A. a statement (refer to sample, **ATTACHMENT A**), signed by the project owner certifying that background investigations have been conducted on all project personnel. Background investigations shall be restricted to determine the accuracy of employee identity and employment history and shall be conducted in accordance with state and federal laws regarding security and privacy;

   B. a statement(s) (refer to sample, **ATTACHMENT B**), signed by the contractor or authorized representative(s) for any permanent contractors or other technical contractors (as determined by the CPM after consultation with the project owner), that are present at any time on the site to repair, maintain, investigate, or conduct any other technical duties involving critical components (as determined by the CPM after consultation with the project owner) certifying that background investigations have been conducted on contractors who visit the project site;

6. site access controls for employees, contractors, vendors, and visitors;

7. a statement(s) (refer to sample, **ATTACHMENT C**), signed by the owners or authorized representative of hazardous materials transport vendors, certifying that they have prepared and implemented security plans in compliance with 49 CFR 172.802, and that they have conducted employee background investigations in accordance with 49 CFR Part 1572, subparts A and B;

8. closed circuit TV (CCTV) monitoring system, recordable, and viewable in the power plant control room and security station (if separate from the control room) with cameras able to pan, tilt, and zoom, have low-light capability, and are able to view the outside entrance to the control room and the front gate; and

9. additional measures to ensure adequate perimeter security consisting of either:

   A. security guard(s) present 24 hours per day, 7 days per week; **or**

   B. power plant personnel on site 24 hours per day, 7 days per week,

   and

the CCTV able to view 100% of the entire solar array fenceline perimeter

or breach detectors **or** on-site motion detectors along the entire solar array fenceline.

The project owner shall fully implement the security plans and obtain CPM approval of any substantive modifications to those security plans. The CPM may authorize modifications to these measures, or may require additional measures such as protective barriers for critical power plant components—transformers, gas lines, and compressors—depending upon circumstances unique to the facility or in response to industry-related standards, security concerns, or additional guidance provided by the U.S. Department of Homeland Security, the U.S. Department of Energy, or the North American Electrical Reliability Council, after consultation with both appropriate law enforcement agencies and the applicant.

Verification: At least thirty (30) days prior to the initial receipt of hazardous materials on site, the project owner shall notify the CPM that a site-specific operations site security plan is available for review and approval. In the annual compliance report, the project owner shall include a statement that all current project employee and appropriate contractor background investigations have been performed, and that updated certification statements have been appended to the operations security plan. In the annual compliance report, the project owner shall include a statement that the operations security plan includes all current hazardous materials transport vendor certifications for security plans and employee background investigations.

C.4.12 CONCLUSIONS

Staff's evaluation of the proposed project (with proposed mitigation measures) indicates that hazardous material use, storage, and transportation would not pose a significant impact on the public. Staff's analysis also shows that there would be no significant cumulative impact. With adoption of the proposed conditions of certification, the proposed project would comply with all applicable LORS. Other proposed conditions of certification address the issues of site security matters.

Staff recommends that the Energy Commission impose the proposed conditions of certification to ensure that the project is designed, constructed, and operated in compliance with applicable LORS, and would protect the public from significant risk of exposure to an accidental release of hazardous materials. If all mitigation proposed by the applicant and by staff are implemented, the use, storage, and transportation of hazardous materials would not present a significant risk to the public.

Staff concludes that there is insignificant potential for hazardous materials release to have an impact beyond the facility boundary, and therefore concludes there is also insignificant potential for significant impacts to the environment. For any other potential impacts upon the environment, including vegetation, wildlife, air, soils, and water resulting from hazardous materials usage and disposal at the proposed facility, the

reader is referred to the **Biology**, the **Air Quality**, the **Soil and Water**, and the **Waste Management** sections of this SA.

Staff proposes six conditions of certification which are mentioned in the text above. **HAZ-1** ensures that no hazardous material would be used at the facility except as listed in **Appendix A** of this section, unless there is prior approval by the Energy Commission Compliance Project Manager. **HAZ-2** ensures that local emergency response services are notified of the amounts and locations of hazardous materials at the facility, **HAZ-3** requires the development of a Safety Management Plan that addresses the delivery of all liquid hazardous materials during the construction, commissioning, and operation of the project would further reduce the risk of any accidental release not specifically addressed by the proposed spill prevention mitigation measures, and further prevent the mixing of incompatible materials that could result in the generation of toxic vapors. **HAZ-4** addresses the use of HTF in the solar array. Site security during both the construction and operation phases is addressed in **HAZ-5** and **HAZ-6.**

SAMPLE CERTIFICATION (Attachment A)

Affidavit of Compliance for Project Owners

I,

_____

(Name of person signing affidavit)(Title)

do hereby certify that background investigations to ascertain the accuracy of the identity and employment history of all employees of

_____

(Company name)

for employment at

_____

(Project name and location)

have been conducted as required by the California Energy Commission Decision for the above-named project.

_____

(Signature of officer or agent)

Dated this _____ day of _____, 20 _____.

THIS AFFIDAVIT OF COMPLIANCE SHALL BE APPENDED TO THE PROJECT SECURITY PLAN AND SHALL BE RETAINED AT ALL TIMES AT THE PROJECT SITE FOR REVIEW BY THE CALIFORNIA ENERGY COMMISSION COMPLIANCE PROJECT MANAGER.

SAMPLE CERTIFICATION (Attachment B)

Affidavit of Compliance for Contractors

I,

_____

(Name of person signing affidavit)(Title)

do hereby certify that background investigations to ascertain the accuracy of the identity and employment history of all employees of

_____

(Company name)

for contract work at

_____

(Project name and location)

have been conducted as required by the California Energy Commission Decision for the above-named project.

_____

HAZARDOUS MATERIALS
APPENDIX A

Hazardous Materials Proposed for Use at the GSEP

THIS PAGE INTENTIONALLY LEFT BLANK

Hazardous Materials Appendix A
Hazardous Materials Proposed for Use at the GSEP

Material	CAS No.	Application	Hazardous Characteristics	Maximum Quantity On Site	CERCLA SARA RQ[a]
Acetylene	74-86-2	Welding gas	Health: moderate toxicity Physical: toxic	600 cubic feet	
Argon	7440-37-1	Welding gas	Health: low toxicity Physical: non-flammable gas	600 cubic feet	
Carbon Dioxide			Health: low toxicity Physical: non-flammable gas	15 tons	
Diesel Fuel		Equipment refueling and emergency diesel fire pump	Health: low toxicity Physical: combustible liquid	3,600 gallons	
Fertilizer Monopotassium Phosphate		Treatment of HTF contaminated soil	Health: low toxicity Physical: irritant	250 pounds	
Fertilizer Urea		Treatment of HTF contaminated soil	Health: low toxicity Physical: N/A	250 pounds	
Hydraulic Fluid		High-pressure combustion turbine starting system, turbine control valve actuators	Health: low to moderate toxicity Physical: Class IIIB combustible liquid	500 gallons in equipment, maintenance inventory of 110 gallons in 55-gallon steel drums	
Hydrogen		Steam turbine generator cooling	Health: low toxicity Physical: flammable gas	20,000 SCF	
Lube Oil		Lubricate rotating equipment (e.g., gas turbine and steam-turbine bearings)	Health: low toxicity Physical: N/A	10,000 gallons in equipment and piping, additional maintenance inventory of up to 550 gallons in 55-gallon steel drums	
Mineral Insulating Oil		Transformers/switchyard	Health: low toxicity Physical: N/A	32,000	
Natural Gas (Methane)	74-82-8	Auxiliary boiler operation	Health: low toxicity Physical: flammable gas	No on-site storage, up to 140 pounds of natural gas in equipment and piping	
Nitrogen	7727-37-9		Health: low toxicity Physical: flammable gas	7,500 pounds	
Material	**CAS No.**	**Application**	**Hazardous Characteristics**	**Maximum Quantity On Site**	**CERCLA SARA RQ[a]**
Oxygen	7782-44-7	Welding gas	Health: low toxicity	600 cubic feet	

			Physical: oxidizer		
Sodium Hypochlorite (12.5%)		Cooling tower biological control	Health: high toxicity Physical: Poison-B, corrosive	8,500 gallons	100 pounds
Sulfur Hexaflouride		230-kV breaker insulating medium	Health: none Physical: none		
Sulfuric Acid (29.5%) solution			Health: high toxicity Physical: corrosive and water reactive	2,000 gallons	1,000 pounds
Sulfuric Acid (93%) solution			Health: high toxicity Physical: corrosive and water reactive	8,500 gallons	1,000 pounds
Therminol VP-1 Diphenyl Ether (73.5%) Biphenyl (26.5%)		Heat transfer fluid in the solar array	Health: moderate toxicity Physical: irritant; combustible liquid (Class III-B)	2.0 MM gallons	100 pounds
Water Treatment Chemical NALCO Tri-Act 1800 Cyclohexlyamine (5 – 10%) Monoehtanolamine (10 – 30%) Methoxyproplyamine (10 – 30%)			Health: high toxicity Physical: corrosive, class II combustible liquid	800 gallons	
Water Treatment Chemical NALCO Elimin-Ox Carbohydazide (5 – 10%)			Health: moderate toxicity Physical: corrosive	800 gallons	
Water Treatment Chemical NALCO 3D Trasar 3DT185 Phosphoric Acid (60 – 100%)			Health: high toxicity Physical: corrosive	800 gallons	
Water Treatment Chemical NALCO 3D Trasar 3DT177 Phosphoric Acid (30%)			Health: moderate toxicity Physical: irritant	800 gallons	
Material	**CAS No.**	**Application**	**Hazardous Characteristics**	**Maximum Quantity On Site**	**CERCLA SARA RQ[a]**
Water Treatment Chemical NALCO 3D Trasar 3DT190			Health: low toxicity Physical: irritant	800 gallons	
Water Treatment Chemical NALCO Acti-Brom ® 7342 Sodium Bromide			Health: low toxicity Physical: irritant	800 gallons	

Water Treatment Chemical NALCO pHreedom ® 5200M Sodium salt of phosphonomethylated diamine			Health: low to moderate toxicity Physical: irritant	800 gallons	
Water Treatment Chemical NALCO PCL-1346			Health: low toxicity Physical: irritant	800 gallons	
Water Treatment Chemical NALCO Permacare ® PC-7408 Sodium Bisulfite			Health: low toxicity Physical: irritant	800 gallons	
Water Treatment Chemical NALCO BT-3000 Sodium Hydroxide Sodium Tripolyphosphate			Health: high toxicity Physical: corrosive	800 gallons	
Water Treatment Chemical NALCO 8338 Sodium Nitrate Sodium Tolytriazole Sodium Hydroxide			Health: moderate toxicity Physical: toxic	800 gallons

C.5 - HEALTH AND SAFETY

Testimony of Alvin Greenberg, Ph.D.

C.5.1 SUMMARY OF CONCLUSIONS

U.S. Bureau of Land Management and Energy Commission staff (hereafter jointly referred to as staff) have analyzed potential public health and safety risks associated with construction and operation of the Genesis Solar Energy Project (GSEP) and does not expect there would be any significant adverse cancer, or short - or long-term noncancer health effects from project toxic emissions. Staff's analysis of potential health impacts from the proposed GSEP project was based on a conservative health protective methodology that accounts for impacts to the most sensitive individuals in a given population, including newborns and infants. According to the results of staff's health risk assessment, emissions from GSEP would not contribute significantly to morbidity or mortality in any age or ethnic group residing in the project area.

C.5.2 INTRODUCTION

The purpose of this Preliminary Staff Assessment/Plan Amendment/Draft Environmental Impact Statement (PSA/DPA/DEIS) is to determine if emissions of toxic air contaminants (TACs) from the proposed GSEP project would have the potential to cause significant adverse public health impacts or to violate standards for public health protection. If potentially significant health impacts are identified, staff will evaluate mitigation measures to reduce such impacts to insignificant levels.

In addition to the analysis contained in this Public Health and Safety Section that focuses on potential effects to the public from emissions of toxic air contaminants, other related aspects to the assessment of potential public health and safety impacts from GSEP are considered elsewhere in this document as listed and briefly described below:

- Air Quality - evaluates the expected air quality impacts from the emissions of criteria air pollutants from both the construction and operation of the GSEP Project; Criteria air pollutants are defined as air contaminants for which the state and/or federal governments have established an ambient air quality standard to protect public health;
- Hazardous Materials Management - evaluates the potential impacts on public and worker health from accidental releases of hazardous materials;
- Socioeconomics and Environmental Justice - evaluates project-induced changes on community services including law enforcement and hospitals;
- Soil and Water Resources – evaluates the potential for GSEP to cause contamination of soil and water resources, to exacerbate flooding, and to cause adverse effects to water supply in consideration of other existing users and projected needs;
- Transmission Line Safety and Nuisance – evaluates potential effects associated with proposed transmission lines accounting for both the physical presence of the lines and the physical interactions of their electric and magnetic fields; The potential effects include aviation safety, interference with radio-frequency communication,

audible noise, fire hazards, hazardous shocks, nuisance shocks, and electric and magnetic field (EMF) exposure.

- Worker Safety and Fire Protection - assess the worker safety and fire protection measures proposed by the applicant including determining whether the project would have any adverse impacts on fire protection and emergency medical services that are also relied upon by the public;
- Waste Management - evaluates issues associated with wastes generated from the proposed project construction and operation including ensuring that wastes would be managed in an environmentally safe manner.

C.5.3 METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

The analysis of proposed project effects must comply with both CEQA and NEPA requirements given the respective power plant licensing and land jurisdictions of the California Energy Commission and U.S. Bureau of Land Management (BLM). CEQA requires that the significance of individual effects be determined by the Lead Agency; however, the use of specific significance criteria is not required by NEPA.

Because this document is intended to meet the requirements of both NEPA and CEQA, the methodology used for determining environmental impacts of the proposed project includes a consideration of guidance provided by both laws.

CEQA requires a list of criteria that are used to determine the significance of identified impacts. A significant impact is defined by CEQA as “a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project” (State CEQA Guidelines Section 15382).

In comparison, the Council on Environmental Quality Regulations for Implementing the Procedural Provisions of the NEPA (CEQ NEPA Regulations) states that “‘Significantly’ as used in NEPA requires considerations of both context and intensity…” (40 CFR 1508.27). Therefore, thresholds serve as a benchmark for determining if a project action will result in a significant adverse environmental impact when evaluated against the baseline. CEQ NEPA Regulations requires that an Environmental Impact Statement (EIS) be prepared when a proposed major federal action (project) as a whole has the potential to “significantly affect the quality of the human environment.”

Thresholds for determining significance in this section are based on Appendix G of the CEQA Guidelines (CCR 2006) and performance standards or thresholds identified by the Energy Commission staff. In addition, staff’s evaluation of the environmental effects of the proposed project on land uses (i.e., those listed below) includes an assessment of the context and intensity of the impacts, as defined in the NEPA implementing regulations 40 CFR Part 1508.27.

Effects of the proposed project on the land use environment (and in compliance with both CEQA and NEPA) have been determined using the thresholds listed below.

The **PUBLIC HEALTH** section of this staff assessment discusses toxic emissions to which the public could be exposed during project construction and routine operation. Following the release of toxic contaminants into the air or water, people may come into contact with them through inhalation, dermal contact, or ingestion via contaminated food or water.

Air pollutants for which no ambient air quality standards have been established are called noncriteria pollutants. Unlike criteria pollutants such as ozone, carbon monoxide, sulfur dioxide, or nitrogen dioxide, noncriteria pollutants have no ambient (outdoor) air quality standards that specify levels considered safe for everyone.

Since noncriteria pollutants do not have such standards, a health risk assessment is used to determine if people might be exposed to those types of pollutants at unhealthy levels. The risk assessment consists of the following steps:

- identify the types and amounts of hazardous substances that GSEP could emit to the environment;
- estimate worst-case concentrations of project emissions in the environment using dispersion modeling;
- estimate amounts of pollutants that people could be exposed to through inhalation, ingestion, and dermal contact; and
- characterize potential health risks by comparing worst-case exposure to safe standards based on known health effects.

Staff relies upon the expertise of the California Environmental Protection Agency (Cal/EPA) Office of Environmental Health Hazard Assessment (OEHHA) to identify contaminants that are known to the state to cause cancer or other noncancer toxicological endpoints and to calculate the toxicity and cancer potency factors of these contaminants. Staff also relies upon the expertise of the California Air Resources Board and the local air districts to conduct ambient air monitoring of toxic air contaminants and the state Department of Public Health to conduct epidemiological investigations into the impacts of pollutants on communities. It is not within the purview or the expertise of the Energy Commission staff to duplicate the expertise and statutory responsibility of these agencies.

Initially, a screening level risk assessment is performed using simplified assumptions that are intentionally biased toward protection of public health. That is, an analysis is designed that overestimates public health impacts from exposure to project emissions. In reality, it is likely that the actual risks from the power plant will be much lower than the risks as estimated by the screening level assessment. The risks for screening purposes are based on examining conditions that would lead to the highest, or worst-case, risks and then using those conditions in the study. Such conditions include:

- using the highest levels of pollutants that could be emitted from the plant;
- assuming weather conditions that would lead to the maximum ambient concentration of pollutants;

- using the type of air quality computer model which predicts the greatest plausible impacts;
- calculating health risks at the location where the pollutant concentrations are estimated to be the highest;
- assuming that an individual's exposure to cancer-causing agents occurs continuously for 70 years; and
- using health-based standards designed to protect the most sensitive members of the population (i.e., the young, elderly, and those with respiratory illnesses).

A screening level risk assessment will, at a minimum, include the potential health effects from inhaling hazardous substances. Some facilities may also emit certain substances that could present a health hazard from noninhalation pathways of exposure (OEHHA 2003, Tables 5.1, 6.3, 7.1). When these substances are present in facility emissions, the screening level analysis includes the following additional exposure pathways: soil ingestion, dermal exposure, and mother's milk (OEHHA 2003, p. 5-3).

The risk assessment process for this project addresses two categories of health impacts: chronic (long-term) noncancer effects, and cancer risk (also long-term). Since the only TAC emitted from this project would be diesel particulate from emergency diesel-fueled engines, and since only long-term health effects have been established for diesel particulate, no acute (short-term) health effects are calculated for this project.

Chronic health effects are those that arise as a result of long-term exposure to lower concentrations of pollutants. The exposure period is considered to be approximately from 12 percent to 100 percent of a lifetime, or from 8 to 70 years (OEHHA 2003, p. 6-5). Chronic health effects include diseases such as reduced lung function and heart disease.

The analysis for noncancer health effects compares the maximum project contaminant levels to safe levels called *Reference Exposure Levels*, or RELs. These are amounts of toxic substances to which even sensitive people can be exposed and suffer no adverse health effects (OEHHA 2003, p. 6-2). These exposure levels are designed to protect the most sensitive individuals in the population, such as infants, the aged, and people suffering from illness or disease which makes them more sensitive to the effects of toxic substance exposure. The Reference Exposure Levels are based on the most sensitive adverse health effect reported in the medical and toxicological literature and include margins of safety. The margin of safety addresses uncertainties associated with inconclusive scientific and technical information available at the time of standard setting and is meant to provide a reasonable degree of protection against hazards that research has not yet identified. The margin of safety is designed to prevent pollution levels that have been demonstrated to be harmful, as well as to prevent lower pollutant levels that may pose an unacceptable risk of harm, even if the risk is not precisely identified as to nature or degree. Health protection is achieved if the estimated worst-case exposure is below the relevant reference exposure level. In such a case, an adequate margin of safety exists between the predicted exposure and the estimated threshold dose for toxicity.

Exposure to multiple toxic substances may result in health effects that are equal to, less than, or greater than effects resulting from exposure to the individual chemicals. Only a small fraction of the thousands of potential combinations of chemicals have been tested for the health effects of combined exposures. In conformity with the California Air Pollution Control Officers Association (CAPCOA 1993) guidelines, the health risk assessment assumes that the effects of each substance are additive for a given organ system (OEHHA 2003, pp. 1-5, 8-12). Other possible mechanisms due to multiple exposures include those cases where the actions may be synergistic or antagonistic (where the effects are greater or less than the sum, respectively). For these types of substances, the health risk assessment could underestimate or overestimate the risks.

For carcinogenic substances, the health assessment considers the risk of developing cancer and assumes that continuous exposure to the cancer-causing substance occurs over a 70-year lifetime. The risk that is calculated is not meant to project the actual expected incidence of cancer, but rather a theoretical upper-bound number based on worst-case assumptions.

Cancer risk is expressed in chances per million and is a function of the maximum expected pollutant concentration, the probability that a particular pollutant will cause cancer (called *potency factors* and established by OEHHA), and the length of the exposure period. Cancer risks for each carcinogen are added to yield total cancer risk. The conservative nature of the screening assumptions used means that actual cancer risks due to project emissions are likely to be considerably lower than those estimated.

The screening analysis is performed to assess worst-case risks to public health associated with the proposed project. If the screening analysis predicts no significant risks, then no further analysis is required. However, if risks are above the significance level, then further analysis, using more realistic site-specific assumptions, would be performed to obtain a more accurate assessment of potential public health risks.

Significance Criteria

Energy Commission staff determines the health effects of exposure to toxic emissions based on impacts to the maximum exposed individual. This is a person hypothetically exposed to project emissions at a location where the highest ambient impacts were calculated using worst-case assumptions, as described above.

As described earlier, noncriteria pollutants for this project are evaluated for long-term (chronic) noncancer health effects as well as cancer (long-term) health effects. The significance of project health impacts is determined separately for each of these categories.

Chronic Noncancer Health Effects

Staff assesses the significance of noncancer health effects by calculating a *hazard index*. A hazard index is a ratio comparing exposure from facility emissions to the reference (safe) exposure level. A ratio of less than 1.0 signifies that the worst-case exposure is below the safe level. The hazard index for every toxic substance that has the same type of health effect is added to yield a Total Hazard Index. A Total Hazard Index of less than 1.0 indicates that cumulative worst-case exposures are less than the

reference exposure levels. Under these conditions, health protection from the project is likely to be achieved, even for sensitive members of the population. In such a case, staff presumes that there would be no significant noncancer project-related public health impacts.

Cancer Risk

Staff relied upon regulations implementing the provisions of Proposition 65, the Safe Drinking Water and Toxic Enforcement Act of 1986, (Health & Safety Code, §§25249.5 et seq.) for guidance to determine a cancer risk significance level. Title 22, California Code of Regulations section 12703(b) states that "the risk level which represents no significant risk shall be one which is calculated to result in one excess case of cancer in an exposed population of 100,000, assuming lifetime exposure." This level of risk is equivalent to a cancer risk of 10 in 1 million, which is also written as 10×10^{-6}. An important distinction is that the Proposition 65 significance level applies separately to each cancer-causing substance, whereas staff determines significance based on the total risk from all cancer-causing chemicals. Thus, the manner in which the significance level is applied by staff is more conservative (health-protective) than that applied by Proposition 65. The significant risk level of 10 in 1 million is consistent with the level of significance adopted by the MDAQMD in Rule 1320.

As noted earlier, the initial risk analysis for a project is typically performed at a screening level, which is designed to overstate actual risks, so that health protection can be ensured. Staff's analysis also addresses potential impacts on all members of the population including the young, the elderly, people with existing medical conditions that may make them more sensitive to the adverse effects of toxic air contaminants and any minority or low-income populations that are likely to be disproportionately affected by impacts. To accomplish this goal, staff uses the most current acceptable public health exposure levels set to protect the public from the effects of airborne toxics. When a screening analysis shows cancer risks to be above the significance level, refined assumptions would likely result in a lower, more realistic risk estimate. Based on refined assumptions, if risk posed by the facility exceeds the significance level of 10 in 1 million, staff would require appropriate measures to reduce the risk to less than significant. If, after all risk reduction measures had been considered, a refined analysis identifies a cancer risk greater than 10 in 1 million, staff would deem such risk to be significant and would not recommend project approval.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

PUBLIC HEALTH AND SAFETY Table 1
Laws, Ordinances, Regulations, and Standards (LORS)

Applicable Law	Description
Federal	
Clean Air Act section 112 (Title 42, U.S. Code section 7412)	This act requires new sources that emit more than 10 tons per year of any specified Hazardous Air Pollutant (HAP) or more than 25 tons per year of any combination of HAPs to apply Maximum Achievable Control Technology.
State	
California Health and Safety Code section 25249.5 et seq. (Proposition 65)	These sections establish thresholds of exposure to carcinogenic substances above which Prop 65 exposure warnings are required.
California Health and Safety Code section 41700	This section states that "no person shall discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health, or safety of any such persons or the public, or which cause, or have a natural tendency to cause injury or damage to business or property."
California Health and Safety Code Sections 44300 et seq.	Air Toxics Hot Spots Program requires participation in the inventory and reporting program at the District level.
California Health and Safety Code Sections 44360 - 44366	Air Toxics Hot Spots Information and Assessment Act requires that based on results of an HRA conducted per CARB/OEHHA guidelines, toxic contaminants do not exceed acceptable levels.
California Public Resource Code section 25523(a); Title 20 California Code of Regulations (CCR) section 1752.5, 2300–2309 and Division 2 Chapter 5, Article 1, Appendix B, Part (1); California Clean Air Act, Health and Safety Code section 39650, et seq.	These regulations require a quantitative health risk assessment for new or modified sources, including power plants that emit one or more toxic air contaminants (TACs).
Local	
Mojave Desert Air Quality Management District (MDAQMD) Rule 1320	Requires the use of BACT and T-BACT at certain projects and the preparation of an HRA.

C.5.4 PROPOSED PROJECT

C.5.4.1 SETTING AND EXISTING CONDITIONS

This section describes the environment in the vicinity of the proposed project site from the public health perspective. Features of the natural environment, such as meteorology and terrain, affect the project's potential for causing impacts on public health. An emissions plume from a facility may affect elevated areas before lower terrain areas, due to a reduced opportunity for atmospheric mixing. Consequently, areas of elevated terrain can often be subjected to increased pollutant impacts. Also, the types of land use near a site influence the surrounding population distribution and density, which, in turn, affects public exposure to project emissions. Additional factors affecting potential public health impacts include existing air quality, existing public health concerns, and environmental site contamination.

Site and Vicinity Description

The proposed facility would be located in the Mojave Desert portion of eastern Riverside County, approximately 25 miles west of Blythe and 4 miles north of I-10. The topography of the site is essentially flat (about 370 to 400 feet above sea level). Land uses in the project vicinity include undeveloped desert, wilderness, and agricultural uses. Elevated terrain can be found at about 5-6 miles north and northwest of the site boundary where the Palen and McCoy mountains begin (GSEP 2009a, Sections 3.3 and Figure 3.2-1).

The general population includes many sensitive subgroups that may be at greater risk from exposure to emitted pollutants. These sensitive subgroups include the very young, the elderly, and those with existing illnesses. Sensitive receptors in the project vicinity are listed in Table 5.15-1 of the AFC. There are no sensitive receptors within a 6-mile radius of the project site, and there are no residences or other public receptors within a 4-mile radius of the site (GSEP 2009a, Section 5.15.1). The Chuckwalla Valley and Ironwood State Prisons are located about nine miles south and the nearest schools or medical facilities are in Blythe, about 25 miles away (GSEP 2009a, 5.12.1.1).

Meteorology

Meteorological conditions, including wind speed, wind direction, and atmospheric stability, affect the extent to which pollutants are dispersed into ambient air as well as the direction of pollutant transport. This, in turn, affects the level of public exposure to emitted pollutants and associated health risks. When wind speeds are low and the atmosphere is stable, for example, dispersion is reduced and localized exposure may be increased.

This region of Riverside County (part of the Mojave Desert) is characterized by a dry-hot desert climate; summers are hot and dry, winters are moderate with low precipitation, and temperature inversions are strong. The region typically experiences over 345 sunny days per year. Winds generally flow from the south and southwest across the region and tend to transport air pollutants from the Los Angeles area into the Mojave Desert Air Basin (GSEP 2009a, section 5.2.1.3).

Atmospheric stability is a measure related to turbulence, or the ability of the atmosphere to disperse pollutants due to convective air movement. Mixing heights (the height above ground level through which the air is well mixed and in which pollutants can be dispersed) are lower during mornings due to temperature inversions and increase during the warmer afternoons. Staff's **AIR QUALITY** section presents more detailed meteorological data.

Existing Air Quality

The proposed site is within the jurisdiction of the Mojave Desert Air Quality Management District (MDAQMD). By examining average toxic concentration levels from representative air monitoring sites in the project vicinity with cancer risk factors specific to each contaminant, lifetime cancer risk can be calculated to provide a background risk level for inhalation of ambient air. For comparison purposes, it should be noted that the overall lifetime cancer risk for the average individual in the United States from all causes is about 1 in 3, or 333,000 in one million. For the year 2004, the American Cancer Society estimated that the death rate due to cancer was 23.1%, about 1 in 4.

The California Air Resources Board (CARB) published a report on emissions and air quality in the state of California in 2008, showing that concentrations of the top ten toxic air contaminants (TAC) and their associated health risk have been substantially reduced since 1990. The concentrations of TACs estimated for the Mojave Desert Air Basin (MDAB) during 2008 are presented in AFC Table 5.15-2 (GSEP 2009a), which shows that diesel PM, formaldehyde, benzene, and acetaldehyde contribute the majority of TAC emissions in the MDAB.

There are no monitoring stations within the MDAB that actively report TACs, and therefore the background cancer risk in the MDAB cannot be determined. The nearest CARB air toxics monitoring station that actively reports values is located in Calexico, approximately 80 miles southwest of the project site. Although staff does not consider this location to be representative of air quality in the area of the proposed site, it serves to show the upper-bound levels of toxic air contaminants found in the region. In 2008, the background cancer risk calculated by CARB for the Calexico monitoring station was about 135 in one million (CARB 2009). The pollutants 1,3-butadiene and benzene, emitted primarily from mobile sources, accounted together for more than half of the total risk. The risk from 1,3-butadiene was about 43 in one million, while the risk from benzene was about 44 in one million. Formaldehyde accounts for about 13% of the 2008 average calculated cancer risk based on air toxics monitoring results, with a risk of about 18 in one million. Formaldehyde is emitted directly from vehicles and other combustion sources, such as the proposed facility. The risk from hexavalent chromium was about 14 in one million, or ~10% of the total risk.

The use of reformulated gasoline, beginning in the second quarter of 1996, as well as other toxics reduction measures, have led to a decrease of ambient levels of toxics and associated cancer risk in all areas of California during the past few years. For example, in one large air district, cancer risk was 342 in one million based on 1992 data and in 2002, the average inhalation cancer risk decreased to 162 in one million (BAAQMD 2004, p. 12). Similar reductions occurred throughout the state's major metropolitan areas.

Existing Public Health Concerns

When evaluating a new Project, staff conducts a study and analysis of existing public health issues in the Project vicinity. This analysis is prepared in order to identify the current status of respiratory diseases (including asthma), cancer, and childhood mortality rates in the population located near the proposed Project, which provides a basis on which to evaluate the significance of any additional health impacts from the proposed Project. Because of the very low population in the immediate vicinity of the project and because no existing health concerns within a 6-mile radius of the project have been identified by the applicant (GSEP 2009a, Section 5.15.1), staff did not conduct an analysis of existing public health issues.

Environmental Site Contamination

Site disturbances occur during demolition of existing structures, facility construction from excavation, grading, and earth moving. Such activities have the potential to adversely affect public health through various mechanisms, such as the creation of airborne dust, material being carried off-site through soil erosion, and uncovering buried hazardous substances. The Phase I Environmental Site Assessment conducted for this site in 2009 found no "Recognized Environmental Conditions" per the American Society for Testing and Materials Standards (ASTM) definition. That is, there was no evidence or record of any use, spillage, or disposal of hazardous substances on the site, nor was there any other environmental concern that would require remedial action (GSEP 2009a, Section 5.13.1.3).

To address the possibility that soil contamination would be encountered during construction of the GSEP, proposed Conditions of Certification **WASTE-1** and **WASTE-2** require a registered professional engineer or geologist to be available during soil excavation and grading to ensure proper handling and disposal of contaminated soil. Staff believes that adherence to current ordinances and to staff's proposed Conditions of Certification mentioned above will be adequate to address any soil or groundwater contamination that exists on this site. See the PSA/DPA/DEIS section on **WASTE MANAGEMENT** for a more detailed analysis of this topic.

C.5.4.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Construction Impacts and Mitigation

Potential risks to public health during construction may be associated with exposure to toxic substances in contaminated soil disturbed during site preparation (discussed in the "Setting" section above), as well as diesel exhaust from heavy equipment operation. Criteria pollutant impacts from the operation of heavy equipment and particulate matter from earth moving are examined in staff's **AIR QUALITY** analysis.

The operation of construction equipment will result in air emissions from diesel-fueled engines. Diesel emissions are generated from sources such as trucks, graders, cranes, welding machines, electric generators, air compressors, and water pumps. Although diesel exhaust contains criteria pollutants such as nitrogen oxides, carbon monoxide, and sulfur oxides, it also includes a complex mixture of thousands of gases and fine particles. These particles are primarily composed of aggregates of spherical carbon

particles coated with organic and inorganic substances. Diesel exhaust contains over 40 substances that are listed by the U.S. Environmental Protection Agency (U.S. EPA) as hazardous air pollutants and by the California Air Resources Board (ARB) as toxic air contaminants.

Exposure to diesel exhaust may cause both short- and long-term adverse health effects. Short-term effects can include increased cough, labored breathing, chest tightness, wheezing, and eye and nasal irritation. Long-term effects can include increased coughing, chronic bronchitis, reductions in lung function, and inflammation of the lung. Epidemiological studies also strongly suggest a causal relationship between occupational diesel exhaust exposure and lung cancer.

Based on a number of health effects studies, the Scientific Review Panel (SRP) on Toxic Air Contaminants recommended a chronic REL (see REL discussion in Method of Analysis section above) for diesel exhaust particulate matter of 5 $\mu g/m^3$ and a cancer unit risk factor of $3x10^{-4}$ $(\mu g/m^3)^{-1}$ (SRP 1998, p. 6). [The SRP, established pursuant to California Health and Safety Code section 39670, evaluates the risk assessments of substances proposed for identification as Toxic Air Contaminants by ARB and the Department of Pesticide Regulation (DPR). The SRP reviews the exposure and health assessment reports and the underlying scientific data upon which the reports are based.] The SRP did not recommend a value for an acute REL, since available data in support of a value was deemed insufficient. On August 27, 1998, ARB listed particulate emissions from diesel-fueled engines as a toxic air contaminant and approved SRP's recommendations regarding health effect levels.

Construction of the GSEP, including site preparation, is anticipated to take place over a period of 37 months (GSEP 2009a, Section 3.7.1). As noted earlier, assessment of chronic (long-term) health effects assumes continuous exposure to toxic substances over a significantly longer time period, typically from eight to seventy years.

AFC Table B.5-5 (GSEP 2009a) and its updated version table K.5-5 (GSEP 2009f) present maximum daily and annual emissions from construction activities including fugitive dust and diesel exhaust. In response to Data Request # 137, the applicant conducted a health risk assessment for diesel particulate matter (DPM) from construction equipment emissions in accordance with methods provided by the South Coast AQMD in their guidance documents on modeling cancer risk from mobile sources. The applicant's modeling of worst-case construction emissions adjusted to a 37-month period (lifetime exposure adjustment factor of 0.0126) found that the cancer risk was estimates to be 0.1 in one million at the maximum impact receptor (MIR), below the level of significance (10 in one million). The chronic hazard index was found to be 0.005 at the MIR, below the level of significance of 1.0 (GSEP 2009f, Data Response Item 137).

Mitigation measures are proposed by both the applicant and Air Quality staff to reduce the maximum calculated PM10 as well as PM2.5 concentrations. These include the use of extensive fugitive dust control measures that are assumed to result in 90% reduction of fugitive dust emissions. In order to mitigate potential impacts from particulate emissions during the operation of diesel-powered construction equipment, Air Quality staff recommends the use of ultra low-sulfur diesel fuel and Tier 2 or Tier 1 California Emission Standards for Off-Road Compression-Ignition Engines or the installation of an

oxidation catalyst and soot filters on diesel equipment. The catalyzed diesel particulate filters are passive, self-regenerating filters that reduce particulate matter, carbon monoxide, and hydrocarbon emissions through catalytic oxidation and filtration. The degree of particulate matter reduction is comparable for both mitigation measures in the range of approximately 85-92%. Such filters will reduce diesel emissions during construction and further reduce the impacts associated with diesel exhaust. (See the **Air Quality** section of this SA/DPA/DEIS for staff's proposal to control particulate matter.)

Operation Impacts and Mitigation

Emissions Sources

The emissions sources at the proposed GSEP site include two natural gas-fired auxiliary boilers, two cooling tower, two diesel-fueled emergency generators, two diesel-fueled emergency fire pumps, DPM from maintenance vehicles, and VOCs from HTF fugitive emissions. In response to Data Requests 139 and 142, the applicant revised the HRA for the entire facility to include maintenance vehicle DPM and HTF fugitive emissions.

As noted earlier, the first step in a health risk assessment is to identify potentially toxic compounds that may be emitted from the facility. Table 5.15-3 of the AFC lists toxic air contaminants that may be emitted by the project. Each TAC has a toxicity value published in the OEHHA Guidelines that includes the REL used to calculate short-term and long-term noncancer health effects, and the cancer unit risks used to calculate the lifetime risk of developing cancer (OEHHA 2003).

Public Health Table 2 lists toxic emissions potentially emitted from the GSEP and shows how each contributes to the health risk analysis. For example, the first row shows that oral exposure to acetaldehyde is not of concern, but if inhaled, may have cancer and chronic (long-term) noncancer health effects, but not acute (short-term) effects.

Public Health Table 2 Types of Health Impacts and Exposure Routes Attributed to Toxic Emissions*

*Source: OEHHA 2003 Appendix L and GSEP 2009a, Table 5.15-3.

Appendix B.1 of the AFC (GSEP 2009a) and Data Responses Set 1A Appendix K (GSEP 2009f) list non-criteria pollutants and their emission factors that may be emitted from the sources listed above. Emission factors were obtained from the U.S. EPA emission factors database (AP-42), the California Air Toxics Emission Factors (CATEF II) database, and the vendors for particular equipment. Table B.1-7 of the AFC (GSEP 2009a) and its updated version Table K.1-7 (GSEP 2009f) list emissions from maintenance vehicles including DPM.

Staff requested in Data Requests 141 and 142 that emissions of HTF toxic thermal degradation products be determined and considered in a HRA. According to the applicant's response, HTF may decompose into the following gases in the ullage system (GSEP 2009f, Data Response Item 141):

- 89.9% by weight Benzene
- 9.8% by weight Phenol
- 0.3 % by weight Other VOCs

The applicant noted that the MSDS sheet for the HTF states that decomposition products of HTF (benzene and phenol) occur in trace amounts. In addition, the applicant proposes to use carbon adsorption technology for the HTF ullage system which is assumed to result in 99% control of VOCs. Therefore, 5% by weight of total VOCs were used to represent the upper limit for trace amounts of benzene and phenol. Table 3 of Data Response #141 provides the estimated emissions of benzene and phenol from HTF system components (GSEP 2009f).

Emissions Levels

Once potential emissions are identified, the next step is to quantify them by conducting a "worst case" analysis. Maximum hourly emissions are required to calculate acute (one-hour) noncancer health effects, while estimates of maximum emissions on an annual basis are required to calculate cancer and chronic (long-term) noncancer health effects.

The next step in the health risk assessment process is to estimate the ambient concentrations of toxic substances that may result from the project. This is accomplished by using a screening air dispersion model and assuming conditions that result in maximum impacts. The applicant's screening analysis was performed using the ARB/OEHHA Hotspots Analysis and Reporting Program (HARP) modeling program. Finally, ambient concentrations were used in conjunction with RELs and cancer unit risk factors to estimate health effects which might occur from exposure to facility emissions. Exposure pathways, or ways in which people might come into contact with toxic substances, include inhalation, dermal (through the skin) absorption, soil ingestion, consumption of locally grown plant foods, and mother's milk.

The above method of assessing health effects is consistent with OEHHA's Air Toxics Hot Spots Program Risk Assessment Guidelines (OEHHA 2003) referred to earlier, and results in the following health risk estimates.

Impacts

The applicant's revised screening health risk assessment for the project including all sources as presented in Data Response 139 resulted in a maximum acute hazard index of 0.00668 and a maximum chronic hazard index of 0.00119 at the Maximum Impact Receptor (MIR). The MIR represents the residential receptor where the highest concentrations of project-related pollutants would exist. The cancer risk was calculated to be 3.27 in 1,000,000 at the MIR.

As **Public Health Table 3** shows, both acute and chronic hazard indices are under the significance level of 1.0 and cancer risk is under the significant level of 10 in 1,000,000, indicating that no cancer or short- or long-term adverse health effects are expected.

Public Health Table 3 Operation Hazard/Risk at the Maximum Impact Receptor

Type of Hazard/Risk	Hazard Index/Risk	Significance Level	Significant?
Acute Noncancer	0.007	1.0	No
Chronic Noncancer	0.001	1.0	No
Individual Cancer	3.3 in one million	10 in one million	No

Source: Data Response Item 139 (GSEP 2009f).

Staff conducted a quantitative evaluation of the risk assessment results presented in the Genesis Solar Energy Project AFC (09-AFC-8) and in the "Data Request Set 1A (#1-227)" (December 2009). Modeling files provided by the applicant were also reviewed.

Construction Phase Analysis

For the construction phase analysis, atmospheric dispersion modeling of diesel particulate matter (DPM) emissions from construction equipment and vehicles was conducted by the applicant using AERMOD. The maximum predicted offsite concentration of diesel particulate matter was reported by the applicant to be 0.02562 ug/m^3. Cancer risk due to diesel exhaust emissions was determined by multiplying the DPM concentration by the diesel cancer inhalation unit risk of 0.0003 $(ug/m^3)^{-1}$ and an adjustment factor of 0.0126 to account for the 37 month construction period. Cancer risk at the location of the maximum offsite concentration was determined to be 0.1 in a million and chronic HI to be 0.005 (noncancer chronic REL is 5 ug/m^3).

Operations Phase Analysis

For the operations phase analysis, atmospheric dispersion modeling of facility emissions was conducted by the applicant using AERMOD. Local meteorological data were used, on-site buildings were included for building downwash effects, and 6814 grid receptors were modeled.

A total of 23 emitting units were modeled by the applicant for facility operations including:

- 2 auxiliary boilers
- 2 diesel emergency generators
- 2 diesel firewater pumps
- 2 HTF (heat transfer fluid) vents
- 14 wet cooling tower cells (2 cooling towers, each with 7 cells)
- Fugitive emissions of toxic thermal degradation products of HTF and fugitive emissions of mobile sources involved in routine operations. These emissions were modeled as being emitted from a single area source located between the two solar fields.
- Total of 23 emitting sources evaluated at the proposed facility.

The HTF (heat transfer fluid) is circulated through the solar field where it is heated by sunlight concentrated on the receiver tube elements of the solar collectors. HTF is comprised biphenyl/diphenyl oxide. Thermal decomposition of HTF results in decomposition products that can include benzene, phenol and toluene. In modeling HTF fugitive loss emissions, the applicant assumed that 89.9% of the emissions would be comprised of benzene and 9.8% of phenol.

Staff used the HARP On-Ramp program to load the applicant's AERMOD results into the CARB/OEHHA Hotspots Analysis and Reporting Program (HARP), Version 1.4a for the risk analysis. Exposure pathways assessed include inhalation, ingestion of home-grown produce, dermal absorption, soil ingestion and mother's milk. Emission factors obtained from the applicant's modeling files and used in this analysis are listed in **Public Health Table 5**. For risk calculations using the HARP model, the "Derived (Adjusted) Method" was used for cancer risk and the "Derived (OEHHA) Method" was used for chronic noncancer hazard.

Cancer risk and chronic and acute hazard index values obtained by staff are compared to results reported by the applicant in the December 2009 response to data requests in **Public Health Table 6**. Risk and hazard were determined at the point of maximum impact, PMI, under the 70 year residential scenario, located between the two solar fields. The nearest residential receptor is located 15 miles from the site and there are no sensitive receptors within six miles of the project site.

Public Health Table 7 presents substance- and source-specific cancer risks at the PMI. Analysis of this table indicates that 100% of the cancer risk at the PMI is attributed to emissions from two sources: 12% due to emissions from the HTF vents and 88% due to fugitive emissions. Additional analysis indicates that 100% of cancer risk at the PMI is attributed to emissions of two substances: 47% due to benzene emissions (from the auxiliary boiler, the HTF vents and fugitive emissions) and 52% due to diesel particulate matter emissions (from onsite mobile sources as well as the two diesel engines).

Cumulative impacts were not evaluated as there are no facilities within an eight mile radius of the project site (source: page 5.15-10 of the AFC).

Public Health Table 5. Operation Phase Emission Rates

Substance	Annual Average Emissions (lbs/year)	Maximum 1-Hour Emissions (lbs/hour)
EMISSION RATES FROM EACH OF 2 AUXILIARY BOILERS		
Acetaldehyde	1.99E-03	1.36E-04

TOTAL	3.88E-07	2.87E-06	3.27E-06

** DieselExhPM is listed twice in the applicant's emissions modeling file and risks are reported in the same manner. It is unclear to staff why this substance is listed twice, however staff retained it as such in staff's calculations of risk.*

Cooling Towers

In addition to being a source of potential toxic air contaminants, the possibility exists for bacterial growth to occur in the two wet cooling towers, including Legionella. Legionella is a bacterium that is ubiquitous in natural aquatic environments and is also widely distributed in man-made water systems. It is the principal cause of legionellosis, otherwise known as Legionnaires' Disease, which is similar to pneumonia. Transmission to people results mainly from inhalation or aspiration of aerosolized contaminated water. Untreated or inadequately treated cooling systems, such as industrial cooling towers and building heating, ventilating, and air conditioning systems, have been correlated with outbreaks of legionellosis.

Legionella can grow symbiotically with other bacteria and can infect protozoan hosts. This provides Legionella with protection from adverse environmental conditions, including making it more resistant to water treatment with chlorine, biocides, and other disinfectants. Thus, if not properly maintained, cooling water systems and their components can amplify and disseminate aerosols containing Legionella.

The State of California regulates recycled water for use in cooling towers in Title 22, Section 60303, California Code of Regulations. This section requires that, in order to protect workers and the public who may come into contact with cooling tower mists, chlorine or another biocide must be used to treat the cooling system water to minimize the growth of Legionella and other micro-organisms. This regulation does not apply to the GSEP project since it intends to use groundwater supplied from on-site wells; however, the potential remains for Legionella growth in cooling water at the GSEP due to nutrients found in groundwater.

The U.S. EPA published an extensive review of Legionella in a human health criteria document (EPA 1999). The U.S. EPA noted that Legionella may propagate in biofilms (collections of microorganisms surrounded by slime they secrete, attached to either inert or living surfaces) and that aerosol-generating systems such as cooling towers can aid in the transmission of Legionella from water to air. The U.S. EPA has inadequate quantitative data on the infectivity of Legionella in humans to prepare a dose-response evaluation. Therefore, sufficient information is not available to support a quantitative characterization of the threshold infective dose of Legionella. Thus, the presence of even small numbers of Legionella bacteria presents a risk - however small - of disease in humans.

In February of 2000 the Cooling Technology Institute (CTI) issued its own report and guidelines for the best practices for control of Legionella (CTI 2000). The CTI found that 40-60 percent of industrial cooling towers tested was found to contain Legionella. More recently, staff has received a 2005 report of testing in cooling towers in Australia that found the rate of Legionella presence in cooling tower waters to be extremely low, approximately three to six percent. The cooling towers all had implemented aggressive water treatment and biocide application programs similar to that required by proposed condition of certification **Public Health-1**.

To minimize the risk from Legionella, the CTI noted that consensus recommendations included minimization of water stagnation, minimization of process leads into the cooling

system that provide nutrients for bacteria, maintenance of overall system cleanliness, the application of scale and corrosion inhibitors as appropriate, the use of high-efficiency mist eliminators on cooling towers, and the overall general control of microbiological populations.

Good preventive maintenance is very important in the efficient operation of cooling towers and other evaporative equipment (ASHRAE 1998). Preventive maintenance includes having effective drift eliminators, periodically cleaning the system if appropriate, maintaining mechanical components in working order, and maintaining an effective water treatment program with appropriate biocide concentrations. Staff notes that most water treatment programs are designed to minimize scale, corrosion, and biofouling and not to control Legionella.

The efficacy of any biocide in ensuring that bacterial and in particular Legionella growth, is kept to a minimum is contingent upon a number of factors including but not limited to proper dosage amounts, appropriate application procedures and effective monitoring.

In order to ensure that Legionella growth is kept to a minimum, thereby protecting both nearby workers as well as members of the public, staff has proposed Condition of Certification **Public Health-1**. The condition would require the project owner to prepare and implement a biocide and anti-biofilm agent monitoring program to ensure that proper levels of biocide and other agents are maintained within the cooling tower water at all times, that periodic measurements of Legionella levels are conducted, and that periodic cleaning is conducted to remove bio-film buildup. Staff believes that with the use of an aggressive antibacterial program coupled with routine monitoring and biofilm removal, the chances of Legionella growing and dispersing would be reduced to insignificance. The applicant has stated that an appropriate biocide program and anti-biofilm agent monitoring program would be implemented for the cooling towers (GSEP 2009a, Section 5.15.2.9). (note: The requirements for the use, storage, and spill response for all chemicals, including biocides, are described in the **HAZARDOUS MATERIALS MANAGEMENT** section of this SA/DPA/DEIS.)

Closure and Decommissioning Impacts and Mitigation

Closure of the proposed GSEP (temporary or permanent) would follow a closure plan prepared by the applicant and designed to minimize public health and environmental impacts. Permanent closure would presumably occur 30 years after the start of operation unless the project remains economically viable. Decommissioning procedures would be consistent with all applicable LORS and would be submitted to the CEC for approval before implementation (GSEP 2009a, Section 3.9). Staff expects that impacts to public health from the closure and decommissioning process would represent a fraction of the impacts associated with the construction or operation of the proposed GSEP. Therefore based on staff's analysis for the construction and operation phases of this project, staff concludes that public health-related impacts from closure and decommissioning of the GSEP would be insignificant.

C.5.4.3 CEQA LEVEL OF SIGNIFICANCE

Staff's analysis of public health impacts from the proposed GSEP has determined that impacts would be below the CEQA level of significance.

C.5.5 REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would essentially be Unit 1 of the proposed project, including a 125 MW solar facility located within the boundaries of the proposed project as defined by NextEra. This alternative is analyzed for two major reasons: (1) it eliminates about 50 percent of the proposed project area so all impacts are reduced, and (2) by eliminating the eastern solar field, it would reduce the water required for wet cooling by 50 percent. The boundaries of the Reduced Acreage Alternative are shown in **Alternatives Figure 1**.

C.5.5.1 SETTING AND EXISTING CONDITIONS

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates effects to the eastern 125 MW solar field and relocates the gas yard approximately 1.75 miles northwest of its present location. As a result, the environmental setting consists of the western portion of the proposed project, as well as the area affected by the linear project components.

C.5.5.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Emissions associated with the construction and operation of the Reduced Acreage Alternative would be reduced by approximately 50% from those estimated for the GSEP as proposed. The reduced emissions would decrease the cancer risk and chronic and acute hazard indices predicted for the 250 MW project as proposed. However, the public health analysis has determined that the cancer risk and chronic and acute hazard indices are far below the level of significance at the point of maximum impact for the project as proposed, indicating that no significant public health impacts are expected. Therefore staff concludes that with respect to public health impacts, the Reduced Acreage Alternative is not preferable over the project as proposed

C.5.5.3 CEQA LEVEL OF SIGNIFICANCE

The CEQA level of significance for public health would not change with the Reduced Acreage Alternative, as both the project as proposed and the Reduced Acreage Alternative would have impacts below the level of significance. The same conditions of certification would be required for the Reduced Acreage Alternative and the project as proposed.

C.5.6 DRY COOLING ALTERNATIVE

This section identifies the potential impacts of using air-cooled condenser (ACC) systems rather than the cooling towers proposed by NextEra for the Genesis project. It is assumed that the ACC systems would be located where the cooling towers are currently proposed for each of the two 125 MW power block, as illustrated in **Alternatives Figure 2** (see Section B.3).

Approximately 18 ACC fans would be required for each of the two solar fields. The 18 fans, or ACC's, would operate when the ambient temperature is above 50 degrees Fahrenheit. When the temperature is below 50 degrees Fahrenheit, only 10 of the fans

would be used (GSEP 2009f). The 18 ACC fans described in the GSEP cooling study would have a length of approximately 279 feet, a width of approximately 127 feet, and a height of 98 feet (GSEP 2009f). However, based on the ACC preliminary designs for nearby solar thermal projects in similar ambient temperatures, an additional 11,690 square feet could be required for siting of the fans and the fans would be up to 120 feet in height. In addition to the ACC fans, NextEra would use a small Wet Surface Air Cooler when needed to provide auxiliary cooling during extremely hot days (GSEP 2009f). This alternative is analyzed because it would reduce the amount of water required for steam turbine cooling from 822 acre-feet per year (AFY) to 66 AFY. This reduction in water use would reduce impacts to water and biological resources.

C.5.6.1 Setting and Existing Conditions

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates the use of wet-cooling towers and incorporated the use of air-cooled condensers (ACC) in the same location. As a result, the environmental setting would be the same as for the proposed project.

C.5.6.2 Assessment of Impacts and Discussion of Mitigation

The **Public Health and Safety** section of this SA/DPA/DEIS discusses toxic emissions to which the public could be exposed during project construction and routine operation. The majority of the toxic emissions from the proposed project would not change with the inclusion of dry cooling and would not cause additional impacts. Dry cooking would however eliminate the risk of contracting legionellosis by inhaling aerosolized Legionella-contaminated water from wet cooling towers.

As noted in the **Air Quality** section, the additional construction activities from erecting a dry cooling structure would increase the dust-related PM10 emissions. PM10 impacts are of concern in this public health analysis because health effects can result from the interaction of the toxic pollutants that might be adsorbed to the PM10. Such adsorption would be associated with specific soil contamination that must be remediated before beginning construction. The toxic health risks from diesel equipment emissions would be minimized through implementation of the Conditions of Certification in the **Air Quality** section, which would also apply to construction of any cooling structures that might be used for the project.

C.5.6.3 CEQA Level of Significance

No new impacts to health and safety resources would be created with use of ACCs in place of cooling towers, and the potential impacts of Legionella growth in the cooling towers would be eliminated. The overall impacts of the project with dry cooling would be similar to those of the proposed project as both would have impacts below the level of significance with incorporated mitigation measures.

C.5.7 NO PROJECT/NO ACTION ALTERNATIVE

There are three No Project/No Action Alternatives evaluated in this section, as follows:

C.5.7.1 NO ACTION ON PROPOSED PROJECT APPLICATION AND ON CDCA LAND USE PLAN AMENDMENT

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and BLM would not amend the CDCA Plan. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, none of the construction or operation air emissions from the proposed project would occur and none of the benefits of the proposed project in displacing fossil fuel fired generation and reducing associated pollutant emissions would occur. However, the land on which the project is proposed would become available to other uses that are consistent with BLM's land use plan, including another solar project requiring a land use plan amendment. In addition, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

C.5.7.2 NO ACTION ON PROPOSED PROJECT APPLICATION AND AMEND THE CDCA LAN USE PLAN TO MAKE THE AREA AVAILABLE FOR FUTURE SOLAR DEVELOPMENT

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and BLM would amend the CDCA Land Use Plan of 1980, as amended, to allow for other solar projects on the site. As a result, it is possible that another solar energy project could be constructed on the project site.

Because the CDCA Plan would be amended, it is possible that the site would be developed with the same or a different solar technology. As a result, air emissions would result from the construction and operation of the solar technology and would likely be similar to the air quality impacts from the proposed project. Different solar technologies require different amounts of grading and maintenance; however, it is expected that all the technologies would require some grading and maintenance. The benefits of the proposed project in displacing fossil fuel fired generation and reducing associated pollutant emissions could occur with a different solar technology at this site and therefore with this alternative. As such, this No Project/No Action Alternative could result in air quality impacts and benefits similar to the impacts under the proposed project.

C.5.7.3 NO ACTION ON PROPOSED PROJECT APPLICATION AND AMEND THE CDCA LAND USE PLAN TO MAKE THE AREA UNAVAILABLE FOR FUTURE SOLAR DEVELOPMENT

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and the BLM would amend the CDCA Plan to make the proposed site unavailable for future solar development. As a result, no solar energy

project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because the CDCA Plan would be amended to make the area unavailable for future solar development, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, the air quality of the site is not expected to change noticeably from existing conditions and, as such, this No Project/No Action Alternative would not result in air quality impacts under the proposed project nor would it result in the air quality benefits from the proposed project. However, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

C.5.8 CUMULATIVE IMPACTS

Section B.3, Cumulative Scenario, provides detailed information on the potential cumulative solar and other development projects in the project area. Together, these projects comprise the cumulative scenario which forms the basis of the cumulative impact analysis for the proposed project. In summary, these projects are:

- Renewable energy projects on BLM, State, and private lands, as shown on **Cumulative Figure 1** and in **Cumulative Tables 1A and 1B.** Although not all of those projects are expected to complete the environmental review processes, or be funded and constructed, the list is indicative of the large number of renewable projects currently proposed in California.
- Foreseeable future projects in the immediate area as shown on **Cumulative Impacts Figure 2, I-10 Corridor Existing and Future/Foreseeable Projects, and Cumulative Tables 2 and 3**. Table 2 presents existing projects in this area and Table 3 presents future foreseeable projects in the I-10 Corridor Area. Both tables indicate project name and project type, its location and its status.

These projects are defined within a geographic area that has been identified by the CEC and BLM as covering an area large enough to provide a reasonable basis for evaluating cumulative impacts for all resource elements or environmental parameters. Most of these projects have, are, or will be required to undergo their own independent environmental review under CEQA and/or NEPA. Even if the cumulative projects described in Section B.3 have not yet completed the required environmental processes, they were considered in the cumulative impacts analyses in this SA/DPA/DEIS.

C.5.8.1 GEOGRAPHIC SCOPE OF ANALYSIS

For the purpose of the public health cumulative analysis, emissions from construction or operation of the GSEP could potentially combine with emissions from past, present and reasonably foreseeable projects to result in adverse health effects to the public. Cumulative impacts in the area of public health could occur if emission sources are close enough so that their plumes combine. Due to differences in emission source elevations, terrain features, wind direction, and other meteorological factors, it is unlikely

that emission plumes from two or more facilities would combine unless they are located in very close proximity. Furthermore, dispersion of plumes tends to occur in parallel, preventing the mixing of plumes from separate locations. On the basis of numerous previous air dispersion modeling conducted by staff to assess public health cumulative impacts, staff finds that the geographic area considered for cumulative impacts on Public Health is only within the project boundaries or within 1/4 mile of project emission sources.

C.5.8.2 EFFECTS OF PAST AND PRESENT PROJECTS

For this analysis, staff analyzed the potential of existing projects in the vicinity of the GSEP to contribute to cumulative impacts. The only existing facility located within nine miles of the project site is the Ironwood State Prison, which has a “no” risk prioritization score according to CARB. This means that emissions from this facility are either below the levels for which a health risk assessment is required or else the calculated risk from this facility is insignificant (GSEP 2009a, Section 5.15.3). The nearest existing source of emissions is Interstate 10, a major route for trucks delivering goods to and from California, located about 4 miles south of the GSEP. As mentioned above, none of these emission sources are close enough to cause cumulative impacts with the proposed GSEP. Staff’s previous modeling has shown repeatedly that unless two sources are within approximately half a mile, their cumulative health risks do not combine to turn an insignificant individual health risk into a significant one.

C.5.8.3 EFFECTS OF REASONABLY FORESEEABLE FUTURE PROJECTS

There is a substantial amount of development planned in the I-10 corridor including over 10 solar power plants and one natural gas-fired power plant as well as commercial and residential projects. Public Health impacts at the proposed project are also not expected to be affected by any reasonably foreseeable future projects, including the proposed Palen and Blythe solar projects proposed for the I-10 corridor. The reasons for staff’s position are described above.

Contribution of the Genesis Solar Energy Project to Cumulative Impacts

Construction. The construction of the GSEP is not expected to result in short term adverse impacts related to public health. It is expected that some of the cumulative projects described above which are not yet built may be under construction the same time as the GSEP, however, short term impacts related to Public Health during construction of those cumulative projects are not expected to occur.

Operation. The operation of the GSEP is not expected to result in long term adverse impacts related to Public Health during operation of the project even though it is expected that some of the cumulative projects described above may be operational at the same time as the GSEP.

Decommissioning. The decommissioning of the GSEP is not expected to result in adverse impacts related to Public Health. It is unlikely that the construction or decommissioning of any of the cumulative projects would occur concurrently with the decommissioning of this project, because the decommissioning is not expected to occur

for approximately 40 years. As a result, it is not expected that significant impacts related to Public Health during decommissioning of the GSEP generated by the cumulative projects will occur.

C.5.9.4 OVERALL CONCLUSION

Public health impacts of the GSEP project would not combine with impacts of any past, present, or reasonably foreseeable projects to result in cumulatively considerable local or regional impacts. Therefore, no mitigation is recommended to address potential cumulative project impacts.

C.5.10 COMPLIANCE WITH LORS

Staff has considered the minority population as identified in **Socioeconomics Figure 1** in its impact analysis and has found no potential significant adverse impacts for any receptors, including environmental justice populations. In arriving at this conclusion, staff notes that its analysis complies with all directives and guidelines from the Cal/EPA Office of Environmental Health Hazard Assessment and the California Air Resources Board. Staff's assessment is biased toward the protection of public health and takes into account the most sensitive individuals in the population. Using extremely conservative (health-protective) exposure and toxicity assumptions, staff's analysis demonstrates that members of the public potentially exposed to toxic air contaminant emissions of this project—including sensitive receptors such as the elderly, infants, and people with pre-existing medical conditions—will not experience any significant chronic or cancer health risk as a result of that exposure. Staff believes that it incorporated every conservative assumption called for by state and federal agencies responsible for establishing methods for analyzing public health impacts. The results of that analysis indicate that there would be no direct or cumulative significant public health and safety impact to any population in the area. Therefore, given the absence of any significant health impacts, there are no disparate health impacts and there are no environmental justice issues associated with **PUBLIC HEALTH AND SAFETY**.

Staff concludes that construction and operation of the GSEP will be in compliance with all applicable LORS regarding long-term and short-term project impacts in the area of **PUBLIC HEALTH AND SAFETY**.

C.5.11 NOTEWORTHY PUBLIC BENEFITS

It is noteworthy that a solar electric generating facility such as the proposed GSEP project would emit significantly less TACs to the environment than other energy sources available in California such as natural gas or biomass, thereby reducing the health risks that would otherwise occur with these non-renewable energy sources. At the same time, the proposed GSEP would provide much needed electrical power to California residences and businesses, and will contribute to electric reliability. Electrical power is not only necessary to maintain a functioning society, but it also benefits many individuals who rely on powered equipment for their health (such as dialysis equipment and temperature control equipment). For example, it is documented that during heat waves in which elevated air-conditioning use causes an electrical blackout, hospitalizations and deaths due to heat stroke are increased.

C.5.12 PROPOSED CONDITIONS OF CERTIFICATION/MITIGATION MEASURES

Public Health-1 The Project owner shall develop and implement a Cooling Water Management Plan to ensure that the potential for bacterial growth in cooling water is kept to a minimum. The Plan shall be consistent with either staff's "Cooling Water Management Program Guidelines" or with the Cooling Technology Institute's "Best Practices for Control of Legionella" guidelines but in either case, the Plan must include sampling and testing for the presence of Legionella bacteria at least every six months. After two years of power plant operations, the Project owner may ask the CPM to re-evaluate and revise the Legionella bacteria testing requirement.

Verification: At least 60 days prior to the commencement of cooling tower operations, the Cooling Water Management Plan shall be provided to the CPM for review and approval.

C.5.13 CONCLUSIONS

Staff has analyzed potential public health risks associated with construction and operation of the GSEP and does not expect any significant adverse cancer, short-term, or long-term health effects to any members of the public including low income and minority populations, from project toxic emissions. Staff also concludes that its analysis of potential health impacts from the proposed GSEP uses a conservative health protective methodology that accounts for impacts to the most sensitive individuals in a given population, including newborns and infants. According to the results of staff's health risk assessment, emissions from the GSEP project would not contribute significantly to morbidity or mortality in any age or ethnic group residing in the project area. With the incorporation of staff's proposed mitigation (Condition of Certification **Public Health-1**), the proposed facility will not present a significant health risk to the public.

C.6 – LAND USE, RECREATION, AND WILDERNESS

Testimony of Negar Vahidi

C.6.1 SUMMARY OF CONCLUSIONS

The U.S. Bureau of Land Management (BLM) and Energy Commission staff (hereafter jointly referred to as "staff") have reviewed the proposed Genesis Solar Energy Project in accordance with the requirements of the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). This section addresses land use issues related to agriculture and rangeland resources, wilderness and recreation resources, wild horses and burros, and compatibility with existing land uses and applicable laws, ordinances, regulations, and standards (LORS). Implementation of the proposed Genesis Solar Energy Project (GSEP or "proposed project") would not result in any adverse impacts to the aforementioned resources.

The applicant has submitted an application to the BLM requesting a right-of-way (ROW) grant to construct the proposed project and its related facilities. Pursuant to the California Desert Conservation Area (CDCA) Plan (1980, as amended), sites associated with power generation or transmission not identified in the CDCA Plan are considered through the Land Use Plan Amendment process. Because the proposed project is not currently identified in the CDCA Plan, the proposed project would require a BLM ROW grant and an approved project-specific CDCA Plan Amendment.

For purposes of CEQA compliance, the level of significance of each impact of the proposed project on land use resources has been determined and is discussed in detail in Section C.6.4.3 (CEQA Level of Significance). In summary, impacts on agricultural lands and rangeland management would be less-than-significant, and there would be no impacts related to Williamson Act contracts. Impacts to recreation and wilderness resources would be less-than-significant. Impacts to horses and burros would be less-than-significant. As discussed in **LAND USE Table 3,** the project would comply with all applicable LORS.

The Reduced Acreage Alternative to the proposed project would essentially be Unit 1 of the proposed project, and would occupy approximately 990 acres of land. The conversion of 990 acres of land to support the components and activities associated with this alternative would disrupt current recreational activities in established federal recreation areas, but would not result in adverse effects on recreational users of these lands. This effect would be proportionally less than the 1,890 acres affected by the proposed project.

The Dry Cooling Alternative would disturb approximately the same amount of land as the proposed project, 1,890 acres of land. The bulk and noise of the ACCs used in this alternative would be marginally more disruptive to current recreational activities in established federal recreation areas, but would not result in adverse effects on recreational users of these lands.

Approximately one million acres of land are proposed for solar and wind energy development in southern California desert lands. Cumulative impacts to approximately

one million acres of land would all combine to result in adverse effects on agricultural lands and recreational resources. The proposed GSEP (and its alternatives) would not contribute to cumulative impacts to agricultural resources or rangelands. The potential of the GSEP (and its alternatives) to disrupt recreational activities would be limited and less than cumulatively considerable when considered in the context of past, present and reasonably foreseeable future projects. However, the GSEP (and its alternatives) would combine with other past and reasonably foreseeable future projects to substantially reduce scenic values of wilderness areas and recreational resources in the Chuckwalla Valley and southern California desert region and therefore, would result in a significant and unavoidable cumulative land use impact.

C.6. 2 INTRODUCTION

The land use analysis focuses on the project's consistency with existing land use resources, land use plans, ordinances, regulations, policies, and the project's compatibility with existing or reasonably foreseeable land uses. In addition, an energy generating system and its related facilities generally have the potential to create impacts in the areas of air quality, noise, dust, public health, traffic and transportation, and visual resources. These individual resource areas are discussed in detail in separate sections of this document.

C.6.3 METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

The analysis of proposed project effects must comply with both CEQA and NEPA requirements given the respective power plant licensing and land jurisdictions of the California Energy Commission and U.S. Bureau of Land Management (BLM). CEQA requires that the significance of individual effects be determined by the lead state Agency; however, the use of specific significance criteria is not required under NEPA.

Because this document is intended to meet the requirements of both NEPA and CEQA, the methodology used for determining environmental impacts of the proposed project includes a consideration of guidance provided by both laws and NEPA Implementing Regulations (40 CFR Parts 1500-1508).

CEQA requires a list of criteria that are used to determine the significance of identified impacts. A significant impact is defined by CEQA as "a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project" (State CEQA Guidelines Section 15382).

In comparison, the Council on Environmental Quality Regulations for Implementing the Procedural Provisions of the NEPA (CEQ NEPA Regulations) states that "'Significantly' as used in NEPA requires considerations of both context and intensity…" (40 CFR 1508.27). Therefore, thresholds serve as a benchmark for determining if a project action will result in a significant adverse environmental impact when evaluated against the baseline. CEQ NEPA Regulations require that an Environmental Impact Statement (EIS) be prepared when a proposed major federal action (project) as a whole has the potential to "significantly affect the quality of the human environment." By preparing this

EIS, the BLM (as the NEPA lead Federal agency) has deemed that the project would generally have a significant impact on the environment.

Thresholds for determining significance in this section are based on Appendix G of the CEQA Guidelines (CCR 2006) and performance standards or thresholds identified by Energy Commission staff. In addition, staff's evaluation of the environmental effects of the proposed project on land uses (i.e., those listed below) includes an assessment of the context and intensity of the impacts, as defined in the CEQ NEPA Regulations 40 CFR Part 1508.27.

Effects of the proposed project on the land use environment (and in compliance with both CEQA and NEPA) have been determined using the thresholds listed below.

Agricultural Lands and Rangeland Management

- Conversion of Farmland or Rangeland
  - Conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use.
  - Conflict with existing zoning for agricultural use, or a Williamson Act contract.
  - Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural uses.

Wilderness and Recreation

- Directly or indirectly disrupt activities in established federal, state, or local recreation areas and/or wilderness areas.
- Substantially reduce the scenic, biological, cultural, geologic, or other important factors that contribute to the value of federal, state, local, or private recreational facilities or wilderness areas.

Horses and Burros

- Involve changes in the existing environment which, due to their nature or location, result in interference with BLM's management of Herd Areas (HAs) and Herd Management Areas (HMAs).

Land Use Compatibility and LORS Compliance

- Directly or indirectly divide an established community or disrupt an existing or recently approved land use.
- Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction, or that would normally have jurisdiction, over the project adopted for the purpose of avoiding or mitigating environmental effects.

Cumulative Land Use Effects

- Individual environmental effects, which, when considered with other impacts from the same project or in conjunction with impacts from other closely related past,

present, and reasonably foreseeable future projects, are considerable, compound, or increase other environmental impacts.

C.6.4 PROPOSED PROJECT

C.6.4.1 SETTING AND EXISTING CONDITIONS

Proposed Project

The proposed Genesis Solar Energy Project (GSEP) site is approximately 1,890 acres and is located in the eastern region of Riverside County. The Applicant has requested a 4,640-acre ROW on public land administered by the Bureau of Land Management (BLM), but only 1,890 acres would be used for the GSEP. The northern boundary of the proposed project site is adjacent to the Palen-McCoy Wilderness, and the southern boundary is approximately two miles north of Interstate Highway 10 (I-10). The Palen Dry Lake Area of Critical Environmental Concern (ACEC), administered by the BLM, is approximately 5.5 miles west of the GSEP site, and the BLM's Chuckwalla Valley Dune Thicket ACEC is adjacent to the southwest of the proposed transmission interconnection.

The GSEP site currently consists of largely undisturbed desert land. A single four-wheel drive road runs north-south through the western portion of the greater 4,640-acre ROW area, but would be approximately 4.5 miles west of the GSEP facility. Access to the GSEP facility would be provided via a new access road constructed to the site from the Wiley Well Rest Area off of I-10 (GSEP 2009a).

Construction and operation of the GSEP would include the following features and facilities:

- two independent 125-MW solar electric generating facilities utilizing parabolic trough technology and associated equipment and infrastructure;
- one 0.46-acre laydown area;
- a minimum of two groundwater wells and a set of storage tanks for each 125-MW unit that would include a 500,000 gallon raw water/fire water tank, a 1,250,000 gallon treated water tank, and a 250,000 gallon wastewater tank;
- each 125-MW unit would have three 8-acre double-lined evaporation ponds, totaling 48 acres of ponds for the two units;
- a common administration building and warehouse would be located between the two units and each unit would have a control building located in each power block, totaling approximately 0.89 acres;
- an approximately 2.5-acre, 230-kV switchyard near the power block of unit two;
- approximately 6.5 miles of 230-kV gen-tie transmission line routed in a southeasterly ROW connecting to the Blythe Energy Project Transmission Line (BEPTL) and ultimately terminating at the proposed Southern California Edison (SCE) Colorado River Substation;

- approximately 6.5-miles of natural gas pipeline roughly paralleling the proposed transmission line to connect with existing Southern California Gas (SCG) infrastructure one mile west of the Wiley Well Rest Area; and
- approximately 6.5-miles of paved access road, also following the proposed transmission line ROW, but extending out to Wiley Well Rest Area.

All of the facilities described above, with the exception of the transmission line, access road, and natural gas pipeline would be enclosed in an eight-foot high chain-link security fence to restrict public access to the site.

Surrounding Area

The proposed project site is located in eastern Riverside County, approximately 25 miles west of the City of Blythe and approximately 35 miles west of the California-Arizona border. The City of Desert Center is located approximately 27 miles west of the proposed GSEP site. The Ironwood and Chuckwalla State Prisons are located adjacent to each other approximately nine miles south of the GSEP site. The surrounding area consists of undeveloped desert land surrounded by the McCoy Mountains to the east, the Palen Mountains (including the Palen/McCoy Wilderness Area) to the north, Ford Dry Lakebed to the south, and I-10 approximately two miles south of the southern border of the project site.

Agricultural Lands and Rangeland Management

According to the California Department of Conservation (DOC) Farmland Mapping and Monitoring Program (FMMP) maps, the majority of the county's existing agricultural land is located in three portions of the county, the San Jacinto and Coachella Valleys in the western half of the county and the Palo Verde Valley in the eastern portion of the county, along the Colorado River. The county's major urban areas such as Riverside, Moreno Valley, Corona, Palm Springs, Palm Desert, and Indio are surrounded by these agricultural lands. The proposed project site is located between the cities of the Desert Center and Blythe. According to the BLM, the proposed project site and associated linear facilities are located wholly within BLM-administered land.

The United States Department of Agriculture (USDA), Natural Resource Conservation Service (NRCS) provides information on designation of soils in areas with agricultural lands (NRCS 2009a). According to the NRCS's Web Soil Survey (WSS), the entire project site is outside the NRCS survey area (NRCS 2009b).

In addition, the Farmland Mapping and Monitoring Program (FMMP) of the California Department of Conservation (DOC) provides statistics on conversion of farmland to non-agricultural uses throughout the State. According to the farmland map of Riverside County, the proposed project site is entirely within BLM-administered lands, and has not been surveyed or included in a farmland mapping category (DOC 2008) of the DOC. No surveyed agricultural lands are adjacent to the proposed GSEP site.

The BLM manages rangelands throughout the west for the use of wildlife and livestock. The rangelands are divided into allotments and pastures for management purposes (BLM 2009b). Livestock grazing allotments on BLM-administered land may be

authorized under a permit or lease. The proposed GSEP site was previously a part of the Ford Dry Lake Pasture livestock grazing allotment, although this allotment was canceled after the Northern and Eastern Colorado Desert Coordinated Management Plan Amendment (NECO) was approved (BLM 2009c, GSEP 2009a).

Wilderness and Recreation

Wilderness land in Riverside County is administered by the BLM. According to the federal Wilderness Act, a designated Wilderness Area is defined as having four primary characteristics, including the following:

- a natural and undisturbed landscape;
- extensive opportunities for solitude and unconfined recreation;
- at least 5,000 contiguous acres; and
- feature(s) of scientific, educational, scenic, and/or historic value (16 USC § 1132(c)).

The wilderness areas closest to the proposed project site are the Palen Dry Lake ACEC, which is approximately 5.5 miles west of proposed project site, the Chuckwalla Valley Dune Thicket ACEC located adjacent to the southwest of the linear ROW, and the Mule Mountain ACEC approximately 12 miles southeast of the GSEP. The 3,632-acre Palen Dry Lake and 4,092-acre Mule Mountain ACECs are closed to recreation and are designated for their archaeological values. The 2,273-acre Chuckwalla Valley Dune Thicket ACEC is also closed to recreation and is designated due to its wildlife habitat (BLM 1999).

The Palen/McCoy Wilderness located adjacent to the northern boundary of the ROW and project site. Spanning 236,488 acres, the Palen/McCoy Wilderness is notable for its opportunities for solitude and unconfined recreational activities including camping, hunting and fishing (BLM 2009d).

The vast majority of Riverside County land is designated as “Open Space/Conservation” according to the county Land Use Map, and the open space and recreation use areas under BLM management are designated as “open” or “limited use” for OHV designations. (RCTLMA 2008; BLM 1999). In “open” areas, all forms of cross-country travel are permitted within the posted boundaries, and in “limited use” areas vehicle travel is limited to approved/signed routes of travel and no cross-country vehicle travel is allowed. The NECO is an amendment to the BLM’s California Desert Conservation Area (CDCA) Plan. Under both the CDCA and the NECO, the proposed project site is categorized as Class M (Moderate Use). Recreational opportunities in Class M (Moderate Use) range from backpacking and primitive, unimproved site camping to hiking to vehicle touring and competitive motorized-vehicle events on approved routes of travel. Prior to adoption of the NECO, Ford Dry Lake was an OHV area without amenities, but allowed cross-country travel. With adoption of the NECO, OHV use within Ford Dry Lake was restricted to approved open routes. There are three (3) approved open routes designated by NECO within the greater 4,640-acre BLM ROW requested by the applicant, but the proposed project site would not be traversed by any open routes. The linear ROW would cross one (1) approved open route that could be disturbed by operation or construction activities related to the proposed project. **Land**

Use Table 1 describes recreation areas beginning with the area closest to the proposed project site.

LAND USE Table 1
Open Space and Recreation Areas

Recreation Area	Jurisdiction/ Administration	Approximate Distance from the Proposed Project Site	Approximate Acreage	Allowed Uses
Palen/McCoy Wilderness	Open Area- BLM	Adjacent to northern boundary	236,488	Camping, hiking, hunting, fishing
Chuckwalla Valley Dune Thicket ACEC	Limited Area-BLM; ACEC	Adjacent to linear facilities ROW	2,273	Closed to recreation
Palen Dry Lake ACEC	Limited Area-BLM; ACEC	5.5 miles west	3,632	Closed to recreation
Mule Mountains ACEC	Limited Area-BLM; ACEC	12 miles southeast	4,092	Closed to recreation
Wiley Well Campground	Open Area-BLM	7 miles south	NA	Camping
Coon Hollow Campground	Open Area-BLM	10 miles south	NA	Camping
Bradshaw Trail	Limited Area-BLM	10 miles south	NA	OHV, Camping

Source: BLM 2009d; BLM 2002.

Horses and Burros

The BLM administers wild horses and burros as guided by the Wild and Free-Roaming Horse and Burro Act of 1971. This includes the management of Herd Areas (HA), which are geographic areas where wild horse and/or burro populations were found at the passage of the Act in 1971 (BLM 2009e) and Herd Management Areas (HMAs), which are designated by BLM through the land use planning process. California contains 33 HAs and 22 HMAs. According to BLM maps, the Chocolate-Mule Mountains HA/HMA is located approximately two miles southeast of the proposed project site in Riverside County near the California-Arizona border (BLM 2009f, BLM 2009g). As such, the proposed project would not contain or traverse any established HMAs or HAs.

Land Use and LORS Compliance

The proposed project site (1,890 acres) is located within the “Moderate Use” category of the BLM’s CDCA Plan. **LAND USE Table 2** provides a general description of the land use LORS applicable to the proposed project and surrounding lands. The project’s consistency with these LORS is discussed in **LAND USE Table 3**. Because the proposed project site would be located solely on BLM-administered land and the only portion of the linear ROW that would be outside of BLM boundaries would be limited to

stringing conductor on existing transmission poles, no state or local LORS are applicable to the proposed project.

LAND USE Table 2
Laws, Ordinances, Regulations, and Standards (LORS)

Applicable LORS	Description
Federal	
Federal Land Policy and Management Act (FLPMA), 1976 – 43 CFR 1600	Establishes public land policy; guidelines for administration; and provides for the management, protection, development, and enhancement of public lands. FLPMA mandates that public lands be managed on the basis of multiple use and sustained yield unless otherwise specified by law. In particular, the FLPMA's relevance to the proposed project is that Title V, Section 501 establishes BLM's authority to grant rights-of-way for generation, transmission, and distribution of electrical energy (FLPMA 2001).
Farmland Protection Policy Act, Subtitle I of Title XV, Section 1539-1549 of the Agriculture and Food Act of 1981(NRCS 2009)	The FPPA is intended to minimize the impact federal programs have on the unnecessary and irreversible conversion of farmland to nonagricultural uses. It assures that—to the extent possible—federal programs are administered to be compatible with state, local units of government, and private programs and policies to protect farmland. Federal agencies are required to develop and review their policies and procedures to implement the FPPA every two years. For the purpose of FPPA, farmland includes prime farmland, unique farmland, and land of statewide or local importance. Farmland subject to FPPA requirements does not have to be currently used for cropland. It can be forest land, pastureland, cropland, or other land, but not water or urban built-up land.
Bureau of Land Management - California Desert Conservation Area (CDCA) Plan, 1980 as Amended (BLM 1980)	The 25 million-acre CDCA contains over 12 million acres of public lands spread within the area known as the California Desert, which includes the following three deserts: the Mojave, the Sonoran, and a small portion of the Great Basin. The 12 million acres of public lands administered by the BLM are half of the CDCA. The CDCA Plan is a comprehensive, long-range plan with goals and specific actions for the management, use, development, and protection of the resources and public lands within the CDCA, and it is based on the concepts of multiple use, sustained yield, and maintenance of environmental quality. The plan's goals and actions for each resource are established in its 12 elements. Each of the plan elements provides both a desert-wide perspective of the planning decisions for one major resource or issue of public concern as well as more specific interpretation of multiple-use class guidelines for a given resource and its associated activities.
Northern and Eastern Colorado Desert Coordinated Management Plan (BLM 2002)	The BLM's Northern and Eastern Colorado Desert Coordinated Management Plan establishes goals and planned actions that are designed to meet the goals of the CDCA Plan. They emphasize the protection of wildlife and cultural resource values while permitting a compatible level of motorized vehicle use.

Applicable LORS	Description
Public Rangelands Improvement Act (1978) (PRIA 1978)	Establishes and reaffirms the national policy and commitment to inventory and identify current public rangeland conditions and trends; manage, maintain and improve the condition of public rangelands so that they become as productive as feasible for all rangeland values in accordance with management objectives and the land use planning process; and continue the policy of protecting wild free-roaming horses and burros from capture, branding, harassment, or death, while at the same time facilitating the removal and disposal of excess wild free-roaming horses and burros which pose a threat to themselves and their habitat and to other rangeland values.
The Wild Free-Roaming Horses and Burros Act of 1971 (BLM 2009h)	The BLM protects, manages, and controls wild horses and burros under the authority of the Wild Free-Roaming Horses and Burros Act of 1971 (Act) to ensure that healthy herds thrive on healthy rangelands. The BLM manages these animals as part of its multiple-use mission under the 1976 Federal Land Policy and Management Act. One of the BLM's key responsibilities under the Act is to determine the "appropriate management level" (AML) of wild horses and burros on the public rangelands.

C.6.4.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Construction and Operation

Agricultural Lands and Rangeland Management

According to the AFC, "no lands designated as containing Prime farmland or Farmland of Statewide Importance are present within the Project site…The nearest farmland of Statewide Importance, which is also Prime Farmland, is approximately 15 miles to the east of the Project, in Blythe. The Project area lies outside of the FMMP [Farmland Mapping and Monitoring Program] survey area" (GSEP 2009a). Staff conducted analysis of agricultural land and rangeland to verify the Applicant's assessment.

As described in detail above under the section entitled **Agricultural Lands**, multiple governmental agencies at the federal, state, and local level have information regarding the agricultural lands relating to the proposed project and the surrounding area. To summarize, the following is a list of the various designations or categorizations these multiple governmental agencies have provided for the proposed project site and construction laydown area:

- **California DOC:** As the project site and linear ROW are located entirely within lands under BLM jurisdiction, this land is unsurveyed by the FMMP (DOC 2008).

- **USDA NRCS:** As with the California DOC, as the project site and linear ROW are located entirely within BLM lands, soil surveys for these sites have not been completed (NRCS 2009b).
- **Riverside County:** As the project site and linear ROW are entirely within BLM lands, these lands are not subject to Riverside County land use regulations (GSEP 2009a).
- **Williamson Act**: The project site is not located in an area that is under a Williamson Act contract (GSEP 2009a).

The DOC's FMMP mapping information is used in Staff Assessments to analyze impacts to important farmlands (i.e., Prime Farmland, Unique Farmland, or Farmland of Statewide Importance) in the state. FMMP designations for the proposed project site and linear ROW are unsurveyed and are not included in any other mapping category, such as Prime Farmland, Farmland of Statewide Importance, Unique Farmland, or Farmland of Local Importance (DOC 2008). Therefore, no farmland conversion impacts are expected as a result of proposed project or linear facilities' construction, and the project would not involve other changes in the existing environment which could result in conversion of farmland, to non-agricultural uses.

In regards to rangeland management, as noted in the "Setting and Exiting Conditions," the project site and linear ROW are located on the canceled Ford Dry Lake Pasture livestock grazing allotment. As the Ford Dry Lake Pasture allotment has been canceled, no livestock grazing would be adversely affected by construction or operation of the proposed project.

Wilderness and Recreation

Approval of the proposed project would directly remove approximately 1,800 acres from potential use for recreational opportunities such as backpacking, camping, rockclimbing, hunting, or other activities. As noted in the "Setting and Existing Conditions" section, no recreational routes designated by the NECO are within the project site and construction laydown site. One "open" route would be crossed by the proposed linear ROW. While the proposed project would remove recreation opportunities at the site, due to the remote nature of the site along with the BLM's existing restrictions on recreational activities in the area, direct impacts to recreation use of the proposed project site would be limited. While construction of the proposed transmission line would traverse an "open" route and result in disruptions to motorized vehicle use along this route, as the transmission line would be strung over the route on existing structures, it would not permanently disrupt use of the route. Any impacts on the route by the linear ROW would be temporary and short-term.

The project would not be constructed on wilderness lands so it would not directly disrupt activities in a federal wilderness area. However, the Palen/McCoy Wilderness north of the project site attracts visitors based on its scenic, biological, cultural, and recreational amenities. The proposed project would not substantially reduce the scenic value of this wilderness area (see the **Visual Resources** section of this document).

The 3,632-acre Palen Dry Lake ACEC occurs southwest of the project site and is managed for protection of its prehistoric resources as a Multiple Use Class M (moderate) unit; the proposed project would not substantially reduce the cultural values of this wilderness area (see the **Cultural Resources** section of this document).

The 2,273-acre Chuckwalla Valley Dune Thicket ACEC occurs approximately two miles southeast of the project site and is managed for Moderate Use Class M unit for its wildlife habitat use, specifically desert tortoise. The proposed project would not substantially reduce the cultural values of this wilderness area (see the **Biological Resources** section of this document).

Thus, from a land use perspective, the proposed project would not adversely affect wilderness areas in the area.

Horses and Burros

The proposed project would not contain or traverse any established BLM HAs or HMAs. The nearest, the Chocolate-Mule Mountains HA/HMA, is located approximately two miles southeast of the proposed ROW in Riverside County near the California-Arizona border (BLM 2002). In addition, following construction, fencing around the site would keep any burros outside of the proposed project location. Therefore, the proposed project would not result in any interference with BLM's management of an HA or HMA. For a discussion of the proposed project's consistency with Chapter 3 of the BLM's CDCA Plan, Wild Horses and Burros Element, please see **LAND USE Table 3** (below).

Land Use Compatibility and LORS Compliance

Physical Division of an Existing Community

The proposed project would not physically divide an established community[1], because the proposed project and associated linear facilities would be located on undeveloped lands (and within existing utility ROWs) administered by the BLM. In addition, the proposed project would not be located within or near an established community. Neither the size nor the nature of the project would result in a physical division or disruption of an established community. In addition, no existing roadways or pathways within an established community would be blocked. Due to the temporary nature of construction activities, construction-generated nuisances such as dust and noise are not expected to adversely affect recreational uses in the area. Due to the intermittent nature of similar operation-related impacts, staff concludes that any potential impacts would not adversely affect recreational uses. For a detailed analysis of construction and operation-related nuisance impacts, please see the **Air Quality** and **Noise** sections.

Conflict with any Applicable Land Use Plan, Policy, or Regulation

As required by California Code of Regulations, Title 20, Section 1744, Energy Commission staff evaluates the information provided by the project owner in the AFC (and any amendments), project design, site location, and operational components to determine if elements of the proposed project would conflict with any applicable land

[1] An established community usually refers to a residential community.

use plan, policy, or regulation of an agency with jurisdiction over the project, or that would normally have jurisdiction over the project except for the Energy Commission's exclusive authority. As part of the licensing process, the Energy Commission must determine whether a proposed facility complies with all applicable state, regional, and local LORS (Public Resources Code section 25523[d][1]). The Energy Commission must either find that a project conforms to all applicable LORS or make specific findings that a project's approval is justified even where the project is not in conformity with all applicable LORS (Public Resources Code section 25525).

In addition, the applicant has submitted an application to the BLM requesting a ROW to construct the proposed project and its related facilities. Pursuant to the California Desert Conservation Area (CDCA) Plan (1980, as amended), sites associated with power generation or transmission not identified in the CDCA Plan are considered through a Land Use Plan Amendment process. Under Federal law, BLM is responsible for processing requests for ROWs to authorize such proposed projects and associated transmission lines and other appurtenant facilities on land it administers. The CDCA Plan, while recognizing the potential compatibility of solar generation facilities on BLM-administered land, requires that all sites associated with power generation or transmission not identified in the Plan be considered through a land use plan amendment process (FR 2008). BLM would use the following Planning Criteria during the Plan Amendment process:

- The plan amendment process would be completed in compliance with the Federal Land Policy and Management Act (FLPMA), NEPA, and all other Federal laws, regulations, and policies relevant to BLM-administered land;
- The plan amendment process would include an EIS (i.e., this joint Energy Commission Staff Assessment/BLM DEIS) to comply with CEQ NEPA Regulations;
- Where existing planning decisions are still valid, those decisions would remain unchanged and be incorporated into the new plan amendment;
- The plan amendment would recognize valid existing rights;
- Native American Tribal consultations would be conducted in accordance with policy, and Tribal concerns would be given due consideration. The plan amendment process would include the consideration of any impacts on Indian trust assets (please see the **Cultural Resources** section);
- Consultation with the State Office of Historic Preservation (SHPO) would be conducted throughout the plan amendment process (please see the **Cultural Resources** section); and
- Consultation with the US Fish and Wildlife Service (USFWS) would be conducted throughout the plan amendment process (please see the **Biological Resources** section).

If the ROW and potential land use plan amendment are approved by BLM, the proposed solar thermal power plant facility on BLM-administered land would be authorized in accordance with Title V of the FLMPA of 1976 and the Federal Regulations at 43 CFR part 2800. This Environmental Impact Statement (EIS) acts as the mechanism for

meeting CEQ NEPA Regulation requirements, and also provides the analysis required to support a land use plan amendment identifying the facility within the Plan.

The proposed project area is within the Northern and Eastern Colorado Desert Coordinated Management Plan (NECO) area. The NECO is an update amendment to the CDCA Plan to make it compatible with Desert tortoise conservation and recovery. The NECO is a landscape-scale planning effort for most of the California portion of the Sonoran Desert ecosystem that promotes desert tortoise conservation and recovery.

In 1990 the Desert tortoise was listed as a threatened species under the federal Endangered Species Act. By law, land managing agencies are required to review their current land use plans, adjust them as necessary, and consult on their adequacy with the U.S. Fish and Wildlife Service.

Energy Commission staff have concluded that without mitigation the project would be a substantial contributor to the cumulatively significant loss of biological resources within the Chuckwalla Valley and the NECO area. Staff has recommended compensatory mitigation to offset direct, indirect, and cumulative impacts to desert tortoise and other special-status species, and to assure compliance with state and federal laws such as the federal and state endangered species acts and regulations protecting waters of the state; see the **BIOLOGICAL RESOURCES** section of the SA/DEIS.

A Biological Resources Mitigation Implementation and Monitoring Plan (BRMIMP) will be required for the project by biological staff as a Condition of Certification by the California Energy Commission; see the **BIOLOGICAL RESOURCES** section. The BRMIMP comprehensively describes avoidance, minimization, and mitigation measures.

With the effective implementation of specific species and habitat mitigation, active management and restoration practices on the WHMA portion of the project area, there would not be a project conflict with this CEQA criterion under this land use plan.

As the proposed project would be located solely on BLM-administered land, there are no state, regional, county, or other local land use LORS applicable to the proposed project. Staff's analysis of the proposed project's consistency with applicable federal land use LORS is presented in **LAND USE Table 3.** Based on staff's independent review of applicable LORS documents, the proposed project would be consistent with applicable land use LORS**LAND USE Table 3.**

LAND USE Table 3
Project Compliance with Adopted Land Use LORS

Applicable LORS	Description of Applicable LORS	Consistent?	Basis for Consistency
Federal			
Federal Land Policy and Management Act, 1976 – 43 CFR 1600, **Sec. 501. [43 U.S.C**. **1761]**	(a) The Secretary, with respect to the public lands … are authorized to grant, issue, or renew rights-of-way over, upon, under, or through such lands for: (4) systems for generation, transmission, and distribution of electric energy, except that the applicant shall also comply with all applicable requirements of the Federal Energy Regulatory Commission under the Federal Power Act, including part I thereof (41 Stat. 1063, 16 U.S.C. 791a-825r) [P.L. 102-486, 1992]	YES	The FLPMA authorizes the issuance of a right-of-way grant for electrical generation facilities and transmission lines. In addition, based on staff's review of the Federal Power Act, the requirements would not be applicable to the proposed project as they are not related to renewable resources, and are otherwise related to administrative procedures. Therefore, the proposed project would be in compliance with this policy.
Farmland Protection Policy Act, Section 658.1	As required by section 1541(b) of the [Farmland Protection Policy] Act, 7 U.S.C. 4202(b), Federal agencies are (a) to use the criteria to identify and take into account the adverse effects of their programs on the preservation of farmland, (b) to consider alternative actions, as appropriate, that could lessen adverse effects, and (c) to ensure that their programs, to the extent practicable, are compatible with State and units of local government and private programs and policies to protect farmland.	YES	As discussed above in detail in Section C.6.4.2 (under the subsection entitled "Agricultural Lands and Rangeland Management"), no farmland would be converted under the proposed project and impacts to rangelands would not be adverse. In addition, construction of the proposed project and its associated linear facilities would be temporary, and the project would not involve other changes in the existing environment which could result in conversion of farmland, to non-agricultural uses. Therefore, proposed project would be consistent with the FPPA.

Applicable LORS	Description of Applicable LORS	Consistent?	Basis for Consistency
Bureau of Land Management – California Desert Conservation Area (CDCA) Plan (Including the Northern and Eastern Colorado Desert Coordinated Management Plan Amendment) (BLM 1980)	**Chapter 2 – Multiple-Use Classes** **MULTIPLE-USE CLASS GUIDELINES** MULTIPLE-USE CLASS M Moderate Use Multiple-Use Class M is based upon a controlled balance between higher intensity use and protection of public lands. This class provides for a wide variety of present and future uses such as mining, livestock grazing, recreation, energy, and utility development. Class M management is also designed to conserve desert resources and to mitigate damage to those resources which permitted uses may cause. All types of electrical generation plants may be allowed in accordance with state, federal, and local laws. New gas, electric, and water transmission facilities and cables for interstate communication may be allowed only within designated corridors. Existing facilities within designated corridors may be maintained and upgraded or improved in accordance with	YES (with an approved BLM project-specific CDCA Plan Amendment)	Approximately 1,890 acres of the proposed project site is administered by the BLM and is managed under multiple use Class M (MultipleUse) categories in conformance with the CDCA Plan (GSEP 2009a). The proposed project consists of an electrical generating facility, a transmission line, a natural gas pipeline, an access road and ancillary facilities. As such, development of the proposed project is an allowed use under the Multiple-Use Class Guidelines. In addition, the CDCA Plan, while recognizing the potential compatibility of solar generation facilities on public lands, requires that all sites associated with power generation or transmission not identified in the Plan be considered through the Plan Amendment process. Therefore, the BLM would undertake a project-specific CDCA Plan amendment along with the ROW grant for the proposed Genesis Solar Energy Project. Upon BLM's amendment of the CDCA plan for the Genesis Solar Energy Project, the proposed project would be fully compliant with the CDCA Plan. This Environmental Impact Statement (EIS) acts as the mechanism for meeting CEQ NEPA Regulation requirements, and also provides the analysis required to support a Land Use Plan Amendment identifying the facility within the Plan.

Applicable LORS	Description of Applicable LORS	Consistent?	Basis for Consistency
	existing rights of way grants or by amendments to right of way grants. Existing facilities outside designated corridors may only be maintained but not upgraded or improved.		
	Chapter 3 **Wild Horse and Burros Element** Goal 2. Protect wild horses and burros on public lands by conducting surveillance to prevent unauthorized removal or undue harassment of animals.	YES	As noted in the "Setting and existing Conditions" subsection above, the proposed project site is not in the vicinity of an HA or HMA; therefore, the project site and surrounding area are not notable for the presence of wild horses or burros. Therefore, the proposed project would not result in any interference with BLM's management of an HA or HMA, and would be consistent with this element of the CDCA Plan.
	Chapter 3 **Energy Production and Utility Element** Goal 1. Fully implement the network of joint-use planning corridors to meet projected utility needs to the year 2000. Specific electrical and natural gas right-of-way or power plant site applications made under the provisions of this element should be consistent with adopted California Energy Commission forecasts, which are reviewed biennially. Decision criteria are to: (1) Minimize the number of separate rights-of-way by utilizing existing rights-of-way as a basis for planning	YES	The proposed project's linear facilities would use existing and established utility ROWs to the greatest extent possible, connecting to existing access roads at Wiley Well and stringing transmission along the BEPTL poles. Therefore, the proposed project would utilize existing ROWs, and would be consistent with this element of the CDCA Plan.

Applicable LORS	Description of Applicable LORS	Consistent?	Basis for Consistency
	corridors; (2) Encourage joint use of corridors for transmission lines, canals, pipelines, and cables; (3) Provide alternative corridors to be considered during processing of applications; (4) Avoid sensitive resources wherever possible; (5) Conform to local plans whenever possible; (6) Consider wilderness values and be consistent with final wilderness recommendations; (7) Complete the delivery-systems network; (8) Consider ongoing projects for which decisions have been made, for example, the Intermountain Power Project; and (9) Consider corridor networks which take into account power needs and alternative fuel resources.		
	Addendum B: Interim Management Guidelines **Chapter III. Guidelines for Specific Activities** **Lands Actions – Disposal, Rights-of-Way, Access and Withdrawals**	YES	The non-impairment standard, directs that "until Congress has determined otherwise" the lands under review be managed so as not to impair their suitability as wilderness (CRS 2004). As the proposed project would not traverse an established Wilderness Area, the project would be in compliance with this guideline of the CDCA Plan.

Applicable LORS	Description of Applicable LORS	Consistent?	Basis for Consistency
	2. Rights-of-Way: Existing rights-of-way may be renewed if they are still being used for their authorized purpose. New rights-of-way may be approved only for temporary uses that satisfy the non-impairment criteria. 3. Right-of-Way Corridors: Right-of-way corridors may be designated on lands under wilderness review.		
Federal Wilderness Act, 16 U.S.C. § 1131-1136	**(a) Establishment; Congressional declaration of policy; wilderness areas; administration for public use and enjoyment, protection, preservation… provisions for designation as wilderness areas** In order to assure that an increasing population, accompanied by expanding settlement and growing mechanization, does not occupy and modify all areas within the United States and its possessions, leaving no lands designated for preservation and protection in their natural condition, it is hereby declared to be the policy of the Congress to secure for the American people of present and future generations the benefits of an enduring resource of wilderness.	YES	As the proposed project would not traverse an established Wilderness Area, the project would be consistent with this guideline.
Public Rangelands	Establishes and reaffirms the	YES	In regards to rangeland management, as noted in the “Setting and Exiting

Applicable LORS	Description of Applicable LORS	Consistent?	Basis for Consistency
Improvement Act	national policy and commitment to inventory and identify current public rangeland conditions and trends; manage, maintain and improve the condition of public rangelands so that they become as productive as feasible for all rangeland values in accordance with management objectives and the land use planning process; and continue the policy of protecting wild free-roaming horses and burros.		Conditions," the proposed project would be located on the canceled Ford Dry Lake Pasture livestock grazing allotment. As this livestock grazing allotment has been canceled, the proposed project would not convert any rangeland used for livestock grazing and so would be in compliance with this Act.
Wild and Free-Roaming Horse and Burro Act	Establishes BLM's authority to protect, manage, and control wild horses and burros to ensure that healthy herds thrive on healthy rangelands. BLM determines the "appropriate management level" (AML) of wild horses and burros on the public rangelands.	YES	As discussed above in detail in Section C.6.4.2, the proposed project would not contain or traverse an established HA or HMA. As such, the proposed project would be consistent with this Act.

Project Closure and Decommissioning

According to Section 3.12 of the applicant's project description, the solar generating facility is expected to have a lifespan of 30 years. At any point during this time, temporary or permanent closure of the solar facility could occur. Temporary closure would be a result of necessary maintenance, hazardous weather conditions, or damage due to a natural disaster. Permanent closure would be a result of damage that is beyond repair, adverse economic conditions, or other significant reasons.

Both temporary and permanent closures would require the applicant to submit to the CEC and BLM a contingency plan or a closure and decommissioning plan, respectively. A contingency plan would be implemented to ensure compliance with applicable LORS, and appropriate shutdown procedures depending on the length of the cessation. A closure and decommissioning plan would be implemented to ensure compliance with applicable LORS, removal of equipment and shutdown procedures, site restoration, potential decommissioning alternatives, and the costs and source of funds associated with decommissioning activities.

Upon closure of the facility decommissioning, the applicant would be required to restore lands affected by the project to their pre-project state. Given the fact that the proposed project site is located on undeveloped land, staff anticipates that project decommissioning would have impacts similar in nature to proposed project construction activities.

In addition, staff's proposed Condition of Certification **BIO-23** requires the applicant to develop a Decommissioning and Closure Plan and cost estimate that meets the requirements of BLM's 43 CFR 3809.550 et seq. Staff acknowledges the uncertainty in planning for conditions 30 to 50 years in the future, but the Decommissioning and Closure Plan cannot defer establishing reasonable performance standards and goals until that time.

Therefore, with proposed Condition of Certification BIO-23 and the eventual return of the lands to their current state, the land use effects of decommissioning would be short term and not adverse.

C.6.4.3 CEQA LEVEL OF SIGNIFICANCE

For the purposes of CEQA compliance, the significance of each identified impact of the proposed project has been determined. The CEQA Lead Agency is responsible for determining whether an impact is significant and is required to adopt feasible mitigation measures to minimize or avoid each significant impact. Conclusions in this section are presented to identify the level of significance of each identified impact (as required by CEQA) as follows: less-than-significant (i.e., adverse, but not significant); less-than-significant with mitigation (i.e., can be mitigated to a level that is not significant); or significant and unavoidable (i.e., cannot be mitigated to a level that is not significant).

Agricultural Lands and Rangeland Management

As discussed above in detail in Section C.6.4.2 (under the subsection entitled "Agricultural Lands and Rangeland Management") no farmland or rangeland used for

livestock grazing would be converted by the proposed project. In addition, construction of the proposed project and its associated linear facilities would be temporary, and the project would not involve other changes in the existing environment which could result in conversion of Farmland to non-agricultural uses. Therefore, proposed project impacts on agricultural lands and rangeland management would be less-than-significant.

Wilderness and Recreation

As discussed above in detail in Section C.6.4.2 (under the subsection entitled "Wilderness and Recreation"), the conversion of 1,890 acres of land to support the proposed project's components and activities would directly disrupt current recreational activities in established federal recreation areas and would result in adverse effects on recreational users of these lands. Due to the limited use of these recreational resources and existing BLM restrictions, however, the disruption to recreation would be less than significant.

The proposed project would not substantially reduce the scenic, biological, or cultural values of federal wilderness areas. Thus, land use impacts to the area's wilderness areas would be less-than-significant.

Horses and Burros

As discussed above in detail in Section C.6.4.2 (under the subsection entitled "Horses and Burros"), the proposed project would not contain or traverse any established BLM HAs or HMAs. Therefore, the proposed project would not result in any interference with BLM's management of an HA or HMA. Impacts would be less than significant.

Land Use Compatibility and LORS Compliance

As discussed above in detail in Section C.6.4.2 (under the subsection entitled "Land Use Compatibility"), the project would not physically divide or disrupt an established community. Impacts would be less than significant.

As the proposed project is located wholly on BLM-administered land, no state, regional, or local land use LORS are applicable to the proposed project. Staff's analysis of the proposed project's consistency with applicable federal land use LORS is presented in **LAND USE Table 3.** The proposed project would be consistent with applicable federal land use LORS. With BLM's approval of a project-specific CDCA Plan Amendment, the proposed project would fully conform to the CDCA. Therefore, impacts associated with compliance with federal land use LORS would be less than significant.

Cumulative Land Use Effects

Section C.6.8 (below) provides a detailed analysis of cumulative impacts. As discussed below, the potential combined development of approximately one million acres of land in the southern California desert, would all combine to result in adverse effects on agricultural lands (one of the state's most important resources), and recreational resources. Although the development of renewable resources in compliance with federal and state mandates is important and required, the conversion of thousands of acres of open space (including areas with high soil quality and agricultural resources) would result in a significant and unavoidable impact. In general, the land conversion

impacts to these lands would preclude numerous existing land uses including recreational activities, rangeland management, and open space. Because the GSEP would have no impacts on agricultural resources or rangelands, it would have no potential to contribute to cumulative impacts in this respect. The GSEP's potential to disrupt recreational activities would be limited and less than cumulatively considerable when considered in the context of past, present and reasonably foreseeable future projects. However, the GSEP would combine with other past and reasonably foreseeable future projects to substantially reduce scenic values of wilderness areas and recreational resources in the Chuckwalla Valley and southern California desert region and therefore, would result in a significant and unavoidable cumulative land use impact in this regard.

C.6.5 REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would essentially be Unit 1 of the proposed project, including a 125 MW solar facility located within the boundaries of the proposed project as defined by NextEra. This alternative is analyzed for two major reasons: (1) it eliminates about 50 percent of the proposed project area so all impacts are reduced, and (2) by eliminating the eastern solar field, it would reduce the water required for wet cooling by 50 percent. The boundaries of the Reduced Acreage Alternative are shown in **Alternatives Figure 1**.

C.6.5.1 SETTING AND EXISTING CONDITIONS

This alternative is located entirely within the boundaries of the proposed project site. It simply eliminates effects to the eastern 125 MW solar field and relocates the gas yard approximately 1.75 miles northwest of its present location. As a result, the environmental setting consists of the western portion of the proposed project, as well as the area affected by the linear project components.

C.6.5.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Agricultural Lands and Rangeland Management

While the Reduced Acreage Alternative would reduce any land conversion impacts by 50 percent, as discussed above in detail in Section C.6.4.2 (under the subsection entitled "Agricultural Lands and Rangeland Management"), no farmlands or rangelands used for livestock grazing would be converted. In addition, construction activities associated with the proposed project and its linear facilities would be temporary, and the project would not involve other changes in the existing environment that could result in conversion of farmland to non-agricultural uses.

Finally, given that this alternative would be located wholly on BLM-administered land, state land preservation contracts (i.e., Williamson Act Contract), and county zoning for agricultural use would not be affected.

Therefore, the types of effects on agricultural lands and rangeland management resulting from this alternative would be the same as the proposed project, but less intense given the reduced size of the site.

Wilderness and Recreation

The conversion of 990 acres of land to support the components and activities associated with this alternative would disrupt current recreational activities, although due to the remote nature of the site along with the BLM's existing restrictions on recreational activities in the area, direct impacts to recreation use of the alternative project site would be limited. Construction of the transmission line would traverse a single "open" route and result in disruptions to motorized vehicle use along this route. As the transmission line would be strung over the route, however, it would not permanently disrupt use of the route. Any impacts on the route by the linear ROW would be temporary and short-term.

This alternative would not be constructed on wilderness lands so it would not directly disrupt activities in a federal wilderness area

This alternative would have similar effects on wilderness and recreation resources that the proposed project would, but these effects would be less intense due to the reduction in the size of the project by 50 percent. Thus, this alternative would not substantially reduce the scenic, biological or cultural value of a wilderness area or recreational resources.

Horses and Burros

Similar to proposed project, this alternative would not contain or traverse any established BLM HAs or HMAs. Therefore, the Reduced Acreage Alternative would not result in any interference with BLM's management of an HA or HMA.

Land Use Compatibility and LORS Compliance

Similar to the proposed project, this alternative would not physically divide or disrupt an established community.

Staff's analysis of the proposed project's consistency with applicable federal land use LORS is presented in **LAND USE Table 3.** These federal LORS would apply to this alternative. Similar to the proposed project, this alternative would be consistent with applicable federal land use LORS. With BLM's approval of a project-specific CDCA Plan Amendment, the proposed project would fully conform with the CDCA.

Cumulative Land Use Effects

This alternative would result in the conversion of 990 acres of undeveloped open space with an industrial utility use (i.e., a 125 MW power plant and associated infrastructure). When compared to the proposed project, this alternative would result in approximately 50 percent less land conversion to industrial uses, and the cumulative effects of this amount of land conversion when combined with all other existing, planned, and proposed projects would result in adverse cumulative land conversion. Section C.6.8 (below) provides a detailed analysis of cumulative impacts. The potential combined development of approximately one million acres of land in the southern California desert, would all combine to result in adverse effects on agricultural lands (one of the state's most important resources), and recreational resources. In general, the conversion of vast amounts of open space lands would preclude numerous existing land

uses including recreational activities, rangeland management, and open space, and therefore, result in a significant cumulative land use impact.

Because this alternative would have no impact on agricultural resources or rangelands, it would have no potential to contribute to cumulative impacts in this respect. This alternative's potential to disrupt recreational activities would be limited and less than cumulatively considerable when considered in the context of past, present and reasonably foreseeable future projects. However, this alternative would combine with other past and reasonably foreseeable future projects to substantially reduce scenic values of wilderness areas and recreational resources in the Chuckwalla Valley and southern California desert region and therefore, would result in a significant and unavoidable cumulative land use impact in this regard.

C.6.5.3 CEQA LEVEL OF SIGNIFICANCE

Agricultural Lands and Rangeland Management

As discussed above in subsection C.6.5.2, and similar to the proposed project, impacts resulting from this alternative on agricultural and rangelands used for livestock grazing would be less than significant.

Wilderness and Recreation

As discussed above in subsection C.6.5.2, and similar to the proposed project, impacts resulting from this alternative to wilderness and recreation would be less than significant.

Horses and Burros

As discussed above in subsection C.6.5.2, and similar to the proposed project, impacts resulting from this alternative on horses and burros would be less than significant.

Land Use Compatibility and LORS Compliance

As discussed above in subsection C.6.5.2, and similar to the proposed project, this alternative would comply with federal LORS. Therefore, impacts would be less than significant.

Cumulative Land Use Effects

As discussed above in subsection C.6.5.2, and similar to the proposed project, the cumulative land use impacts of this alternative when combined with other existing, planned, and proposed projects would be significant and unavoidable.

C.6.6 DRY COOLING ALTERNATIVE

This section identifies the potential impacts of using air-cooled condenser (ACC) systems rather than the cooling towers proposed by NextEra for the Genesis project. It is assumed that the ACC systems would be located where the cooling towers are currently proposed for each of the two 125 MW power block, as illustrated in Alternatives Figure 2 (see Section B.3).

Approximately 18 ACC fans would be required for each of the two solar fields. The 18 fans, or ACC's, would operate when the ambient temperature is above 50 degrees Fahrenheit. When the temperature is below 50 degrees Fahrenheit, only 10 of the fans would be used (GSEP 2009f). The 18 ACC fans described in the GSEP cooling study would have a length of approximately 279 feet, a width of approximately 127 feet, and a height of 98 feet (GSEP 2009f). However, based on the ACC preliminary designs for nearby solar thermal projects in similar ambient temperatures, an additional 11,690 square feet could be required for siting of the fans and the fans would be up to 120 feet in height. In addition to the ACC fans, NextEra would use a small Wet Surface Air Cooler when needed to provide auxiliary cooling during extremely hot days (GSEP 2009f). This alternative is analyzed because it would reduce the amount of water required for steam turbine cooling from 822 acre-feet per year (AFY) per unit to 66 AFY. This reduction in water use would reduce impacts to water and biological resources.

C.7.6.1 SETTING AND EXISTING CONDITIONS

This alternative is located entirely within the boundaries of the proposed project site. It simply eliminates the use of wet-cooling towers and incorporated the use of air-cooled condensers (ACC) in the same location. As a result, the environmental setting would be the same as for the proposed project.

C.7.6.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

The Dry Cooling Alternative and use of the ACC system would not require any additional use of land or any additional ground disturbing activities. In regard to land use, the impacts of the Dry Cooling Alternative in comparison to the proposed project would primarily include increased noise and increased facility size and bulk. However, because the increased facility size and bulk would occur within the GSEP site, impacts to land use would be expected to be similar as with the proposed GSEP project.

Because the ACC system is approximately 98-120 feet in height, the ACC system would be more visible from the surrounding areas. The Palen/McCoy Wilderness and several areas of critical environmental concern (ACEC) are located within the vicinity of the proposed GSEP site. As such, the ACC system would be visible from the Palen/McCoy Wilderness and ACECs and would potentially be more visible than the proposed GSEP with use of the wet-cooled system. However, even without the ACC system, the GSEP and the 1,800 acre fields of solar troughs would be visible from the Palen/McCoy Wilderness. For a detailed discussion of this alternatives visual impacts, please see the **Visual Resources** section of this document.

Agricultural Lands and Rangeland Management

The Dry Cooling Alternative and use of the ACC system would not require any additional use of land or any additional ground disturbing activities. In regard to land use, the impacts of the Dry Cooling Alternative in comparison to the existing facility would primarily include increased noise and increased facility size and bulk. However, because the increased facility size and bulk would occur within the GSEP site, impacts to land use would be expected to be similar as with the proposed GSEP project. As discussed above in detail in Section C.6.4.2 (under the subsection entitled "Agricultural Lands and Rangeland Management"), no farmlands or rangelands used for livestock

grazing would be converted. In addition, construction activities associated with the proposed project and its linear facilities would be temporary, and the project would not involve other changes in the existing environment that could result in conversion of farmland to non-agricultural uses.

Finally, given that this alternative would be located wholly on BLM-administered land, state land preservation contracts (i.e., Williamson Act Contract), and county zoning for agricultural use would not be affected.

Therefore, the types of effects on agricultural lands and rangeland management resulting from this alternative would be the same as the proposed project.

Wilderness and Recreation

The conversion of 1,890 acres of land to support the components and activities associated with this alternative would be the same as described for the proposed project. Similar to the proposed project, the Dry Cooling Alternative would disrupt recreational activities such as backpacking, camping, rockclimbing, hunting, or other activities by the removal of 1,890 acres from recreational use. The remote location of the site and the BLM's existing OHV use restrictions limit the direct impacts to these recreation uses. Construction of the transmission line would traverse a single "open" route and result in disruptions to motorized vehicle use along this route. As the transmission line would be strung over the route, however, it would not permanently disrupt use of the route. Any impacts on the route by the linear ROW would be temporary and short-term.

This alternative would not be constructed on wilderness lands so it would not directly disrupt activities in a wilderness area. The operational impacts of the Dry Cooling Alternative would be greater than the proposed project as a result of the greater bulk and noise of the ACCs. For a detailed discussion of this alternative's noise and visual impacts, please see the **Noise** and **Visual Resources** sections of this document. This alternative would not substantially reduce the scenic, biological, or cultural value of a wilderness area or recreational facility (see the **Visual Resources**, **Biological Resources** and **Cultural Resources** sections of this document).

Horses and Burros

Similar to proposed project, this alternative would not contain or traverse any established BLM HAs or HMAs. Therefore, the Dry Cooling Alternative would not result in any interference with BLM's management of an HA or HMA.

Land Use Compatibility and LORS Compliance

Similar to the proposed project, this alternative would not physically divide or disrupt an established community.

Staff's analysis of the proposed project's consistency with applicable federal land use LORS is presented in **LAND USE Table 3.** These federal LORS would apply to this alternative. Similar to the proposed project, this alternative would be consistent with applicable federal land use LORS. With BLM's approval of a project-specific CDCA Plan Amendment, the proposed project would fully conform to the CDCA.

Cumulative Land Use Effects

This alternative would result in the conversion of 1,890 acres of undeveloped open space with an industrial utility use (i.e., two 125 MW power plants and associated infrastructure). The potential combined development of approximately one million acres of land in the southern California desert, would all combine to result in adverse effects on agricultural lands (one of the state's most important resources), and recreational resources. In general, the conversion of vast amounts of open space lands would preclude numerous existing land uses including recreational activities, rangeland, and open space, and therefore, result in a significant cumulative land use impact. Because this alternative would have no impact on agricultural resources or rangelands, it would have no potential to contribute to cumulative impacts in this respect. This alternative's potential to disrupt recreational activities would be limited and less than cumulatively considerable when considered in the context of past, present and reasonably foreseeable future projects. However, this alternative would combine with other past and reasonably foreseeable future projects to substantially reduce scenic values of wilderness areas and recreational resources in the Chuckwalla Valley and southern California desert region and therefore, would result in a significant and unavoidable cumulative land use impact in this regard.

C.7.6.3 CEQA LEVEL OF SIGNIFICANCE

Agricultural Lands and Rangeland Management

As discussed above in subsection C.6.5.2, and similar to the proposed project, impacts resulting from this alternative on agricultural and rangeland management would be less than significant.

Wilderness and Recreation

As discussed above in subsection C.6.5.2, and similar to the proposed project, impacts resulting from this alternative to wilderness and recreation would be less than significant.

Horses and Burros

As discussed above in subsection C.6.5.2, and similar to the proposed project, impacts resulting from this alternative on horses and burros would be less than significant.

Land Use Compatibility and LORS Compliance

As discussed above in subsection C.6.5.2, and similar to the proposed project, this alternative would comply with federal LORS. Therefore, impacts would be less than significant.

Cumulative Land Use Effects

As discussed above in subsection C.6.5.2, and similar to the proposed project, the cumulative land use impacts of this alternative when combined with other existing, planned, and reasonably foreseeable projects would be significant and unavoidable.

C.6.7 NO PROJECT/NO ACTION ALTERNATIVES

There are three No Project/No Action Alternatives evaluated in this section, as follows:

NO PROJECT/NO ACTION ALTERNATIVE #1

No Action on Genesis Solar Energy Project application and on CDCA land use plan amendment

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM, and BLM would not amend the CDCA Plan. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land uses described and approved in the CDCA Plan of 1980, as amended.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site and no land disturbance. As a result, the land use-related impacts of the Genesis Solar Energy Project would not occur at the proposed site. The conversion of 1,890 acres of land resulting from construction of the proposed project would not occur. In addition, recreationists would continue to be able to use the lands affected by the proposed project occurring under existing conditions. Although it is possible that the proposed project site could be developed with power generation and/or utility uses in the future given the existing and planned energy-related infrastructure and industrial uses in the area (i.e., Palen Power Solar Project, Blythe Solar Power Project, Mule Mountain Solar Project, McCoy Soleil Project, etc.), the specific size, type, and timing of such use would be unknown. In addition, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

NO PROJECT/NO ACTION ALTERNATIVE #2

No Action on Genesis Solar Energy Project and amend the CDCA land use plan to make the area available for future solar development

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM, and BLM would amend the CDCA Plan of 1980, as amended, to allow for other solar projects on the site. As a result, it is possible that another solar energy project could be constructed on the project site.

Because the CDCA Plan would be amended, it is possible that the site would be developed with the same or a different solar technology. Different solar technologies require the use of different amounts of land; however, it is expected that all utility solar technologies would require the use of large amount of the site. As a result, construction and operation of the solar technology would likely result in the conversion of 1,890 acres of land and would create impacts to existing uses of the land, including recreational users. As such, this No Project/No Action Alternative could result in the conversion of 1,890 acres of land similar to the proposed project.

NO PROJECT/NO ACTION ALTERNATIVE #3

No Action on Genesis Solar Energy Project application and amend the CDCA land use plan to make the area unavailable for future solar development

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM, and the BLM would amend the CDCA Plan to make the proposed site unavailable for future solar development. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use described and approved in the CDCA Plan of 1980, as amended.

Because the CDCA Plan would be amended to make the area unavailable for future solar development, it is expected that the site would continue to remain in its existing condition, and the conversion of 1,890 acres of land as a result of the proposed project would not occur. Recreationists would continue to be able to use the lands affected by the proposed project as is occurring under existing conditions. As a result, the use of the site is not expected to change noticeably from existing conditions and, as such, this No Project/No Action Alternative would not result in impacts from the conversion of 1,890 acres of land at the project site. However, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

C.6.8 CUMULATIVE IMPACT ANALYSIS

Section B.3, Cumulative Scenario, provides detailed information on the potential cumulative solar and other development projects in the project area. Together, these projects comprise the cumulative scenario which forms the basis of the cumulative impact analysis for the proposed project. In summary, these projects are:

- Renewable energy projects on BLM, State, and private lands, as shown on **Cumulative Figure 1** and in **Cumulative Tables 1A and 1B.** Although not all of those projects are expected to complete the environmental review processes, or be funded and constructed, the list is indicative of the large number of renewable projects currently proposed in California.
- Foreseeable future projects in the immediate area, as shown on **Cumulative Impacts Figure 2, I-10 Corridor Existing and Future/Foreseeable Projects, and Cumulative Tables 2 and 3**. Table 2 presents existing projects in this area and Table 3 presents future foreseeable projects in the I-10 Corridor Area. Both tables indicate project name and project type, its location and its status.

These projects are defined within a geographic area that has been identified by the Energy Commission and BLM as covering an area large enough to provide a reasonable basis for evaluating cumulative impacts for all resource elements or environmental parameters. Most of these projects have, are, or will be required to undergo their own independent environmental review under CEQA and/or NEPA. Even if the cumulative projects described in Section B.3 have not yet completed the required environmental processes, they were considered in the cumulative impacts analyses in this SA/Draft EIS.

Geographic Extent

The geographic scope for the analysis of cumulative impacts on land use encompasses Riverside County. As agricultural land statistics and characteristics are typically collected at the county level, cumulative impacts to agricultural land and rangeland management should be evaluated within the context of Riverside County and rangeland administered by BLM throughout the Riverside County region. Recreational opportunities primarily include OHV use and dispersed camping throughout the county. Likewise, wilderness areas and ACECs are located throughout Riverside County. While no HAs and HMAs would be affected by the proposed project, the geographic scope for the analysis of cumulative impacts related to horses and burros includes the Riverside County region to encompass other HAs and HMAs. Projects related to cumulative land use impacts consist of all construction activities and residential and industrial developments within the region. The geographic scope for the analysis of cumulative impacts related to land use compatibility and LORS compliance are the local and regional communities and sensitive receptors. For the purpose of this analysis, in addition to the projects listed in **Cumulative Tables 2 and 3,** data obtained from the NRCS, the U.S. Census, and the BLM's online GIS maps were considered when identifying activities that could contribute to cumulative land use impacts.

Effects of Past and Present Projects

A wide variety of past and present development projects contribute to the cumulative conditions for land use. As noted above in the "Setting and Existing Conditions" subsection for agricultural lands, the majority of the county's agricultural land is surrounded by the county's largest urban areas. According to the DOC, from 2006 to 2008, approximately 3 percent of Riverside County agricultural land was converted to non-agricultural uses (DOC 2008). This is an example of the decline in agricultural acreage throughout this portion of Riverside County. As a result, past and present residential, commercial, and industrial development has contributed to the conversion of existing rural and open space land uses, including agriculture, to other land uses. In regards to rangeland, three livestock grazing allotments are located within Riverside County. The BLM allotment closest to the project site is the Keough allotment north of the proposed project. Past and present projects contribute to the cumulative baseline conditions for rangeland management, including industrial and military developments.

Existing recreation and wilderness areas throughout the county are abundant and maintained by the BLM and California State Parks. However, past and present developments, in particular BLM ACECs, occupy significant portions of areas that could be used for recreation activities. The Chocolate-Mule Mountains HMA is the closest herd management area, which is located approximately 2 miles southeast of the project site near the California-Arizona border. This area is not notable for significant past or present development. Past and present projects occurring in the vicinity of the proposed project site include recreational activities proposed by the BLM, energy development in and around Blythe, and development of the existing state prisons south of I-10.

Effects of Reasonably Foreseeable Future Projects

As shown in **Cumulative Tables 1a, 1b, 2 and 3** renewable energy projects are proposed throughout the California desert lands. According to **Cumulative Tables 1a**

and **1b**, a total of 72 projects and 649,440 acres of solar energy and 61 projects and 433,721 acres of wind energy are currently proposed for development in the California desert lands. This represents a worst-case scenario and not all of these projects would be ultimately developed. As shown in **Cumulative Figures 1 and 2,** one other energy application is proposed in areas surrounding the Chocolate-Mule Mountains HMA.

Contribution of the Genesis Solar Energy Project to Cumulative Impacts

Construction. The construction of the Genesis Solar Energy Project is expected to result in short term adverse impacts related to construction activities. It is expected that some of the cumulative projects described above which are not yet built may be under construction the same time as the Genesis Solar Energy Project. As a result, there may be substantial short term impacts during construction of those cumulative projects related to land use. These short-term impacts would include dust, noise, and traffic. Because the project would not be constructed on wilderness lands the short-term construction impacts would not directly disrupt activities in a federal wilderness area, including, as described above, the Palen/McCoy Wilderness north of the project site, the 3,632-acre Palen Dry Lake ACEC southwest of the project site, and the 2,273-acre Chuckwalla Valley Dune Thicket ACEC approximately two miles southeast of the Project site.

Condition of Certification **TRANS- 1** requires applicants of the Palen, Blythe, and Genesis projects to coordinate construction schedules to ensure that during overlapping construction periods, parking for all workers would be provided at a location that will minimize traffic on I-10 and transport workers to their respective job sites to ensure that I-10, including all intersections, operate at an acceptable LOS.

Operation. The operation of the Genesis Solar Energy Project is expected to result in long term adverse impacts during operation of the project related to land use. It is expected that some of the cumulative projects described above may be operational at the same time as the Genesis Solar Energy Project. As a result, there may be substantial long term impacts during operation of those cumulative projects related to land use.

The proposed project would not convert any agricultural land to a nonagricultural use. The cumulative impacts of additional development projects that would convert the county's agricultural land to non-agricultural uses and conflict with agricultural operations, could be cumulatively considerable over time. However, all development projects must go through environmental review and be in compliance with all applicable LORS. Because the proposed project would not convert any agricultural land or rangeland to nonagricultural uses, the GSEP's contribution to cumulative impacts to agricultural resources and rangelands would be less than significant under CEQA.

The proposed project would permanently change the nature of land use at the proposed project site from Government Special Public Limited Use to an intensive utility for the generation of power. Although the proposed project's effects on recreation and wilderness areas would be less than significant, the combined effect of the overall cumulative past, present, and proposed and reasonably foreseeable projects in eastern

Riverside County could adversely affect recreation and wilderness resources. The GSEP's potential to disrupt recreational activities would be limited and less than cumulatively considerable when considered in the context of past, present and reasonably foreseeable future projects. However, the GSEP would combine with other past and reasonably foreseeable future projects to substantially reduce scenic values of wilderness areas and recreational resources in the Chuckwalla Valley and southern California desert region and therefore, would result in a significant and unavoidable cumulative land use impact in this regard.

Although the proposed GSEP facility would not adversely impact horses or burros, there are other present or reasonably foreseeable future actions that could contribute to impacts to HAs and HMAs within the region. Authorized and unauthorized vehicle use, and maintenance and construction of utility rights-of-way can have a slight impact to burros by removal of vegetation utilized for forage and the danger of vehicles colliding with burros. The impact of the proposed and probable development projects would cumulatively remove and isolate potential grazing sites for burros. However, in areas of close proximity to HAs and HMAs, development projects would be required to consider impacts related to wild horses and burros. Therefore, the GSEP would not contribute to a cumulative significant adverse impact to this resource.

Proposed developments near the project site that would have the potential to induce cumulative impacts include five transmission line projects, thirteen solar energy generation projects, and numerous residential developments. In consideration of cumulative land use compatibility impacts, the implementation of renewable projects in Southern California would occur mostly in undeveloped desert lands or areas of rural development and would not create physical divisions of established residential communities.

Decommissioning. The decommissioning of the Genesis Solar Energy Project is expected to result in adverse impacts related to land use similar to construction impacts. It is unlikely that the construction or decommissioning of any of the cumulative projects would occur concurrently with the decommissioning of this project, because the decommissioning is not expected to occur for approximately 30 years. As a result, there may not be impacts related to land use during decommissioning of the Genesis Solar Energy Project generated by the cumulative projects. However, due to the temporary nature of decommissioning activities and the eventual return of the lands to their current state, the impacts of the decommissioning of the Genesis Solar Energy Project would not be expected to contribute to cumulative impacts related to wilderness and recreation resources. Therefore, the effects of decommissioning on land use are not expected to be adverse.

C.6.9 COMPLIANCE WITH LORS

A detailed discussion of the proposed project's compliance with LORS applicable to land use, recreation, and wilderness is provided above in subsection C.6.4.2, and **LAND USE Table 3** (Project Compliance with Adopted Land Use LORS).

C.6.10 NOTEWORTHY PUBLIC BENEFITS

The proposed project would, for the life of the project, change the nature of land use from BLM-administered open space land, to an intensive utility for the generation of power. Therefore, from a land use perspective, development of the proposed project would not result in any noteworthy public benefits because:

- the Genesis Solar Energy Project site would result in approximately 1,890 acres of total permanent surface disturbance, converting the land from BLM-administered public land to solar energy capture and energy conversion apparatus, attendant outbuildings, supporting structures, roadways, and parking lots; and
- there would be a loss of recreational use at the project site that is used for dispersed camping and associated OHV use.

Therefore, although the development of the proposed project is intended to address the requirements of federal and State mandates for renewable energy, the land conversion and associated land use impacts would not yield any noteworthy public benefits related to land use, recreation, or wilderness.

C.6.11 PROPOSED CONDITIONS OF CERTIFICATION/MITIGATION MEASURES

No Conditions of Certification are proposed for this project.

C.6.12 CONCLUSIONS

- No farmland conversion impacts are expected as a result of linear facilities' construction, and the proposed project would not involve other changes in the existing environment which could result in conversion of farmland, to non-agricultural uses.
- No conversion of rangelands would occur, nor would they be adversely affected by construction or operation of the proposed project.
- The conversion of 1,890 acres of land to support the components and activities associated with the project would disrupt current recreational activities, although due to the remote nature of the site along with the BLM's existing restrictions on recreational activities in the area, direct impacts to recreation use of the project site would be less than significant. Construction of the transmission line would traverse a single "open" route and result in disruptions to motorized vehicle use along this route. As the transmission line would be strung over the route, however, it would not permanently disrupt use of the route.
- The Palen/McCoy Wilderness north of the project site, the Palen Dry Lake ACEC, and the Chuckwalla Valley Dune Thicket ACEC attract visitors based on their scenic, biological, cultural, and recreational amenities. The proposed project would not substantially reduce the scenic, biological or cultural value of a wilderness area.
- The proposed project would not contain or traverse any established BLM HAs or HMAs, and the Chocolate-Mule Mountains HMA and HA are approximately 2 miles

southeast of the proposed project site. In addition, following construction, fencing around the site would keep any burros outside of the proposed project location. Therefore, the proposed project would not result in any interference with BLM's management of an HMA or HA.

- The proposed project would not disrupt or divide the physical arrangement of an established community.
- The applicant has submitted an application to the BLM requesting a ROW to construct the proposed project and its related facilities. Pursuant to the CDCA Plan (1980, as amended), sites associated with power generation or transmission not identified in the CDCA Plan are considered through the Plan Amendment process. Under Federal law, BLM is responsible for processing requests for ROWs to authorize such proposed projects and associated transmission lines and other appurtenant facilities on land it manages. If the ROW and proposed land use plan amendment are approved by BLM, the proposed solar thermal power plant facility on public lands would be authorized in accordance with Title V of the FLMPA of 1976 and the Federal Regulations at 43 CFR part 2800.
- As the proposed project would be located wholly on BLM administered land, no state, regional, or local land use LORS would be applicable to the project. Based on staff's independent review of applicable federal LORS documents, the proposed project would be consistent with applicable land use LORS.
- For purposes of CEQA compliance, the level of significance of each impact of the proposed project on land use resources has been determined and is discussed in detail in Section C.6.4.3 (CEQA Level of Significance). In summary, impacts on agricultural lands and rangelands would be less than significant, and there would be no impacts related to Williamson Act contracts. Impacts to recreation and wilderness resources would be less than significant. Impacts to horses and burros would be less than significant. As proposed, the project would be in compliance with all LORS.
- The land use impacts associated with the Reduced Acreage Alternative would be similar to the proposed project, but less intense given that 50 percent less land would be affected.
- The land use impacts associated with the Dry Cooling Alternative would be similar to the proposed project, but more intense given the bulk and noise of the ACCs.
- The implementation of renewable projects in Southern California would occur mostly in undeveloped desert lands or areas of rural development, and therefore, would not create physical divisions of established residential communities. Nonetheless, approximately one million acres of land are proposed for solar and wind energy development in the Southern California desert lands. In general, the land conversion impacts to these lands would preclude numerous existing land uses including recreational activities, rangeland management, and open space. Because the GSEP would have no impacts on agricultural resources or rangelands, it would have no potential to contribute to cumulative impacts in this respect. The GSEP's potential to disrupt recreational activities would be limited and less than cumulatively considerable when considered in the context of past, present and reasonably foreseeable future projects. However, the GSEP would combine with other past and reasonably foreseeable future projects to substantially reduce scenic values of

wilderness areas and recreational resources in the Chuckwalla Valley and southern California desert region and therefore, would result in a significant and unavoidable cumulative land use impact in this regard.

C.7 - NOISE AND VIBRATION

Testimony of Erin Bright

C.7.1 SUMMARY OF CONCLUSIONS

California Energy Commission staff concludes that the Genesis Solar Energy Project can be built and operated in compliance with all applicable noise and vibration laws, ordinances, regulations, and standards and, if built in accordance with the conditions of certification proposed below, would produce no significant adverse noise impacts on people within the affected area, either direct, indirect, or cumulative.

C.7.2 INTRODUCTION

The construction and operation of any power plant creates noise, or unwanted sound. The character and loudness of this noise, the times of day or night that it is produced, and the proximity of the facility to sensitive receptors combine to determine whether the facility would meet applicable noise control laws and ordinances and whether it would cause significant adverse environmental impacts under CEQA. In some cases, vibration may be produced as a result of power plant construction practices, such as blasting or pile driving. The groundborne energy of vibration has the potential to cause structural damage and annoyance.

The purpose of this analysis is to identify and examine the likely noise and vibration impacts from the construction and operation of the Genesis Solar Energy Project (Genesis) and to recommend procedures to ensure that the resulting noise and vibration impacts would be adequately mitigated to comply with applicable laws, ordinances, regulations, and standards (LORS) and to avoid creation of significant adverse noise or vibration impacts. For an explanation of technical terms and acronyms employed in this section, please refer to **Noise Appendix A** immediately following.

C.7.3 METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

California Environmental Quality Act

The California Environmental Quality Act (CEQA) requires that significant environmental impacts be identified and that such impacts be eliminated or mitigated to the extent feasible. Section XI of Appendix G of CEQA Guidelines (*See* Cal. Code Regs., tit. 14, Section 15063) sets forth some characteristics that may signify a potentially significant impact. Specifically, a significant effect from noise may exist if a project would result in:

1. exposure of persons to, or generation of, noise levels in excess of standards established in the local General Plan or noise ordinance or applicable standards of other agencies;

2. exposure of persons to or generation of excessive ground-borne vibration or ground-borne noise levels;

3. substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project; or

4. substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.

The Energy Commission staff, in applying item 3 above to the analysis of this and other projects, has concluded that a potential for a significant noise impact exists where the noise of the project plus the background exceeds the background by 5 dBA or more at the nearest sensitive receptor. A change in level of at least 5 dB is required before any noticeable change in community response would be expected.

Staff considers it reasonable to assume that an increase in background noise levels up to 5 dBA in a residential setting is insignificant; an increase of more than 10 dBA is considered significant. An increase between 5 and 10 dBA should be considered adverse, but may be either significant or insignificant, depending on the particular circumstances of the case.

Factors to be considered in determining the significance of an adverse impact (as defined above) include:

1. the resulting combined noise level;[1]

2. the duration and frequency of the noise;

3. the number of people affected;

4. the land use designation of the affected receptor sites; and

5. public concern or controversy expressed at workshops or hearings or in correspondence.

Noise impacts due to construction activities are usually considered to be insignificant if:

- the construction activity is temporary;
- use of heavy equipment and noisy activities are limited to daytime hours; and
- all industry-standard noise abatement measures are implemented for noise-producing equipment.

Staff uses the above method and threshold to protect the most sensitive populations, including the minority population.

[1] For example, a noise level of 40 dBA would be considered quiet in many locations. A noise limit of 40 dBA would be consistent with the recommendations of the California Model Community Noise Control Ordinance for rural environments and with industrial noise regulations adopted by European jurisdictions. If the project would create an increase in ambient noise no greater than 10 dBA at nearby sensitive receptors, and the resulting noise level would be 40 dBA or less, the project noise level would likely be insignificant.

Laws, Ordinances, Regulations, and Standards

Noise Table 1
Laws, Ordinances, Regulations, and Standards

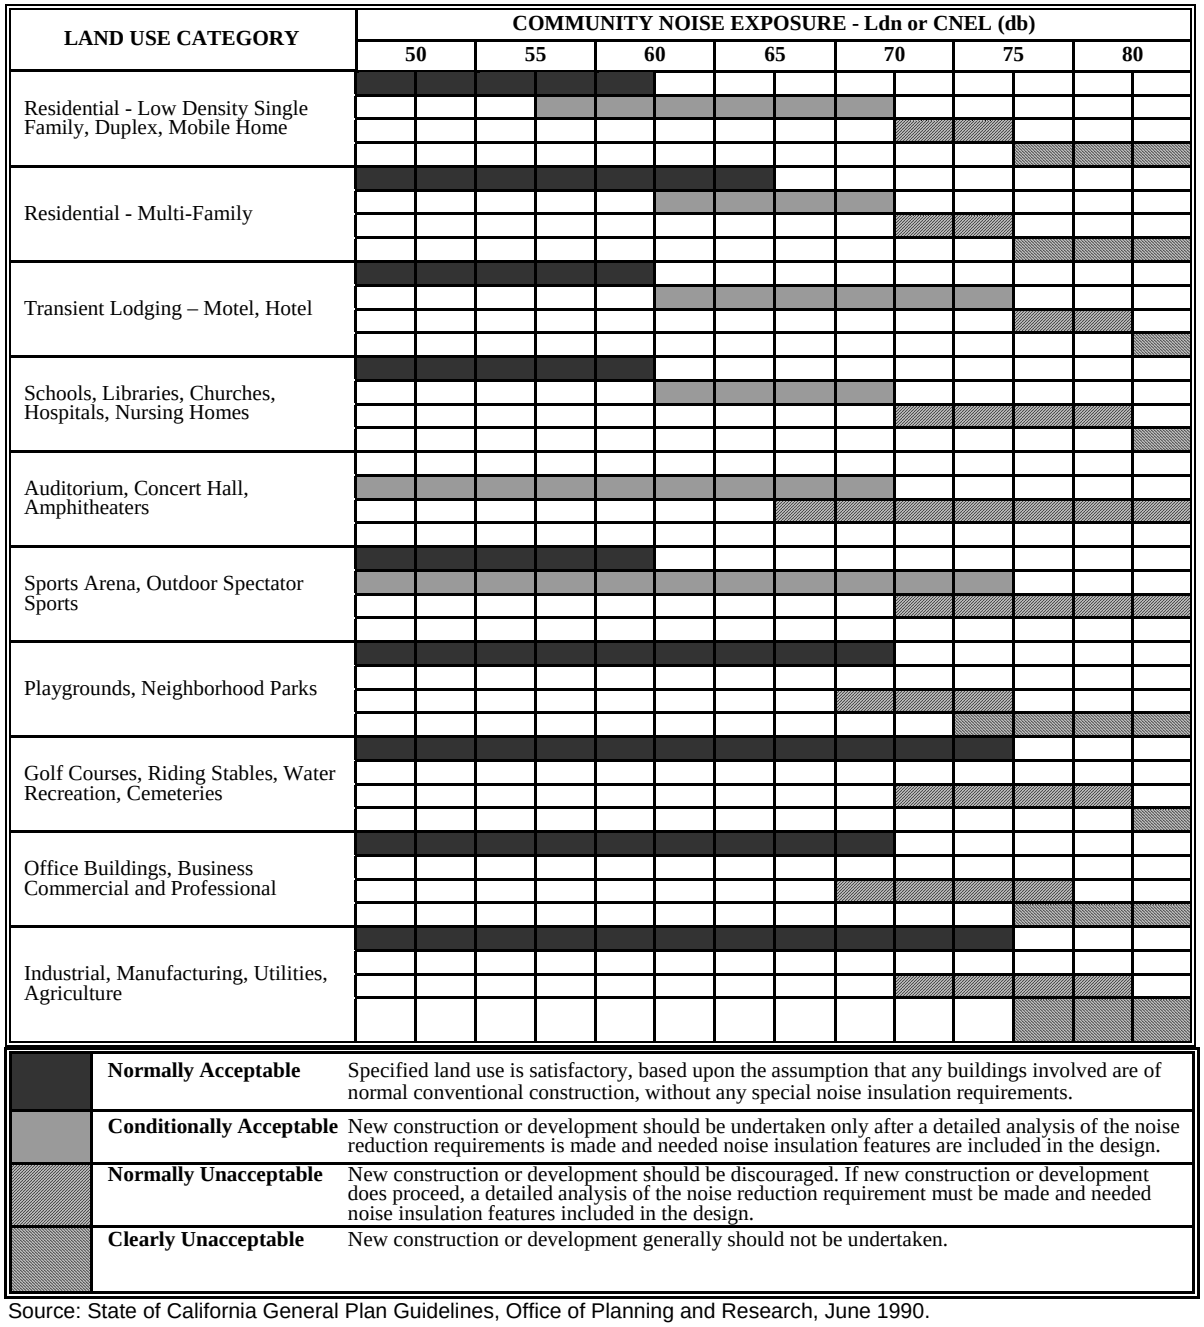
Applicable Law	Description
Federal (OSHA): 29 U.S.C. § 651 et seq.	Protects workers from the effects of occupational noise exposure.
State (Cal/OSHA): Cal. Code Regs., tit. 8, §§ 5095–5099	Protects workers from the effects of occupational noise exposure.
Local Riverside County General Plan - Noise Element	Establishes acceptable noise levels.
Riverside County Noise Ordinance	Limits hours of noisy construction.

FEDERAL

Under the Occupational Safety and Health Act of 1970 (29 USC § 651 et seq.), the Department of Labor, Occupational Safety and Health Administration (OSHA) has adopted regulations designed to protect workers against the effects of occupational noise exposure (29 CFR § 1910.95). These regulations list permissible noise exposure levels as a function of the amount of time during which the worker is exposed (see **NOISE Appendix A, Table A4** immediately following this section). The regulations further specify a hearing conservation program that involves monitoring the noise to which workers are exposed, assuring that workers are made aware of overexposure to noise, and periodically testing the workers' hearing to detect any degradation.

There are no federal laws governing off-site (community) noise.

The only guidance available for evaluation of power plant vibration is guidelines published by the Federal Transit Administration (FTA) for assessing the impacts of groundborne vibration associated with construction of rail projects. These guidelines have been applied by other jurisdictions to assess groundborne vibration of other types of projects. The FTA-recommended vibration standards are expressed in terms of the "vibration level," which is calculated from the peak particle velocity measured from groundborne vibration. The FTA measure of the threshold of perception is 65 VdB,[2] which correlates to a peak particle velocity of about 0.002 inches per second (in/sec). The FTA measure of the threshold of architectural damage for conventional sensitive structures is 100 VdB, which correlates to a peak particle velocity of about 0.2 in/sec.



STATE

California Government Code section 65302(f) encourages each local governmental entity to perform noise studies and implement a noise element as part of its General Plan. In addition, the California Office of Planning and Research has published

[2] VdB is the common measure of vibration energy.

guidelines for preparing noise elements, which include recommendations for evaluating the compatibility of various land uses as a function of community noise exposure. The State land use compatibility guidelines are listed in **Noise: Table 2**.

Noise Table 2
Land Use Compatibility for Community Noise Environment

Source: State of California General Plan Guidelines, Office of Planning and Research, June 1990.

The California Occupational Safety and Health Administration (Cal/OSHA) has promulgated Occupational Noise Exposure Regulations (Cal. Code Regs., tit. 8, §§ 5095–5099) that set employee noise exposure limits. These standards are equivalent to the federal OSHA standards (see the **Worker Safety and Fire Protection** section of this document, and **NOISE Appendix A, Table A4**).

LOCAL

Riverside County General Plan Noise Element

The Noise Element of the Riverside County General Plan contains standards, policies and procedures that are intended to minimize noise impacts to the community (Riverside 2008). The noise level standards for new projects, including non-transportation noise sources, employ the Community Noise Equivalent Level (CNEL) or Day-Night Level (L_{dn}), and are similar to those shown by **Noise Table 2**. Specifically, the County Noise Element standards for residential land uses are: Normally Acceptable: CNEL or L_{dn} up to 60 dB; Conditionally Acceptable: up to 70 dB CNEL or Ldn.

Riverside County Code

Riverside County has adopted restrictions affecting construction noise sources in Ordinance 847 of the Riverside County Code. Construction within one-quarter mile of an occupied residence is prohibited between the hours of 6 p.m. and 6 a.m., except as allowed with the written consent of the building official (Riverside 2007).

C.7.4 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

The analysis of proposed project effects must comply with both CEQA and NEPA requirements given the respective power plant licensing and land jurisdictions of the California Energy Commission and U.S. Bureau of Land Management (BLM). Because this document is intended to meet the requirements of both NEPA and CEQA, the methodology used for determining environmental impacts of the proposed project includes a consideration of guidance provided by both laws.

As noted above, CEQA identifies criteria that may be used to determine the significance of identified impacts. A significant impact is defined by CEQA as “a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project” (Cal. Code Reg., tit. 14 (hereinafter State CEQA Guidelines) Section 15382).

In comparison, NEPA states that “‘Significantly’ as used in NEPA requires considerations of both context and intensity…” (40 CFR 1508.27). Therefore, thresholds serve as a benchmark for determining if a project action will result in a significant adverse environmental impact when evaluated against the baseline. NEPA requires that an Environmental Impact Statement (EIS) is prepared when the proposed federal action (project) as a whole has the potential to “significantly affect the quality of the human environment.”

Criteria for determining significance in this section are based on Appendix G of the CEQA Guidelines (CCR 2006) and performance standards or thresholds identified by the Energy Commission staff. In addition, staff’s evaluation of the environmental effects of the proposed project on land uses (i.e., those listed below) includes an assessment of the context and intensity of the impacts, as defined in the NEPA implementing regulations 40 CFR Part 1508.27.

Effects of the proposed project on noise and vibration (and in compliance with both CEQA and NEPA) have been determined using the thresholds listed below.

C.7.5 PROPOSED PROJECT

C.7.5.1 SETTING AND EXISTING CONDITIONS

The proposed Genesis Solar Energy Project would be constructed on a 1,800 acre site located approximately 25 miles west of the town of Blythe in Riverside County. The site is primarily on undisturbed federal land managed by the BLM (GSEP 2009a, AFC §§ 3.2, 5.9.1).

The ambient noise regime in the project vicinity consists of aircraft traffic, highway traffic, wind and wildlife. There are no noise sensitive receptors within 9 miles of the project site, however, two state prisons are located approximately 9 miles southeast of the project site (GSEP 2009a, AFC §§ 1.0, 5.9.1, 5.9.4.1).

Ambient Noise Monitoring

There are no noise sensitive receptors located within nine miles of the project site. The Energy Commission's siting regulations only require ambient noise measurements when it is likely that operational or construction noise from a project will increase the ambient noise levels at nearby noise sensitive receptors by 5 dBA or more. Given that there are no noise sensitive receptors located within nine miles of the project site, and that the ambient noise regime in the surrounding area includes highway traffic and aircraft traffic, it is extremely unlikely that the ambient noise at the nearest noise sensitive receptor (more than nine miles away from the project site) would be low enough that attenuated project noise would cause a 5 dBA increase in the ambient noise level. Thus, staff agrees with the applicant that ambient noise monitoring is not required.

C.7.5.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

DIRECT IMPACTS AND MITIGATION

Noise impacts associated with the project can be created by short-term construction activities and by normal long-term operation of the power plant.

Construction Impacts and Mitigation

Construction of Genesis is expected to occur over a period of 37 months (GSEP 2009a, AFC § 3.7.1). Each unit of the project is expected to require approximately 25 months to be constructed, with the construction of each unit overlapping by 12 months.

Compliance with LORS

Construction of an industrial facility such as a power plant is typically noisier than permissible under usual noise ordinances. In order to allow the construction of new facilities, construction noise during certain hours of the day is commonly exempt from enforcement by local ordinances.

The Applicant has predicted that there will be no noise impacts due to project construction on the nearest sensitive receptors (GSEP 2009a, AFC §§ 5.9.4.1, 5.9.5.1, Table 5.9-5). Assuming an average construction noise of 93 dBA L_{eq} at 50 feet from the noise center (the upper range of noise levels for construction equipment), project construction noise would attenuate to 39 dBA at a distance of five miles from the acoustic center. Project construction noise would further attenuate to 34 dBA at the state prisons, 9 miles away.

There are no LORS that limit construction noise levels for the project. The Riverside County Code prohibits noisy construction work to daytime hours when a project is within one-quarter mile of a noise sensitive receptor. Given the distance between the proposed project site and the nearest noise sensitive receptor, this limitation does not apply. No limit on construction hours needs to be enforced for the Genesis project.

CEQA Impacts

Power Plant Site

To evaluate construction noise impacts, staff compares the projected noise levels to the ambient levels. Since construction noise typically varies continually with time, it is most appropriately measured by, and compared to, the L_{eq} (energy average) metric.

Ambient noise levels were not measured because there are no noise sensitive receptors within 9 miles of the project site. Aggregate construction noise would attenuate to less than 35 dBA at a distance of nine miles from the project site, which is generally considered to be very quiet. Given the lack of receptors in the vicinity of the project site, staff considers the noise impacts due to construction activity to be insignificant.

In the event that actual construction noise should annoy nearby residents, staff proposes Conditions of Certification **NOISE-1** and **NOISE-2**, which would establish a public notification process to notify nearby residents of the project construction and operation, and a Noise Complaint Process that would require the applicant to resolve any complaints regarding project noise.

Linear Facilities

Linear facilities include a new six-mile natural gas pipeline connecting to an existing Southern California Edison pipeline located north of highway I-10, as well as new electrical transmission lines interconnecting to the transmission system to the southeast of the project site. Both the natural gas pipeline and the transmission lines would extend past the project site boundaries; neither would pass close to noise sensitive receptors (GSEP 2009a, AFC Figure 5.12-1).

Steam Blows

Typically, the loudest noise encountered during construction, inherent in building any project incorporating a steam turbine, is created by the steam blows. After erection and assembly of the feedwater and steam systems, the piping and tubing that comprises the steam path has accumulated dirt, rust, scale and construction debris such as weld

spatter, dropped welding rods and the like. If the plant were started up without thoroughly cleaning out these systems, all this debris would find its way into the steam turbine, quickly destroying the machine.

In order to prevent this, before the steam system is connected to the turbine, the steam line is temporarily routed to the atmosphere. High pressure steam is then raised in a heat recovery steam generator (HRSG) or a boiler and allowed to escape to the atmosphere through the steam piping. This flushing action, referred to as a steam blow, is quite effective at cleaning out the steam system. A series of short steam blows, lasting two or three minutes each, is performed several times daily over a period of two or three weeks. At the end of this procedure, the steam line is connected to the steam turbine, which is then ready for operation.

These steam blows can produce noise as loud as 130 dBA at a distance of 100 feet. This would attenuate to about 82 dBA at a distance of five miles from the project site, and 77 dBA at the prisons nine miles from the project site. While this is an annoying noise level, even at these great distances from the project site, there are no noise sensitive receptors within these distances and the noise would attenuate further with greater distances. Staff concludes that steam blows would likely not cause a significant impact.

Pile Driving

The applicant does not explicitly state that pile driving would be necessary for construction of Genesis. However, staff has analyzed the potential noise impacts of pile driving in case it is found necessary during the construction process. If pile driving is required for construction of the project, the noise from this operation could be expected to reach 101 dBA at a distance of 50 feet (GSEP 2009a, AFC Table 5.9-5). Pile driving noise would thus be projected to reach levels of 47 dBA at distance of five miles from the project site, and 42 dBA at the prisons nine miles from the project site. Impacts due to pile driving, if it should occur, would not be significant.

Vibration

The only construction operation likely to produce vibration that could be perceived off site would be pile driving, should it be employed. Vibration attenuates rapidly; it is likely that no vibration would be perceptible at any appreciable distance from the project site. Staff therefore believes there would be no significant impacts from construction vibration.

Worker Effects

The applicant has acknowledged the need to protect construction workers from noise hazards and has recognized those applicable LORS that would protect construction workers (GSEP 2009a, AFC § 5.9.5.4). To ensure that construction workers are, in fact, adequately protected, staff has proposed Condition of Certification **NOISE-3**, below.

Operation Impacts and Mitigation

The primary noise sources of Genesis include the steam turbine generators, cooling tower, start-up boiler, and various pumps and fans (GSEP 2009a, AFC §§ 3.5.1,

5.9.5.2; Table 5.9-7). Staff compares the projected noise with applicable LORS. In addition, staff evaluates any increase in noise levels at sensitive receptors due to the project in order to identify any significant adverse impacts.

Common noise mitigating factors included in parabolic trough solar thermal generating facilities include:

- metal acoustical steam turbine enclosure; and
- 25-foot high solar mirror arrays surrounding the power block.

Compliance with LORS

The applicant did not perform full noise modeling for project operation because there were no noise sensitive receptors in the vicinity of the project that would be impacted by operating noise (GSEP 2009a, AFC §§ 5.9.4.1, 5.9.5.2; Figure 3.2-1).

The applicant estimates that project operational noise levels would be less than 30 dBA at a distance of five miles; staff considers this a reasonable estimation. Project operating noise would thus comply with the standard set by the Riverside County General Plan (60 dBA CNEL at the nearest receptor).

CEQA Impacts

Power plant noise is unique. Essentially, a power plant operates as a steady, continuous, broadband noise source, unlike the intermittent sounds that comprise the majority of the noise environment. As such, power plant noise contributes to, and becomes part of, the background noise level, or the sound heard when most intermittent noises cease. Where power plant noise is audible, it will tend to define the background noise level. For this reason, staff compares the projected power plant noise to the existing ambient background (L_{90}) noise levels at the affected sensitive receptors. If this comparison identifies a significant adverse impact, then feasible mitigation must be incorporated in the project to reduce or remove the impact.

In many cases, a power plant will be intended to operate around the clock for much of the year. As a solar thermal generating facility, Genesis would operate only during the daytime hours, typically 15 hours per day during the summer (with fewer hours during the fall, winter, and spring), when sufficient solar insulation is available. Typically, daytime ambient noise consists of both intermittent and constant noises. The noise that stands out during this time is best represented by the average noise level, or L_{eq}. Thus, staff normally compares a project's daytime noise levels to the daytime ambient L_{eq} levels at the project's noise-sensitive receptors.

As noted above, there are no sensitive receptors within nine-miles of the project site. The applicant has predicted that project operational noise levels would attenuate to less than 30 dBA at a distance of five miles from the project site, which would attenuate further at greater distances. At the state prisons located nine miles from the project site, project operating noise would attenuate to less than 25 dBA, which is a very quite level for daytime ambient even in rural areas. Given the distance, and thus the amount of noise attenuation, project noise levels would not be expected to be higher than ambient

values at the prison or any noise sensitive receptors further away. No change in ambient noise would be expected to result from plant operation.

Tonal Noises

One possible source of disturbance would be strong tonal noises. Tonal noises are individual sounds (such as pure tones) that, while not louder than permissible levels, stand out in sound quality. The applicant plans to avoid the creation of annoying tonal (pure-tone) noises by balancing the noise emissions of various power plant features during plant design. Given the lack of noise sensitive receptors within the vicinity of the project, tonal noises would not be expected to cause annoyance.

Linear Facilities

The electrical interconnection line would not pass by any noise sensitive receptors and would thus not be expected to have any effects. Additionally, noise effects from electrical interconnection lines typically do not extend beyond the right-of-way easement of the line and thus are generally inaudible to any nearby receptors.

Vibration

Vibration from an operating power plant could be transmitted by two chief means; through the ground (groundborne vibration) and through the air (airborne vibration).

The operating components of the Beacon project consist of a high-speed steam turbine generator and various pumps and fans. All of these pieces of equipment must be carefully balanced in order to operate; permanent vibration sensors are attached to the turbines and generators. Based on experience with numerous previous projects employing similar equipment, Energy Commission staff believes that ground borne vibration from Genesis would be undetectable at distances greater than a few hundred feet from the power block. Given that there are no receptors within nine miles of the project, vibration would not have an impact on any receptors.

Airborne vibration (low frequency noise) can rattle windows and objects on shelves and can rattle the walls of lightweight structures. None of the project equipment is likely to produce low frequency noise; this makes it highly unlikely that Genesis would cause perceptible airborne vibration effects.

Worker Effects

The applicant has acknowledged the need to protect plant operating and maintenance workers from noise hazards and has committed to comply with applicable LORS (GSEP 2009a, AFC § 5.9.5.4). To ensure that plant operation and maintenance workers are, in fact, adequately protected, Energy Commission staff has proposed Condition of Certification **NOISE-4**, below.

FACILITY CLOSURE

In the future, upon closure of Genesis, all operational noise from the project would cease, and no further adverse noise impacts from operation of Genesis would be possible. The remaining potential temporary noise source is the dismantling of the structures and equipment and any site restoration work that may be performed. Since

the noise would be similar to that caused by the original construction, it would likely cause no noise impacts given the remote location of the project. Any noise LORS that are in existence at that time would apply. Applicable conditions of certification included in the Energy Commission decision would also apply unless modified by the Energy Commission.

C.7.5.3 CEQA LEVEL OF SIGNIFICANCE

For the purposes of CEQA compliance, the significance of construction and operating noise impacts of the proposed project at the nearest sensitive receptors has been determined.

Construction Impacts

As discussed in detail in section C.7.4.2 above (under the subsection entitled "Construction Impacts and Mitigation"), there are no noise sensitive receptors within nine miles of the project that would be impacted by construction noise; the impacts due to construction noise are considered insignificant.

Operation Impacts

As discussed in detail in section C.7.4.2 above (under the subsection entitled "Operation Impacts and Mitigation"), power plant noise levels are predicted to be less than 30 dBA L_{eq} at a distance of five miles from the project site during daytime operation, which would not likely result in an increase over ambient noise. No change in ambient noise at any sensitive receptor at night would result from plant operation. Thus, operation noise impacts of the project would be insignificant.

C.7.6 REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would essentially be Unit 1 of the proposed project, including a 125 MW solar facility located within the boundaries of the proposed project as defined by NextEra. This alternative is analyzed for two major reasons: (1) it eliminates about 50 percent of the proposed project area so all impacts are reduced, and (2) by eliminating the eastern solar field, it would reduce the water required for wet cooling by 50 percent. The boundaries of the Reduced Acreage Alternative are shown in **Alternatives Figure 1**.

C.7.6.1 Setting and Existing Conditions

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates effects to the eastern 125 MW solar field and relocates the gas yard approximately 1.75 miles northwest of its present location. As a result, the environmental setting consists of the western portion of the proposed project, as well as the area affected by the linear project components.

C.7.6.2 Assessment of Impacts and Discussion of Mitigation

The Reduced Acreage alternative would most likely correspond to lower operational, given that only half of the noise generating equipment (steam turbine generator, wet cooling tower, etc) would be included in the project. Because there are no noise sensitive receptors within the vicinity of the project, noise impacts for the Reduced

Acreage alternative would most likely be the same, as for the proposed project, which as discussed above in section 10.4.2 are insigificant.
Because this alternative would result in fewer construction activities conducted at greater distances from sensitive receptors than the proposed project, the analysis for the proposed project demonstrates that the Reduced Acreage alternative can be built and operated in compliance with all applicable noise and vibration laws, ordinances, regulations, and standards. Also, if built in accordance with the conditions of certification proposed for the proposed project, it would produce no significant adverse noise impacts on people within the affected area, either direct, indirect, or cumulative.

C.7.6.3 CEQA Level of Significance

Like the proposed project, the Reduced Acreage alternative, if built and operated in conformance with the proposed conditions of certification defined for the proposed project, would comply with all applicable noise and vibration LORS and would produce no significant adverse noise impacts on people within the project area, directly, indirectly, or cumulatively.

C.7.7 DRY COOLING ALTERNATIVE

This section identifies the potential impacts of using air-cooled condenser (ACC) systems rather than the cooling towers proposed by NextEra for the Genesis project. It is assumed that the ACC systems would be located where the cooling towers are currently proposed for each of the two 125 MW power block, as illustrated in **Alternatives Figure 2** (see Section B.3).
Approximately 18 ACC fans would be required for each of the two solar fields. The 18 fans, or ACC's, would operate when the ambient temperature is above 50 degrees Fahrenheit. When the temperature is below 50 degrees Fahrenheit, only 10 of the fans would be used (GSEP 2009f). The 18 ACC fans described in the GSEP cooling study would have a length of approximately 279 feet, a width of approximately 127 feet, and a height of 98 feet (GSEP 2009f). However, based on the ACC preliminary designs for nearby solar thermal projects in similar ambient temperatures, an additional 11,690 square feet could be required for siting of the fans and the fans would be up to 120 feet in height. In addition to the ACC fans, NextEra would use a small Wet Surface Air Cooler when needed to provide auxiliary cooling during extremely hot days (GSEP 2009f). This alternative is analyzed because it would reduce the amount of water required for steam turbine cooling from 822 acre-feet per year (AFY) to 66 AFY. This reduction in water use would reduce impacts to water and biological resources.

C.7.7.1 Setting and Existing Conditions

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates the use of wet-cooling towers and incorporated the use of air-cooled condensers (ACC) in the same location. As a result, the environmental setting would be the same as for the proposed project.

C.7.7.2 Assessment of Impacts and Discussion of Mitigation

The use of a Dry Cooling Alternative would introduce additional noise sources to the overall plant design, consisting of fans, motors, and gearboxes, but would eliminate

cooling tower noise (a noise source that significantly contributes to project noise levels). The overall difference in project noise level between dry cooling and wet cooling would be small.

The far field noise level for the Dry Cooling Alternative is expected to be approximately 60 dBA at 400 feet (GSEP 2009f). This level would attenuate to approximately 47 dBA at the facility fenceline (approximately 1,800 feet from the proposed position of the ACC) and approximately 25 dBA at a distance of five miles from the project site, compared to less than 30 dBA at five miles for the proposed project. As with the proposed cooling system, no change in ambient noise levels at any noise sensitive receptor would result from the project because there are no such receptors within the vicinity of the project. If the project were to use dry cooling, noise impacts would be insignificant.

C.7.7.3 CEQA Level of Significance

No new impacts to noise and vibration would be created with use of ACCs in place of cooling towers. The overall impact of the project with dry cooling would be similar to that of the proposed project.

C.7.8 NO PROJECT/NO ACTION ALTERNATIVES

No Project/No Action Alternative #1:

No Action on Genesis Solar Energy Project application and on CDCA land use plan amendment

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and BLM would not amend the CDCA Plan. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, the construction and operation noise-related impacts of the Genesis Solar Energy Project would not occur at the proposed site. However, the land on which the project is proposed would become available to other uses that are consistent with BLM's land use plan, including another solar project requiring a land use plan amendment. In addition, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

No Project/No Action Alternative #2:

No Action on Genesis Solar Energy Project and amend the CDCA land use plan to make the area available for future solar development

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and BLM would amend the CDCA Land Use Plan of

1980, as amended, to allow for other solar projects on the site. As a result, it is possible that another solar energy project could be constructed on the project site.
Because the CDCA Plan would be amended, it is possible that the site would be developed with the same or a different solar technology. Different solar technologies use different machinery during construction and would create different ambient noise levels during operation; however, it is expected all technologies would require the use of large construction vehicles that would create unwanted noise and some intermittent noise during operations. However, as with the proposed project, it is expected that solar technologies create minor increases in ambient noise during operation. As such, this No Project/No Action Alternative could result in an impact from increased ambient noise during construction and operation similar to under the proposed project.

No Project/No Action Alternative #3:

No Action on Genesis Solar Energy Project application and amend the CDCA land use plan to make the area unavailable for future solar development

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and the BLM would amend the CDCA Plan to make the proposed site unavailable for future solar development. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.
Because the CDCA Plan would be amended to make the area unavailable for future solar development, it is expected that the site would continue to remain with the existing ambient noise from its existing condition. Ambient noise of the site is not expected to change noticeably from existing conditions and, as such, this No Project/No Action Alternative would not result in impacts from any increase in noise at the project site. However, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

C.7.9 CUMULATIVE IMPACT ANALYSIS

Geographic Extent

The geographic scope for considering cumulative noise impacts on sensitive receptors for this project consists of the region immediately surrounding any identified receptors. There are no noise-sensitive receptors within nine miles of the project site, the fact of which inherently precludes the possibility for cumulative noise impacts from the project.

C.7.10 COMPLIANCE WITH LORS

A detailed discussion of the proposed project's compliance with LORS applicable to noise and vibration is provided above in subsection C.7.4.2.

C.7.11 NOTEWORTHY PUBLIC BENEFITS

The proposed project would affect the daytime ambient noise levels in the immediate project area. While this change would not be noticeable at the sensitive receptors near the project, and thus not significant, development of the proposed project would not result in any noteworthy public benefits.

C.7.12 PROPOSED CONDITIONS OF CERTIFICATION/MITIGATION MEASURES

NOISE-1 At least 15 days prior to the start of ground disturbance, the project owner shall notify all residents within two miles of the project site boundaries and one-half mile of linears, by mail or other effective means, of the commencement of project construction. At the same time, the project owner shall establish a telephone number for use by the public to report any undesirable noise conditions associated with the construction and operation of the project and include that telephone number in the above notice. If the telephone is not staffed 24 hours per day, the project owner shall include an automatic answering feature, with date and time stamp recording, to answer calls when the phone is unattended. This telephone number shall be posted at the project site during construction in a manner visible to passersby. This telephone number shall be maintained until the project has been operational for at least one year.

Verification: Prior to ground disturbance, the project owner shall transmit to the Compliance Project Manager (CPM) a statement, signed by the project owner's project manager, stating that the above notification has been performed and describing the method of that notification, verifying that the telephone number has been established and posted at the site, and giving that telephone number.

NOISE COMPLAINT PROCESS

NOISE-2 Throughout the construction and operation of Genesis, the project owner shall document, investigate, evaluate, and attempt to resolve all project-related noise complaints. The project owner or authorized agent shall:

- Use the Noise Complaint Resolution Form (below), or a functionally equivalent procedure acceptable to the CPM, to document and respond to each noise complaint;
- Attempt to contact the person(s) making the noise complaint within 24 hours;
- Conduct an investigation to determine the source of noise related to the complaint;
- Take all feasible measures to reduce the noise at its source if the noise is project related; and
- Submit a report documenting the complaint and the actions taken. The report shall include: a complaint summary, including final results of noise

reduction efforts, and if obtainable, a signed statement by the complainant stating that the noise problem is resolved to the complainant's satisfaction.

Verification: Within five days of receiving a noise complaint, the project owner shall file a copy of the Noise Complaint Resolution Form with the CPM, documenting the resolution of the complaint. If mitigation is required to resolve a complaint, and the complaint is not resolved within a three-day period, the project owner shall submit an updated Noise Complaint Resolution Form when the mitigation is implemented.

NOISE-3 The project owner shall submit to the CPM for review and approval a noise control program and a statement, signed by the project owner's project manager, verifying that the noise control program will be implemented throughout construction of the project. The noise control program shall be used to reduce employee exposure to high noise levels during construction and also to comply with applicable OSHA and Cal/OSHA standards.

Verification: At least 30 days prior to the start of ground disturbance, the project owner shall submit to the CPM the noise control program and the project owner's project manager's signed statement. The project owner shall make the program available to Cal/OSHA upon request.

NOISE-4 Following the project's first achieving a sustained output of 90 percent or greater of rated capacity, the project owner shall conduct an occupational noise survey to identify the noise hazardous areas in the facility.

The survey shall be conducted by a qualified person in accordance with the provisions of Title 8, California Code of Regulations sections 5095–5099 and Title 29, Code of Federal Regulations section 1910.95. The survey results shall be used to determine the magnitude of employee noise exposure.

The project owner shall prepare a report of the survey results and, if necessary, identify proposed mitigation measures that will be employed to comply with the applicable California and federal regulations.

Verification: Within 30 days after completing the survey, the project owner shall submit the noise survey report to the CPM. The project owner shall make the report available to OSHA and Cal/OSHA upon request.

C.7.13 CONCLUSIONS

Staff concludes that Genesis, if built and operated in conformance with the proposed conditions of certification below, would comply with all applicable noise and vibration LORS and would produce no significant adverse noise impacts on people within the project area, directly, indirectly, or cumulatively.

NOISE APPENDIX A
FUNDAMENTAL CONCEPTS OF COMMUNITY NOISE

To describe noise environments and to assess impacts on noise sensitive area, a frequency weighting measure, which simulates human perception, is customarily used. It has been found that "A-weighting" of sound intensities best reflects the human ear's reduced sensitivity to low frequencies and correlates well with human perceptions of the annoying aspects of noise. The A-weighted decibel scale (dBA) is cited in most noise criteria. Decibels are logarithmic units that conveniently compare the wide range of sound intensities to which the human ear is sensitive. **NOISE Table A1** provides a description of technical terms related to noise.

Noise environments and consequences of human activities are usually well represented by an equivalent A-weighted sound level over a given time period (L_{eq}), or by average day and night A-weighted sound levels with a nighttime weighting of 10 dBA (L_{dn}). Noise levels are generally considered low when ambient levels are below 45 dBA, moderate in the 45 to 60 dBA range, and high above 60 dBA. Outdoor day-night sound levels vary over 50 dBA depending on the specific type of land use. Typical L_{dn} values might be 35 dBA for a wilderness area, 50 dBA for a small town or wooded residential area, 65 to 75 dBA for a major metropolis downtown (e.g., San Francisco), and 80 to 85 dBA near a freeway or airport. Although people often accept the higher levels associated with very noisy urban residential and residential-commercial zones, those higher levels nevertheless are considered to be levels of noise adverse to public health.

Various environments can be characterized by noise levels that are generally considered acceptable or unacceptable. Lower levels are expected in rural or suburban areas than would be expected for commercial or industrial zones. Nighttime ambient levels in urban environments are about seven decibels lower than the corresponding average daytime levels. The day-to-night difference in rural areas away from roads and other human activity can be considerably less. Areas with full-time human occupation that are subject to nighttime noise, which does not decrease relative to daytime levels, are often considered objectionable. Noise levels above 45 dBA at night can result in the onset of sleep interference effects. At 70 dBA, sleep interference effects become considerable (U.S. Environmental Protection Agency, Effects of Noise on People, December 31, 1971).

To help the reader understand the concept of noise in decibels (dBA), **NOISE Table A2** illustrates common noises and their associated sound levels, in dBA.

NOISE Table A1 Definition of Some Technical Terms Related to Noise	
Terms	**Definitions**
Decibel, dB	A unit describing the amplitude of sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure, which is 20 micropascals (20 micronewtons per square meter).
Frequency, Hz	The number of complete pressure fluctuations per second above and below atmospheric pressure.
A-Weighted Sound Level, dBA	The sound pressure level in decibels as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise. All sound levels in this testimony are A-weighted.
L_{10}, L_{50}, & L_{90}	The A-weighted noise levels that are exceeded 10%, 50%, and 90% of the time, respectively, during the measurement period. L_{90} is generally taken as the background noise level.
Equivalent Noise Level, L_{eq}	The energy average A-weighted noise level during the noise level measurement period.
Community Noise Equivalent Level, CNEL	The average A-weighted noise level during a 24-hour day, obtained after addition of 4.8 decibels to levels in the evening from 7 p.m. to 10 p.m., and after addition of 10 decibels to sound levels in the night between 10 p.m. and 7 a.m.
Day-Night Level, L_{dn} or DNL	The Average A-weighted noise level during a 24-hour day, obtained after addition of 10 decibels to levels measured in the night between 10 p.m. and 7 a.m.
Ambient Noise Level	The composite of noise from all sources, near and far. The normal or existing level of environmental noise at a given location.
Intrusive Noise	That noise that intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, and time of occurrence and tonal or informational content as well as the prevailing ambient noise level.
Pure Tone	A pure tone is defined by the Model Community Noise Control Ordinance as existing if the one-third octave band sound pressure level in the band with the tone exceeds the arithmetic average of the two contiguous bands by 5 decibels (dB) for center frequencies of 500 Hz and above, or by 8 dB for center frequencies between 160 Hz and 400 Hz, or by 15 dB for center frequencies less than or equal to 125 Hz.

Subjective Response to Noise

The adverse effects of noise on people can be classified into three general categories:

- Subjective effects of annoyance, nuisance, dissatisfaction.
- Interference with activities such as speech, sleep, and learning.
- Physiological effects such as anxiety or hearing loss.

The sound levels associated with environmental noise, in almost every case, produce effects only in the first two categories. Workers in industrial plants can experience noise effects in the last category. There is no completely satisfactory way to measure the subjective effects of noise or of the corresponding reactions of annoyance and dissatisfaction, primarily because of the wide variation in individual tolerance of noise.

One way to determine a person's subjective reaction to a new noise is to compare the level of the existing (background) noise, to which one has become accustomed, with the level of the new noise. In general, the more the level or the tonal variations of a new noise exceed the previously existing ambient noise level or tonal quality, the less acceptable the new noise will be, as judged by the exposed individual.

With regard to increases in A-weighted noise levels, knowledge of the following relationships can be helpful in understanding the significance of human exposure to noise.

1. Except under special conditions, a change in sound level of 1 dB cannot be perceived.

2. Outside of the laboratory, a 3-dB change is considered a barely noticeable difference.

3. A change in level of at least 5 dB is required before any noticeable change in community response would be expected.

4. A 10-dB change is subjectively heard as an approximate doubling in loudness and almost always causes an adverse community response (Kryter, Karl D., The Effects of Noise on Man, 1970).

Combination of Sound Levels

People perceive both the level and frequency of sound in a non-linear way. A doubling of sound energy (for instance, from two identical automobiles passing simultaneously) creates a 3-dB increase (i.e., the resultant sound level is the sound level from a single passing automobile plus 3 dB). **NOISE Table A3** indicates the rules for decibel addition used in community noise prediction.

NOISE Table A3
Addition of Decibel Values

When two decibel values differ by:	Add the following amount to the larger value
0 to 1 dB	3 dB
2 to 3 dB	2 dB
4 to 9 dB	1 dB
10 dB or more	0
Figures in this table are accurate to ± 1 dB.	

Source: Architectural Acoustics, M. David Egan, 1988.

Sound and Distance

Doubling the distance from a noise source reduces the sound pressure level by 6 dB.

Increasing the distance from a noise source 10 times reduces the sound pressure level by 20 dB.

Worker Protection

OSHA noise regulations are designed to protect workers against the effects of noise exposure and list permissible noise level exposure as a function of the amount of time to which the worker is exposed, as shown in **NOISE Table A4**.

NOISE Table A4
OSHA Worker Noise Exposure Standards

Duration of Noise (Hrs/day)	A-Weighted Noise Level (dBA)
8.0	90
6.0	92
4.0	95
3.0	97
2.0	100
1.5	102
1.0	105
0.5	110
0.25	115

C.8 - SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE

Testimony of Scott Debauche

C.8.1 SUMMARY OF CONCLUSIONS

Energy Commission staff (hereafter referred to as "staff") have reviewed the Genesis Solar Energy Project (GSEP or proposed project) in accordance with the requirements of the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). With respect to CEQA and NEPA, staff concludes that the GSEP would not under CEQA cause a significant adverse direct or indirect impact or contribute to a cumulative socioeconomic impact on the area's housing, schools, parks and recreation, police, emergency medical services, or hospitals, because the project's construction and operation workforce currently resides in the regional or local labor market area. Staff also concludes that the project would not require the construction of new or altered public facilities.

The construction and operation of the proposed GSEP would not result in any disproportionate impacts to low-income or minority populations. Gross public benefits from the proposed project include capital costs, construction and operation payroll, and sales taxes from construction and operational spending.

Please refer to the **Land Use, Recreation, and Wilderness** section of this document for further analysis of recreation impacts.

C.8.2 INTRODUCTION

Staff's socioeconomics impact analysis evaluates project-induced changes on existing population and employment patterns, community services. In addition, this section provides demographic information related to environmental justice. A discussion of the estimated beneficial economic impacts of the construction and operation of the proposed GSEP and other related economic impacts are provided.

C.8.3 METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

The analysis of proposed project effects must comply with both California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA) requirements given the respective power plant licensing and land jurisdictions of the California Energy Commission and U.S. Bureau of Land Management (BLM). CEQA requires that the significance of individual effects be determined by the Lead State Agency. However, the use of specific significance criteria is not required under NEPA.

Because this document is intended to meet the requirements of both NEPA and CEQA, the methodology used for determining environmental impacts of the proposed project includes a consideration of guidance provided by both laws.

The Council on Environmental Quality Regulations for Implementing the Procedural Provisions of the NEPA (CEQ NEPA Regulations) states that “Significantly” as used under NEPA requires considerations of both context and intensity…” (40 CFR 1508.27). Significance varies with the setting of the proposed action (40 CFR 1508.27[a]); and 40 CFR 1508.8 adds that indirect effects may include those that are growth inducing and others related to induced changes in the pattern of land use, population density, or growth rate. With respect to CEQA, socioeconomic impacts are limited to those that would result in direct physical effects on the environment, such as changes to population and housing, and that are separate from strictly economic impacts, such as a loss of revenue.

Based on a review of recent environmental assessment documents prepared for the BLM and the CEQA Guidelines, Appendix G, staff has determined the list of thresholds below to be appropriate for analysis of socioeconomics impacts under both NEPA and CEQA. A project may have a significant effect on socioeconomics if the project would:

- Induce substantial population growth in an area, either directly or indirectly;
- Displace substantial numbers of people and/or existing housing, necessitating the construction of replacement housing elsewhere; or
- Adversely impact acceptable levels of service for fire and police protection, schools, parks and recreation, and other public facilities.

In addition to the above, the GSEP socioeconomics analysis identifies beneficial fiscal and economic effects, including impacts on local finances from property and sales taxes as well as the creation of employment, employment revenue, and the purchases of goods and services during both GSEP construction and operation.

To satisfy the requirements of Executive Order 12898, “Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations,” this section identifies any disproportionate minority and low-income populations within the GSEP study area. Any disproportionate significant impacts to minority and low-income populations are discussed within each environmental issue area section of this document.

Criteria for subject areas such as utilities, fire protection, water use, and wastewater disposal are analyzed in the **Soil and Water Resources**, **Reliability**, **Worker Safety and Fire Protection**, and **Waste Management** sections of this document. Impacts on population, housing, parks and recreation, schools, medical services, law enforcement, and cumulative impacts are based on subjective judgments and data from local and state agencies. Typically, long-term employment of people from regions outside the study area could potentially result in significant adverse socioeconomic impacts.

C.8.4 PROPOSED PROJECT

C.8.4.1 SETTING AND EXISTING CONDITIONS

Laws, Ordinances, Regulations, and Standards

The following table contains all socioeconomic laws, ordinances, regulations, and standards (LORS) applicable to the GSEP.

SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 1
Laws, Ordinances, Regulations, and Standards (LORS)

Applicable LORS	Description
Federal	
Emergency Economic Stabilization Act of 2008 (P.L. 110-343) Business Solar Investment Tax Credit (IR Code §48)	Extends the 30% investment tax credit (ITC) for solar energy property for eight years through December 31, 2016. The bill allows the ITC to be used to offset both regular and alternative minimum tax (AMT) and waives the public utility exception of current law (i.e., permits utilities to directly invest in solar facilities and claim the ITC). The five-year accelerated depreciation allowance for solar property is permanent and unaffected by passage of the eight-year extension of the solar ITC.
State	
California Revenue and Taxation Code, sections 721–725: California Board of Equalization (BOE) – Property Tax Rule 905 (BOE authority to assess electrical generating facilities is found in Article XIII, section 19, of California's Constitution)	Property Tax Rule 905 states "the Board shall annually assess every electric generation facility with generating capacity of 50 MW or more..." It also states that for purposes of this rule, "electric generation facility" does not include a qualifying small power production facility or qualifying cogeneration facility within the meaning of section 201 and section 210 of Title II of the Public Utility Regulatory Policies Act of 1978. According to this act, (16 USC, section 796 [17] [A]), a "small power production facility is defined as 'A facility which is eligible solar, wind, waste, or geothermal facility...[that] has a power production capacity, which together with any other facilities located at the same site, is not greater than 80 MW.'"
California Revenue and Tax Code 70-74.7	Property taxes are not assessed on solar facilities. Assembly Bill 1451 extended the current property tax exclusion for new construction of solar energy systems to January 1, 2017.
California Education Code, Section 17620	The governing board of any school district is authorized to levy a fee, charge, dedication, or other requirement for the purpose of funding the construction or reconstruction of school facilities.
California Government Code, Sections 65996-65997	Except for a fee, charge, dedication, or other requirement authorized under Section 17620 of the Education Code, state and local public agencies may not impose fees, charges, or other financial requirements to offset the cost for school facilities.

Regional Study Area

The proposed project includes the construction and operation of a solar generating facility located in the Southern California inland desert on federal land managed by the BLM, approximately 25 miles west of the City of Blythe and approximately 35 miles west of the California-Arizona border in unincorporated eastern Riverside County. The town of Desert Center is located approximately 27 miles west of the proposed GSEP site. The Ironwood and Chuckwalla State Prisons, which are technically part of the City of Blythe, are located adjacent to each other approximately 9 miles south of the GSEP site. Research shows that workers may commute as much as two hours each direction from their communities rather than relocate (EPRI 1982). Therefore, for purposes of this analysis, the socioeconomics study area is Riverside County, CA; San Bernardino County, CA; and La Paz County, AZ.

Current and forecasted population trends, as well as current housing trends for the study area are summarized in **SOCIOECONOMICS AND ENVIRONMENAL JUSTICE Table 2**. As shown in **Table 2.** From 2008 through 2030, the populations of Riverside and San Bernardino Counties are forecasted to comprise the majority of the total GSEP study area population, with Riverside County expected to experience the highest total population increase. Also shown in **Table 2**, the regional study area contains a high number of housing units, with San Bernardino and Riverside Counties contributing the largest numbers within the GSEP study area. Among all communities within the study area, La Paz County has the highest vacancy rate.

SOCIOECONOMICS AND ENVIRONMENAL JUSTICE Table 2
Population and Housing Profile of the Regional Study Area

Population				
Area	**Year**			
	2008 Population	**2010 Projected Population**	**2020 Projected Population**	**2030 Projected Population**
Riverside County, CA	2,078,601	2,239,053	2,904,848	3,507,498
San Bernardino County, CA	2,055,766	2,177,596	2,582,777	2,957,744

Local Study Area

As required by the Bureau of Land Management (BLM) Land Use Planning Handbook, Appendix D requirements (BLM 2009), a project analysis of this type needs to consider existing socioeconomic conditions and impacts on several geographic scales. An analysis at a local level presents a challenge because the proposed project is in a

sparsely populated area, with the largest urban center being the city of Riverside located approximately 100 miles west of the site. Based on BLM requirements, a reasonable study area for localized socioeconomic impacts would include the two nearest communities: the city of Blythe, CA (approximately 25 miles east of the GSEP site); and the city of Ehrenburg, AZ (approximately 30 miles east of the GSEP site). The most recently published population and housing data for these communities is presented below in **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 3.**

SOCIOECONOMICS AND ENVIRONMENAL JUSTICE Table 3
Population and Housing Profile of the Local Study Area

Area	Year		
	2008 Population	2008 Total Housing Units	2008 Vacancy Rate Percentage (%)
Blythe, CA	13,541	5,444	16.1
Ehrenburg, AZ	1,409	824[1]	34.9[1]

Notes: [1] Data from 2000.
Source: GSEP 2009a, Tables 5.11-4 and 5.11-5

Based on Staff research, the economic structure of these local study area communities that may be affected by the management of BLM lands includes primarily a tourism, mining, and infrastructure related economic base, with both communities being rural suburban locations closely tied to the Interstate 10 travel route between the cities of Los Angeles, CA and Phoenix, AZ.

Environmental Justice/Demographic Screening

Executive Order 12898, “Federal Actions to address environmental justice in Minority Populations and Low-Income Populations,” focuses federal attention on the environment and human health conditions of minority communities and calls on agencies to achieve environmental justice as part of this mission. The order requires the US Environmental Protection Agency (EPA) and all other federal agencies (as well as state agencies receiving federal funds) to develop strategies to address this issue. The agencies are required to identify and address any disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on minority and/or low-income populations.

Civil Rights Act of 1964, Public Law 88-352, 78 Stat.241 (Codified as amended in scattered sections of 42 U.S.C.) Title VI of the Civil Rights Act prohibits discrimination on the basis of race, color, or national programs in all programs or activities receiving federal financial assistance.

California law defines environmental justice as “the fair treatment of people of all races, cultures and income with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies” (Government Code Section 65040.12 and Public Resources Code Section 72000).

All Departments, Boards, Commissions, Conservancies and Special Programs of the

Resources Agency must consider environmental justice in their decision-making process if their actions have an impact on the environment, environmental laws, or policies. Such actions that require environmental justice consideration may include:

- Adopting regulations;
- Enforcing environmental laws or regulations;
- Making discretionary decisions of taking actions that affect the environment;
- Providing funding for activities affecting the environment; and
- Interacting with the public on environmental issues.

In considering environmental justice in energy siting cases, staff uses a demographic screening analysis to determine whether a low-income and/or minority population exists within the potentially affected area of the proposed site. The potentially affected area consists of a six-mile radius of the site and is consistent with air quality modeling of the range of a project's air quality impacts. The demographic screening is based on information contained in two documents: *Environmental Justice: Guidance Under the National Environmental Policy Act* (Council on Environmental Quality, December, 1997) and *Guidance for Incorporating Environmental Justice Concerns in EPA's Compliance Analyses* (U.S. Environmental Protection Agency, April, 1998). The screening process relies on Year 2000 U.S. Census data to determine the presence of minority and below-poverty-level populations.

In addition to the demographic screening analysis, staff follows the steps recommended by the U.S. EPA's guidance documents which are outreach and involvement, and if warranted, a detailed examination of the distribution of impacts on segments of the population.

Staff has followed each of the above steps for the following 11 sections in the SA/DEIS: Air Quality, Hazardous Materials, Land Use, Noise, Public Health, Socioeconomics, Soils and Water, Traffic and Transportation, Transmission Line Safety/Nuisance, Visual Resources, and Waste Management. Over the course of the analysis for each of the 11 areas, staff considered potential impacts and mitigation measures, significance, and whether there would be a significant impact on an environmental justice population.

Minority Population

According to *Environmental Justice: Guidance Under the National Environmental Policy Act*, minority individuals are defined as members of the following groups: American Indian or Alaskan Native; Asian or Pacific Islander; Black, not of Hispanic origin; or Hispanic. A minority population, for the purposes of environmental justice, is identified when the minority population of the potentially affected area is greater than 50 percent or meaningfully greater than the percentage of the minority population in the general population or other appropriate unit of geographical analysis.

For the proposed GSEP, the total population within a six-mile radius of the proposed project is 8,308 persons (including prison populations of 3,913 at Chuckwalla and 3,945 at Ironwood state prisons), and the total minority population is 6,628 persons or 79.77

percent of the total population (see **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Figure 1**). As the demographic screening area as a whole exceeds 50.0 percent, as shown in **Figure 1**, staff in several technical areas identified in the Executive Summary has considered environmental justice in their environmental impact analyses.

Below-Poverty-Level Population

Staff has also identified the below-poverty-level population based on Year 2000 U.S. Census block data within a six-mile radius of the project site. Poverty status excludes institutionalized people, people in military quarters, people in college dormitories, and unrelated individuals under 15 years old. The below-poverty-level population within a six-mile radius of the proposed GSEP consists of no people or 0.0 percent of the total population in that area.

C.8.4.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Induce Substantial Population Growth

For the purpose of this analysis, staff defines "induce substantial population growth" as workers permanently moving into the project area because of project construction and operation, thereby encouraging construction of new homes or extension of roads or other infrastructure. To determine whether the project would induce population growth, staff analyzes the availability of the local workforce and the population within the region. Staff defines "local workforce" for the GSEP to be Riverside/San Bernardino/Ontario Metropolitan Statistical Area (MSA), which includes both Riverside and San Bernardino Counties.[1] While the city of Ehrenberg within La Paz County, AZ is located within the proposed project local and regional study areas, respectively, and could contribute to the local workforce, detailed labor skill data is unavailable for this limited portion of the regional and local study area. As shown above in **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 2**, due to the size of the La Paz County population, presenting local workforce data for the entire State of Arizona would not be representative of the available workforce within the county. However, it should be noted that construction workforce from within this county and local communities would contribute to the local workforce as identified in detail below.

Construction. It is anticipated that the construction period for the proposed GSEP would occur over a 37-month construction period. There would be an average of approximately 646 daily construction workers, with a peak daily workforce of 1,085, depending on the month and the work required. Laborers would consist of craftspeople and supervisory, support, and construction management personnel on site during construction. According to AFC section 5.8 (Socioeconomics), the peak construction labor force of 1,085 total daily construction workers would occur during the 23rd month of construction. This maximum employment number is used to analyze worst-case construction population and employment impacts. **SOCIOECONOMICS AND**

[1] Metropolitan Statistical Areas are geographic entities defined by the U.S. Office of Management and Budget (OMB) for use by Federal and State statistical agencies in collecting, tabulating, and publishing socioeconomic statistics.

ENVIRONMENTAL JUSTICE Table 4 shows Year 2006-2016 occupational employment projections for the Riverside/San Bernardino/Ontario MSA by construction labor skill as compared to the estimated number of total construction workers by craft needed during the peak month (month 23) as presented in the AFC (GSEP 2009a).

SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 4
Total Labor by Skill in Riverside/San Bernardino/Ontario MSA (2006 and 2016 Estimate) and GSEP Required Construction by Craft Peak Month

Trade	Total # of Workers for Project Construction by Craft – Peak Month	Riverside/San Bernardino/Ontario MSA 2006	Riverside/San Bernardino/Ontario MSA 2016
Insulators[1]	24	27,930	32,080
Operating Engineers	60	4,790	5,460
Laborer[1]	96	27,930	32,080
Teamsters[1]	38	27,930	32,080
Painters[1]	15	27,930	32,080
Carpenter	44	28,850	32,390
Solar Field Craft[1]	305	27,930	32,080
Pipe Fitter	200	4,630	5,330
Electrician	105	6,740	7,600
Cement Mason	4	4,110	4,690
Ironworker	70	19,460	20,800
Millwright[3]	22	2,630	2,960
Construction Staff[4]	92	10,990	12,380

Notes: [1] The "Construction Laborers" category was used, [2] the "Plumbers, Pipefitters, and Steamfitters" category was used, [3] the "Machinists" category was used, [4] the "Supervisors, Construction and Extraction Workers" category was used, [5] the "Helpers-Construction Trades" category was used.
Source: GSEP 2009a, Tables 5.8-12 and 5.8-15.

As shown in **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 4**, there is more than adequate local availability of construction workforce within the Riverside/San Bernardino/Ontario MSA alone for the GSEP. As mentioned above, additional workforce would be available and likely come from within La Paz County, AZ and local communities within such as Ehrenberg and Quartzsite. Should some construction workers from within the study area choose to stay temporarily at a local area motel or hotel close to the GSEP site, there is ample transient housing available. There are approximately 630 hotel/motel rooms and suites among 11 different establishments in the Blythe area (AS 2009a). As such, staff finds that the proposed project would not induce substantial growth or concentration of population in either the regional or local study areas and construction of the GSEP would not encourage people to permanently relocate to the area.

Operation. The proposed GSEP is expected to require a total of 40 to 50 permanent full-time employees (GSEP 2009a). **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 5** shows Year 2006-2016 occupational employment projections for the Riverside/San Bernardino/Ontario MSA (by operational labor skill as compared to the estimated number of total operational workers needed as presented in the AFC (GSEP 2009a).

SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 5
Total Labor by Skill in Riverside/San Bernardino/Ontario MSA (2006 and 2016 Estimate) and GSEP Required Operation

Trade	Total # of Workers for Project Operation	Riverside/San Bernardino/Ontario MSA 2006	Riverside/San Bernardino/Ontario MSA 2016
Plant and System Operators	--	2,030	2,380
Power Plant Operators	--	310	370
Total	*40-50*	*2,340*	*2,750*
Source: GSEP 2009a.			

As shown in **Table 5**, data for the Riverside/San Bernardino/Ontario MSA indicates that in the Year 2006, the "Plant and System Operators" and "Power Plant Operators" employment sector contained a total of 2,350 workers, with Year 2016 forecasts for these employment sectors to grow to a total of 2,750 employees. On p. 5.8-23 of the AFC, the applicant states that 50 percent of workers would come from within the regional study area workforce, resulting in a potential influx of approximately 25 workers in communities within the proposed GSEP regional and local study areas (GSEP 2009a). However, Staff's independent analysis (based on **Table 5**) shows that there is more than an adequate local workforce for project operation regardless of the specialized nature of the proposed project. Therefore, due to the labor force located within the Riverside/San Bernardino/Ontario MSA, Staff concludes that the new operational employees required for the GSEP would be found locally.

In the event any permanent operational employees chose to live closer to the GSEP site, as shown earlier in **Table 3** the current vacancy rates for the cities of Blythe, CA and Ehrenberg, AZ are 16.1 and 34.9 percent, respectively. These vacancy rates indicate ample local housing should operational employees choose to relocate. Staff concludes that under CEQA, inducement of substantial population growth either directly or indirectly by the GSEP would not be significant or adverse.

Displace Existing Housing and Substantial Numbers of People

The proposed GSEP site would be located within vacant BLM land and contains no housing. As such, no housing would be displaced. Furthermore, staff has determined that no housing would be displaced from required transmission line and other infrastructure linear connections associated with the GSEP. As discussed above, staff finds the required construction and operational workforce of the GSEP would be found locally and no inmigration would occur that would trigger the need for new housing. Furthermore, vacancy rates within the local study area offer operational employees wishing to relocate within the local study area ample available housing. A high number of transient lodging opportunities exist within the regional study area to serve construction employees. Therefore, staff concludes that no significant construction or operation-related impacts are expected for the regional and local study area housing supply, availability, or demand, and the GSEP would not displace any populations or existing housing, and it would not necessitate construction of replacement housing elsewhere.

Result in Substantial Physical Impacts to Government Facilities

Physical impacts to public services and facilities are usually associated with population in-migration and growth in an area, which increase the demand for a particular service and lead to the need for expanded or new facilities. Physical impacts to public services and facilities are usually associated with population in-migration and growth in an area, which increase the demand for a particular service, leading to the need for expanded or new facilities. Public service providers serving the GSEP site are located within Riverside County only and represent the local study area. Therefore, the study area for the public services analysis is limited to Riverside County.

As discussed under the subject headings below, the GSEP would not cause significant impacts to service ratios, response times, or other performance objectives relating to law enforcement, schools, parks and recreation, or emergency medical service facilities. Fire protection is analyzed in the **Worker Safety and Fire Protection** section of this document.

Police Protection

The GSEP site would be served by the Riverside County Sheriff's Department Colorado River Station at 260 North Spring Street in Blythe provides service to the unincorporated area from Red Cloud Road on the west, to the Arizona state line on the east, and county line to county line on the north and south. Communities included in this service area are Desert Center, Eagle Mountain, East Blythe, Hayfield, Midland, Nicholls Warm Springs, Ripley, and the Colorado River. Currently, the Riverside County Sheriff's Department average response time to the GSEP site depends on the severity of the incident and the location of the deputies on call; however, response time is estimated at 30 minutes.

Construction. As discussed above, the construction workforce for the GSEP would be hired locally. There would be no population inmigration occurring from GSEP construction that would increase the local population or would require the need for new or expanded law enforcement facilities or staff levels within the GSEP regional or local study areas.

Operation. As discussed above, staff's analysis shows the operational workforce for the GSEP would be hired locally and no population inmigration would occur. Staff concludes that operation of the proposed GSEP would not increase the local population or require the need for new or expanded law enforcement facilities or staff levels within the GSEP regional or local study areas.

Schools

The proposed GSEP site area is served by the Palo Verde Unified School District serving the city of Blythe and other remote areas of Riverside County and the Desert Center Unified School District in Desert Center (GSEP 2009a). **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 6** identifies the schools and year 2006-2007 student enrollments in each of the respective school districts. As shown in **Table 6**, Palo Verde Unified School District (PVUSD), approximately 25 miles east of the GSEP site,

offers a full range of educational opportunities with three elementary schools, one middle school, one high school, and a continuation high school.

SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 6
Summary of Schools and Enrollment in Palo Verde and Desert Center School Districts, Year 2006–2007

Palo Verde Unified School District			
School Name	**Community**	**Grades**	**Students**
Felis J. Appleby Elementary School	Blythe	K-5	527
Margaret White Elementary School	Blythe	K-5	666
Ruth Brown Elementary School	Blythe	K-5	652
Blythe Middle School	Blythe	6-8	841
Palo Verde High School	Blythe	9-12	952
Twin Palms Continuation School	Blythe	9-12	97
Desert Center Unified School District			
School Name	**Community**	**Grades**	**Students**
Eagle Mountain Elementary School	Desert Center	K-8	16
Source: Solar Millennium2009a, Tables 5.11-14 and 5.11-15.			

Construction. As discussed above, the required construction workforce of the GSEP would be hired locally. There would be no population inmigration occurring from GSEP construction that would increase the local population or would require the need for new or expanded school facilities or staff levels within the GSEP regional or local study areas.

Operation. Like all school districts in the state, the PVUSD is entitled to collect school impact fees for new construction within their district under the California Education Code Section 17620. These fees are based on the project's square feet of industrial space. Because the main services complex of the GSEP (considered "industrial space") would be constructed entirely on BLM land, no private land would be affected and therefore, the provisions of Education Code Section 17620 would not apply to this project. Therefore, the GSEP would be in compliance with Education Code section 17620 (as described in **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 1)**. Additionally, as discussed above, the required operational workforce of the GSEP would be found locally with no population in-migration occurring that would increase the local population or would require the need for new or expanded school facilities or staff levels within the GSEP regional or local study areas.

Parks and Recreation

The site is currently undeveloped, although recreational use of the area is allowed under the BLM California Desert Conservation Area (CDCA), but infrequent (GSEP 2009a). The nearest park facilities to the GSEP site are located within the city of Blythe, located approximately 40 miles east of the GSEP site. The city of Blythe Parks Department is responsible for the maintenance and upkeep of the area's seven parks and one pocket park (City of Blythe, 2009).

Construction. As discussed above, the required construction workforce of the GSEP would be hired locally. There would be no population inmigration occurring that would

increase the local population or would require the need for new or expanded parks and recreational facilities or staff levels within the GSEP regional or local study areas.

Operation. As discussed above, the proposed GSEP would not eliminate any lands designated for recreational use. Furthermore, as the required operational workforce of the GSEP would be found locally, there would be no population inmigration occurring that would increase the local population or would require the need for new or expanded parks and recreational facilities or staff levels within the GSEP regional or local study areas.

Hospitals

The closest hospitals to the proposed GSEP site are the Palo Verde Hospital approximately 25 miles east in Blythe, the John F. Kennedy Memorial Hospital approximately 78 miles west in Indio, and the Desert Regional Medical Center approximately 99 miles west in Palm Springs. Palo Verde Hospital provides intensive care/critical/emergency care on site, including four adult intensive-care beds for critically ill patients, and contracts ambulance service to the hospital via private ambulance service providers within Blythe (Solar Millennium2009a).

SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 7 identifies the nearest emergency medical service facilities to the site and their respective available services.

SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 7
Hospitals and Services Serving the GSEP Site

Hospital/Address	Available Services
Palo Verde Hospital 251 First Street Blythe, CA	Hospital, blood bank, computerized tomography scan, intensive care unit, labor/delivery/recovery rooms, magnetic resonance imaging, nuclear medicine, outpatient services, ultrasound.
John F. Kennedy Memorial Hospital 47111 Monroe St. Indio, California	Hospital, cardiac and vascular, healthgrades, orthopedic and arthritis institute, outpatient rehabilitation, women and children, emergency department, free physician referral and community education, emergency and express care.
Desert Regional Medical Center 1150 N. Indian Canyon Dr. Palm Springs, California	Hospital, hematologists, pathologists, radiology, general surgeons, emergency medical and surgical service, anesthesiologists, physical therapists, obstetricians, and gynecologists, rehabilitation services.
Source: Solar Millennium2009a, Table 5.11-13.	

Construction. Construction of the proposed GSEP would last 39-months and include an average of 646 daily construction workers, peaking with a daily workforce of 1,085 workers during month 23 of construction (GSEP 2009a). In the event an on-site accident occurred during project construction, both private ambulance service and Riverside County Fire Department firefighters would provide first responder emergency medical care. As discussed in the **WORKER SAFETY AND FIRE PROTECTION** section of this document, the nearest Riverside County Fire Department fire stations are staffed full-time, 24 hours/7 days a week, with a minimum 3-person crew, including paramedics. Once transported, as shown above in **Table 7**, a number of local area

hospitals are available to provide emergency and express medical care. Therefore, while a high number of construction employees would be located on-site, local area emergency medical facilities are expected to adequately handle any worksite accidents requiring their attention. No additional constraints or physical impacts would occur to the local study area healthcare services or facilities identified in **Table 7** serving the GSEP site.

Operation. The proposed GSEP is expected to require a total of 40 to 50 permanent full-time employees (GSEP 2009a). As discussed above for construction, the available emergency medical and hospital facilities identified in **Table 7** and serving the GSEP site and local study area are expected to adequately handle the permanent addition of 50 on-site staff and the long-term demands of the GSEP. Furthermore, as all operational employees are expected to come from within the regional study area, no new population in migration would occur that could decrease existing emergency medical care providers existing service ratios. Operation of the GSEP is not expected to significantly impact the existing service levels, response times, or capacities of the hospitals serving the GSEP.

Project Closure and Decommissioning

According to Section 3.12 of the applicant's project description, the solar generating facility is expected to have a lifespan of 30 years. At any point during this time, temporary or permanent closure of the solar facility could occur. Temporary closure would be a result of necessary maintenance, hazardous weather conditions, or damage due to a natural disaster. Permanent closure would be a result of damage that is beyond repair, adverse economic conditions, or other significant reasons.

Both temporary and permanent closures would require the applicant to submit to the CEC and BLM a contingency plan or a decommissioning plan, respectively. A contingency plan would be implemented to ensure compliance with applicable LORS, and appropriate shutdown procedures depending on the length of the cessation. A decommissioning plan would be implemented to ensure compliance with applicable LORS, removal of equipment and shutdown procedures, site restoration, potential decommissioning alternatives, and the costs and source of funds associated with decommissioning activities. As described in the **Project Description** section of the Staff Assessment, it is assumed decommissioning of the facility would be similar to that described above for construction of the GSEP.

Staff cannot speculate as to the long-term economic and fiscal effects that closure and decommissioning activities would have on the study area because future conditions are unknown. Upon permanent closure of the GSEP, the beneficial socioeconomic operational impacts such as worker payroll, project expenditures, and local economic stimulus would no longer occur. It should be noted that closure and decommissioning of the GSEP would likely require further environmental impact evaluation, and most likely would have some beneficial fiscal and non-fiscal impacts to the area.

C.8.4.3 CEQA LEVEL OF SIGNIFICANCE

As discussed in the subject headings above, under CEQA, project-related socioeconomic impacts would be less than significant for population, housing, and public services including law enforcement, schools, parks and recreation, and emergency medical services.

C.8.5 REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would essentially be Unit 1 of the proposed project, including a 125 MW solar facility located within the boundaries of the proposed project as defined by NextEra. This alternative is analyzed for two major reasons: (1) it eliminates about 50 percent of the proposed project area so all impacts are reduced, and (2) by retaining the eastern solar field, which is located on flowing desert washes, it would reduce impacts to the sand dune and playa areas and to the Mojave Fringe-toed Lizard habitat. The alternative would also reduce impacts to wildlife movement by reducing obstruction of the Palen wash and would maintain, thru both fluvial and Aeolian processes, the dune and sandy habitats. The boundaries of the Reduced Acreage Alternative are shown in **Alternatives Figure 1**.

C.8.5.1 SETTING AND EXISTING CONDITIONS

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates effects to the eastern 125 MW solar field and relocates the gas yard approximately 1.75 miles northwest of its present location. As a result, the environmental setting consists of the western portion of the proposed project, as well as the area affected by the linear project components.

C.8.5.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Induce Substantial Population Growth

Under the Reduced Acreage Alternative, only one generating unit would be constructed. Due to phasing of the construction of the generating units, the peak number of workers required for construction would be reduced from 1,085 to approximately 734. However, this potential reduction in construction would not result in a change to socioeconomic impacts when compared to the proposed GSEP as the regional study area provides a substantial number of construction workers by type to serve the Reduced Acreage Alternative as well as the GSEP (refer to **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 4**). Therefore, all construction workers required for the Reduced Acreage Alternative are expected to come from within the regional study area and would not result in population inmigration.

It is assumed that operation of this alternative would require a similar number of operational employees as the GSEP. As discussed above in Section C.8.4.2 (refer to **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 5**), operational employees are expected to come from within the regional study area and not result in population inmigration.

Displace Existing Housing and Substantial Numbers of People

The housing impacts of the Reduced Acreage Alternative would be identical to those of the proposed GSEP, as described in Section C.8.4.2. As discussed above, this alternative would reduce the footprint of the proposed GSEP site. Therefore, as discussed above for the GSEP, no housing would exist within the alternative site and required infrastructure ROW. Therefore, the Reduced Acreage Alternative would not displace any housing during construction or operation. Furthermore, similar to that of the GSEP, both construction and operational employment associated with the Reduced Acreage Alternative would not result in the demand for new housing in either the regional or local study areas (refer above to Section C.8.4.2).

Result in Substantial Physical Impacts to Government Facilities

The public services impacts of the Reduced Acreage Alternative would be similar to those of the proposed GSEP, as described in Section C.8.4.2. As discussed above, all construction and operational employees associated with the Reduced Acreage Alternative are expected to come from within the regional study area. Therefore, no new population inmigration would occur that could decrease existing public service providers service levels and ratios, response times, capacities, or require new or expanded facilities serving the GSEP regional or local study areas. As this alternative would also be located entirely within BLM lands, no private land would be affected and therefore, the provisions of Education Code Section 17620 would not apply to this alternative.

Cumulative Socioeconomics Effects

The cumulative socioeconomic impacts of the Reduced Acreage Alternative would be similar to those of the proposed GSEP, as described below in Section C.8.8. While this alternative could result in a decrease in construction schedule and required workforce, the regional and local study area would continue to provide adequate construction and operational employees for the Reduced Acreage Alternative and cumulative development projects. While these projects would combine to increase the demand for localized transient lodging and potentially permanent housing in the local study area, a large number of hotel/motel rooms are available and local study area vacancy rates indicate ample permanent housing is available to those operational employees choosing to relocate locally to the site. Therefore, the Reduced Acreage Alternative would not contribute to adverse cumulative socioeconomic impacts. It should be noted that any decrease in construction activities and site footprint associated with this alternative would likely result in a decrease in tax benefits to local governments and construction expenditures compared to those provided below in **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 8** for the proposed GSEP.

C.8.5.3 CEQA LEVEL OF SIGNIFICANCE

Induce Substantial Population Growth

As discussed above in subsection C.8.5.2, and similar to the proposed GSEP, impacts resulting from this alternative to socioeconomics would be less than significant.

C.8.6 DRY COOLING ALTERNATIVE

This section identifies the potential impacts of using air-cooled condenser (ACC) systems rather than the cooling towers proposed by NextEra for the Genesis project. It is assumed that the ACC systems would be located where the cooling towers are currently proposed for each of the two 125 MW power block, as illustrated in **Alternatives Figure 2** (see Section B.3).

This alternative is analyzed because it would reduce the amount of water required for steam turbine cooling from 822 acre-feet per year (AFY) to 66 AFY. This reduction in water use would reduce impacts to water and biological resources.

C.8.6.1 SETTING AND EXISTING CONDITIONS

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates the use of wet-cooling towers and incorporates the use of air-cooled condensers (ACC) in the same location. As a result, the environmental setting would be the same as for the proposed project.

C.8.6.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Induce Substantial Population Growth

The Dry Cooling Alternative would be located in the same location as the proposed GSEP site and would use approximately the same amount of construction and operation workers as the proposed project. Impacts to population and employment are anticipated to be the same as the proposed project.

Displace Existing Housing and Substantial Numbers of People

The Dry Cooling Alternative would be located in the same location as the proposed GSEP site and would use approximately the same amount of construction and operation workers as the proposed project. Impacts to housing are anticipated to be the same as the proposed project.

Result in Substantial Physical Impacts to Government Facilities

The Dry Cooling Alternative would be located in the same location as the proposed GSEP site and would use approximately the same amount of construction and operation workers as the proposed project. Impacts to public services are anticipated to be the same as the proposed project.

Cumulative Socioeconomics Effects

The cumulative socioeconomic impacts of the Dry Cooling Alternative would be similar to those of the proposed GSEP, as described below in Section C.8.8. This alternative would result in a similar construction schedule and required workforce, and the regional and local study area would provide adequate construction and operational employees for the Dry Cooling Alternative and cumulative development projects. While these projects would combine to increase the demand for localized transient lodging and

potentially permanent housing in the local study area, a large number of hotel/motel rooms are available and local study area vacancy rates indicate ample permanent housing is available to those operational employees choosing to relocate locally to the site. Therefore, the Dry Cooling Alternative would not contribute to adverse cumulative socioeconomic impacts.

C.8.6.3 CEQA LEVEL OF SIGNIFICANCE

Induce Substantial Population Growth

As discussed above in subsection C.8.6.2, and similar to the proposed GSEP, impacts resulting from this alternative to socioeconomics would be less than significant.

C.8.7 NO PROJECT/NO ACTION ALTERNATIVES

There are three No Project/No Action Alternatives evaluated in this section, as follows:

NO PROJECT/NO ACTION ALTERNATIVE #1

No Action on Genesis Solar Energy Project application and on CDCA land use plan amendment

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and BLM would not amend the CDCA Plan. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, the socioeconomics impacts of the GSEP and the gross public benefits, including capital costs, construction and operation payroll and sales taxes, would not occur at the proposed site. However, the land on which the project is proposed would become available to other uses that are consistent with BLM's land use plan, including another solar project requiring a land use plan amendment. In addition, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations

NO PROJECT/NO ACTION ALTERNATIVE #2:

No Action on Genesis Solar Energy Project and amend the CDCA land use plan to make the area available for future solar development

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and BLM would amend the CDCA Land Use Plan of 1980, as amended, to allow for other solar projects on the site. As a result, it is possible that another solar energy project could be constructed on the project site.

Because the CDCA Plan would be amended, it is possible that the site would be developed with the same or a different solar technology. As a result, it is expected that

the socioeconomics impacts and the gross public benefits, including capital costs, construction and operation payroll and sales taxes, from the construction and operation of a different solar project would likely be similar to the socioeconomic impacts and benefits from the proposed project. As such, this No Project/No Action Alternative could result in socioeconomic impacts and benefits similar to the impacts under the proposed project.

NO PROJECT/NO ACTION ALTERNATIVE #3:

No Action on Genesis Solar Energy Project application and amend the CDCA land use plan to make the area unavailable for future solar development

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and the BLM would amend the CDCA Plan to make the proposed site unavailable for future solar development. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because the CDCA Plan would be amended to make the area unavailable for future solar development, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As such, this No Project/No Action Alternative would not result in socioeconomics impacts nor would it provide the gross public benefits, including capital costs, construction and operation payroll and sales taxes from the proposed project. However, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

C.8.8 CUMULATIVE IMPACT ANALYSIS

C.8.8.1 POPULATION AND EMPLOYMENT

Section B.3, Cumulative Scenario, provides detailed information on the potential cumulative solar and other development projects in the project area. Together, these projects comprise the cumulative scenario which forms the basis of the cumulative impact analysis for the proposed project. In summary, these projects are:

- Renewable energy projects on BLM, State, and private lands, as shown on **Cumulative Figure 1** and in **Cumulative Tables 1A and 1B.** Although not all of those projects are expected to complete the environmental review processes, or be funded and constructed, the list is indicative of the large number of renewable projects currently proposed in California.
- Foreseeable future projects in the immediate area, as shown on **Cumulative Impacts Figure 2, I-10 Corridor Existing and Future/Foreseeable Projects, and Cumulative Tables 2 and 3**. Table 2 presents existing projects in this area and Table 3 presents future foreseeable projects in the I-10 Corridor Area. Both tables indicate project name and project type, its location and its status.

These projects are defined within a geographic area that has been identified by the CEC and BLM as covering an area large enough to provide a reasonable basis for evaluating cumulative impacts for all resource elements or environmental parameters. Most of these projects have, are, or would be required to undergo their own independent environmental review under CEQA and/or NEPA. Even if the cumulative projects described in Section B.3 have not yet completed the required environmental processes, they were considered in the cumulative impacts analyses in this SA/Draft EIS.

Geographic Extent

The area of cumulative effect for socioeconomic resources is Riverside and San Bernardino Counties, CA and La Paz County, AZ. The analysis of cumulative effects considers a number of variables including geographic (spatial) limits, time (temporal) limits, and the characteristics of the resource being evaluated. The geographic scope of cumulative impact analysis is based on the workforce boundaries of the cumulative development projects. While it is possible that the geographic scope of cumulative effects would extend beyond these three counties, with some workers potentially coming from adjacent counties beyond a two-hour commute radius of the proposed GSEP site, due the similar nature of skill set required by the workforce during construction activities, as well as the number of proposed cumulative renewable energy projects, it is not anticipated that the geographic scope for cumulative impact analysis extent beyond the scope of the direct and indirect effects of the proposed action.

Cumulative Impact Types

The GSEP cumulative analysis will separately assess cumulative impacts of the following two categories of cumulative projects:

- Existing cumulative conditions
- Future foreseeable projects

Effects of Past and Present Projects

A wide variety of past and present development projects contribute to the cumulative conditions for socioeconomics. As shown in **Cumulative Table 2** and in **Cumulative Impacts Figure 2, I-10 Corridor Existing and Future/Foreseeable Projects**, nine projects are ongoing or recently completed in immediate area around the proposed GSEP site and as shown in **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 2**, Riverside County population is estimated to have grown by 43 percent between the years 2000 and 2010. Riverside County's growth has resulted in the generation of jobs, revenue, housing, and public services. The projects shown in **Cumulative Table 2** largely represent development intended to meet the demand of Riverside County's increased population.

Effects of Reasonably Foreseeable Future Projects

Socioeonomics are also expected to be affected by the following reasonably foreseeable future projects as follows: a number of large electrical generation and distribution infrastructure development projects are proposed along the I-10 corridor (as

shown in **CUMULATIVE IMPACTS Figure 1** and **CUMULATIVE IMPACTS Table 3**); and solar and wind applications proposed on approximately 1,000,000 acres of BLM land in the California Desert District Planning Area as well as a large number of electrical generation and distribution infrastructure development projects proposed on non-federal land in the I-10 corridor (as shown in **CUMULATIVE IMPACTS Table 1b**, **CUMULATIVE IMPACTS Figure 1,** and **CUMULATIVE IMPACTS Table 1a**).

Contribution of the Genesis Solar Energy Project to Cumulative Impacts

Construction. The construction of the GSEP is expected to result in short term adverse impacts related to construction activities. It is expected that some of the cumulative projects described above which are not yet built may be under construction the same time as the GSEP. As a result, there may be adverse short term impacts during construction of those cumulative projects related to socioeconomics.

The GSEP would be expected to contribute only a small amount to the possible short-term cumulative impacts related to socioeconomics. Foreseeable development in the project area includes primarily renewable energy electrical generation and transmission infrastructure projects. With the large number of renewable energy projects occurring within the GSEP regional study area, it is possible that some overlap of construction phasing could occur between the GSEP and the cumulative development projects. **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 4** present the most recently published data (Year 2006-2016) on labor force characteristics for the GSEP regional study area. As discussed above, staff concludes that the required construction workforce of the proposed GSEP would be found locally, with no cumulative contribution to population inmigration that would increase the local population. Therefore, because the local labor force would adequately serve construction and operation of the GSEP, it would not contribute to cumulative increases in population that would generate an increase in demand for local housing and public services. However, a large influx in construction labor to the area could create demand for temporary housing that is greater than the existing supply.

All cumulative projects identified in **CUMULATIVE IMPACTS Tables 1a, 1b, 2** and **3** would be expected to draw on the large regional construction workforce in Riverside/San Bernardino/Ontario MSA, the State of Arizona, and likely extending to the Los Angeles County MSA. In the event an influx of construction workers occurred within the area as a result of the large renewable energy projects being constructed, due to the temporary duration of construction activities it is assumed these construction workers would choose to stay at a local area motel or hotel and not permanently relocate to the area. There are approximately 630 hotel/motel rooms and suites among 11 different establishments in the City of Blythe area serving the GSEP site and local study area, with extensive additional available temporary housing in the communities within 2 hours of the proposed project site serving the regional study area. Therefore, due to the availability of temporary and permanent housing to both the regional and local labor force associated with both the GSEP and cumulative development within the GSEP geographic extent for cumulative impacts, the GSEP would not contribute to cumulative increases in demand for local housing. Despite the potential for construction

schedule overlaps with known projects within the proposed GSEP study area, Staff concludes construction of the GSEP would not contribute to adverse cumulative socioeconomic impacts.

In addition, short-term construction-related spending activities of the GSEP project are expected to have cumulative economic benefits for the study area (refer below to **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 8**). The cumulative benefits would increase when revenues accrued as a result of the proposed GSEP are combined with spending, and any local revenues accrued as a result of current and future reasonably foreseeable cumulative development projects.

Operation. The operation of the GSEP is not expected to result in long-term adverse impacts during operation of the project related to socioeconomics. It is expected that some of the cumulative projects described above may be operational at the same time as the GSEP. However, the GSEP would be expected to contribute only a small amount to these possible long-term operational cumulative impacts related to socioeconomics. **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 5** present the most recently published data (Year 2006-2016 projections) on labor force characteristics for the GSEP regional study area. As discussed above, Staff concludes that the required operational workforce of the proposed GSEP would be found locally, with no cumulative contribution to population inmigration occurring that would increase the local population. Therefore, because the local labor force would adequately serve construction and operation of the GSEP, it would not contribute to cumulative increases in population that would generate an increase in demand for local housing and public services.

Based on the most recently published vacancy rates for both the regional and local study areas (refer to **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Tables 2** and **3**), a large number of permanent housing units are available to any operational employees who may choose to relocate locally and regionally to proposed cumulative development projects. Despite the potential for construction schedule overlaps with known projects within the proposed GSEP study area, Staff concludes operation of the GSEP would not contribute to adverse cumulative socioeconomic impacts.

In addition, the long-term operation-related spending activities of the GSEP project are expected to have cumulative economic benefits for the study area (refer below to **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 8**). The cumulative benefits would increase when revenues accrued as a result of the proposed GSEP are combined with spending, and any local revenues accrued as a result of current and future reasonably foreseeable cumulative development projects.

Decommissioning. The decommissioning of the Genesis Solar Energy Project is expected to result in adverse impacts related to socioeconomics similar to construction impacts. It is unlikely that the construction or decommissioning of any of the cumulative projects would occur concurrently with the decommissioning of this project, because the decommissioning is not expected to occur for approximately 30 years. As a result, there may not be impacts related to socioeconomics during decommissioning of the Genesis Solar Energy Project generated by the cumulative projects. Therefore, the effects of decommissioning on land use are not expected to be adverse.

C.8.9 COMPLIANCE WITH LORS

As the GSEP and all proposed alternatives would be located entirely within BLM lands, no private land would be affected and therefore, the provisions of Education Code Section 17620 would not apply to this alternative. Therefore, the GSEP and all proposed alternatives, as proposed, are consistent with applicable Socioeconomic LORS, as identified in **SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 1**.

C.8.10 NOTEWORTHY PUBLIC BENEFITS

Important public benefits discussed under the fiscal and non-fiscal effects section are O&M capital expenditures, construction payroll, and annual property and sales taxes. **Socioeconomic Table 8** provides a summary of economic benefits of the GSEP.

SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE Table 8
Noteworthy Public Benefits
Related to Genesis Solar Energy Project

Fiscal Benefits	
Estimated annual property taxes	$627,000 per year (If the California property tax exemption for solar systems is not renewed when it expires during the 2015-2016 fiscal year, property taxes could be approximately $10,455,000)
State and local sales taxes: Construction	$1.3 million
State and local sales taxes: Operation	$44,000 per year
Non-Fiscal Benefits	
Total capital costs	$1,000 million
Construction payroll	$165 million
Operations payroll	$6 million
Construction materials and supplies	$14.5 million
Operations and maintenance supplies	$0.5 million per year
Direct, Indirect, and Induced Benefits	
Estimated Direct Employment	
Construction	An average of 646 jobs per month
Operation	40 to 50 full-time jobs
Estimated Secondary Employment	
Construction	446 jobs
Operation	124 jobs
Estimated Secondary Income	
Construction	$26.8 million
Operation	$3.0 million

C.8.11 PROPOSED CONDITIONS OF CERTIFICATION/MITIGATION MEASURES

No conditions of certification/mitigation measures are required as all potential socioeconomic impacts associated with the proposed GSEP and alternatives would be less than significant.

C.8.12 CONCLUSIONS

No significant adverse socioeconomics impacts would occur as result of the construction or operation of the proposed GSEP project. Staff believes the GSEP would not cause a significant adverse direct, indirect, or cumulative impact on population, housing, or public services. In addition, because there would be no adverse project-related socioeconomic impacts, minority and low-income populations would not be disproportionately impacted. The proposed GSEP would benefit the local and regional study areas in terms of an increase in local expenditures and payrolls during construction and operation of the facility, as well as a benefit to public finance and local economies through taxation. These activities would have a positive effect on the local and regional economy.

C.9 - SOIL AND WATER RESOURCES

Testimony of Michael Donovan P.G., C.Hg., Michael Daly P.E.,
Andrew Collison, Ph.D. and John Thornton P.E.

C.9.1 SUMMARY OF CONCLUSIONS

With the information provided to date, the Bureau of Land Management (BLM) and California Energy Commission staff (hereafter jointly referred to as staff) have determined that construction, operation, and decommissioning of the proposed Genesis Solar Energy Project (GSEP) could potentially impact soil and water resources. Where these potential impacts have been identified, staff has proposed mitigation measures to reduce identified impacts to levels that are less than significant. The mitigation measures, as well as specifications for laws, ordinances, regulations and standards (LORS) conformance, included herein as conditions of certification, address the California Environmental Quality Act (CEQA) requirements for the Energy Commission's analysis and BLM's needs for a National Environmental Policy Act (NEPA) analysis. With implementation of the water entitlement or offset measures identified by staff, the Project would conform to all applicable LORS. Staff's conclusions based on analysis of the information submitted to-date are as follows:

1. The proposed Project would be located on an alluvial fan where flash flooding and mass erosion could impact the Project. Project-related changes to the alluvial fan hydrology could result in impacts to adjacent land users. A Draft Drainage, Erosion, and Sedimentation Control Plan (DESCP) has been developed to mitigate the potential storm water and sediment project-related impacts. However, the calculations and assumptions used to evaluate potential storm water and sedimentation impacts are imprecise and have limitations and uncertainties associated with them such that the magnitude of potential impacts that could occur cannot be determined precisely. Based on these factors, the proposed Project could result in impacts that would be significant with respect to CEQA significance criteria specified herein and the Council on Environmental Quality Regulations for Implementing the Procedural Provisions of the NEPA (CEQ NEPA Regulations) significance criteria specified in 40 CFR 1508.27. Therefore, Conditions of Certification have been developed that define the requirements for reports, plans, monitoring, and inspection, as well as standards and procedures for implementing Best Management Practices during construction and operations.

2. The proposed Project would be located in an area with no designated entity responsible for maintaining integrity of the rerouted channels. Staff believes the applicant should be required to establish a Channel Maintenance Program as indicated in Condition of Certification **SOIL&WATER-13**.

3. The proposed Project would have an impact on levels of groundwater in the Chuckwalla Valley Groundwater Basin (CVGB). However, the calculations and assumptions used to evaluate potential groundwater level impacts are imprecise and have limitations and uncertainties associated with them such that the magnitude of potential impacts that could occur cannot be determined precisely. To ensure that the Project's proposed use of groundwater does not significantly impact the

groundwater levels in the CVGB, staff believes the Applicant should be required to develop a monitoring program and identify what changes are occurring in basin water levels. Substantial changes to groundwater levels caused by the proposed Project and other pumping in the basin would be documented by this monitoring, and a mitigation and reporting program would be required in accordance with Conditions of Certification **SOIL&WATER-3**, **-4**, **-5,** and **-20**.These measures, along with mitigation identified in the Biological Resources section of this Staff Assessment that could be required for impacts to groundwater-dependent vegetation that may occur, will be sufficient to ensure that significant impacts related to changes in groundwater levels do not occur.

The cumulative impact analysis indicates that groundwater extraction during construction and operation of this and other foreseeable projects would place the basin into an overdraft condition. This impact may be exacerbated by other unidentified renewable energy projects in the I-10 corridor, which has been targeted as a potential area for further renewable energy development. However, the amount of water in storage in the basin greatly exceeds the amount of cumulative overdraft, rendering the project's contribution to this cumulative impact less than cumulatively considerable.

Finally, the cumulative effects may indirectly impact the adjacent Palo Verde Mesa Groundwater Basin inducing underflow from the Colorado River. To mitigate the project's contribution to impacts to the Colorado River, the applicant must complete **SOIL&WATER-15** that would require mitigation to ensure that impacts to the Lower Colorado River do not occur.

4. The applicant has proposed to use groundwater for wet cooling when other feasible technologies are available. Staff believes the proposed use of groundwater for wet cooling would not comply with the state's water policies. To address this inconsistency with state water policy, staff recommends implementation of Condition of Certification **SOIL&WATER-18** that would require the project owner to reduce the proposed water use through a project design change(s) and/or through a water conservation program.

5. The applicant has proposed the use of evaporation ponds as the preferred method of wastewater disposal. Staff believes potential impacts related to the use of evaporation ponds to dispose of the industrial wastewater could be mitigated through effective application of state and local LORS. However, this method of wastewater disposal is not consistent with the Energy Commission's policy that encourages the use of zero liquid discharge (ZLD) systems that are designed to eliminate wastewater discharge and inherently conserve water. Therefore, staff finds that this method of wastewater disposal does not comply with the state's water policies. As discussed above, to, address this inconsistency with state water policy, staff recommends implementation of Condition of Certification **SOIL&WATER-18**

The state has expressed a strong interest in developing its solar energy resources. However, the construction and operation of solar energy facilities requires the use of water, which state policy also protects. The Energy Commission must balance the state's interest in promoting solar energy development with its interest in conserving and

protecting the state's water resources. Several projects currently proposed for the Mojave and Colorado deserts would use water for power plant cooling, which staff believes is contrary to the state's long term interest in maximizing solar power generation and minimizing adverse environmental impacts. This will be an especially critical issue in the renewable development areas that will be identified in the Desert Renewable Energy Conservation Plan (DRECP). Later this year, staff plans to file a request for an Order Instituting an Informational Proceeding to address this issue.

Completion of staff's analysis of the proposed Project is subject to the following:

- A finding by the U.S. Army Corps of Engineers of whether the ephemeral drainages on the Project site are jurisdictional waters of the U.S. Without this determination, staff cannot determine whether the Project would comply with Section 404 of the Clean Water Act.

C.9.2 INTRODUCTION

The proposed action evaluated within this Staff Assessment (SA)/Draft Environmental Impact Statement (DEIS) is the construction and operation of the Genesis Solar Energy Project (GSEP, referred to herein as the Project), a proposed solar-thermal electricity generation facility located on public lands administered by the BLM in Riverside County, California. The SA/DEIS represents a joint environmental analysis document developed by the Energy Commission and BLM to evaluate potential impacts associated with the proposed action.

Genesis Solar, LLC, a Delaware limited liability company and wholly owned subsidiary of NextEra Energy Resources, LLC, (herein referred to as the Applicant or owner), proposes to construct, own, and operate the Project. The Project consists of two independent solar electric generating facilities with a nominal net electrical output of 125 megawatts (MW) each, for a total net electrical output of 250 MW. The solar steam generators receive heated transfer fluid from solar thermal equipment comprised of arrays of parabolic mirrors that collect energy from the sun.

The Project proposes to use a wet cooling tower for power plant cooling. Water for cooling tower makeup, process water makeup, and other industrial uses such as mirror washing would be supplied from onsite groundwater wells. Project cooling water blowdown will be piped to lined, onsite evaporation ponds.

The Applicant has applied for a right-of-way (ROW) grant from the BLM for approximately 4,640 acres of flat desert terrain. Once constructed, the Project would permanently occupy approximately 1,800 acres in the eastern portion of the ROW (the Project footprint), plus approximately 90 acres of linear facilities. The remainder of the acreage in the ROW application is not anticipated to be needed for the Project.

This SA/DEIS examines engineering, environmental, public health and safety aspects of the proposed Project, based on the information provided by the applicant and other sources available at the time the SA/DEIS was prepared. The SA/DEIS contains analyses similar to those normally contained in an Environmental Impact Report (EIR)

required by CEQA, as well as analyses required for an EIS prepared under CEQ NEPA Regulations.

C.9.3 METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

Significance criteria are based on those listed in CEQA Appendix G. Hydrology and water resources impacts would be significant if the project would:

- violate any water quality standards or waste discharge requirements.
- substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted).
- substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation onsite/offsite.
- substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding onsite/offsite,
- create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff.
- otherwise substantially degrade surface water or groundwater quality
- place structures within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map.

C.9.4 PROPOSED PROJECT

Water to supply the Project will be derived from a minimum of two groundwater supply wells located near each unit's power block area. The Project well field will also include a sufficient number of standby wells to provide the Project with water in the event the primary wells are shut down for maintenance. As currently planned, the wells will pump groundwater from the Bouse Formation and/or the underlying Fanglomerate within the Chuckwalla Valley Groundwater Basin. The Bouse Formation occurs at a depth of approximately 260 feet below ground surface (bgs) at the site and extends to approximately 2,050 feet bgs, and the Fanglomerate is inferred to extend from approximately 2,050 to 2,950 feet bgs. On a preliminary basis, the wells are proposed to pump groundwater from below 800 feet bgs.

Construction activities for a single 125 MW unit are expected to take place over a period of approximately 25 months with a 12-month delay between the start of construction for Unit 1 and the start of construction for Unit 2, for a total anticipated construction period

of 37 months. It is anticipated that water use during this period will be from on-site groundwater using the production wells that will be installed for the Project. It is anticipated that water usage for the construction period will proceed along the following schedule:

- Average water usage during earthwork (Month 1 to Month 5): 1.7 million gallons per day (mgd),
- Average water usage during post earthwork phase (Month 6 to Month 37: 0.55 mgd.
- Peak water usage: 3 mgd
- Total construction water demand: approximately 2,440 acre feet over approximately 3 years (1 acre-foot equals 325,851.429 gallons).

Initial construction water usage will be in support of site preparation and grading. Subsequent to Month Five of construction, water usage will be in support of dust suppression and normal construction water requirements that are associated with construction of the buildings, power block, and solar array.

The Project proposes to use a wet cooling tower for power plant cooling. Water for cooling tower makeup, process water makeup, and other industrial uses such as mirror washing will be supplied from selected onsite groundwater wells. Water from the on-site wells also will be used to supply nonpotable water for employees (*e.g.,* showers, sinks, toilets). A water treatment system will be used to treat the groundwater pumped for domestic use.

The average total annual water usage for each 125 MW power plant is estimated to be about 822 acre-ft/ yr, or 1,644 acre-ft/yr for the entire Project, which corresponds to an average daily flow rate of about 1,000 gallons per minute (gpm) and is presented in **Soil and Water Table 1**.

Soil and Water Table 1
Estimated Average and Peak Water Demand for GSEP

Water Use	Annualized Average Rate (gpm) (1)	Estimated Peak Rate (gpm) (2)	Estimated Annual Use (acre-feet)
Plant Operation			
125 MW Plant	500	2,013	822
125 MW Plant	500	2,013	822
Total Project	1,000	4,026	1,644

1) – The estimated groundwater usage in gallons per minute is based on an average daily consumption.
2) The peak rate is the instantaneous maximum for summer usage.

Usage rates will vary during the year and will be higher in the summer months when the peak maximum daytime usage rate could be as high as about 2,013 gpm for each 125 MW power plant, or about 4,026 gpm for the Project. However, assuming that the makeup operates at a constant flow rate throughout the night and day, then the makeup flow rate can be averaged. **Soil and Water Table 2** represents the average makeup flow rate (gpm) by month as well as the acre-feet per month for the total Project.

Soil and Water Table 2
Makeup Water Flow Rates for Total Project

Flow	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
gpm (average)	360	404	982	1,192	1,640	1,814	1,598	1,436	1,126	852	426	322

C.9.4.1 SETTING AND EXISTING CONDITIONS

The Project is located between the communities of Blythe, California (approximately 25 miles east) and Desert Center, California (approximately 27 miles west) and is presented in **Soil and Water Figure 1**.

The Project site is located in the Mojave Desert Geomorphic Province. The Mojave Desert is a broad interior region of isolated mountain ranges separated by expanses of desert plains. It has an interior enclosed drainage and many playas. There are two important fault trends that control topography—a prominent NW-SE trend and a secondary east-west trend (apparent alignment with Transverse Ranges is significant). The Mojave province is wedged in a sharp angle between the Garlock Fault (southern boundary Sierra Nevada) and the San Andreas Fault, where it bends east from its northwest trend. The northern boundary of the Mojave is separated from the prominent Basin and Range by the eastern extension of the Garlock Fault.

Physiography

The Project Site lies on a broad, relatively flat, southward sloping surface dominantly underlain by alluvial deposits derived from the Palen Mountains to the north and the McCoy Mountains to the east. The alluvial deposits have created two distinct landform types and several discernable landform ages. The deposits immediately adjacent to the mountains have formed alluvial fans from multiple identifiable sources, and multiple fan surfaces have coalesced into a single bajada surface that wraps around each of these mountain fronts. Between the bajada surfaces from each mountain chain is a broad valley-axial drainage that extends southward between the mountains and drains to the Ford Dry Lake playa, located about 1 mile south of the Site (WPAR, 2009).

The elevation of Chuckwalla Valley ranges from under 400 feet at Ford Dry Lake to approximately 1,800 feet above mean sea level (msl) west of Desert Center and along the upper portions of the alluvial fans that ring the valley flanks. The surrounding mountains rise to approximately 3,000 and 5,000 feet msl.

The Site itself is relatively flat and generally slopes from north to south with elevations of approximately 400 to 370 feet msl. It is occupied by a community of low creosote and bursage scrub vegetation.

Climate and Precipitation

The climate in the Chuckwalla Valley, which is classified as a “low desert,” is characterized by high aridity and low precipitation. The region experiences a wide variation in temperature, with very hot summer months with an average maximum

temperature of 108 degrees Fahrenheit (ºF) in July and cold dry winters with an average minimum temperature of 66.7 ºF in December. The Blythe area receives an average of approximately 3.5 inches of rainfall per year. The majority of the rainfall occurs during the winter months, but rainfall during the late summer is not uncommon. The summer rainfall events tend to be a result of tropical storms that have a short duration and a higher intensity than the winter rains. Annual precipitation ranges from 0.02 to 0.47 inches per month for a total average annual precipitation of just under four inches per year. **Soil and Water Table 3** and **Soil and Water Table 4** display the average monthly and annual minimum and maximum temperatures and precipitation (rainfall) from 1913 to 2008 collected from the Blythe Airport, located approximately 35 miles southeast of the Project site.

Soils

The USDA soil survey classified the soil on site as typical durorthids, loamy-skeletal, mixed, hyperthermic, and shallow (Cherioni series), and typical torripsamments, mixed, hyperthermic (Rositas series). The following are descriptions of the two main soil series at the Project site (GSEP, 2009a)

Cherioni Series

The Cherioni series consists of very shallow and somewhat excessively drained soils that formed in slope alluvium on volcanic bedrock. Cherioni soils are on fan terraces or hills and have slopes of 0 to 70 percent. Cherioni soils somewhat excessively drained; have medium to rapid runoff; and moderate permeability. The soils are often used for livestock grazing. Vegetation commonly found associated with these soils includes creosotebush, paloverde, saguaro, cholla, ocotillo, triangleleaf bursage, and ratany (GSEP, 2009a).

Rositas Series

The Rositas series consists of very deep, somewhat excessively drained soils formed in sandy eolian material. Rositas soils are on dunes and sand sheets. Slopes range from 0 to 30 percent with hummocky or dune micro relief. Mean annual precipitation is about four inches and the mean annual air temperature is about 72 ºF. The soils are reported

to be somewhat excessively drained; have negligible to low runoff; and rapid permeability (GSEP, 2009a). Rositas soils are used for rangeland and wildlife habitat. Present vegetation is creosotebush, white bursage, desert buckwheat, and mesquite.

Soil and Water Figure 2 shows the soils present at the Project site using the NRCS.

Geology

The Project site is situated within the central portion of Chuckwalla Valley, an east-southeast trending valley in California's Mojave Desert Geomorphic Province. The Mojave Desert Geomorphic Province is a wedge-shaped interior region separated from the Sierra Nevada and Basin and Range Provinces to the northwest by the Garlock Fault and its eastward extensions, and is bounded to the southwest by the Transverse Range and Colorado Desert Provinces, the San Andreas Fault, and its southern extensions. The Mojave Desert Geomorphic Province is characterized by northwest-southeast as well as east-west trending structures and mountain ranges, separated by desert valleys and plains with many enclosed drainages and playas.

Regional & Local Geology

The region has a complex geologic history that includes sedimentation, volcanic activity, folding, faulting, uplift, and erosion. The project area is underlain by Holocene to Miocene basin fill deposits (Stone, 2006). These deposits include younger alluvium, older (Pleistocene) alluvium, the Pliocene Bouse Formation, and the Miocene Fanglomerate. The uppermost alluvium in the basin consists of Holocene to Pleistocene alluvial fan, valley axial (fluvial), playa (dry lake), and Aeolian (wind blown) deposits. **Soil and Water Figure 3** presents the surficial geology of the Project site.

Quaternary Alluvium

Quaternary alluvial fill in the basin consists of Holocene to Pleistocene alluvial fan and valley axial (fluvial or stream) deposits, as well as lacustrine (lake) and playa (ephemeral lake) deposits (CDWR, 2004). These deposits consist of gravel, sand, silt, and clay (CDWR, 1963). In general, coarser alluvial fan deposits are expected near the valley edges and grade into finer distal fan deposits that interfinger with fine-grained lacustrine and playa deposits near the center of the basin. These deposits are typically heterogeneous. Valley axial drainages tend to be more uniform and continuous, and contain a greater proportion of sand and fine gravel. Portions of the basin are also occupied by aeolian (wind blown) sand deposits, but the identified aeolian deposits occur at the ground surface and are of limited thickness. The Quaternary sediments include the Pleistocene-age Pinto Formation, which consists of coarse fanglomerate (cemented, consolidated, or semiconsolidated alluvial fan gravels) containing boulders and lacustrine clay with some interbedded basalt (CDWR, 2004).

Pliocene Bouse Formation

The Pliocene Bouse Formation underlies the Quaternary sediments. The Bouse Formation includes a marine to brackish-water estuarine sequence deposited in an arm of the proto-Gulf of California (Stone, 2006; Wilson and Owen-Joyce, 1994). This formation has alternatively been interpreted as, or may include, lacustrine sediments deposited in a closed, brackish basin (Stone, 2006). The Bouse Formation is widely

reported in the Colorado Valley and tributary basins in southeastern California and descriptions of this formation come from occurrences outside of Chuckwalla Valley. It is reported to be composed of a basal limestone (marl) overlain by interbedded clay, silt, sand, and tufa. The top of the Bouse Formation is relatively flat-lying with a reported dip of approximately 2 degrees south of Cibola (Metzger and others, 1973).

Miocene Fanglomerate

The Bouse Formation is unconformably underlain by a fanglomerate composed chiefly of angular to subrounded and poorly sorted partially to fully cemented pebbles with a sandy matrix (Metzger and others, 1973). The Fanglomerate is likely Miocene-age; however, it may in part be Pliocene-age (Metzger and others, 1973). The Fanglomerate represents composite alluvial fans built from the mountains towards the valley and the debris of the Fanglomerate likely represents a stage in the wearing-down of the mountains following the pronounced structural activity that produced the basin and range topography in the area (Metzger and others, 1973). Bedding surfaces generally dip from the mountains towards the basin. The Fanglomerate reportedly dips between 2 and 17 degrees near the mountains due to structural warping (Metzger and others, 1973). The amount of tilting indicates a general decrease in structural movements since its deposition (Metzger and others, 1973).

Bedrock

Bedrock beneath the Project site consists of metamorphic and igneous intrusive rocks of pre-Tertiary age that form the basement complex (CDWR, 1963), including Proterozoic schist and gneiss, Paleozoic sedimentary rocks, and Mesozoic sedimentary and metavolcanic rock sequences (Stone, 2006). In some areas of the Chuckwalla Valley, volcanic rocks of Tertiary age overlie the basement complex (CDWR, 1963). The bedrock topography in the study area, as interpreted by modeling of Bouger gravity data obtained from USGS and interpreted by Worley-Parsons (2009b), is illustrated in **Soil and Water Figure 4**.

Mapped Geologic Units at the Project Site

The Project site lies on a broad, relatively flat, sloping surface underlain by alluvial deposits derived from the Palen Mountains to the north and the McCoy Mountains to the east. These alluvial deposits have created two distinct landform types and several discernable landform ages. The deposits immediately adjacent to the mountains have formed alluvial fans from multiple identifiable sources, and multiple fan surfaces have coalesced into a single bajada surface that wraps around each of these mountain fronts. Between the bajada surfaces from each mountain chain is a broad valley axial drainage that extends southward between the mountains and drains to the Ford Dry Lake playa, located about 1 mile south of the Project site. The Project site itself is relatively flat and generally slopes from north to south with elevations of approximately 400 to 370 feet msl. It is occupied by a community of low creosote and bursage scrub vegetation.

Three lines of evidence have been used to describe the shallow geological conditions underlying the Project site. First, geophysical investigations conducted at the Project site indicate the electrical conductivity of the underlying sediments (an indicator of the amount of fine-grained sediment and salinity of the groundwater) is consistent and similar across the Project site area. Second, seismic refraction profiling suggests the

shallow alluvium has similar properties across the Project site. Third, site-specific subsurface investigations demonstrated the Project site is underlain by alluvium consisting of interbedded and intermixed dense sand and gravel, and hard silt and clay to a depth of approximately 245 to 275 feet below ground surface (bgs), which is approximately 125 feet msl. These sediments are heterogeneous both laterally and vertically, although the valley axial alluvium beneath the eastern portion of the Project site may contain cleaner sands than sediments underlying the bajada surfaces, and laterally may be more homogenous.

Groundwater occurs within the shallow alluvium at a depth of approximately 70 to 90 feet bgs. Beneath the alluvium, the Pliocene Bouse Formation is estimated to extend to approximately 2,000 feet bgs (approximately -1,500 feet msl), and is generally richer in fine-grained sediments than the overlying alluvium. The Miocene fanglomerate is inferred to underlie the alluvium at this depth and is estimated to extend to approximately 2,900 feet bgs (-2,400 feet msl).

A map presenting the surficial geology in the Project site area is presented as **Soil and Water Figure 5**. In developing this map, alluvial sediment units established by the USGS (Stone, 2006) have been adopted, with modifications, as summarized in **Soil and Water Table 6**, and described in greater detail below.

Soil and Water Table 6
Mapped Surficial Geologic Units

Map Unit	Inferred Age	Descriptive Name
Qyva	Post-Holocene	Younger Valley Axial Alluvial Deposits
Qyma	Post-Holocene	Younger Mixed Alluvial and Aeolian Deposits
Qyaf	Late Holocene	Younger Alluvial Fan Deposits
Qiaf	Mid-Holocene	Intermediate Alluvial Fan Deposits
Qoaf	Late Pleistocene	Older Alluvial Fan Deposits

Younger Valley Axial Alluvial Deposits (*Qyva*). Alluvial deposits in the valley axial drainage that underlie the majority of the eastern part of the Project site are characterized by a north-south trending fabric aerial photographs and possess a generally subdued bar and swale topography at ground level. These deposits represent the distal end of a northeast to southwest-trending valley axial drainage which lies between the Palen and McCoy Mountains and terminates at Ford Dry Lake. Very few small washes are continuous across the eastern part of the Project site.

The valley axial deposit surfaces display local incipient desert pavement development, and no carbonate accumulation in the soil. Surface morphology is a subdued bar and swale morphology generally lacking water erosional features and indicative of a depositional surface. Evidence of competing wind erosion, including lag deposits and small mounds next to bushes, was also noted; however, the dominant processes appear to be alluvial. The morphology and lack of soil development are consistent with depositional surfaces that are at most a few hundred years old, and suggest a prograding alluvial apron.

Subsurface stratification observed in the top 12 to 18 inches of these deposits consists of silty sand deposits in the downslope portions of the Project site, which is consistent

with the formation of silt crusts after sheet floods. Also observed were cross-bedded silty sand beds about 8 to 10 cm thick and massive silty sand with gravel just upslope of the Project site. The recurrence interval of floods leaving these deposits is not known. Floods reaching Ford Dry Lake and filling the lakebed are reported to occur about once every 10 years. If each of these beds represents 10 years of accumulation, they would be indicative of deposition rates of 1 meter (m)/1,000 years in the downslope portions of the Project site and up to 10 times that in the upslope portions of the Project site. However, beneath the upslope portions of the Project site that are closer to the fan intersection points, the locus of deposition would be more likely to change from one flood event to the next, so the deposition rates are probably less.

Younger Mixed Alluvial and Aeolian Deposits (*Qyma*). Between the Project site and Ford Dry Lake, the alluvial fan and valley axial alluvium deposits described above grade into a mixture of deposits consisting of distal alluvial deposits, sand and silt sheet flood deposits, and interspersed aeolian sand sheets and local small coppice dunes. These deposits are generally located south of the Project site boundaries, but underlie much of the alignment of the off-site linears associated with the Project.

Younger Alluvial Fan Deposits (*Qyaf*). Similar to the Palen Mountains, the downslope extent of the Pleistocene-age, relict alluvial fan surfaces at the foot of the McCoy Mountains appear to mark the same type of intersection point on the fans in this area. However, the aerial photographs of this area suggest the bajada surface downslope of the McCoy Mountains has a more pronounced bar and swale topography, is generally lighter in color, and has more developed (or preserved) distributary channel development extending to the lower reaches of this surface. In addition, the presumed ancient shoreline feature that trends across the Qiaf surfaces downslope of the Palen Mountains (see description below) is not discernible across these fans, and appears to have been covered by deposition during the late Holocene. The Qyaf deposits consist of silty sands and gravelly silty sands, with generally finer-grained gravel than the upslope deposits.

Intermediate Alluvial Fan Deposits (*Qiaf*). The downslope extent of the Pleistocene terraces at the foot of the Palen Mountains marks the “intersection point” of the fans in this area. Downslope of these points, the incised (and confined) washes emerge from an erosional setting and transition into a depositional mode with fan lobes, subdued bar and swale topography, and shallow distributary washes, all of which are consistent with a distal fan environment. These lower fan deposits exhibit a darker color than the adjacent valley axial (Qyva), aeolian (Qyma), or playa (not mapped) deposits.

Desert pavement is present, but its development is not as extensive, and the individual clasts that comprise the pavement do not exhibit the same degree of desert varnish development as the upslope, and older, alluvial fan surfaces. The intermediate fan deposits consist of silty sands and gravelly silty sands, with generally finer-grained gravel than the upslope deposits.

A linear feature visible on an aerial photograph is discernible in **Soil and Water Figure 5** (marked as Ancient Shoreline) based on a change from a rougher, lighter-colored and more dissected surface (on its north side) to a darker, smoother surface (on its south side). This lineament extends across the bajada surface in an east-west direction

approximately along the 400 foot msl elevation contour. The photo lineament disappears in the lighter-colored valley axial deposits that underlie the majority of the eastern portion of the Project site. To the west of the Project site, where the 400 foot contour trends southward across the valley floor, the lineament also disappears. However, similar features can be observed at approximately the same elevation on the south side of Chuckwalla Valley (*i.e.,* south of I-10), and on the south flank of the McCoy Mountains (north of I-10).

A plausible explanation for this feature consistent with the above observations is the preservation of an ancient shoreline developed during a pluvial lake highstand of Ford Dry Lake. The potential validity of this interpretation will be further investigated during future reconnaissance and reported to Energy Commission. Shoreline features related to pluvial lake highstands are widely reported elsewhere in the southwestern United States, where they record the influence of wetter climates during the last glacial Maximum of the latest Pleistocene (approximately 17,000 to 10,000 years before present [BP]), as well as Holocene glacial oscillations approximately 8,300 years BP (early Holocene), 6,400 years BP (mid-Holocene), and 4,000 years BP (early Neoglacial) (Castiglia and Fawcett, 2006; Enzel et al., 1989; Briggs, 2003; and Wells, McFadden and Dohrenwend, 1986). More recent standing lakes were reported for short periods in some arid basins in the Mojave Desert during cooler, wetter intervals approximately 200 and 600 years BP, and during particularly wet periods in recorded history, such as 1916 to 1917, 1938 to 1939, and 1969. Based on the moderate degree of desert pavement development on these fan surfaces and slight to moderate desert varnish development on the pebble surfaces, it is estimated the lake highstand theorized to be responsible for this relict shoreline feature would have occurred during the mid-Holocene, at least 4,000 years ago (Elvidge and Iverson, 1983).

If the presumed ancient shoreline can be verified, this would suggest the intermediate alluvial fan deposit surfaces at the Project site have been in a state of relative equilibrium (undergoing little erosion or sedimentation) for the last 4,000 years.

Older Alluvial Fan Deposits (*Qoaf*). The upper and middle alluvial fan surfaces, located north of, and upslope from, the western portion of the Project site, consist of coarse to medium grained sandy gravels and gravelly sands and are extensively dissected by deep washes that are up to 1/4 mile wide and over 50 feet deep in the proximal fan areas. Between these incised washes, the remnant alluvial fan surfaces are covered by well-developed desert pavement with nearly 100 percent stone cover, dark brown to nearly black desert varnish, and carbonate deposition on the lower sides of the clasts. The desert pavement development is consistent with a Pleistocene surface age and these remnant fan surfaces were mapped as late Pleistocene by Stone (2006). These remnant fan surfaces extend largely unbroken (between the incised washes) into the upslope portions of the western parcel of the Project site and northwestern-most corner of the eastern parcel.

Regional Tectonic Setting

The Mojave Desert comprises an area bounded by the seismically active Salton Trough to the west and southwest, and the Garlock Fault to the north. To the east and southeast it is bounded by the Sonoran Desert subprovince, a relatively stable tectonic

region located in southeastern California, southwestern Arizona, southern Nevada, and northern Mexico (Balderman, et al., 1978). Chuckwalla Valley is located in the eastern Mojave Desert province in an area that is relatively stable tectonically. Faults in the area occur primarily in Tertiary and pre-Tertiary strata and are related to compressional tectonism along a convergent Andean and island arc margin in the Mesozoic, and extensional detachment and block faulting during Tertiary time. No faults of Quaternary age are known to exist near the Project site.

Local Faulting

The Project site lies within the eastern part of Riverside County in a part of California considered to be not very seismically active. Although there are several bedrock faults off-site in the mountains surrounding Chuckwalla Valley, these do not exhibit recent activity and are presumed to be Tertiary or pre-Tertiary in age (Stone, 2006). In addition, gravity anomalies suggest the presence of several subsurface faults beneath Chuckwalla Valley in the vicinity of the project area (Stone, 2006; Rotstein, et al., 1976). The gravity anomalies reflect abrupt changes in basement elevation strongly suggestive of dip-slip movements. In addition, some of these faults may have undergone right-lateral strike slip movements. These faults are presumed Tertiary and likely inactive with very low chance of earthquakes.

Geomorphology

The Project Site lies on a broad, relatively flat, southward sloping surface dominantly underlain by alluvial deposits derived from the Palen Mountains to the north and the McCoy Mountains to the east. The alluvial deposits have created two distinct landform types and several discernable landform ages. The deposits immediately adjacent to the mountains have formed alluvial fans from multiple identifiable sources, and multiple fan surfaces have coalesced into a single bajada surface that wraps around each of these mountain fronts. Between the bajada surfaces from each mountain chain is a broad valley-axial drainage that extends southward between the mountains and drains to the Ford Dry Lake playa, located about 1 mile south of the Site. The Site itself is relatively flat and generally slopes from north to south with elevations of approximately 400 to 370 feet msl (WPAR, 2010).

The ground surface in this area slopes very gently to the southwest, toward Ford Dry Lake, at inclinations of approximately 1/2 percent. Landforms include alluvial and sand plains, local coppice dunes, and local subdued bar and swale topography associated with sheet flood deposits. East of Ford Dry Lake, the off-site linears cross the distal portions of a valley axial drainage that enters Ford Dry Lake from the east. The ground surface in this area slopes westward at less than 1/2 percent and the alluvial and the aeolian plain in this area includes similar landforms as described above (WPAR, 2010).

The proposed development exists within the Mojave Desert Geomorphic Province. Geomorphic provinces are naturally defined geologic areas with a distinct landscape or landform resulting primarily from their predominant underlying geologic structure. The southeast portion of this province, where the Project site is located, is physiographically part of the Sonoran Desert, which includes the lower Colorado River region of southeastern California and extends into southern Arizona. The Mojave Desert Geomorphic Province exists within the larger Basin and Range Geomorphic Province

(BRGP), with which it shares a strikingly similar geologic history and resulting geomorphology. For the purposes of this site evaluation, the use of the term BRGP will include the Mojave Desert Geomorphic Province. The geomorphology of the BRGP is dominated by mountains and valleys produced during dramatic tectonic extension in the western and southwestern United States primarily during the mid to late Tertiary (Nelson, 1981; Armstrong, 1982; Rehrig, 1982; Hamilton, 1982; Anderson, 1988; Wernicke, 1992).

The Project site exists within the distal fan portion of a series of alluvial fans and bajadas flanking the east side of the Palen Mountains to the north and northwest of the Project site, and the southwestern side of the McCoy Mountains to the northeast (Plate 1). The piedmont bajadas merge within an approximately northward trending axial valley between the Palen and McCoy Mountains (referred to herein as the Palen-McCoy Valley) that terminates in Ford Dry Lake. Topographically, the area of the proposed Project solar array and linear facilities are relatively flat, with an approximately 0.3 degree southwest slope and exhibits surficial sediments composed of silty sands with lesser amounts of fine grained gravel. The Project site exhibits relatively thin alluvium, relict dune and current drainage deposits overlying older alluvium across most of the site above an elevation of 377 feet msl (See report in Appendix A). Below an elevation of approximate 377 feet msl, the thin layer of alluvium, relict dune and current drainage deposits overly latest Pleistocene lacustrine deposits.

The aerial extent of aeolian activity is moderately less than during past regional dune aggradational events. This can be seen on **Soil and Water Figure 6**, where unit Qsr (relict dune fields) extends beyond the northern boundary of the primary sand migration corridor from Palen Lake through the Ford Dry Lake area, and south of the Project solar arrays. In addition, considerable near surface Qsr deposits are identified within interdune regions of mapped aeolian sand migration corridors (mapped unit Qsad on **Soil and Water Figure 6**). For the most part, the same sand migration corridors that were active during past dune aggradational events within the Chuckwalla Valley region are still the primary pathways of sand migration.

Active aeolian sand migration in the Project site vicinity occurs within existing sand migration corridors located south of the Project site and linears (the PDL-Chuckwalla Valley Axis Sand Corridor), and east of the Project site and Ford Dry Lake (the Palen-McCoy Valley Sand Corridor). The vast majority of sand moving within the Palen-McCoy Valley Sand Corridor passes east of the proposed solar array, and a relatively minor component migrates within the easternmost portion of the proposed solar array (see WPAR, 2010 - Plate 14 — Photos A, B, and C).

The aeolian sand migration within the eastern-most area of the proposed Project solar array has two sources. These include sand derived from the local small ephemeral washes within the footprint of the proposed facility soon after they flow, and from southward migrating sand moving down the Palen-McCoy Valley Sand Corridor. Based on field mapping, aerial photograph evaluation and evidence that the onsite drainages flow infrequently (estimated to be approximately every 20 years and likely associated with relatively large El Nino events) the aeolian sand derived from the onsite drainages represents a very small component of the total aeolian sand within the Palen-McCoy Valley Sand Corridor system. In addition, the amount of wind-blown sand passing

through the eastern-most portion of the proposed Project solar array represents a very minor component to the total aeolian sand migrating in the Palen-McCoy Valley Sand Corridor. Based on the existing data, it is likely that the component of aeolian sand migrating through, or derived in, the eastern-most portion of the Project solar array site is less than 5 percent of the total wind blown sand migrating within the Palen-McCoy Valley Sand Corridor system.

Based on the existing data, the following conclusions may be made about the relative contribution of various aeolian sand sources and about sand migration in the region of the Project:

- The majority of the region of the proposed solar arrays is not located within aeolian sand migrating corridors and thus will not block wind blown sand within the Ford Dry Lake dune system.
- The southern and eastern-most regions of the proposed solar arrays are within the outer envelope of an aeolian sand migrating corridor but these regions experience a relatively minor magnitude of wind blown sand migration.
- The washes and surface areas within the proposed solar arrays and linears represent a very minor source of aeolian sand. Thus, proposed grading and development will not remove a significant source of aeolian sand and adversely affect mapped areas of active aeolian deposits.
- The PDL-Chuckwalla Valley Axis Sand Corridor is a major source of wind blown sand for the dune system located south of I-10. Thus, most of the aeolian migrating sand from the Palen Lake-Chuckwalla valley axis does not reach the Project.
- Ford Dry Lake proper is a minor to moderate source of aeolian sand for the region of the Project linears.
- The aeolian sand corridor along the eastern side of the Palen-McCoy Valley (**Soil and Water Figure 6**) is a major aeolian sand source feeding the dune system east of the solar array and linears. Over 95 percent of the migrating aeolian sand in the Palen-McCoy Valley sand corridor migrates east of the proposed Project. Thus, less than 5 percent of the migrating aeolian sand is estimated to be derived from the area within the proposed solar arrays.
- Local washes located along the rim of Ford Dry Lake proper represent a very minor source of aeolian sand to the regions bounding the linears and south of the solar arrays.

Hydrogeology

Groundwater Basins

The site is located within the CVGB (CDWR Basin No. 7-5), which has a surface area of 940 mi^2 (2,435 km^2) underlying Chuckwalla Valley (CDWR, 2004). The CVGB is an unadjudicated groundwater basin and owners of property overlying the basin have the right to pump groundwater from the basin for reasonable and beneficial use, provided that the water rights were never severed or reserved. In addition, groundwater production in the basin is not managed by an entity and no groundwater management plan has been submitted to the California Department of Water Resources.

The site location in the basin is shown on **Soil and Water Figure 7**. The CVGB is bounded by the consolidated rocks of the surrounding mountains. Three water-bearing Quaternary- and Tertiary-age sedimentary units overly non-water bearing bedrock in the CVGB (CDWR, 2004; DWR, 1963). DWR reports the maximum thickness of these deposits as about 1,200 feet in the CVGB (CDWR 1979); however, modeling of Bouger gravity data obtained from USGS suggest greater depths to bedrock exist in some parts of the basin (See **Soil and Water Figure 4**).

The CVGB is bounded upgradient by two other groundwater basins that include the eastern part of the Orocopia Valley (CDWR Basin No. 7-31) and Pinto Valley (CDWR Basin No. 7-6) groundwater basins and downgradient by the Palo Verde Mesa (CDWR Basin No. 7-5) Groundwater basin. A brief overview of the adjoining basins follows:

Eastern Orocopia Valley (7-31)

This basin underlies Orocopia Valley, northeast of the Salton Sea, in central Riverside County. It is bounded by impermeable rocks of the Cottonwood and Eagle Mountains on the north and of the Orocopia and Chocolate Mountains on the south (see **Soil and Water Figure 7)**. The basin is bounded by a section of the San Andreas fault zone and semi-permeable rocks of the Mecca Hills on the west and by a bedrock constriction on the east. The western portion of the valley drains westward toward the Salton Sea, but the eastern part drains eastward into Hayfield (dry) Lake and Chuckwalla Valley. Average annual precipitation ranges to 4 inches (CDWR, 2003).

Pinto Valley (7-6)

This groundwater basin underlies Pinto Valley in northern Riverside County (see **Soil and Water Figure 7)**. It is bounded by nonwater-bearing rocks of the Coxcomb Mountains on the east and northwest, the Pinto Mountains on the north, of the Eagle Mountains on the south, and the Hexie Mountains on the west (Bishop 1963; Jennings 1967). The valley is drained eastward by the Fried Liver, Smoketree, and Porcupine Washes (Jennings 1967). Average annual precipitation ranges to 6 inches (CDWR, 2003).

Palo Verde Mesa (7-39)

This basin underlies Parker Valley in eastern Riverside County (see **Soil and Water Figure 7)**. The basin is bounded by nonwater-bearing rocks of the Big Maria and Little Maria Mountains on the north, the McCoy and Mule Mountains on the west, the Palo Verde Valley on the east, and of the Palo Verde Mountains on the south (CDWR 1979; Jennings 1967). The northwest boundary and parts of the western boundary are drainage divides (Metzger 1973; Jennings 1967). The valley is drained by McCoy Wash to the Colorado River. Average annual precipitation ranges to 6 inches (CDWR, 2003).

Groundwater Inflow/Outflow

Natural groundwater recharge to the CVGB includes recharge from precipitation and subsurface inflow from the Pinto Valley Groundwater Basin to the northwest and the Orocopia Valley Groundwater Basin to the Southwest (CDWR, 2004; Eagle Crest, 2009). Underflow from the Cadiz Valley Groundwater Basin has also been hypothesized by DWR (2004); however, recent work has reportedly confirmed that the Cadiz Valley

Groundwater Basin does not contribute inflow to the CVGB (BV and WCC, 1998). CVGB also shares a boundary with the Ward Valley Groundwater Basin, but groundwater is not reported to flow across this boundary (Bedinger, et al., 1989). Other sources of recharge to the basin include agricultural return flow and return flow from treated wastewater disposal.

Recharge from Precipitation

In this part of California, almost all moisture from rain is lost through evaporation or evapotranspiration and runoff occurs principally during intense thunderstorms (RWQCB, 2006). Most recharge from precipitation occurs when runoff from the surrounding mountains exits bedrock canyons and flows across the coarse sediments deposited in the proximal portions of the alluvial fans that ring Chuckwalla Valley. To a lesser extent, recharge occurs from infrequent precipitation or runoff on the valley floor (CDWR, 2004). The area of the Chuckwalla Valley watershed encompasses Chuckwalla Valley (601,543 acres) and the surrounding bedrock mountains (258,825 acres), for a total area of approximately 860,368 acres. Available estimates of recharge in CVGB are variable and in some cases based on incomplete or incorrect data. DWR has not published an estimated recharge rate for the basin (CDWR, 2004). In 1986, Woodward Clyde calculated recharge from precipitation for the Chuckwalla Valley watershed to be 29,530 acre feet per year (afy) (Woodward Clyde, 1986). This equates to an average recharge rate of approximately 0.036 feet per year (0.4 inches). Woodward Clyde reported this number as approximately 12.8 percent of an average annual precipitation of 3.39 inches per year across the watershed; however, this was the average annual precipitation in Blythe at the time, and does not consider that the orographic effect of the surrounding mountains which results in precipitation rates of over 6 inches per year in the higher elevation portions of the watershed (Hely and Peck, 1964). In 1992, the average recharge to CVGB was reportedly estimated by BLM and the County of Riverside to be 5,540 to 5,600 afy based upon an assumed 10 percent infiltration of precipitation (Eagle Crest, 2009); however, this number evidently considered only a portion of the watershed as it would equate to an average annual precipitation depth of only about 1 inch per year across the watershed. Recent studies have demonstrated recharge rates for nearby desert basins ranging from approximately 3 to 5 percent of the total incident precipitation on the basin catchment area (Whitt and Jonker, 1998). A review of recharge studies in the arid southwest performed by USGS (2007b) cited a wide range of recharge rates, but rates in similar basins ranged from about 3 to 7 percent.

For this study, recharge from precipitation was estimated by overlaying isohyetal maps prepared by Hely and Peck on the Chuckwalla watershed boundaries and calculating the volume of average annual precipitation for each of four precipitation zones for the valley and bedrock portions of the watershed. Recharge was then estimated as 3, 5 and 7 percent of total incident precipitation and a reasonable lower bound recharge estimate was adopted. The calculated average annual precipitation volume for the CVGB watershed is 286,250 acre feet over an area of 822,259 acres. Recharge for the CVGB is estimated as a fraction of 3, 5 and 7 percent of total incident precipitation is therefore calculated to be 8,588, 14,313 and 20,038 afy, respectively.

An analysis of infiltration and runoff rates for the CVGB is provided in **Soil and Water Table 7.**

Based on the above analysis, approximately 36 percent of precipitation in the watershed falls on the bedrock areas that ring the watershed. This is significant because precipitation that falls on the valley floor is not expected to contribute consistently to recharge. Studies published by USGS report approximately 7 to 8 percent of precipitation falling on bedrock mountains in other arid basins goes to mountain front recharge (USGS, 2007).

This would amount to approximately 3 percent of the total precipitation that falls on the Chuckwalla Valley watershed. In the absence of more detailed study, 3 percent of total precipitation falling on the Chuckwalla Valley watershed (8,588 afy) is used as a reasonable lower bound estimate of recharge to the CVGB.

Subsurface Inflow

Underflow from the Pinto Valley Groundwater Basin has been calculated to be 3,173 afy (GeoPentech, 2003, Eagle Crest Energy Company, 2009). Inflow from the Orocopia Valley Groundwater Basin has been estimated to be 1,700 afy (LCA, 1981). CH2M Hill (1996) estimated the combined subsurface inflow from both basins to be 6,700 afy. However, recent studies by GeoPentech reportedly indicate that subsurface inflow from Orocopia Valley Groundwater Basin may be as low as several hundred afy. Therefore a combined subsurface inflow rate of 3,500 afy was assumed for both basins for water budget purposes.

Wastewater Return Flow

Chuckwalla State Prison was constructed approximately 7 miles southwest of the project site in 1988, and Ironwood State Prison became operational in 1994. The prisons use an unlined pond to dispose of treated wastewater, and a large percentage of this discharge is reported to infiltrate into the subsurface and recharge the CVGB. For the years 1998 through 2001, the California Department of Water Resources-Department of Planning and Local Assistance (CDWR-DPLA) reported that deep percolation of applied urban water in the Chuckwalla Planning Area (assumed to be wastewater return flow) was 500 to 800 afy (CDWR-DPLA, 2007).

Source: Derived from Solar Millennium 2010a.

According to authorities at the State prison complex (Lanahan, 2009), they indicated that approximately 600 afy of treated effluent recharges the basin. Recently published water budget information for the Eagle Crest Pumped Storage Project (Eagle Crest, 2009), indicates 795 afy of treated effluent are recharged by the prisons. An additional

source of wastewater return flow in the basin is approximately 36 afy from the Lake Tamarisk development near Desert Center (Eagle Crest, 2009).

Irrigation Return Flow

The amount of applied irrigation water that returns to recharge a groundwater basin depends on the soil, crop type, amount and method of irrigation, and climatic factors. Woodward Clyde (1986) reported an irrigation efficiency of 60 percent (return flow of 40 percent) for jojoba crops in Chuckwalla Valley. DWR-DPLA reported an irrigation efficiency of 72 percent (return flow of 28 percent) for subtropical crops in the Palen Detailed Analysis Unit (DAU) of the Chuckwalla Planning Area (CDWR-DPLA, 2007). In its water budget calculations for the Chuckwalla Planning Area in support of California Water Plan updates, DWR-DPLA calculated an irrigation return flow of approximately 9 to 11 percent for 1998, 2000 and 2001, respectively. A 10 percent return flow is a reasonable factor for deep percolation from irrigation in the basin, and was applied to the assumed agricultural and landscape water demand in the basin for the purposes of a water budget. Current pumpage associated with activities associated with irrigation return flow is estimated to be approximately 7,700 afy in the CVGB that includes 6,400 afy for agriculture, 215 afy for aquaculture pumping, and 1,090 afy for Tamarisk Lake (Worley-Parsons (2010). Return flows are calculated using the 10 percent or approximately 800 afy and included in Soil and Water Table-6.

Groundwater Demand/Outflow

Groundwater provides the only available water resource in Chuckwalla Valley. Designated and potential beneficial uses of groundwater in the basin include domestic, municipal, agricultural and industrial use (RWQCB, 2006). As such, groundwater demand is a significant contributor to basin outflow. Other sources of basin outflow include subsurface discharge to the Palo Verde Mesa Groundwater Basin, and evapotranspiration at Palen Lake.

Groundwater Demand

Current and historical groundwater pumpage in CVGB includes agricultural water demand, pumping for Chuckwalla and Ironwood State Prisons, pumping for the Tamarisk Lake development and golf course, domestic pumping, and a minor amount of pumping by Southern California Gas Company. In addition, historical pumpage included water supply for the Kaiser Corporation Eagle Mountain Mine. With the exception of pumping for Chuckwalla Valley and Ironwood State Prisons, most of the current groundwater pumping in the basin occurs in the western portion of the basin, near the town of Desert Center. Current pumpage is estimated to be approximately 7,756 afy in the western CVGB and 2,605 afy in the eastern basin WPAR, 2010 – Table 3-4). Agricultural production is limited to the western portion of the basin (Eagle Crest, 2009; DWR-DPLA, 2007 and 2009), with the exception of a relatively limited amount of acreage that is associated with the state prisons.

Subsurface Outflow

Subsurface outflow to Palo Verde Mesa Groundwater Basin was estimated by Metzger (1973) to be 400 afy. This calculation was based on a cross sectional profile of the boundary between the two basins derived using geophysical methods and regional data

regarding groundwater gradients and hydraulic conductivity. Woodward Clyde (1986) revised this estimate based on the results of pump testing at Chuckwalla State Prison and calculated the basin outflow to be 870 afy. Engineering Science (1990) updated this estimate to 1,162 afy, presumably as a result of return flow from prison wastewater disposal; however, the rationale for this adjustment was not provided. Using more recent gravity data, Wilson and Owens-Joyce (1994) found that the area through which discharge occurs is significantly more limited than previously thought due to the presence of a buried bedrock ridge. As a result, the most recent available water budget for the basin has adopted an outflow rate of 400 afy (Eagle Crest, 2009). For purposes of this analysis, staff has adopted the 400 afy as being representative of subsurface outflow from the CVGB.

Palen Lake Evapotranspiration

Regional groundwater flow and discharge mapping performed by USGS (Bedinger, et al., 1989) did not identify Palen Lake as an area where groundwater discharges at the ground surface. Nevertheless, groundwater elevation contour mapping suggests that groundwater may occur near the ground surface beneath approximately the northwestern 25 percent of Palen Lake. It is therefore possible that a portion of Palen Lake is operating as a wet playa. Groundwater levels beneath the southeastern portions of Palen Lake, and a small ancillary playa located approximately one mile southeast of Palen Lake, were reported by Steinemann (1979) as being 20 to 30 feet below ground level, suggesting that Palen Lake would be a dry playa at various times.

Review of aerial photography indicates what appears to be a relatively small area of dissected salt pan near the northern and western sides of the playa. Because the salt pan is dissected, it is not clear whether salt deposition is actively occurring or whether this material is residual deposition from surface water evaporation. Immediately northwest of Palen Lake, between Palen Lake and Desert Center-Rice Road, Pleistocene lake bed deposits crop out at the ground surface in the form of dissected, mesa-like prominences that are 5 to 10 feet high (CDWR, 1963). These deposits are capped with a layer of caliche and locally support scattered mesquite trees. There does not appear to be any other evidence of shallow groundwater or evapotranspiration visible in aerial photography.

Groundwater elevation contour mapping (Steinemann, 1989) suggests that groundwater may occur near the ground surface beneath approximately the northwestern 25 percent of Palen Lake. A well located approximately two miles north of Palen Lake is reported to be completed to a depth of 501 feet below the ground surface and has a ground surface elevation of 500 feet msl (WPAR, 2009a). A screened interval for the well is not reported. Groundwater levels in this well were reported to be approximately 20 to 25 feet below the ground surface (bgs) between 1932 and 1984. Given that the surface elevation at Palen Lake two miles to the south is approximately 460 feet msl, or 40 feet lower, it appears possible that groundwater levels are very close to the ground surface beneath the northern portion of the playa. In addition, DWR (1963) identified the presence of mesquite trees on low mesa-like promontories of Pleistocene lacustrine sediments at the northwest margin of Palen Lake playa, also suggesting the possible presence of relatively shallow groundwater. These data suggest it is possible that an area in the northern portion of Palen Lake is discharging groundwater by evaporation as

a wet playa. Groundwater levels beneath the southeastern portions of Palen Lake, and a small ancillary playa located approximately one mile southeast of Palen Lake, are 20 to 30 feet below ground level (Steinemann, 1989), indicating these are dry playa areas.

Review of aerial photography indicates an approximately 700-acre area of dissected salt pan in the northwest portion of the playa (Worley-Parsons, 2010). This feature is surrounded by an additional approximately 1,300 acres that show evidence of more limited surface salt accumulation. The extent of this area is visible in aerial imagery from November 2005, and was generally confirmed by a reconnaissance performed on December 10 and 30, 2009. Review of the historical progression aerial imagery (Worley-Parsons 2010**)** indicates no or limited salt accumulation in this area from 1996 through 2002, light salt accumulation in March of 2005, and the currently observed salt pan area in November 2005. This suggests that salt pan accumulation in the playa is episodic; however, seasonal, intermittent accumulation cannot be ruled out. Historical precipitation records indicate that 2005 rainfall in Blythe was approximately twice the long term annual average, with 5.10 inches occurring in January and February 2005 (WRCC, 2009), just before the March 2005 aerial photograph was taken. These storm events would be expected to have resulted in the accumulation of runoff in Palen Lake, and consequently in dissolution and re-crystallization of salt deposits during evaporation of surface water, and by wetting and subsequent drying of salt containing playa sediments. As such, these rainfall events are likely responsible for at least a portion of the observed salt accumulation; however, groundwater discharge by evaporation at the ground surface could also be responsible.

During a December 10, 2009 site visit by Worley-Parsons (2010), conditions at the northwestern edge of the playa were investigated. Intermittent salt deposits were observed to be located both in low lying areas and on the tops of low, dissected, mesa-like promontories of Pleistocene lacustrine sediments approximately three feet high that extend into the playa. Deposition of salt by groundwater evaporation at the surface would be expected to occur on the sides as well as the top of these promontories. The occurrence of salt deposits on the top, but not on the sides, suggests that these deposits are the result of salt dissolution from layers with elevated salt content and reposition as soil moisture evaporates at the ground surface. The shallow soil beneath the salt deposits was observed to be wetted to a depth of approximately three inches from a recent rain event, but underlying soil to depths of approximately one foot were observed to be generally dry. As such, evidence of salt deposition by evapotranspiration at the playa surface was not observed in this area during Worley-Parsons' reconnaissance (Worley-Parsons 2010).

Mesquite trees were observed in the area north of the playa, but wetland species or other species indicative of or dependant on shallow groundwater were not observed. Mesquite trees are typically thought to be associated with "shallow" groundwater; however, the term shallow should be understood in a relative sense—the depth to groundwater utilized by mesquite trees may be several tens of feet below the ground surface. This would be too deep to support groundwater discharge at the ground surface. Thus, the presence of mesquite is not necessarily indicative of discharging playas.

In December 2009, Worley-Parsons advanced two hand auger borings to approximately 10 feet bgs beneath the salt pan area in the northwest portion of the playa. The moisture content of the soil was observed to increase with depth in both borings, and free groundwater was encountered at a depth of approximately 8 feet below the playa salt pan surface in one of the borings. Subsurface soil encountered consisted of alternating layers clay/silt mixtures and sandy sediments. A depth of 2 to 3 meters is generally the maximum depth of free water documented beneath discharging playas. This suggests that groundwater could be shallow enough to discharge at the surface by capillary rise and evaporation to occur at least some of the time (Worley-Parsons, 2010).

Based on the above data, salt accumulation at Palen Lake is likely the result of dissolution and recrystallization of existing salt deposits during times of surface water inflow, as well as limited episodic and possibly seasonal or intermittent groundwater discharge. The rate of groundwater discharge in a wet playa is dependent on the depth to groundwater and magnitude of upward vertical gradients, the ability of subsurface materials to facilitate capillary rise, climatic conditions, and the presence and extent of free water, wetlands and salt pans on the playa surface (Tyler, 2005; Allen and Sharike, 2003). In general, groundwater discharge rates are highest when groundwater is shallow, temperatures are high, and when open water or wetlands are exposed at the playa surface.

Increased depth to groundwater, lower temperatures, the presence of coarse grained material that inhibits capillary rise, and the presence of salt pan (which increases albedo) tends to decrease groundwater discharge rates. Based on these factors, discharge of groundwater at Palen Lake appears to be limited based on the depth to groundwater (including absence of vegetation that indicates consistent shallow groundwater), the presence of coarse grained layers that limit capillary rise and the apparent intermittent or episodic nature of discharge.

Groundwater discharge rates were estimated based on reported groundwater discharge rates at other playas, the area of identified salt accumulation, and the evident episodic or intermittent nature of salt accumulation. Measured evapotranspiration rates at Franklin Lake Playa were used to form a basis for this estimate (Czarnecki, 1997). Franklin Lake Playa is a well developed and extensively characterized wet playa in the Death Valley area (USGS, 2007b). Evapotranspiration rates at Franklin Lake Playa are calculated to be 38 to 41 cm/year (1.3 to 1.4 feet/year) based on the Energy-Balance Eddy-Correlation method, which is reported to be the most reliable method by the USGS. WorleyParsons (WPAR, 2010a) suggested that these rates would be a conservative measure of evapotranspiration for active wet playa areas at Palen Lake for the following reasons:

- Franklin Lake Playa is a terminal playa, which is the terminal discharge point of the local groundwater flow system; whereas, Palen Lake is a bypass playa, with most groundwater flowing laterally past the playa.
- Franklin Lake Playa includes extensive groundwater discharge features (e.g., saltpan, puffy ground and halophyte wetlands) that are generally less developed or lacking at Palen Lake, indicating less groundwater discharge would be expected at Palen Lake.

- Evapotranspiration rates at wet playas are temperature dependent, with maximum rates occurring during the summer months. Franklin Lake Playa occurs in Death Valley, where mean annual and summer high temperatures typically exceed those at Palen Lake.
- The available data suggest that groundwater discharge, if it is occurring at Palen Lake, is episodic or intermittent; whereas groundwater discharge at Franklin Lake Playa occurs throughout the year.

The total area of potential groundwater discharge at Palen Lake is estimated to be approximately 2,000 acres, with salt pan occupying approximately 700 acres of this total. Based on a groundwater discharge rate that is approximately half that at Franklin Lake Playa, and is estimated to occur for three months every year, the total discharge rate would be approximately 0.175 feet of water per year. Over an area of 2,000 acres, this equates to approximately 350 afy. (WorleyParsons, 2010a)

Groundwater Budget

The perennial yield (the maximum quantity of water that can be annually withdrawn from a groundwater basin over a long period of time [during which water supply conditions approximate average conditions] without developing an overdraft condition.- CDWR, 1998) of CVGB was estimated to be between 10,000 and 20,000 afy (Hanson, 1992). A perennial yield of 12,200 afy was adopted in the EIS for the Eagle Crest Landfill project in 1992 (BLM and County of Riverside, 1992); however, the amount of recharge from precipitation used to derive this number appears to be based on recharge to only a portion of the basin, so the perennial yield may be underestimated.

A comprehensive water budget was compiled based on published literature, water budget information collected by the DWR for updates to the California Water Plan, information obtained from the California State Prison Authority, and the analysis of basin inflow and outflow discussed in the previous two sections. This information is summarized in **Soil and Water Table 8**, below.

Soil and Water Table 8
Groundwater Budget (afy)

Budget Components	Totals
Inflow	
Recharge from Precipitation	8,588
Underflow from Pinto Valley and Orocopia Valley Groundwater Basins	3,500
Irrigation Return Flow	800
Wastewater Return Flow	831
Total Inflow	13,719
Outflow	
Groundwater Extraction	-10,361
Underflow to Palo Verde Mesa Groundwater Basin	-400
Evapotranspiration at Palen Dry lake	-350
Total Outflow	-11,111
Budget Balance (Net Inflow)	2,608

The analysis suggests that the CVGB is in positive balance (inflow exceeds outflow) by approximately 2,600 afy under average conditions.

Water Bearing Units

The following water-bearing formations have been identified in the CVGB. The extent and relationship of these formations is presented in hydrostratigraphic cross sections A-A' and B-B' included as **Soil and Water Figures 8** and **9.** The location of the cross section is shown on **Soil and Water Figure 10**.

Quaternary Alluvium

Quaternary alluvial fill in the basin consists of Holocene to Pleistocene alluvial fan and fluvial (stream) deposits, as well as lacustrine (lake) and playa (ephemeral lake) deposits (CDWR, 2004). These deposits consist of gravel, sand, silt and clay (CDWR, 1963). In general, coarser alluvial fan deposits are expected near the valley edges and grade into finer distal fan deposits that interfinger with fine grained lacustrine and playa deposits near the center of the basin. These deposits are typically heterogeneous. Valley axial drainages tend to be more uniform and continuous, and contain a greater proportion of sand and fine gravel. Portions of the basin are also occupied by aeolian (wind blown) sand deposits, but the identified aeolian deposits occur at the ground surface and are of limited thickness. Therefore, they are not believed to be an important water bearing unit.

The majority of the Project site is underlain by a relatively thin veneer of active valley axial alluvial sediments that is in equilibrium (neither eroding or aggrading) and underlain at shallow depth by older alluvium with buried soil horizons (WorleyParsons, 2009b). A seismic shear wave profile investigation indicates that shear wave velocities are highest in a layer that occurs at about 20 to 30 feet below ground surface (bgs), which is consistent with the presence of carbonate cementation (JRA, 2009). Portions of the basin are also occupied by aeolian (wind blown) sand deposits, and these sediments increase in prevalence near Ford Dry lake and the area southeast of the Project site (DWR, 1963; WorleyParsons, 2009b). The identified aeolian deposits occur at the ground surface and are of limited thickness. The Quaternary sediments include the Pleistocene-age Pinto Formation, which consists of coarse fanglomerate (cemented, consolidated or semi-consolidated alluvial fan gravels) containing boulders and lacustrine clay with some interbedded basalt (DWR, 2004).

Pliocene Bouse Formation

The Pliocene Bouse Formation underlies the Quaternary sediments. The Bouse Formation includes a marine to brackish-water estuarine sequence deposited in an arm of the proto-Gulf of California (Metzger, 1968; Wilson and Owen-Joyce, 1994). This formation has alternatively been interpreted as, or may include, lacustrine sediments deposited in a closed, brackish basin (Stone, 2006). The Bouse Formation is widely reported in the Colorado Valley and tributary basins in southeastern California and descriptions of this formation come from occurrences outside of Chuckwalla Valley. It is reported to be composed of a basal limestone (marl) overlain by interbedded clay, silt, sand, and tufa. The top of the Bouse Formation is relatively flat lying with a reported dip of approximately 2 degrees south of Cibola (Metzger and others, 1973). The Bouse Formation in the CVGB is estimated to extend to approximately 2,200 feet bgs

(approximately -1,800 feet msl) beneath the site based on geophysical modeling (see WPAR, 2010 Figure 5). These unconsolidated to semi-consolidated sediments are reported to yield several hundred gallons per minute (gpm) to wells perforated in coarse grained units (Wilson and Owen-Joyce, 1994).

Miocene Fanglomerate

The Bouse Formation is unconformably underlain by a fanglomerate composed chiefly of angular to subrounded and poorly sorted partially to fully cemented pebbles with a sandy matrix (Metzger and others, 1973). The Fanglomerate is likely Miocene-age; however, it may in part be Pliocene-age (Metzger and others, 1973). The Fanglomerate represents composite alluvial fans built from the mountains towards the valley and the debris of the Fanglomerate likely represent a stage in the wearing down of the mountains following the pronounced structural activity that produced the basin and range topography in the area (Metzger and others, 1973). Bedding surfaces generally dip from the mountains towards the basin. The Fanglomerate reportedly dips between 2 and 17 degrees near the mountains due to structural warping (Metzger and others, 1973). The amount of tilting indicates a general decrease in structural movements since its deposition (Metzger and others, 1973). The Fanglomerate is estimated to extend to approximately 3,000 feet bgs (-2,600 feet msl) beneath the site based on geophysical modeling by Worley-Parsons (WPAR, 2009).

Bedrock

Bedrock beneath the site consists of metamorphic and igneous intrusive rocks of pre-Tertiary age that form the basement complex (CDWR, 1963). In some areas of the basin, volcanic rocks of Tertiary age overlie the basement complex (CDWR, 1963). These rocks are considered nonwater bearing. The bedrock topography in the study area as interpreted by modeling of Bouger gravity data obtained from USGS is illustrated in **Soil and Water Figure 4** The methods used to model the bedrock topography are discussed in more detail in Genesis Solar Energy Project Application for Certification Appendix D (Worley-Parsons, 2009).

Groundwater Occurrence and Movement

In general, groundwater flow in the basin is south-southeastward (**Soil and Water Figure 7**). Groundwater flow is directed southward from the basin's boundary with the Cadiz Valley Basin and east-southeastward from its boundary with the Pinto Valley Basin, toward the eastern basin boundary where it flows into the adjacent Palo Verde Mesa Basin (Steinemann, 1989). The groundwater gradient is the steepest in the western half of the basin and is nearly flat in the central portion of the basin (CDWR, 1963). Near Ford Dry Lake and east of Ford Dry Lake the gradient becomes steeper as groundwater approaches the narrows in the southeast portion of the basin (Steinemann, 1989; DWR 1963).

Groundwater levels exceed 500 feet msl in the western portions of the basin and fall to less than 275 feet msl near the eastern end of the basin in the narrows between the Mule and McCoy Mountains (Steinemann, 1989). Near Palen Lake, groundwater occurs near the ground surface, resulting in groundwater discharge by evapotranspiration at the land surface. Near Ford Dry Lake, groundwater is reported at depths of 50 feet below ground surface. Beneath the Project site, groundwater occurs at depths of

approximately 70-90 feet bgs (approximately 400 feet msl) based on site-specific investigation (WPAR, 2009a). **Soil and Water Figures 11 and 12** present groundwater level contours for 1963 and 1992, respectively.

The DWR reports that groundwater levels in the basin are generally stable (CDWR, 2004). **Soil and Water Figure 13** shows hydrographs for selected wells within the Chuckwalla Valley from 1950 to 2009. The wells selected to present the hydrograph data were chosen to present the most complete set of historic water level elevation data across the Chuckwalla Valley. The hydrographs show that the water level has been generally stable over the last 40 years in the eastern part of the basin. The hydrograph for well 7/20-18H1 in the eastern part of the basin shows a decrease in water level elevation occurred between 1985 and 1990. This well is associated with the Chuckwalla and Ironwood Prisons and the decline in water level is likely due to increased water use at the prisons. The hydrograph for well Township7S Range 18E-14H1 shows a slight (approximately 20 foot) increase in the water level between 1983 and 1992. This well and the three other wells at this location are associated with agriculture activities and the water level increase is likely due to the fallowing of the land.

Aquifer Characteristics

The basin fill sediments within the CVGB include three aquifers: the alluvium, the Bouse Formation, and the Fanglomerate. Groundwater in the alluvium likely occurs under unconfined conditions but could locally be semi-confined. Groundwater in the Bouse Formation and the Fanglomerate was reported to be under semi-confined to confined conditions based on stratigraphic data and storativity values derived from aquifer pumping tests at the GSEP (Worley-Parsons, 2010). However, the continuity of confining layers across the basin has not been established and may not be present as you progress toward the alluvial source areas away from the Ford Dry Lake area. **Soil and Water Table 9** summarizes the reported and estimated aquifer properties for these aquifers based on data from specific capacity tests and aquifer pumping tests performed on wells in the CVGB.

Groundwater Quality

Groundwater quality varies markedly in the basin. Groundwater in the western portion of the basin near Desert Center generally contains lower concentrations of total dissolved solids (TDS) than groundwater in the eastern, downgradient portion of the basin near Ford Dry Lake (Steinemann, 1989). Groundwater to the south and west of Palen Lake is typically sodium chloride to sodium sulfate-chloride in character (DWR, 2004). The detected concentrations of TDS in the basin ranges from 274 milligrams per liter (mg/L) to 8,150 mg/L with an average concentration of 2,100 mg/L (Steinemann, 1989). In general, the groundwater in the basin has concentrations of sulfate, chloride, fluoride, and dissolved solids too high for domestic use and concentrations of sodium, boron and dissolved solids too high for irrigation use (DWR, 1975). Several of the wells sampled in the basin contain high levels of fluoride and boron.

Reported water quality of samples collected from wells at the Site is presented in **Soil and Water Table 10**. This table indicates that water quality varies laterally and vertically in the area. Generally, water quality improves vertically with depth and laterally to the

south. Vertically, TDS concentrations are generally highest in the alluvium followed by the Bouse Formation and finally by the Fanglomerate.

Soil and Water Table 9

2) °C = Celsius
3) mg/L = milligrams per liter
4) µS/cm - microsiemens per centimeter
5) -- = not analyzed
6) ND<0.10 = not detected above the noted laboratory reporting limit.

SOURCE: Derived from WPAR, 2009b.

Calculated TDS concentrations from borehole geophysical logging indicate TDS concentrations as high as 30,500 mg/L within finer grained units (silt and clay) in the alluvium decreasing to less than 5,000 mg/L TDS in more transmissive sediments in the Bouse Formation at depths of 800 to 900 feet bgs (see AFC Appendix D). Laterally, TDS concentrations in groundwater decrease south and southeast of the Site within all three water bearing units in the basin, and are lowest in the are south of I-10, as referenced in **Soil and Water Figure 14.**

Groundwater Wells in Proximity to the Proposed Project

An inventory of groundwater wells in the area was compiled from published literature, review of data from the National Water Information System (NWIS), and by obtaining well completion records from the DWR for wells registered in the eastern Chuckwalla Valley Groundwater Basin. A total of 50 wells were identified, the majority of which were reported by Worley-Parsons (2010) as abandoned or disused. Information regarding the completion depths, construction details, and status of these wells, to the extent available, is presented in **Soil and Water Table 11** and shown in **Soil and Water Figure 7.**

Surface Water Hydrology

The site is located within the Colorado River Basin, within the Chuckwalla Valley Drainage Basin. There are no perennial streams in Chuckwalla Valley. Chuckwalla Valley is an internally drained basin, and all surface water flows to Palen Dry Lake in the western portion of the valley and Ford Dry Lake in the eastern portion of the valley. Palen Dry Lake is a “wet playa” with significant shallow groundwater discharge at the ground surface by evaporation; whereas, Ford Dry Lake is a “dry playa,” with groundwater occurring well below the ground surface. Palen Dry Lake is located in the central portion of Chuckwalla Valley about 11 miles west of the proposed plant location at the site.

The only perennial surface water resources in the eastern portion of Chuckwalla Valley are McCoy Spring, at the foot of the McCoy Mountains approximately 6.5 miles northeast of the site and 7.5 miles northeast of the proposed well field, and Chuckwalla Spring, approximately 15 miles south of the site at the foot of the Chuckwalla Mountains.

Off-site storm water flows impacting the project site are from a large watershed area to the north of the site which covers approximately 91,627 acres. The upstream extents of the contributing watersheds extend into the Palen Mountains. The extents of the watershed impacting the project were delineated utilizing existing USGS digital elevation model data and are shown on **Soil and Water Figure 15** which was taken directly from the preliminary Drainage Erosion and Sediment Control Plan (DESCP)(GSEP 2009a).

7) Well could not be located by WorleyParsons. Reported as destroyed.

SOURCE:WPAR, 2009b.

The overall offsite watershed impacting the project has been divided into three distinct sub-basins in the DESCP for the purpose of designing and sizing engineered channels to collect flow and convey it around and through the Project site. However, the boundaries of the sub-basins are not well defined and are subject to change depending on the magnate of the flow event and the propensity for the small drainages to migrate in response to erosion and sediment deposition. Peak discharges for each sub-basin were calculated using the Bently Pondpack software package and generally followed the guidelines presented in the *Riverside County Flood Control and Water Conservation District Hydrology Manual.* The results of the peak discharge analysis are summarized in **Soil and Water Table 12*.***

A comparison was made between the discharge data provided as part of the Conceptual Drainage Study and discharges obtained using the USGS Regional Regression Equation for the region. The purpose of the comparison was to provide some insight into the reasonableness of the calculated discharges when compared to some other regionally accepted methodology. The discharges presented in the Concept Drainage Study (GSEP 2009a) were significantly lower than those calculated using the regional regression equations. The subject area is likely significantly flatter with much more dispersed flow than the “average” watershed used in the derivation of the regional regression equation, which could account for lower discharges for the larger watersheds. Overall, the reported discharges appear to fulfill the purpose of design given the site specific watershed conditions.

Soil and Water Table 12
Summary of Offsite Peak Discharges

Sub-basin ID	Sub-basin Area (Sq. Mi.)	Q100 (cfs) (HEC-HMS)	Q100 (cfs) (Regression)*
1	27.9	4070	11,476
2	17.2	2203	8,140
3	98.1	10,022	28,022

Dry Washes

There are no perennial streams in Chuckwalla Valley and a vast majority of the time, the area is dry and devoid of any surface flow anywhere. Water runoff occurs only in response to infrequent intense rain storms. Much of the area is subject to inundation either by sheet flow or weakly-expressed braided ephemeral surface water flow. The entire area drains to Palen and Ford Dry Lakes, but runoff from most of the basin generally does not reach these dry lakes. During large rainfall events, Ford Dry Lake and Palen Dry Lake will retain water in shallow ponds for days or weeks. This occurs on average approximately once every 20 years (RCFCWCD, 2009). There are no named ephemeral washes within the Project site, however, a few ephemeral washes are located upslope of the Project site or traverse the southeastern part of the proposed off-

site linear alignment. The Project site itself is located in an area where washes disperse into a subdued bar and swale morphology, with widely dispersed swales that are small, only a few inches deep and do not have defined banks (Worley Parsons, 2009b).

There are numerous small dry washes which traverse the site which have no or poorly developed banks. These channels are typically very subtle, with a width of 2 to 8 feet and a depth of 3 to 9 inches. These features are poorly expressed and can be difficult to discern on aerial photography. Many of these channels do not reach the dry lake but fade out on the vegetated sand dune surface. The conveyance capacity of these washes is limited and runoff during moderate to large events will break out of these features and be conveyed across the terrain as shallow sheet flow.

Springs, Seeps and Playa Lakes

A comprehensive review was conducted to identify potential springs, seeps and surface water discharges that may be present in the central and eastern portions of Chuckwalla Valley (the area that may be affected by drawdown from project pumping). Sources reviewed included published reports and maps by the United States Geological Survey and California Department of Water Resources, maps published by the Bureau of Land Management, and contact with BLM personnel. The only springs, seeps or surface discharges identified are McCoy Spring (at the foot of the McCoy Mountains approximately 6.5 miles northeast of the Project site and 7.5 miles northeast of the proposed well field), and Chuckwalla Spring (approximately 15 miles south of the site, which is actually located outside the valley a short distance in the Chuckwalla Mountains) (BLM, 2002 and 2009b; DWR, 1963; RWQCB, 2006; Stone and Pelka, 1989; and USGS, 1983a, 1983b). McCoy Spring and Chuckwalla Spring are perennial springs; however, there is no information available regarding the discharge quantity for these springs. Published water quality data for McCoy Spring is included in DWR, 1963.

McCoy Spring is located at an elevation of 889 feet msl at the outlet of a bedrock canyon near the toe of the western slope of the McCoy Mountains, and includes a cistern and seeps. Based on the close proximity of bedrock outcrops to the spring and seeps, the spring likely represents baseflow discharge from the McCoy Mountains. As such, it would not have a direct hydraulic connection to the aquifers in the Chuckwalla Valley Groundwater Basin, which occur in the basin fill materials to the west of McCoy Spring.

Storm Water Flow

Storm water flow across and adjacent to the project occurs in a network of shallow and poorly expressed alluvial channels, and during larger events, as widespread sheetflow. The applicant completed existing conditions FLO-2D modeling on the project to provide information regarding the extents, depths, and velocities of surface flow across the project during the 100-year event as well as for more frequent storm events. The results of the analysis confirm the presence of general widespread and shallow sheet flooding across the site and do not provide resolution on the distribution of flow in individual washes due to a lack of detailed topographic data and the fact that the washes are so poorly expressed.

Surface and Groundwater Beneficial Uses

The Basin Plan for the CRBRWQCB establishes water quality objectives, including narrative and numerical standards that protect the beneficial uses of surface and ground waters in the region. The Basin Plan describes implementation plans and other control measures designed to ensure compliance with statewide plans and policies and provides comprehensive water quality planning.

Beneficial water uses are of two types – consumptive and non-consumptive. Consumptive uses are those normally associated with people's activities, primarily municipal, industrial and irrigation uses that consume water and cause corresponding reduction and/or depletion of water supply. Non-consumptive uses include swimming, boating, waterskiing, fishing, and other uses that do not significantly deplete water supplies.

1. Past or Historical Beneficial Uses
    a. Historical beneficial uses of water within the Colorado River Basin Region have largely been associated with irrigated agriculture and mining. Industrial use of water has become increasingly important in the Region, particularly in the agricultural areas.

2. Present Beneficial Uses
    a. Agricultural use is the predominant beneficial use of water in the Colorado River Basin Region, with the major irrigated acreage being located in the Coachella, Imperial and Palo Verde Valleys. The second in quantity of usage is the use of water for municipal and industrial purposes. The third major category of beneficial use, recreational use of surface waters, represents another important segment of the Region's economy.

3. Sources of Drinking Water Policy
    a. All surface and ground waters are considered to be suitable, or potentially suitable, for municipal or domestic water supply with the exception of:
        i. Surface and ground waters where: the TDS exceed 3,000 mg/L, and it is not reasonably expected by the Regional Board to supply a public water system, or
        ii. There is contamination, either by natural process or by human activity, that cannot be treated for domestic use using either Management Practices or best economically achievable treatment practices, or
        iii. The water source does not provide sufficient water to supply a single well capable of producing an average, sustained yield of 200 gallons per day.

Existing uses of waters from springs in the Colorado River Basin include the Box Spring, Crystal Spring, Old Woman Spring, Cove Spring, Mitchell Caverns Spring, Bonanza Spring, Agua Caliente Spring, Kleinfelter Spring, Von Trigger Spring, Malpais Spring, and Sunflower Spring. Based on a review of available information include the USGS NWIS database, USGS quadrangle maps and data provided by the BLM, none

of these springs are within the area that would be influenced by the project. Existing uses of water from springs in the Colorado River Basin include Bousic Spring, Veale Spring, Nett Spring, Gordon Spring, and Arctic Canyon Spring. None of these springs are within the area that would be influenced by the project.

Water quality objectives are established for the reasonable protection of beneficial uses of water or the prevention of nuisance within a specific area.

1) **General Surface Water Objectives** (CRBRWQCB)

   a. Aesthetic Qualities - All waters shall be free from substance attributable to wastewater of domestic or industrial origin or other discharges which adversely affect beneficial uses not limited to: setting to form objectionable deposits; floating as debris, scum, grease, oil, wax, or other matter that may cause nuisances; and producing objectionable color, odor, taste, or turbidity.

   b. Tainting Substances – Waters shall be free of unnatural materials which individually or in combination produce undesirable flavors in the edible portions of aquatic organisms.

   c. Toxicity – All waters shall be maintained free of toxic substances in concentrations which are toxic to, or which produce detrimental physiological responses in human, plant, animal, or indigenous aquatic life. Compliance with this objective will be determined by use of indicator organisms, analyses of species diversity, population density, growth anomalies, 96-hour bioassay or bioassays of appropriate duration or other appropriate methods as specified by the CRBRWQCB. Effluent limits based upon bioassays of effluent will be prescribed where appropriate, additional numerical receiving water objectives for specific toxicants will be established as sufficient data to become available, and source control of toxic substances will be encouraged. The survival of aquatic life in surface waters subjected to a waste discharge or other controllable water quality factors, shall not be less than that for the same water body in areas unaffected by the waste discharge, or other control water which is consistent with the requirements for “experimental water” as described in Standards Methods for the Examination of Water and Wastewater.

   d. Temperature – temperature shall not be altered.

   e. pH – shall range from 6.0 to 9.0

   f. Dissolved Oxygen – shall not be reduced below the following minimum levels at any time: warm – 5.0 mg/L, cold – 8.0 mg/L, and warm and cold – 8.0mg/L

   g. Total Dissolved Solids – discharges of wastes or wastewater shall not increase the total dissolved solids content of receiving waters, unless it can be demonstrated to the satisfaction of the Regional Board that such an increase in total dissolved solids does not adversely affect beneficial uses.

   h. Bacteria – The geometric mean of the indicated bacterial densities should not exceed one or the other of the following: E. coli – 630 colonies (col) per 100 ml and enterococci – 165 col per 100 ml. Nor shall any sample exceed one other

following maximum allowable: E.coli 2000 col per 100 ml and enterococci 500 col per 100 ml.

Any discharge, except from agricultural, shall not cause concentration of total dissolved solids in surface waters to exceed the following limits:

TDS (mg/L)	Annual Average	Maximum
• Coachella Valley Drains	2000	2500
• Palo Verde Valley Drains	2000	2500

2) **General Groundwater Objectives**: Establishment of numerical objectives for groundwater involves complex considerations and it is acknowledged that the quality of groundwater varies significantly throughout the CVGB and varies with depth. It is the CRBRWQCB's goal to maintain the existing quality of non-degraded groundwater basins and to minimize the quantities of contaminants reaching any groundwater basin.

   a. Groundwater designated for domestic or municipal supply shall not contain taste or odor producing substances

   b. Groundwater designated for domestic or municipal supply shall not contain coliform organisms in excess of limits specified in the regulations.

   c. Groundwater designated for domestic or municipal supply shall not contain concentrations of chemical constituents in excess of the limits specified in California Code of Regulations, Title 22 regulations.

   d. Discharges of water softeners regeneration brines, other mineralized wastes, and toxic wastes to disposal facilities which ultimately discharge in areas where such waste can percolate to ground waters useable for domestic and municipal purposes, are prohibited.

Wastewater reclamation and reuse is encouraged, however, such use must meet applicable water quality standards.

C.9.4.2 ASSESSMENT OF DIRECT AND INDIRECT IMPACTS AND DISCUSSION OF MITIGATION

The direct potential effects of the Project on local water resources are those associated with using groundwater for construction (specifically for demands during site grading) and with the plant's operational process water demand. No surface water will be used, though Project construction and operation may have an effect on the ephemeral washes traversing the site, or springs and wet playas.

Potential impacts on water resources during construction and operation include soil erosion, geomorphology, groundwater basin balance, groundwater levels, groundwater quality, surface water hydrology, and surface water quality impacts.

Soil Erosion

Erosion is the displacement of solids (soil, mud, rock, and other particles) by wind, water, or ice and by downward or down-slope movement in response to gravity. Due to generally flat terrain, the Project site is not prone to significant mass wasting (gravity-driven erosion and non-fluvial sediment transport).

Environmental impacts associated with the construction and operations of the Project are discussed in the following sections. Significance criteria were developed based on California CEQA Guidelines and evaluated using accepted methodologies and professional judgment. Impacts would be considered significant if:

- Substantially increased wind or water-induced soil erosion occurred as a result of Project construction or operation;
- Substantially increased sedimentation occurred in areas adjacent to construction areas;
- Construction activities were to occur in areas of high erosion susceptibility and the disturbed areas were left exposed and not properly stabilized; or
- Prime Farmlands, Farmlands of Statewide Importance, or Unique Farmland were lost as a result of erosion.

Grading of the Project site will result in a less than one percent slope downward from the north to the south of the site. Earthwork associated with the Project will include excavation for foundations and underground systems, and the total earth movement that will occur is approximately 1,000,000 cubic yards. Cut and fill will be balanced on site and there will be no need to either import or export earthen material.

The vast majority of the Project grading and excavation will occur on the Project site with only minor grading and excavation needed for the transmission line (at the locations of the monopoles) as well as the gas pipeline and access road. Known onsite soil types that will be affected by Project grading and excavation are listed in Section C.9.4.1. The wind erosion hazard is moderate to high. During construction, the area within the plant site fence line (1,800 acres) will be disturbed. There also will be small, localized disturbance at the specific locations where transmission structures will be installed.

During construction, the surface of the disturbed areas will be devoid of vegetation and there will be the highest potential for erosion, as well as associated effects including soil loss and increased sediment yields downstream from disturbed areas. With implementation of BMPs such as straw bales, silt fences, and limiting exposed areas as detailed in the DESCP and SWPPP (see Condition of Certification **SOIL&WATER-1** and **2**, erosion is expected to be mitigated to a less than significant level. Site grading will be balanced on site; there will be no import or export of fill material. The Project is not located on farmland or in areas where agricultural protection legislation is applicable; therefore, there will be no impacts to agricultural soils at or near the Project site.

Construction and Operation

Wind Erosion

The potential for soil loss by wind erosion was estimated using the Wind Erosion Prediction System for pre-development (undisturbed), during construction, and operational conditions.

The area of the Project site and Project-related off-site linears has a moderate to high potential for wind and water erosion. The Wind Erosion Prediction System (WEPS) model was used to estimate soil loss due to wind erosion. Wind erosion rates at this project are an order of magnitude higher than soil erosion by rainfall runoff at this location due to the relatively low annual rainfall amount and the presence of fine, sandy soils. The results are presented in **Soil and Water Table 13** presented below.

Soil and Water Table 13
Estimate of Soil Loss by Wind Erosion Using
Wind Erosion Prediction System (WEPS)(1) Model

Description	Acres(2)	Predicted Soil Loss (tons per acre per year)	Wind Erosion Soil Loss (Tons per year)
No Project	1,800	72.88	131,184
On-Site Project Construction (no BMPs)	1,800	27.82	50,076
On-Site Project Construction (with BMPs)	1,800	1.25	2,250
Off-Site Linear Construction (with BMPs)	61	0.63	11
Project Operation (with BMPs)	1,650	1.25	2,063

Notes:
(1) Wind Erosion Soil losses (tons/acre/year) are estimated using WEPS software (NRCS, 2008). The soil characteristics were estimated using WEPS soil profiles corresponding to the mapped soil unit. Estimates of annual soil losses use the WEPS soil loss times the affected area. Off site linear construction will take less than one year.
(2) Project Acreages based on the assumption that 100 percent of the project site will be graded. Off-site area acreages are based on project disturbance table for acreage outside the project footprint.
WEPS Assumptions:
Climate and wind data from Blythe, CA.
BMPs for the project site include fencing the area and applying dust palliatives at least annually. BMPs for the off site linears do not include fencing the area.
Source: WPAR, 2009.

Under current conditions, these processes are in relative equilibrium with ongoing depositional processes and soil loss is estimated at approximately 72.88 tons per acre per year or 131,184 tons for the proposed project area of 1,800 acres (WPAR, 2009). Construction without implementation of BMPs would result in a potential for soil loss of about 50,000 tons; however, the implementation of BMPs is expected to reduce water and wind erosion of soils during construction to less than 2,250 tons. Based on the conceptual grading plan (WPAR, 2009; see Appendix A) for the Project site, construction will require cut and fill activities on the Project site, but import/export of earthen materials to and from the Project site will not be required.

Roads and paved areas will be kept free of dust, dirt and visible soil materials. Materials will be kept on site to implement temporary control measures during the operational life of the Project.

Impacts of project operations on the proposed rerouted desert washes are discussed in Section C.2, Biological Resources. As discussed in Air Quality, Section C.1, by its nature, a solar thermal project must keep dust to a minimum, as a film on the collectors of the solar array will reduce their efficiency for power production. Dust control will be achieved by a combination of soil stabilizers, water from the collector washing and waste cooling water, and compaction of the driving surface over time. Therefore, operational controls designed to control dust are expected to reduce the overall soil erosion in the area. Therefore, potential construction and operational-related impacts to onsite soils would be confined to the Project site and related off-site linears. With implementation of BMPs as detailed in the DESCP and SWPPP (see Condition of Certification **SOIL&WATER-1** and **2**, erosion is expected to be mitigated to a less than significant level.

Water Erosion

For potential soil loss associated with water erosion, it was assumed that100 percent of the project site would be graded. Those estimates are detailed in **Soil and Water Table 14**.

To address the management of sediment transport, erosion, and sedimentation during operation, the project design will incorporate diversion berms, channels, and detention basins, as discussed in Section C.9.11 *Conditions of Certification/Mitigation Measures.* Dirt roads and exposed surfaces will be periodically treated with dust palliatives as needed to reduce wind erosion. Construction and maintenance of the proposed drainage and sediment management system at the Project site is expected to reduce water and wind erosion at, and downstream of, the Project site to less than significant levels.

Soil and Water Table 14
Estimate of Soil Loss by Water Erosion Using Revised Universal Soil Loss Equation (RUSLE2)[1]

Feature (acreage)[2]	Activity	Duration (months)[3]	Soil Loss (tons) w/o BMPs	Soil Loss (tons) with BMPs	Soil Loss (tons/yr) No Project
Project Site (1,800 acres total graded)	Grading Construction	6 9	441.0 1,396.5	6.93 21.95	1.53 ---
Roads 15.76 acres)	Grading Construction	3			
Transmission lines (9.18 acres for construction;0.05 acres for pole footprints	Grading Construction	2 4	0.0041 1.499	0.000064 0.0236	0.00043 ---
Natural Gas Pipeline (36.36 acres for construction; 2.91 acres for trench)	Grading Construction	2 3	0.238 4.454	0.0037 0.0699	0.00247 ---
Project Soil Loss Estimates (Construction)	All activities listed above		1,845.63	29.00	1.16
Project Annual Soil Loss Estimate (Operation (1,650 acres exposed soil)		12		12.71	

Notes:
[1] Water Erosion Soil losses (tons/acre/year) are estimated using RUSLE2 software. (NRCS, 2002) The soil characteristics were estimated using RUSLE2 soil profiles corresponding to the mapped soil unit. Estimates of actual soil losses use the RUSLE2 soil loss times the duration and affected area. The No Project Alternative estimate does not have a specific duration, and loss is given in tons/year.
[2] Project Acreages based on the assumption that 100 percent of the project site will be graded. Off-site area acreages are based on project disturbance table for acreage outside the project footprint.
[3] Duration of activities based upon assumptions in the Plan of Development (Genesis Solar, LLC, 2009)
RUSLE2 Assumptions:
100-ft slope length, 2 percent slope
Construction and Grading soil losses assume the following inputs: Management - bare ground; Contouring - None, rows up and down hill; Diversion/terracing - None; Strips and Barriers - None.
Construction and Grading with BMP and Annual Operational soil losses assume the following inputs: Management – Silt fence; Contouring - Perfect, no row grade; Diversion/terracing - None; Strips and Barriers- 2 fences, 1 at end of slope.
No Project soil losses assume the following inputs: Management - Dense grass, not harvested; Contouring -None, rows up and down hill; Diversion/terracing - None; Strips and Barriers - None.
Source: WPAR, 2009.

Mitigation

Construction and operation of the Project could result in significant impacts related to water erosion of soils. Implementation of BMPs and condition of certification would reduce the impacts to insignificant. Implementation of Conditions of Certification **SOIL&WATER-1** and **-2**, and **SOIL&WATER-8** through **-13** described in detail in Section C.9.11, *Proposed Conditions of Certification/Mitigation Measures,* below, would ensure there would be no potential for impacts to soils related to water erosion.

Geomorphology

The GSEP involves a series of solar arrays within a roughly 1,800 acre rectangular shaped parcel and linears (access road, gas line, transmission lines) involving approximately 90 acres. The method of construction is important in assessing the potential impact to geomorphological conditions associated with the solar arrays and linears. Solar array construction will involve mass grading that will require drainage to be intercepted up-gradient and routed around the arrays to the down-gradient side of the facility to continue flow. Construction of the linears will involve placement of an underground gas line, electric transmission line towers and an access road. The

underground gas lines finish grade will be close to exiting ground surface contours and thus have a minimal affect on aeolian systems. The overhead transmission lines will have a minimal effect on aeolian systems and only in areas of the proposed tower foundations. The current design for the proposed access road involves a low relief road close to existing contours that will not adversely affect aeolian sand migration but may require some special design considerations where it crosses existing drainages.

Impacts to the Qal

The Qal is a relatively stable surface, with little evidence of active sand transport. The presence of the gravel with desert pavement and varnish is evidence that this surface is also stable from a fluvial perspective (i.e. that the small channels, while potentially prone to lateral migration and avulsion across the stable surface, do not tend to cut vertically into the surface. From a geomorphic perspective, construction of the project on the Qal area should have relatively little off site impact. Because there is little sediment transport occurring on this surface construction of the proposed project does not appear likely to disrupt the movement of sediment to habitat areas elsewhere. No mitigation is required or proposed.

Impacts to the Qsr

The Qsr is a relatively stable surface, with little evidence of active sand transport. The presence of the soil horizons is evidence that this surface is also stable from a fluvial perspective (i.e. that the small channels, while laterally active, do not tend to downcut or fill vertically). From a geomorphic perspective construction of the project on the Qal area should have relatively little off site impact. Because there is little sediment transport occurring on this surface construction of the proposed project does not appear likely to disrupt the movement of sediment to habitat areas elsewhere. No mitigation is required or proposed.

Impacts to the Qsad/Chuckwalla Wind Transport Corridor

The western array avoids the Chuckwalla sand transport corridor as mapped by Dr. Kenney (WPAR, 2010). The eastern array intrudes into the corridor by approximately 1,600 feet at a point where the corridor is 24,000 feet wide. This intrusion represents about 7 percent of the Chuckwalla sand corridor width. This part of the corridor does not appear to be the most active with regard to sediment transport rates (based on the amount of sand in storage on the ground, evidence for sand transport from ripples and coppice dunes etc) so the reduction in sediment transport capacity is not considered a significant impact. Based on the degree of intrusion into the corridor and the length of the intrusion it was estimated that an area of 157 acres of vegetated sand dune (Qsad) downwind of the intrusion that might be expected to experience moderate impacts from loss of sand due to the project site (see Soil and Water Appendix A - Figure 17).

It is recommended that the project minimize encroachment of the main footprint into the Qsad/sand transport corridor.

Impacts to the Palen-McCoy Wind Transport Corridor

The eastern solar array intrudes into the Palen-McCoy corridor by approximately 2,800 feet at a point where the corridor is 15,000 feet wide (cutting off 19% of the corridor).

Although the project cuts off a large area of corridor, there is good evidence to suggest that most sand transport takes place east of this zone (outside the project footprint, though within the area crossed by the laterals). Plates 14 and 15 of the Worley Parsons report (WPAR, 2010) show field conditions in the impacted area (WPAR, 2010-Plate 14) and further east (WPAR, 2010-Plate 15), providing evidence of much greater rates of sand transport to the east of the project footprint. In the absence of quantitative data and conservatively assuming that the rate of sediment transport is half as much in the outer corridor as it is in the inner corridor the intrusion probably represents less than a 10% reduction in sand transport. Based on the photos it is feasible that the true rate of sediment transport in the impacted area may be an order of magnitude less than this. However, although the magnitude of impact to the entire wind transport corridor is relatively low, the area of off-site impacts immediately downwind of the project is large: the lee area downwind of the project that is likely to experience sand depletion is 309 acres (see Appendix A-Figure 17). Since there are 13 acres of overlap from both wind shadows, the combined area impacted by intrusions into both corridors is 453 acres. This area would be expected to experience deflation (loss of sand from the existing vegetated dunes over time) and armoring (coarsening of the sand and gravel as fine sand is eroded by the wind).

Impacts to the Qsa

The Qsa is the active area of sand dunes supplied by wind and water transport from the Palen – McCoy Valley sand corridor. This corridor supplies significant sand dune habitat downwind. This area is crossed by the laterals near Wiley Wells Rest Stop.

The main project footprint should avoid this area completely since large scale obstruction of this unit would be hard or impossible to mitigate for. The project should be able to avoid or minimize impacts created by the laterals within this zone by avoiding creation of barriers to wind and water transport as indicated in Condition of Certification/Mitigation Measures described in **SOIL&WATER-1**. Most wind-borne transport of sand occurs within 3 feet of the ground, so infrastructure should be constructed flush with the surrounding ground surface and without ground level obstructions. Power pylons should not pose a significant problem due to their small surface area at ground level. Water and gas pipelines should be buried below ground. Road surfaces should be flush with the ground surface. There should not be drainage ditches running perpendicular to the wind direction (approximately north-south in the northern section of the lateral route, shifting to west-east in the southern area).

Groundwater Basin Balance

There is concern that the amount of groundwater used for both construction and operations would place the groundwater basin into overdraft. Groundwater overdraft is “the condition of a groundwater basin in which the amount of water withdrawn by pumping exceeds the amount of water that recharges the basin over a period of years during which water supply conditions approximate average conditions.” (CDWR, 1998).

As previously indicated, the CVGB is an unmanaged groundwater basin where overlying property owners withdraw groundwater for beneficial use. Typically this use has been for municipal and domestic, agricultural and industrial purposes. For purposes of impact analysis, it is assumed that any withdrawals that exceed the average natural

recharge and exceeds a significant percentage of the total amount of groundwater in storage would be a significant impact. The following discussion presents an analysis of the potential for overdraft to occur.

Construction and Operations

The project has proposed to utilize underlying groundwater to supply project water needs during construction. There is a concern that the water demand of the project will exceed the groundwater basin budget and lead to overdraft conditions.

A comparison was made between the average annual basin budget with the anticipated project water production requirements. **Soil and Water Table 15** presents the anticipated projects water requirements along with the average annual basin budget for the 37-month construction period. Currently, the CVGB balance is positive by approximately 2,608 afy whereby inflow (approximately 13,719 afy) to the basin is slightly greater than estimated outflows (approximately 11,111 afy) to the basin. Approximately 400 afy of the outflow is attributed to subsurface outflow to the adjacent Palo Verde Mesa Groundwater Basin.

It is anticipated that groundwater extraction during construction (~616 to 1,368 afy) and operation (~1,644 afy) will not significantly impact the CVGB balance as the 1,368 afy during construction and the 1,644 afy during operations would not exceed the positive yearly balance of 2,608 afy.

Soil and Water Table 15
Estimated Change to Chuckwalla Valley Groundwater Basin Budget (Average Year Conditions)

Project Component	Years	Annual Basin Budget Balance	Project Requirements (afy)	Net Budget Balance (afy)
Construction	1	2,608	1,368	1,240
	2	2,608	616	1,992
	3	2,608	616	1,992
Operations	4-33	2,608	1,644	964
Note: See **Soil and Water Table 8** for Groundwater Basin Budget				

Construction and operation of the Project would have an impact on basin balance in the CVGB. The impacts are considered insignificant, due to the fact that project pumping does not exceed net average recharge to the basin.

The project's pumping could also have an effect on the adjacent Palo Verde Mesa Groundwater Basin by inducing flows from the Colorado River. Given the location of the Project and the anticipated annual Project water requirements, staff anticipates that the project may have a significant impact on the adjacent (Palo Verde Mesa) groundwater basin. We note that future water use in the CVGB may be governed by impending regulations being formulated by the USBR. These are discussed in the section addressing LORS, below.

The Applicant did not provide an analysis of the proportion of water originating from storage, from natural recharge and/or the Colorado River underflow. However, water in

the Colorado River is fully appropriated and according to a 2006 U.S. Supreme Court Decision issued in Arizona v. California (2006) 547 U.S. 150, 126 S.Ct. 1543 "[c]onsumptive use from the mainstream [of the Colorado River] within a State shall include all consumptive uses of water of the mainstream, including water drawn from the mainstream by underground pumping." The mainstream was indicated as "the mainstream of the Colorado River downstream from Lee's Ferry within the United States, including the reservoirs thereon." The Supreme Court went on to state that the State of California is enjoined "from diverting or purporting to authorize the diversion of water from the mainstream the diversion of which has not been authorized by the United States for use in the respective States; provided, however, that no party named in this Article and no other user of water in said States shall divert or purport to authorize the diversion of water from the mainstream the diversion of which has not been authorized by the United States for its particular use."

The U.S. Geological Survey has indicated that the PVMGB and the CVGB lie within a basin tributary to the Colorado River and that wells drawing groundwater within those groundwater basins could be considered to be withdrawing water from the Colorado River Aquifer (Wilson et al., 1994). Consequently, the Project has the potential to divert Colorado River water without any entitlement to the water, and all groundwater production at the site could be considered Colorado River water. The Project owner will be required to implement **SOIL&WATER-15** to replace the quantity of water contributed by the Colorado River from the Project's proposed groundwater extraction. Staff understands that the foregoing conclusion is based on a simplified methodology for calculating contribution of water from the Colorado River from the Project's proposed groundwater extraction. The Project applicant could choose to implement **SOIL&WATER-19** Condition of Certification specified in Section C.9.11, *Proposed Conditions of Certification/Mitigation Measures,* below and conduct a refined analysis of the quantity of water contributed by the Colorado River from Project groundwater extraction. This analysis may be used to estimate the volume of water that must be replaced in accordance with Condition of Certification **SOIL&WATER-15.** We also note that future water use in the CVGB and PVMGB may be governed by impending regulations being formulated by the USBR. These are discussed in the section addressing LORS, below (Section C.9.9.1).

Implementation of the Condition of Certification **SOIL&WATER-15** specified in Section C.9.11, *Proposed Conditions of Certification/Mitigation Measures,* below, is anticipated to reduce the potential for impacts from water drawn from the Colorado River through groundwater pumping to below the level of significance.

Groundwater Levels

The project has the potential to lower groundwater levels as a result of water production during both construction and operations. The lowering of groundwater levels could have a significant impact if the lowering of the groundwater levels: 1) impacts existing water wells in the basin; 2) lowers the water table in areas where deep-rooted phreatophytes are prevalent (see Section C.2 for impacts related to biological resources, 3) affects surface water features including springs and/or 4) induces permanent ground subsidence.

Drawdown imposed by a well on another nearby pumping well can have adverse affects on the performance of that well and is referred to as interference drawdown or well interference. Specific potential adverse affects evaluated in this study include the following:

- Interference drawdown can result in the water level of an aquifer being drawn down below the screen of the well (i.e., the well goes dry);
- Interference drawdown can result in the water level of an aquifer being drawn down to a point where the affected well's capacity to pump water is decreased and the well can no longer produce the amount of water that is needed for a particular use, or the well is at risk of becoming damaged and unusable over time due to exposure of the well's screen above the water table and resulting corrosion;
- Interference drawdown can result in the water level in the affected well being drawn down to near the intake of the well's pump, requiring lowering of the pump intake in order for the well to remain operational; and/or
- Interference drawdown can cause a decrease in groundwater level in the affected well such that the well and pump can continue to operate and produce adequate amounts of water, but pumping must occur at either greater frequency or duration, and/or water must be lifted to a greater height, resulting in greater operational and maintenance costs.

The extent and type of well interference experienced by an affected well is dependant on hydrogeologic conditions in the aquifer as well as the characteristics of the affected well. These include the following:

- The amount of interference drawdown that is applied (which varies with the distance of the impacted well from the Project well(s);
- The depth and screened interval of the affected well;
- The thickness of saturated sediments penetrated by the affected well;
- Local variations in the transmissivity of the saturated sediments in which the affected well is completed, if any;
- The condition and efficiency of the affected well;
- The affected well's pump specifications, including its rating curve, the depth at which the pump intake is set, and the resulting pumping water level in the well during operation; and
- The minimum required water production rate of the well.

Phreatophyte trees such as Mesquite, Ironwood or Palo Verde have deep root systems that can extend tens of feet below the ground surface to the underlying water table. In addition, wet playas can harbor halophyte plant communities that depend on a shallow water table for their moisture. Lowering of the water table below the root depth of these plants could result in stress or death. If this impact affects sensitive species, it is significant and requires mitigation. There is additional discussion of this issue in the Biological Resources section of this SA/DEIS.

Ground subsidence can occur as a result of water level decline in aquifer systems. When the fluid pressure in an aquifer is reduced as a result of changes in the groundwater level, a shift in the balance of support for the overlying materials causes the "skeleton" of the aquifer system to deform slightly. Reversible deformation occurs in all aquifer systems as a result of the cyclical rise and fall of groundwater levels associated with short and longer term climatic cycles. Permanent ground subsidence can occur when pore water pressures in the aquifer fall below their lowest historical point, and the particles in the aquifer skeleton are permanently rearranged and compressed. Soils particularly susceptible to such consolidation and subsidence include compressible clays in a confined aquifer system. This type of deformation is most prevalent when confined alluvial aquifer systems are overdrafted.

Construction and Operation

Preliminary investigations conducted at the GSEP site suggest that the aquifer proposed for development is under confined to semi-confined conditions and is separated in part from the shallow alluvial groundwater system by low permeability sediments. For purposes of analysis of impacts to water levels, a numerical model was developed by Worley-Parsons (WPAR, 2010) that separated the impacts between two water-bearing zones, the shallow alluvial zone (referred to as Layer 1), and the deeper Bouse Formation (referred to as Layer 11 and Layer 12). Correspondingly, impacts to these layers varied due to the assumption that the confining layers are laterally continuous and maintain hydraulic separation away from the proposed pumping wells.

The maximum predicted water table (Layer 1) drawdown associated with the Project is approximately 0.3 feet in the area of the pumping well, and the area where drawdown exceeds 0.25 foot is limited to within approximately 2.5 to 3.5 miles of the Project wells (see **Soil and Water Figure 16**).
The maximum predicted drawdown in the Bouse Formation (Layer 12) associated with the Project is approximately 10 feet in the area of the pumping well, and the area where drawdown exceeds 1 foot is limited to within approximately 7 to 10 miles of the Project wells (see **Soil and Water Figure 17**).

Based on the general geology of the Chuckwalla Valley, the Riverside County General Plan Safety Element designates basin fill sediments in the valley as being susceptible to subsidence (Riverside County, 2008). However, the Applicant (2009a) indicated in the AFC that during a recent period when groundwater demand was at a maximum and estimated to exceed 48,000 afy, the valley did not experience any subsidence. The applicant's supposition that no subsidence will be caused by the project is based upon historical response of the CVGB to groundwater level declines that took place in the western portion of the basin and may not be applicable beneath the GSEP located in the eastern portion of CVGB. The potential for significant subsidence associated with the pumping of groundwater for the Project is considered low. However, due to the uncertainty related to conditions at the GSEP site, staff recommends that a monitoring program be implemented to assess long term changes that may occur as a result of groundwater pumping in the area.

The nearest potential wetland or halophyte communities would be near Palen Lake. BLM has identified an ironwood woodland community approximately 5 miles north of the

Project site. Predicted water table drawdowns beneath this woodland are in the range of 0.05 to 0.2 feet. Section C.2, Biological Resources describes potential impacts to vegetation that may be dependent on shallow groundwater table conditions.

Given the current understanding of the hydrogeology of the Quaternary Alluvium, the Bouse Formation and the Fanglomerate, as well as the current understanding concerning existing wells that may be affected by Project-induced drawdown, it is unlikely that groundwater pumping for the Project would cause any nearby wells to go dry or be severely impaired or rendered unusable by declining groundwater levels. Staff has proposed Conditions of certification to ensure that any significant impacts that do occur are mitigated.

Mitigation

Groundwater levels near the Project's water supply wells will decline during the Project pumping. Local decline of groundwater levels within the cone of depression could affect nearby wells. While preliminary studies and calculations have been made to assess the potential for impact, the quantification of the impact is considered an estimation and will not be able to be accurately quantified until actual long-term groundwater production occurs. Implementation of Conditions of Certification **SOIL&WATER-3** through **SOIL&WATER-5**, provided in Section C.9.11, *Proposed Conditions of Certification/Mitigation Measures,* below, are expected to minimize impacts to groundwater levels below the level of significance.

The applicant will be required to implement Condition of Certification **SOIL&WATER-17** that requires a Subsidence Monitoring and Action Plan to assess and mitigate potential effects of non-elastic subsidence associated with groundwater extraction in the vicinity of the proposed production wells.

Mitigation for potential impacts to groundwater-dependent vegetations is discussed in the Biological Resources section of this SA/DEIS.

Groundwater Quality

Construction and Operation

There is a potential that significant groundwater quality impacts could occur during construction if contaminated or hazardous materials used during construction were to be released and migrate to the groundwater table. Given the distance to the groundwater table (70-90 feet bgs) and the proposed implementation of a hazardous material management plan during construction (see Section C.4, Hazardous Materials Management), staff expects impacts to groundwater quality to be below the level of significance.

There is a potential that Project extraction of groundwater may induce vertical flow of high saline groundwater from beneath Ford Dry Lake to lower aquifers being used for water production located beneath the site. Slight lateral transport of high TDS groundwater may occur as a result of the project and the vertical transport of high saline groundwater downward may slightly increase TDS concentrations in some limited areas. Under State Water Resources Control Board (SWRCB) Resolution 88-63, the

brackish water underlying the Project site that exceeds TDS concentrations of 3,000 mg/L or 250 mg/L chloride would not be considered a potential source of drinking water; and would be suitable only for potential industrial use.

The impact upon water quality due to project pumping was completed by simulating transport of chloride in groundwater using the MT3D transport model. Groundwater velocity data output from the groundwater flow model impact assessment was utilized by the MT3D transport model for this assessment. Chloride was selected as the preferred solute, as it is conservative (e.g. does not undergo chemical reactions or attenuation) and is a dominant anion in groundwater in the Project area for which significant baseline analytical data is available for the lower aquifers being used for water production. In addition, chloride can be directly related to TDS concentration with a reasonable degree of accuracy. Chloride concentrations in groundwater in the eastern portion of the basin are approximately 38 percent of the TDS concentration (WPAR, 2010a).

The water quality impact model was run for a period of 33 years to simulate the expected duration of project operations and the modeled concentrations of chloride in groundwater extracted from the well were recorded. Chloride in the model will migrate with the groundwater that is being extracted, and increases in chloride concentrations imply vertical or lateral migration of high chloride, and hence high TDS groundwater into lower concentration areas, thus potentially degrading water quality (WPAR, 2010a).

During the 33-year pumping simulation, chloride concentrations are projected to decrease slightly, from a baseline concentration of approximately 1,600 mg/L to approximately 1,470 mg/L at the end of the simulation. This is a decrease of approximately 8 percent and is likely due to the dilution of groundwater in the project area by lower TDS groundwater drawn in from the north and east of the Project site.

However, due to the uncertainty associated with the amount of information available concerning shallow groundwater quality, continuity of confining layers and on vertical migration, implementation of Conditions of Certification **SOIL&WATER-3** through **SOIL&WATER-5** and **SOIL&WATER -20**, provided in Section C.9.11, *Proposed Conditions of Certification/Mitigation Measures,* below, are expected to minimize impacts to groundwater quality below the level of significance.

With regard to the operation of the Land Treatment Unit (LTU) on the project site, the material that will be placed in the LTU consists of soil that is impacted with Therminol® VP1 HTF as a result of minor leaks or spills (see Section C.4 Hazardous Materials Management) that occur during the course of daily operational or maintenance activities. The LTU will cover an area of approximately 600 feet by 725 feet, including the staging area, and will cater to both 125 MW units. The LTU will be constructed with a prepared base consisting of two feet of compacted, low permeability, lime treated material and be surrounded on all sides by a minimum two foot high compacted earthen berm with slopes of approximately 3:1 (horizontal:vertical) that will serve as a protective barrier to the downward movement of contaminants from the LTU. Moreover, should any contaminants escape the LTU, the water table is approximately 70-90 feet beneath the LTU.

At ambient temperatures, HTF is a highly viscous material (crystallizes at ~54°F) that is virtually insoluble in water (solubility of ~25 mg/L [WPAR, 2009]). Operation of an LTU is not expected to impact surface water or groundwater quality beneath the site. The LTU will be surrounded on all four sides by berms that will protect the LTU from surface water flow. Because of the viscous and insoluble nature of HTF, it is not likely to mobilize from the soil downwards to the water table (approximately 70-90 feet bgs). Compliance with the requirements of CCR Title 23, Division 3, Chapter 15 and Title 27, Section 2000 et seq. and Title 23, Section 2510 et seq and Condition of Certification **SOIL&WATER-6** would minimize potential impacts to groundwater quality to below the level of significance.

In summary, because of the viscosity of HTF at ambient temperatures, the insolubility of HTF, the depth of the water table, and the placement of protective berms around the LTU, it is expected that surface water and groundwater quality beneath the site will not be impacted by LTU operation.

Each 125 MW unit will have three double-lined evaporation ponds. Each pond will have a nominal surface area of eight acres resulting in a total of 24 acres of evaporation ponds for each unit or a total of 48 acres of ponds for both 125 MW units. The ponds will be designed and permitted as Class II Surface Impoundments in accordance with CRBWQCB requirements, as well as the requirements of the California Integrated Waste Management Board (CIWMB). Multiple ponds are planned to allow plant operations to continue in the event that a pond needs to be taken out of service for some reason, *e.g.,* needed maintenance. Each pond will have enough surface area so the evaporation rate exceeds the cooling tower blowdown rate at maximum design conditions and annual average conditions.

The average pond depth is eight feet and residual precipitated solids will be removed approximately every seven years to maintain a solids-depth no greater than approximately three feet for operational and safety purposes. The precipitated solids will be sampled and analyzed to meet the characterization requirements of the receiving disposal facility. The characteristics of the precipitated solids will determine the transportation and disposal methodology. It is anticipated the pond solids and other non-hazardous wastes would be classified as Class II Designated Waste, a non-hazardous industrial waste. Genesis Solar, LLC will test the pond solids using appropriate test methods in advance of removal from the evaporation ponds to confirm this determination; however, preliminary data estimates show the material will be non-hazardous. Approximately 6,150 tons of evaporative residue will be accumulated yearly, which equates to approximately 50,000 tons of evaporative residue being removed during each cleanout and a total estimated amount of 214,500 tons over 30 years.

The pond liner system will consist of a 60 mil high density polyethylene (HDPE) primary liner and a secondary 40 mil HDPE liner. Between the liners is a synthetic drainage geonet and collection piping that is used as part of the leachate collection and removal system (LCRS), which will be directed back to the pond. There will be a hard surface protective layer on top of the 60 mil HPDE which will consist of a non-woven geotextile, a one foot thick granular fill/free draining material, and a one foot thick hard surface such as roller-compacted concrete. The hard surface provides protection against accidental damage to the HDPE from falling objects, varying climatic conditions, and

worker activities during cleanout and maintenance. Monitoring of the evaporation ponds will be required to detect the presence of liquid and/or constituents of concern. Based on the experience of the existing SEGS plants, it is expected the constituents of concern for this monitoring will include chloride, sodium, sulfate, TDS, biphenyl, diphenyl oxide, potassium, selenium, and phosphate. Due to the aforementioned construction and operational procedures of the surface impoundments along with Condition of Certification **SOIL&WATER-20**, groundwater quality is not anticipated to be affected as a result of disposal of this waste stream and impacts to groundwater quality would be below the level of significance.

Additional requirements for mitigation of potential groundwater quality impacts will also be included as a part of the waste discharge requirements for the surface impoundment that would be included in Condition of Certification **SOIL&WATER-6.** These requirements will be included in the Supplemental Staff Assessment after all relevant information is reviewed by the CRBRWQCB and staff.

The use and application of septic fields is an established practice as a method of wastewater treatment. The closest septic field to a privately owned parcel of land is in excess of ½ mile. The septic system will have no effect on the surface water in or around the Project site. The septic system will be installed approximately 5-6 feet deep. In addition, the Riverside County Department of Environmental Health has a Technical Guidance manual for Onsite Wastewater Treatment Systems and this requires a setback of 100 feet between this type of system and the nearest groundwater well. It is assumed that individual septic systems and leach fields are planned for each of the two power blocks in support of the Project's administrative, warehouse, and control room and facilities. The proposed septic systems and leach fields for the various facilities are hydraulically up-gradient approximately 3 miles from the nearest offsite well. Therefore, operation of the septic systems and leach fields from these areas are not expected to impact groundwater quality at the nearest offsite wells.

The septic system and leach fields for the Project will be constructed in accordance with the requirements of Riverside County:

1. Ordinance 650.5 (amending Ordinance 650, which regulates the discharge of sewage in unincorporated areas of the County of Riverside and incorporates by reference Ordinance 725),

2. Title 15 Section 15.24.010 (the Uniform Plumbing Code) Appendix K for Private Sewage Disposal – General and Disposal Fields, and

3. Title 8 Section 8.124.030 (Approval and Construction Permit for Sewage Discharge) and Section 8.124.050 (Operation Permit for Sewage Disposal).

Soil and Water Table 16 lists septic system and leach field minimum setbacks as required by the County of Riverside and the Project setbacks for the GSEP site.

Soil and Water Table 16
Sanitary Facility Set-Backs Requirements

County of Riverside Requirement	Minimum Set Back	Project Set Back	Reference
Minimum Distance Between Groundwater and Leach Lines	5 feet	175 feet	Riverside County Ordinance 650.5 (& OWTS Guidance Manual)
Minimum Horizontal Distance From Water Supply Wells	50 feet	250 feet	2007 California Plumbing Code (adopted by Reference as Riverside County Title 15, Chapter 15)

Source: Derived from AECOM (2009) and WPAR, 2010a..

Mitigation

Groundwater quality in the vicinity of the project site could be impacted as a result of the operation of the LTU, surface impoundments and septic fields. Preliminary studies and calculations have been made to assess the potential for impact. These studies suggest that there is a low potential to impact groundwater quality in the vicinity of the project site. Due to the uncertainty associated with the potential to impact groundwater quality and the regulatory requirements for operation of the LTU, surface impoundments as well as stormwater and potentially septic system operations, staff recommends implementation of specific monitoring and mitigation requirements.

Implementation of Conditions of Certification **SOIL&WATER-5** through **SOIL&WATER-7** and **SOIL&WATER-20** are anticipated to minimize impacts below a level of significance. Additional requirements for mitigation of potential groundwater quality impacts will also be included as a part of the waste discharge requirements for the LTU and surface impoundment that would be included in Condition of Certification **SOIL&WATER-6.** These requirements will be included in the Supplemental Staff Assessment after all relevant information is reviewed by the CRBRWQCB and staff. These measures are provided in detail in Section C.9.11, *Proposed Conditions of Certification/Mitigation Measures,* below.

Surface Water Hydrology

The impacts of the Project on the local surface water hydrology are directly related to proposed onsite grading and the construction and operation of a network of engineered collector/conveyance channels designed for the purpose of protecting the Project from flooding. The Project will change both the extent and physical characteristics of the existing floodplain within the Project site and downstream of the Project site. A change in sediment transport and depositional characteristics at and downstream of the Project site will also occur.

The Concept Drainage Study (GSEP 2009a) provides a summary of discharges at the downstream property boundary which compares existing total outflow at the project boundary with post-development outflows at the project boundary. The post-development discharges from the Project watersheds are significantly higher than existing conditions as shown on **Soil and Water Table 17.** This is to be expected given the change to surface conditions, including soil compaction and a more efficient drainage system. The study indicates that the increase in discharge is to be mitigated by the use of detention basins located at each of the solar fields. These basins would be

sized and designed to operate in a manner as to reduce the post-development discharges to pre-development conditions.

The use of detention basins can be of concern as they tend to allow for the deposition of sediment leaving the discharged flow in a sediment deficient condition. This situation can favor downstream erosion as the more concentrated flows balance their sediment load. The Conceptual Grading Plans (GSEP 2010a) for the project do provide for erosion control downstream of the outlet in the form of an engineered energy dissipater and downstream riprap splashpad comprised of 6" rock. The proposed splashpad is not compatible with the wildlife traversability requirements for the project and the design will need to be modified during the formal construction plan process. The velocity and depth of flow off of the energy dissipater structure will need to be reviewed within the context of allowable non-erosive velocities based on site specific soil conditions.

Soil and Water Table 17
Summary of Existing and Proposed Peak Flow Rates at Downstream Project Boundary

Sub-basin ID	Existing Q_{100}	Developed Q_{100}
1	4070	1156
2	2203	4086
3	10,022	2006
A (onsite)	519	1295
B (onsite)	419	1127

Engineered drainage channels will be constructed along the project boundary wherever the potential for the interception of offsite surface flows exists. These channels will intercept offsite flows and convey them around and through the project for discharge along the southern project boundary. Onsite flows would be discharged directly into detention basins via a series of smaller internal swales and channels. The conceptual layout of the drainage system is provided on **Soil and Water Figure 18** as well as on Sheets 1 through 7 of the Conceptual Grading Plans (GSEP 2010a). Discharge of flow along the downstream project boundary would be through the use flow dispersion structures in the form of pipes and weirs. The intent of these structures is to reduce flow velocities and allow flow to be released/spread out in a manner that mimics existing sheet flow conditions downstream of the project.

Releasing flow back to native ground in a manner similar to existing conditions is of concern for two primary reasons. The first is that flow collected from a large area and discharged in a more concentrated area may result in the potential for increased erosion. The second potential concern is that the significant change in flow patterns may essentially "dry-up" discreet areas downstream of the project potentially resulting in a significant impact to the existing biological resources beyond the project boundary. This issue is discussed further in Section C.2 – Biological Resources.

Alteration of Drainage Patterns

Construction and Operation

Onsite Drainage

All existing washes and floodplains within the Project boundary will be completely eliminated by the grading of approximately 1,800 acres to provide the flat, uniform and vegetation-free topography required for the construction and operation of the solar mirror array. The existing natural drainage system will be replaced with a system of constructed swales and channels designed to collect and convey onsite flows to designated points of discharge from the project. Onsite stormwater from the Project will be discharged offsite through constructed detention basins which will provide for attenuation of increased discharges due to site development. The impact to onsite drainage patterns will be significant.

Offsite Drainage

The Project will not impact the existing natural drainage system upstream of the Project boundary as there are no plans for any diversions, basins, dams or other surface water controls beyond the upstream limits of the Project. However, there is the potential for erosion of offsite areas upstream due to the formation of headcuts which could migrate laterally from the engineered channels if they are not stabilized and protected.

Physical modifications to the natural drainage system downstream of the Project boundary are not proposed. However, there will be changes to both the existing drainage patterns and sediment transport characteristics as the result of the concentration and diversion of flows upstream of the project, and the subsequent release of those flows at discreet locations on the downstream side of the project. Certain downstream areas will receive more flow than under existing conditions, while other areas may no longer receive any surface flow beyond what may be the result of direct precipitation. The release of concentrated flows at the proposed dispersion structures may have the potential for increased erosion.

The assessment of the impacts to the existing surface flow patterns requires a detailed analysis utilizing FLO-2D or a similar model to clearly delineate the pre- and post-project conditions. Information obtained from such an analysis is critical to assess the extent and adequacy of the proposed flood control measures on the northern eastern project boundaries as well as along the downstream project boundary where flow is released from the engineered channels onto existing ground. The applicant completed FLO-2D modeling for existing conditions and provided the results of that analysis in a Technical Memorandum. The modeling confirmed extensive sheet flow conditions along the entire upstream project boundary. The applicant also provided preliminary FLO-2D modeling for proposed conditions to demonstrate how flow will be released from the downstream project boundary back onto native ground. A conceptual diagram showing flow patterns downstream of the project site is provided on **Soil and Water Figure 19.** The design for the outlet structures from the downstream engineered channel will allow for flexibility for where flow is released and how much is released at discreet locations.

Mitigation

Implementation of Condition of Certification **SOIL&WATER-10** and **SOIL&WATER-11**, (described in detail in Section C.9.11, *Proposed Conditions of Certification/ Mitigation Measures,* below) is anticipated to minimize impacts related to surface drainage associated with construction and operation of the Project to below the level of significance. Implementation of Conditions of Certification **SOIL&WATER-8** and **SOIL&WATER-9** will ensure that adequate studies and data are provided to assess the that **SOIL&WATER-10** and **SOIL&WATER-11** have been implemented within the context of site specific conditions.

Flood Hazards

Construction

The Project will be protected from flooding from offsite sources through the construction of engineered channels along upstream project boundaries. These channels will capture and convey up to the 100-year flow through and around the Project and discharge it along the southern project boundary. The Concept Drainage Study (GSEP 2009a) and Conceptual Grading Plans (GSEP 2010a) for the project provide information on the layout and geometry of the proposed channels as well as the design discharges for each reach. Cross-sections for each channel were also provided which show how the channels will tie into existing grade and into the proposed facility. Given the extremely flat nature of the site, there do not appear to be any major grading related issues that would favor erosion, such as large cut slopes to accommodate a terraced project design. Channel profiles and flow analyses to determine flow depth and velocity were not provided in support of this impact analysis. In general, the preliminary plans were incomplete with regard to fully providing a sound drainage concept.

A summary of the proposed channel geometry and hydraulic characteristics as provided in the Concept Drainage Study (GSEP 2009a) and Conceptual Grading Plans (GSEP 2010a) is provided in **Soil and Water Table 18**. Hydraulic data were not provided for the 10-year flow, which is usually used to demonstrate reasonable channel velocities. However, the 100-year hydraulic data does indicate that most channel reaches do meet, or likely meet, established and reasonable guidelines for allowable channel velocities. Special consideration will need to be given in those sections that do not meet these guidelines for the 10-year flow event.

Soil and Water Table 18
Summary of Proposed Collector and Conveyance Channel Hydraulic Characteristics

Channel ID	Design Discharge (cfs)	Approximate Length (ft)	Bottom Width (ft)	Channel Depth (ft)	Side Slopes (H:V)	100-Year Velocity Range (ft/s)
A	1,156	7,500	20'-43'	3' to 4'	3:1	4.5 to 5.1
B	4,086	8,000	31'-150'	3' to 4'	3:1	5.6 to 9.6
C	2,006	3,800	20' to 45'	3' to 4'	3:1	3.0 to 3.7
B/C	,6092	5,000	150' to 156'	4' to 5'	3:1	5.7 to 7.2
D	2,600	7,500	24' to 91'	3' to 6'	3:1	5.5 to 9.6
E	254	1,300	20'	3'	3:1	3.2 to 8.6
D/E	2,854	3,500	95'	5'	3:1	5.7

The Conceptual Grading Plan provided in the DESCP (GSEP 2009a) provides typical channel sections for the proposed collector and conveyance channels. These details show fully armored slopes utilizing gabions or riprap. These materials are not consistent with project requirements for traversability by wildlife and should not be utilized. Soil cement is the preferred method of channel stabilization. The typical sections in the Conceptual Grading Plan (GSEP 2009a) show 3:1 slopes are predominate for the larger channels. Experience has shown that anything steeper than approximately a 4:1 slope is impractical for a "slope paving" type of construction. At steeper slopes, the soil cement is difficult to place and compact within industry accepted specifications, especially in channels which are more than a few feet deep. The other option is to construct the soil cement in lifts which significantly increases material quantities and most likely construction time.

Operation

During operation, the proposed collector and conveyance channel along the west project boundary will be exposed to incoming side flows along most of its extent. These inflows could include concentrated runoff at the more defined drainages, shallow sheet flow, and smaller more localized flows. All of these elements have the ability to cause significant erosion of unprotected channel banks as well as to create headcutting which will extend roughly perpendicular from the outer channel bank into the adjacent floodplain. These headcut features have the potential to achieve the same depth as the main collector channel and can extend upstream for several hundred feet over time due to numerous smaller flow events, or can occur very quickly from a single large event depending on the magnitude of flow at a given location. Significant impacts to areas beyond the project boundaries can occur due to these erosional features. Appropriate bank stabilization measures must be implemented to ensure that headcutting is prevented at all locations where flow enters the engineered channels.

Operation of the proposed channels and erosion mitigation measures will require significant inspection and maintenance over the life of the facility to ensure that the channels are operating as intended and that potential and observed erosion issues are addressed promptly to minimize damage to the facility and areas beyond the Project boundary. Relatively small problems and erosional features which develop during smaller more frequent event can become the focal point for problems during larger

events. The applicant has prepared a Draft Channel Maintenance Plan which addresses some of the potential issues associated with long term operation of the channels. However, the plan does not adequately address the issue of the collection of offsite flows or the use of soil cement along areas subject to inflows from offsite watersheds. The monitoring and mitigation of erosion to offsite areas caused by the presence and operation of the proposed collector and conveyance channels must explicitly addressed in the document.

Channel Maintenance Program

The applicant shall develop and implement a Channel Maintenance Program that provides a framework for routine channel maintenance projects and ensures compliance with conditions of certification in a feasible and environmentally-sensitive manner. The Channel Maintenance Program would be a process document prepared by the project owner, which would be reviewed and approved by the both BLM's Authorized Officer and the CPM. Staff is requiring as part of Condition of Certification **SOIL&WATER-13** that the Channel Maintenance Program provide long-term guidance to the applicant to implement routine channel maintenance projects and comply with GSEP's related biological (see Section C.2, Biological Resources) and flood protection (**SOIL&WATER-1, SOIL&WATER-2,** and **SOIL&WATER-12**) conditions of certification. Condition of Certification **SOIL&WATER-13** requires that the applicant will implement the measures identified in the program. The main goals of the Channel Maintenance Program would be to maintain the diversion channels to meet its original design to provide flood protection, protect offsite areas form erosion, support GSEP mitigation, protect wildlife habitat and movement/migration, and maintain groundwater recharge. Compliance with Condition of Certification **SOIL&WATER-13** would reduce the impacts below the level of significance.

Mitigation

Implementation of Conditions of Certification **SOIL&WATER-9** through **SOIL&WATER-13**, described in detail in Section C.9.11, *Proposed Conditions of Certification/Mitigation Measures,* below, is anticipated to minimize impacts related to flood hazards and erosion associated with construction and operation of the Project to below the level of significance. They will also provide the basic information to assist both the AO and the CPM to adequately review and assess the appropriateness of the proposed design within the context of the site specific conditions.

Surface Water Quality

Project storm water may encounter soil or chemicals deleterious to aquatic and terrestrial plant and wildlife. The Project Applicant proposes to implement BMPs for managing potentially harmful storm water and protect water quality. Potentially significant water quality impacts could occur during operations if contaminated or hazardous materials used during operations were to contact storm water and drain offsite. The Project would alter natural storm water drainages and use BMPs to reduce potentially significant impacts related to concentrated drainage and ensuing soil erosion and sediment transport offsite. Recognizing these potential impacts, the applicant has prepared a draft industrial SWPPP required by the general waste discharge requirements for industrial activity.

Construction

Potential threats to surface water quality related to construction on the project site as well as linear features and would include: potential increases in sediment loads to adjacent streams and washes; accidental spills of hydrocarbon fuels and greases associated with construction equipment. Implementation of Conditions of Certification **SOIL&WATER-1** and **SOIL&WATER-2** (found in Section C.9.11, *Proposed Conditions of Certification/Mitigation Measures,* below) would reduce potential water quality impacts to insignificant.

Operation

Potential threats to surface water quality related to operations include: potential increases in sediment loads to adjacent washes; accidental spills of hydrocarbon fuels and greases (including HTF fluid) associated with operations equipment, and accidental releases from HTF treatment area and the surface impoundments that includes wastewater from the pre-treatment and RO reject water.

Mitigation

Implementation of Condition of Certification **SOIL&WATER-1**, **SOIL&WATER-2**, **SOIL&WATER-12**, and **SOIL&WATER-13** (described in detail in Section C.9.11, *Proposed Conditions of Certification/Mitigation Measures,* below), is anticipated to reduce impacts to surface water quality to below the level of significance associated with construction and operation of the Project. Additional requirements for mitigation of potential surface water quality impacts will also be included as a part of the waste discharge requirements for the LTU and surface impoundment that would be included in Condition of Certification **SOIL&WATER-6.** These requirements will be included in the Supplemental Staff Assessment after all relevant information is reviewed by the CRBRWQCB and staff.

C.9.4.3 CEQA LEVEL OF SIGNIFICANCE

Section 15064.7 of the CEQA Guidelines encourages each public agency to “develop and publish thresholds of significance that the agency uses in the determination of the significance of environmental effects.” The section continues to define a significance threshold as being an “identifiable quantitative, qualitative, or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect will normally be determined to be less than significant.”

The Energy Commission, in its role as CEQA lead agency for the Project, has not developed or published significance thresholds related to soil and water resources. In the absence of Energy Commission-specified significance thresholds, the analysis of the significance of potential environmental effects related to soil and water resources contained herein is made based on the criteria specified in Appendix G of the CEQA Guidelines, as identified in Section C.9.3, Methodology and Thresholds for Determining Environmental Consequences, above.

C.9.5 REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative (RAA) would essentially be Unit 1 of the proposed project, including a 125 MW solar facility located within the boundaries of the proposed project as defined by the Applicant. This alternative is analyzed for two major reasons: (1) it eliminates about 50 percent of the proposed project area so all impacts are reduced, and (2) by eliminating the eastern solar field, it would reduce the water required for wet cooling by 50 percent. The boundaries of the Reduced Acreage Alternative are shown in **Alternatives Figure 1**.

C.9.5.1 SETTING AND EXISTING CONDITIONS

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates effects to the eastern 125 MW solar field and relocates the gas yard approximately 1.75 miles northwest of its present location. As a result, the environmental setting consists of the western portion of the proposed project, as well as the area affected by the linear project components.

C.9.5.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Soil Erosion

Soil erosion at the RAA Project site could be impacted as a result of the construction and operation of the RAA Project. Impacts related to soil erosion from wind and surface water are anticipated to be similar to those associated with the proposed Project.

The RAA Project construction activities would disturb site soils at the site and along the linear facilities route(s). It is at the time of this disturbance that there would be the highest potential for erosion, as well as associated effects including soil loss and increased sediment yields downstream from disturbed areas. It is expected that BMPs would be utilized to minimize the impacts of soil erosion during construction to less than significant.

Geomorphology

The Reduced Acreage Alternative (shown in Appendix A-Figure 25) was assessed for its potential geomorphic impacts. The alternative removes the proposed eastern solar array from the project. Since the main geomorphic impacts identified in this report are associated with the eastern solar array this alternative would have lower impacts, with no impact on the Chuckwalla and Palen-McCoy sand corridors or on the eastern wash complex. No mitigation is required or proposed.

Groundwater Basin Balance

Groundwater basin balance in the vicinity of the RAA Project site could be impacted as a result of the construction and operational water use. The potential impact would be approximately 50 percent less than the proposed Project as the RAA uses approximately 50 percent less water than the proposed Project.

As previously stated, the Project has the potential to indirectly impact flow in the Colorado River by inducing underflow into the PVMGB. Implementation of the Condition of Certification **SOIL&WATER-15** specified in Section C.9.11, *Proposed Conditions of Certification/Mitigation Measures,* below, is anticipated to reduce the potential for impacts from water drawn from the Colorado River through groundwater pumping to below the level of significance.

Groundwater Levels

Groundwater levels in the vicinity of the RAA Project site could be impacted as a result of the construction and operational water use. The potential impact is expected to be approximately 50 percent less than the proposed Project as the RAA would use approximately 50 percent less water than the proposed Project.
Groundwater levels near the Project's water supply wells will decline during the Project pumping. Local decline of groundwater levels within the cone of depression could affect nearby wells. While preliminary studies and calculations have been made to assess the potential for impact, the quantification of the impact is considered an estimation and will not be able to be accurately quantified until actual long-term groundwater production occurs. Implementation of Conditions of Certification **SOIL&WATER-3** through **SOIL&WATER-5**, provided in Section C.9.11, *Proposed Conditions of Certification/Mitigation Measures,* below, are expected to minimize impacts to groundwater levels below the level of significance.

The applicant will be required to implement Condition of Certification **SOIL&WATER-17** that requires a Subsidence Monitoring and Action Plan to assess and mitigate potential effects of non-elastic subsidence associated with groundwater extraction in the vicinity of the proposed production wells.

Mitigation for potential impacts to groundwater-dependent vegetations is discussed in the Biological Resources section of this SA/DEIS.

Groundwater Quality

Groundwater quality in the vicinity of the RAA Project site could be impacted as a result of the operation of the LTU, surface impoundments, and septic fields. The potential impact would be similar as for the proposed Project. Implementation of Conditions of Certification **SOIL&WATER-5** through **SOIL&WATER-7** and **SOIL&WATER-20**, provided in Section C.9.11, *Proposed Conditions of Certification/Mitigation Measures,* below, are expected to minimize impacts to groundwater levels below the level of significance.

Surface Water Hydrology

The impacts and mitigation measures of the RAA Project would be similar to the proposed project, except proportionately smaller in scale with regards to overall natural area lost to mass grading. All existing washes within the smaller developed portion of the site would be eliminated by onsite grading and replaced with a system of engineered swales and channels. Mitigation of potential erosion and headcutting in the engineered channels would still be required as would a careful design along the downstream project boundary to ensure the diverted flows are released in a manner which does not increase offsite erosion. However, the overall volume of offsite flow that

would need to be collected and conveyed around the project would be significantly less due to reduced footprint, and impacts to the floodplain downstream would also be proportionately reduced.

Surface Water Quality

Surface water quality in the vicinity of the RAA Project site could be impacted as a result of surface grading. In addition, potentially significant water quality impacts could occur during operations if contaminated or hazardous materials used during operations were to contact storm water and drain offsite. Moreover, the RAA would alter natural storm water drainages and significantly impact surface water quality.

C.9.5.3 CEQA LEVEL OF SIGNFICANCE

Section 15064.7 of the CEQA Guidelines encourages each public agency to "develop and publish thresholds of significance that the agency uses in the determination of the significance of environmental effects." The section continues to define a significance threshold as being an "identifiable quantitative, qualitative, or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect will normally be determined to be less than significant."

The Energy Commission, in its role as CEQA lead agency for the Project, has not developed or published significance thresholds related to soil and water resources. In the absence of Energy Commission-specified significance thresholds, the analysis of the significance of potential environmental effects related to soil and water resources contained herein is made based on the criteria specified in Section C.9.3, Methodology and Thresholds for Determining Environmental Consequences, above.

C.9.6 DRY COOLING ALTERNATIVE

A project may result in a significant adverse cumulative impact where its effects are cis section identifies the potential impacts of using air-cooled condenser (ACC) systems rather than the cooling towers proposed by NextEra for the GSEP. It is assumed that the ACC system would be located where the cooling towers are currently proposed for each of the two 125 MW power block, as illustrated in **Alternatives Figure 2** (see Section B.3).

Approximately 18 fans would be required for each ACC for the two solar fields. The 18 fans would operate when the ambient temperature is above 50 degrees Fahrenheit. When the temperature is below 50 degrees Fahrenheit, only 10 of the fans would be used (GSEP 2009f). The ACC described in the GSEP cooling study would have a length of approximately 279 feet, a width of approximately 127 feet, and a height of 98 feet (GSEP 2009f). However, based on the ACC preliminary designs for nearby solar thermal projects in similar ambient temperatures, an additional 11,690 square feet could be required for siting of the ACCs up to 120 feet in height. In addition to the ACC and fans, NextEra would use a small Wet Surface Air Cooler when needed to provide auxiliary cooling during extremely hot days (GSEP 2009f). This alternative is analyzed because it would reduce the amount of water required for steam turbine cooling from

822 acre-feet per year (AFY) to 66 AFY. This reduction in water use would reduce impacts to water and biological resources.

C.9.6.2 SETTING AND EXISTING CONDITIONS

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates the use of wet-cooling towers and incorporated the use of air-cooled condensers (ACC) in the same location. As a result, the environmental setting would be the same as for the proposed project.

C.9.6.3 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Wet-cooling maximizes power plant fuel efficiency by providing a continuous source of effective cooling for the plant's steam condensers. Dry cooling will typically provide less effective cooling of the condensers, reducing the efficiency of the steam cycle portion of the power plant, and thus the overall fuel efficiency of the facility.

The FSA for the Beacon Solar Energy Project (08-AFC-2; BSEP 2009) showed that annual average fuel efficiency would be reduced 5-7 percent compared to a wet cooling system. The GSEP applicant stated that use of dry cooling would result in a 7.4 percent decrease in total annual net MWh compared with a wet cooling system (GSEP 2009a). In order to counter the reduction in generation that would result from dry cooling, the Beacon Solar Energy Project applicant proposed expanding the solar field by 12 percent.

The GSEP applicant states that the proposed project has been optimized for the land available, and therefore solar field expansion infeasible (GSEP 2009a). However, the power block and solar arrays would occupy approximately 1,360 acres of the 1,800-acre site. Evaporation ponds, access roads, administration buildings, and other support facilities would require a portion of the 1,800-acre site, and there is also remaining open space (GSEP 2009a). Additionally, use of dry-cooling would require smaller evaporation ponds opening up additional land for solar field expansion. A 12 percent increase in the solar field would require approximately an additional 150 acres. While it is uncertain whether the entire 150 acres is available for use and would comply with the engineering requirements for GSEP, it is clear from the site plan that there is some available land immediately adjacent to existing solar trough rows and this land could be used to offset all or a portion of the efficiency loss due to the use of dry-cooling.

Soil Resources

Because the ACC system would not require any additional ground disturbance other than what would be required for the proposed GSEP with the use of wet-cooled towers, impacts to soil resources from use of the Dry-Cooling Alternative would be expected to be similar as for the proposed project. Erosion impacts would be expected to be similar; however, the ACC system would potentially require some increase in truck traffic and related erosion due to the larger size of the system.

Water Resources

The Dry Cooling Alternative would reduce operation use of water from 822 AFY to approximately 66 AFY per 125 MW power block (GSEP 2009f). The Dry Cooling Alternative would include a Wet Surface Air Cooler to provide auxiliary cooling during extremely hot days.

A comparison was made between the average annual basin budget balance with the anticipated project water production requirements. **Soil and Water Table 19** presents the anticipated projects water requirements along with the average annual basin budget balance for the 37-month construction period. Currently, the CVGB balance is positive by approximately 2,608 afy whereby inflow (approximately 13,719 afy) to the basin is slightly greater than estimated outflows (approximately 11,111 afy) to the basin. Approximately 400 afy is attributed to subsurface outflow to the adjacent Palo Verde Mesa Groundwater Basin.

It is anticipated that groundwater extraction during construction (~616 to 1,368 afy) and operation (~132 afy) would not significantly impact the CVGB balance as the 1,368 afy during construction and the 132 afy during operations would not exceed the positive yearly balance of 2,608 afy.

Soil and Water Table 19
Estimated Change to Chuckwalla Valley Groundwater Basin Budget
(Average Year Conditions)

Project Component	Years	Annual Basin Budget Balance	Project Requirements (afy)	Net Budget Balance (afy)
Construction	1	2,608	1,368	1,240
	2	2,608	616	1,992
	3	2,608	616	1,992
Operations	4-33	2,608	132	2,476
Note: See **Soil and Water Table 8** for Groundwater Basin Budget				

Construction and operation of the Project would have an impact on basin balance in the CVGB. The impacts are considered insignificant, due to the fact that project pumping does not exceed net average recharge to the basin. The project's pumping could also have an effect on the adjacent Palo Verde Mesa Groundwater Basin (PVMGB) by inducing flows from the Colorado River into the PVMGB and as such those effects could be significant. Given the location of the Project, the anticipated annual Project water requirements, staff anticipates that the project may have a significant impact on adjacent (Palo Verde Mesa) groundwater basin.

The Applicant did not provide an analysis of the proportion of water originating from storage, from natural recharge and/or the Colorado River underflow. However, as previously stated water in the Colorado River is fully appropriated and any diversion of water from the Colorado River would be a significant impact. The U.S. Geological Survey has indicated that the PVMGB and the CVGB lies within a basin tributary to the Colorado River and that wells drawing groundwater could be considered to be withdrawing water from the Colorado River Aquifer (Wilson et al., 1994). Consequently, the Project has the potential to divert Colorado River water without any entitlement to

the water, and all groundwater production at the site would be considered Colorado River water. Staff understands that the foregoing conclusion is based on a simplified methodology for calculating contribution of water from the Colorado River from the Project's proposed groundwater extraction. The Project applicant could choose to implement **SOIL&WATER-19** Condition of Certification specified in Section C.9.11, *Proposed Conditions of Certification/Mitigation Measures,* below to conduct a refined analysis of the quantity of water contributed by the Colorado River from Project groundwater extraction. This analysis may also be used to estimate the volume of water that must be replaced in accordance with Condition of Certification **SOIL&WATER-15.**

We note that future water use in the CVGB may be governed by impending regulations being formulated by the USBR. These are discussed in the section addressing LORS, below. Waste discharge to the evaporation ponds using the ACC is approximately 50 percent of the wet cooling option (92 gpm compared with the annual average of 182 gpm for the proposed project using wet-cooling). As such, the applicant estimates that approximately one 12-acre evaporation pond would be required for each 125 MW power block (GSEP 2009f).

C.9.6.4 CEQA LEVEL OF SIGNFICANCE

Section 15064.7 of the CEQA Guidelines encourages each public agency to "develop and publish thresholds of significance that the agency uses in the determination of the significance of environmental effects." The section continues to define a significance threshold as being an "identifiable quantitative, qualitative, or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect will normally be determined to be less than significant."

The Energy Commission, in its role as CEQA lead agency for the Project, has not developed or published significance thresholds related to soil and water resources. In the absence of Energy Commission-specified significance thresholds, the analysis of the significance of potential environmental effects related to soil and water resources contained herein is made based on the criteria specified in Section C.9.3, Methodology and Thresholds for Determining Environmental Consequences, above.

C.9.7 NO PROJECT/NO ACTION ALTERNATIVES

C.9.7.1 NO PROJECT/NO ACTION ALTERNATIVE #1:

No Action on Genesis Solar Energy Project application and on CDCA land use plan amendment

Under this alternative, the proposed GSEP would not be approved by the Energy Commission and BLM and BLM would not amend the CDCA Plan. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, the impacts to soils and water from the construction and operation of the proposed project would not occur. However, the land on which the project is proposed would become available to other uses that are consistent with BLM's land use plan, including another solar project requiring a land use plan amendment. In addition, in the absence of this project, other renewable energy projects may be constructed to meet State and federal mandates, and those projects would have similar impacts in other locations.

C.9.7.2 NO PROJECT/NO ACTION ALTERNATIVE #2:

No Action on Genesis Solar Energy Project and amend the CDCA land use plan to make the area available for future solar development

Under this alternative, the proposed GSEP would not be approved by the Energy Commission and BLM and BLM would amend the CDCA Land Use Plan of 1980, as amended, to allow for other solar projects on the site. As a result, it is possible that another solar energy project could be constructed on the project site.
Because the CDCA Plan would be amended, it is possible that the site would be developed with the same or a different solar technology. As a result, impacts to soils and water would result from the construction and operation of the solar technology and resulting ground disturbance and would likely be similar to the impacts to soils and water from the proposed project, including erosion impacts and impacts to jurisdictional waters. Different solar technologies require different amounts of grading; however, it is expected that all solar technologies would require grading and maintenance. As such, this No Project/No Action Alternative could result in impacts to soils and water similar to the impacts under the proposed project.

C.9.7.3 NO PROJECT/NO ACTION ALTERNATIVE #3:

No Action on Genesis Solar Energy Project application and amend the CDCA land use plan to make the area unavailable for future solar development

Under this alternative, the proposed GSEP would not be approved by the Energy Commission and BLM and the BLM would amend the CDCA Plan to make the proposed site unavailable for future solar development. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because the CDCA Plan would be amended to make the area unavailable for future solar development, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site and no soil erosion impacts or impacts to jurisdictional waters. As a result, this No Project/No Action Alternative would not result in the impacts to soils and water under the proposed project. However, in the absence of this project, other renewable energy projects may

be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

C.9.8 CUMULATIVE IMPACTS

A project may result in a significant adverse cumulative impact where its effects are cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects (California Code Regulation, Title 14, section 15130). NEPA states that cumulative effects can result from individually minor but collectively significant actions taking place over a period of time (40 CFR §1508.7).

Section B.3, Cumulative Scenario, provides detailed information on the potential cumulative solar and other development projects in the project area. Together, these projects comprise the cumulative scenario which forms the basis of the cumulative impact analysis for the proposed project. In summary, these projects are:

- Renewable energy projects on BLM, State, and private lands, as shown on **Cumulative Figure 1** and in **Cumulative Tables 1A and 1B.** Although not all of those projects are expected to complete the environmental review processes, or be funded and constructed, the list is indicative of the large number of renewable projects currently proposed in California.
- Foreseeable future projects in the immediate Chuckwalla Valley area, as shown on **Cumulative Impacts Figure 2, I-10 Corridor Existing and Future/Foreseeable Projects, and Cumulative Tables 2 and 3**. Table 2 presents existing projects in this area and Table 3 presents future foreseeable projects in the I-10 Corridor Area. Both tables indicate project name and project type, its location and its status.

These projects are defined within a geographic area that has been identified by the Energy Commission and BLM as covering an area large enough to provide a reasonable basis for evaluating cumulative impacts for all resource elements or environmental parameters. Most of these projects have, are, or will be required to undergo their own independent environmental review under CEQA and/or NEPA. Even if the cumulative projects described in Section B.3 have not yet completed the required environmental processes, they were considered in the cumulative impacts analyses in this SA/Draft EIS.

C.9.9 GEOGRAPHIC EXTENT

The geographic extent used as part of the cumulative impact assessment includes the CVGB. The extent of the basin is described in Section C.9.4.1. Setting and Existing Conditions.

C.9.9.2 EXISTING CUMULATIVE CONDITIONS

Section C.9.4.1, Setting and Existing Conditions describes the current conditions of the CVGB that would take into account existing cumulative conditions as they were known to occur.

C.9.9.3 FUTURE FORESEEABLE PROJECTS

Foreseeable Projects in the Project Area

Foreseeable projects that may impact the soil and water resources of the area were deemed to include only those projects located in the CVGB. **Soil and Water Table 20** lists the foreseeable projects and the anticipated water use associated with each of the projects.

Foreseeable Renewable Projects in the California Desert

All of the foreseeable projects were renewable projects and are listed in **Soil and Water Table 20**.

C.9.9.4 CONTRIBUTION OF THE PROJECT TO CUMULATIVE IMPACTS

Construction and Operation

The construction of the proposed Project is expected to result in short term adverse impacts related to construction activities. It is expected that some of the cumulative projects described above which are not yet built may be under construction the same time as the proposed Project. In addition, it is expected that some of the future and foreseeable projects described above may be operational at the same time as the proposed Project. As a result, there may be substantial long term cumulative impacts during operation of these projects related to soils and water resources.

There may be substantial short term and long-term impacts during construction and operations of those cumulative projects related to: soil erosion, geomorphology, basin balance, groundwater levels, groundwater quality, surface water hydrology and surface water quality, and they are discussed below.

Soil Erosion

Construction the proposed Project would result in both temporary changes at the Project site which could incrementally increase local soil erosion and storm water runoff during construction. The proposed Project would be expected to contribute only a small amount to the possible short term cumulative impacts related to soil erosion because the Project Applicant will be required to implement the mitigation measures defined in this analysis, which are expected to bring short term impacts below the level of significance.

Operation of the proposed Project would result in permanent changes at the Project site. These changes could incrementally increase local soil erosion and storm water runoff. The proposed Project would be expected to contribute only a small amount to these possible long term operational cumulative impacts because potential Project-related soil erosion and increased sedimentation resulting from storm water runoff are expected to be reduced to a level of insignificance through implementation of the conditions of certification/mitigation measures **SOIL&WATER-1, 2, 8, 9, 10, 11** and **13** specified in Section C.9.11, below.

Geomorphology

There is a concern that implementation of all of the reasonably foreseeable projects could have a cumulative impact on the regionally-significant geomorphic processes that transport sand downwind along the Chuckwalla Valley and to the Colorado River. Blocking or disrupting the sand transport corridors would impact various sites that provide habitat for biological resources such as the Mojave Fringe-Toed Lizard. See Section C.2 Biological Resources for further analysis of potential cumulative impacts related to geomorphic processes.

Groundwater Basin Balance

There is concern that the amount of groundwater used for both construction and operations would place the groundwater basin into overdraft. Groundwater overdraft is “the condition of a groundwater basin in which the amount of water withdrawn by pumping exceeds the amount of water that recharges the basin over a period of years during which water supply conditions approximate average conditions.” (CDWR, 1998).

For purposes of impact analysis, it is assumed that any withdrawals that exceed the average natural recharge and exceed a significant percentage of the total amount of groundwater in storage would be a significant impact. The following discussion presents an analysis of the potential for overdraft and significant depletion of groundwater in storage to occur.

A comparison was made between the average annual basin budget with the anticipated foreseeable projects cumulative construction and operation water production requirements. **Soil and Water Table 21** presents the anticipated projects water requirements (Years 2011-2043) along with the average annual basin budget. Currently, the CVGB balance is positive by approximately 2,608 afy whereby inflow (approximately 13,719 afy) to the basin is slightly greater than estimated outflows (approximately 11,111 afy) to the basin.

It is anticipated that groundwater extraction of foreseeable projects during construction of the GSEP would range from 1,915 afy in Year 2011 and peak at 10,048 afy in Years 2014 through 2017 which would exceed the basin balance in Years 2014 through 2017 by 7,440 afy. The CVGB would be in overdraft conditions commencing in Year 2014. It is anticipated that groundwater extraction during operations of reasonably foreseeable projects would be approximately 3,745 afy which would exceed the basin balance by 1,137 afy. The cumulative change in storage over the construction and operational period (33 years) would amount to approximately -57,000 af, which would equate to less than 0.5 percent of the total amount of the estimated total recoverable groundwater in storage (15,000,000 af).

Soil and Water Table 21
Estimated Change to Chuckwalla Valley Groundwater Basin Budget (Average Year Conditions)

Years	Annual Basin Budget Balance (1)	Cumulative Project Requirements (afy) (2)	Net Budget Balance (afy)	Cumulative Budget Balance (af)	Cumulative Positive/Deficit as a Percent of Total Recoverable Storage (3)
2011	2,608	1,915	693	693	0.005%
2012	2,608	1,526	1,082	1775	0.012%
2013	2,608	1,518	1,090	2865	0.019%
2014	2,608	10,048	-7,440	-4575	-0.031%
2015	2,608	10,048	-7,440	-12,015	-0.08%
2016	2,608	10,048	-7,440	-19,455	-0.13%
2017	2,608	10,048	-7,440	-26,895	-0.18%
2018	2,608	4,670	-2,062	-28,957	-0.19%
2019	2,608	4,670	-2,062	-30,094	-0.20%
2043	2,608	3,745	-1,137	-57,382	-0.383%

Notes:
(1) – See Soil and Water Table 8
(2) – See Soil and Water Table 20
(3) – Based on a total recoverable storage of 15,000,000 af.

However, the amount of water that is storage (estimated to be as much as 15,000,000 af) in the basin greatly exceeds the amount of cumulative overdraft (57,000 af). In light of these facts, the project's contribution to the cumulative impact to basin balance is less than cumulatively considerable.

Lastly, the I-10 corridor within the CVGB has been targeted for renewable energy projects that have not been identified or quantified as to amounts of water required for development. Given that perennial surface water sources are non-existent and the only available water source is groundwater, it is likely that these as yet unidentified projects could further develop the groundwater resources and exacerbate the cumulative overdraft conditions identified above. However, given the amount of total recoverable groundwater in storage (estimated at 15,000,000 af), the impact would be insignificant.

In addition, the cumulative impact analysis conducted by the GSEP suggested that during the course of operations for all reasonably foreseeable projects, the subsurface outflow from the CVGB into the PVMGB would decline from approximately 400 afy to approximately 81 afy in 2043 (see WPAR, 2009b Table 2). This could have an indirect significant impact on the Palo Verde Mesa Groundwater Basin by inducing underflow

from the Colorado River to the Palo Verde Mesa Groundwater Basin. Staff believes that inducing flow from the Colorado River into the Palo Verde Mesa Groundwater Basin is a significant impact.

Staff believes that the impact related to outflow could be fully mitigated, such that the project would not contribute to cumulative impacts. The measures, **SOIL&WATER-15** and **SOIL&WATER-19** are provided in detail in Section C.9.11, *Proposed Conditions of Certification/Mitigation Measures,* below.

Groundwater Levels

The regional model used by AECOM (2010a) is a two-dimensional superposition model developed using MODFLOW code (Harbaugh et al., 2000) for the Parker-Palo Verde-Cibola area, which includes the CVGB and the Project site. The model employed a simple vertical geometry and a large grid spacing to evaluate the impacts from groundwater pumping on the Colorado River.

The modeling results suggest (see **Soil and Water Figure 20**) that during the life of all the reasonably foreseeable projects, groundwater level declines of five feet or more would be located at a distance of approximately 4 miles from the proposed production wells at the Project site. The closest existing well is located at a distance of 3 miles. In addition, water level declines of 1 foot or more could be observed up to eight miles from the proposed production wells.

Staff notes that modeling conducted by the applicant indicated water level declines less than what is conservatively presented here. While preliminary studies and calculations have been made to assess the potential for impact, the quantification of the impact is considered an estimation and will not be able to be accurately quantified until actual long-term groundwater production occurs. Consequently, the potential impact to water levels in existing wells appears to be cumulatively significant. Implementation of Conditions of Certification **SOIL&WATER-3** through **SOIL&WATER-5** specified in Section C.9.11, *Proposed Conditions of Certification/Mitigation Measures,* below, is anticipated to mitigate the impacts to groundwater users (wells) to any impacted by lowering of the groundwater table. Impacts and proposed mitigation associated with biological dependent resources is discussed in Section C.2, Biological Resources***.**

Groundwater Quality

There is a potential that significant cumulative groundwater quality impacts could occur from the proposed Projects as listed on Soil and Water Table 20 during construction and operation if contaminated or hazardous materials used during construction and operations were to be released and migrate to the groundwater table.

The proposed Project would be expected to contribute only a small amount to the possible short-term cumulative impacts related to groundwater quality, given the distance to the groundwater table (70-90 feet bgs) over the CVGB and the proposed implementation of a hazardous material management plan as well as monitoring plans associated with operation of LTUs, surface impoundments, septic systems and other various operations. With implementation of the mitigation measures Conditions of Certification **SOIL&WATER-6** and **7** and **SOIL&WATER-20** specified in Section C.9.11,

Proposed Conditions of Certification/Mitigation Measures, below, cumulative impacts associated with the Project to groundwater quality are anticipated to be below the level of significance.

Surface Water Hydrology

The cumulative impacts of the proposed Projects as listed on Soil and Water Table 20 on the local surface water hydrology are directly related to proposed onsite grading and the potential construction and operation of a network of engineered collector/conveyance channels designed for the purpose of protecting the various projects from flooding. The proposed projects could change both the extent and physical characteristics of the existing floodplains within and downstream of each project site,. There is not enough information available on each site nor has a regional study been completed to define the extent of the cumulative effects of these projects on surface water within the watershed. However, it is assumed that each of these projects will be required to define their impacts and mitigate where required.

The proposed Project would be expected to contribute only a small amount to the possible short-term cumulative impacts related to surface water hydrology because the implementation of the mitigation measures specified in Section C.9.11, below, would reduce the project specific impacts below the level of significance.

Surface Water Quality

The cumulative impacts of the proposed foreseeable projects as listed on **Soil and Water Table 20** could have an impact on surface water quality. It is expected that stormwater generated on the various project sites may encounter soil or chemicals deleterious to aquatic and terrestrial plant and wildlife. It is expected that all of the projects would be required to implement BMPs for managing potentially harmful storm water and protect water quality. Implementation of the conditions of certification/mitigation measures **SOIL&WATER-1, 2, 8, 9, 10, 11** and **13** specified in Section C.9.11, below would reduce the project specific impacts below the level of significance. Potentially significant water quality impacts could occur during operations if contaminated or hazardous materials used during operations were to contact storm water and drain offsite. It is expected that all of the projects would have Hazardous Material Management Plans (see Section C.4, Hazardous Materials Management) to reduce impacts below the level of significance.

All of the proposed projects would alter natural storm water drainages and the expected use of BMPs would reduce potentially significant impacts related to concentrated drainage and ensuing soil erosion and sediment transport offsite. The proposed Project would be expected to contribute only a small amount to the possible short-term cumulative impacts related to surface water quality with implementation of the Conditions of Certification **SOIL&WATER-1, 2, 8, 9, 10, 11** and **13** specified in Section C.9.11, below would reduce the project specific impacts below the level of significance..

Closure and Decommissioning

The decommissioning of the proposed Project is expected to result in adverse impacts related to soils and water resources similar to construction impacts. It is unlikely that the construction or decommissioning of any of the cumulative projects would occur

concurrently with the decommissioning of this Project, because the decommissioning is not expected to occur for approximately 40 years. As a result, there may not be impacts related to soils and water resources during decommissioning of the proposed Project generated by the cumulative projects. The impacts of the decommissioning of the proposed Project would not be expected to contribute to cumulative impacts related to soils and water resources. To ensure there would be no impacts to soil and water resources during and after project decommissioning the applicant should be required to comply with Condition of Certification **SOIL&WATER–14.**

C.9.10 COMPLIANCE WITH LORS

Applicable Federal, State, and local LORS are summarized discussed in the following text. Non-applicable Federal and State LORS are also discussed to explain why they are not applicable.

C.9.10.1 FEDERAL

Clean Water Act (CWA) of 1977 (Including 1987 Amendments) Sections 401, 402 and 404

The primary objective of the CWA is to restore and maintain the chemical, physical, and biological integrity of the Nation's surface waters. Pollutants regulated under the CWA include "priority" pollutants, including various toxic pollutants; "conventional" pollutants, such as biochemical oxygen demand, total suspended solids, oil and grease, and pH; and "non-conventional" pollutants, including any pollutant not identified as either conventional or priority.

Clean Water Act Section 401

Section 401 of the CWA requires certification from the CRBRWQCB that the proposed project is in compliance with established water quality standards. Projects that have the potential to discharge pollutants are required to comply with established water quality objectives. These requirements include the implementation of BMPs during site grading activities and other activities associated with construction of the facility.

Section 401 provides the SWRCB and the CRBRWQCB with the regulatory authority to waive, certify, or deny any proposed federally permitted activity, which could result in a discharge to waters of the State. To waive or certify an activity, these agencies must find that the proposed discharge will comply with state water quality standards. According to the CWA, water quality standards include beneficial uses, water quality objectives/criteria, and compliance with the EPA's anti-degradation policy.

No license or permit may be issued by a federal agency until certification required by Section 401 has been granted. Under the CWA, USACE Section 404 permits are subject to CRBRWQCB Section 401 Water Quality Certification (Title 23 CCR Sections 3830 through 3869). As such, a determination of "federal waters" under Section 404 is required by the USACE. The ephemeral drainages on the Site were found not to conform to the requirements for designation as jurisdictional waters of the U.S. However, this finding still needs to be formally confirmed by the USACE and this process is underway.

While there is not a direct requirement under a 404 jurisdiction, the CRBRWQCB has authority under Porter-Cologne to regulate discharge of waste to waters of the state. The definition of the waters of the state is broader than that for waters of the U.S. in that all waters are considered to be a water of the state regardless of circumstances or condition. The term “discharge of waste” is also broadly defined in Porter-Cologne, such that discharges of waste include fill, any material resulting from human activity, or any other “discharge” that may directly or indirectly impact waters of the state relative to implementation of Section 401 of the CWA.

Porter-Cologne authorizes the CRBRWQCB to regulate discharges of waste and fill material to waters of the state, including “isolated” waters and wetlands, through the issuance of waste discharge requirements (WDRs). Under Porter-Cologne all parties proposing to discharge waste that could affect the quality of waters of the state, other than into a community sewer system, shall file with the appropriate CRBRWQCB a Report of Waste Discharge (ROWD) containing such information and data as may be required by the CRBRWQCB. As such, the PSPP will file a ROWD for evaluation of 401 water quality impacts and in association with the proposed LTU. The schedule for filing of such document is provided in Section 5.17.1.5.

Clean Water Act Section 402

Direct and indirect discharges and stormwater discharges into waters of the United States must be made pursuant to a NPDES permit (CWA Section 402). NPDES permits contain industry-specific, technology-based limits and may also include additional water quality-based limits, and establish pollutant-monitoring requirements. A NPDES permit may also include discharge limits based on Federal or State water quality criteria or standards.

In 1987, the CWA was amended to include a program to address stormwater discharges for industrial and construction activities. Stormwater discharge is covered by an NPDES permit, either as an individual or general permit. The Colorado River Basin RWQCB administers the NPDES permit program under the CWA in the Project area. Appendix L of this AFC provides a preliminary construction SWPPP/DESCP.

Clean Water Act Section 404

Activities resulting in the dredging or filling of jurisdictional waters of the U.S. require authorization under a Section 404 permit issued by the USACE. The USACE may grant authorization under either an individual permit or a nationwide permit (NWP) to address operations that may affect the ephemeral washes on the Project site. Section 404 permits are also subject to CWA Section 401 water quality certification through the CRBRWQCB.

An evaluation for jurisdictional waters on the Project site was performed by the Applicants. The ephemeral drainages on the Site were found not to conform to the requirements for designation as jurisdictional waters of the U.S. As noted above, this finding is under review and still needs to be confirmed by the USACE. Several drainages on the Site were delineated as jurisdictional waters of the State and are discussed in Section 5.17.1.2. A report documenting the results of the evaluation of the presence of jurisdictional waters of the U.S. is provided in Appendix F.

The U.S. Bureau of Reclamation, Colorado River – Proposed Accounting Surface Rule, 73 Federal Register 40, 916 (July 16, 2008) (subsequently withdrawn)

The Consolidated Decree of the United Sates Supreme Court in Arizona vs. California, 547 U.S. 150 recognized that consumptive use of water from the Colorado River can occur by groundwater withdrawal. Under this decree, users within the lower Colorado River Basin (which includes the PSPP) can divert tributary flow before it reaches the Colorado River. Once it reaches the river, entitlements are required for diversions. Wilson and Owen-Joyce and Owen-Joyce and others proposed the "river aquifer", which is hydraulically connected to the Colorado River, and the "accounting surface", which is defined as groundwater levels that would occur should the Colorado River be the only source of groundwater in the aquifer. Water levels higher than the accounting surface indicate recharge from tributary water sources.

Wells drawing water from the river aquifer (or water below the accounting surface) draw water from the Colorado River, and as such need to be accounted in the consumptive use of the river. In cases where water is drawn from the river aquifer, an entitlement is required from the USBR. The USBR proposed the accounting surface rule to eliminate the unlawful use of Colorado River on July 16, 2008 in the Federal Register (73 Federal Regulation 40,916). The USBR is currently preparing a new proposed rule.

The Project is proposing to use annually about 300 afy of groundwater from an onsite source for operational processes, including mirror washing, process makeup, equipment cooling, dust suppression and potable uses. Because groundwater is the only source of water for the proposed Project, and if the proposed rule is established, the Applicant will be required to submit an Application for Lower Colorado Water Supply Project Water to the Colorado River Board of California for entitlement to the groundwater. A contract with the City of Needles would be required to withdraw this water. Currently, a preliminary timeline for final implementation of the accounting surface rule is Summer 2011.

C.9.10.2 STATE

The administering agencies for the State LORS are the Energy Commission, the SWRCB, and the Colorado River Basin RWQCB

State of California Constitution Article X, Section 2

Article X, Section 2 prohibits the waste or unreasonable use of water, regulates the method of use and method of diversion of water and requires all water users to conserve and reuse available water supplies to the maximum extent possible. The project use of dry cooling will significantly reduce potential water use and prohibit waste and unreasonable use of groundwater.

California Storm Water Permitting Program

California Construction Storm Water Program. Construction activities that disturb one acre or more are required to be covered under California's General Permit for Discharges of Storm Water Associated with Construction Activity, Water Quality Order 99-08-DWQ (General Construction Permit CAS 000002).

Activities subject to permitting include clearing, grading, stockpiling, and excavation. The General Construction Permit requires the development and implementation of a SWPPP that specifies BMPs that will reduce or prevent construction pollutants from leaving the site in storm water runoff and will also minimize erosion associated with the construction project. The SWPPP must contain site map(s) that show the construction site perimeter; existing and proposed structures and roadways; storm water collection and discharge points, general topography both before and after construction; and drainage patterns across the site. Additionally, the SWPPP must describe the monitoring program to be implemented. GSEP also will prepare a DESCP to meet Energy Commission requirements (Appendix L). The content of a DESCP is very similar to a SWPPP, but the DESCP covers both construction and operation in one document whereas separate SWPPPs are prepared for construction and operation.

California Industrial Storm Water Program. Industrial activities with the potential to impact stormwater discharges are required to obtain a NPDES permit for those discharges. In California, an Industrial Storm Water General Permit, Order 97-03-DWQ (General Industrial Permit CAS 000001) may be issued to regulate discharges associated with ten broad categories of industrial activities, including electrical power generating facilities. The General Industrial Permit requires the implementation of management measures that will protect water quality. In addition, the discharger must develop and implement a SWPPP and a monitoring plan. Through the SWPPP, sources of pollutants are to be identified and the means to manage the sources to reduce storm water pollution described. The monitoring plan requires sampling of storm water discharges during the wet season and visual inspections during the dry season.

A report documenting the status of the program and monitoring results must be submitted to the CRBRWQCB annually by July 1. The General Industrial Permit, which requires the development and implementation of a SWPPP, is required for the Project's operations phase. The Applicant will prepare a separate SWPPP that outlines the monitoring and reporting plan, along with storm water mitigation measures for the facility based on BMPs.

California Water Code

Section 461. Stipulates that the primary interest of the people of the State of California is the conservation of all available water resources and requires the maximum reuse of reclaimed water as an offset to using potable resources.

The applicant was exploring a possible agreement with Chuckwalla Valley State Prison to treat reclaimed wastewater from that facility. Although the applicant states the amount of water would be insufficient for project needs, Staff urges GSEP to consider the option as a way to offset some use of groundwater.

Section 1200 "Water Rights." All water in California falls within one of three categories: surface water, percolating groundwater, or "subterranean streams that flow through known and definite channels." California's water rights law is a hybrid system in that the use of certain types of water requires a permit from the SWRCB, while other types of uses are governed by common law. Only surface water and subterranean stream water

are within the permitting jurisdiction of the SWRCB. Since 1914, appropriation of those waters has required a SWRCB permit, and is subject to various permit conditions.

Interstate water courses (such as the Colorado River) have additional contract requirements that are the equivalent of permits. For example, use of Colorado River water requires a contract with the Secretary of the Interior (through the Bureau of Reclamation).

Pre-1914 appropriative and riparian rights do not require a permit. Riparian rights are correlative rights of equal priority among all riparian right holders. The place of use of such water is limited to riparian property (property that is contiguous to a watercourse) that has not had its riparian rights severed. Riparian rights are senior to any appropriative rights, and may not be separated from the riparian parcel and used elsewhere.

Groundwater can be (a) the underground portion of a surface water course (subject to the same rights/permits as the affiliated water course); (b) a wholly underground water course which is treated like a water course; or (c) percolating groundwater. Water subject to appropriation is defined in Water Code Section 1201, as "all water flowing in any natural channel," except water that is or may be needed for use upon riparian land or water that is otherwise appropriated. The SWRCB's authority over groundwater extends only to the underground portion of a surface stream and to the water in un-appropriated subterranean streams that flow through known or defined channels, except as it is or may be reasonably be needed for useful and beneficial purposes upon lands riparian to the channel through which it is flowing. The traditional test to establish SWRCB jurisdiction over groundwater was whether there is sufficient evidence of bed and banks and water flowing along a line of a surface stream (Sax 2002).

Recent case law has redefined the boundaries of an underground stream to mean the bedrock bottom and side boundaries that are materially less permeable than the alluvium holding groundwater found within an alluvial valley across which flows a surface stream. If there is insufficient evidence to support a finding that the groundwater fits this definition, the SWRCB has no jurisdiction and no permit is required to appropriate the water.

Percolating groundwater has no SWRCB permit requirement and supports two kinds of rights: (a) overlying rights, a correlative right of equal priority shared by all who own overlying property and use groundwater on the overlying property; and (b) groundwater appropriative rights for use of the overlying property or on overlying property for which the water rights have been severed. The right to use groundwater on property that is not an overlying right is junior to all overlying rights, but has priority among other appropriators on a first in time use basis. Overlying users cannot take unlimited quantities of water without regard to the needs of other users. Surplus groundwater may be appropriated for use on non-overlying lands, provided such use will not create an overdraft condition.

Riparian water rights, groundwater rights and appropriative rights are all subject to modification to some degree if there is a basin-wide adjudication, which proceeding can be commenced before the SWRCB as an adjudicative body (not a permitting role) or

before a court. In adjudication, unused riparian rights and unused overlying rights can be subordinated to appropriative rights.

Water rights in California can be held by any legal entity. Thus the owner can be an individual, related individuals, non-related individuals, trusts, corporations and/or government agencies. Water rights are considered real property. Riparian rights and overlying groundwater rights are lost if severed from the land, while appropriative rights can be preserved and transferred to other properties. Transfers of water for use elsewhere are permissible without transfers of water rights, subject to many other conditions and approvals, including a "non-injury" to other water rights holders test, assessment of environmental impacts, and for post 1914 appropriative rights, SWRCB approval of any change in place of use, diversion point and/or purpose of use.

The California Water Code allows any local public agency that provides water service whose service area includes a groundwater basin or portion thereof that is not subject to groundwater management pursuant to a judgment or other order, to adopt and implement a groundwater management plan (California Water Code Sections 10750 et. seq.) Groundwater Management Plans often require reports of pumping and some restrictions on usage. There is no Groundwater Management Plan for the CVGB listed on the DWR website on Groundwater Management Plans.

The California Legislature has found that by reason of light rainfall, concentrated population, the conversion of land from agricultural to urban uses and heavy dependence on groundwater, the counties of Riverside, Ventura, San Bernardino and Los Angeles have certain reporting requirements for groundwater pumping. Any person or entity that pumps in excess of 25 af of water in any one year must file a "Notice of Extraction and Diversion of Water" with the SWRCB. (See Water Code Sections 4999 et. seq.) The Project would be subject to this requirement since it is located in Riverside County and will require more than 25 afy. Condition of Certification SOIL&WATER-16 would ensure the applicant complies with this requirement.

The GSEP is in Riverside County and the Chuckwalla Valley has no perennial streams. The Project site is located on BLM land that overlies the CVGB, which has a surface area of about 822,000 acres. A method was developed by the USGS, in cooperation with the USBR, to identify groundwater wells outside the flood plain of the lower Colorado River that yield water that will be replaced by water from the river. Wells placed into the groundwater beneath the Project site that extract groundwater may be considered as drawing water from the Colorado River and require an entitlement to extract groundwater. The specific method to determine whether wells draw water from the Colorado River (referred to as the accounting surface) has not been promulgated by the USBR. Entitlements to extract and use the groundwater beneath the site are granted by the USBR through their designated representative in California, the Colorado River Board of California. After eligibility for groundwater extraction has been approved by the USBR, a contract must be established with the City of Needles to acquire the water. In California, the City of Needles monitors the use of water extracted from the river aquifer and is the designated contracting agent for the USBR.

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act of 1967, Water Code Section 13000 et. seq. requires the SWRCB and the nine RWQCBs to adopt water quality standards to protect State waters. Those standards include the identification of beneficial uses, narrative and numerical water quality criteria, and implementation procedures. Water quality standards for the proposed project area are contained in the Water Quality Control Plan for the Colorado River Basin Region (Basin Plan), which was adopted in 1994 and was amended in 2006. This plan sets numeric and/or narrative water quality criteria controlling the discharge of wastes to the State's waters and land.

The Applicant proposes to construct a LTU as part of the facility. The LTU will be used to receive, temporarily store, and treat soil impacted with heat transfer fluid (HTF). The Project will comply with Title 23 CCR Division 3, Chapters 9 and 15 regarding the establishment of requirements for waste discharge and reporting along with requirements specifying conditions for the protection of water quality. Under Chapter 9, the CRBRWQCB is required to issue a ROWD for discharges of waste to land pursuant to the Water Code. The report requires the submittal of information regarding the proposed discharge and waste management unit design and monitoring program. WDRs issued by the CRBRWQCB provide construction and monitoring requirements for the proposed discharge. Chapter 15 outlines siting, construction, and monitoring requirements for waste discharges to land for landfills, surface impoundments, LTUs, and waste piles. The Chapter provides closure and post-closure maintenance and monitoring requirements for Class II designated waste facilities that are applicable to this project.

The Project will also comply with CCR Title 27 Division 2, Chapter 3. Section 20377 provides guidance for LTUs, referencing general criteria (Section 20320), precipitation, and drainage control (Section 20365) and seismic design requirements (Section 20370). Section 20250 stipulates operational and maintenance procedures to minimize mobilization of waste materials.

Section 13050. Surface waters (including ephemeral washes) that are affected by the Project are waters of the State and are subject to State requirements and the CRBRWQCB' authority to issue WDRs for construction and industrial storm water activities.

Section 13260 et seq. This section requires filing with the appropriate CRBRWQCB a ROWD for activities in which waste is discharged that could affect the water quality of the State. The report shall describe the physical and chemical characteristics of the waste and include the results of all tests required by regulations adopted by the board, any test adopted by the Department of Toxic Substances Control (DTSC) pursuant to Section 25141 of the Health and Safety Code for extractable, persistent, and bioaccumulative toxic substances in a waste or other material, and any other tests that the SWRCB or CRBRWQCB may require.

Section 13173 (Designated Wastes). This section defines designated waste as either: a) hazardous waste that has been granted a variance from hazardous waste management requirements pursuant to Section 14142 of the Health and Safety Code,

or, b) Non-hazardous waste that consists of, or contains, pollutants that, under ambient environmental conditions at a waste management unit, could be released in concentrations exceeding applicable water quality objectives or could reasonably be expected to affect beneficial uses of the waters of the state contained in the appropriate state water quality control plan.

As noted above, the Applicant proposes to construct an LTU to treat HTF-impacted soils. In 1995, the California DTSC determined that soils containing HTF up to 10,000 mg/kg were considered nonhazardous. However, recently the DTSC indicated that any determination of waste classification needs to be site specific.

Section 13240 et seq. (Water Control Plan). The Basin Plan for the Colorado River Basin Region establishes water quality objectives, including narrative and numerical standards that protect the beneficial uses of surface and ground waters in the region. The Basin Plan describes implementation plans and other control measures designed to ensure compliance with statewide plans and policies and provide comprehensive water quality planning. The following chapters are applicable to determining appropriate control measures and cleanup levels to protect beneficial uses and to meet the water quality objectives: Chapter 2, Beneficial Uses; Chapter 3, Water Quality Objectives; and the sections of Chapter 4, Implementation, entitled “Point Source Controls” and “Non-Point Source Controls.”

- Beneficial Uses: Chapter 2 of the Basin Plan describes beneficial uses of surface and ground waters. Beneficial uses of surface waters for the Chuckwalla Valley are not listed in the Basin Plan. The beneficial uses of ground waters of the Chuckwalla Valley Hydrologic Unit (717.00) are: municipal and domestic supply, industrial service supply, and agricultural supply.
- Water Quality Objectives: Region-wide numeric and narrative objectives for general surface waters are described in Chapter 3 of the Basin Plan under the “General Surface Water Quality Objectives” and region-wide objectives for groundwater under the “Ground Water Objectives.”
- Waste Discharge Requirements: Chapter 4 of the Basin Plan describes “Point-Source Controls” for wastewater reclamation and reuse, stormwater, and septic systems. The discussion of “Non-Point Source Controls” in the Basin Plan describes the authority given to the CRBRWQCB to certify projects for CWA Section 401 permits.

Section 13243. Under this section, the Regional Water Boards are granted authority to specify conditions or areas where the discharge of waste will not be permitted. The discharge of designated waste can only be discharged to an appropriately designed waste management unit.

Section 13263 (Waste Discharge Requirements). The CRBRWQCB will regulate the proposed discharge of fill material, including structural material and/or earthen wastes into wetlands and other waters of the State through WDRs. The CRBRWQCB considers WDRs necessary to adequately address potential and planned impacts to waters of the State and to require mitigation for these impacts to comply with the water quality standards specified in the Basin Plan.

WDRs from the CRBRWQCB are required for the LTU that will be used to treat (through bioremediation techniques) HTF-impacted soil. The Applicant will submit a ROWD application to the CRBRWQCB after AFC submittal.

Section 13271 (Discharge Notification). CWC section 13271 requires any person who, without regard to intent or negligence, causes or permits any hazardous substance or sewage to be discharged in or on any waters of the state, or discharge or deposited where it is, or probably will be, discharged in or on any waters of the state, to notify the Office of Emergency Services (OES) of the discharge as specified in that section. The OES then immediately notifies the appropriate regional board and the local health officer and administrator of environmental health of the discharge.

Section 13550. "The Legislature hereby finds and declares that the use of potable domestic water for non-potable uses, including, but not limited to, cemeteries, golf courses, parks, highway, landscaped areas, and industrial and irrigation uses, is a waste or an unreasonable use of the water within the meaning of Section 2 of Article X of the California Constitution if recycled water is available which meets all of the following conditions, as determined by the State Board." This section requires the use of recycled water for industrial purposes subject to recycled water being available and upon a number of criteria including: provisions that the quality and quantity of the recycled water are suitable for the use, the cost is reasonable, the use is not detrimental to public health, and the use will not impact downstream users or biological resources.

Section 13551. This section prohibits a person or public agency, including a State agency, city, county, city and county, district, or any other political subdivision of the State, shall not use water from any source of quality suitable for potable domestic use for non-potable uses if suitable recycled water is available as provided in Section 13550.

Section 13552. This section specifically identifies the use of potable domestic water for cooling towers as unreasonable use of water within the meaning of Article X Section 2 of the California Constitution, if suitable recycled water is available and the water meets the requirements set forth in Section 13550.

Section 13571. Requires that anyone who constructs, alters, or destroys a water well, cathodic protection well, groundwater monitoring well, or geothermal heat exchange well, file a well completion report with the California Department of Water Resources (CDWR). With no nearby sources of water available and no existing water supply wells on the Project site, a water supply well and groundwater monitoring wells will be constructed at the Site. These wells are required as part of the evaluation of water resources for the Project. A well completion report will be filed with DWR for each well that is constructed. Measures will be undertaken to protect the groundwater wells (whether for water supply or for monitoring purposes) on the Project site through the use of physical barriers (e.g., fencing, traffic bollards, etc.). In the event that an existing well is altered or destroyed, a well completion report will be filed with the DWR.

California Code of Regulations

Title 22, Article 3, Sections 64400.80 through 64445. This section requires monitoring for potable water wells, defined as non-transient, non-community water systems (serving 25 people or more for more than six months); the Project will employ approximately 130 workers during operations. Regulated wells must be sampled for bacteriological quality once a month and the results submitted to the California Department of Health Services (DHS). The wells must also be monitored for inorganic chemicals once and organic chemicals quarterly during the year designated by the DHS. DHS will designate the year based on historical monitoring frequency and laboratory capacity.

Title 23, Division 3, Chapter 9. Requires the CRBRWQCB to issue a report of waste discharge for discharges of waste to land pursuant to the Water Code. The report requires submittal of information regarding the proposed discharge and waste management unit design and monitoring program. WDRs issued by the CRBRWQCB provide construction and monitoring requirements for the proposed discharge. The SWRCB has adopted general waste discharge requirements (97-10-DWQ) for discharge to land by small domestic wastewater treatment systems.

Title 23, Division 3, Chapter 15. Regulates all discharges of hazardous waste to land that may affect water quality. Chapter 15 broadly defines a waste management area as "an area of land, or a portion of a waste management facility, at which waste is discharged." Therefore, unless exempted, all discharges of hazardous waste to land that may affect water quality are regulated by Chapter 15. This chapter outlines siting, construction and monitoring requirements for waste discharges to land for landfills, surface impoundments, land treatment units, and waste piles. The chapter provides closure and post-closure maintenance and monitoring requirements for surface impoundments that are applicable to the Project.

Title 27, Section 2000 et seq. and Title 23, Section 2510 et seq. These sections include requirements for siting and minimum waste management standards for discharges of waste to land. Establishes monitoring and corrective action requirements for discharges to land, including spills and leaks and other unauthorized discharges. Requires, assurances of financial responsibility for closure and post-closure activities and corrective actions for all known or reasonably foreseeable releases.

As discussed above, the Project would employ a LTU to manage soils impacted by releases of HTF. Provisions of Title 27 CCR apply to designated and non-hazardous solid waste. Provisions of Title 23 apply to hazardous waste. Energy Commission and CRBRWQCB staff are currently developing requirements for monitoring, mitigating, and reporting that will ensure compliance with these regulations and will include them as a condition of certification. Engineered alternatives that are consistent with Title 27 and Title 23 CCR performance goals may be considered for approval by the CRBRWQCB.

Section 20375 provides guidance for surface impoundments, including construction requirements (Table 4.1), operation, maintenance, and inspection. Section 20377 provides guidance for LTUs, referencing general criteria (Section 20320) and precipitation and drainage control (Section 20365) and seismic design requirements

(Section 20370). The regulations stipulate operational and maintenance procedures to minimize mobilization of the waste materials (Section 20250).

State Water Resources Control Board Policies

Anti-Degradation Policy (Resolution No. 68-16). Requires the CRBRWQCB, in regulating the discharge of waste, to: (a) maintain existing high quality waters of the State until it is demonstrated that any change in quality will be consistent with maximum benefit to the people of the State, will not unreasonably affect present and anticipated beneficial uses, and will not result in water quality less than that described in State or Regional Water Boards policies; and (b) require that any activity which produces or may produce a waste or increased volume or concentration of waste and which discharges or proposes to discharge to existing high quality waters, must meet waste discharge requirements which will result in the best practicable treatment or control of the discharge necessary to assure that: a) a pollution or nuisance will not occur and b) the highest water quality consistent with maximum benefit to the people of the State will be maintained.

Power Plant Cooling Water Policy (Resolution No. 75-58). On June 19, 1975, the SWRCB adopted the Water Quality Control Policy on the Use and Disposal of Inland Waters used for Power Plant Cooling. The purpose of the policy is to provide consistent statewide water quality principles and guidance for adoption of discharge requirements, and implementation actions for power plants that depend on inland waters for cooling.

The Resolution encourages the use of wastewater for power plant cooling and sets the following order of preference for cooling purposes: 1) wastewater being discharged to the ocean; 2) ocean water; 3) brackish water or irrigation return flows; 4) inland waste waters of low total dissolved solids (TDS); and 5) other inland waters. The criteria for the selection of water delivery options involves economic feasibility; engineering constraints, such as cooling water composition and temperature; and environmental considerations such as impacts on riparian habitat, groundwater levels, and surface and subsurface water quality.

Water Reclamation Policy (Resolution No. 77-01). Under this policy, the SWRCB and CRBRWQCBs shall encourage reclamation and reuse of water in water-short areas. Reclaimed water will replace or supplement the use of fresh water or better quality water.

Sources of Drinking Water Policy (Resolution No. 88-63). This policy designates all groundwater and surface waters of the States as potential sources of drinking water, worthy of protection for current or future beneficial uses, except where: (a) the total dissolved solids are greater than 3,000 milligrams per liter, (b) the well yield is less than 200 gallons per day (gpd) from a single well, (c) the water is a geothermal resource, or in a water conveyance facility, or (d) the water cannot reasonably be treated for domestic use using either best management practices or best economically achievable treatment practices.

Policies and Procedures for Investigations and Clean-up and Abatement of Discharges Under CWC Section 13304 (Resolution No. 92-49). This policy establishes

requirements for investigation and cleanup and abatement of discharges. Under this policy, clean-up and abatement actions are to implement applicable provisions of Title 23 CCR Chapter 15, to the extent feasible. The policy also requires the application of Section 2550.4 of Chapter 15 when approving any alternative cleanup levels less stringent than background. It requires remediation of the groundwater to the lowest concentration levels of constituents technically and economically feasible, which must be at least protect the beneficial uses of groundwater, but need not be more stringent than is necessary to achieve background levels of the constituents in groundwater.

Water Quality Control Policy for Recycled Water (Resolution No. 209-0011). (Not yet approved by Office of Administrative Law as of May 2009). The Recycled Water Policy is intended to promote sustainable local water supplies. The purpose of this Policy is to increase the use of recycled water from municipal wastewater sources that meets the definition in CWC Section 13050(n), in a manner that implements state and Federal water quality laws.

LORS and State Policy and Guidance

The Energy Commission has five sources for statements of policy relating to water use in California applicable to power plants. They are the California Constitution, the Warren-Alquist Act, the Commission's restatement of the State's water policy in the 2003 Integrated Energy Policy Report ("IEPR"), the State Water Resources Control Board ("SWRCB" or "Board") resolutions (in particular Resolutions 75-58 and 88-63), and the Genesis Solar Project Committee's water-issues order as guidance for interpreting all of the above.

California Constitution

Article X, section 2 prohibits the waste or unreasonable use, including unreasonable method of use, of water, and it requires all water users to conserve and reuse available water supplies to the maximum extent possible (Cal. Const., art. X, § 2). Groundwater is subject to reasonable use (*Katz v. Walkinshaw* (1903) 141 Cal. 116).

Warren-Alquist Act

Section 25008 of the Energy Commission's enabling statutes echoes the Constitutional concern, by promoting "all feasible means" of water conservation and "all feasible uses" of alternative water supply sources (Pub. Resources Code § 25008).

Integrated Energy Policy Report

In the 2003 Integrated Energy Policy Report (IEPR or Report), the Energy Commission reiterated certain principles from SWRCB's Resolution 75-58, discussed below, and clarified how they would be used to discourage use of fresh water for cooling power plants under the Commission's jurisdiction. The Report states that the Commission will approve the use of fresh water for cooling purposes only where alternative water supply sources or alternative cooling technologies are shown to be ‘‘environmentally undesirable" or "economically unsound" (IEPR (2003), p. 41). In the Report, the Commission interpreted "environmentally undesirable" as equivalent to a "significant adverse environmental impact" under CEQA, and "economically unsound" as meaning "economically or otherwise infeasible," also under CEQA (IEPR, p. 41). CEQA and the

Commission's siting regulations define feasible as "capable of being accomplished in a successful manner within a reasonable amount of time," taking into account economic and other factors (Cal. Code Regs., tit. 14, § 15364; tit. 20, § 1702, subd. (f)). At the time of publication in 2003, dry cooling was already feasible for three projects—two in operation and one just permitted (IEPR, p. 39).

The Report also notes California's exploding population, estimated to reach more than 47 million by 2020, a population that will continue to use "increasing quantities of fresh water at rates that cannot be sustained" (IEPR, p. 39).

State Water Resources Control Board Resolutions

The SWRCB not only considers quantity of water in its resolutions, but also the quality of water. In 1975, the Board adopted the *Water Quality Control Policy on the Use and Disposal of Inland Waters Used for Power Plant Cooling* (Resolution 75-58). In it, the Board encourages the use of wastewater for power plant cooling. It also determined that water with a TDS concentration of 1,000 mg/L or less should be considered fresh water (Resolution 75-58). One express purpose of that Resolution was to "keep the consumptive use of fresh water for power plant cooling to that *minimally essential*" for the welfare of the state (*Ibid*; emphasis added).

In 1988, the Board determined that water with TDS concentrations of 3,000 mg/L or less should be protected for and considered as potential supplies for municipal or domestic use unless otherwise designated by one of the Regional Water Quality Control Boards (Resolution 88-63).

Order from the Genesis Solar Project Committee

The Genesis Solar Project Committee considered all these sources of policy to arrive at a simple yet flexible determination for water use by power plants under Commission jurisdiction. The Order states:

> The Committee reads [the policies] as requiring projects seeking to use groundwater for power plant cooling to use the least amount of the worst available water, considering all applicable technical, legal, economic, and environmental factors (Genesis Solar Energy Project Committee, Decision and Scoping Order, Feb. 2, 2010).

Staff carefully considers all relevant factors when conducting analysis and arriving at recommendations for the Commission. Thus, staff must determine what is the least but nevertheless feasible amount of water available for use, and also the worst, feasible available water that applicant could use for particular purposes on a project.

In several cases, the Commission has accepted conservation programs that conserve water in the region as means of accepting compliance with the water policies. Staff takes this to mean that such conservation programs are an acceptable method to ensure compliance for current projects.

Proposed Use of Wet Cooling by the Genesis Solar Energy Project

To summarize, the applicant for the Genesis Solar Energy Project applicant proposes a wet-cooled facility that would use 1,644 acre feet a year (afy) of groundwater from onsite wells. Chuckwalla Valley is the source of groundwater for the project area. The project would pump water from new wells drilled near the project's power blocks. Pumped water would be used for various purposes besides cooling, including domestic use by workers, dust suppression, and mirror washing. Water is the only feasible means of cleaning the mirrors, which must be clean to maintain efficiency of output by parabolic trough solar plants. No use of reclaimed water and no recycling of water is currently proposed. Reject water from the treatment process would be discharged to evaporation ponds. Overall use of water would be inefficient for this technology, requiring 658 afy per 100 MW of capacity, or 2.834 acre feet per gigawatt hour generated versus 60 afy per 100 MW of capacity, or 0.30 acre feet per gigawatt hour generated for dry-cooled technology.

Quality of groundwater varies markedly in the basin and in the immediate project area. Applicant's test drilling found low quality water, with TDS levels of 5,000 mg/l or more, well beyond the CRBRWQCB Basin Plan's definition of municipal water of TDS levels at 3,000 mg/l or less.

The use of groundwater for wet cooling compounds the environmental concerns because the applicant proposes to use evaporation ponds for disposal of the wastewater generated by the wet cooling process. Potential impacts from the use of evaporation ponds could be mitigated consistent with state and local LORS. However, this method of wastewater disposal is not consistent with the Energy Commission's policy that encourages the use of ZLD systems that are designed to eliminate wastewater discharge and inherently conserve water. Therefore, staff finds this method of wastewater disposal does not comply with the state's water policies.

Staff concludes that the GSEP, as proposed by applicant, does not comply with the state's water policies as detailed above. While using poor quality water, and possibly the worst quality water reasonably available for the purposes of the project, the proposed project fails to use the least amount of water available. Staff believes the applicant has not demonstrated that dry cooling is environmentally undesirable nor has it fully demonstrated that it is economically unsound, especially in the light of parallel applications in the same region for dry cooled solar power plants. Therefore, staff recommends that the Commission adopt Condition of Certification **SOIL&WATER-18**, that requires the applicant to submit a Water Conservation Plan that outlines the actions necessary to bring the project cooling water use into compliance with the water policies. Staff would like to work with the applicant between the publication of this SA and the SSA to develop the details of the Water Conservation Plan. Specific options we would like to explore include:

1. Dry-cooling or hybrid cooling systems;

2. Use of a ZLD system;

3. Increase water use efficiency through project design changes such as increasing cycles of concentration for the evaporative cooling processes;

4. Payment for irrigation improvements in Palo Verde Irrigation District;

5. Purchase of water rights within the Colorado River Basin that will be held in reserve;

6. Funding of Tamarisk removal; and,

7. Other water conserving activities in the Colorado River Basin.

After exploring these options, as well as any others the applicant would like to consider, staff will draft a Condition of Certification that identifies the types of activities the applicant could take to ensure the project's conformity with state water policy. The condition could require the Water Conservation Plan to identify the details and descriptions of these activities, including:

a. Feasibility studies and costs;

b. Identification of the activity and water source, and the quantity of basin water that would be conserved;

c. Demonstration of the project owner's legal entitlement to the water or ability to conduct the activity;

d. Discussion of whether any agency, non-government organization, or private property right holders approval of the identified activities will be needed, and, if so, whether additional approval will require compliance with CEQA;

e. Demonstration of how groundwater will be replaced for each of the activities;

f. An estimated schedule for completion of the activities;

g. Performance measures that would be used to evaluate the amount of water replaced by the activities; and

h. Monitoring and Reporting Plan outlining the steps necessary and proposed frequency of reporting to show the activities are achieving the intended conservation.

C.9.10.3 REGIONAL AND LOCAL

Riverside County Ordinance Code, Title 13, Chapter 13.20 – Water Wells

Section 13-.20.160 Well Logs. This section requires that a report of well excavation for all wells dug or bored for which a permit has been issued be submitted to the Riverside County Department of Environmental Health within 60 days after completion of drilling. DWR Form 188 shall satisfy this requirement as stipulated under California Water Code Section 13571.

Section 13.20.190 Water Quality Standards. This section requires that water from wells that provide water for beneficial use shall be tested radiologically, bacteriologically and chemically as indicated by the Riverside County Department of Environmental Health. Laboratory testing must be performed by a State of California-certified laboratory. The results of the testing shall be provided to the County Department of Environmental Health within 90 days of pump installation.

Section 13.20.220 Well Abandonment. This section provides that all abandoned wells shall be destroyed in such a way that they will not produce water or act as a channel for

the interchange of water, and will not present a hazard to the safety and well-being of people or animals. Destruction of any well shall follow requirements stipulated in DWR Bulletin No.74-81, provided that at a minimum the top 50 feet shall be sealed with concrete, or other approved sealing material. Applications for well destruction must be submitted 90 days following abandonment of the well and in accordance with Section 14.08.170.

Section 13.20.240 Declaration of Proposed Reuse. Requires that any well that has not been used for a period of one (1) year shall be properly destroyed unless the owner has filled a "Notice of Intent" with the health officer declaring the well out of service and declaring his intention to use the well again.

Riverside County Ordinance Code, Title 8, Chapter 8.124 - Sewage Discharge

Section 8.124.030, General Requirements for an Approval and Construction Permit. The type, capacity, location, and layout of each private system shall comply with the rules and regulations of the health officer, and the WDRs of the CRBRWQCB. A private system shall be constructed and maintained on the lot which is the site of the building it serves, unless the health officer in his discretion authorizes a different location.

Section 8.124.050 Operation Permits. Each private system shall be managed, cleaned, regulated, repaired, modified and replaced from time to time by the owner or owner's representatives, in accordance with the rules, regulations and other reasonable requirements of the health officer in conformity with the WDR issued by the regional board and in a manner which will safeguard against and prevent pollution, contamination or nuisance.

Riverside County Title 15 Chapter 15, 24 Uniform Plumbing Code

Section 15.24.010. Adopted by Reference,, Appendix K, Section K1 amended – Private Sewage Disposal – General. In certain areas of the County which have poor soils or other problems relative to sewage disposal, the sewage disposal system shall be installed and inspected before the building foundation inspection is made.

Section 15.24.010. Adopted by Reference, Appendix K, Section K6(i) amended – Disposal fields. Disposal fields, trenches, and leaching beds shall not be paved over or covered by concrete or any material that can reduce or inhibit any possible evaporation of the sewer effluent unless the area of the disposal fields, trenches, and leaching beds is increased by a minimum of 25 percent.

Riverside County Title 15 Chapter 15.80 Regulating Flood Hazard Areas and Implementing the National Flood Insurance Program

This ordinance was developed to comply with Title 44 CFR Part 65 regarding requirements for the identification and mapping of areas identified as Federal Emergency Management Agency (FEMA) Special Flood Hazard Areas. The ordinance is applicable to development within unincorporated areas of Riverside County and is integrated into the process of application for development permits under other county ordinances including, but not limited to, Ordinance Nos. 348, 369, 457, 460, and 555. When the information required, or procedures involved, in the processing of such applications is not sufficient to assure compliance with the requirements of Chapter 15.80, a separate application must be filed.

Flood insurance rate maps for the Project site or surrounding areas have not been prepared by FEMA. According to the Riverside County General Plan (Riverside County, 2000) the Project site and surrounding lands do not lie within a 100-year or 500-year flood plain.

C.9.11 NOTEWORTHY PUBLIC BENEFITS

No noteworthy public benefits of the proposed Project were identified associated with soil and water resources.

C.9.12 PROPOSED CONDITIONS OF CERTIFICATION/MITIGATION MEASURES

This section section presents the mitigation, monitoring, compliance, and reporting measures for Soil and Water Resources. For a summary of all proposed Project impacts and their respective mitigation measures, please see the Impact Summary Tables provided at the end of the Executive Summary.

DRAINAGE EROSION AND SEDIMENTATION CONTROL PLAN (DESCP)

SOIL&WATER-1 Prior to site mobilization, the Project owner shall obtain both the BLM's Authorized Officer (AO) and Compliance Project Manager (CPM) approval of the Drainage Erosion and Sedimentation Control Plan (DESCP) for managing stormwater during Project construction and operations as normally administered by the County of Riverside. The DESCP must ensure proper protection of water quality and soil resources, demonstrate no increase in off-site flooding potential, include provisions for sediment and stormwater retention from both the power block, solar fields and transmission right of way to meet Riverside County requirements, address exposed soil treatments in the solar fields for both road and non-road surfaces, and identify all monitoring and maintenance activities. The DESCP shall contain, at minimum, the elements presented below that outline site management activities and erosion and sediment-control BMPs to be implemented during site mobilization, excavation, construction, and post construction (operating) activities.

A. Vicinity Map – A map(s), at a minimum scale 1 inch=100 feet, shall be provided indicating the location of all Project elements (construction sites, laydown area, pipelines) with depictions of all significant geographic features including swales, storm drains, and sensitive areas.

B. Site Delineation – All areas subject to soil disturbance for the proposed Project (Project phases, laydown area, all linear facilities, landscaping areas, and any other Project elements) shall be delineated showing boundary lines of all construction areas and the location of all existing and proposed structures, pipelines, roads, and drainage facilities.

C. Watercourses and Critical Areas – The DESCP shall show the location of all nearby watercourses including swales, storm drains, and drainage

ditches. It shall indicate the proximity of those features to the proposed Project construction, laydown, and landscape areas and all transmission and pipeline construction corridors.

a. The DESCP shall describe how the project will avoid or minimize impacts to Palen-McCoy Valley sand corridor,

b. All proposed linear features (with the exception of Power Pylons) shall be constructed flush with the surrounding ground surface and without ground level obstructions.

D. Drainage Map – The DESCP shall provide a topographic site map(s), at a minimum scale of 1 inch=100 feet, showing existing, interim, and proposed drainage swales and drainage systems and drainage-area boundaries. On the map, spot elevations are required where relatively flat conditions exist. The spot elevations and contours shall be extended off site for a minimum distance of 100 feet.

E. Drainage of Project Site Narrative – The DESCP shall include a narrative of the drainage measures necessary to protect the site and potentially affected soil and water resources within the drainage downstream of the site. The narrative shall include the summary pages from the hydraulic analysis prepared by a professional engineer and erosion control specialist. The narrative shall state the watershed size(s) in acres that was used in the calculation of drainage features.

F. Clearing and Grading Plans – The DESCP shall provide a delineation of all areas to be cleared of vegetation and areas to be preserved. The plan shall provide elevations, slopes, locations, and extent of all proposed grading as shown by contours, cross sections, or other means. The locations of any disposal areas, fills, or other special features shall also be shown. Existing and proposed topography shall be illustrated by tying in proposed contours with existing topography.

G. Clearing and Grading Narrative – The DESCP shall include a table with the quantities of material excavated or filled for the site and all Project elements (Project site, laydown area, transmission and pipeline corridors, roadways, and bridges) whether such excavation or fill is temporary or permanent, and the amount of such material to be imported or exported.

H. Soil Wind and Water Erosion Control - The plan shall address exposed soil treatments to be used during construction and operation of the proposed Project for both road and non-road surfaces including specifically identifying all chemical based dust palliatives, soil bonding, and weighting agents appropriate for use at the proposed Project site that would not cause adverse effects to vegetation. BMPs shall include measures designed to prevent wind and water erosion including application of chemical dust palliatives after rough grading to limit water use. All dust palliatives, soil binders, and weighting agents shall be approved by both the AO and CPM prior to use.

I. **Best Management Practices Plan –** The DESCP shall identify on the topographic site map(s) the location of the site specific BMPs to be employed during each phase of construction (initial grading, Project element excavation and construction, and final grading/stabilization). BMPs shall include measures designed to control dust, stabilize construction access roads and entrances, and control storm water runoff and sediment transport.

J. **Best Management Practices Narrative –** The DESCP shall show the location (as identified in (I) above), timing, and maintenance schedule of all erosion- and sediment-control BMPs to be used prior to initial grading, during all Project element (site, pipelines) excavations and construction, final grading/stabilization, and operation. Separate BMP implementation schedules shall be provided for each Project element for each phase of construction. The maintenance schedule shall include post-construction maintenance of structural-control BMPs, or a statement provided about when such information would be available.

K. **Project Schedule –** The DESCP shall identify on the topographic site map the location of the site-specific BMPs to be employed during each phase of construction (initial grading, Project element construction, and final grading/stabilization). Separate BMP implementation schedules shall be provided for each Project element for each phase of construction.

L. **Erosion Control Drawings –** The erosion-control drawings and narrative shall be designed, stamped and sealed by a professional engineer or erosion control specialist.

M. **Agency Comments –** The DESCP shall include copies of recommendations, conditions, and provisions from the County of Riverside, California Department of Fish and Game (CDFG), and CRBRWQCB.

N. **Monitoring Plan:** Monitoring activities shall include routine measurement of the volume of accumulated sediment in the onsite drainage ditches, and storm water diversions. The monitoring plan shall be part of the Channel Monitoring and Maintenance Plan, **SOIL&WATER-13.**

Verification: No later than 90 days prior to start of site mobilization, the Project owner shall submit a copy of the final DESCP to the County of Riverside, the CRBRWQCB, and both the AO and CPM for review and comment. No later than 60 days prior to start of site mobilization, the Project owner shall submit the DESCP with the County's and CRBRWQCB's comments to the both the AO and CPM for review and approval. Both the AO and CPM shall consider comments by the county and CRBRWQCB before approval of the DESCP.

The DESCP shall be consistent with the grading and drainage plan as required by Condition of Certification **CIVIL-1**, and relevant portions of the DESCP shall clearly show approval by the chief building official. The DESCP shall be a separate plan

from the SWPPP developed in conjunction with any NPDES permit for Construction Activity. The Project owner shall provide in the monthly compliance report with a narrative on the effectiveness of the drainage, erosion, and sediment-control measures and the results of monitoring and maintenance activities. Once operational, the Project owner shall update and maintain the DESCP for the life of the Project and shall provide in the annual compliance report information on the results of monitoring and maintenance activities.

NPDES STORMWATER PERMIT-CONSTRUCTION ACTIVITY

SOIL&WATER-2 In the event it is determined the project will discharge to water of the US, the Project owner shall comply with the requirements of the general National Pollutant Discharge Elimination System (NPDES) permit for discharge of stormwater associated with construction activity. The Project owner shall develop, obtain both the AO and CPM approval of, and implement a Storm Water Pollution Prevention Plan (SWPPP) for the construction of the GSEP phases, laydown area, and all linear facilities.

Verification: At least 60 days prior to site mobilization, the Project owner shall submit to both the AO and CPM a copy of the final construction SWPPP for review and approval prior to site mobilization. The Project owner shall retain a copy at the Project site. The Project owner shall submit copies to the both the AO and CPM all correspondence between the Project owner and the CRBRWQCB regarding the NPDES permit for the discharge of stormwater associated with construction activity within 10 days of its receipt or submittal. Copies of correspondence shall include the notice of intent sent to the SWRCB, and the SWRCB confirmation letter indicating receipt and acceptance of the notice of intent.

PROJECT GROUNDWATER WELLS, PRE-WELL INSTALLATION

SOIL&WATER-3 The Project owner proposes to construct and operate up to two onsite groundwater production wells that produce water from the CVGB. The Project owner shall ensure that the wells are completed in accordance with all applicable state and local water well construction permits (see C.9.9.2) and requirements. Prior to initiation of well construction activities, the Project owner shall submit for review and comment a well construction packet to the County of Riverside and fees normally required for the county's well permit, with copies to both the AO and CPM. The Project shall not construct a well or extract and use groundwater until both the AO and CPM provide approval to construct and operate the well.

Post-Well Installation. The Project owner shall provide documentation to both the AO and CPM that the well has been properly completed. In accordance with California's Water Code section 13754, the driller of the well shall submit to the DWR a Well Completion Report for each well installed. The Project owner shall ensure the Well Completion reports are submitted. The Project owner shall ensure compliance with all county water well standards and requirements for the life of the wells and shall provide the AO and CPM with two (2) copies each of all monitoring or other reports required for compliance with the County of Riverside water well standards and

operation requirements, as well as any changes made to the operation of the well.

Verification: The Project owner shall do all of the following:

A. No later than sixty (60) days prior to the construction of the onsite groundwater production wells, the Project owner shall submit to both the AO and CPM a copy of the water well construction packet submitted to the County of Riverside.

B. No later than thirty (30) days prior to the construction of the onsite groundwater production wells, the Project owner shall submit a copy of written concurrence received from the County of Riverside that the proposed well construction activities comply with all county well requirements and meet the requirements established by the county's water well permit program.

C. No later than sixty (60) days after installation of each well at the Project site, the Project owner shall ensure that the well driller submits a Well Completion Report to the DWR with a copy provided to both the AO and CPM. The Project owner shall submit to both the AO and the CPM, together with the Well Completion Report, a copy of well drilling logs, water quality analyses, and any inspection reports.

D. During well construction and for the operational life of the well, the Project owner shall submit two (2) copies each to the AO and CPM of any proposed well construction or operation permit changes within ten (10) days of submittal to or receipt from the County of Riverside.

E. No later than fifteen (15) days after completion of the onsite groundwater production wells, the Project owner shall submit documentation to BLM's Authorized Officer, the CPM, and the CRBRWQCB that well drilling activities were conducted in compliance with Title 23, California Code of Regulations, Chapter 15, Discharges of Hazardous Wastes to Land, (23 CCR, sections 2510 et seq.) requirements and that any onsite drilling sumps used for Project drilling activities were removed in compliance with 23 CCR section 2511(c).

CONSTRUCTION AND OPERATION WATER USE

SOIL&WATER-4 The Project owner proposes to use groundwater for water supply during construction and during operation. The proposed Project's use of groundwater during construction shall not exceed 1,368 afy during the 37 months of construction and 1,644 afy during operation. Water quality used for project construction and operation will be reported in accordance with Condition of Certification **SOIL&WATER-20** to ensure compliance with this condition.

Prior to the use of groundwater for construction, the Project owner shall install and maintain metering devices as part of the water supply and distribution system to document Project water use and to monitor and record in gallons per day the total volume(s) of water supplied to the Project from this water source. The metering devices shall be operational for the life of the Project.

Verification: At least sixty (60) days prior to the start of construction of the proposed Project, the Project owner shall submit to both the AO and CPM a copy of evidence that metering devices have been installed and are operational.

Beginning six (6) months after the start of construction, the Project owner shall prepare a semi-annual summary of amount of water used for construction purposes. The summary shall include the monthly range and monthly average of daily water usage in gallons per day.

The Project owner shall prepare an annual summary, which will include daily usage, monthly range and monthly average of daily water usage in gallons per day, and total water used on a monthly and annual basis in acre-feet. For years subsequent to the initial year of operation, the annual summary will also include the yearly range and yearly average water use by source. For calculating the total water use, the term "year" will correspond to the date established for the annual compliance report submittal.

GROUNDWATER LEVEL MONITORING, MITIGATION, AND REPORTING

SOIL&WATER-5 The Project owner shall submit a Groundwater Level Monitoring and Reporting Plan to both the AO and CPM for review and approval. The Groundwater Level Monitoring and Reporting Plan shall provide detailed methodology for monitoring background and site groundwater levels. Monitoring shall include pre-construction, construction, and Project operation water use. The primary objective for the monitoring is to establish pre-construction and Project related groundwater level trends that can be quantitatively compared against observed and simulated trends near the Project pumping wells and near potentially impacted existing wells.

The Project Owner shall:

A. Prior to Project Construction

1. Monitor to establish preconstruction base-line conditions. The monitoring plan and network of monitoring wells may make use of existing wells in the basin that would satisfy the requirements for the monitoring program. The monitoring plan shall also include the identification of any seeps and or springs within one mile of the perimeter of the project site. The seeps and or springs shall be included in the groundwater level monitoring network.

2. Collect groundwater levels from the off-site and on-site wells, seeps and or springs to provide baseline groundwater levels for both on-site and off-site wells.

3. Map groundwater levels within the CVGB from the groundwater data collected prior to construction. Update trend plots and statistical analyses, as data is available.

B. During Construction:

1. Collect water levels within the monitoring network and seeps and or springs on a quarterly basis throughout the construction period and at the end of the construction period. Perform statistical trend analysis for water levels and the water quality data. Assess the significance of an apparent trend and estimate the magnitude of that trend.

C. During Operation:

1. On a quarterly basis for the first five years of operation, collect water level measurements from the wells and seeps and or springs identified in the groundwater monitoring program to evaluate operational influence from the Project. Quarterly operational parameters (i.e., pumping rate) of the water supply wells shall be monitored. Additionally, quarterly groundwater-use in the CVGB shall be estimated.

2. On an annual basis, perform statistical trend for water levels. Analysis of the significance of an apparent trend shall be determined and the magnitude of that trend estimated. Based on the results of the statistical trend analyses, the Project owner shall determine if the Project pumping has induced a drawdown in the water supply at a level of 5 feet or more below the baseline trend.

3. If water levels have been lowered below pre-site operational trends, and monitoring data provided by the Project owner show these water level changes are different from background trends and are caused by Project pumping, then the Project owner shall provide mitigation to the well owner(s) if impacted. Mitigation shall be provided if the both the AO and CPM's inspection of the well monitoring data confirms changes to water levels and water level trends relative to measured pre-project water levels, and the well yields outside the Project have been lowered by Project pumping. The type and extent of mitigation shall be determined by the amount of water level decline and site specific well construction and water use characteristics. The mitigation of impacts shall be determined as follows:

    a. If Project pumping has lowered water levels and increased pumping lifts, increased energy costs shall be calculated. Payment or reimbursement for the increased costs shall be provided at the option of the affected well owner.

    b. If groundwater monitoring data indicate Project pumping has lowered water levels below the top of the well screen, and the well yield is shown to have decreased by 10 percent or more of the initial yield, compensation shall be provided for the diagnosis and maintenance to treat and remove encrustation from the well screen. Reimbursement shall be provided at an amount equal to the customary local cost of performing the necessary diagnosis and maintenance for well screen encrustation. Should well yield

reductions be reoccurring, the Project owner shall provide payment or reimbursement for either periodic maintenance throughout the life of the Project or, if treatment is anticipated to be required more frequently than every 3-5 years, replacement of the well.

c. If Project pumping has lowered water levels to significantly impact well yield or cause casing collapse, payment or reimbursement of an amount equal to the cost of deepening or replacing the well shall be provided to accommodate these effects. Payment or reimbursement shall be at an amount equal to the customary local cost of deepening the existing well or constructing a new well. The demand for water, which determines the required well yield, shall be determined on a per well basis using well owner interviews and field verification of property conditions and water requirements compiled as part of the pre-project well reconnaissance. Well yield shall be considered significantly impacted if it is incapable of meeting 150 percent of the well owner's maximum daily demand, dry-season demand, or annual demand – assuming the pre-project well yield documented by the initial well reconnaissance met or exceeded these yield levels. For already low-yielding wells identified prior to Project construction, a reduction due solely to Project pumping of 10 percent or more below the pre-project yield shall be considered a significant impact. The contribution of Project pumping to observed decreases in observed well yield shall be determined using the groundwater monitoring data collected.

d. Electrical cost reimbursement – If the pumping water level falls below a depth of 5 feet from an average of the baseline measurements, the well owner shall be compensated by the Project owner for the additional electrical costs commensurate with the additional lift required to pump. The water level in the well will be assessed relative to the pumping rate established during the pre-site development period.

e. The Project owner shall notify all owners of the impacted wells within one month of both the AO and CPM approval of the compensation analysis for increased energy costs.

f. Pump lowering – In the event that groundwater is lowered to an extent where pumps are exposed but well screens remain submerged the pumps shall be lowered to maintain production in the well. All costs associated with lowering pumps shall be borne by the Project owner.

g. Deepening of wells – If the groundwater is lowered enough that well screens are exposed, pump lowering is not an option. In this case, the wells shall be deepened or new wells constructed. All costs associated with deepening existing wells or constructing new wells shall be borne by the Project owner.

4. After the first five-year operational and monitoring period both the AO and CPM shall evaluate the data and determine if the monitoring program water level measurement frequencies should be revised or eliminated. Revision or elimination of any monitoring program elements shall be based on the consistency of the data collected. The determination of whether the monitoring program should be revised or eliminated shall be made by the both the AO and CPM.

5. At the end of every subsequent five-year monitoring period, the collected data shall be evaluated by the both the AO and CPM and they shall determine if the sampling frequency should be revised or eliminated.

6. During the life of the Project, the Project owner shall provide to the both the AO and CPM all monitoring reports, complaints, studies and other relevant data within 10 days of being received by the Project owner.

Verification: The Project owner shall do all of the following:

1. At least 30 days prior to Project construction, the Project owner shall submit to the both the AO and CPM, a comprehensive report presenting all the data and information required in item A above.

2. The Project owner shall submit to the both the AO and CPM all calculations and assumptions made in development of the report data and interpretations.

3. During Project construction, the Project owner shall submit to the both the AO and CPM quarterly reports presenting all the data and information required in item B above.

4. The Project owner shall submit to the both the AO and CPM all calculations and assumptions made in development of the report data and interpretations.

5. No later than 60 days prior to Project operation, the Project owner shall provide to the both the AO and CPM for review and approval, documentation showing that any mitigation to private well owners during Project construction was satisfied, based on the requirements of the property owner as determined by both the AO and CPM.

6. During Project operation, the Project owner shall submit to the both the AO and CPM, applicable quarterly and annual reports presenting all the data and information required in item C above.

7. The Project owner shall submit to the both the AO and CPM all calculations and assumptions made in development of report data and interpretations, calculations, and assumptions used in development of any reports.

8. The Project owner shall provide mitigation as described in item 3.c above, if the both the AO and CPM's inspection of the monitoring information confirms changes to water levels and water level trends relative to measured pre-project water levels, and well yield has been lowered by Project pumping. The type and extent of

mitigation shall be determined by the amount of water level decline and site specific well construction and water use characteristics. The mitigation of impacts will be determined as set forth in item 3.c above.

9. If mitigation includes monetary compensation, the Project owner shall provide documentation to the both the AO and CPM that compensation payments have been made by March 31 of each year of Project operation or, if lump-sum payment are made, payment is made by March 31 following the first year of operation only. Within 30 days after compensation is paid, the Project owner shall submit to the both the AO and CPM a compliance report describing compensation for increased energy costs necessary to comply with the provisions of this condition.

10. After the first five year operational and monitoring period, the Project owner shall submit a 5 year monitoring report to both the AO and CPM that submits all monitoring data collected and provides a summary of the findings. Both the AO and CPM will determine if the water level measurement frequencies should be revised or eliminated.

WASTE DISCHARGE REQUIREMENTS

SOIL&WATER-6 Conditions to require implementation of waste discharge requirements for LTU and surface impoundments are currently in development and will be included in the SA/FEIS.

SEPTIC SYSTEM AND LEACH FIELD REQUIREMENTS

SOIL&WATER-7 The project owner shall comply with the requirements of the County of Riverside Ordinance Code Title 8, Chapter 8.124 and the California Plumbing Code (California Code of Regulations Title 24, Part 5) regarding sanitary waste disposal facilities such as septic systems and leach fields. The septic system and leach fields shall be designed, operated, and maintained in a manner that ensures no deleterious impact to groundwater or surface water. Compliance shall include an engineering report on the septic system and leach field design, operation, maintenance, and loading impact to groundwater.

Verification: The project owner shall submit all necessary information and the appropriate fee to the County of Riverside to ensure that the project has complied with county sanitary waste disposal facilities requirements. Written assessments prepared by the County of Riverside regarding the project's compliance with these requirements must be submitted to the AO and CPM for review and approval 30-days prior to the start of power plant operation.

REVISED PROJECT DRAINAGE REPORT AND PLANS

SOIL&WATER-8 The Project owner shall provide a revised Drainage Report which includes the following additional information:

A. Channel rating calculations for all the collector/conveyance channels and onsite drainage channels. Data provided shall include depth, velocity, Froude number and other relevant hydraulic parameters.

B. Detailed scour calculations to justify toe-down depths for all soil cement segments, drop structures, slope protection, and any other features where scour is an issue.

C. A discussion and associated calculation documenting the methods to be used for erosion control at outlet locations along the southern property boundary where flow is released to existing ground.

D. Revised hydrology map showing peak discharge values at locations where the onsite drainage system discharges into the proposed detention basins, or directly offsite, including discharge values at each of the outlet structures along the southern project boundary.

E. Stage-discharge ratings calculations for all outlet structures (i.e. pipes and weirs) used to outlet water along the southern project boundary.

F. Digital copies of all hydrologic and hydraulic analysis.

The Project owner shall also provide the 30 percent Grading and Drainage Plans which include the design based on information provided in the revised Drainage Report outlined above.

Verification: The Project owner shall submit a Revised Project Drainage Report with the 30 percent Grading and Drainage Plans to both the AO and CPM for their review and comments 30 days after project certification. The owner will address comments provided by both the AO and CPM until approval of the report is issued. All comments and concepts presented in the approved Revised Project Drainage Report with the 30 percent Grading and Drainage Plans will be included in the final Grading and Drainage Plans. The Revised Project Drainage Report and 30 percent Grading and Drainage Plans shall be approved by both the AO and CPM.

DETAILED FLO-2D ANALYSIS

SOIL&WATER-9 The Project owner shall provide a revised FLO-2D analysis which models the post-development flood conditions for the 10-, 25- and 100-year storm events along the southern project boundary where flow is released to existing ground. The post-development model must include all outlet structure in the model with appropriate elevations and stage-discharge data. The methods and results of the analysis must be fully documented in the revised Project Drainage Report required in **Soil&Water-8**. Graphical output must include depth and velocity mapping for the post-development condition. Color shading schemes used for the mapping must be consistent between all maps as well as clear and easily differentiated between designated intervals for hydraulic parameters. Intervals to be used in the mapping are as follows:

- Flow Depth: at 0.20 ft intervals up to 1 ft, and 0.40 ft intervals thereafter.
- Velocity: 0.5 ft/s intervals

A set of figures will be provided for the 10-, 25- and 100-year events at a scale of no less than 1 in=200 ft which show the extent, depths and velocities of flows being

discharged along the southern property boundary, as well as annotation indicating the location and type of outlet structure. Digital input and output files associated with the FLO-2D analysis must be included with all submittals.

The results of this analysis will be used for design of the 30 percent project grading and drainage plans

Verification: The Project owner shall submit a detailed FLO-2D analysis to both the AO and CPM for their review and comments with the 30 percent Grading and Drainage Plans and revised Project Drainage Report required in **Soil&Water-8**. The Project owner will address comments provided by both the AO and CPM until approval of the analysis is issued.

DRAINAGE CHANNEL DESIGN

SOIL&WATER-10 All collector and conveyance channels shall be constructed consistent with Riverside County Flood Control and Water Conservation District (RCFCWCD) guidelines where applicable. Deviation from those guidelines should be documented in the Project drainage report along with justification. Grade control structures shall be utilized where needed to meet channel velocity and Froude number requirements. Channels shall be sized along discreet sections based on the results of the detailed FLO-2D analysis described in **SOIL&WATER-9**. All grade control and drop structures shall have adequate toe-down to account for the design drop plus two additional feet to account for potential downcutting of the channel over time.

Channel confluence design must be given special consideration, especially as the preliminary Grading and Drainage Plans show 90 degree angles of confluence at nearly all locations. The issues of confluence hydraulics and potential scour shall be specifically addressed in the revised Drainage Report.

Offsite flows shall discharge directly into collector channels following the natural drainage patterns. The Project owner shall also flatten constructed channel side slopes at a 4:1 ratio along reaches requiring soil cement.

The proposed collector channel design must be fully documented in the Grading and Drainage plans and must include the following information:

A. Detailed and accurate cut/fill lines demonstrating in plan view how the channel would tie into existing grade and the solar facility.

B. Channel cross-sections at 100-foot intervals showing the channel geometry, existing grade, proposed grade at the facility and how the channel would tie in at on both sides.

C. Detailed channel profiles showing existing and finished grades at channel flow line and left and right banks. All drop structures as well as the toe-of soil cement profile must also be shown and fully annotated. The 100-year water surface elevation will be provided on all profiles.

D. Typical sections and design details for all discreet channel sections, drop structures, channel confluences, flow dispersion structures and other relevant drainage features.

E. Details for all outlet structures to be used along the downstream property boundary to release flow from the engineered channels to existing ground as well as details and specifications for all erosion protection measures to be used at those locations.

F. Consistent nomenclature and stationing on all plans, sections, profiles and details.

Verification: The Project owner shall prepare preliminary, 30 percent channel design drawings and submit two (2) copies for both the AO and CPM review and comment. The preliminary design drawings shall be submitted at the same time as the **Revised Project Drainage Report** in **SOIL&WATER-8** and FLO 2D Analysis in **SOIL&WATER-9**. The Project owner will update and modify the design as necessary to obtain both the AO and CPM approval.

CHANNEL EROSION PROTECTION

SOIL&WATER–11 The Project owner must provide revised preliminary Grading and Drainage Plans which incorporate the items and information as listed below for the channels designated as A, B, C, D, E, B/C, D/E on the Conceptual Grading Plans (GSEP 2010a).

A. Soil cement bank protection must be provided such that the channels are protected from bank erosion and lateral headcutting. The extents of the proposed bank protection must be shown on the revised Grading and Drainage Plans. Typical sections for these channels must show the layout of the bank protection including thickness, width and toe-down location and depth consistent with the scour calculation provided in the revised Drainage Report.

B. Soil cement bank protection shall be provided on both channel banks wherever 10-year channel flow velocity exceeds 5 ft/s. It shall be provided on the outer channel bank wherever offsite topography and a detailed FLO-2D analysis indicate surface flow would enter the collector channels.

C. Soil cement bank protection shall be provided at all channel confluences of otherwise unlined channels where the result of the detailed hydraulic analysis presented in the revised Drainage Report indicate the increased potential for erosion due to adverse angles of confluence. Detailed plans for each confluence showing the extents of the soil cement based on specific hydraulic conditions shall be provided in the formal Grading and Drainage Plans.

D. Other methods of channel stabilization, such as dumped riprap or gabions, will not be permitted. Bio-stabilization measures are not permitted.

E. Earthen berms used on the outside of collector channels to guide flow to discreet points of discharge into a channel shall not be utilized in lieu of soil cement on the outside bank of collector channels. Offsite flows shall discharge directly into collector channels.

F. The plans shall include reference to regionally accepted specifications for soil cement production and construction. A copy of the specification must be submitted with the revised plans.

G. A soils report indicating the suitability of the Project soils for use in the production of soil cement to the Project specifications shall be submitted with the revised Grading and Drainage Plans.

H. The bottom of engineered collector channels may be left earthen or fully lined at the discretion of the engineer. Fully lined channels will have higher allowable velocities and Froude numbers assuming hydraulic jumps are modeled and considered in the channel design.

I. If modifications to the existing drainages to allow construction of and future access to linear facilities require stabilization of the channel in the vicinity of those modifications, location of disturbance to the existing drainages shall be stabilized consistent with best engineering practice to eliminate future negative impacts to those drainages upstream and downstream of the linear facility in the form of downcutting, erosion and headcutting. The use of "non-engineered" culvert crossings shall not be allowed. All structures to be utilized in existing drainages along linear facilities shall be documented in the project drainage report and reflected in the project improvement plans. Channel erosion mitigation measures along linear facilities shall be subject to all the requirements of this Condition of Certification where applicable.

Verification: The required information and criteria shall be incorporated into the Grading and Drainage Plans and with all subsequent submittals as required in **SOIL&WATER-8** through **SOIL&WATER-10**. The Project owner will update and modify the design as necessary to obtain both the AO and CPM approval.

NPDES STORMWATER PERMIT- INDUSTRIAL ACTIVITY

SOIL&WATER-12 In the event it is determined the project will discharge to waters of the US, the Project owner shall comply with the requirements of the general NPDES permit for discharges of storm water associated with industrial activity. The Project owner shall develop, obtain both the AO and CPM approval of, and implement an industrial SWPPP for the operation of the Project.

Verification: At least 60 days prior to commercial operation, the Project owner shall submit to the both the AO and CPM a copy of the final industrial SWPPP for operation of the Project for review and approval prior to commercial operation. The Project owner shall retain a copy on site. The Project owner shall submit copies to the both the AO and CPM of all correspondence between the Project owner and the CRBRWQCB regarding the general NPDES permit for discharge of storm water associated with

industrial activity within 10 days of its receipt or submittal. Copies of correspondence shall include the Notice of Intent sent by the Project owner to the SWRCB.

CHANNEL MAINTENANCE PROGRAM

SOIL&WATER-13 The Project owner shall develop and implement a Channel Maintenance Program that provides long-term guidance to implement routine channel maintenance projects and comply with conditions of certification in a feasible and environmentally-sensitive manner. The Channel Maintenance Program will be a process and policy document prepared by the Project owner, reviewed by both the AO and CPM. The Channel Maintenance Program shall include the following:

A. Purpose and Objectives – establishes the main goals of the Program, of indefinite length, to maintain the diversion channel to meet its original design to provide flood protection, support GSEP mitigation, protect wildlife habitat and movement/ migration, and maintain groundwater recharge.

B. Application and Use - The channel maintenance work area is defined as the GSEP engineered channel, typically extending to the top of bank, include access roads, and any adjacent property that GSEP owns or holds an easement for access and maintenance. The Program would include all channel maintenance as needed to protect the GSEP facilities and downstream property owners.

C. Channel Maintenance Activities

1. **Sediment Removal** - sediment is removed when it: (1) reduces the diversion channel effective flood capacity, to less than the design discharge, (2) prevents appurtenant hydraulic structures from functioning as intended, and (3) becomes a permanent, non-erodible barrier to instream flows.

2. **Vegetation Management** - manage vegetation in and adjacent to the diversion channel to maintain the biological functions and values proposed in the mitigation. Vegetation management shall include control of invasive or nonnative vegetation as prescribed in Condition of Certification **BIO-14**.

3. **Bank Protection and Grade Control Repairs** – Bank protection and grade control structure repairs involve any action by the Project owner to repair eroding banks, incising toes, scoured channel beds, as well as preventative erosion protection. The Project owner would implement instream repairs when the problem: (1) causes or could cause significant damage to GSEP; adjacent property, or the structural elements of the diversion channel; (2) is a public safety concern; (3) negatively affects groundwater recharge; or (4) negatively affects the mitigation vegetation, habitat, or species of concern.

4. **Routine Channel Maintenance** - trash removal and associated debris to maintain channel design capacity; repair and installation of fences, gates and signs; grading and other repairs to restore the original contour of access roads and levees (if applicable); and removal of flow obstructions at GSEP storm drain outfalls.

5. **Channel Maintenance Program –** Exclusions including: emergency repair and CIP.

D. Related Programmatic Documentation – both the AO and CPM will review and approve the Channel Maintenance Program programmatic documentation. Maintenance activities shall comply with the stream alteration agreement provisions and requirements for channel maintenance activities consistent with California's endangered species protection regulations and other applicable regulations.

E. Channel Maintenance Process Overview

1. **Program Development and Documentation** – This documentation provides the permitting requirements for channel maintenance work in accordance with the conditions of certification for individual routine maintenance of the engineered channel without having to perform separate CEQA/NEPA review or obtain permits.

2. **Maintenance Guidelines** - based on two concepts: (1) the maintenance standard and (2) the acceptable maintenance condition, and applies to sediment removal, vegetation management, trash and debris collection, blockage removal, fence repairs, and access road maintenance.

3. **Implementation** – Sets Maintenance Guidelines for vegetation and sediment management. GSEP's vegetation management activities are established in Condition of Certification **BIO-14**. Maintenance Guidelines for sediment removal provide information on the allowable depth of sediment for the engineered channel that would continue to provide design discharge protection.

4. **Reporting** – both the AO and CPM requires the following reports to be submitted each year as part of the Annual Compliance Report:

   a. Channel Maintenance Work Plan - Describes the planned "major" maintenance activities and extent of work to be accomplished; and

   b. Channel Maintenance Program Annual Report – Specifies which maintenance activities were completed during the year including type of work, location, and measure of the activity (e.g. cubic yards of sediment removed).

   c. A report describing "Lessons Learned" to evaluate the effectiveness of both resource protection and maintenance methods used throughout the year.

F. Resource Protection Policies - establishes policies to ensure that resources would be protected to the fullest extent feasible during routine channel maintenance activities. Policies would be developed to guide decision-making for channel maintenance activities. BMPs shall be developed to implement these policies.

Verification: At least 60 days prior to the start of any project-related site disturbance activities, the Project owner shall coordinate with both the AO and CPM to develop the Channel Maintenance Program. The Project owner shall submit two copies of the programmatic documentation, describing the proposed Channel Maintenance Program, to the both the AO and CPM (for review and approval). The Project Owner shall provide written notification that they plan to adopt and implement the measures identified in the approved Channel Maintenance Program. The Project owner shall:

- Supervise the implementation of a Channel Maintenance Program in accordance with conditions of certification;
- Ensure the GSEP Construction and Operation Managers receive training on the Channel Maintenance Program;
- As part of the GSEP Annual Compliance Report to the both the AO and CPM , submit a Channel Maintenance Program Annual Report specifying which maintenance activities were completed during the year including type of work, location, and measure of the activity (e.g. cubic yards of sediment removed).

CLOSURE AND DECOMMISSIONING PLAN

SOIL&WATER–14 The Project owner shall identify likely decommissioning scenarios and develop specific decommissioning plans for each scenario that will identify actions to be taken to avoid or mitigate long-term impacts related to water and wind erosion after decommissioning. Actions may include such measures as a decommissioning SWPPP, revegetation and restoration of disturbed areas, post-decommissioning maintenance, collection and disposal of project materials and chemicals, and access restrictions.

Verification: At least 90 days prior to the start of site mobilization, the Project owner shall submit decommissioning plans to the AO and CPM for review and approval. The Project owner shall amend these documents as necessary, with approval from the AO and CPM, should the decommissioning scenario change in the future.

MITIGATION OF COLORADO RIVER IMPACTS

SOIL&WATER–15 The Project owner shall undertake one or more of the activities identified below to mitigate project impacts to flows in the Colorado River. These activities shall result in replacement of 51,920 acre feet or 1,644 AFY under wet cooling Project or 6,560 acre feet or 132 AFY for a dry cooling Project alternative in the Colorado River Basin over the life of the project.

The Project owner shall first consider the use of dry cooling for project operation, and mitigate any remaining project impacts on the Colorado River.

If dry-cooling is not used for project operation then the activities may include water conservation projects in the following order of priority: Zero Liquid Discharge systems, increase cycles of concentration in the evaporative cooling process, hybrid cooling, payment for irrigation improvements in Palo Verde Irrigation District, purchase of water rights within the Colorado River Basin that will be held in reserve, and/or BLM's Tamarisk Removal Program.

The activities proposed for mitigation will be outlined in a Water Supply Plan that will be provided to the CPM and AO for review and approval.

If the project owner has filed an application to the Colorado River Board to obtain an allocation of water from the Colorado River, obtaining an allocation of 51,920 acre feet or 1,644 AFY under a wet cooling Project alternative or 6,560 acre feet or 132 AFY for a dry cooling Project alternative will meet the requirements of this condition.

The Project owner can choose to refine the estimate of the quantity of water attributed to flow from the Colorado River by implementing **SOIL&WATER-19.** If a lesser volume of water is determined to be diverted from the Colorado River as a result of project pumping pursuant to **SOIL&WATER-19**, that lesser volume shall be replaced in accordance with this Condition

Verification: The Project Owner shall submit a Water Supply Plan to the CPM and AO for review and approval 30 days before the start of extraction of groundwater for construction or operation. The Water Supply Plan shall include the following at a minimum:

a. Identification of the activity and water source that will replace 51,920 acre feet or 1,644 AFY under a wet cooling Project alternative or 6,560 acre feet or 132 AFY for a dry cooling Project alternative diverted from the Colorado River over the life of the project;

b. Demonstration of the project owner's legal entitlement to the water or ability to conduct the activity;

c. Include a discussion of any needed governmental approval of the identified activities, including a discussion of whether that approval that requires ;

d. Discuss whether any governmental approval of the identified activities will be needed, and, if so, whether additional that approval will require compliance with CEQA or NEPA;

e. Demonstration of how water diverted from the Colorado River will be replaced for each of the activities;

f. An estimated schedule for completion of the activities;

g. Performance measures that would be used to evaluate the amount of water replaced by the activities;

h. Monitoring and Reporting Plan outlining the steps necessary and proposed frequency of reporting to show the activities are achieving the intended benefits and replacing Colorado River diversions; and

i. If the application for allocation from the Colorado River is accepted by the USBR, the project owner shall submit to both AO and the CPM for their approval, a copy of a water allocation from the Colorado River issued by the CRB for the Projects diversion of Colorado River water.

The project owner shall implement the activities reviewed and approved in the Water Supply Plan in accordance with the agreed upon schedule in the Water Supply Plan. If agreement on identification or implementation of mitigation activities cannot be achieved the project owner shall immediately halt construction or operation until assurance that the agreed upon activities can be identified and implemented.

GROUNDWATER PRODUCTION REPORTING

SOIL&WATER–16 The Project is subject to the requirement of Water Code Sections 4999 et. seq. for reporting of groundwater production in excess of 25 acre feet per year.

Verification: The Project Owner shall file an annual "Notice of Extraction and Diversion of Water" with the SWRCB in accordance with Water Code Sections 4999 et. seq. The Project Owner shall include a copy of the filling in the annual compliance report.

GROUND SUBSIDENCE MONITORING AND ACTION PLAN

SOIL&WATER–17 Three extensometers shall be constructed to measure potential inelastic subsidence that may alter surface characteristics of the Chuckwalla Valley near the proposed production wells. The applicant will be required to:

A. Prepare and submit a Subsidence Monitoring Plan (SMP). The plan shall include the following elements:

   1. Construction diagrams of the proposed extensometers including borehole size, planned depth of anchor point(s), measuring points,

   2. Map depicting locations (minimum of three) of the planned extensometers;

   3. Monitoring program that includes monitoring frequency, thresholds of significance, reporting format.

B. Prepare quarterly reports commencing 3 months following commencement of groundwater production during construction and operations.

   1. The reports will include presentation and interpretation of the data collected including comparison to the thresholds developed in Item C.

C. Prepare a Mitigation Action Plan that will detail the following:

1. Thresholds of significance for implementation of proposed action plan;

a. Any subsidence that may occur will not be allowed to damage existing structures either on or off the site or alter the appearance or use of the structure;

b. Any subsidence that may occur will not be allowed to alter the natural drainage patterns or permit the formation of playas or lakes to form;

c. Any subsidence that violates (a) or (b) will result in the Project owner immediately reducing/ceasing pumping until subsidence abates and the structures or drainage patterns are returned to their pre-subsidence conditions.

2. Action Plan that details proposed actions by the applicant in the event thresholds are achieved during the monitoring program

The applicant will be required to submit the Ground Subsidence Monitoring and Action Plan that is prepared by an Engineering Geologist registered in the State of California 30 days prior to the start of extraction of groundwater for construction or operation.

Verification: The Project owner shall do all of the following:

1. At least 30 days prior to Project construction, the Project owner shall submit to the both the AO and CPM, a comprehensive report presenting all the data and information required in item A above.

2. The Project owner shall submit to the both the AO and CPM all calculations and assumptions made in development of the SMP.

3. During Project construction and operations, the Project owner shall submit to the both the AO and CPM quarterly reports presenting all the data and information required in item B above.

4. The Project owner shall submit to the both the AO and CPM all calculations and assumptions made in development of the report data and interpretations.

5. After the first five years of the monitoring period, the Project owner shall submit a 5 year monitoring report to both the AO and CPM that submits all monitoring data collected and provides a summary of the findings. Both the AO and CPM will determine if the Ground Subsidence Monitoring and Action Plan frequencies should be revised or eliminated.

WATER POLICY COMPLIANCE

SOIL&WATER-18 Pending agreement on the actions needed to bring the project into compliance with the water policy.

ESTIMATION OF COLORADO RIVER IMPACTS

SOIL&WATER-19 The Project owner may choose to refine the estimates of the amount of subsurface water flowing from the Colorado River due to project pumping. This estimate may be used for determining the appropriate volume of water for mitigation in accordance with **SOIL&WATER-15**. The Project owner shall do the following to provide an estimate for review and approval by the AO and CPM:

1. The Project owner shall conduct a detailed analysis of the contribution of Colorado River water to the PVMGB from the Projects groundwater extraction activities. The detailed analysis shall include:

   a. The development of a conceptual model

   b. The use of a numerical model.

   c. Reporting of the results of the modeling effort

   d. Estimation of the contribution of Colorado River water and groundwater from the adjacent Palo Verde Valley Groundwater Basin to the Palo Verde Mesa Groundwater Basin as a result of Project groundwater extraction in the CVGB.

2. The analysis shall include development of a conceptual model that includes a detailed description of the: geology; hydrogeology; boundary conditions; aquifer homogeneity/heterogeneity, recharge estimates, discharge estimates, flow regime and water balance.

   The development of the conceptual model shall be based on existing data. In instances where available data is deficient, assumptions shall be developed along with the basis of the assumptions. The conceptual model shall be the basis for the numerical model.

3. The development of the numerical model shall include development of the grid orientation, cell size, and layering in sufficient detail to provide information concerning inflow from adjacent groundwater basins and boundaries including the Colorado River and the adjacent Palo Verde Valley Groundwater Basin for the life of the project. Model input data shall be developed for each of the boundary conditions and aquifer properties identified in the Conceptual Model.

   The numerical model shall be run under steady-state conditions using groundwater heads from existing wells in the basin. The numerical model shall include calibration of the model with existing conditions including simulation of groundwater levels. The model shall be based upon an industry standard model whose code is available in the public domain. The creation and calibration of the model shall use the following techniques/requirements set forth in:

   a. ASTM D5447 - Application of a Ground-Water Flow Model to a Site-Specific Problem

   b. ASTM D5490 - Comparing Ground-Water Flow Model Simulations to Site-Specific Information

c. ASTM D5609 - Defining Boundary Conditions in Ground-Water Flow Modeling

d. ASTM D5610 - Defining Initial Conditions in Ground-Water Flow Modeling

e. ASTM D5981 - Calibrating a Ground-Water Flow Model Application

f. ASTM D5611 - Standard Guide for Conducting a Sensitivity Analysis for a Ground-Water Flow Model Application

4. The numerical model shall be calibrated and shall consist of comparing model results with actual field measurements and adjusting model parameters within predefined limits to improve the agreement between model estimates and actual data. Model calibration shall be completed for a specific time period that represents a period for which sufficient field data (e.g. groundwater levels) are available. Initial calibration efforts shall be completed for “steady-state” conditions when groundwater pumping was minimal. This portion of the calibration effort shall be designed to test the basic components of the conceptual model and to provide a set of groundwater levels that can be used to initialize the transient calibration solution. The transient period shall be selected based on data availability, and the model shall be calibrated using data and information from Item (1).

5. The Project owner shall conduct transient groundwater model runs (including analysis) of the proposed project from construction through operation for the life of the project. The model shall use the information developed in Item (1).

6. The Project owner shall conduct an analysis of the anticipated increased inflow (in afy) from the Colorado River and adjacent Palo Verde Valley Groundwater Basin during the life of the project.

7. The Project owner shall provide a statistical analysis identifying the accuracy of the results of the model as well as the information developed in Item (6) in terms of percent error.

8. The Project owner shall present the results of the development of the conceptual model, numerical model, calibration, transient runs and sensitivity analysis in a report for review and approval by AO and CPM. The report shall include all pertinent information regarding the development of the conceptual and numerical models. The report shall include:

   a. Introduction

   b. Previous Investigations and Data Collection Results

   c. Conceptual Model Development/Refinement

   d. Mathematical Model and Input Parameters

   e. Calibration and Sensitivity Analysis

   f. Transient Modeling Runs

g. Conclusions

Verification: Within 30 days following certification of the proposed Project, the Project owner will submit to both AO and the CPM for their approval a report detailing the results of the modeling effort. The report will include the estimated amount of subsurface water flowing from the Colorado River due to project pumping. This estimate shall be used for determining the appropriate volume of water for mitigation in accordance with **SOIL&WATER-15**.

GROUNDWATER QUALITY MONITORING AND REPORTING PLAN

SOIL&WATER-20 The project owner shall submit a Groundwater Quality Monitoring and Reporting Plan to the CPM for review and approval. The Groundwater Quality Monitoring and Reporting Plan shall provide a description of the methodology for monitoring background and site groundwater levels and quality. Prior to project construction, monitoring shall commence to establish pre-construction base-line groundwater level conditions and shall include pre-construction, construction, and project operation water use. A water quality baseline and groundwater level baseline shall be established for any existing and newly installed well on the ROW. The primary objectives for the monitoring is to ensure the project does not degrade the existing water quality of the proposed water supply in concert with Condition of Certification **SOIL&WATER–4,** establish pre-construction and project related groundwater quality and groundwater elevation levels that can be quantitatively compared against observed and simulated levels near the project pumping well and near potentially impacted existing wells, and to avoid, minimize, or mitigate impacts or degradation to sensitive receptors (springs and groundwater-dependent vegetation, and groundwater supply users) .

Verification: The project owner shall complete the following:

1. At least six (6) weeks prior to construction, a Groundwater Level and Quality Monitoring and Reporting Plan shall be submitted to the BLM AO and CPM for review and approval before completion of Condition of Certification **SOIL&WATER-3**. The Plan shall include a scaled map showing the site and vicinity, existing well locations, and proposed monitoring locations (both existing wells and new monitoring wells proposed for construction). The map shall also include relevant natural and man-made features (existing and proposed as part of this project). The plan also shall provide: (1) well construction information and borehole lithology for each existing well proposed for use as a monitoring well; (2) description of proposed drilling and well installation methods; (3) proposed monitoring well design; and, (4) schedule for completion of the work.
2. At least four (4) weeks prior to construction, a Well Monitoring Installation and Groundwater Level Network Report shall be submitted to the CPM for review and approval. The report shall include a scaled map showing the final monitoring well network. It shall document the drilling methods employed, provide individual well construction as-builds, borehole lithology recorded from the drill cuttings, well development, and well survey results. The well survey shall measure the location and elevation of the top of the well casing and reference point for all water level measurements, and shall include the coordinate system and datum for the survey

measurements. Additionally, the report shall describe the water level monitoring equipment employed in the wells and document their deployment and use.

3. As part of the monitoring well network development, all newly constructed monitoring wells shall be constructed consistent with State and Riverside County specifications.
4. At least four (4) weeks prior to project construction, all groundwater quality and groundwater level monitoring data shall be reported to the CPM. The report shall include the following:
    a. An assessment of pre-project groundwater levels, a summary of available climatic information (monthly average temperature and rainfall records from the nearest weather station), and a comparison and assessment of water level data relative to the assumptions and spatial trends simulated by the applicant's groundwater model.
    b. As assessment of pre-project groundwater quality with groundwater samples analyzed for TDS, chloride, nitrates, major cations and anions, oxygen-18 and deuterium isotopes, and any other constituents the AO and/or CPM deem critical in protecting existing water supply quality.
    c. The data shall be tabulated, summarized, and submitted to the AO and CPM. The data summary shall include the estimated range (minimum and maximum values), average, and median for each constituent analyzed. The data shall also be analyzed using the Mann-Kendall test for trend to assess whether pre-project water quality trends, if any, are statistically significant.
5. During project construction and during project operations, the project owner shall semi-annually monitor the quality of groundwater and changes in groundwater elevation and submit data semi-annually to the CPM and BLM AO. The summary report shall document water level monitoring methods, the water level data, water level plots, and a comparison between pre- and post-project start-up water level trends as itemized below. The report shall also include a summary of actual water use conditions, monthly climatic information (temperature and rainfall), and a comparison and assessment of water level data relative to the assumptions and simulated spatial trends predicted by the applicant's groundwater model.
    a. Groundwater samples from all wells in the monitoring well network shall be analyzed and reported semi-annually for TDS, chloride, nitrates, cations and anions, oxygen-18 and deuterium isotopes. These analyses, and particularly the stable isotope data, can be useful for identifying water sources and assessing their contributions to the quality of water produced by wells.
    b. For analysis purposes, pre-project water quality shall be defined by samples collected prior to project construction as specified above, and compliance data shall be defined by samples collected after the construction start date. The compliance data shall be analyzed for both trends and for contrast with the pre-project data.
    c. Trends shall be analyzed using the Mann-Kendall test for trend. Trends in the compliance data shall be compared and contrasted to pre-project trends, if any.

d. The contrast between pre-project and compliance mean or median concentrations shall be compared using an Analysis of Variance (ANOVA). A parametric ANOVA (for example, an F-test) can be conducted on the two data sets if the residuals between observed and expected values are normally distributed and have equal variance, or the data can be transformed to an approximately normal distribution. If the data cannot be represented by a normal distribution, then a nonparametric ANOVA shall be conducted (for example, the Kruskal-Wallis test). If a statistically significant difference is identified between the two data sets, the monitoring data are inconsistent with random differences between the pre-project and baseline data indicating a significant water quality impact from project pumping may be occurring.

e. If compliance data indicate that the water supply quality has deteriorated (exceeds pre-project constituent concentrations in TDS, sodium, chloride, or other constituents identified as part of the monitoring plan) for three consecutive years, the project owner shall provide treatment or a new water supply to either meet or exceed pre-project water quality conditions to any impacted water supply wells.

C.9.13 CONCLUSIONS

Staff's conclusions based on analysis of the information submitted to-date are as follows:

1. The proposed Project would be located on an alluvial fan where flash flooding and mass erosion could impact the Project. Project-related changes to the alluvial fan hydrology could result in impacts to adjacent land users. A Draft Drainage, Erosion, and Sedimentation Control Plan (DESCP) has been developed to mitigate the potential storm water and sediment project-related impacts. However, the calculations and assumptions used to evaluate potential storm water and sedimentation impacts are imprecise and have limitations and uncertainties associated with them such that the magnitude of potential impacts that could occur cannot be determined precisely. Based on these factors, the proposed Project could result in impacts that would be significant with respect to CEQA significance criteria specified herein and the Council on Environmental Quality Regulations for Implementing the Procedural Provisions of the NEPA (CEQ NEPA Regulations) significance criteria specified in 40 CFR 1508.27. Therefore, Conditions of Certification have been developed that define the requirements for reports, plans, monitoring, and inspection, as well as standards and procedures for implementing Best Management Practices during construction and operations.

2. The proposed Project would be located in an area with no designated entity responsible for maintaining integrity of the rerouted channels. Staff believes the applicant should be required to establish a Channel Maintenance Program as indicated in Condition of Certification **SOIL&WATER-13**.

3. The proposed Project would have an impact on levels of groundwater in the Chuckwalla Valley Groundwater Basin (CVGB). However, the calculations and assumptions used to evaluate potential groundwater level impacts are imprecise and

have limitations and uncertainties associated with them such that the magnitude of potential impacts that could occur cannot be determined precisely. To ensure that the Project's proposed use of groundwater does not significantly impact the groundwater levels in the CVGB, staff believes the Applicant should be required to develop a monitoring program and identify what changes are occurring in basin water levels. Substantial changes to groundwater levels caused by the proposed Project and other pumping in the basin would be documented by this monitoring, and a mitigation and reporting program would be required in accordance with Conditions of Certification **SOIL&WATER-3**, **-4**, **-5** and **-20**.These measures, along with mitigation identified in the Biological Resources section of this document that could be required for impacts to groundwater-dependent vegetation that may occur, will be sufficient to ensure that significant impacts related to changes in groundwater levels do not occur.

The cumulative impact analysis indicates that groundwater extraction during construction and operation of this and other foreseeable projects would place the basin into an overdraft condition. This impact may be exacerbated by other unidentified renewable energy projects in the I-10 corridor, which has been targeted as a potential area for further renewable energy development. However, the amount of water that is storage in the basin greatly exceeds the amount of cumulative overdraft, rendering the project's contribution to this cumulative impacts less than cumulative considerable.

Finally, the cumulative effects may indirectly impact the adjacent Palo Verde Mesa Groundwater Basin inducing underflow from the Colorado River. To mitigate the project's contribution to impacts to the Colorado River, the applicant must complete **SOIL&WATER-15** that would require mitigation to ensure that impacts to the Lower Colorado River do not occur.

4. The applicant has proposed to use groundwater for wet cooling when other feasible technologies are available. Staff believes the proposed use of groundwater for wet cooling would not comply with the state's water policies. To address this inconsistency with state water policy, staff recommends implementation of Condition of Certification **SOIL&WATER-18** that would require the project owner to reduce the proposed water use through a project design change(s) and/or through a water conservation program.

5. The applicant has proposed the use of evaporation ponds as the preferred method of wastewater disposal. Staff believes potential impacts related to the use of evaporation ponds to dispose of the industrial wastewater could be mitigated through effective application of state and local LORS. However, this method of wastewater disposal is not consistent with the Energy Commission's policy that encourages the use of zero liquid discharge (ZLD) systems that are designed to eliminate wastewater discharge and inherently conserve water. Therefore, staff finds that this method of wastewater disposal does not comply with the state's water policies. As discussed above, to resolve this impact, staff recommends implementation of Condition of Certification **SOIL&WATER-18**

The state has expressed a strong interest in developing its solar energy resources. However, the construction and operation of solar energy facilities requires the use of water, which state policy also protects. The Energy Commission must balance the state's interest in promoting solar energy development with its interest in conserving and protecting the state's water resources. Several projects currently proposed for the Mojave and Colorado deserts would use water for power plant cooling, which staff believes is contrary to the state's long term interest in maximizing solar power generation and minimizing adverse environmental impacts. This will be an especially critical issue in the renewable development areas that will be identified in the Desert Renewable Energy Conservation Plan (DRECP). Later this year, staff plans to file a request for an Order Instituting an Informational Proceeding to address this issue.

Completion of staff's analysis of the proposed Project is subject to the following:

A finding by the U.S. Army Corps of Engineers of whether the ephemeral drainages on the Project site are jurisdictional waters of the U.S. Without this determination, staff cannot determine whether the Project would comply with Section 404 of the Clean Water Act.

GLOSSARY

Drought condition - hydrologic conditions during a defined period when rainfall and runoff are much less than average.

Groundwater Overdraft - the condition of a groundwater basin in which the amount of water withdrawn by pumping exceeds the amount of water that recharges the basin over a period of years during which water supply conditions approximate average conditions (CDWR, 1998).

Perennial Yield - the maximum quantity of water that can be annually withdrawn from a groundwater basin over a long period of time [during which water supply conditions approximate average conditions] without developing an overdraft condition.- CDWR, 1998).

APPENDIX A (SOIL & WATER REPORT)

Date: February 26, 2010
To: Susan Sanders
CC: Susan Lee, Mike Monasmith, CEC workgroup for Genesis
From: Andrew Collison, Ph.D.
PWA Project #: #2006.00 CEC Genesis
Subject: **Geomorphic assessment of Genesis Solar project site**

Objectives of this Appendix:

1. Provide a brief description of the project area's sand dunes and a discussion of the sand transport processes that created and now maintain the existing dunes.

2. Discussion of potential direct and indirect impacts of the proposed project and its alternative on the existing sand dune system and the processes that support them.

3. Mitigation for those impacts, or a well-supported conclusion that those impacts cannot be mitigated.

Summary of Key Findings

PWA has reviewed the applicant's geomorphic review of the Genesis project site entitled "Aeolian transport evaluation and ancient shoreline delineation report", Worley Parsons, February 5th 2010. I visited the western part of the field site with the report's author, Dr. Miles Kenney, to assess the accuracy of the mapping and conclusions, and carried out a desk study for the eastern side of the project based on aerial photos, literature sources and experience in similar locations. I am largely in agreement with the report conclusions regarding the western solar array: it is located on two land surface units that are relatively geomorphically stable and that are not part of an active wind transport corridor. There are no large washes in this part of the site that carry large amounts of sediment across the project site. As a result there should not be significant off-site geomorphic impacts from the western solar array or project components. There will be some disruption of drainage from capturing a large number of small ephemeral washes that currently cross the project site from north to south, diverting them around the property and discharging them back on to the fan surface. I have investigated a similar reference site 12 miles to the west of the Genesis site where I10 drainage is captured over a similar area, concentrated into a single channel and released back on to the fan surface. This site suggests that it is feasible to capture drainages and redistribute them on the alluvial fan with relatively minor impacts, though care will be needed in the design of this system.

The eastern solar array is somewhat more complex since it overlays a larger and more active ephemeral wash and it intrudes into the outer edges of two wind-borne sand transport corridors that deliver sand to ecologically-significant dune habitat downwind, including habitat that supports Mojave Fringe Toed Lizard. The degree of intrusion is somewhat hard to estimate since both wind corridors have poorly defined edges, and because sand transport rates vary greatly across the corridor width. By the applicant's estimation (Worley Parsons, 2010) the eastern solar array intrudes across 19% of the width of the Palen-McCoy corridor, and 7% of the Chuckwalla corridor. These delineations appear reasonable based on a field and aerial photo analysis, and by comparison with the NECO land classification maps (BLM CDD, 2002). There is good evidence from the field and the Worley Parsons report to demonstrate that the rate of sand transport is relatively low in the edges of the corridor where the project footprint is proposed, with most of the sand volume being transported in more central parts of the corridor. The overall disruption to sand delivery is conservatively estimated by this author to be less than 10% for the Palen-McCoy transport corridor and less than 6% for the Chuckwalla corridor. Note however that the project laterals will pass through the core of the Palen-McCoy corridor where there is a much higher rate of sediment transport, and will need to be designed to minimize disruption of sand transport by both wind and water. This will preclude the use of wind fences beyond the initial construction period, and will require keeping infrastructure below or at ground level where possible, and avoiding constructing berms or drainage channels that trap sediment or disrupt channel processes.

Although the magnitude of sand reduction from the eastern solar array is not believed to be great in terms of regional sand transport patterns along the Chuckwalla Valley, an area of approximately 453 acres of sandy plains and partially stabilized vegetated sand dunes immediately downwind of the eastern solar array will be indirectly impacted by the project, with wind-borne sand being cut off by the project footprint. Based on previous studies on the effects of wind breaks on sand dune habitat in the Coachella Valley (Turner et. al. 1984), this area is likely to experience deflation (blowing away of sand from the dunes) and potential loss of sandy habitat within a few years of the project's construction.

A large wash complex that currently crosses the eastern side of the proposed eastern solar array will be captured and redirected around the project footprint. Unlike the small washes that cross the western solar array site, this wash complex appears to supply a large amount of sand to the surrounding area (under the proposed eastern solar array). It appears that it may be possible to redirect this wash east of the project site in a natural (earth rather than concrete or soil cement) channel, to minimize erosion and habitat impacts. As with the western solar array, the applicant proposes to capture small drainages and pass them around the project footprint before dispersing them downstream. This should be feasible without major impacts downstream provided that the drainage plan is well designed and implemented.

Relationship Between Hydro-Geomorphic Processes and Biological Resources

This Appendix focuses on several hydro-geomorphic processes that play a significant role in the health of the ecosystem of the project site and its surroundings. These processes are wind transportation of sand relative to the creation, preservation and destruction of sand dunes, and water transport of sediment through the alluvial fan drainage system.

Wind Transport

The Fringe Toed Lizard relies on active sand dunes and a regular supply of fine wind blown sand for its habitat (Figure 1). Active sand dunes (dunes that have an active layer of mobile sand) exist in a state of dynamic equilibrium: they are continuously losing sand downwind due to erosion and transport, but that is offset by supplies of new sand from upwind (see Figure 2). If the upwind sand supply is cut off the dunes *deflate*; that is to say they lose sand downwind and shrink in size and depth (see Figure 3 for an example). The finest sand (which is most easily transported) is lost first with coarser sand and gravel being left behind to form an armor or lag. This combination of lag and thin sand deposits does not support FTL habitat.

Maintaining FTL habitat requires the regular addition of wind-blown sand from a reliable source. Most of the sand in the Chuckwalla Valley is transported via a series of sand transport corridors, controlled by wind direction and the availability of loose sand to be transported. The applicant's sand dune report (Worley Parsons, 2010) provides a good explanation of the location of these corridors relative to the project site. The main Chuckwalla Valley corridor runs west to east across the southern edge of the proposed Genesis project, while the Palen-McCoy corridor runs through the eastern edge of the site. Sand delivered from upwind passes through dune areas including FTL habitat and is deposited, replenishing sand that has been lost downwind. In addition to the direct biological impact of constructing a project in a dune area (direct loss of habitat), construction activities have two potential offsite impacts on sand transport corridors. Firstly, if the project footprint is constructed in a dune area it will cut off a supply of sand that would otherwise have been transported downwind to other dune areas. Dunes downwind of a constructed site will deflate over time as sand output is not matched by sand input. Secondly, new sand that would have been transported across the project footprint from upwind will potentially be cut off by drainage ditches, wind fences and above ground infrastructure. Thus, if a project is built into a wind corridor it will create a 'sand shadow' area where dune deflation occurs over time.

Turner et al (1984) conducted experiments on paired plots of sand dunes up and downwind of wind barriers. They showed that 'sand shadows' formed within 4-17 years of the erection of a relatively small wind barrier (a single line of tamarisk trees) and that while FTL were abundant upwind of the barriers they were virtually absent downwind. Thus barriers pose a direct threat to sand transport and habitat.

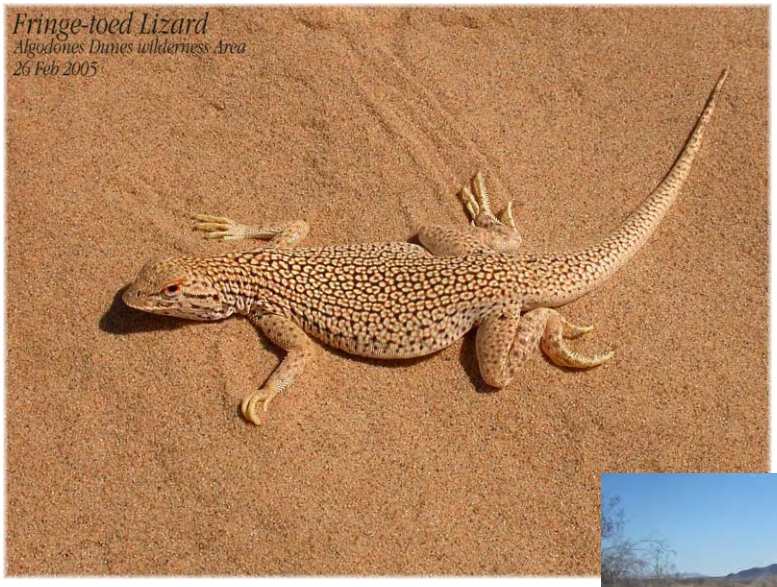

Figure 1. Fringe Toed Lizard showing its preferred habitat of fine, loose sand. Source: Southwest Images.

Figure 2. Potential FTL habitat showing 'plump', vegetated dunes connected by relatively deep, loose sand sheets with active sand movement.

Figure 3. Deflated former vegetated dune showing remnants of eroding dune under creosote bushes surrounded by shallow, compacted sand. This habitat does not support FTL.

Figure 4. Sparse sand on an alluvial fan area away from a major wash (note photos are not from Genesis – shown to illustrate the concept)

Figure 5. Much sandier conditions than Figure 4 in a large wash complex indicating sand transport from the channel to the surrounding alluvial fan. (Note photos are not from Genesis – shown to illustrate the concept.)

Sand Transport by Alluvial Fan Washes

In addition to the regional wind transport corridor sand can also be transported locally by washes. These carry sediment from upstream and distribute it on the alluvial fan where it is available to wind transport, creating smaller sand corridors around the main washes. The large wash complex that passes east of the solar arrays and is crossed by the laterals likely functions in this way.

Disrupting the drainage pattern (for example by channelizing the washes in hydraulically-efficient concrete channels deep below the fan surface) is likely to move sediment downstream at the expense of the surrounding habitat corridor. (The area where the channel discharges may however benefit from greater-than-before sand delivery.)

Description of the Genesis Project Sites

I visited the Genesis project site on January 12th 2010. Conditions on January 12th were warm and dry, with no recent rain. I visited the area of active sand dunes in the Wiley Wells Rest Stop where the proposed lateral meet I10, traversed the Chuckwalla Valley sand transportation corridor, hiked in to the western boundary of the property and hiked a loop of approximately 3 miles in the proposed western solar array area. On a subsequent visit to the Palen project site located 12 miles west of Genesis I visited a large ephemeral wash that passed under I10 to assess the effects of concentrating several small washes into a single channel, as a reference condition for potential site drainage approaches on Genesis.

The site is located on an alluvial fan that drains from north to south towards Ford Dry Lake. The average gradient is about 0.5 degree. There are a series of different geological units that underlay the site and its laterals (shown in Figure 4 below). The boundaries between these areas are somewhat interwoven and gradual, but can be seen on aerial photos and in the field. In addition there are a series of smaller land units that cut across the major land units.

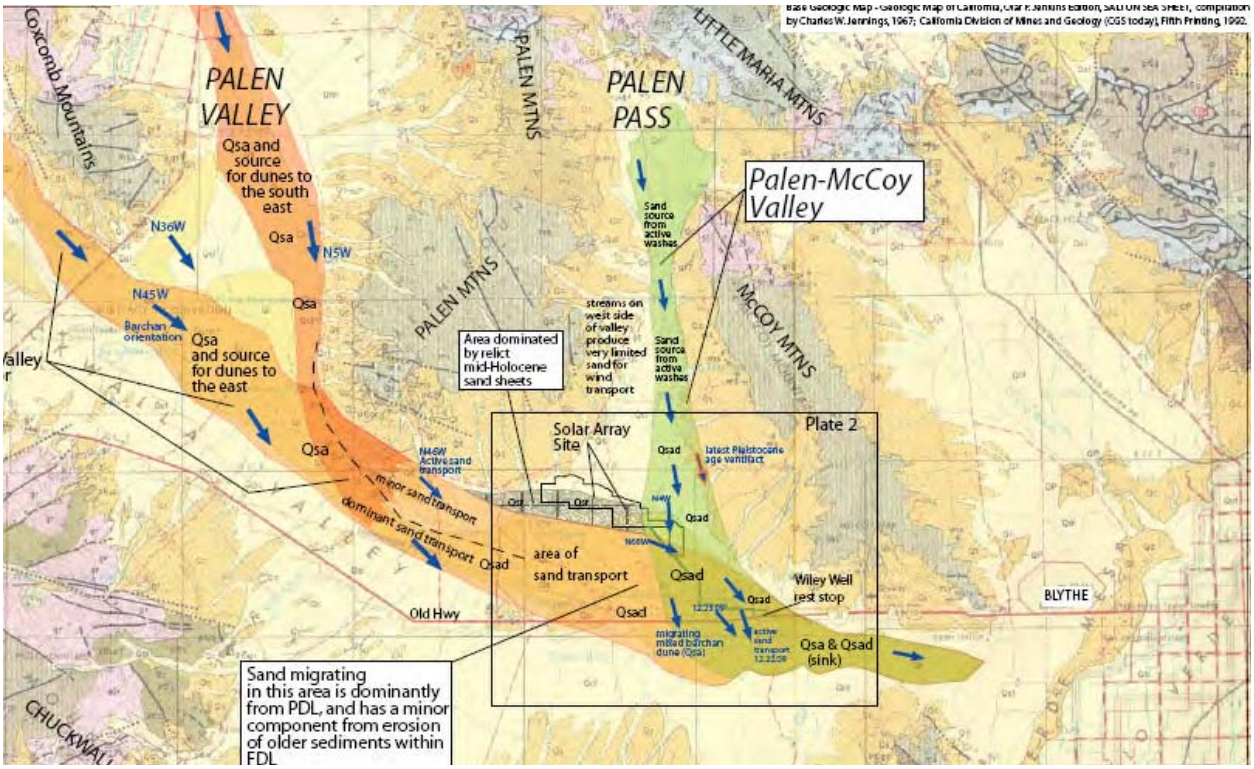

Figure 4. Generalized Sand Migration Corridors, Worley Parsons 2010.

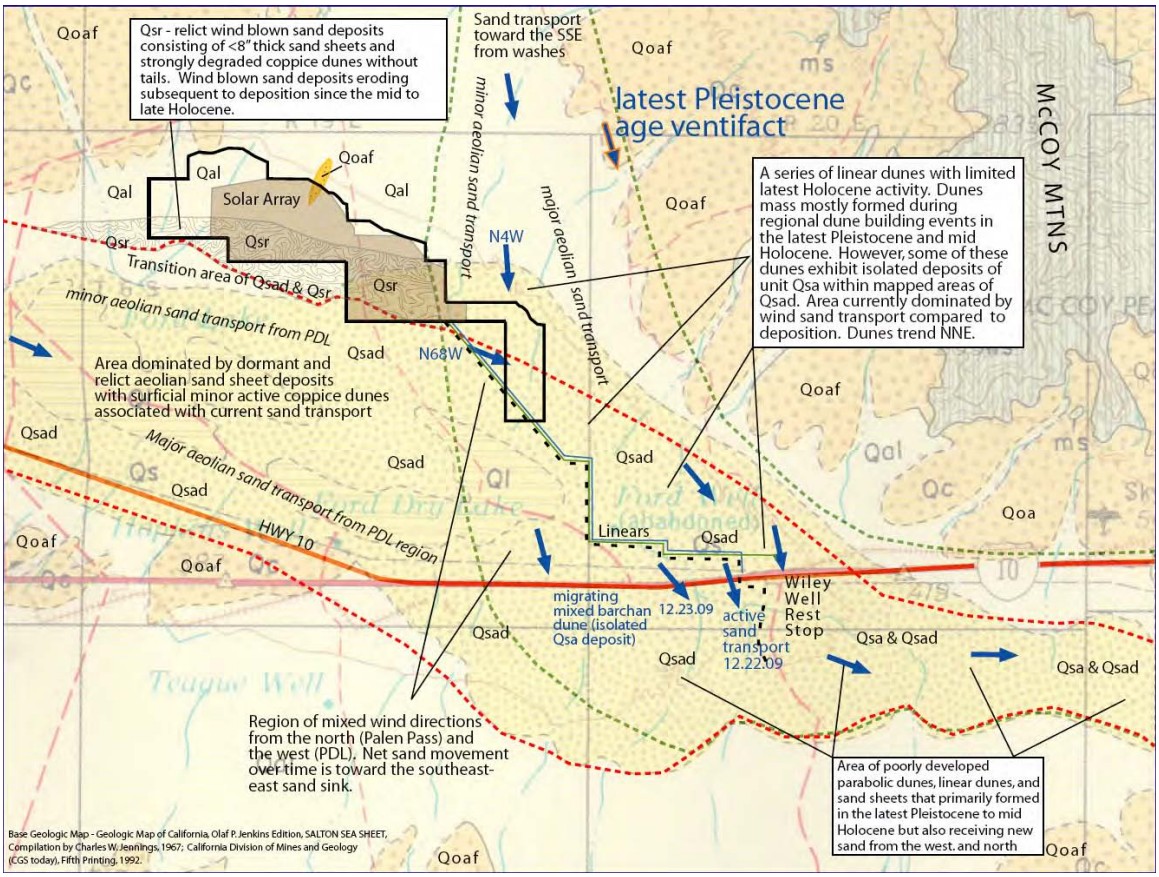

Figure 5. Detail of sand migration corridor and geological units around project site, Plate 2, Worley Parsons 2010.

Major Land Units

I visited as many of the main land types mapped by Worley Parsons as possible to assess their geomorphic condition and the accuracy with which they were delineated. These are described below. In each case I start with the description provided by Worley Parsons (in italics) and add my own comments and photos below (plain text).

<u>Qal Quaternary Alluvium</u>

Description (from Worley Parsons, 2010)

Quaternary Alluvium consisting of fluvial distal fan deposits. Within the site these deposits are composed of fine to very coarse sand and small gravel, well bedded and generally only 6-inches to 2-feet thick. Soil horizons indicate that the deposits are between 1ky to approximately 8 ky old.

These areas are found on the upper (north) area of the project site, and make up much of the footprint for the proposed western solar array. They cover some of the northern portion of the proposed eastern solar

array. The presence of coarse alluvial gravels with desert varnish (see figures 6 and 7) and established soil horizons is an indicator that this surface has been relatively stable for several thousand years. This is because desert varnish and soil horizons take thousands of years to develop, so that if the surface was subject to more frequent erosion or deposition these features would either be buried or eroded rather than found on the surface. This implies that sand deposition is not taking place, and that the fluvial channels found here are in equilibrium (pass the sediment they receive from upstream, but neither erode or deposit in significant amounts).

Figure 6. Alluvium surface. Person in photo is pointing into the northwest corner of the project site from the west.

Figure 7. Close up of alluvium surface showing lag (residual deposit) of coarse gravel overlaying sand, with desert varnish (black coloration of gravel).

Qsr Relict Sand Sheets and Dunes

Description (from Worley Parsons, 2010)

Area containing relict wind blown sand sheet and degrading coppice dune sediments with very limited to no active sand transport. These deposits are typically stabilized with grasses, creosote and wind generated very coarse sand to small gravel abrasion lag deposits. The youngest members of this unit exhibit near surface soil Bw soil horizons with an estimated minimum age of 1000 years.

Figure 8. Relict sand sheets and deflated vegetated dunes in the southern part of the project footprint.

This is the predominant land unit under the proposed eastern solar array, and along the southern edge of the western array. This surface is a transitional unit between the Qal and the Qsad, with thin sheets of sand and degraded vegetated dunes but little evidence of active sand transport or storage. As with the Qal this unit has soils that indicate relative stability over the order of thousands of years, but has not formed an alluvial lag surface. This unit provides little or no habitat for FTL.

Qsad Stabilized Dunes

Description (from Worley Parsons, 2010)

Area dominated by latest Pleistocene to late Holocene stabilized dunes but remain regions of current sand transport with isolated areas exhibiting wind blown sand deposition (sand sheets, coppice and avalanche face of linear dunes). Thus, many areas within mapped Qsad do not exhibit loose sand on the surface and fall under the definition of unit Qsr. Small isolated areas of mapped Qsad also fall under the definition of unit Qsa.

Figure 9. Vegetated sand dunes in the sand transportation corridor mostly south of the project footprint, with close up of ground surface.

This unit makes up the area south of the main project boundary. The southwest corner of the eastern solar array intrudes into this unit by about 1,500 – 2,000 feet. This unit appears suitable for FTL habitat, and has evidence of active wind transport of sand (for example 'plumper' vegetated dunes, coppice dunes indicating active sand movement, deeper sheets of sand with ripples). This area is part of the Chuckwalla Valley sand transport corridor.

Qsa Active Quaternary Sand Areas

Description (from Worley Parsons, 2010)

Areas of reasonable size to map that receive sufficient active wind blown sand migration to maintain dune system. Dunes within Qsa areas generally exhibit free avalanche faces and surficial loose sand. Qsa areas may exhibit active sand sheets (deposits from migrating ripples) and coppice dunes with tails (deposits associated with vegetation). Qsa areas are primarily located in Palen [Ford?] *Dry Lake and east of Wiley Well road. Limited areas of Qsa occur east of the Genesis Power site.*

Figure 10. Active sand dunes north of Wiley Wells Rest Stop. The laterals will pass through and alongside patches of similar conditions along their course.

Figure 11. Coppice dunes indicating active sand transport near Wiley Wells Rest Stop.

The Qsa formation is active sand associated with the Palen – McCoy Valley sand transport corridor and the large washes on the eastern side of the project. These routes deliver large quantities of sand to the east of the project area and supports active migrating sand dunes. The laterals will need to be designed to avoid blocking wind transport south through this unit, since blocking this corridor would .

Qoaf Fine Alluvial Deposits
Description (from Worley Parsons, 2010)
Latest Pleistocene distal fan deposits. They are composed silty fine to very coarse sand and minor small gravel. The unit is generally within 1 to 2 feet of the surface within the Project Solar Array site and exhibits a pedogenic soil horizon sequence that is likely a minimum of latest Pleistocene age.

Note – I did not visit any Qoaf sites in the field. It makes up a very small area in the north edge of the western solar array. It is possible that this unit supports FTL.

Drainage Features
Overlain on the major landscape units there are a series of drainage lines that cross the site from north to south. The vast majority of these are minor washes that appear to be distributary channels or that capture local flow in the fan surface. On my field visit I encountered only one well defined channel (west of the project footprint). It appears that there are much larger well defined channels that run east of the proposed eastern solar array and through the laterals corridor.

Minor Washes
More than a hundred minor washes cross the site from north to south. These channels are typically very subtle, with a width of 2-10 feet and a depth of 3-9 inches. They are found approximately every 100 feet when traversing along a contour on the mid fan surface. The presence of these channels in areas of desert varnish and soil horizons suggests that these channels are relatively stable (do not cut and fill vertically). It is likely that in the Qsr unit the channels avulse laterally across the surface without cutting vertically. The channels do not appear to transport much sediment, as evidenced by their shallow depth and the absence of scour features.

Figure 12. Typical minor ephemeral wash in the proposed western solar array.

Figure 13. Typical minor wash in the proposed western solar array.

Major ephemeral washes

Figure 14. Larger wash in western side of property showing west bank.

Figure 15. Larger wash with west bank out of shot on right, and east bank visible on upper left of photo.

A single larger wash was encountered that passes within the project boundary but west of the proposed western solar array. This was looked at as a potential reference condition for the washes that passes through the eastern side of the site, though these washes appear from aerial photos to be larger, and to carry more sand. The larger washes have braided channels that show more evidence of active sediment transport, with well defined banks and some sand in the channel bottom. Large washes visited elsewhere in the Chuckwalla Valley show evidence of wind-blown sand and vegetated sand dunes in a corridor around the channels, though this could not be confirmed in the Genesis project as the eastern washes were not visited.

Discussion of Mapping Accuracy and Interpretation

During the site visit I inspected most of the geologic units with Dr. Miles Kenney, who conducted the mapping and field investigation for Worley Parsons. I visited representative units of Qal and Qsr (which make up most of the proposed array footprints) and crossed the Qsad/Chuckwalla sand transport corridor from south to north in the western part of the project. I visited an area of Qsa at the south end of the laterals. I did not visit the western edge of the Palen-McCoy wind corridor and the large washes in this area. Defining the boundaries of the wind corridors is somewhat subjective since they do not have sharp edges and different researchers will likely place them in slightly different locations. The NECO land classification map provides a potential method of cross checking the boundaries, since it classifies areas of 'sand covered plains' and 'undifferentiated sand dunes' that tend to conform to wind transport corridors in other places where they have been mapped. The NECO classification (see Figure 16) is very similar to the Worley Parsons classification for the northern edge of the Chuckwalla corridor within the project area, with the NECO classification placing the corridor approximately 500 feet further within the project footprint. Given the subtleties of the boundary this difference is very minor. The NECO classification for the western edge of the Palen-McCoy corridor places it further east than Worley Parsons, reducing the area within the project footprint.

Based on the field visit, review of the applicant's reports, review of aerial photos and of the NECO classification I found the applicant's classification and interpretation to be reasonable and was satisfied with the evidence used to indicate the location and geomorphic stability of the different units. My only area of potential disagreement is over the importance of the large wash that crosses the project in the eastern array (discussed under the impacts section).

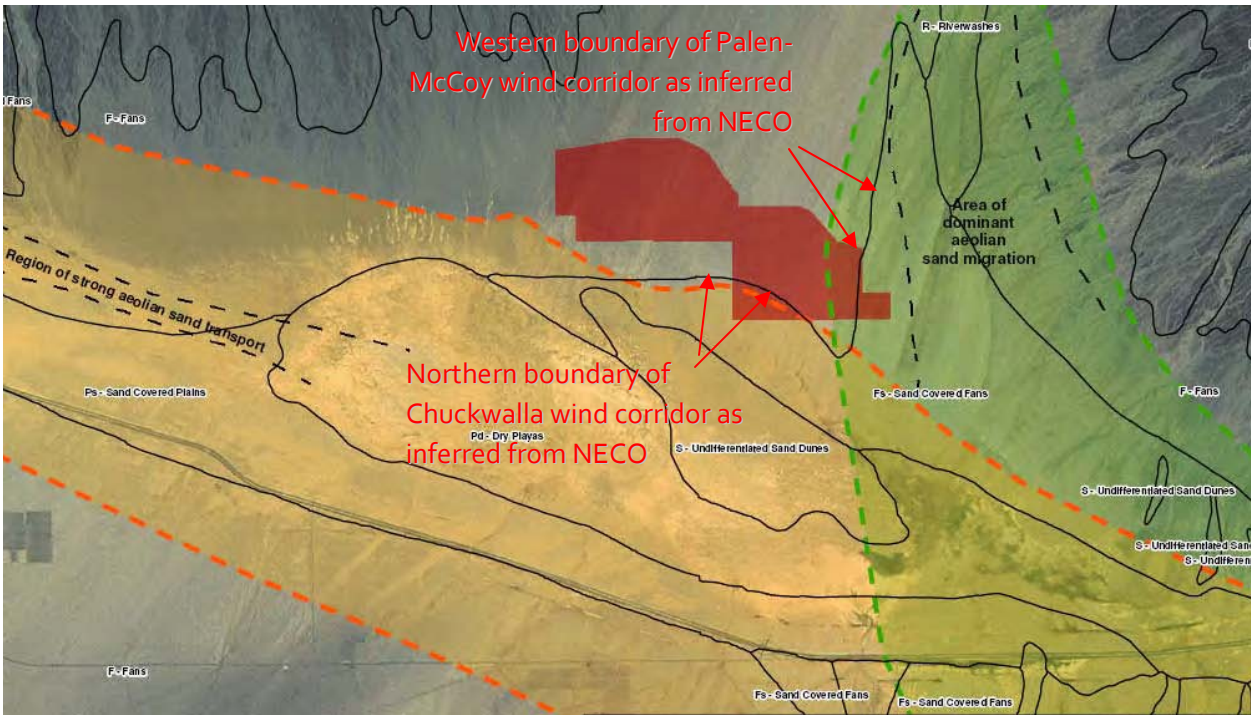

Figure 16. Detail of NECO land classifications superimposed over Worley Parsons mapping (Sources: Helix, 2010 and Plate 5, Worley Parsons, 2010). Note black comments and all dashed lines are from Worley Parsons, black text with white shadow and black line boundaries are from NECO classification, and red text and red arrows are from PWA.

Potential Project Impacts

Impacts to the Qal

The Qal is a relatively stable surface, with little evidence of active sand transport. The presence of the gravel with desert pavement and varnish is evidence that this surface is also stable from a fluvial perspective (i.e. that the small channels, while potentially prone to lateral migration and avulsion across the stable surface, do not tend to cut vertically into the surface. From a geomorphic perspective construction of the project on the Qal area should have relatively little off site impact. Because there is little sediment transport occurring on this surface construction of the proposed project does not appear likely to disrupt the movement of sediment to habitat areas elsewhere.

Potential Avoidance and Mitigation of Impacts to the Qal Area

None proposed on geomorphic grounds.

Impacts to the Qsr

The Qsr is a relatively stable surface, with little evidence of active sand transport. The presence of the soil horizons is evidence that this surface is also stable from a fluvial perspective (i.e. that the small channels, while laterally active, do not tend to downcut or fill vertically). From a geomorphic perspective construction of the project on the Qal area should have relatively little off site impact. Because there is little sediment transport occurring on this surface construction of the proposed project does not appear likely to disrupt the movement of sediment to habitat areas elsewhere.

Potential Avoidance and Mitigation of Impacts to the Qsr Area

None proposed on geomorphic grounds.

Impacts to the Qsad/Chuckwalla Wind Transport Corridor

The western array avoids the Chuckwalla sand transport corridor as mapped by both Worley Parsons and NECO. The eastern array intrudes into the corridor by approximately 1,600 feet at a point where the corridor is 24,000 feet wide based on Worley Parsons. This intrusion represents about 7% of the Chuckwalla sand corridor width. Using the NECO classification the intrusion is 12% (largely due to NECO mapping the corridor as thinner than Worley Parsons rather than big differences in the boundary at the project site). The part of the corridor that is impacted does not appear to be the most active with regard to sediment transport rates based on the amount of sand in storage on the ground, evidence for sand transport from ripples and coppice dunes etc. Conservatively assuming that sediment transport rates in the area impacted are half those in the central corridor, and taking the more conservative NECO corridor classification, the reduction in sediment transport capacity is less than 6%, and likely lower. This does not represent a significant impact on sediment transport processes for the corridor as a whole, though

it does present a moderate off-site impact immediately downwind of the project site. Based on the degree of intrusion into the corridor and the length of the intrusion I estimated an area of 157 acres of sand covered plains (Qsad) that would be impacted. This area is expected to experience deflation of existing sand areas and armoring of substrate (see Figure 17).

Potential Avoidance and Mitigation of Impacts to the Qsad/Chuckwalla Wind Transport Corridor

It is recommended that the project minimize encroachment of the main footprint into the Qsad/sand transport corridor. Mitigation to compensate for 157 acres of vegetated sand dune is proposed for the current project footprint.

Impacts to the Palen-McCoy Wind Transport Corridor

Based on the applicant's report the eastern solar array intrudes into the Palen-McCoy corridor by approximately 2,800 feet at a point where the corridor is 15,000 feet wide (cutting off 19% of the corridor). Based on the NECO mapping the intrusion is smaller (1,700 feet) but the undisturbed corridor is also narrower (8,300 feet), also resulting in a 20% reduction in width. Although the project cuts off a large area of sand corridor, there is good evidence to suggest that most sand transport takes place east of this zone (outside the project footprint, though within the area crossed by the laterals). Plates 14 and 15 of the Worley Parsons report show field conditions in the impacted area (Plate 14) and further east (Plate 15), providing evidence of much greater rates of sand transport to the east of the project footprint. In the absence of quantitative data and conservatively assuming that the rate of sediment transport is half as much in the outer corridor as it is in the inner corridor the intrusion probably represents less than a 10% reduction in sand transport. Based on the photos it is feasible that the true rate of sediment transport in the impacted area may be significantly less than this. However, although the magnitude of impact to the entire wind transport corridor is relatively low, the area of off-site impacts immediately downwind of the project is large: the lee area downwind of the project that is likely to experience sand depletion is 309 acres (see Figure 17). Since there is 13 acres of overlap from both wind shadows the combined area impacted by intrusions into both corridors is 453 acres. This area would be expected to experience deflation (loss of sand from the existing vegetated dunes over time) and armoring (coarsening of the sand and gravel as fine sand is eroded by the wind).

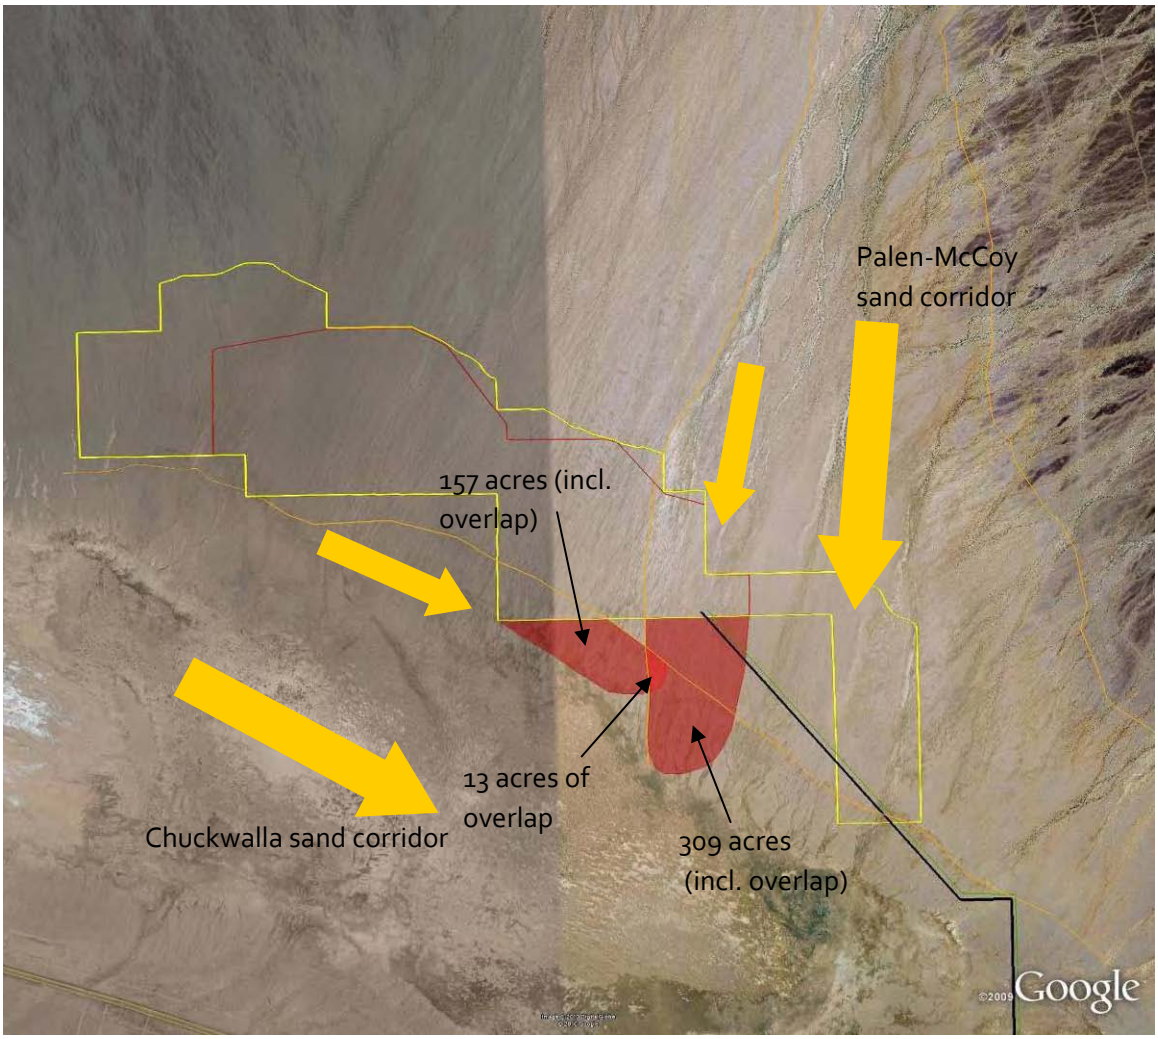

Figure 17. Zones of moderate impact to the wind transport corridor and vegetated sand dunes from encroachment of the project into the Chuckwalla and Palen-McCoy sand corridors. Major wind transport zones shown with large gold arrows, less significant wind transport zones shown with small gold arrows.

Impacts to the Qsa

The Qsa is the active area of sand dunes supplied by wind and water transport from the Palen – McCoy Valley sand corridor. This corridor supplies biologically-significant sand dune habitat downwind, and preserving sand transport is important. This area is crossed by the laterals near Wiley Wells Rest Stop.

Potential Avoidance and Mitigation of Impacts to the Qsa Area

The main project footprint should avoid this area completely since large scale obstruction of this unit would be hard or impossible to mitigate for. The project should be able to avoid or minimize

impacts created by the laterals within this zone by avoiding creating barriers to wind and water transport. Most wind-borne transport of sand occurs within 3 feet of the ground, so infrastructure should be constructed flush with the surrounding ground surface and without ground level obstructions. Power pylons should not pose a significant problem due to their small surface area at ground level. Water and gas pipelines should be buried below ground. Road surfaces should be flush with the ground surface. There should not be drainage ditches running perpendicular to the wind direction (approximately north-south in the northern section of the lateral route, shifting to west-east in the southern area). Wind fences should not be permanently erected in the lateral area. It is understood that temporary wind fences are proposed for during construction, but not permanently. The duration that wind fences are used for should be kept to the minimum, since downwind impacts may be felt within 1-2 years.

Drainage Plan

The drainage plan for Genesis involves constructing an interceptor channel around the north project boundary, collecting flows in constructed channels and passing them around the project for discharge onto the alluvial fan downslope. In order to assess whether such a plan is likely to cause impacts I visited I10 to look at a drainage that passes through the freeway and back on to the alluvial fan surface 12 miles west of Genesis. The pattern of major and minor washes may be an analogue for conditions following construction of a solar array and drainage plan at Genesis.

I10 as a Reference Site for the Genesis Drainage Plan

Numerous small ephemeral channels heading towards I10 have been intercepted and concentrated into two drainage channels. The westerly channel intercepts a 1.6 mile width of upper alluvial fan, and the easterly channel intercepts 1.9 miles of fan. The flow is collected into a single engineered earth channel then passed under I10 in a concrete trapezoidal channel and discharged back onto the fan surface downslope without any dissipation. The applicant for Genesis proposes an interceptor channel that collects flow from the ephemeral washes, routes it around the solar arrays, and discharges flow back onto the fan below, but with a more controlled treatment of flows at the discharge point consisting of a series of structures designed to spread flow out in small volumes across a wide fan area. Thus I10 might be viewed as a ‘worst case’ scenario for release of concentrated flows. Offsetting this, the discharge point on I10 is in coarse alluvial gravels, which have mitigated some of the impacts of uncontrolled flow.

I visited the easterly collector channel and walked it for a distance of 1,000 feet onto the mid fan surface. The collector channel that ran parallel with I10, though artificial, had a somewhat natural appearance and function (earth banks and bed, apparently stable, no excessive erosion or deposition, some typical wash vegetation present in the channel). The wash formed a slightly incised single channel immediately downstream of I10 where it passed from the concrete channel onto the mid fan (vertical banks

approximately 4 feet high, with a width of 50 feet). However, incision ceased within a few hundred feet of I10 and the channel widened and formed braids. The channel showed evidence of higher energy flows in the presence of scour features and very coarse bed material (coarse gravel and cobble sized sediment). However, the gravel and cobble bed appeared to be a natural armor layer that formed from selective scour of the finer sand, forming a protective layer. Within a few hundred feet of I10 the wash supported typical large wash morphology and vegetation, and appeared to be depositing the sand eroded upstream along its margins, creating good quality sandy habitat.

Figure 18. Interceptor channel running parallel with I10 (flow towards viewer)

Figure 19. Close up of vegetation in the constructed interceptor channel

Figure 20. Interceptor channel passes under I10 (flow away from viewer)

Figure 21. Incised and scoured channel immediately downstream of I10. Bank detail shown in next photo.

Figure 22. Channel bank is 4 feet high. Gravel in the fan provides armor that stabilizes the channel.

Figure 23. Channel widens and becomes less incised 300 feet downstream of I10

Figure 24. Channel widens and becomes less incised 800 feet downstream of I10

Based on this reconnaissance-level assessment it seems likely that it would be feasible to capture the minor washes at the Genesis project boundary, concentrate them in earth-lined channels and dissipate them back on to the fan surface downstream provided that:

- The watershed area of the captured channels is similar to that of the reference reaches assessed
- The fan gradient at the discharge point is similar or less
- The sediment at discharge point has some coarse gravel and cobble to form an armor (or this is imported for a few hundred feet)

The first two assumptions are likely to be correct, though the third assumption is likely not since sediment tends to be finer downfan and the proposed discharge locations may be more prone to scour than the area near I10. If this is the case cobble and gravel would need to be added to provide an armor layer.

Assuming these conditions to be the case it appears that it is feasible to bring water around the Genesis site in relatively natural channels that may provide habitat and migration value. It also appears likely that water may be discharged back on to the fan surface with minimal impact, provided that there is a cobble supply to armor the first few hundred feet of discharge. There is potential to develop the drainage channels using more natural channel morphology than currently proposed, to provide biological functions and act as wildlife corridors.

Discussion of Project Alternatives

The Reduced Acreage Alternative (shown in Figure 25) was assessed for its potential geomorphic impacts. The alternative removes the proposed eastern solar array from the project. Since the main geomorphic impacts identified in this report are associated with the eastern solar array this alternative would have lower impacts, with no impact on the Chuckwalla and Palen-McCoy sand corridors or on the eastern wash complex.

C.10 - TRAFFIC AND TRANSPORTATION

Testimony of Candace M. Hill

C.10.1 SUMMARY OF CONCLUSIONS

With implementation of the recommended conditions of certification, the Genesis Solar Energy Project would be consistent with the County of Riverside General Plan Circulation Element. The project would also be consistent with all other applicable federal, state, and local laws, ordinances, regulations, and standards related to traffic and transportation. As a result, the Genesis Solar Energy Project would not have a significant adverse impact on the local and regional roadway network. With implementation of recommend conditions of certification, during the construction and operation phases, local roadway and highway demand resulting from the daily movement of workers and materials would not increase beyond significance thresholds established by the County of Riverside for local roads and the State of California for state highways.[1]

C.10.2 INTRODUCTION

In the Traffic and Transportation analysis, staff focuses on (1) whether construction and operation of the Genesis Solar Energy Project (GSEP) would result in traffic and transportation impacts under the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA); (2) whether the project would be in compliance with applicable laws, ordinances, regulations and standards (LORS).

The analysis identifies potential impacts related to the construction and operation of GSEP on the surrounding transportation systems and roadways. Staff proposes mitigation measures (condition of certification) where necessary.

C.10.2.1 PROJECT DESCRIPTION

The proposed GSEP is designed to utilize solar parabolic trough technology to generate electricity. The GSEP would consist of two independent solar electric generating facilities with a nominal net electrical output of 125 megawatts (MW), resulting in a total net electrical output of 250 MW.

The proposed project consists of approximately 1,800 acres located on Bureau of Land Management (BLM) acreage in eastern Riverside County. The project site is located approximately four miles north of Interstate 10 (I-10), 25 miles west of the city of Blythe and 27 miles east of the community of Desert Center.

Access to the site would be off Interstate 10 (I-10) via the Wiley's Well Road Interchange, which can be accessed by both eastbound and westbound traffic, and then north to a new six and half mile paved access road extending north and west from the

[1] The federal government (NEPA) has not established any standards for congestion, as this is a matter of local preference.

existing Wiley's Well Road. If approved, the construction of GSEP would be completed in two phases over a 37 month period. Phase 1 would consist of the Unit 1 powerblock, access road, gas, and transmission line and Phase 2 would consist of the Unit 2 powerblock.

C.10.3 METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

Significance criteria for project impacts to the surrounding traffic and transportation systems are based on three items:

1. California Environmental Quality Act (CEQA) Guidelines.
2. CEQA Environmental Checklist.
3. Performance standards and thresholds established by interested agencies.

The National Environmental Policy Act (NEPA) does not provide any standards specific to transportation.

A project may have a significant impact on traffic and transportation if it would:

1. Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrians and mass transit.
2. Conflict with and applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways.
3. Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks.
4. Substantially increase hazards due to a design feature or incompatible uses.
5. Result in inadequate emergency access.
6. Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities.

Level of Service

When evaluating the project-related impacts on the local transportation system, staff bases its analysis on level of service (LOS) determinations. Level of service is a generally accepted measure used by traffic engineers, planners, and decision-makers to describe and quantify the congestion level on a particular roadway or intersection in terms of speed, travel time, and delay.

The Highway Capacity Manual 2000, published by the Transportation Research Board, Committee on Highway Capacity and Quality of Service, includes six levels of service

for roadways or intersections ranging from LOS A - the best operating conditions - to LOS F - the worst, most congested operating conditions. The County of Riverside uses the LOS criteria to assess the performance of its street and highway system and the capacity of roadway segments. The County's Circulation Element Policy C 2.1 requires "LOS C along all county maintained roads and conventional state highways."

Therefore, the LOS standards for GSEP as required by the County of Riverside and the State of California are LOS C on County roads and LOS C on State of California Interstate 10 (I-10), the main access to the project site.

A significant impact would be caused if the project causes intersection operations to exceed the accepted LOS standards on a county, state or federal roadway currently operating at LOC C or better to LOS D or worse.

C.10.4 PROPOSED PROJECT

C.10.4.1 SETTING AND EXISTING CONDITIONS

The GSEP site is located in eastern Riverside County, approximately four miles north of I-10, 25 miles west of the city of Blythe and 27 miles east of the community of Desert Center. The site is undisturbed desert land and the surrounding areas include the McCoy Mountains to the east, the Palen Mountains to the north, and Ford Dry Lake to the south of the site.

Regional vehicular access is provided by Interstate 10 (I-10) which is a four-lane, limited access, divided, east-west interstate highway. The California segment is a major traffic corridor that links the Greater Los Angeles Metropolitan Region eastward through the California desert, Arizona, and ultimately terminates at Jacksonville, Florida.
Access to the project site would be off Interstate 10 (I-10) via the Wiley's Well Road Interchange, which can be accessed by both eastbound and westbound traffic, and then north to a new six and half mile paved access road extending north and west from the existing Wiley's Well Road.

Local Highways and Roads

The following roads are located in the vicinity of the project site, Interstate 10 (I-10), United States 95 (US-95) and Wiley's Well Road:

Interstate 10 (I-10)

Interstate 10 (I-10) is a four-lane, limited access, divided, east-west interstate highway. The California segment is a major traffic corridor that links the Greater Los Angeles Metropolitan Region eastward through the California desert, Arizona, and ultimately terminates at Jacksonville, Florida. Due to the limited number of interchanges off I-10 in the vicinity, access to the project site is provided only from the Wiley's Well Road Interchange, which can be accessed by both eastbound and westbound traffic. According to the Department of Transportation (Caltrans) 2008 average annual daily traffic (AADT) counts, I-10 carries approximately 24,600 vehicles west of Wiley's Well Road and 27,000 vehicles east of Wiley's Well Road.

United States 95 (US-95)

US-95 is a two-lane north-south highway that traverses from the Canadian border in Idaho to the Mexican border near Yuma, Arizona. According to the Department of Transportation (Caltrans) 2008 average annual daily traffic (AADT) counts, US-95 carries approximately 3,500 vehicles north of I-10. In the vicinity of the GSEP site the highway lacks bicycle or pedestrian facilities.

Wiley's Well Road

Wiley's Well Road is a two-lane, arterial road accessed by eastbound and westbound traffic from the I-10 Wiley's Well Road Interchange. This road runs north of I-10 to serve the Department of Transportation (Caltrans) Wiley's Well Road Rest Area and terminates and south of I-10 to the Chuckawalla Valley and Ironwood State Prisons and points south. Access to the project site will be via a new six and half mile paved road extending north and west from Wiley's Well Road. The posted speed limit is 20 mph through the Wiley's Well Road Rest Area and the road lacks bicycle or pedestrian facilities.

PUBLIC TRANSPORTATION

Public transportation consists of bus service, bicycle and pedestrian facilities, airports, and rail service. Information about these forms of public transportation follows.

Bus Service

The Palo Verde Valley Transit Agency (PVVTA) and the Sunline Transit Agency provides public transit for eastern Riverside County. The nearest transit line to the project site is the PVVTA Red Route 3 Express which provides weekday service from the city of Blythe, to the Ironwood and Chuckawalla prisons located off Wiley's Well Road south of I-10. National bus service is provided by Greyhound Lines, which has a station located in the city of Blythe, city of Palm Springs and city of Indio.

Bicycle and Pedestrian Facilities

Due to the remoteness of the area and the distance to the nearest city being the city of Blythe, no bicycle facilities such as on-street lanes and off-street paths exist in the area. As a result, bicycle activity in the vicinity is minimal-to-none.

The County of Riverside Bicycle Master Plan Update (from September 2003) identifies all planned bicycle facilities in the county. However, the GSEP site is located outside of the Master Plan's study area and no bicycle facilities are planned for the study area.

In addition, due to the remoteness of the area, pedestrian facilities, such as sidewalks and walkways, do not exist.

Airports

Two airports are located in the general vicinity of the project site, Blythe Airport is located approximately 15 miles east of GSEP and is operated by the County of Riverside.

The privately-owned, non-commercial Desert Center Airport is located five miles northeast of the community of Desert Center and approximately 13 miles west of GSEP.

Rail Service

There is no freight rail service in the project area. The Arizona and California Railroad Company (ARZC) had previously provided rail service to Riverside and San Bernardino

Counties, however, sought permission to abandon service to these counties from the Federal Surface Transportation Board (STB.)
The STB on January 13, 2010 ruled the ARZC could abandon service in Riverside and San Bernardino County. Therefore, no rail service is available for the city of Blythe, the nearest siding to the GSEP within in Riverside County, or Vidal, California located in San Bernardino County.
In addition, no regional passenger railroad serves the project area. The nearest rail passenger service is an Amtrak station in Palm Springs, California or Yuma, Arizona.

C.10.4.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

The direct and indirect impacts of the proposed GSEP on the transportation system are discussed in this section. The assessments of transportation-related impacts are based on evaluations and technical analysis which compare the pre-Project GSEP conditions to the post-Project GSEP conditions, including the following:

1. Studied intersection and road segment locations.
2. Direct/Indirect impacts and mitigation.
3. Construction period impacts and mitigation.
4. Operations impact and mitigation.
5. Emergency services vehicle access.
6. Water, rail and air traffic.
7. Impact on glare on motorists.
8. Parking capacity.
9. Transportation of hazardous materials.
10. Law, ordinances, regulations and standards (LORS).
11. Conflict with policies, plans or programs.

Study Intersection and Road Segment Locations

The following locations on the surrounding roadway network were reviewed:

1. I-10 at Wiley's Well Road, West of the Project Site.
2. I-10 at Wiley's Well Road, East of the Project Site.
3. US-95 at Hobsonway, North of the city of Blythe.

Direct/Indirect Impacts and Mitigation

Determinations of the direct and indirect impacts are based on relevant laws, ordinances, regulations and standards (LORS) pertaining to this project. To address

direct and indirect impacts and mitigation, two major project scenarios have been evaluated: construction and operational phase.
Impacts were addressed for two separate future year scenarios: peak construction year (2012) and operational year (2012). Traffic during the decommissioning period would be expected at a level between those experienced during operation and construction and likely closer to the operational levels.

Construction Period Impacts and Mitigation

Potential traffic impacts associated with construction of the GSEP were evaluated for both construction workforce traffic and construction truck traffic.

Construction Workforce Traffic

The construction of GSEP would be completed in two phases over an approximately 37 month period beginning fourth quarter, 2010 and ending in third quarter, 2014. Phase 1 would consist of the Unit 1 powerblock, access road, gas and transmission line and Phase 2 would consist of the Unit 2 powerblock.
The construction workforce would peak during month 23 with approximately 1,093 workers per day and average approximately 652 workers during the course of construction. In addition, approximately 110 workers would be required to construct the new access road, the gas line and transmission line which would occur during peak periods. However, the construction of these facilities would not coincide with the peak of the plant site construction employment.
A worst-case scenario, where all workers commute with only one occupant per vehicle, would yield a peak trip generation of approximately 1,093 inbound trips during the morning peak period and another 1,093 outbound trips during the evening peak period.
Based on regional demographics, remoteness of the location and availability of skilled laborers, it is expected that the construction employees would be drawn from the Los Angeles Basin Region and greater Phoenix, Arizona. During construction, it is anticipated that construction workers and technical workers would reside in temporary housing during the week to be located in the city of Blythe and Parker, Arizona area.

To reach the GSEP site, construction workers would likely travel from the east and west and would primarily use I-10. It is anticipated approximately 75 percent of construction workers would travel from the east and 25 percent from the west. The workers would access the site off Interstate 10 (I-10) via the Wiley's Well Road Interchange.

Construction period parking demands are to be accommodated by a temporary on-site parking area of approximately 9 acres, which would be relocated around the project site as needed during different stages of construction. The size of the construction staging/laydown area was not described in the AFC but would be provided within the project site. In addition, a staging/laydown area would be provided at the Wiley's Well Road Rest Area for the construction of the generator tie line.
As **Traffic and Transportation Table 1** depicts, the LOS in 2012 for the three study intersections without the project would remain at LOS A. With the addition of GSEP construction traffic, LOS would change from A to B at one intersection, the I-10 interchange at Wiley's Well Road east of the project site. LOS B is an acceptable level of service on California state highways.

Traffic and Transportation Table 1
Comparison Construction Year (2012) Roadway Segment Level of Service

	2012 Conditions without GSEP Construction Traffic [1]			*2012 Conditions with GSEP Construction Traffic [2]*		
Roadway Segment	***ADT***	***CAPACITY***	***LOS***	***ADT***	***CAPACITY***	***LOS***
I-10 at Wiley's Well Road, West of the Project Site	3,350	6,800	A	3,623	6,800	A
I-10 at Wiley's Well Road, East of the Project Site	3,700	6,800	A	4,520	6,800	B
US-95 at Hobsonway, North of Blythe,	450	2,000	A	655	2,000	A

1 – Year 2008 traffic volumes expanded to Year 2012 at historical rates from Year 2004 to 2008 (3.8% for Wiley's Well Road west; 6.8% Wiley's Well Road east and 8.6% for US-95)

2 – Month 23 peak construction traffic with 1,093 workers (Assumes 75% traveling from the east and 25% traveling from the west.)

This decrease in the LOS at this intersection is consistent with the proposed construction traffic patterns as it is anticipated approximately 75 percent of the traffic would utilize the eastbound Wiley's Well Road Interchange. Traffic volumes would increase from 3,700 ADT to 4,520 ADT. As a result of this increase, vehicles could become stacked as drivers exit I-10.
While traffic volumes would increase, the LOS at the study intersections and roadway segments would remain within the LOS thresholds identified by the state and local jurisdictions. All study roadway segments and intersections are expected to operate at LOS A and at LOS B at one intersection with the GSEP-related construction traffic as shown in **Traffic and Transportation Table 1**. Therefore, direct impacts on LOS from GSEP-related construction traffic would be less than significant and mitigation would not be required.

While the GSEP would not create significant direct impacts related to traffic congestion, the construction of the GSEP may overlap with two other solar projects in the immediate vicinity, the Palen Solar Power Project (PSPP) and the Blythe Solar Power Project (BSPP), and cause significant cumulative impacts. All three projects would utilize I-10 and at peak construction employ approximately 3,000 employees. The Cumulative Impacts and Mitigation section discuses these three projects and proposed mitigation (see Condition of Certification **TRANS-1**).

Construction Truck Traffic

GSEP construction is expected to generate approximately 15 to 20 one way truck trips per day peaking at approximately 50 to 75 trucks per day. The peak truck travel would not coincide with the peak month 23 construction timeframe.

In addition to the standard equipment, several pieces of equipment that exceed roadway or size limits would need to be transported to the GSEP site via I-10 during construction. This equipment includes the steam turbine generator and main transformers. The AFC indicated this equipment would have been delivered via the

Arizona and California Railroad Company at either Vidal, California or Parker, Arizona. However, as previously discussed, rail service has since been eliminated. As a result, the nearest siding to the project site would be the Parker site. The equipment would be transported using multi-axle trucks from US-95 to I-10. To transport this equipment along highway corridors, the applicant must obtain special permits from the Department of Transportation (Caltrans) to move oversized or overweight materials. The Department of Transportation, District 8, commented that GSEP would be required to obtain permits for vehicles/load exceeding limitations on size and weight.

Oversized or overweight trucks with unlicensed drivers could be hazardous to the general public and/or damage roadways. Condition of Certification **TRANS-2** requires that the project owner comply with limits on vehicle sizes and weights and driver licensing regulations. Improper transportation of hazardous materials could also prove a danger to the general public, therefore, Condition of Certification **TRANS-4** requires the owner to secure permits and licenses for the transport of hazardous materials. Finally, even properly sized and licensed trucks could damage roadways. For this reason, Condition of Certification **TRANS-5** requires that the owner restore all roads damaged by construction activities.

Operation Impacts and Mitigation

Due to the nature and remote location of the GSEP project, a relatively minor amount of traffic would be generated to and from the site during standard operations.

Operation of the facility would require a labor force of up to 66 full-time employees operating round-the-clock. In a worst-case scenario, where all workers commute with only one occupant per vehicle, would generate 132 employee commute trips spread over a 24-hour period.

In addition, GSEP will generate approximately 38 truck trips per month (average of one to two truck trips per day) for delivery of materials and supplies. Approximately 15 of these truck trips per month would be for the delivery of hazardous materials. Delivery drivers and workers would use the Wiley's Well Road offramp from either eastbound or westbound I-10 to access the site. To ensure safe handling and transportation of hazardous materials, staff proposes Condition of Certification **HAZ-3** requiring the applicant to develop and implement a Safety Management Plan for the delivery and handling of liquid and gaseous hazardous materials. Please see the **HAZARDOUS MATERIALS MANAGEMENT** section of this document

These trip additions of employees or deliveries would not cause a significant impact to the highways. It is anticipated the LOS will remain at LOS A. **Traffic and Transportation Table 2** includes information regarding the expected traffic volumes during standard operations with the base traffic volumes on the study roadway segments. The average daily traffic (ADT) volumes are expected to remain low. As indicated, the study roadway segments are expected to experience a nominal increase in GSEP-related traffic. Therefore, operations impacts from GSEP-related traffic are considered less than significant.

Traffic and Transportation Table 2
Comparison of Standard Operations (Year 2012) Traffic on Study Roadways

	2012 Standard Operations Without GSEP [1]		*2012 Standard Operations With GSEP [2]*		*Percent Change Associated with GSEP*
Roadway Segment	***ADT***	***CAPACITY [3]***	***ADT***	***CAPACTIY [3]***	
I-10 at Wiley's Well Road, West of the Project Site	3,350	6,800	3,367	6,800	0.5%
I-10 at Wiley's Well Road, East of the Project Site	3,700	6,800	3,750	6,800	1.35%
US-95 at Hobsonway, North of Blythe	450	2,000	462	2,000	2.7%

1 - Year 2008 traffic volumes expanded to Year 2012 at historical rates from Year 2004 to 2008 (3.8% for Wiley's Well Road west; 6.8% for Wiley's Well Road east and 8.6% for US-95)
2 – Project operations with 66 employees (Assumes 75% traveling from the east and 25% traveling from the west; split shifts spread over a 24 hour period.)
3 – Two-way capacity in vehicles per hour

Traffic and Transportation Table 3 includes information regarding the level of service of the study roadway segments during standard operations. As shown, the study roadway segments are expected to operate at the same condition, LOS A, as in existing conditions.

Traffic and Transportation Table 3
Standard Operations (Year 2012) Roadway Segment Level of Service Summary

Roadway Segment	***Standard Operating Year 2012 Without GSEP [1]***		***Standard Operations Year 2012 with GSEP [2]***	
	ADT	**LOS**	**ADT**	**LOS**
I-10 at Wiley's Well Road, West of the Project Site	3,350	A	3,367	A
I-10 at Wiley's Well Road, East of the Project Site	3,700	A	3,750	A
US-95 at Hobsonway, North of Blythe	450	A	462	A

1 - Year 2008 traffic volumes expanded to Year 2012 at historical rates from Year 2004 to 2008 (3.8% for Wiley's Well Road west; 6.8% for Wiley's Well Road east and 8.6% for US-95)

2 - Project operations with 66 employees (Assumes 75% traveling from the east and 25% from the west; split shifts over a 24 hour period.)

Emergency Services Vehicle Access

The environmental review of emergency service vehicle access considers the off-site accessibility by emergency vehicles to the site. It is staff's opinion that the regional access to the site is adequate based on emergency vehicles can access the site directly from I-10 via the new access road that would connect with Wiley's Well Road.

On-site circulation and secondary emergency access for vehicles would be subject to site plan review by the Riverside County Fire Department per Condition of Certification **WS-6** in the **WORKER SAFETY AND FIRE PROTECTION** section of this document. Roads also will be built to County and Fire Code requirements for adequate access for emergency vehicles.

Water, Rail, and Air Traffic

The proposed GSEP is not adjacent to a navigable body of water; therefore, the GSEP would not to alter water-related transportation. In regards to rail, there are no rail tracks on or near GSEP.

The Federal Aviation Administration (FAA) requires an analysis of facilities located within 20,000 feet of an airport. No commercial airport or military airport is located within 20,000 feet of the GSEP site boundary.

Transport of Hazardous Materials

Both the construction and operation of the proposed GSEP would involve the transport of hazardous materials to the site. The transport vehicles are required to follow federal regulations governing the proper containment vessels and vehicles, including appropriate identification of the nature of the contents.

In addition to the governing federal regulations, staff has recommended Condition of Certification **TRANS-4** requiring the applicant to obtain appropriate permits from the California Highway Patrol and Department of Transportation for the delivery of hazardous materials.

In addition, Condition of Certification **HAZ-3** requires the applicant to develop and implement a Safety Management Plan for the delivery and handling of liquid and gaseous hazardous materials. Please see the **HAZARDOUS MATERIALS MANAGEMENT** section of this document.

Glare Impact on Motorists

The Visual Resources section of this document includes general information about the impacts of glare. The traffic and transportation section contains information about glare as it relates to motorists.

The GSEP power blocks and solar arrays would occupy approximately 1,360 acres of the 1,800 acres of the BLM site. A parabolic trough is a type of a solar thermal energy collector. Constructed as a long parabolic mirror, a Dewar tube runs its length at the focal point. Sunlight is reflected by the mirror and focused on the Dewar tube. The trough is usually aligned on a north-south axis and rotated to track the sun as it moves

across the sky each day. Troughs are stowed facing the ground, a position from which no glare occurs.

When a parabolic trough rotates from the stowed position to the tracking position in the morning and in the reverse in the evening they produce a linear reflected solar image which may be visible briefly to nearby observers. Within a zone of 20 meters from the plan perimeter this image may exceed an energy level deemed safe for the human eye of 4.5 kW/m². Based on the distance of the GSEP from I-10, there does not appear to be a danger of retinal damage. However, distant observers such as motorists on nearby highways may encounter "bright spots" which are generated from the bottom edge of the mirrors which are the result of a tangentially reflected image of the sun presented by spread reflection. This spot will move as the observer changes relation to the sun and appear to "follow" the observer. Since this moving spot is several orders of brightness greater than the reflected sky and clouds on the mirrors, it may be an annoying distraction. To mitigate this impact, staff has recommended Condition of Certification **VIS-4** Reduction of Glint and Glare, in the Visual Resources Section. This condition will require a chain link fence, minimum 10-feet in height, installed around the entire project perimeter and include opaque privacy slats in order to reduce brightness of spread reflection.

Parking Capacity

The project would include a temporary parking area of approximately nine acres for construction workers, based on 350 square feet per vehicle. The parking area would be relocated around the site as construction progresses. An additional area would be required for staging and laydown of equipment, materials and supplies. This staging and laydown area would also be relocated around the site as construction progresses.

This parking area would accommodate all construction workforce vehicles if workers commuted individually, however, based on workers would participate in the park-and-ride bus service or have staggered work hours (per Condition of Certification **TRANS-1**), this parking area would be oversized.

During operations, employees would park on-site in a combined administration/parking area. Figure 3.4-1 in the AFC, depicts the administration and warehouse covering approximately 39,000 square feet. Approximately 23,100 square feet would be required for the parking area, based on 350 square feet per vehicle which would accommodate approximately 66 vehicles. This would adequately accommodate the 66-employee workforce, as employees would not be on-site simultaneously as they would work different shifts to staff the GSEP 24 hours a day, 7 days a week.

With the proposed construction parking area on-site as well as on-site parking for operational employees, the project would not result in any parking spill-over to sensitive areas or create any adverse impacts.

Laws, Ordinances, Regulations, and Standards

Staff uses LORS as significance criteria to determine if the proposed GSEP project would have a significant adverse impact on the environment. The federal, state, and

local regulations that are applicable to the proposed GSEP are listed in **Traffic and Transportation Table 4.**

Traffic and Transportation Table 4
Laws, Ordinances, Regulations and Standards

Applicable LORS	Description
Federal	
Title 49 Code of Federal Regulations (CFR) Subtitle B, Parts 171-173, 177-178, 350-359, 397.9 and Appendices A-G	Addresses safety considerations for the transport of goods, materials, and substances. Governs the transportation of hazardous materials including types of materials and marking of the transportation vehicles.
State	
California Vehicle Code (VC) Sections 353; 2500-2505; 31303-31309; 32000-32053; 32100-32109; 31600-31620; California Health and Safety Code Section 25160 et seq.	Regulates the highway transport of hazardous materials.
VC Sections 13369; 15275 and 15278	Addresses the licensing of drivers and the classification of licenses required for the operation of particular types of vehicles; also requires certificates permitting operation of vehicles transporting hazardous materials.
VC Sections 35100 et seq.; 35250 et seq.; 35400 et seq.	Specifies limits for vehicle width, height, and length.
VC Section 35780	Requires permits for any load exceeding Caltrans weight, length, or width standards on public roadways.
California Streets and Highways Code Section 117, 660-672	Requires permits for any load exceeding Caltrans weight, length, or width standards on County roads.
California Streets and Highways Code Sections 117, 660-670, 1450, 1460 et seq., and 1480 et seq.	Regulates permits from Caltrans for any roadway encroachment from facilities that require construction, maintenance, or repairs on or across State highways and County roads.

Local	
Riverside County General Plan Circulation Element	Specifies long-term planning goals and procedures for transportation infrastructure system quality and specifies LOS standards used to assess the performance of a street or highway system and the capacity of a roadway.
Riverside County Municipal Code Title 10, Chapter 10.08, Sections 10.08.010-10.08.180	Specifies limits and permit requirements for oversize loads.
Riverside County Municipal Code Title 12, Chapter 12.08, Sections 12.08.010-12.08.100	Specifies requirements for encroachment permits.

Conflict with Policies, Plans, or Programs

GSEP would not conflict with any formal policies, plans, or programs related to transportation aspects of the project.

C.10.4.3 CEQA LEVEL OF SIGNIFICANCE

With implementation of conditions of certification, the impacts of the GSEP project as proposed would be less than significant for issues related to traffic and transportation.

C.10.5 REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would essentially be Unit 1 of the proposed project, including a 125 MW solar facility located within the boundaries of the proposed project as defined by NextEra. This alternative is analyzed for two major reasons: (1) it eliminates about 50 percent of the proposed project area so all impacts are reduced, and (2) by retaining the eastern solar field, which is located on flowing desert washes, it would reduce impacts to the sand dune and playa areas and to the Mojave Fringe-toed Lizard habitat. The alternative would also reduce impacts to wildlife movement by reducing obstruction of the Palen wash and would maintain, thru both fluvial and Aeolian processes, the dune and sandy habitats. The boundaries of the Reduced Acreage Alternative are shown in **Alternatives Figure 1**.

C.10.5.1 SETTING AND EXISTING CONDITIONSC

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates effects to the eastern 125 MW solar field and relocates the gas yard approximately 1.75 miles northwest of its present location. As a result, the

environmental setting consists of the western portion of the proposed project, as well as the area affected by the linear project components.

C.10.5.2 ASSESMENT OF IMPACTS AND DISCUSSION OF MITIGATION

The Reduced Acreage Alternative would have a similar impact on the traffic and transportation system as the proposed project. This is due to the fact that the Reduced Acreage Alternative uses similar project access and numbers of construction workers, operators, and truck deliveries. If anything, the Reduced Acreage Alternative may have fewer impacts than the proposed project because it is smaller in size.

C.10.5.3 CEQA LEVEL OF SIGNIFICANCE

Like the proposed project, impacts would be less than significant with mitigations and would not cause an unacceptable LOS.

C.10.6 DRY COOLING ALTERNATIVE

This section identifies the potential impacts of using air-cooled condenser (ACC) systems rather than the cooling towers proposed by NextEra for the Genesis project. It is assumed that the ACC systems would be located where the cooling towers are currently proposed for each of the two 125 MW power block, as illustrated in **Alternatives Figure 2** (see Section B.3).

Approximately 18 ACC fans would be required for each of the two solar fields. The 18 fans, or ACC's, would operate when the ambient temperature is above 50 degrees Fahrenheit. When the temperature is below 50 degrees Fahrenheit, only 10 of the fans would be used (GSEP 2009f). The 18 ACC fans described in the GSEP cooling study would have a length of approximately 279 feet, a width of approximately 127 feet, and a height of 98 feet (GSEP 2009f). However, based on the ACC preliminary designs for nearby solar thermal projects in similar ambient temperatures, an additional 11,690 square feet could be required for siting of the fans and the fans would be up to 120 feet in height. In addition to the ACC fans, NextEra would use a small Wet Surface Air Cooler when needed to provide auxiliary cooling during extremely hot days (GSEP 2009f). This alternative is analyzed because it would reduce the amount of water required for steam turbine cooling from 822 acre-feet per year (AFY) to 66 AFY. This reduction in water use would reduce impacts to water and biological resources.

C.10.6.1 SETTING AND EXISTING CONDITIONS OF MITIGATION

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates the use of wet-cooling towers and incorporated the use of air-cooled condensers (ACC) in the same location. As a result, the environmental setting would be the same as for the proposed project.

C.10.6.2 ASSESMENT OF IMPACTS AND DISCUSSION OF MITIGATION

With implementation of conditions of certification, no new impacts to traffic and transportation would be created with the use of ACC's in place of cooling towers. Therefore, the impacts of the GSEP project as proposed would be less than significant for issues related to traffic and transportation.

C.10.6.3 CEQA LEVEL OF SIGNIFICANCE

Like the proposed project, impacts would be less than significant with mitigations and would not cause an unacceptable LOS.

C.10.7 NO PROJECT/NO ACTION ALTERNATIVE

CEQA No Project Alternative

The No Project Alternative under CEQA defines the scenario that would exist if the proposed Genesis Solar Energy Project were not constructed. The CEQA Guidelines state that "the purpose of describing and analyzing a 'no project' alternative is to allow decision makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project" (Cal. Code Regulations.. 14 § 15126.6(i)). The No Project analysis in this SA/DEIS considers existing conditions and "what would be reasonably expected to occur in the foreseeable future if the project were not approved…" (Cal. Code Regulations. 14 § 15126.6(e)(2)).

If the No Project Alternative were selected, the construction and operational impacts of the Genesis Solar Energy Project would not occur. There would be no grading of the site, no loss of resources or disturbance of desert habitat, and no installation of power generation and transmission equipment. The No Project Alternative would also eliminate contributions to cumulative impacts on a number of resources and environmental parameters in Riverside County and in the Mojave Desert as a whole.
In the absence of the Genesis Solar Energy Project, however, other power plants, both renewable and non-renewable, may have to be constructed to serve the demand for electricity and to meet RPS. The impacts of these other facilities may be similar to those of the proposed project because these technologies require large amounts of land like that required for the Genesis Solar Energy Project. The No Project/No Action Alternative may also lead to siting of other non-solar renewable technologies to help achieve the California RPS.

Additionally, if the No Project/No Action Alternative were chosen, additional gas-fired power plants may be built, or that existing gas-fired plants may operate longer. If the proposed project were not built, California would not benefit from the reduction in greenhouse gases that this facility would provide, and California utilities would not receive the 250 MW contributions to its renewable state-mandated energy portfolio.

NEPA No Action Alternatives

Under NEPA, the No Action Alternative is used as a benchmark of existing conditions by which the public and decision makers can compare the environmental effects of the

proposed action and the alternatives. Like the No Project Alternative described above, under the No Action Alternative, the impacts of the Genesis Solar Energy Project would not occur.

BLM is considering two separate actions (whether to approve a plan amendment and whether to approve the proposed project or an alternative). BLM's "action alternative" would be to amend the CDCA Plan to include Genesis Solar Energy Project (250 MW), and to approve the project as proposed. The Genesis Solar Energy Project and ancillary facilities are approved, a ROW grant is issued, and the CDCA Plan is amended to include the Genesis Solar Energy Project generation facilities and transmission line as an approved site under the Plan. Similarly, BLM could amend CDCA Plan to include one of the alternatives fully analyzed in this Draft EIS (the Reconfigured Alternative or Reduced Acreage Alternative), and approve the construction and operation of those alternatives. The alternative and ancillary facilities would be approved, a ROW grant for the appropriate acreage would be issued, and the CDCA Plan would be amended to include the alternative power generation facilities and transmission line as an approved site under the Plan.
BLM's alternatives related to the No Action Alternative and the Plan amendment are the following:

- **No Action on project but amend the CDCA plan to make the area available for future solar development.** The Genesis Solar Energy Project is not approved (project denied), and no ROW grant is issued to SES, but the CDCA plan is amended to make the project area available for large scale renewable energy development under a future project .
- **No Action on project and amend the CDCA plan to make the area unavailable for future solar development.** The Genesis Solar Energy Project is not approved (project denied), and no ROW grant is issued to SES, and the CDCA plan is amended to make the project area unavailable for large scale renewable energy development.
- **No Action on project application and on land use plan amendment**. The Genesis Solar Energy Project is not approved (denied), no ROW grant is issued, and no CDCA Plan amendment is approved. There is no consideration of information that would allow approval of a CDCA Plan amendment that would make the land available for large scale energy development in the future.

C.10.8 CUMULATIVE IMPACTS AND MITIGATION

A project may result in a significant adverse cumulative impact where its effects are cumulatively considerable. *Cumulatively considerable* is interpreted to mean that the incremental effects of an individual project are significant when viewed in connection with the effects of (1) past projects; (2) other current projects; and (3) probable future projects (California Code Regulation, Title 14, Section 15130). According to the National Environmental Policy Act (NEPA), cumulative effects can result from individually minor but collectively significant actions taking place over a period of time (40 CFR §1508.7).

The potential exists for substantial future development throughout the Southern California Desert Region as well as on the Interstate 10 (I-10) corridor in eastern

Riverside County. See **Traffic and Transportation, Figure 3**, 1-10 Corridor Existing and Proposed Projects.
Energy Commission staff has limited the traffic and transportation analysis to the I-10 corridor of eastern Riverside County, the location of the proposed Blythe, Palen, and Genesis solar projects. These three projects were included in one cumulative analysis for the following reasons:

1. Access to all three projects is off I-10.

2. All three projects exist in close proximity to one another and their construction schedule would overlap. Construction schedules are projected to overlap beginning in fourth quarter 2010 through 2015. Therefore, to accurately reflect the cumulative impacts, all three projects must be considered cumulatively. Refer to **Traffic and Transportation, Figure 3** for the location of all three projects.

The analysis in this section first defines the geographic area over which cumulative impacts to traffic and transportation could occur. It then provides information about the potential for cumulative impacts to occur as a result of implementation of the Blythe, Palen, and Genesis solar projects along the I-10 corridor in addition to the applicable local and regional projects listed in **Traffic and Transportation, Figure 3**.

Geographic Extent

The Blythe Solar Power Project (BSPP), Palen Solar Power Project (PSPP), and Genesis Solar Energy Project (GSEP) are located within 45 miles of the city of Blythe on the I-10 corridor. The Bureau of Land Management has developed coordinated management plans for various areas in the California desert owned by the federal government. These three proposed solar facilities are included within the Northern and Eastern Colorado Desert Coordinated Management Plan.

For this same 1-10 corridor in which Blythe, Palen, and Genesis solar facilities are proposed, approximately 20 additional energy-related projects, including solar, wind, pumped storage, and transmission lines, are being considered or expected to be considered for development by the Federal Energy Regulatory Commission (FERC); Bureau of Land Management (BLM); and the California Energy Commission. In addition, local residential and commercial development is proposed during this period. As a result, traffic could be cumulatively affected.

Cumulative impacts could occur to both the local roadway network and the regional roadway network. Cumulative impacts to the local roadway network would occur if the impacts of the three projects are combined with impacts of projects already located or to be located within the same general vicinity of the Blythe, Palen, and Genesis solar projects. Local impacts include damage to local roadways; traffic delays due to road closures; and increased congestion from project-related traffic.

Cumulative impacts could also affect the regional roadway network if impacts were to occur on I-10, the primary access to the 3 project sites. I-10 is the southernmost east–west, coast-to-coast highway in the United States, stretching from Santa Monica, California, through Phoenix and Tucson, Arizona; New Mexico, Texas, Louisiana, Mississippi, Alabama, and connecting to Interstate 95 in Jacksonville, Florida.

In California, the Santa Monica Freeway comprises the western most segment of I-10. I-10 merges with the Santa Monica Freeway and the San Bernardino Freeway and goes eastward to Riverside County. Traffic on I-10 is significantly reduced as flows through Coachella and into the Mojave Desert.

In this analysis, Energy Commission staff concentrates on the cumulative impacts on traffic and transportation along I-10 for approximately 170 miles beginning near Indio, California, and ending approximately 50 miles west of Blythe, California. [2]

The three projects analyzed in this section expect to employ more than one thousand workers during the construction period. For the three projects the construction workforce is expected to come from the surrounding local and regional area, including workers from the Los Angeles basin and the Phoenix, Arizona area. However, the majority of construction workers for three projects are expected to live or reside temporarily in the Indio, Blythe, or Parker, Arizona area, which is about 35 miles north of I-10. All workers would arrive at the project sites via I-10 east and I-10 west.

The regional cumulative impacts analysis of these three projects does not include currently proposed solar and wind projects located more than 45 miles east and west and 30 miles north of the Blythe Solar Power Project. This is based on the vast area over which these projects are spread and as a result, the projects would utilize different interchanges and roadways of I-10 making the impacts from projects further away unlikely. In addition, cumulative impacts from beyond this area would be tempered by: differing construction schedules; combined CEQA/NEPA requirements for mitigating significant cumulative traffic impacts; and the California Energy Commission's conditions of certification for ensuring that no significant cumulative impacts result from the Blythe, Palen and Genesis projects.

Potential Environmental Impacts

Local Impacts

Construction and operation and equipment deliveries for the Blythe, Palen, and Genesis solar projects are as follows:

Blythe

Construction of the BSPP would be completed over an approximately 69-month period, beginning in fourth quarter 2010 and ending in fourth quarter 2016. Construction work force would peak during month 16 at approximately 1,000 workers per day and average approximately 600 workers over the course of construction. Construction of the transmission line would require fewer than 25 workers during peak periods. The construction schedule will not coincide with the peak of plant site construction employment.

A worst-case scenario, where all workers commute in autos with only one occupant per vehicle, would result in approximately 1,000 inbound trips during the morning peak

[2] The Mojave Desert covers an area of approximately 25,000 square miles. In California, the Mojave Desert is bordered on the south by I-10; on the west by US 395. The desert's northern border is US 50, its southern border, I-15 in Nevada.

period and another 1,000 outbound trips during the evening peak hour. During Month 16, the estimated construction peak, the BSPP would generate approximately 2,000 one-way worker commute trips per day.

In addition, construction is also forecast to generate an average of approximately 15 to 20 one-way, truck trips per day with a peak of approximately 50-75 truck trips per day. The peak truck travel would be during plant site foundation construction and would not coincide with the peak on-site worker commute times during Month 16.

Palen

Palen construction activities will occur over an approximate 39-month period, beginning fourth quarter 2010 and ending in fourth quarter 2013. The number of construction workers will peak at Month 17 at approximately 1,141 per day and average approximately 566 workers over the course of construction. In addition, a transmission line extending from the project site to a new Southern California Edison substation west of the project site would require approximately 30 workers. The construction schedule of the power line is not expected to coincide with the construction of the solar facility. In addition, construction would not encroach on a public right-of-way nor coincide with peak employment.

The worst-case scenario for Palen, where all workers commute with only one occupant per vehicle, yields a peak trip generation of approximately 1,141 inbound trips during the morning peak period and another 1,141 outbound trips during the evening peak hour. Peak travel times would result in 2,282 one-way worker commute trips per day and an average of 1,132 one-way trips per day. The construction period is expected to generate an average of approximately 20 to 30 one-way, truck trips per day with a peak of approximately 40 truck trips per day.

Genesis

The 37-month construction period is expected to begin in fourth quarter 2010 and end third quarter 2014. The Project construction work force will peak during month 23 at approximately 1,093 workers per day and average approximately 652 workers over the course of construction.

Construction of the access road, transmission line, and gas line will require approximately 110 workers and would not coincide with the plant's peak construction period.

The worst-case scenario for Genesis, where all workers commute in autos with only one occupant per vehicle, yields a peak trip generation of approximately 1,093 inbound trips during the morning peak period and another 1,093 outbound trips during the evening peak hour occurring in Month 23. In addition, construction impacts will result in an average of approximately 15 to 20 one-way, truck trips per day with a peak of approximately 50 to 75 truck trips per day. Peak truck travel would occur during plant site foundation construction and would not coincide with the peak on-site worker commute time.

All Three Projects: Blythe, Palen and Genesis

In addition to using I-10 for construction traffic, each project would generate trips during operations over its own particular interchange/local intersections, as follows:

1. I-10 at Corn Springs Road, West of the Palen site

2. 1-10 at Wiley's Well Road, East and West of the Genesis project site

3. 1-10 at Mesa Drive, East of the Blythe project site

Since the Blythe, Palen and Genesis projects would have overlapping construction schedules, traffic impacts could potentially be exacerbated locally along I-10 and at the above intersections. Therefore, staff has proposed Condition of Certification **TRANS-1** to require coordinated traffic plans for all three projects. The Blythe and Palen projects also include this condition of certification. The traffic plans would include park-and-ride bus transportation and staggered work schedule start times to ensure acceptable loads on I-10 are maintained throughout the projects' construction periods.

Staff has also proposed Condition of Certification **TRANS-5** to ensure repair of any roadway damage caused by construction equipment and supply delivery. The Blythe and Palen projects also include this condition.

Regional Impacts during Construction

Several proposed and existing projects shown on the **Traffic and Transportation, Figure 3** have the potential to result in increased congestion on I-10. These projects include Chuckwalla Valley State Prison, Eagle Mountain Pumping Plant; commercial projects approved by the city of Blythe; Blythe Energy Project II; Blythe Airport Solar I Project; Mule Mountain Solar Project; Big Maria Vista Solar Project; Blythe PV Project; Desert Quartzite; Desert Sunlight; Mojave Solar Park/Desert Lilly Project; McCoy Soleil; Red Bluff Substation and the Chuckwalla Valley Raceway.

Although I-10 currently operates at LOS A, the high volume of traffic resulting from the overlapping construction of the Blythe, Palen and Genesis projects could result in I-10 operating at an unacceptable LOS. In addition, the LOS on I-10 could further denigrate with the identified additional projects. As a result of all these projects, cumulative impacts are significant and the BSPP, PSPP and GSEP would mitigate their contribution to this cumulative impact through the measures outlined in Condition of Certification **TRANS- 1.** This condition of certification requires applicants of the three projects examined in this analysis to coordinate construction schedules to ensure that during overlapping construction periods, parking for all workers is provided at a location that will minimize traffic on I-10 and transport workers to their respective job sites to ensure that I-10, including all intersections, operate at an acceptable LOS. Lastly, the BLM and the County of Riverside could also require similar types of mitigation to reduce the other projects contributions to the significant cumulative impacts on I-10.

Local and Regional Impacts during Operation and Decommissioning

Operation

The operation of the three solar projects analyzed in this section would not significantly contribute to long-term operational cumulative impacts related to traffic and transportation. During operation years, I-10 is expected to carry low traffic volumes and operate at LOS A. The small number of operations workers for each project would not increase the traffic volumes enough to reduce operations to below LOS A.

Decommissioning

The decommissioning of the Blythe, Palen, and Genesis solar projects, which is unlikely during the next 40 years, is not expected to result in adverse cumulative traffic and transportation impacts. These three projects are not likely to be decommissioned at the same time, and even if they were, any cumulative impacts could easily be mitigated by staggering construction employees' work schedules to ensure acceptable LOS levels. Also, construction of other solar projects is not likely to occur during the decommissioning of the Blythe, Palen, and Genesis solar projects.

Cumulative Impacts Conclusion

In this analysis, staff considered the cumulative impacts of Blythe, Palen, and Genesis, solar projects on the I-10 traffic corridor in eastern Riverside County (I-10 for approximately 170 miles beginning near Indio, California, and ending approximately 50 miles west of Blythe, California). Without mitigation, the traffic and transportation impacts of the Blythe, Palen, and Genesis solar projects have the potential to result in cumulatively considerable impacts to I-10 as well as to local streets, highways, and intersections in the vicinity of the project sites.

These cumulatively considerable impacts could also combine with impacts of past, present, or reasonably foreseeable projects to result in even greater cumulative impacts. Therefore, staff has recommended Condition of Certification **TRANS-1,** to reduce the cumulative impacts of these three projects to less than significant. However, other projects in the area are not under the scope of this analysis could result in cumulative impacts on I-10, reducing the LOS.

C.10.9 COMPLIANCE WITH LORS

The proposed GSEP is intending to comply with all federal, state, and local LORS. Development and operation of the GSEP as planned would not conflict with the LORS as described in this section. **Traffic and Transportation Table 5** summarizes the GSEP's conformance with all applicable LORS.

Traffic and Transportation Table 5
GSEP Compliance with Adopted Traffic and Transportation LORS

Applicable LORS	Description
Federal	
Title 49 Code of Federal Regulations (CFR) Subtitle B, Parts 171-173, 177-178, 350-359, 397.9 and Appendices A-G	Addresses safety considerations for the transport of goods, materials, and substances. Governs the transportation of hazardous materials including types of materials and marking of the transportation vehicles. Consistent: The GSEP will comply with these regulations. Enforcement is provided by federal enforcement agencies. Adherence is made part of the licensing process as Condition of Certification **TRANS-4**.
State	
California Vehicle Code (VC) Sections 353; 2500-2505; 31303-31309; 32000-32053; 32100-32109; 31600-31620; California Health and Safety Code Section 25160 et seq.	Regulates the highway transport of hazardous materials. Consistent: The GSEP will comply with these regulations. Enforcement is provided by state and local law enforcement agencies, and through ministerial state agency licensing and permitting and/or local agency permitting. Adherence is made part of the licensing process as Condition of Certification **TRANS-4**.
VC Sections 13369; 15275 and 15278	Addresses the licensing of drivers and the classification of licenses required for the operation of particular types of vehicles; also requires certificates permitting operation of vehicles transporting hazardous materials. Consistent: The GSEP will comply with these regulations. Enforcement is provided by state and local law enforcement agencies, and through ministerial state agency licensing and permitting and/or local agency permitting. Adherence is made part of the licensing process as Conditions of Certification **TRANS-2** and **TRANS-4**.
VC Sections 35100 et seq.; Section 35250 et seq.; and Section 35400 et seq.	Specifies limits for vehicle width, height, and length. Consistent: The GSEP will comply with these regulations. Enforcement is provided by state and local law enforcement agencies, and through ministerial state agency licensing and permitting and/or local agency permitting. Adherence is made

	part of the licensing process as Condition of Certification **TRANS-2**.
VC Section 35780	Requires permits for any load exceeding Caltrans weight, length, or width standards for public roadways. Consistent: The GSEP will comply with these regulations. Enforcement is provided by state and local law enforcement agencies, and through ministerial state agency licensing and permitting and/or local agency permitting. Adherence is made part of the licensing process as Condition of Certification **TRANS-2**.
California Streets and Highways Code Section 117, 660-672	Requires permits for any load exceeding Caltrans weight, length, or width standards on County roads. Consistent: The GSEP will comply with these regulations. Enforcement is provided by state and local law enforcement agencies, and through ministerial state agency licensing and permitting and/or local agency permitting. Adherence is made part of the licensing process as Condition of Certification **TRANS-2**.
California Streets and Highways Code Sections 117, 660-670, 1450, 1460 et seq., and 1480 et seq.	Regulates permits from Caltrans for any roadway encroachment for facilities that require construction, maintenance, or repairs on or across State highways and County roads. Consistent: The GSEP will comply with these regulations. Enforcement is provided by state and local law enforcement agencies, and through ministerial state agency licensing and permitting and/or local agency permitting. Adherence is made part of the licensing process as Condition of Certification **TRANS-3** and **TRANS-5**.
Local	
Riverside County General Plan Circulation Element	Specifies long-term planning goals and procedures for transportation infrastructure system quality and specifies LOS standards used to assess the performance of a street or highway system and the capacity of a roadway. Consistent: The GSEP is consistent with the goals and policies of the Circulation Element. The GSEP mitigates project-related impacts through Conditions of Certification, and it incorporates transportation demand management through park-and-ride and staggered work hours. See **TRANS-1**

	and **TRANS-5**.
Riverside County Municipal Code Title 10, Chapter 10.08, Sections 10.08.010-10.08.180	Specifies limits and permit requirements for oversize loads. Consistent: The GSEP will comply with these regulations. Riverside County will provide enforcement and any necessary permitting. Adherence is made part of the licensing process as Condition of Certification **TRANS-2**.
Riverside County Municipal Code Title 12, Chapter 12.08, Sections 12.08.010-12.08.100	Specifies permit requirements for encroachment permits. Consistent: The GSEP will comply with these regulations. Riverside County will provide enforcement and any necessary permitting. Adherence is made part of the licensing process as Condition of Certification **TRANS-3**.

C.10.10 NOTEWORTHY PUBLIC BENEFITS

While the development of the proposed project is intended to address the requirements of federal and state mandates to develop renewable energy, it would not yield any noteworthy public benefits related to traffic and transportation.

C.10.11 PROPOSED CONDITIONS OF CERTIFICATION

It should be noted that the Bureau of Land Management (BLM) has reviewed and agreed to the following conditions of certification for the Genesis Solar Energy Project.

TRAFFIC CONTROL PLAN

TRANS-1 Prior to start of construction of the Genesis Solar Energy Project (GSEP), the project owner shall prepare and implement a Traffic Control Plan (TCP). In preparing this TCP, the applicant shall:

1. Take into account the cumulative traffic impacts of the overlapping construction schedules of the Blythe Solar Power Project (BSPP) and the Palen Solar Power Project (PSPP).

2. Consult with Solar Millenium, LLC to:[3]

a. Provide for a coordinated park-and-ride system of bus service for workers at all three sites to ensure that I-10 operates at LOS C or higher. The park-and-ride system shall not cause any significant impacts in the vicinity of the park-and-ride facilities.

[3] Solar Mellinium LLC is the applicant for both Blythe Solar Power Project and Palen Solar Power Project.

b. Address the movement of other vehicles and materials, including delivery routes, workforce travel routes, and the arrival and departure schedules of equipment, materials, and workers, to ensure that I-10 operates at LOC or better.

For all three projects, the TCP shall include:

- A coordinated park-and-ride program designed to transport construction workers to all three sites via a van or bus service.
- Assessment and implementation, if needed, of coordinated work hours and arrival/departure times outside of peak traffic.
- A revised traffic study designed to ensure that LOS on I-10 can be maintained by implementing measures included in the TCP. The revised traffic study shall also include information about procedures designed to ensure that the park-and-ride program does not result in significant impacts in the vicinity of the park-and-ride facilities.
- A plan for monitoring LOS during construction on I-10 and within the vicinity of the park-and ride facilities. The applicant shall report LOS findings to the BLM's Authorized Officer and the Energy Commission's CPM and/or park-and-ride program as necessary.
- Limitation of truck deliveries to the project site.
- Redirection of construction traffic with a flag person as necessary to ensure traffic safety and minimize interruptions to non-construction related traffic flow.
- Placement signage, lighting, and traffic control devices at the project construction site and laydown areas.
- Placement of signage along eastbound and westbound Wiley's Well Road Interchange and at the entrance of each of the I-10 northbound and southbound off-ramps at Wiley's Well Road Interchange notifying drivers of construction traffic throughout the duration of the construction period.
- A heavy-haul plan to address the transport and delivery of heavy and oversized loads requiring permits from the Department of Transportation (Caltrans) or other state and federal agencies.
- Development of a work schedule and end-of-shift plan with the Chuckawalla Valley and Ironwood State Prisons.
- Timing of heavy equipment and building material delivery to the sites.
- Emergency vehicle access to the project site.
- Temporary closing of travel lanes, if necessary.
- arking for workforce and construction vehicles.

The project owner shall consult with the County of Riverside and the Department of Transportation (Caltrans) District 8 office in the preparation and implementation of the Traffic Control Plan and shall submit in sufficient time for review and comment the proposed Traffic Control Plan to the:

1. County of Riverside and the Department of Transportation (Caltrans) District 8 office.

2. BLM's Authorized Officer and the California Energy Commission Compliance Project Manager (CPM) for review and approval. This submittal to BLM and California Energy Commission must occur prior to the proposed start of construction and implementation of the plan. BLM's Authorized Officer and the CPM shall review and approve the TCP or identify any material deficiencies within thirty (30) days of receipt.

Verification: At least 90 calendar days prior to the start of construction, including any grading or site remediation on the power plant site or its associated easements, the project owner shall submit the proposed traffic control plan to the County of Riverside and the Department of Transportation (Caltrans) District 8 office for review and comment and to BLM's authorized officer and the CPM for review and approval. The project owner shall also provide BLM's Authorized Officer and the CPM with a copy of the transmittal letter to the County of Riverside and the Department of Transportation (Caltrans) District 8 office requesting review and comment.

At least 30 calendar days prior to the start of construction, the project owner shall provide copies of any comment letters received from either the County of Riverside and the Department of Transportation (Caltrans) District 8 office, along with any changes to the proposed Traffic Control Plan to BLM's Authorized Officer and the CPM for review and approval.

TRANS-2 The project owner shall comply with limitations imposed by the Department of Transportation (Caltrans) District 8 office and other relevant jurisdictions including the County of Riverside on vehicle sizes and weights and driver licensing. In addition, the project owner or its contractor shall obtain necessary transportation permits from the Department of Transportation (Caltrans) and all relevant jurisdictions for use of roadways.

Verification: In the Monthly Compliance Reports (MCRs), the project owner shall report permits received during that reporting period. In addition, the project owner shall retain copies of these permits and supporting documentation on-site for Compliance Project Manager (CPM) inspection if requested.

TRANS-3 **Encroachment into Public Rights-of-Way** The project owner or its contractor shall comply with the Department of Transportation (Caltrans) and other relevant jurisdictions limitations for encroachment into public rights-of-way and shall obtain necessary encroachment permits from the Department of Transportation (Caltrans) and all relevant jurisdictions.

Verification: In the MCR's, the project owner shall report permits received during that reporting period. In addition, for at least six months after the start of commercial operation, the project owner shall retain copies of permits and supporting documentation on-site for CPM inspection, if requested.

TRANS-4 Securing Permits/Licenses to Transport Hazardous Materials The project owner shall ensure that permits and/or licenses are secured from the California Highway Patrol and Department of Transportation (Caltrans) for the transport of hazardous materials.

Verification: In the MCR's, the project owner shall report permits and/or licenses for hazardous substance transportation received during that reporting period. In addition, the project owner shall retain copies of permits, licenses, and supporting documentation on-site for CPM inspection if requested.

TRANS-5 Restorations of All Public Roads, Easements, and Rights-of-Way The project owner shall restore all public roads, easements, and rights-of-way that have been damaged due to project-related construction activities to original or near-original condition in a timely manner, as directed by BLM's Authorized Officer and CPM. Repairs and restoration of access roads may be required at any time during the construction phase of the project to assure safe ingress and egress.

Verification: At least 30 days prior to the start of mobilization, the project owner shall photograph or videotape all affected public roads, easements, and right-of-way segments and/or intersections and shall provide BLM's Authorized Officer, the CPM, the affected local jurisdictions and the Department of Transportation (if applicable) with a copy of these images. The project owner shall rebuild, repair and maintain all public roads, easements, rights-of-way in a usable condition throughout the construction phase of the project.

Prior to the start of site mobilization, the project owner shall consult with the County of Riverside and the Department of Transportation (Caltrans) District 8 and notify them of the proposed schedule for project construction. The purpose of this notification is to request that the County of Riverside and the Department of Transportation (Caltrans) consider postponement of public right-of-way repair or improvement activities in areas affected by project construction until construction is completed and to coordinate with the project owner regarding any concurrent construction-related activities that are planned or in progress and cannot be postponed.

Within 60 calendar days after completion of construction, the project owner shall meet with BLM's Authorized Officer and the CPM, the County of Riverside and Caltrans District 8 to identify sections of public right-of-way to be repaired. At that time, the project owner shall establish a schedule to complete the repairs and to receive approval for the action(s). Following completion of any public right-of-way repairs, the project owner shall provide a letter signed by the County of Riverside and the Department of Transportation(Caltrans) District 8 stating their satisfaction with the repairs to BLM's Authorized Officer and the CPM.

C.10.13 CONCLUSIONS

1. The GSEP as proposed with conditions of certification would comply with all applicable LORS related to traffic and transportation. As a result, it would result in less than significant impacts to the traffic and transportation system.

2. Based on the GSEP's distance from the nearest airport, no impact on the Blythe Airport or Desert Center Airport would occur, and the project would not impact aviation safety.

3. Based on the GSEP's distance from the nearest rail and bus service, the project would not have an impact on these forms of transportation.

4. The GSEP as proposed with conditions of certification would not result in significant direct, indirect or cumulative traffic and transportation impacts, and therefore, no environmental justice issues.

5. Staff is proposing Condition of Certification **TRANS-1,** which requires the owner to develop and implement a Traffic Control Plan. The Traffic Control Plan would include a plan for reducing peak construction workforce vehicle trips.

6. Staff is proposing Condition of Certification **TRANS- 2,** limitation of vehicle size and weights to ensure compliance with limitations on use on roadways.

7. Staff is proposing Condition of Certification **TRANS- 3** requiring compliance with limitations on encroachment into public rights-of-ways.

8. Staff is proposing Condition of Certification **TRANS- 4** to ensure safe transport of hazardous materials.

9. Staff is proposing Condition of Certification **TRANS-5** to ensure all public roads, easements and rights-of-ways are restored to their original condition if damaged by project related construction.

C.11 - TRANSMISSION LINE SAFETY AND NUISANCE

Testimony of Obed Odoemelam, Ph.D.

C.11.1 SUMMARY OF CONCLUSIONS

The applicant, Genesis Solar, LLC proposes to transmit the power from the proposed Genesis Solar Energy Project (GSEP) to the Southern California Edison's (SCE's) transmission grid through SCE's proposed Colorado River Substation at a location approximately 6.5 miles east of the site. The project's tie-in line would be a single-circuit 230-kilovolt (kV) transmission line routed in a southerly right-of-way eventually connecting to the proposed SCE Colorado River Substation. This proposed substation would be under the jurisdiction of the California Public Utilities Commission (PUC) and the Bureau of Land management (BLM), therefore, this staff analysis is for the tie-in project line as it stretches from the proposed on-site substation to the proposed SCE substation. Since the proposed line would be located in the SCE service area, it would be constructed, operated, and maintained according to SCE's guidelines for line safety and field management which conform to applicable laws, ordinances, regulations and standards (LORS). The proposed route would traverse undisturbed desert land with no nearby residents, thereby eliminating the potential for residential electric and magnetic field exposures when the line is operating. With the four proposed conditions of certification, any safety and nuisance impacts from energizing the proposed tie-in line would be less than significant.

C.11.2 INTRODUCTION

The purpose of this staff assessment is to assess the proposed Genesis Solar Energy Project's (GSEP's) transmission line's design and operational plan to determine whether its related field and nonfield impacts would constitute a significant environmental hazard in the areas around the proposed route as it runs between the site and the Southern California Edison's (SCE's) planned Colorado River Substation 6.5 miles to the east. GSEP would consist of two generating units (Units 1 and Unit 2), each of 125 megawatts (MW) for a total of 250 megawatts. The generated power would be transmitted using an overhead single-circuit 230-kilovolt (kV) line. The SCE substation would be built by SCE under the jurisdiction of the California Public utilities Commission (PUC) and the Bureau of Land Management (BLM). Therefore, this staff analysis is for the proposed GSEP tie-in line and the related on-site 230-kV switchyard and not the proposed Colorado River Substation. Since the proposed line would be built and operated within the SCE service area, it would be designed, built, and operated according to SCE's guidelines. The potential impacts of concern in this analysis are those to be encountered along the proposed route. All related health and safety laws, ordinances, regulations, and standards (LORS) are currently aimed at minimizing such impacts along any given corridor. Staff's analysis in this regard focuses on the following issues taking into account both the physical presence of the line and the physical interactions of its electric and magnetic fields:

- aviation safety;
- interference with radio-frequency communication;

- audible noise;
- fire hazards;
- hazardous shocks;
- nuisance shocks; and
- electric and magnetic field (EMF) exposure.

Section C.11.3 shows the federal, state, and local laws and policies that apply to the control of the field and nonfield impacts of electric power lines. Staff's analysis examines the project's compliance with these requirements.

C.11.3 METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

The potential magnitude of the line impacts of concern in this staff analysis depends on compliance with the listed design-related LORS and industry practices. These LORS and practices have been established to maintain impacts below levels of potential significance. Thus, if staff determines that the project would comply with applicable LORS, we would conclude that any transmission line-related safety and nuisance impacts would be less than significant. The nature of these individual impacts is discussed below together with the potential for compliance with the LORS that apply.

Laws, Ordinances, Regulations, and Standards

TRANSMISSION LINE SAFETY AND NUISANCE (TLSN) TABLE 1
Laws, Ordinances, Regulations, and Standards (LORS)

Applicable LORS	Description
Aviation Safety	
Federal	
Title 14, Part 77 of the Code of Federal Regulations (CFR),"Objects Affecting the Navigable Air Space"	Describes the criteria used to determine the need for a Federal Aviation Administration (FAA) "Notice of Proposed Construction or Alteration" in cases of potential obstruction hazards.
FAA Advisory Circular No. 70/7460-1G, "Proposed Construction and/or Alteration of Objects that May Affect the Navigation Space"	Addresses the need to file the "Notice of Proposed Construction or Alteration" form (Form 7640) with the FAA in cases of potential for an obstruction hazard.
FAA Advisory Circular 70/460-1G, "Obstruction Marking and Lighting"	Describes the FAA standards for marking and lighting objects that may pose a navigation hazard as established using the criteria in Title 14, Part 77 of the CFR.
Interference with Radio Frequency Communication	
Federal	
Title 47, CFR, section 15.2524, Federal Communications Commission (FCC)	Prohibits operation of devices that can interfere with radio-frequency communication.

Applicable LORS	Description
State	
California Public Utilities Commission (CPUC) General Order 52 (GO-52)	Governs the construction and operation of power and communications lines to prevent or mitigate interference.
Audible Noise	
Local	
Riverside County General Plan, Noise Element	Establishes policies and programs to ensure that noise levels are appropriate to land uses.
Riverside County Noise Ordinance	Establishes performance standards for planned residential or other noise-sensitive land uses.
Hazardous and Nuisance Shocks	
State	
CPUC GO-95, "Rules for Overhead Electric Line Construction"	Governs clearance requirements to prevent hazardous shocks, grounding techniques to minimize nuisance shocks, and maintenance and inspection requirements.
Title 8, California Code of Regulations (CCR) section 2700 et seq. "High Voltage Safety Orders"	Specifies requirements and minimum standards for safely installing, operating, working around, and maintaining electrical installations and equipment.
National Electrical Safety Code	Specifies grounding procedures to limit nuisance shocks. Also specifies minimum conductor ground clearances.
Industry Standards	
Institute of Electrical and Electronics Engineers (IEEE) 1119, "IEEE Guide for Fence Safety Clearances in Electric-Supply Stations"	Specifies the guidelines for grounding-related practices within the right-of-way and substations.
Electric and Magnetic Fields	
State	
GO-131-D, CPUC "Rules for Planning and Construction of Electric Generation Line and Substation Facilities in California"	Specifies application and noticing requirements for new line construction including EMF reduction.
CPUC Decision 93-11-013	Specifies CPUC requirements for reducing power frequency electric and magnetic fields.
Industry Standards	
American National Standards Institute (ANSI/IEEE) 644-1944 Standard Procedures for Measurement of Power Frequency Electric and Magnetic Fields from AC Power Lines	Specifies standard procedures for measuring electric and magnetic fields from an operating electric line.
Fire Hazards	
State	
14 CCR sections 1250-1258, "Fire Prevention Standards for Electric Utilities"	Provides specific exemptions from electric pole and tower firebreak and conductor clearance standards and specifies when and where standards apply.

C.11.4 PROPOSED PROJECT

C.11.4.1 SETTING AND EXISTING CONDITIONS

As discussed by the applicant, Genesis Solar LLC, the two units of the proposed Genesis Solar Energy Project would occupy approximately 1,800 acres of federal land currently managed by the Bureau of Land Management (BLM). An additional 90 acres would be required for the right-of-way of the project's transmission line. The applicant proposes to obtain a total of 4,600 acres to constitute the total right-of-way for the project and all related facilities. The site is desert land located in east Riverside County approximately 25 miles west of Blythe and 27 miles east of Desert Center (GSEP 2009a pp.3-1 and 3-25). As more fully discussed by the applicant, each of the two proposed units would have its own solar field with the generated power transmitted to the SCE power grid from a common switchyard using a single-circuit overhead, 230 -kV line. The point of connection with the SCE grid would be SCE's planned 500/230-kV Colorado River Substation approximately 6.5 miles east of the site. Since the planned SCE Colorado Substation would be under the jurisdiction of the CPUC, it would be designed, built, and operated to reflect implementation of related CPUC requirements.

The proposed project site is in an uninhabited open desert land with no existing structures. The proposed line's right-of-way would traverse BLM-administered land in a largely uninhabited desert land where there is no residential area within 15 miles (GSEP 2009 p. 4-4). The general absence of residences in the area around the proposed GSEP and related transmission line means that there would not be the type of residential field exposure that has been of health concern in recent years.

PROJECT DESCRIPTION

The proposed GSEP 230-kV tie-in line would consist of the following individual segments:

- A new, single-circuit 230-kV overhead transmission line extending the 6.5 miles from the on-site project switchyard to the planned SCE Colorado River Substation to the east;
- The project's on-site 230-kV switchyard from which the conductors would extend to the planned Colorado River Substation; and
- Project-related upgrades at the Colorado River Substation.

The line would exit the facility in a southeast direction to a point where it would cross the existing Imperial County District's Blythe to Eagle Mountain 161-KV transmission line and then I-10. From the I-10 crossing, the line would further extend east and share transmission poles with the Blythe Energy Project Transmission Line (still under construction directly south of the project). From there the line would extend eastwards to ultimately terminate at the interconnection point within the planned Colorado River Substation (GSEP 2009a, p 3-25 through 3-37).

The proposed line conductors would be aluminum steel-reinforced cables supported on steel mono-pole structures placed approximately 880 feet apart and with heights of from 70 feet to a maximum of 145 feet as typical of similar SCE lines). The applicant

provided the details of the proposed support structures as related to line safety, maintainability, and field reduction efficiency (GSEP 2009a, Figures 3.6-2, 3-26, and 4.2-1).

C.11.4.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

DIRECT IMPACTS AND MITIGATION METHODS

Aviation Safety

Any potential hazard to area aircraft would relate to the potential for collision in the navigable airspace. The requirements listed on **TLSN Table 1** establish the standards for assessing the potential for obstruction hazards within the navigable space and establish the criteria for determining when to notify the FAA about such hazards. These regulations require FAA notification in cases of structures over 200 feet from the ground. Notification is also required if the structure is to be below 200 feet in height but would be located within the restricted airspace in the approaches to public or military airports. For airports with runways longer than 3,200 feet, the restricted space is defined by the FAA as an area extending 20,000 feet from the runway. For airports with runways of 3,200 feet or less, the restricted airspace would be an area that extends 10,000 feet from this runway. For heliports, the restricted space is an area that extends 5,000 feet.

The nearest airport to the project and related line is the Blythe Airport approximately 15 miles east of the project and 10 miles east of the proposed tie-in line meaning that the airport would be too far away for the project to pose a collision hazard to area aviation according to FAA criteria. Furthermore, the line support structures would, at less than 145 feet would be significantly less than the 200 feet in height that triggers the FAA concern over collision hazards. Therefore, staff does not recommend any related condition of certification.

Interference with Radio-Frequency Communication

Transmission line-related radio-frequency interference is one of the indirect effects of line operation and is produced by the physical interactions of line electric fields. Such interference is due to the radio noise produced by the action of the electric fields on the surface of the energized conductor. The process involved is known as *corona discharge*, but is referred to as *spark gap electric discharge* when it occurs within gaps between the conductor and insulators or metal fittings. When generated, such noise manifests itself as perceivable interference with radio or television signal reception or interference with other forms of radio communication. Since the level of interference depends on factors such as line voltage, distance from the line to the receiving device, orientation of the antenna, signal level, line configuration and weather conditions, maximum interference levels are not specified as design criteria for modern transmission lines. The level of any such interference usually depends on the magnitude of the electric fields involved and the distance from the line. The potential for such impacts is therefore minimized by reducing the line electric fields and locating the line away from inhabited areas.

The proposed project line would be built and maintained in keeping with standard SCE practices that minimize surface irregularities and discontinuities and related corona noise. Such corona effects would further be minimized by the specific low-corona designs proposed by the applicants. Since the line would traverse an uninhabited open space, staff does not expect any corona-related radio-frequency interference or related complaints and does not recommend any related condition of certification.

Audible Noise

The noise-reducing designs related to electric field intensity are not specifically mandated by federal or state regulations in terms of specific noise limits. As with radio noise, such noise is limited instead through design, construction, or maintenance practices established from industry research and experience as effective without significant impacts on line safety, efficiency, maintainability, and reliability. Audible noise usually results from the action of the electric field at the surface of the line conductor and could be perceived as a characteristic crackling, frying, or hissing sound or hum, especially in wet weather. Since the noise level depends on the strength of the line electric field, the potential for perception could be assessed from estimates of the field strengths expected during operation. Such noise is usually generated during rainfall, mainly from overhead lines of 345 kV or higher such as the proposed line. Research by the Electric Power Research Institute (EPRI 1982) has validated the efficacy of available mitigation measures by showing that the fair-weather audible noise from all modern transmission lines even of more than 345 kV would be generally indistinguishable from background noise at the edge of a right-of-way of 100 feet or more. Since the proposed low-corona design is also aimed against surface electric fields, staff does not expect the proposed line operation to add significantly to current background noise levels in the project area. For an assessment of the noise from the proposed line and related facilities, please refer to staff's analysis in the **Noise and Vibration** section.

Fire Hazards

The fire hazards addressed through the related LORS in **TLSN Table 1** are those that could be caused by sparks from conductors of overhead lines, or that could result from direct contact between the line and nearby trees and other combustible objects.

Standard fire prevention and suppression measures for similar SCE lines would be implemented for the proposed project line GSEP 2009a, p. 4-7). The applicant's intention to ensure compliance with the clearance-related aspects of GO-95 would be an important part of this mitigation approach. Condition of Certification **TLSN-3** is recommended to ensure compliance with important aspects of the fire prevention measures.

Hazardous Shocks

Hazardous shocks are those that could result from direct or indirect contact between an individual and the energized line, whether overhead or underground. Such shocks are capable of serious physiological harm or death and remain a driving force in the design and operation of transmission and other high-voltage lines.

No design-specific federal regulations have been established to prevent hazardous shocks from overhead power lines. Safety is assured within the industry from compliance with the requirements specifying the minimum national safe operating clearances applicable in areas where the line might be accessible to the public.

The applicant's stated intention to implement the GO-95-related measures against direct contact with the energized line (GSEP 2009a, pp. 3-25 and 4-7) would serve to minimize the risk of hazardous shocks. Staff's recommended Condition of Certification **TLSN-1** would be adequate to ensure implementation of the necessary mitigation measures.

Nuisance Shocks

Nuisance shocks are caused by current flow at levels generally incapable of causing significant physiological harm. They result mostly from direct contact with metal objects electrically charged by fields from the energized line. Such electric charges are induced in different ways by the line's electric and magnetic fields.

There are no design-specific federal or state regulations to limit nuisance shocks in the transmission line environment. For modern overhead high-voltage lines, such shocks are effectively minimized through grounding procedures specified in the National Electrical Safety Code (NESC) and the joint guidelines of the American National Standards Institute (ANSI) and the Institute of Electrical and Electronics Engineers (IEEE). For the proposed project line, the project owner will be responsible in all cases for ensuring compliance with these grounding-related practices within the right-of-way.

The potential for nuisance shocks around the proposed line would be minimized through standard industry grounding practices (GSEP 2009a, p.4-7). Staff recommends Condition of Certification **TLSN-4** to ensure such grounding for BSPP.

Electric and Magnetic Field Exposure

The possibility of deleterious health effects from EMF exposure has increased public concern in recent years about living near high-voltage lines. Both electric and magnetic fields occur together whenever electricity flows, and exposure to them together is generally referred to as *EMF exposure*. The available evidence as evaluated by the CPUC, other regulatory agencies, and staff has not established that such fields pose a significant health hazard to exposed humans. There are no health-based federal regulations or industry codes specifying environmental limits on the strengths of fields from power lines. Most regulatory agencies believe, as staff does, that health-based limits are inappropriate at this time. They also believe that the present knowledge of the issue does not justify any retrofit of existing lines.

Staff considers it important, as does the CPUC, to note that while such a hazard has not been established from the available evidence, the same evidence does not serve as proof of a definite lack of a hazard. Staff therefore considers it appropriate, in light of present uncertainty, to recommend feasible reduction of such fields without affecting safety, efficiency, reliability, and maintainability.

While there is considerable uncertainty about EMF health effects, the following facts have been established from the available information and have been used to establish existing policies:

- Any exposure-related health risk to the exposed individual will likely be small.
- The most biologically significant types of exposures have not been established.
- Most health concerns are about the magnetic field.
- There are measures that can be employed for field reduction, but they can affect line safety, reliability, efficiency, and maintainability, depending on the type and extent of such measures.

State's Approach to Regulating Field Exposures

In California, the CPUC (which regulates the installation and operation of many high-voltage lines owned and operated by investor-owned utilities) has determined that only no-cost or low-cost measures are presently justified in any effort to reduce power line fields beyond levels existing before the present health concern arose. The CPUC has further determined that such reduction should be made only in connection with new or modified lines. It requires each utility within its jurisdiction to establish EMF-reducing measures and incorporate such measures into the designs for all new or upgraded power lines and related facilities within their respective service areas. The CPUC further established specific limits on the resources to be used in each case for field reduction. Such limitations were intended by the CPUC to apply to the cost of any redesign to reduce field strength or relocation to reduce exposure. Publicly owned utilities, which are not within the jurisdiction of the CPUC, voluntarily comply with these CPUC requirements. This CPUC policy resulted from assessments made to implement CPUC Decision 93-11-013.

In keeping with this CPUC policy, staff requires a showing that each proposed overhead line would be designed according to the EMF-reducing design guidelines applicable to the utility service area involved. These field-reducing measures can impact line operation if applied without appropriate regard for environmental and other local factors bearing on safety, reliability, efficiency, and maintainability. Therefore, it is up to each applicant to ensure that such measures are applied in ways that prevent significant impacts on line operation and safety. The extent of such applications would be reflected by ground-level field strengths as measured during operation. When estimated or measured for lines of similar voltage and current-carrying capacity, such field strength values can be used by staff and other regulatory agencies to assess the effectiveness of the applied reduction measures. These field strengths can be estimated for any given design using established procedures. Estimates are specified for a height of one meter above the ground, in units of kilovolts per meter (kV/m), for the electric field, and milligauss (mG) for the companion magnetic field. Their magnitude depends on line voltage (in the case of electric fields), the geometry of the support structures, degree of cancellation from nearby conductors, distance between conductors, and, in the case of magnetic fields, amount of current in the line.

Since the CPUC currently requires that most new and upgraded lines in California be designed according to the EMF-reducing guidelines of the electric utility in the service

area involved, their fields are required under this CPUC policy to be similar to fields from similar lines in that service area. Designing the proposed project line according to existing SCE field strength-reducing guidelines would constitute compliance with the CPUC requirements for line field management.

The CPUC has recently revisited the EMF management issue to assess the need for policy changes to reflect the available information on possible health impacts. The findings did not point to a need for significant changes to existing field management policies. Since there are no residences in the immediate vicinity of the proposed project line, there would not be the long-term residential EMF exposures mostly responsible for the health concern of recent years. The only project-related EMF exposures of potential significance would be the short-term exposures of plant workers, regulatory inspectors, maintenance personnel, visitors, or individuals in the vicinity of the line. These types of exposures are short term and well understood as not significantly related to the health concern.

Industry's and Applicant's Approach to Reducing Field Exposures

The present focus is on the magnetic field because unlike electric fields, it can penetrate the soil, buildings, and other materials to produce the types of human exposures at the root of the health concern of recent years. The industry seeks to reduce exposure, not by setting specific exposure limits, but through design guidelines that minimize exposure in each given case. As one focuses on the strong magnetic fields from the more visible high-voltage power lines, staff considers it important, for perspective, to note that an individual in a home could be exposed to much stronger fields while using some common household appliances than from high-voltage lines (National Institute of Environmental Health Services and the U.S. Department of Energy, 1998). The difference between these types of field exposures is that the higher-level, appliance-related exposures are short term, while the exposures from power lines are lower level, but long term. Scientists have not established which of these types of exposures would be more biologically meaningful in the individual. Staff notes such exposure differences only to show that high-level magnetic field exposures regularly occur in areas other than around high-voltage power lines.

As with similar SCE lines, specific field strength-reducing measures would be incorporated into the proposed line's design to ensure the field strength minimization currently required by the CPUC in light of the concern over EMF exposure and health.

The field reduction measures to be applied include the following:

1. increasing the distance between the conductors and the ground to an optimal level;

2. reducing the spacing between the conductors to an optimal level;

3. minimizing the current in the line; and

4. arranging current flow to maximize the cancellation effects from interacting of conductor fields.

Since the route of the proposed project line would have no nearby residences, the long-term residential field exposures at the root of the health concern of recent years would not be a significant concern for the line. The field strengths of most significance in this regard would be as encountered at the edge of the line's 100-foot right-of-way. These field intensities would reflect the effectiveness of the applied field-reducing measures.

The applicant (GSEP 2009a, p. 4-6 and Figures 4.22 through 5.25) calculated the maximum electric and magnetic field intensities expected for the edge of the 100-foot right-of- way. Staff has verified the accuracy of the modeling approach used in the applicant's calculations with regard to parameters bearing on field strength dissipation and exposure assessment. The maximum electric field intensity at this location was calculated as 0.7 kV/m which reflects the effectiveness of the applied field-reducing design. The corresponding magnetic field value was calculated as 32 mG. These field strengths are as staff would expect for an SCE line of the same voltage and current-carting capacity and reflect effective implementation of related SCE's field reduction measures. The corresponding magnetic field intensity was calculated as 143 mG at the edge of this right-of-way and is also similar to that of SCE lines of similar voltage rating and current-carrying capacity as required under current CPUC regulation. The requirements in Condition of Certification **TLSN-2** for field strength measurements are intended to validate the applicant's assumed reduction efficiency.

CLOSURE AND DECOMMISSIONING IMPACTS AND MITIGATION

If the proposed GSEP were to be closed, decommissioned and all related structures are removed as described in the **Project Description** section, the minimal area aviation risk and electric shocks and fire hazards from the physical presence of this tie-in line would be eliminated. Decommissioning and removal would also eliminate the line's field impacts assessed in this analysis in terms of nuisance shocks, radio-frequency impacts, audible noise, and electric and magnetic field exposure. Since the line would be designed and operated according existing SCE guidelines, these impacts would be as expected for SCE lines of the same voltage and current-carrying capacity and therefore, at levels reflecting compliance with existing health and safety LORS.

C.11.5 REDUCED ACREAGE ALTERNATIVE

The reduced acreage alternative would essentially be Unit 1 of the proposed project which would be a 125 MW solar facility located within the boundaries of the proposed project. This alternative is analyzed for two main reasons: First it would eliminate about 50 percent of the proposed project area so all impacts would be reduced proportionately and second, it would retain the eastern solar field, which is located on flowing desert washes. It would also reduce impacts on the sand dune and playa areas and the Mojave Fringe-toed Lizard habitat. The alternative would also reduce impacts on wildlife movement by reducing obstruction of the Palen Wash and would maintain the dune and sandy habitats through both fluvial and Aolian processes. The boundaries of the Reduced Acreage Alternative are shown in **Figure 1** in the **Alternatives** section.

For this Reduced Acreage Alternative, the generated power would still be transmitted to the SCE power grid through the Colorado River Substation and would require

infrastructure similar to that for the proposed version, including a water supply pipeline, transmission line. No downstream line upgrades would likely be necessary.

C.11.5.1 SETTING AND EXISTING CONDITIONS

This alternative would be located entirely within the boundaries of the proposed project. Its use would simply eliminate the projects impacts on the eastern 125 MW solar field and cause relocation of the gas yard approximately 1.75 miles northwest of its present location. As a result, the environmental setting would consist of the western portion of the proposed project as well as the area potentially affected by the linear facilities.

C.11.5.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Staff's analysis focuses on the transmission line required to serve the generation facility, and addresses the following issues taking into account both the physical presence of the line and the physical interactions of its electric and magnetic fields:

aviation safety;

interference with radio-frequency communication;

audible noise;

fire hazards;

hazardous shocks;

nuisance shocks; and

electric and magnetic field (EMF) exposure.

The transmission line for the Reduced Acreage alternative would follow the same route as that for the proposed project. The line would (a) be constructed, operated, and maintained according to SCE's guidelines for line safety and field management which conform to applicable laws, ordinances, regulations and standards and (b) would traverse undisturbed desert land with no nearby residents, thereby eliminating the potential for residential noise electric and magnetic field exposures.

C.11.5.3 CEQA LEVEL OF SIGNIFICANCE

With the four conditions of certification recommended for the proposed project, any safety and nuisance impacts from the line for the Reduced Acreage Alternative would be less than significant.

C.11.6 DRY COOLING ALTERNATIVE

The project is proposed to use a wet cooling tower for plant cooling and would utilize groundwater from wells at the site for this purpose. The Dry Cooling Alternative would preclude the use of such cooling water as cooling would be achieved without water.

C.11.6.1 SETTING AND EXISTING CONDITIONS

The setting for the Dry Cooling Alternative would be the same as described for the project and associated linear facilities as described in Subsection C.8.4.1 above. The

only substantive change would be the substitution of a dry cooling facility for the proposed cooling tower to produce the same amount of power.

C.11.6.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Staff's analysis focuses on the transmission line required to serve the generation facility, and addresses the following issues taking into account both the physical presence of the line and the physical interactions of its electric and magnetic fields:

aviation safety;

interference with radio-frequency communication;

audible noise;

fire hazards;

hazardous shocks;

nuisance shocks; and

electric and magnetic field (EMF) exposure.

Since the same amount of power would be generated as with the proposed project, the same transmission infrastructure would be used for this Dry Cooling Alternative. The line would also (a) be constructed, operated, and maintained according to SCE's guidelines for line safety and field management which conform to applicable laws, ordinances, regulations and standards and (b) would traverse undisturbed desert land with no nearby residents, thereby eliminating the potential for residential noise and electric and magnetic field exposures.

C.11.6.3 CEQA LEVEL OF SIGNIFICANCE

With the four conditions of certification recommended for the proposed project, any safety and nuisance impacts from the line for the proposed Western Lands #2 Alternative would be less than significant.

C.11.7 NO ACTION ALTERNATIVE

With the No Project/No Action Alternative, the proposed action would not be undertaken. Unless BLM implements an amendment to the CDCA Plan, the BLM land on which the project is proposed would continue to be managed within BLM's framework of a program of multiple use and sustained yield, and the maintenance of environmental quality [43 U.S.C. 1781 (b)] in conformance with applicable statutes, regulations, policy and land use plan.

C.11.7.1 SETTING AND EXISTING CONDITIONS

The setting for the No Project/No Action Alternative would include lands in which the proposed project and its associated linear facilities would be located. Subsection C.8.4.1 (above) describes in detail the lands that would be affected.

C.11.7.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

In the No Project / No Action Alternative, the proposed action would not be undertaken. The BLM land on which the project is proposed would continue to be managed within BLM's framework of a program of multiple use and sustained yield, and the maintenance of environmental quality [43 U.S.C. 1781 (b)] in conformance with applicable statutes, regulations, policy and land use plan. For example, there are seven large solar projects proposed on BLM land within the area served by the BLM El Centro Field Office, and there are currently 70 applications for solar projects covering 611,692 acres pending with BLM in the California Desert District.

Under the No Project/No Action alternative, the transmission line safety and nuisance impacts of the proposed GSEP would not occur at the proposed site. This would help reduce the total human exposure to area field and non-field impacts from electric power lines in general.

C.11.7.3 CEQA LEVEL OF SIGNIFICANCE

Under the No Project/No Action alternative, the transmission line safety and nuisance impacts from the proposed project line would not occur thereby contributing to the general effort to reduce these impacts on humans. However, given the potentially low levels of these line impacts, such contribution to exposure reduction would be less than significant.

C.11.8 CUMULATIVE IMPACTS

A project may result in a significant adverse cumulative impact where its effects are cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects (California Code Regulation, Title 14, section 15130). NEPA states that cumulative effects can result from individually minor but collectively significant actions taking place over a period of time" (40 CFR §1508.7).

When field intensities are measured or calculated for a specific location, they reflect the interactive, and therefore, cumulative effects of fields from all contributing conductors. This interaction could be additive or subtractive depending on prevailing conditions. Since the proposed project's transmission line would be designed, built, and operated according to applicable field-reducing SCE guidelines (as currently required by the CPUC for effective field management), any contribution to cumulative area exposures should be at levels expected for SCE lines of similar voltage and current-carrying capacity. It is this similarity in intensity that constitutes compliance with current CPUC requirements on EMF management. The actual field strengths and contribution levels for the proposed line design would be assessed from the results of the field strength measurements specified in Condition of Certification **TLSN-2**.

C.11.9 COMPLIANCE WITH LORS

As previously noted, current CPUC policy on safe EMF management requires that any high-voltage line within a given area be designed to incorporate the field strength-reducing guidelines of the main area utility lines to be interconnected. The utility in this case is SCE. Since the proposed project 230-kV line and related switchyard would be designed according to the respective requirements of the LORS listed in **TLSN Table 1**, and operated and maintained according to current SCE guidelines on line safety and field strength management, staff considers the proposed design and operational plan to be in compliance with the health and safety requirements of concern in this analysis. The actual contribution to the area's field exposure levels would be assessed from results of the field strength measurements required in Condition of Certification **TLSN-2**.

C.11.10 NOTEWORTHY PUBLIC BENEFITS

Since the proposed BSPP tie-in line would pose specific, ant risks of the field and nonfield effects of concern in this analysis, its building and operation would not yield any public benefits regarding the effort to minimize any human risks from these impacts.

C.11.11 PROPOSED CONDITIONS OF CERTIFICATION/MITIGATION MEASURES

TLSN-1 The project owner shall construct the proposed transmission line according to the requirements of California Public Utility Commission's GO-95, GO-52, GO-131-D, Title 8, and Group 2. High Voltage Electrical Safety Orders, sections 2700 through 2974 of the California Code of Regulations, and Southern California Edison's EMF reduction guidelines.

Verification: At least 30 days before starting the transmission line or related structures and facilities, the project owner shall submit to the Compliance Project Manager (CPM) a letter signed by a California registered electrical engineer affirming that the lines will be constructed according to the requirements stated in the condition.

TLSN-2 The project owner shall use a qualified individual to measure the strengths of the electric and magnetic fields from the line at the points of maximum intensity along the route for which the applicant provided specific estimates. The measurements shall be made before and after energization according to the American National Standard Institute/Institute of Electrical and Electronic Engineers (ANSI/IEEE) standard procedures. These measurements shall be completed no later than 6 months after the start of operations.

Verification: The project owner shall file copies of the pre-and post-energization measurements with the CPM within 60 days after completion of the measurements.

TLSN-3 The project owner shall ensure that the rights-of-way of the proposed transmission line are kept free of combustible material, as required under the provisions of section 4292 of the Public Resources Code and section 1250 of Title 14 of the California Code of Regulations.

Verification: During the first 5 years of plant operation, the project owner shall provide a summary of inspection results and any fire prevention activities carried out along the right-of-way and provide such summaries in the Annual Compliance Report.

TLSN-4 The project owner shall ensure that all permanent metallic objects within the right-of-way of the project-related lines are grounded according to industry standards regardless of ownership.

Verification: At least 30 days before the lines are energized, the project owner shall transmit to the CPM a letter confirming compliance with this condition.

C.11.12 CONCLUSIONS

Since staff does not expect the proposed 230-kV transmission line to pose a significant aviation hazard according to current FAA criteria, we do not consider it necessary to recommend location changes on the basis of a potential hazard to area aviation.

The potential for nuisance shocks would be minimized through grounding and other field-reducing measures that would be implemented in keeping with current SCE guidelines (reflecting standard industry practices). These field-reducing measures would maintain the generated fields within levels not associated with radio-frequency interference or audible noise.

The potential for hazardous shocks would be minimized through compliance with the height and clearance requirements of CPUC's General Order 95. Compliance with Title 14, California Code of Regulations, section 1250, would minimize fire hazards while the use of low-corona line design, together with appropriate corona-minimizing construction practices, would minimize the potential for corona noise and its related interference with radio-frequency communication in the area around the route.

Since electric or magnetic field health effects have neither been established nor ruled out for the proposed GSEP and similar transmission lines, the public health significance of any related field exposures cannot be characterized with certainty. The only conclusion to be reached with certainty is that the proposed line's design and operational plan would be adequate to ensure that the generated electric and magnetic fields are managed to an extent the CPUC considers appropriate in light of the available health effects information. The long-term, mostly residential magnetic exposure of health concern in recent years would be insignificant for the proposed line given the absence of residences along the proposed route. On-site worker or public exposure would be short term and at levels expected for SCE lines of similar design and current-carrying capacity. Such exposure is well understood and has not been established as posing a significant human health hazard.

Since the proposed project line would be operated to minimize the health, safety, and nuisance impacts of concern to staff and would be routed through an area with no nearby residences, staff considers the proposed design, maintenance, and construction plan as complying with the applicable LORS. With implementation of the four recommended conditions of certification, any such impacts would be less than significant.

C.12 - VISUAL RESOURCES

Testimony of William Kanemoto, James Jewell, and William Walters

C.12.1 SUMMARY OF CONCLUSIONS

Bureau of Land Management and Energy Commission staff (hereafter jointly referred to as staff) have analyzed visual resource-related information pertaining to the proposed Genesis Solar Project and conclude that the proposed project, with all staff-recommended conditions of certification, would have adverse, but less-than-significant visual impacts.

Impacts of the Reduced Acreage Alternative, with staff-recommended conditions of certification, would also have less-than-significant visual impacts. However, the degree and extent of those impacts would be substantially less than those of the Proposed Project.

Impacts of the Dry Cooling Alternative, with staff-recommended conditions of certification, would be substantially similar to the Proposed Project and would also have less-than-significant visual impacts. The Dry Cooling Alternative could be somewhat superior to the Proposed Project due to a lower incidence of visible vapor plumes.

However, the anticipated visual impacts of the Proposed Project, Reduced Acreage, and Dry Cooling Alternatives, in combination with past and foreseeable future local projects in the Chuckwalla Valley, and past and foreseeable future region-wide projects in the southern California desert are considered cumulatively significant and unavoidable.

All action alternatives studied, with staff-recommended conditions of certification, would conform with all applicable Laws, Ordinances, Regulations and Standards (LORS).

C.12.2 INTRODUCTION

The following analysis evaluates potential visual impacts of the Genesis Solar Project; its consistency with applicable Laws, Ordinances, Regulations and Standards (LORS); and conformance with applicable guidelines of the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA).

In order to provide a consistent framework for the analysis, a standard visual assessment methodology developed by California Energy Commission staff and applied to numerous siting cases in the past was employed in this study. A description of this methodology is provided in **Appendix VR-1.** The analysis was also based upon a visual resource inventory and Interim Visual Resource Management Class mapping of the area prepared for the Devers-Palo Verde No. 2 Transmission Line EIR/EIS, and is consistent with that inventory.

As noted above, the project is evaluated for conformance with applicable LORS. Adopted expressions of local public policy pertaining to visual resources are also given great weight in determining levels of viewer concern. In accordance with staff's

procedure, conditions of certification are proposed as needed to reduce potentially significant impacts to less than significant levels, and to ensure LORS conformance, if feasible.

C.12.3 METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

Federal

The National Environmental Policy Act (NEPA) requires that the federal government use 'all practicable means to ensure all Americans safe, healthful, productive, and *aesthetically* (emphasis added) and culturally pleasing surroundings (42 U.S. Code 4331[b][2]).'

Significance under NEPA is defined in terms of a) context and b) intensity. Context means that the significance of an action must be analyzed in several contexts, such as society, the affected region, affected interests, and locale. Intensity refers to the severity of impact, and includes a variety of factors to be considered (40 CFR 1508.27).

Some of the intensity factors cited in 40 CFR 1508.27 that are potentially relevant to visual impacts include 'unique characteristics of the geographic area such as proximity to historic or cultural resources, park lands . . . ,' degree of controversy, degree of uncertainty about possible effects, degree to which an action may establish a precedent for future actions, and potential for cumulatively significant impacts.

In this study, staff utilized visual resource inventory and Interim Visual Resource Management Class assignments conducted for BLM for the Devers-Palo Verde 2 Transmission Line EIR/EIS, as a part of the environmental baseline for this analysis, as described in greater detail in Section C.12.4.1, below (CPUC/USDOI, 2006). The analysis of this staff assessment does not apply the BLM Visual Resource Management (VRM) system. In staff's professional opinion, however, despite differences in application and process, the fundamental visual assessment principles used in the BLM and CEC methodologies are consistent with one another, and BLM has consequently agreed to assess the visual effects of the project using the CEC method. Staff thus considers that the conclusions of this analysis are substantially equivalent to those that would be reached by applying BLM-specific methods of visual assessment, although the large-scale land management orientation of the VRM system differs in application from the CEQA-oriented CEC approach in some ways.

State

The CEQA *Guidelines* define a "significant effect" on the environment to mean a "substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including . . . objects of historic or aesthetic significance." (Cal. Code Regs., tit.14, § 15382.) Appendix G of the *Guidelines*, under Aesthetics, lists the following four questions to be addressed regarding whether the potential impacts of a project are significant:

a. Would the project have a substantial adverse effect on a scenic vista?

b. Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

c. Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

d. Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

In addition, staff evaluates potential impacts in relation to standard criteria described in detail in Appendix VR-1. Staff evaluates both the existing visible physical environmental setting, and the anticipated visual change introduced by the proposed project to the view, from representative, fixed vantage points (called “Key Observation Points” (KOPs). KOPs are selected to be representative of the most characteristic and most critical viewing groups and locations from which the project would be seen. The likelihood of a visual impact exceeding Criterion C. of the CEQA Guidelines, above, is determined in this study by two fundamental factors: the susceptibility of the setting to impact as a result of its existing characteristics (reflected in its current level of visual quality, the potential visibility of the project, and the sensitivity to scenic values of its viewers); and the degree of visual change anticipated as a result of the project. These two factors are summarized respectively as *visual sensitivity* (of the setting and viewers), and *visual change* (due to the project) in the discussions below. Briefly, KOPs with high sensitivity (due to outstanding scenic quality, high levels of viewer concern, etc.), that experience high levels of visual change from a project, are more likely to experience adverse impacts.

Under the Energy Commission criteria, as under all professionally accepted visual assessment methods, visibility of a project per se does not constitute a threshold for significant visual impact, regardless of the sensitivity of viewers, except under unusual circumstances in which applicable legal restrictions apply. For example, within a national park or BLM Wilderness Area, very low levels of visibility of a project may be considered the appropriate significant visual impact threshold. However, this threshold would apply only to actions within the park or wilderness boundaries.

Local

Staff also reviews local LORS and their policies or guidelines for aesthetics or preservation and protection of sensitive visual resources that may be applicable to the project site and surrounding area. These LORS include local government land use planning documents where applicable.

Please refer to **Appendix VR-1** for a complete description of staff’s visual resources evaluation criteria.

C.12.4 PROPOSED PROJECT

C.12.4.1 SETTING AND EXISTING CONDITIONS

Regional Landscape

The Project is located within the Mojave Desert, a sub-region of the Sonoran Desert. The Mojave is bordered to the south (at I-10) by the hotter Colorado Desert (also a sub-region of the Sonoran Desert) and to the north (near the Sierra Nevada Mountains) by the colder Basin and Range Desert.

The Mojave Desert is a landscape typical of the basin and range physiographic province of which it is part, with small, rocky mountain ranges with jagged peaks alternating with talus slopes and desert floor. Flat basins form broad flat expanses of barren plains typified by low scrub vegetation and expansive views. Dark browns and garnets are the dominant mountain hues, although blues and purples prevail as viewing distance increases. In contrast, lighter brown and tan soils dominate the desert floor, sparsely dotted with the grey-green of Sonoran creosote bush and golden bursage scrub vegetation. Although Joshua Tree National Park is located to the west of the project vicinity, there are no Joshua Trees in the project viewshed. However, desert Ironwood (*Olneya tesota*), a tree species unique to portions of the Sonoran Desert known for its occasional colorful pink bloom, are evident in the project area, and outstanding concentrations of Ironwood forest are located among washes north of the project site (ASDM 2010).

The Project site is located in the center of the Chuckwalla Valley, a northwest-southeast trending valley, roughly 40 miles long and 5 to 10 miles wide. Valley elevations range from 350 feet at Ford Dry Lake just south of the Project site to about 800 feet. The small surrounding mountain ranges rise 3,000 to 5,000 feet above mean sea level (amsl): McCoy Mountains to the east, Palen Mountains to the north, Mule Mountains to the southeast, Little Chuckwalla Mountains to the south, and Chuckwalla Mountains to the southwest. Like the Mojave desert in general, the Chuckwalla Valley is a highly visible landscape, affording wide, panoramic views of long duration and depth. Flat desert plains combine with sparse vegetation to allow distant views of mountain ranges that form a backdrop.

There are no residences within 15 miles of the Project site. The nearest communities are Lake Tamarisk and Desert Center, over 20 miles to the west, and Blythe, over 20 miles to the east. None of these communities have views of the Project site due to distance and topography.

The BLM manages several congressionally designated wilderness areas near the project site: the Palen/McCoy Wilderness Area abuts the northern site boundary; the Little Chuckwalla Wilderness Area is six to twelve miles to the southeast; and the Chuckwalla Wilderness Area is about five miles to the southwest. Other special designation areas in the area include several Areas of Critical Environmental Concern (ACECs). The Palen Dry Lake ACEC lies roughly 5 miles to the west. The Desert Lily Sanctuary ACEC is located off of Route 177 northeast of Desert Center. The eastern boundary of Joshua Trees National Monument is also located just west of Route 177.

Use of Ford Dry Lake directly south of the project site is limited to travel on designated routes; there are no camping facilities and no off-road travel allowed. There is an undeveloped camping area at the end of Corn Springs Road adjacent to the Chuckwalla Wilderness, approximately 18 miles southwest of the Project. There are no facilities or designated trails within the Palen-McCoy Wilderness, although hiking access is possible via old, closed jeep trails.

There is limited existing development in the vicinity of the site: I-10, roughly two miles south of the Project site, is the dominant man-made feature. Other developments include Chuckwalla Valley State Prison and Ironwood State Prison, 2-1/2 miles south of I-10 off of Wiley's Well Road. Both are roughly nine miles southeast of the Project and are visible but visually very subordinate from I-10. Approximately one to three miles to the south of I-10, there are Western Area Power Administration (WAPA) and Southern California Edison (SCE) transmission lines and substations within BLM's Utility Corridor K (GSEP 2009a). The Devers-Palo Verde transmission line runs east to west roughly one to 3 miles south of the highway but remains largely visually subordinate from the highway within most of the Chuckwalla Valley. Despite these man-made features the natural setting predominates and the existing landscape of the Chuckwalla Valley appears relatively intact, dominated by vast expanses of dry lake and scrub-covered valley floor, and vivid mountains behind them.

Project Site

VISUAL RESOURCES Figure 1, View of the Project Site, depicts a panoramic view of the Genesis project site and vicinity looking northward from the Ford Dry Lake Road interchange on I-10. The site is located behind the lighter-colored dry lakebed in the foreground, and below the sloping alluvial fans at the foot of the mountains. The Palen Mountains appear to the left of the photograph, the McCoy Mountains appear to the right.

The 1,800 acre project site consists of two separate solar fields that span roughly 3.2 miles of the northeastern Chuckwalla Valley. The site is flat undeveloped desert abutting allluvial fans from the Palen and McCoy Mountains. The Project site is relatively flat, sloping north to south from roughly 360 to 390 feet with an overall existing slope of approximately 0.5%. The Project transmission line would also traverse flat undeveloped land before connecting to the Blythe Energy Project Transmission Line (BEPT) currently under construction in the BLM Utility Corridor K, two miles south of I-10.

The Project site and transmission line corridor are located on Federal lands administered by the BLM for Multiple Use Class (MUC) M (Moderate Use) which allows for uses such as mining, livestock, grazing, recreation, utilities and energy development, provided desert resources are conserved and impacts from such uses are mitigated. The Project transmission line would connect with the Blythe Energy Transmission Line that is under construction within the BLM's Utility Corridor K.

Project Visual Setting: Viewshed, Landscape Units, and KOPs

Project Viewshed

As illustrated in **VISUAL RESOURCES Figure 2**, which includes a computer-generated GIS viewshed map, the project would be visible to virtually all of the area within a 5-mile radius, and potentially visible to much of the area within a ten-mile radius, though mediated by distance. A characteristic feature of this desert landscape is the potential for large projects to be seen over great distances where even slightly elevated viewpoints exist, due to the large open areas of level topography and absence of intervening landscape features. Nearly all of the viewshed visible to the north of the project site lies within the Palen-McCoy Wilderness Area, which borders the site immediately to the north. However, the flatness of the project site and the level elevation relationships between the project, I-10, and low-lying viewpoints within the wilderness area, result in very oblique vertical viewing angles that reduce the prominence of the site from these viewpoints. Only from elevated viewpoints would viewers be exposed to large expanses of the site. As indicated in the viewshed mapping, however, only a very small portion of these elevated viewpoints lie within a 5-mile middle-ground radius of the project, reducing its potential visual magnitude and dominance due to distance.

Landscape Units and KOPs: Visual Quality, Viewer Concern, and Viewer Exposure

VISUAL RESOURCES Figure 2, Existing Landscape Setting, Project Viewshed, and Key Observation Points (KOPs), subdivides the project viewshed into broad landscape units delineating areas of broadly consistent scenic quality, viewer sensitivity, and distance zone (from viewers) as previously adopted by BLM. It also depicts Key Observation Points (KOPs) used as the basis for this analysis. KOPs are used in the Energy Commission visual analysis method as the basis for evaluating potential project impacts, and represent the key sensitive viewer groups and viewing locations likely to be affected by the project. This use of KOPs is analogous to their use in the VRM method, in which KOPs are used from which to conduct contrast ratings for impact evaluation. **VISUAL RESOURCES Figure 3,** Visual Setting Character Photos, depicts various typical image types and features within the project viewshed.

In the CEC assessment approach, KOPs are rated according to the visual quality of their setting, and an assessment of their level of viewer concern and viewer exposure. Those three primary attributes are summarized in a KOP's *overall visual sensitivity* rating, which reflects an assessment of the overall susceptibility to visual impact of the viewer group/receptors it represents. These sensitivity ratings serve as the environmental baseline against which potential project impacts, measured in terms of level of *visual change*, are evaluated. Because viewer concern and exposure may vary among different receptors within a landscape unit, overall sensitivity of particular KOPs within a unit may also vary.

The baseline mapping of landscape units in this assessment, as depicted in **VISUAL RESOURCES Figure 2,** is derived from the visual resource inventory and subsequent Interim Visual Resource Management (IVRM) Classes assigned with the involvement of BLM in the Devers-Palo Verde No. 2 Transmission Line EIR/EIS (CPUC/BLM, 2006). In the baseline setting for that document, landscape units were delineated, assessed and

rated following the BLM's Visual Resource Management (VRM) system, as documented in the visual resources analysis of that document. Following the VRM methodology, the inventory mapping and evaluation reflect an assessment of the landscape's *scenic quality*, *viewer sensitivity*, and *distance zone* of observers. While the application of the two agency methods differ in various ways, these categories are generally analogous to the three primary components of overall visual sensitivity - visual quality, viewer concern, and viewer exposure - in the Energy Commission staff method.

In general, VRM inventories within the California Desert Conservation Area (CDCA) have historically regarded the entire CDCA as having a high viewer sensitivity level, in accord with the primary goals of the CDCA Plan, which include recognition and protection of the area's unique scenic value (USDOI 1980)(CDCA Plan). In field observations at the site, staff found no inconsistencies between the delineation and evaluation of the project visual baseline in the Devers-Palo Verde study and a baseline or visual setting evaluation following the typical CEC visual assessment methods.

In the following analysis, as in other recent CEC/BLM joint visual analyses, conclusions of CEQA significance reference the IVRM Class mapping solely with respect to their field delineation of landscape units and the scenic quality ratings that underlie them. That is, for purposes of CEQA, VRM mapping is used in reference to the underlying visual resource *inventory* values. In the specific case of the Devers-Palo Verde No. 2 EIR/EIS, the Visual Resource Inventory (VRI) and Interim Visual Resource Management (IVRM) Class mapping were equivalent.

KOPs used in this study include those used in the project AFC, which were selected for the AFC in consultation with BLM staff. Additional KOPs were added by staff for this analysis. For simplicity the numbering of viewpoints in the AFC have been retained in this analysis. (All figures referred to in the text may be found at the end of this section).

In the following discussion, distance zone terminology does not refer to the BLM VRM usage, but rather is used, in the context of the Energy Commission method, as follows: 'foreground' is used generically to refer to viewing distances under ½-mile; 'middle-ground' to distances between ½ and 5 miles; 'near middle-ground' refers to that portion of middle-ground under roughly one mile; and 'background' to distances over 5 miles.

Because KOP photos represent the existing views of project simulations, the reader is referred below to these 'before project' photos in the discussion that follows. The figure numbers referring to each KOP below thus appear out of sequence, but may be found along with all other figures, at the end of this section.

KOP 1 - Ford Dry Lake Bridge Over I-10 (VRI Class III)

KOP 1 represents potential viewers of the Project from I-10 at Ford Dry Lake, as well as motorists on I-10 in general. The location is representative of the highway segment at the nearest viewing distance to the project site. KOP 1 is located on the I-10 bridge over the Ford Dry Lake Exit, directly south of the proposed eastern solar field, approximately 3 miles from the nearest site boundary. Ford Dry Lake was used as an OHV recreational area in the past, but OHV use is no longer permitted in the area. The view from the bridge is to the north and represents a middle-ground viewing distance.

VISUAL RESOURCES Figure 8a depicts the existing view from KOP 1. The bridge is slightly elevated above the desert floor, providing greater visual exposure to the site than the adjoining freeway. Expansive, panoramic views of Ford Dry Lake and Chuckwalla Valley in the foreground and middle-ground, and the Palen and McCoy Mountains in the near background, are highly intact and undisturbed.

Looking northward toward the project site, the landscape foreground and near-middle-ground is characterized by the flat plain of Ford Dry Lake, atypically light-colored due to a relative absence of the darker Creosote scrub vegetation cover of the region within the dry lake bed. Behind the lakebed, the distinctly darker color of scrub vegetation cover is evident, particularly on the sloping bajadas or alluvial fans descending gently from the foot of the mountains behind the site. The lakebed and bajadas are back-dropped by dark, jagged, un-vegetated ridges of the Palen and McCoy Mountains. The horizontal, homogenous form of the desert plain contrasts against the vertical irregularity of the mountain ranges that enclose it. Light soils and sparse, low-lying vegetation of the foreground lakebed contrast with dark garnets and purples of the mountains, which dominate the scene at distances close enough to reveal detail in form and texture.

Visual Quality: Overall visual quality of the lakebed and bajada landscape in which both the project site and KOP are located is considered moderate. The landscape character of the lowlands themselves is common to this region and lacking in vivid elements, but are strongly influenced and defined by the adjacent scenery of the Palen and McCoy Mountains. Visual quality of the Palen Mountains in the background is moderately high due to their vivid, highly intact character, dramatic jagged vertical form and line, and prominent, defining presence within the overall view. The McCoy Mountains to the northeast were not inventoried or mapped by BLM, but have a similar defining and vivid character in views toward the project site, and are likewise considered moderately high in visual quality.

Viewer Concern: Viewer concern is considered high due to the high number of travelers on I-10 that would be provided middle-ground views of the project from this location and vicinity. According to Caltrans Year 2008 Average Annual Daily Traffic (AADT) volumes, I-10 averages approximately 24,600 vehicles west of Wiley's Well Road (GSEP 2009a). As mentioned above, BLM considers all areas within the CDCA to have high viewer sensitivity by virtue of the special status of the area and the primary importance of scenic resources in the plan area's goals.

Viewer Exposure: Viewer exposure to the site is moderate. Although there is nothing obstructing views of the site, in general the very flat site terrain and very level viewing relationship between viewers on I-10 and the site result in a very oblique viewing angle. This viewing angle would be even more oblique from highway level than from this view from the elevated overcrossing. Consequently, despite the vast area of the proposed site and its vast horizontal extent, this factor in combination with distance reduces the site to a very narrow horizontal portion of the view, dominated by the dry lake foreground, and more vivid and prominent mountains and bajadas behind it. Viewer numbers on I-10 are high.

Overall visual sensitivity, reflecting the combined ratings of visual quality, viewer concern, and viewer exposure, above, is considered to be moderately high. (Please refer to Section C.12.3, above for description of sensitivity ratings.)

KOP 2 -Wiley's Well Bridge Over I-10 (VRI Class III)

VISUAL RESOURCES Figure 9a depicts the existing view from KOP 2. KOP 2 represents potential viewers of the project site from near the Wiley's Well Rest Area and interchange, as well as I-10 motorists as they approach the site from background distance. This heavily used I-10 rest area is approximately 17 miles west of Blythe. Viewing distance to the project site is roughly 5 miles or background distance. The location on the bridge provides a more elevated view than views from the rest stop itself, which are largely blocked by nearby foreground topography, or from the highway itself. The bridge is elevated above the desert floor providing a panoramic view of Chuckwalla Valley in the foreground and middleground, and Palen Mountains in the background.

The depicted in the photograph, the foreground landscape is characterized by a flat light-colored desert plain with a more typical, if sparse, creosote scrub land-cover than at Ford Dry Lake. In views northwest toward the project site, the Palen Mountains form a vivid backdrop of dark, jagged slopes and ridges at a distance of approximately 10 to 15 miles. The horizontal, homogenous form of the desert plain contrasts against the vertical irregularity of the mountain ranges enclose it. Light soils and sparse, low-lying vegetation contrast against dark garnets and purples of distant mountains.

Visual Quality: Overall visual quality of the flat plain landscape in which both the project site and KOP are located is considered moderate since the landscape character, even more than that of Ford Lake, is typical of the region and lacking in vivid elements. At this distance the sloping alluvial bajadas at the foot of the mountains are less distinct and prominent than from nearer viewpoints. Visual quality of the Palen Mountains in the background however, is moderately high due to their vivid, highly intact character, dramatic jagged vertical form and line, and prominent, defining presence within the overall view. The visual foreground seen from the rest area has a moderately high level of intactness and unity. Small, wooden H-frame poles can be seen in the foreground, but remain visually subordinate due to their small scale and dark color.

Viewer Concern: Viewer concern of this KOP is considered high due to the relatively high number of users of the Wiley's Well Rest Area, and of I-10 in the project area in general. As discussed above, BLM considers all areas within the CDCA to have high viewer sensitivity by virtue of the special status of the area and the primary importance of scenic resources in the plan area's goals.

Viewer Exposure: Viewer exposure is moderate. In general the very flat site terrain and very level viewing relationship between viewers on I-10 and the site result in a very oblique viewing angle. Thus, despite the vast area of the proposed site and its vast horizontal extent, this factor in combination with distance reduces the site to a very narrow horizontal portion of the view, dominated by the scrub foreground, and more vivid and prominent mountains and bajadas behind it. However, in the vicinity of KOP 2 at Wiley's Well Road, the most prominent project feature would be the project

transmission line. Exposure to this feature would be open and unobscured at foreground and middle-ground distances, though foreground exposure would be of relatively short duration. Viewer numbers on I-10 and at the rest area are high.

Overall visual sensitivity is considered to be moderately high.

KOP 3 - Corn Springs BLM Road

VISUAL RESOURCES Figure 10a depicts the existing view from KOP 3. KOP 3 represents the view from BLM Corn Springs Road, connecting to the Corn Springs Campground and traihead within the Chuckwalla Mountains Wilderness Area (WA) at a distance of roughly 14 miles from the nearest project features. The Corn Springs Campground is located roughly 17.5 miles from the nearest project feature, at an elevation of approximately 1600 feet. This KOP was selected by BLM staff as representative of an actively used recreational destination within the project viewshed. However, at this far background distance, project visibility would be limited, despite the elevated viewing position in relation to the project. As a designated wilderness, the Chuckwalla Mountains WA were assigned an IVRM Class I or special designation status. However, the area is located within a surrounding context assigned IVRM Class II.

Visual Quality: Visual quality of the landscape within which the KOP is located, the Chuckwalla Mountains WA, is considered moderately high. The area is highly intact and characterized by panoramic, elevated views over vast areas of the Chuckwalla Valley desert floor to the distant Palen and McCoy Mountains. As described previously, visual quality of the project site is moderate, and the adjoining Palen and McCoy Mountains are considered moderately high.

Viewer Concern: Viewer concern of visitors to the Chuckwalla WA are considered high. As discussed above, BLM considers all areas of the CDCA to have high viewer sensitivity, but this would be even more so within the WA, where the panoramic views and scenic values generally would be particularly high.

Viewer Exposure: Viewer exposure to the project is moderately low. While viewer numbers would not be high in this location, they are relatively high because the presence of a designated campsite and trailhead and their accessibility via Corn Springs Road makes it much more accessible than most of the wilderness areas in the project viewshed. While the elevation of the photograph in **VISUAL RESOURCES Figure 10a** is not known, the Corn Springs campsite and trailhead are located at roughly elevation 1,600 feet, far above the valley floor. These viewpoints (on Corn Springs Road and vicinity) are thus among the few that are readily accessible and offer elevated, panoramic views overlooking the entirety of the proposed project site. Even from this high elevation, however, the great distance (14 to 17+ miles) to the project features places the viewpoints in the far background distance zone. At this distance, the project would appear evident but would not be highly prominent.

Overall visual sensitivity from this viewpoint is considered to be moderately high.

KOP 4a, 4b – Palen/McCoy Mountains Elevated Viewpoints

Staff was unable to visit viewpoints representing elevated locations within the Palen or McCoy Mountains, and the AFC analysis does not address these viewpoints. Points within the WA are considered potentially sensitive, however. **VISUAL RESOURCES Figure 11a,** is a virtual view created with Google Earth to simulate views toward the project site from the nearest ridges of the Palen Mountains at a distance of roughly 3.75 miles to the nearest boundary of the project site, and elevation of approximately 1,475 feet. **VISUAL RESOURCES Figure 11b** is a similar virtual view from a high ridge near McCoy Springs in the McCoy Mountains at a distance of roughly 6.6 miles and elevation of approximately 2,250 feet. As described previously, the project site directly abuts the southern boundary of the Palen-McCoy WA. Most of these wilderness lands adjoining the project site comprise valley floor or sloping bajadas (alluvial fans) to background distance (5 miles). However, as indicated in the viewshed mapping in **VISUAL RESOURCES Figure 2**, a small portion of the Palen Mountain ridges falls within the middle-ground distance zone (under 5 miles). KOP 4a represents a ridge top within that small middle-ground area of exposure, located roughly 2.5 miles from the nearest (closed) jeep trail. (Motorized travel is not allowed on this trail segment.)

As also indicated in the viewshed mapping, a considerable portion of the south-facing slopes of the Palen Mountains, and most of the west-facing slopes of the McCoy Mountains, would have views of the site in the background distance zone (beyond 5 miles). KOP4b represents such a background distance view, from a ridge top in the McCoy Mountains a short distance from McCoy Springs and an existing jeep trail. Staff was unable to visit these KOPs in the field. In order to evaluate potential project effects on views to these elevated portions of the WA, staff created these virtual KOPs using Google Earth. Though less desirable than an actual field photo, these views at least provide an understanding of site visibility and exposure from these locations based on accurate topographic and project data.

Visual Quality: Visual quality of KOPs within the Palen and McCoy Mountains is considered to be moderately high. The rocky, jagged ridges and contrasting swales and alluvial washes are highly intact, with vivid form, line, color and texture. Panoramic elevated views of the vast, largely visually intact Chuckwalla Valley and Ford Dry Lake are back-dropped by distant views of the Chuckwalla and Little Chuckwalla Mountains to the south.

Viewer Concern: Again, BLM considers all areas of the CDCA to have high viewer sensitivity, and this would be even more so within the wilderness areas and elevated viewpoints, where the panoramic views, sensitivity levels, and scenic values generally would be particularly high.

Viewer Exposure: As indicated in the viewshed mapping of **VISUAL RESOURCES Figure 2,** the project site would be visible from various points within the Palen and McCoy Mountains, primarily south-facing ridges of the Palen Mountains, and west-facing slopes of the McCoy Mountains. These elevated viewpoints are the only ones from which the expanse of the project site could be clearly seen. Visibility would range from moderate to moderately low as a function of height and distance. Within middle ground distance (under roughly 5 miles), the vertical angle of view from elevated

portions within the mapped viewshed would be sufficiently great, and sufficiently near, to expose the expanse of the mirror fields to view with a moderate level of dominance within the overall field of view. Viewers would be near enough to be looking ‘down’ on the expanse of the mirror field, at a relatively perpendicular vertical angle, as indicated in KOP 4a. In contrast, from more distant portions of the viewshed (very roughly beyond 5 miles), the angle of view would decrease as a function of distance, becoming more oblique so that the project site would occupy a smaller proportion of the overall field of view. With increasing distance viewers are no longer looking ‘down’ at the project, but ‘across’ it at a flat (oblique) angle that results in considerable foreshortening of the mirror field, reducing its expanse to a relatively narrow area, as indicated in KOP 4b. Viewer numbers are not known, but are considered to be low. Motorized travel is not allowed within the WA. The nearest (closed) jeep trail is roughly 2.5 aerial miles from KOP 4a; the nearest motorized portion of that trail is several miles to the southwest of that point. The McCoy Mountains, located largely though not entirely outside of the designated WA, appear from aerial photos to be more accessible by jeep trail. However, distance to the project site from elevated portions of the McCoy Mountains is well over 5 miles at the nearest points, with a resulting decrease in visual exposure due to distance and oblique vertical angle, as described above.

There are no designated trails within the WA, but closed jeep trails are present in the valley and can be used for hiking. The accessibility of elevated viewpoints within the middle-ground distance zone, and therefore the potential number of viewers, is presumed to be low. In addition, the extent of elevated viewpoints within middle-ground distance of the project site is very limited, essentially to portions of one ridge north of the site, as indicated in the mapped computer-generated viewshed depicted in Visual Resources Figure 2 View duration at both elevated portions of the viewshed (Palen and McCoy Mountains) is relatively high due to the fact that any viewers would be on foot. In the Palen Mountains, however, the duration of middle-ground views is limited somewhat by the very small area in which project visibility occurs at those distances and corresponding viewing angles; hikers on this ridge would presumably soon leave the ridge on which the project is seen at perpendicular vertical angles and middleground distance. Beyond this small portion of the viewshed, visual magnitude of the mirror fields would fall off due both to distance, and to increasingly oblique (flat) vertical viewing angle. (Visual magnitude decreases as the square of distance). For these reasons – the limited extent of this portion of the viewshed, and resulting limited viewer numbers and view duration - viewer exposure to the project from within the elevated middle-ground, where viewing angles are more perpendicular and visual magnitude higher, is considered to be very limited. Viewer exposure to the site from the elevated background distance zone within the Palen and McCoy Mountains is considered to be moderately low: the area in which exposure occurs is much greater than within middleground; viewer numbers are likewise higher due to greater (motorized) accessibility in the McCoy Mountains, but remain relatively low, and visibility is considerably reduced by both oblique vertical viewing angle and reduced visual magnitude due to angle and distance. Because the viewer number and duration with moderate project visibility appears limited, overall viewer exposure is characterized as moderately low. Consequently, overall viewer sensitivity of these elevated viewpoints in the Palen and McCoy Mountains is considered moderate.

Palen-McCoy WA Lowland Viewpoints (No KOP)

Staff was unable to obtain photographs of a representative KOP in the lowland portions of the WA. However, studies of 3D ground-level views via Google Earth appeared to confirm viewing conditions that seem intuitively obvious; that is, from valley viewpoints north of the project site, the relatively level terrain relationship between viewers and site would be very similar to those depicted in KOPs 1 and 2. Because of the very oblique vertical viewing angle, the site would tend to be reduced to a very narrow horizontal line within the overall view in all but the foreground distance zone (under ½ mile), contributing to low viewer exposure. The vast horizontal scale of the site would remain evident, particularly within the middle-ground distance zone (under 5 miles). The number of viewers from such lowland viewpoints is not known, but is considered to be relatively low based on anecdotal knowledge of BLM staff. The likely number of viewers at foreground distance to the project would be insignificant and their view duration low. Numbers at middle-ground and background distances would be moderately low. Overall exposure would thus remain moderately low.

Thus, despite high visual quality and viewer concern, overall sensitivity is considered moderate.

Project Visual Description

Power Plant

The following description is taken entirely from the AFC project description (GSEP 2009a). **VISUAL RESOURCES Figure 4** depicts the layout of the two proposed project phases. **VISUAL RESOURCES Figure 5** depicts architectural elevations of the proposed power blocks. **VISUAL RESOURCES Figure 6** depicts the proposed solar collector mirror units. **VISUAL RESOURCES Figure 7** depicts the proposed Gen-Tie transmission line poles.

The proposed project would include an overall project footprint of approximately 1,800 acres (2.8 square miles), plus approximately 90 acres of linear facilities. The overall number of solar arrays is not identified in the AFC but the arrays are conceptually depicted in **VISUAL RESOURCES Figure 4.** Site elevation ranges from roughly 370 to 400 feet. This amount of fall (roughly 30 feet) over a minimum distance of over one mile results in a virtually flat site, with an overall .5% slope. Because the trough technology requires nearly level grades, the entire site would be benched and graded to 2% slope or less.

The collector field consists of multiple single-axis parabolic trough solar collectors, aligned on a north-south axis. Each parabolic trough focuses the sun's rays on a linear, length-wise heat collection element at the parabolic focal point. In addition, the project would include:

- Two power blocks, one per plant, including steam turbine generators and related equipment;
- Administrative building and warehouse between the two power plants; a control building within each power block; a water treatment building and other structures with an overall area of approximately 39,000 square feet (0.9 acre).

- Two 500,000 gallon cooling water storage tanks; a 1,250,000 gallon treated water storage tank; a 250,000 waste water storage tank; a 40,0000 gallon demineralized water storage tank
- Two wet cooling towers
- A 270-by-400-foot switchyard
- 35 acres of paved area
- two 24-acre of evaporation ponds (one per generation unit, locate between the two mirror fields

Construction Staging Area

The size of construction laydown areas is not described in the AFC but would be provided within the project site or, for construction of the proposed transmission gen-tie line, at Wiley's Well Rest Area southeast of the site north of I-10. Project construction is expected to last 37 months.

Site Grading

Site grading would potentially represent a substantial visual component of the proposed project during construction. After construction, grading of roads, laydown areas and other activities outside the main project footprint would remain visually disturbed unless restored. Surface disturbance of the proposed site, as in most desert landscapes of the region, can often result in high contrast between the disturbed area and surroundings, due to high contrast between the disturbed soil color and albedo, and the color and albedo of the existing undisturbed, vegetated surface. Furthermore, effectiveness of revegetation in this arid environment is difficult, of limited effectiveness, and capable of recovery only over a very long-term time frame.

Plant Night Lighting

Project lighting is not described, but would be designed to provide 'minimum illumination needed to achieve safety and security.'

Linear Facilities

Linear facilities would include:

- a six-mile long, eight-inch natural gas pipeline connecting to a Southern California Edison pipeline north of I-10. The pipeline ROW would follow the proposed gen-tie transmission line alignment.
- A gen-tie transmission line connecting to the SCE Colorado River substation, consisting of 75-foot tall single-pole towers. The line would cross I-10 from north to south at Wiley's Well Road and join the Blythe Energy Project Transmission Line a short distance south of I-10 along Wiley's Well Road. Length of the line is not described in the AFC but appears from figures to be approximately 7.5 miles off-site, and roughly 3.4 miles within the site.

C.12.4.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Direct Project Impacts

Project Operation Impacts

Impacts of Structures on Key Observation Points

KOP 1 - Ford Dry Lake Bridge Over I-10 (VRI Class III)

Visual Resources Figures 8A and 8B depict the view of the site from KOP1, at a middle-ground distance of approximately 3 miles looking northward, and is representative of the view of motorists on I-10 at their nearest point to the project. As depicted in Figure 8B (Phases 1 and 2), the project would occupy a vast horizontal area, extending across the entire width of the field of view. However, as illustrated in the simulation, the proportion of the field of view at this distance remains very small due to the level viewing relationship, low facility height, and distance. Staff understands that frequently, the level of brightness of the mirror field could be much greater than depicted in the simulation, substantially increasing the project's level of contrast under certain conditions. In general, the thin horizontal line of the mirror field mimics the predominantly horizontal lines of the broad, level foreground lakebed. A small amount of vertical form contrast is visible from the power blocks, warehouses, cooling towers and other site buildings, but at this distance the contrast is minimal and largely attributable to color contrast.

Spatial and scale dominance of the vast mirror fields is potentially great, but again greatly moderated by the very narrow portion of the view affected. Dominance would be accentuated during conditions of bright mirror reflection, which would draw attention to the facility. Overall, however, visual dominance of the project from this typical highway viewpoint would be moderately low under most conditions, to moderate during times of bright reflection.

View blockage would be negligible. Taller structures such as the control building and transmission towers would intrude slightly into the view of background bajadas but would remain at a low level. This intrusion would be reduced greatly by Condition of Certification VIS-1, requiring painting of structures in colors selected to blend with the background characteristic landscape.

Overall visual change to viewers on I-10 is thus considered moderately low, or moderate during the brightest periods of diffuse glare as indicated in **Visual Resources Figure 12** (below). Visual change could rise to a moderately high level if viewers were exposed to bright point spread reflections of the sun as depicted in **Visual Resources Figure 13** (below). With staff-recommended Condition of Certification VIS-4, bright point reflections could be blocked, reducing glare to occasional episodes of moderate visual change from diffuse reflection from the mirror fields as a whole. With all recommended conditions of certification, overall visual change would thus remain moderate. Depending upon lighting conditions, the project would range from weak to moderate levels of visual change, would attract some attention but would not dominate the existing landscape.

In the context of the setting's moderately high visual sensitivity, this moderate level of visual change would, with recommended conditions of certification, be less-than-significant.

Mitigation – To minimize form and color contrast of the taller project facilities, staff recommends Condition of Certification VIS-1, Surface Color Treatment of Non-Mirror Structures. To minimize potential bright reflective glare effects, staff recommends Condition of Certification VIS-4, Reflective Glare Mitigation. To reduce other visual contrasts from roads, structures, buildings, and support infrastructure, staff recommends VIS-6, Reduction of Form, Line, and Texture Contrast.

KOP 2 -Wiley's Well Bridge Over I-10 (VRI Class III)

Visual Resources Figures 9A and 9B depict the view from KOP 2, Wiley's Well Rest Area, approximately 5 miles southeast of the project site. It is also representative of the views of motorists on I-10 as they enter the middle-ground distance zone from background distance. The photograph actually depicts views from atop the Wiley's Well over-crossing bridge and is slightly elevated above the main highway and rest area. Actually, the project mirror fields would not generally be visible from the rest area itself due to foreground anomalies in terrain, which block views to the site from the rest area.

Staff comment on AFC simulation of KOP 2: The simulation of KOP 2 is framed in such a way as to omit proposed project transmission towers closer than three miles in distance. However, the proposed transmission line would actually be the most prominent project feature from the vicinity of Wiley's Well Road, with the nearest poles paralleling I-10 a short distance to the north (roughly ¼-mile for one mile; less than ½-mile for one mile), and then paralleling Wiley's Well Road immediately south of the over-crossing. There are thus no simulations of the transmission line within the foreground distance zone where it would appear most prominent.

As suggested in the simulation of KOP 2, visual contrast of the mirror fields at background and far-middle-ground viewpoints similar to this would be low. On occasions of greatest reflective brightness, contrast could rise to moderate levels. With staff-recommended glare mitigation measures, bright spot reflections of the sun would not be anticipated, as discussed further below.

The proposed transmission line and towers however would be visible in the foreground from Wiley's Well Road and vicinity, including I-10. The portions of the transmission line following Wiley's Well Road to the interconnection with the Blythe Project Transmission Line would not be a concern because views southward toward this segment include a very prominent communication tower adjacent to the interchange, the Blythe transmission line at a distance of roughly 1-1/4 mile, and Chuckwalla Valley and Ironwood State Prisons at a distance of roughly 3 miles to the south. However towers and lines paralleling I-10 would introduce a moderately prominent discordant element into the freeway foreground, with strong vertical line and form contrast for a roughly two-mile segment of highway. **Visual Resources Figure 9C** depicts the portion of I-10 in which the proposed transmission line would parallel the highway at foreground distance, as viewed from the Wiley's Well Road overcrossing.

At this distance and horizontal viewing angle, the mirror fields' spatial and scale dominance would remain low, occupying a small portion of the field of view. The segments of the proposed transmission line in the I-10 foreground would exert moderately strong contrast and dominance.

View blockage due to the mirror fields would be negligible. The transmission line would intrude into the foreground of northward views from the highway toward the Palen Mountains, degrading the quality of those views for a distance of roughly two miles.

Overall visual change of the mirror fields from this location and others at a similar distance zone would thus be low and impacts relatively minor.

The proposed transmission line, including 75-foot single-pole transmission towers, however, would be an obtrusive element in the foreground of views for roughly two miles of I-10 and, in the context of moderately high viewer sensitivity, could represent a substantial impact. Staff thus recommends Condition of Certification VIS-1, Surface Color Treatment of Non-Mirror Structures, to lower color contrast of the proposed transmission poles and blend with the visual background; and Condition of Certification VIS-3, Realignment and Visual Mitigation of Proposed Transmission Line, to reduce the contrast of transmission towers by use of lattice-style towers, and to minimize the portion of the ROW within foreground viewing distance of I-10 by ½-mile setbacks from the highway. Setbacks of transmission lines, however, shall be determined consistent with any cultural or biological constraints identified in those portions of this Staff Assessment. With these measures, portions of the new line beyond foreground distance would exert moderately low overall visual change under most viewing conditions. Foreground portions of the line would remain obtrusive but would be substantially reduced in extent. With these measures, impacts to motorists and rest area visitors would be adverse, but less-than-significant.

A proposed construction laydown area would be located near this KOP, with potentially substantial visual impacts to visitors at the rest area for the period of construction. This impact is discussed further under Project Construction Impacts, below.

Mitigation - To minimize adverse impacts of proposed transmission poles, staff recommends Condition of Certification VIS-1 and VIS-6 to be applied to the proposed gen-tie transmission poles; and Condition of Certification VIS-3 to reduce the visual contrast of towers and the length of the segment of transmission line within foreground distance of Highway I-10.

KOP 3 - Corn Springs BLM Road

Visual Resources Figures 10A and 10B depict KOP 3, the view from Corn Springs Road, an unpaved BLM road leading to a campground and trailhead approximately 14 miles southwest of the project site adjoining the Wilderness Area. This KOP was selected by BLM staff as representative of an actively used recreational destination within the project viewshed. However, at this far background distance, project visibility would be limited, despite the elevated viewing position in relation to the project.

As described in Section C.12.4.1, overall visual sensitivity from this viewpoint is considered to be moderately high. The KOP is located within an area designated as VRM Class I, since it is within the Chuckwalla WA. Nearby areas outside the WA were assigned VRI/IVRM Class II.

As depicted in **Visual Resources Figures 10A and 10B,** the elevated location within the Chuckwalla Mountains presents a panoramic view of a vast expanse of the valley floor. However, at this far background distance the project, while visible, would exhibit a low level of overall contrast. The simulation depicts hazy conditions that reduce visibility of the project, and those conditions would not always be the case. The project would be evident to viewers, drawing attention by its textural and color contrast, and the valley floor would lose its existing highly intact, undisturbed character. That level of contrast would be greater periodically, during instances of higher reflected glare, particularly in the afternoon. However, the project at this distance would have low form and line contrast with its setting and would remain visually subordinate to the background mountains, valley floor, and Palen and Ford Dry Lakes.

Spatial and scale dominance of the project at this distance would be low, subordinate to other features dominating the view, particularly the Palen Mountains. The project would occupy a small portion of the overall view.

View blockage would be negligible. The low project features would not intrude into views of the mountains or other scenic elements.

Overall visual change from the project at this distance would thus range from low to moderately low depending upon brightness of reflected glare. In the context of moderately high visual sensitivity, this would represent a less-than-significant impact.

KOP 4a, 4b – Palen/McCoy Mountains Elevated Viewpoints

VISUAL RESOURCES Figure 11A is a virtual view created with Google Earth to simulate views toward the project site from the nearest ridges of the Palen Mountains at a distance of roughly 3.75 miles to the nearest boundary of the project site. Elevation is approximately 1,475 feet or roughly 1,100 feet above the project site. It is representative of a small area of the nearest ridge of the Palen Mountains north of the project site with views of the project that fall within the middle-ground distance zone (under 5 miles). This one ridge is the only elevated location with views to the project site from middle-ground distance. **VISUAL RESOURCES Figure 11B** is a similar virtual view from the McCoy Mountains at a background distance of roughly 6.6 miles and elevation of 2,250 feet. It is representative of the more extensive portions of the McCoy and Palen Mountains from which the project would be visible at background distance (over 5 miles) as depicted in viewshed mapping in **VISUAL RESOURCES Figure 2.** Both schematic simulated views are created in Google Earth from accurately scaled layouts of the project footprint, and have been cropped to emulate a ‘normal’ camera lens (approximately 40 degree horizontal angle of view**).**

KOP 4a (Elevated Middle-Ground). As suggested in **VISUAL RESOURCES Figure 11A,** from elevated middle-ground viewpoints in the Palen Mountains, the vertical angle of view is such that visual exposure of the mirror fields would exhibit moderate

rectilinear form contrast, as well as strong color and texture contrast with the setting. The latter, however, would vary greatly according to changing brightness levels of diffuse reflected sunlight. At this height and distance, the project would appear as more than a thin contrasting line, as it would in views from the valley; however, the angle of view also remains sufficiently oblique that the proportion of the overall view occupied by the mirrors is moderate. Taller project structures would present some vertical form contrast, but would be seen against the background of the mirror fields, reducing character contrast. At this distance, the relative contrast and dominance from the non-mirror structures would be subordinate to the mirror fields, and would be reduced by painting to blend with the surrounding landscape under staff-recommended Condition of Certification VIS-1 and VIS-6. The project would block views. It is not possible for staff to predict the brightness of reflection or the frequency of distracting or nuisance levels of glare to be anticipated without more experience with similar projects viewed from similar viewpoints. However, based on aerial photographs of existing trough projects, as illustrated in **VISUAL RESOURCES Figure 12,** staff concludes that overall visual change from the project would vary from moderate to moderately strong levels according to time of day and brightness of diffuse reflection.

In the context of moderate visual sensitivity, this could represent an adverse visual impact under conditions of bright reflection. However, taking into account both the episodic nature of bright reflections, and the very low number of viewers from this middle-ground portion of the viewshed, the level of impact is considered to be less-than-significant.

VISUAL RESOURCES Figure 12 depicts photos of similar solar trough projects, including oblique aerial photos of the 64 MW Acciona Nevada Solar One pilot project. As illustrated in these photographs, the appearance of solar trough projects from elevated viewpoints changes substantially according to time of day and sun angles to the viewer, ranging from a brightly lit surface, to reflections of the sky, to dark colors, each condition contrasting with the surroundings in a different way and degree. Photo 12a also illustrates the phenomenon in which bright spread reflections of the sun's image may cause bright linear or point reflections at certain sun/viewer angles. This impact is discussed below under the analysis of glare impacts. Note also the large evaporation ponds, which are visible from elevated viewpoints and display strong color contrast in some photos. According to the AFC there would be two 24-acre evaporation ponds, one for each generation unit, located between the two mirror fields ((GSEP 2009a).

KOP 4b (Elevated Background). **VISUAL RESOURCES Figure 11B** is representative of background distance zone viewpoints within the Palen and McCoy Mountains. It is a virtual view of the project footprint from the ridge above McCoy Springs, a short distance from a jeep trail at the spring, roughly 6.6 miles from the project site at an elevation of approximately 2,250 feet or roughly 1,800 feet above the project site.

As suggested in the figure, from this high point of the first ridge facing the project site, the project footprint appears relatively oblique, with moderately low rectilinear form and line contrast. Taller project structures would present some vertical form contrast, but at background distance, this component of project contrast would be relatively low. Color

and texture contrast of mirror fields would again vary from moderate to strong levels depending upon light conditions. Overall, contrast would be moderate.

At this distance, the project occupies a moderate proportion of the field of view and remains subordinate to the visual foreground and the expanse of the valley floor. The project would block views of the portion of the valley floor it occupies, but only to a very limited degree due to the very oblique vertical viewing angle.

Overall visual change from the project at such elevated background viewpoints would thus be moderate. The project would be very evident and begin to attract attention, but would remain subordinate within the existing setting.

In the context of moderate overall visual sensitivity, this could represent an adverse visual impact, particularly under episodic conditions of bright reflection, but is considered to be less-than-significant. As distance to viewpoints increased, the level of impact would decline further.

Palen-McCoy WA Lowland Viewpoints (No KOP)

As indicated in the viewshed mapping of **VISUAL RESOURCES Figure 2,** the project would be visible from nearly the entire radius of the valley floor around it within the middle-ground distance zone (less than 5 miles), including a large portion within the Palen-McCoy WA to the north and northeast of the site. A large area of lowlands within the WA at background distance (beyond 5 miles) would also have views of the site.

Staff was unable to access or obtain photographs of a representative KOP in these lowland portions of the visual middle-ground within the WA. However, studies of 3D ground-level views using Google Earth appeared to confirm viewing conditions that seem intuitively obvious; that is, from valley viewpoints north of the project site, the relatively level terrain relationship between viewers and site would be very similar to those depicted in KOPs 1 and 2. Due to the very level viewer-to-site relationships, the project, which is low in height, would appear as a thin horizontal line in all but foreground (1/2-mile and under) views. As from KOP 1, the project would extend over a vast horizontal extent of the view from middle-ground viewpoints. However, the proportion of the overall field of view occupied by the mirror fields would be small due to the level viewing conditions and low project height, appearing as a thin contrasting line. The field of view would be strongly dominated by an expansive visual foreground, and visually dominant mountains in the middle-ground and background. As from KOP 1, project contrast and dominance in the middle-ground distance zone would range from moderately low to moderate depending upon brightness of reflective glare. However, with staff-recommended Condition of Certification VIS-4, bright spread reflection as seen from valley floor viewpoints would be screened by slatted fencing at the project perimeter. Glare-related contrast and dominance would consequently be kept to moderately low levels. Project structures would also exert some vertical form contrast. However as noted under the discussion of KOP 1, at distances of roughly 2-1/2 or 3 miles, structure contrast is subordinate within the overall view and attributable primarily to color contrast. With staff-recommended Condition of Certification VIS-1, color contrast would be substantially reduced to blend with the darker visual background and reduce form and line contrast. The project would not block or intrude into scenic views

except from foreground locations. Overall visual change with recommended mitigation would thus be moderately low.

The number and duration of views within foreground and very-near-middle-ground viewpoints where the project could have high contrast is considered to be very low and thus of minor concern. Therefore, notwithstanding a moderately high level of viewer sensitivity, this would represent a less-than-significant level of impact.

Glare Impacts

The primary source of potential glare from the project is the mirrored surfaces of the solar collector arrays. Staff observations confirm that during certain times of day the mirror units can produce substantial glare and that such glare can be experienced by the public from locations in the project vicinity as intrusive nuisances and may be a distraction, but generally do not pose a visual hazard except for persons within 60 feet of the plant perimeter fence. Public exposure to the Genesis project at this distance is not anticipated. There are no known quantitative thresholds for determining unacceptable levels of nuisance or discomfort glare.

Visual Resources Figure 13A depicts a typical project reflection as documented by staff at the Kramer Junction SEGS project in mid-morning. **Visual Resources Figure 13B** depicts a view of the Acciona Nevada One trough project at middle-ground distance. When looking toward the mirrors, the bright spots depicted are believed by staff to be spread reflections of the sun. They are seen when the observer is off-axis from the focal plane of the troughs and, as can be seen in the photos, may appear to be very bright. The bright spots also appear to 'follow' the viewer as one's relationship to the sun changes. Based on data on file with the Commission, staff concludes that when trough systems rotate from stow position to tracking position in the morning and the reverse in the evening they produce a linear reflected solar image which may be visible briefly to nearby observers. As illustrated in **Visual Resources Figure 13B**, these reflections may, under the right conditions, be prominently visible from several miles away. Within a zone of 20 meters from the plant perimeter this image may exceed a level deemed safe for the human eye of 4.5 kW/m^2. Beyond this distance, though potentially very bright, they are not believed to pose a physical hazard. At a minimum, however, similar off-site glare observed by staff was considered a nuisance, and felt to be a discomfort if directly observed for more than a few moments.

In order to substantially reduce the brightness of such spread reflections of the sun for valley floor viewers, staff recommends Condition of Certification VIS-4, Reflected Glare Mitigation, requiring slatted perimeter fencing. Based on available data, staff concludes that implementation of this measure would prevent bright spot reflections for viewers at ground level on the valley floor, including motorists on Highway I-10.

Nighttime light pollution as a result of the project is a concern in the project vicinity. The existing Chuckwalla Valley within the project viewshed is essentially dark at night. The pristine, unlit night sky is an important part of the camping experience for many visitors to remote areas such as the nearby Wilderness Areas. Unmitigated night lighting of the project could represent a substantial impact to the experience of campers in these wilderness areas.

Project lighting is not described in detail in the AFC, but would be designed to provide 'minimum illumination needed to achieve safety and security.'

To minimize potential nighttime light pollution, address potential impacts from construction lighting, and further minimize potential night lighting impacts to campers in the Palen-McCoy Wilderness, staff recommends Condition of Certification VIS-2. This measure would require that all exterior lighting be designed such that lamps and reflectors are not visible from beyond the project site; lighting does not cause excessive reflected glare; direct lighting does not illuminate the nighttime sky, except for required FAA aircraft safety lighting, if any; and illumination of the project and its immediate vicinity is minimized to an 'as needed' basis wherever feasible consistent with safety.

Visible Vapor Plume Impacts

The proposed project is a thermal solar design that requires cooling to condense the steam that is recycled. The applicant has proposed two seven-cell mechanical-draft cooling towers for project cooling. The applicant has not proposed to use any methods to abate visible plumes from the cooling towers.

Staff completed a modeling analysis for the applicant's proposed unabated cooling tower design using the Combustion Stack Visible Plume (CSVP) model to estimate plume frequency and plume dimensions for the cooling tower exhaust. This model provides conservative estimates of both plume frequency and plume size. The modeling study may be found in its entirety in **Appendix VR-2.**

Based on this analysis, visible water vapor plumes from the proposed Genesis Solar cooling tower would occur 10.75% seasonal daylight clear hours. Energy Commission staff apply a 20% seasonal daylight clear hour criterion for identifying potentially significant visible plume impacts. Because visible plumes are anticipated to occur for less than 20% of seasonal daylight clear hours, no significant impact is anticipated and no further modeling was performed.

Due to their small size and limited operation significant visible water vapor plumes are not expected from the two small Genesis auxiliary boilers.

Project Construction Impacts

Construction Staging Area

The size of construction laydown areas is not described in the AFC but would be provided within the project site or, for construction of the proposed transmission gen-tie line, at Wiley's Well Rest Area southeast of the site north of I-10. Project construction is expected to last 37 months. Laydown within the project site would thus be potentially visible but would occupy a smaller area than the project itself. Laydown would thus have substantially lower impact than either site grading or the completed project itself. The effects of laydown within the main project footprint would be less than significant. Laydown for construction of the proposed transmission line is proposed near the Wiley's Well Rest Area. Because of proximity, this laydown area could potentially be visually prominent, and represent an adverse effect on the visual quality of the rest area for the high numbers of visitors to this facility over the period of transmission line construction,

which is not quantified in the AFC. This could represent a substantial visual impact. In order to minimize these impacts, staff recommends Condition of Certification VIS-5, Visual Mitigation and Revegetation of Staging Area, including screening of the laydown area with earth berms, opaque fencing, and/or other measures to minimize visibility from within the main rest area, consistent with any cultural or biological resource constraints identified in those portions of this Staff Assessment; and restoration and revegetation of the laydown area after completion of construction, again consistent with cultural and biological constraints. Staff also recommends VIS – 6, Reduction of Form, Line, and Texture Contrast to minimize the contrast of laydown areas with associated graded landscapes, roads, and other infrastructures. With these recommended measures, impacts would be reduced to a less-than-significant level.

Site Grading

Site grading would potentially represent a substantial visual component of the proposed project during construction. Surface disturbance of the proposed site, as in most desert landscapes of the region, would result in high contrast between the disturbed area and surroundings, due to high contrast between the disturbed soil color and albedo, and the color and albedo of the existing undisturbed, vegetated surface. Furthermore, effectiveness of revegetation in this arid environment is difficult, often of limited effectiveness, and capable of recovery only over a very long-term time frame. Although grading impacts would be similar in extent to the completed project itself, the latter were found to be less-than-significant from all KOPs. Therefore, grading impacts would also be less-than-significant.

Indirect Impacts

No indirect visual impacts of the project were identified.

Closure and Decommissioning Impacts and Mitigation

Permanent closures would require the applicant to submit to the Energy Commission a contingency plan or a decommissioning plan. A decommissioning plan would be implemented to ensure compliance with applicable LORS, removal of equipment and shutdown procedures, site restoration, potential decommissioning alternatives, and the costs and source of funds associated with decommissioning activities.

The removal of the existing facility would leave a very prominent visual impact over the entire site due to form, line, color and texture contrast created between graded or disturbed soil areas and undisturbed areas in the region of the project site. This color contrast is due particularly to the removal of the dark color element contributed by normal scrub vegetation cover. After decommissioning, the site would leave a rectilinear area of form, line, color and texture contrast visible mainly to elevated locations within the adjacent wilderness area. Revegetation of areas in this desert region are difficult but have been implemented by the BLM with success over time. Thus, visual recovery from land disturbance after closure and decommissioning could take place, although over a long period of time, with implementation of an active and comprehensive revegetation program for the site.

C.12.4.3 CEQA LEVEL OF SIGNIFICANCE

Appendix G of the CEQA Guidelines four significance criteria for evaluating aesthetic impacts, as follows.

A. Would the project have a substantial adverse effect on a scenic vista?

No specific designated scenic vista locations were identified in the project viewshed. However, as discussed above, BLM considers that a primary purpose of the CDCA is to recognize and conserve the natural beauty and scenic recreational qualities of the California Desert. As described above, various KOPs with high levels of viewer concern for scenic values would be affected by the project, including motorists on Highway I-10, and visitors to the Palen McCoy Wilderness Area. Because these effects were determined to be less than significant in the staff analysis presented above, significant adverse effects on scenic vistas are not anticipated.

B. Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway?

The project is adjacent to Highway I-10, which is not listed as an eligible State Scenic Highway. No notable scenic features or resources are present on-site. The project would not directly damage any specific scenic resources located within the project site. Potential effects on scenic resources within the project viewshed in general are discussed under Item C, below.

C. Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

As described in the main analysis above, the project could degrade the existing visual character and quality of views from Highway I-10 and the Palen McCoy Wilderness. However, with staff-recommended Conditions of Certification, these impacts are considered to be either less-than-significant, or mitigable to less-than-significant levels

D. **Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?**

Reflected glare is an issue of concern for the Genesis Solar Project, primarily due to the potential to accentuate project contrast and aesthetic impact. Potentially affected receptors would include motorists on I-10 and at Wiley's Well Rest Area, and visitors to the Palen McCoy Wilderness.

Staff conducted an independent review of potential glare impacts. The results of this review are summarized in the discussion of Glare Impacts, above. With recommended Condition of Certification **VIS-4**, impacts could be reduced to less-than-significant levels.

Project lighting is not described in detail in the AFC, but would be designed to provide 'minimum illumination needed to achieve safety and security.' However, night lighting of control room, warehouses, administration building, project roadways, or security lighting could all potentially contribute to nighttime light pollution.

To minimize potential night lighting impacts to campers in the Palen McCoy Wilderness, staff recommends Condition of Certification **VIS-2**. This measure would require that all exterior lighting is designed such that lamps and reflectors are not visible from beyond the project site; lighting does not cause excessive reflected glare; direct lighting does not illuminate the nighttime sky, except for required FAA aircraft safety lighting, if any; and illumination of the project and its immediate vicinity is minimized and kept to an 'as needed' basis wherever feasible consistent with safety.

With the measures in this condition, project night lighting would be reduced to a less-than-significant level.

C.12.5 REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would essentially be Unit 1 of the proposed project, including a 125 MW solar facility located within the boundaries of the proposed project as defined by NextEra. This alternative is analyzed for two major reasons: (1) it eliminates about 50 percent of the proposed project area so all impacts are reduced, and (2) by eliminating the eastern solar field, it would reduce the water required for wet cooling by 50 percent. The boundaries of the Reduced Acreage Alternative are shown in **Alternatives Figure 1**.

C.12.5.1 SETTING AND EXISTING CONDITIONS

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates effects to the eastern 125 MW solar field and relocates the gas yard approximately 1.75 miles northwest of its present location. As a result, the environmental setting consists of the western portion of the proposed project, as well as the area affected by the linear project components, and is as described for the Proposed Project in section 14.4.1.

C.12.5.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Project Operation Impacts

Impacts of the Reduced Acreage Alternative would be similar in character but greatly reduced in extent and degree compared to the Proposed Project from all KOPs. Under the Proposed Project, staff concluded that impacts to all KOPs with recommended conditions of certification could be reduced to less-than-significant levels. Those impacts would be reduced further under the Reduced Acreage Alternative.

Impacts of non-mirror project structures would be reduced in extent compared to the Proposed Project but could still result in form, line and color contrast that would introduce an industrial character into the view of all KOPs. Staff therefore recommends Condition of Certification VIS-1 to reduce contrast of non-mirror project structures. Similarly, night lighting impacts would be reduced but not eliminated and could result in adverse nighttime light pollution. Staff therefore recommends Condition of Certification VIS-2 to reduce and minimize potential nighttime lighting impacts.

However, the anticipated operation and construction impacts of the proposed gen-tie transmission line would remain the same as under the Proposed Project, and potentially significant. Staff therefore recommends Conditions of Certification VIS-3 and VIS-5 for the Reduced Acreage Alternative as well, in order to reduce potential impacts of the transmission line to less-than-significant levels.

Contributions to heightened project contrast due to reflective glare would be reduced because the area and extent of the project footprint would be reduced by half. However, bright spread reflections could still be visible off-site under the Reduced Acreage Alternative. Staff therefore recommends Condition of Certification VIS-4 under this alternative to screen potential bright off-site reflection impacts.

Potential visible vapor plume impacts under the Proposed Project were found by staff to fall below Energy Commission impact thresholds and therefore to be less-than-significant. Visible vapor plumes would presumably be reduced substantially as compared to the Proposed Project, reducing this impact further and representing an overall visual improvement as compared to the Proposed Project.

Project Construction Impacts

Presumably the area needed for project laydown under Alternative 1 would be proportionately less than under the proposed project, both in extent, and in duration. However, impacts from laydown within the project site were considered to be less-than-significant in impact. This would also be true of impacts under the Reduced Acreage Alternative.

Laydown for construction of the proposed transmission line would take place near the Wiley's Well Rest Area under this alternative. Presumably, the length of time for this portion of project construction would be the same as that under the Proposed Project thus resulting in substantial visual impacts to the high numbers of visitors to this facility over the period of transmission line construction, which is not described in the AFC. In order to minimize these impacts, staff recommends Condition of Certification VIS-5, Visual Mitigation and Revegetation of Staging Area, including relocation of the laydown site to the south of the Wiley's Well Road interchange; or screening of the laydown area with earth berms, opaque fencing, and/or other measures to minimize visibility from within the main rest area; restoration and revegetation of the laydown area after completion of construction. Staff also recommends Condition of Certification VIS-6, Reduction of Form, Line, and Texture Contrast, to minimize the contrast of solar panels and supports, laydown areas, roads, buildings, other structures, and graded landscapes.Site grading impacts would be substantially less than under the Proposed Project because the affected area would be less. These impacts would be less-than-significant under all action alternatives.

C.12.5.3 CEQA LEVEL OF SIGNIFICANCE

Appendix G of the CEQA Guidelines four significance criteria for evaluating aesthetic impacts, as follows:.

A. Would the project have a substantial adverse effect on a scenic vista?

No specific designated scenic vista locations were identified in the project viewshed. However, as discussed above, BLM considers that a primary purpose of the CDCA is to recognize and conserve the natural beauty and scenic recreational qualities of the California Desert. As described above, various KOPs with high levels of viewer concern for scenic values would be affected by the project, including motorists on Highway I-10, and visitors to the Palen McCoy Wilderness Area. These effects would be substantially less under the Reduced Acreage Alternative than under the Proposed Project. Because potential visual effects were considered to be mitigable with staff-recommended mitigation measures under both the Proposed Project and Reduced Acreage Alternative, substantial adverse effects on scenic views are not anticipated under either alternative.

B. Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway?

The project is adjacent to Highway I-10, which is not listed as an eligible State Scenic Highway. No notable scenic features or resources are present on-site. The project would not directly damage any specific scenic resources located within the project site. Potential effects on scenic resources within the project viewshed in general are discussed under Item C, below.

C. Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

As described in the main analysis above, the project could degrade the existing visual character and quality of views from Highway I-10 and the Palen McCoy Wilderness. These effects would be substantially less than under the Proposed Project because the affected area would be roughly ½ of the Proposed Project. However, with staff-recommended Conditions of Certification, these impacts are considered to be mitigable to less-than-significant levels under all action alternatives, including the Reduced Acreage Alternative.

D. **Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?**

Reflected glare is an issue of concern for the Genesis Solar Project, primarily due to the potential to accentuate project contrast and thus aesthetic impact. Potentially affected receptors would include motorists on I-10 and at Wiley's Well Rest Area, and visitors to the Palen McCoy Wilderness. Under the Reduced Acreage Alternative these effects would be substantially less, because the affected area would be roughly ½ of the Proposed Project. However, the potential to create occasional, very bright spread reflections of the sun visible at a distance would remain under this alternative and could be substantial. With recommended Condition of Certification **VIS-4**, however, this impact would be reduced to a less-than-significant level.

Project lighting is not described in detail in the AFC, but would be designed to provide 'minimum illumination needed to achieve safety and security.' However, night lighting of

control room, warehouses, administration building, project roadways, or security lighting could all potentially contribute to nighttime light pollution.

To minimize potential night lighting impacts to campers in the Palen McCoy Wilderness, staff recommends Condition of Certification **VIS-2**. This measure would require that all exterior lighting is designed such that lamps and reflectors are not visible from beyond the project site; lighting does not cause excessive reflected glare; direct lighting does not illuminate the nighttime sky, except for required FAA aircraft safety lighting, if any; and illumination of the project and its immediate vicinity is minimized and kept to an 'as needed' basis wherever feasible consistent with safety.

With the measures in this condition, project night lighting would be reduced to a less-than-significant level.

C.12.6 DRY COOLING ALTERNATIVE

This section identifies the potential impacts of using air-cooled condenser (ACC) systems rather than the cooling towers proposed by NextEra for the Genesis project. It is assumed that the ACC systems would be located where the cooling towers are currently proposed for each of the two 125 MW power block, as illustrated in **Alternatives Figure 2** (see Section B.3).

Approximately 18 ACC fans would be required for each of the two solar fields. The 18 fans, or ACC's, would operate when the ambient temperature is above 50 degrees Fahrenheit. When the temperature is below 50 degrees Fahrenheit, only 10 of the fans would be used (GSEP 2009f). The 18 ACC fans described in the GSEP cooling study would have a length of approximately 279 feet, a width of approximately 127 feet, and a height of 98 feet (GSEP 2009f). However, based on the ACC preliminary designs for nearby solar thermal projects in similar ambient temperatures, an additional 11,690 square feet could be required for siting of the fans and the fans would be up to 120 feet in height. In addition to the ACC fans, NextEra would use a small Wet Surface Air Cooler when needed to provide auxiliary cooling during extremely hot days (GSEP 2009f). This alternative is analyzed because it would reduce the amount of water required for steam turbine cooling from 822 acre-feet per year (AFY) to 66 AFY. This reduction in water use would reduce impacts to water and biological resources.

C.12.6.1 SETTING AND EXISTING CONDITIONS

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates the use of wet-cooling towers and incorporated the use of air-cooled condensers (ACC) in the same location. As a result, the environmental setting would be the same as for the proposed project.

C.12.6.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Under the Dry Cooling Alternative, the ACC would be located immediately north of the proposed power block in the location where the cooling towers would be located for the proposed project. The ACC would appear as a large elevated box-like structure and

would range from 98 to 120 feet in height. The ACC fans would be at least double the height of any of the proposed components of the GSEP (GSEP 2009a). As such, the ACC would be prominently visible. The ACC facilities would have a much stronger industrial character due to greater structural complexity and highly metallic coloration and texture. However, the ACC fans would be located approximately 1,800 feet from the project fenceline and would be surrounded by the solar trough fields.

Project Operation Impacts

Because of the increase in height by incorporating the ACC fans into the GSEP, there would be an increase in visual contrast, project dominance, and view blockage caused by the ACC structures when compared to views with the proposed wet-cooling system. However, in staff's opinion this difference would be meaningfully evident mainly from middle-ground KOPs, and not background distance zone KOPs. From middle-ground KOPs, including KOPs 1 and 4A, the structure would present increased vertical form, line and color contrast. This increase would tend to draw the eye of casual viewers to a greater degree than the Proposed Project structures. However, even at these middle-ground distances (3 miles and 3.7 miles respectively) the difference in vertical form contrast would not be so great as to qualitatively increase the overall level of visual change. The most noticeable component of increased structure contrast, particularly from KOP 1 and the highway generally, would be from color contrast if the ACC were light-colored or metallic, thus contrasting against the darker mountain background and drawing viewers' attention. With staff-recommended Condition of Certification VIS-1, Surface Treatment of Non-Mirror Project Structures, and Condition of Certification VIS-6, Reduction of Form, Line, and Texture Contrast, potential form, color, line, and texture contrast could be minimized to make the ACC blend in value with the dark mountain background. With this measure, overall project contrast would be reduced, the structure would be less likely to draw the attention of casual viewers, and overall visual change would remain moderate. Visual change of the alternative would be somewhat greater than the Proposed Project but would remain moderate and less-than-significant.

Apart from the change in structure contrast due to the increased height of the ACC compared to proposed structures, impacts of the Dry Cooling Alternative would remain largely as described for the Proposed Project. Potential glare impacts would be identical to the Proposed Project. Impacts from the proposed gen-tie line would remain the same. Therefore, staff recommends adoption of all Conditions of Certification as under the Proposed Project. With these measures, visual impacts of the Dry Cooling Alternative would be less-than-significant. There would be no visible vapor plumes under this alternative due to the replacement of wet cooling with dry cooling. Although visible plumes from the Proposed Project were found by staff to fall below Energy Commission thresholds of visual impact significance, the complete elimination of any visible plumes by air-cooling would represent an overall visual improvement compared to the Proposed Project.

Project Construction Impacts

Project construction impacts would be substantially the same as under the Proposed Project.

C.12.6.3 CEQA LEVEL OF SIGNIFICANCE

A. Would the project have a substantial adverse effect on a scenic vista?

No specific designated scenic vista locations were identified in the project viewshed. However, as discussed above, BLM considers that a primary purpose of the CDCA is to recognize and conserve the natural beauty and scenic recreational qualities of the California Desert. As described above, various KOPs with high levels of viewer concern for scenic values would be affected by the project, including motorists on Highway I-10, and visitors to the Palen McCoy Wilderness Area. These effects would be substantially similar under the Dry Cooling Alternative compared to the Proposed Project. Structure contrast would be higher due to the ACC structure, but this increase is considered to be mitigable with color treatment. Visible vapor plumes would be eliminated, representing an improvement over the Proposed Project. Because visual effects under the Proposed Project were considered to be mitigable to less-than-significant levels, and because overall impacts of the Dry Cooling Alternative would be substantially similar with recommended mitigation, substantial adverse effects on scenic views are not anticipated under this alternative.

B. Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway?

The project is adjacent to Highway I-10, which is not listed as an eligible State Scenic Highway. No notable scenic features or resources are present on-site. The project would not directly damage any specific scenic resources located within the project site. Potential effects on scenic resources within the project viewshed in general are discussed under Item C, below.

C. Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

As described in the main analysis above, the project could degrade the existing visual character and quality of views from Highway I-10 and the Palen McCoy Wilderness. These effects would be substantially similar to those under the Proposed Project. Structure contrast would be higher due to the ACC structure, but this increase is considered to be mitigable with color treatment. Visible vapor plumes would be eliminated, representing an improvement over the Proposed Project. Because visual effects under the Proposed Project were considered to be mitigable to less-than-significant levels, and because overall impacts of the Dry Cooling Alternative would be substantially similar with recommended mitigation, this alternative is not expected to substantially degrade the existing visual character or quality of the surroundings.

D. Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

As under the Proposed Project, reflected glare would accentuate project contrast and thus increase aesthetic impact. Potentially affected receptors would include motorists on

I-10 and at Wiley's Well Rest Area, and visitors to the Palen McCoy Wilderness. Under the Dry Cooling Alternative these effects would be substantially the same as under the Proposed Project. Consequently, as under the Proposed Project, with staff-recommended Condition VIS-4, this impact is considered mitigable to a less-than-significant level.

Night lighting/light pollution impacts would be substantially the same as under the Proposed Project. Consequently, as under the Proposed Project, with staff-recommended Condition VIS-2, this impact is considered mitigable to a less-than-significant level.

C.12.7 NO PROJECT/NO ACTION ALTERNATIVE

There are three No Project/No Action Alternatives evaluated in this section, as follows:

No Project/No Action Alternative #1:

No Action on Genesis Solar Energy Project application and on CDCA land use plan amendment

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and BLM would not amend the CDCA Plan. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, the views of the site are not expected to change noticeably from existing conditions under this alternative and, therefore, this No Project/No Action Alternative would not result in adverse visual, light, and glare impacts at this location. However, the land on which the project is proposed would become available to other uses that are consistent with BLM's land use plan, including another solar project requiring a land use plan amendment. In addition, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations

No Project/No Action Alternative #2:

No Action on Genesis Solar Energy Project and amend the CDCA land use plan to make the area available for future solar development

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and BLM would amend the CDCA Land Use Plan of 1980, as amended, to allow for other solar projects on the site. As a result, it is possible that another solar energy project could be constructed on the project site.

Because the CDCA Plan would be amended, it is possible that the site will be developed with another solar technology. As a result, it is possible that views of the site

could change substantially based on the required buildings and structures on the site for the different solar technologies. Different solar technologies would create different visual effects based on the technology components. It is expected that the views of the site could change substantially with a different solar technology, similar to the changes in views under the proposed project. Therefore, this No Project/No Action Alternative could result in adverse visual, light, and glare impacts similar to the impacts under the proposed project.

No Project/No Action Alternative #3:

No Action on Genesis Solar Energy Project application and amend the CDCA land use plan to make the area unavailable for future solar development

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and the BLM would amend the CDCA Plan to make the proposed site unavailable for future solar development. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because the CDCA Plan would be amended so no solar projects can be approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, the views of the site are not expected to change noticeably from existing conditions under this alternative and, therefore, this No Project/No Action Alternative would not result in adverse visual, light, and glare impacts. However, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

C.12.8 CUMULATIVE IMPACTS

Section B.3, Cumulative Scenario, provides detailed information on the potential cumulative solar and other development projects in the project area. Together, these projects comprise the cumulative scenario which forms the basis of the cumulative impact analysis for the proposed project. In summary, these projects are:

- Renewable energy projects on BLM, State, and private lands, as shown on **Cumulative Figure 1** and in **Cumulative Tables 1A and 1B.** Although not all of those projects are expected to complete the environmental review processes, or be funded and constructed, the list is indicative of the large number of renewable projects currently proposed in California.
- Foreseeable future projects in the immediate Chuckwalla Valley viewshed, as shown on **Cumulative Impacts Figure 2, I-10 Corridor Existing and Future/Foreseeable Projects, and Cumulative Tables 2 and 3**. Table 2 presents existing projects in this area and Table 3 presents future foreseeable projects in the I-10 Corridor Area. Both tables indicate project name and project type, its location and its status.

These projects are defined within a geographic area that has been identified by the CEC and BLM as covering an area large enough to provide a reasonable basis for evaluating cumulative impacts for all resource elements or environmental parameters. Most of these projects have, are, or will be required to undergo their own independent environmental review under CEQA and/or NEPA. Even if the cumulative projects described in Section B.3 have not yet completed the required environmental processes, they were considered in the cumulative impacts analyses in this SA/Draft EIS.

GEOGRAPHIC SCOPE OF ANALYSIS

Cumulative impacts could occur if implementation of the Genesis Solar Project would combine with those of other local or regional projects. The Genesis Solar Project is potentially associated with two types of cumulative impact:

1. cumulative impacts within the immediate, local project viewshed, essentially comprising foreseeable future projects in the Chuckwalla Valley;

2. cumulative impacts of foreseeable future solar and other renewable energy projects within the southern California Colorado (Sonoran) Desert, or other broad regional basin of the project's affected landscape type. The widest applicable basin of cumulative effect would include all of the southern California desert, or the Sonoran and Mojave desert landscapes extending into neighboring states. This analysis, focusing on reqional effects of renewable projects only, is considered appropriate because the potential cumulative contribution of all other types of permissible development within this region is comparatively minor, and is dwarfed by the potential cumulative effect of renewable projects.

Local Projects (Project Viewshed)

Effects of Past and Present Projects

For this analysis, the following projects or developments are considered most relevant to effects on visual resources:

- Interstate 10 (I-10) (**Cumulative Table 2, item 1**)
- Chuckwalla and Ironwood State Prisons (**Cumulative Table 2, items 2 and 3**)
- Devers-Palo Verde Transmission Line (**Cumulative Table 2, item 4**)

Visual resources in the geographic area have been impacted by these past and currently approved projects as follows:

I-10 is an object of view from elevated KOPs in the Palen McCoy and Chuckwalla Wilderness Areas (WAs). It is also the viewshed's principal KOP, introducing large numbers of motorists into the area, many with relatively high scenic expectations and sensitivity. The two state prisons named are visible to the south of the highway within the same viewshed as the proposed project, but at a distance that renders them visually very subordinate. As such, the visual interaction between the project and these prisons is relatively weak. Similarly, the existing Devers-Palo Verde Transmission Line is visible within the same viewshed south of the highway, but tends to blend with its visual background, and is sufficiently distant as to remain visually subordinate. Together,

these existing projects have the effect of rendering the Chuckwalla Valley south of I-10 less visually intact than the views northward toward the project site and the Palen-McCoy Wilderness. However, taken together they are not so intrusive as to substantially detract from the moderately high overall sensitivity of the viewshed.

Effects of Reasonably Foreseeable Future Projects

Visual resources are also expected to be affected by the following reasonably foreseeable future projects as follows:

- Devers-Palo Verde 2 Transmission Line Project (**Cumulative Table 2, item D**)
- Blythe Energy Project Transmission Line (**Cumulative Table 2, item F**)
- Palen Solar Power Project (**Cumulative Table 2, item K**)

Contribution of the Genesis Solar Energy Project to Cumulative Impacts

Construction. The construction of the Genesis Solar Energy Project is expected to result in short term adverse impacts related to construction activities. It is expected that some of the cumulative projects described above which are not yet built may be under construction the same time as the Genesis Solar Energy Project. As a result, there may be substantial short-term impacts during construction of those cumulative projects related to visual resources.

The Genesis Solar Energy Project would be expected to contribute only a small amount to the possible short-term cumulative construction impacts related to visual resources because the principal anticipated construction impacts of the Genesis project are related to the transmission line construction laydown area near the Wiley's Well rest area. It is unlikely that the construction activities of the other named projects would occur within the same vicinity, so the likelihood of their visual interaction appears low.

Operation. The operation of the Genesis Solar Energy Project is expected to result in long-term adverse impacts during operation of the project related to visual resources. It is expected that some of the cumulative projects described above may be operational at the same time as the Genesis Solar Energy Project. As a result, there may be substantial long-term impacts during operation of those cumulative projects related to visual resources. The addition of the two proposed transmission lines in the same general corridor as the existing Devers-Palo Verde line have the potential to raise the cumulative level of contrast and dominance of the overall transmission corridor to a level that begins to attract attention and detract from the intactness and visual quality of the viewshed as seen from I-10. The project, through its proposed transmission line, would contribute incrementally to that increase in dominance of transmission lines within the Chuckwalla Valley.

Direct visual interaction of the Genesis and Palen power projects is expected to be relatively weak due to distance, and to the relatively subordinate level of dominance of the Genesis project as seen from I-10. The two projects would both be visible from viewpoints in a small portion of the Palen Mountains at background distances, although not in the same views, since they would be located in different directions (southwest and southeast, respectively). Both projects would be visible from KOP 3 (Corn Springs Road/Campground); the Palen Project would be visible at middle-ground distance from

Corn Springs Road, and from about 6 miles from Corn Springs Campground. The Genesis Project would also be visible at background distance in those views. The Genesis Project would contribute incrementally to a small degree to that impact, which could potentially be substantial from some portions of Corn Springs Road and the Chuckwalla Wilderness. The anticipated operational visual impacts of the Genesis Solar Project in combination with past and foreseeable future projects in the local viewshed of Chuckwalla Valley are thus considered potentially significant from some sensitive viewpoints, particularly within the Chuckwalla Wilderness.

Decommissioning. The decommissioning of the Genesis Solar Energy Project is expected to result in adverse impacts related to visual resources similar to construction impacts. Although decommissioning of the Palen and Genesis projects could conceivably overlap in time, particularly when considering the long period involved in restoration of such disturbed sites in the desert, the cumulative contribution of the Genesis project to these effects from KOP 3 and similar sensitive local cumulative viewpoints is expected to be minor due to distance and moderate anticipated level of contrast. Consequently, the impacts of the decommissioning of the Genesis Solar Energy Project would not be expected to contribute substantially to local cumulative viewshed impacts.

Regional Solar/Renewable Development Projects

Effects of Past and Present Projects

The Genesis Solar Project is among the first of a large number of existing renewable project applications in the southern California desert. As such, past and present projects have had a negligible region-wide cumulative impact.

Effects of Reasonably Foreseeable Future Projects

The analysis of cumulative impacts is not necessarily restricted to the immediate viewshed of a project, and the need for cumulative analysis over a broad geographic area may often be determined by the affected resource itself. In this case the affected resource is the unique and highly valued landscape type of which the project site forms a small part – the landscape of the southern California and Sonoran Desert. The Sonoran Desert and California Desert Conservation Area (CDCA) within which the Genesis Solar Project is located are a unique and highly valued scenic resource of national importance, as reflected by the presence of three national parks and numerous Wilderness Areas within the CDCA boundaries. Cumulative Impacts Table 1 identifies 63 solar projects and 62 wind project applications with a total overall area of over one million acres within the CDCA, which is indicative of the interest in, and potential impact on, public lands for renewable energy generation at a regional level. This figure does not include renewable projects within the Nevada and Arizona portions of the Sonoran and Mojave Deserts. Of the 62 wind applications in the California Desert District, only five of the applications are for wind development; the remaining proposals are for site testing and monitoring. BLM's experience is that a small percentage of applications for site testing have resulted in wind development proposals. In regards to the solar applications filed with BLM in California, only approximately 10 percent of the proponents have prepared acceptable detailed Plans of Development required by BLM to begin a NEPA analysis.

Although it is not likely that all of the future solar and wind development projects proposed in the region would be constructed, it is reasonable to assume that some of them will. With this very high number of renewable energy applications currently filed with BLM, the potential for profound widespread cumulative impacts to scenic resources within the southern California desert is clear. These cumulative impacts could include a substantial decline in the overall number and extent of scenically intact, undisturbed desert landscapes, and a substantially more urbanized character in the overall southern California desert landscape. In particular, the number of current renewable applications before the BLM and Energy Commission that could potentially be prominently visible from the desert region's major highways is proportionally high. Likewise, the cumulative length of potentially affected highways also appears proportionately high. Because these highways are the location from which the vast majority of viewers experience the California desert, this potential effect is of concern to staff. Viewed in the cumulative context of the Southern California desert region as a whole, potential visual impacts of renewable energy projects are thus considered to be cumulatively considerable and potentially significant.

Contribution of the Genesis Solar Energy Project to Cumulative Impacts
Construction. Cumulative construction impacts of renewable projects on a regional basis would be expected to be similar to the cumulative operation impacts, only less extensive, and short-term.

Operation. The cumulative operational impacts renewable projects on a regional landscape basis would be as described above. That is, there is a potential for a regional decline in the overall number and extent of scenically intact, undisturbed desert landscapes, particularly as experienced from the region's major highways and roadways, and thus a more urbanized character in the overall southern California desert landscape. Among the foreseeable renewable applications, the Genesis Project would have a smaller contribution to this effect than many projects because of its limited exposure to views from the highway and middle-ground viewpoints in the adjoining wilderness. Nevertheless, these individually minor effects could be considered cumulatively considerable when viewed together on a regional basis.

Decommissioning. Cumulative regional decommissioning impacts of the Genesis Solar Energy Project together with other foreseeable renewable projects could result in adverse impacts related to visual resources similar to construction and operation impacts. That is, decommissioning impacts of many projects could overlap in time due to the long recovery period required for disturbed desert landscapes. Impacts from disturbed, decommissioned sites could thus become a substantial region-wide cumulative one, though eventual recovery would be anticipated over the long term due to anticipated conditions for decommissioning of the individual projects. In the very long term, potential decommissioning impacts would thus be expected to be mitigated.

Cumulative Impact Conclusion

The anticipated operational visual impacts of the Genesis Solar Project in combination with past and foreseeable future projects in the local viewshed of Chuckwalla Valley are considered potentially significant from some sensitive viewpoints, particularly within the Chuckwalla Wilderness. Anticipated cumulative operational impacts of past and

foreseeable future region-wide projects in the southern California desert are considered cumulatively considerable and potentially significant.

C.12.9 COMPLIANCE WITH LORS

VISUAL RESOURCES Table 3
Project Compliance with Laws, Ordinances, Regulations, and Standards (LORS)

LORS		Consistency with Staff-Recommended Conditions of Certification (Project)
FEDERAL		
National Environmental Policy Act (NEPA)	As discussed above, the analysis conducted in this assessment is considered by staff to be consistent with BLM environmental review requirements under NEPA as well as CEQA.	
Federal Land Policy and Management Act of 1976 (FLPMA)	Section 102 (a) of the Federal Land Policy and Management Act of 1976 (FLPMA) states that " . . . . the public lands be managed in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archeological values …. " Section 103 (c) identifies "scenic values" as one of the resources for which public land should be managed. Section 201 (a) states that "The Secretary shall prepare and maintain on a continuing basis an inventory of all public lands and their resources and other values (including ... scenic values) ...." Section 505 (a) requires that "Each right-of-way shall contain terms and conditions which will... minimize damage to the scenic and esthetic	Refer to CDCA discussion, below.

	values....”	
California Desert Conservation Area Plan (CDCA Plan)	The CDCA Plan represents the Resource Management Plan (RMP) for the area required under FLPMA. The CDCA Plan did not contain VRM mapping as in most RMPs. However, VR Inventory mapping and Interim VRM Classes were assigned to the study area prior to this project by BLM. In staff’s opinion, the analysis in this assessment is consistent with the VRI mapping and IVRM Class mapping previously conducted, although the VRM methodology was not utilized. The Genesis Solar Project site is classified in the CDCA Plan as Multiple-Use Class (MUC) M (Moderate Use). Multiple-Use Class M calls for “a controlled balance between higher intensity use and protection of public lands. This class provides for a wide variety of present and future uses such as mining, livestock grazing, recreation, energy, and utility development. Class M management is also designed to conserve desert resources and to mitigate damage to those resources which permitted uses may cause.” “The goal of the(CDCA) Plan is to provide for the use of the public lands, and resources of the California Desert Conservation Area, including economic, educational, scientific, and recreational	Consistent. Solar electrical generation plants are specifically allowed for under the MUC Class M Guidelines if NEPA requirements are met. Disclosure of potential visual project effects under NEPA has been conducted through the analysis in this study. In general, BLM considers viewer sensitivity (in the VRM usage of the term) throughout the CDCA as High, due to the primary importance given to scenic values under the main goals of the CDCA Plan. In staff’s opinion, the analysis in this assessment reflects view through a high level of assumed viewer concern within the Energy Commission methodology.

	uses, in a manner which enhances wherever possible—and which does not diminish, on balance—the environmental, cultural, and *aesthetic* values of the Desert and its productivity." Under the CDCA Plan Electrical Power Generation Facilities, including Wind/Solar facilities, may be allowed within MUC Class M if NEPA requirements are met.	
STATE		
State Scenic Highway Program (CA. Streets and Highways Code, Section 260 et seq.)	The State Scenic Highway Program promotes protection of designated State scenic highways through certification and adoption of local scenic corridor protection programs that conform with requirements of the State program.	Consistent. Highway I-10 within the project viewshed is not an eligible or designated State scenic highway. To become eligible would require listing by act of the state legislature. Eligibility is a pre-requisite to state designation.
LOCAL		
Riverside County General Plan (2003) Related Multipurpose Open Space Element	**Multipurpose Open Space Element** Scenic Resources Policies: OS 21.1 Identify and conserve the skylines, view corridors, and outstanding scenic vistas within Riverside County. (AI 79) Scenic Corridors Policies: OS 22.1 Design developments within designated scenic highway corridors to balance the objectives of maintaining scenic resources with accommodating compatible	The project is located entirely on BLM lands and is thus not subject to County General Plan jurisdiction. The following related policies are provided for background purposes: The County has not yet mapped or listed specific view corridors or vistas for protection. I-10 is identified as a County eligible scenic corridor in the General Plan Circulation Element (Figure C-9). However, there are no designated state or county scenic highways within the project viewshed.

	land uses. (AI 3)	
	OS 22.2 Study potential scenic highway corridors for possible inclusion in the Caltrans Scenic Highways Plan.	As stated above, state designation requires listing of a road segment as an eligible State Scenic Highway by an act of the state legislature (California Streets and Highways Code, Division 1, Chapter 2, Article 2.5, Section 261).
	OS 22.3 Encourage joint efforts among federal, state, and County agencies, and citizen groups to ensure compatible development within scenic corridors	Again, there are no designated scenic corridors within the project viewshed.

C.12.10 NOTEWORTHY PUBLIC BENEFITS

No noteworthy public benefits in the area of visual resources were identified.

C.12.11 CONCLUSIONS

Staff have analyzed visual resource-related information pertaining to the proposed Genesis Solar Project and conclude that the proposed project, with all staff-recommended conditions of certification, would have adverse but less-than-significant visual impacts.

Impacts of the Reduced Acreage Alternative, with staff-recommended conditions of certification, would also have less-than-significant visual impacts. However, the degree and extent of those impacts would be substantially less than those of the Proposed Project.

Impacts of the Dry Cooling Alternative, with staff-recommended conditions of certification, would be substantially similar to the Proposed Project and would also have less-than-significant visual impacts. The Dry Cooling Alternative could be somewhat superior to the Proposed Project due to a lower incidence of visible vapor plumes.

The anticipated visual impacts of the Proposed Project, Reduced Acreage, and Dry Cooling Alternatives, in combination with past and foreseeable future local projects in the Chuckwalla Valley, and past and foreseeable future region-wide projects in the southern California desert are considered cumulatively considerable and potentially significant.

All action alternatives studied, with staff-recommended conditions of certification, would conform with all applicable Laws, Ordinances, Regulations and Standards (LORS).

C.12.12 MITIGATION MEASURES/PROPOSED CONDITIONS OF CERTIFICATION/APPROVAL

SURFACE TREATMENT OF NON-MIRROR PROJECT STRUCTURES AND BUILDINGS

VIS-1 The project owner shall treat all non-mirror surfaces of all project structures and buildings visible to the public such that a) their colors minimize visual intrusion and contrast by blending with the existing dark brown color of the background bajadas and mountain slopes as seen from the highway or, in the case of foreground transmission poles, the lighter tan color of the valley floor; b) their colors and finishes do not create excessive glare; and c) their colors and finishes are consistent with local policies and ordinances. The transmission line conductors shall be non-specular and non-reflective, and the insulators shall be non-reflective and non-refractive. This measure shall include coloring of security fencing with vinyl or other non-reflective coating; or with slats or similar semi-opaque, non-reflective material, to blend to the greatest feasible extent with the background soil.

The project owner shall submit for CPM and BLM Authorized Officer review and approval, a specific Surface Treatment Plan that will satisfy these requirements. The treatment plan shall include:

A. A description of the overall rationale for the proposed surface treatment, including the selection of the proposed color(s) and finishes;

B. A list of each major project structure, building, tank, pipe, and wall; the transmission line towers and/or poles; and fencing, specifying the color(s) and finish proposed for each. Colors must be identified by vendor, name, and number; or according to a universal designation system;

C. One set of color brochures or color chips showing each proposed color and finish;

D. A specific schedule for completion of the treatment; and

E. A procedure to ensure proper treatment maintenance for the life of the project.

The project owner shall not specify to the vendors the treatment of any buildings or structures treated during manufacture, or perform the final treatment on any buildings or structures treated in the field, until the project owner receives notification of approval of the treatment plan by BLM's Authorized Officer and the CPM. Subsequent modifications to the treatment plan are prohibited without BLM's Authorized Officer and CPM approval.

Verification: At least 90 days prior to specifying to the vendor the colors and finishes of the first structures or buildings that are surface treated during manufacture,

the project owner shall submit the proposed treatment plan to BLM's Authorized Officer and the CPM for review and approval and simultaneously to San Bernardino County for review and comment. If BLM's Authorized Officer and the CPM determine that the plan requires revision, the project owner shall provide to BLM's Authorized Officer and the CPM a plan with the specified revision(s) for review and approval by BLM's Authorized Officer and the CPM before any treatment is applied. Any modifications to the treatment plan must be submitted to BLM's Authorized Officer and the CPM for review and approval.

Prior to the start of commercial operation, the project owner shall notify BLM's Authorized Officer and the CPM that surface treatment of all listed structures and buildings has been completed and they are ready for inspection and shall submit to each one set of electronic color photographs from the same key observation points identified in (d) above. The project owner shall provide a status report regarding surface treatment maintenance in the Annual Compliance Report. The report shall specify a): the condition of the surfaces of all structures and buildings at the end of the reporting year; b) maintenance activities that occurred during the reporting year; and c) the schedule of maintenance activities for the next year.

TEMPORARY AND PERMANENT EXTERIOR LIGHTING

VIS-2 To the extent feasible, consistent with safety and security considerations, the project owner shall design and install all permanent exterior lighting and all temporary construction lighting such that a) lamps and reflectors are not visible from beyond the project site, including any off-site security buffer areas; b) lighting does not cause excessive reflected glare; c) direct lighting does not illuminate the nighttime sky, except for required FAA aircraft safety lighting; d) illumination of the project and its immediate vicinity is minimized, and e) the plan complies with local policies and ordinances. The project owner shall submit to BLM's Authorized Officer and the CPM for review and approval and simultaneously to the County of San Bernardino for review and comment a lighting mitigation plan that includes the following:

A. Location and direction of light fixtures shall take the lighting mitigation requirements into account;

B. Lighting design shall consider setbacks of project features from the site boundary to aid in satisfying the lighting mitigation requirements;

C. Lighting shall incorporate fixture hoods/shielding, with light directed downward or toward the area to be illuminated;

D. Light fixtures that are visible from beyond the project boundary shall have cutoff angles that are sufficient to prevent lamps and reflectors from being visible beyond the project boundary, except where necessary for security;

E. All lighting shall be of minimum necessary brightness consistent with operational safety and security; and

F. Lights in high illumination areas not occupied on a continuous basis (such as maintenance platforms) shall have (in addition to hoods) switches, timer switches, or motion detectors so that the lights operate only when the area is occupied. To the greatest feasible extent, project lighting shall be used on an 'as needed' basis and turned off at other times.

Verification: At least 90 days prior to ordering any permanent exterior lighting or temporary construction lighting, the project owner shall contact BLM's Authorized Officer and the CPM to discuss the documentation required in the lighting mitigation plan. At least 60 days prior to ordering any permanent exterior lighting, the project owner shall submit to BLM's Authorized Officer and the CPM for review and approval and simultaneously to the County of San Bernardino for review and comment a lighting mitigation plan. If BLM's Authorized Officer and the CPM determine that the plan requires revision, the project owner shall provide to BLM's Authorized Officer and the CPM a revised plan for review and approval by BLM's Authorized Officer and the CPM.

The project owner shall not order any exterior lighting until receiving BLM Authorized Officer and CPM approval of the lighting mitigation plan.

Prior to commercial operation, the project owner shall notify BLM's Authorized Officer and the CPM that the lighting has been completed and is ready for inspection. If after inspection, BLM's Authorized Officer and the CPM notify the project owner that modifications to the lighting are needed, within 30 days of receiving that notification the project owner shall implement the modifications and notify BLM's Authorized Officer and the CPM that the modifications have been completed and are ready for inspection.

Within 48 hours of receiving a lighting complaint, the project owner shall provide BLM's Authorized Officer and the CPM with a complaint resolution form report as specified in the Compliance General Conditions including a proposal to resolve the complaint, and a schedule for implementation. The project owner shall notify BLM's Authorized Officer and the CPM within 48 hours after completing implementation of the proposal. A copy of the complaint resolution form report shall be submitted to BLM's Authorized Officer and the CPM within 30 days.

RE-ALIGNMENT AND VISUAL MITIGATION OF PROPOSED TRANSMISSION INTERCONNECTION

VIS-3 To reduce the prominence of the proposed new segment of transmission line paralleling Highway I-10, the applicant shall set back the transmission line at least 1/2 mile from Highway I-10. In addition, to reduce contrast and prominence of the transmission line, lattice-style transmission towers shall be utilized, and painted in non-reflective natural tones to blend with the visual background. Re-alignment of the transmission line shall be consistent with any cultural or biological constraints identified in those portions of this Staff Assessment/DEIS. In the event of conflict, cultural or biological constraints shall prevail.

Verification: At least 90 days prior to start of construction, the project owner shall present to BLM's Authorized Officer and the CPM a revised plan depicting how the proposed transmission line will be set back from the highway, and depicting scaled

architectural elevations of lattice transmission towers to be used. If BLM's Authorized Officer and the CPM determine that the plan requires revision, the project owner shall provide to BLM's Authorized Officer and the CPM a revised plan for review and approval by BLM's Authorized Officer and the CPM.

The project owner shall not begin construction until receiving BLM Authorized Officer and CPM approval of the revised plan.

REFLECTIVE GLARE MITIGATION

VIS-4 In order to reduce brightness of spread reflections of the sun to off-site viewers, the perimeter chain link fencing proposed by Applicant shall include opaque privacy slats of a minimum 10 feet in height. The slats shall be of a dark tan or earth-tone color selected to blend with the visual background of the site.

Verification: At least 90 days prior to start of construction, the project owner shall present to BLM's Authorized Officer and the CPM a glare mitigation plan describing the fencing measures and materials proposed for mitigating off-site glare. The plan shall include color samples of slatted fencing proposed for use. If BLM's Authorized Officer and the CPM determine that the plan requires revision, the project owner shall provide to BLM's Authorized Officer and the CPM a revised plan for review and approval by BLM's Authorized Officer and the CPM.

The project owner shall not begin construction until receiving BLM Authorized Officer and CPM approval of the revised plan.

Within 48 hours of receiving a glare complaint, the project owner shall provide the BLM Authorized Officer and CPM with a complaint resolution form report as specified in the Compliance General Conditions including a proposal to resolve the complaint, and a schedule for implementation. The project owner shall notify the BLM Authorized Officer and CPM within 48 hours after completing implementation of the proposal. A copy of the complaint resolution form report shall be submitted to the BLM Authorized Officer and CPM within 30 days

VISUAL MITIGATION AND RE-VEGETATION OF STAGING AREA

VIS-5 In order to minimize the visual prominence of the proposed staging area to visitors at Wiley's Well Rest Area on I-10, the project owner shall provide a revised site plan for staging that includes screening of the proposed laydown area with earth berms, opaque fencing, and/or other measures to minimize visibility from within the main rest area, and restoration and revegetation of the laydown area after completion of construction. The revised staging plan shall be consistent with any cultural or biological resource constraints identified elsewhere in this Staff Assessment/DEIS. Restoration shall include re-grading to original contours in order to appear natural and undisturbed; revegetation shall employ appropriate locally native species only, again in accordance with conditions identified in the cultural and biological resource analyses of this report. The project owner shall provide a re-vegetation plan describing how the staging site will be restored following construction. The

plan shall call for beginning of restoration of the site within the shortest feasible time following completion of construction.

Verification: At least 90 days prior to start of construction, the project owner shall present to BLM's Authorized Officer and the CPM a revised staging area site plan. If BLM's Authorized Officer and the CPM determine that the plan requires revision, the project owner shall provide to BLM's Authorized Officer and the CPM a revised plan for review and approval by BLM's Authorized Officer and the CPM. The project owner shall not begin construction until receiving BLM Authorized Officer and CPM approval of the revised plan.

At least 60 days prior to start of operation, the project owner shall present to BLM's Authorized Officer and the CPM a revegetation plan for the staging area. If BLM's Authorized Officer and the CPM determine that the plan requires revision, the project owner shall provide to BLM's Authorized Officer and the CPM a revised plan for review and approval by BLM's Authorized Officer and the CPM. The project owner shall not begin operation until receiving BLM Authorized Officer and CPM approval of the revised plan.

REDUCTION OF FORM, LINE, AND TEXTURE CONTRAST

VIS-6 To the extent possible, the project owner will use applicable design principles to reduce the visual contrast of the project with the characteristic landscape. These include proper siting and location; reduction of visibility; repetition of form, line, color (see VIS-1) and texture of the landscape; and reduction of unnecessary disturbance. Design strategies to address these fundamentals will be based on the following factors:

Earthwork: Select locations and alignments that fit into the landforms to minimize the size of cuts and fills. Avoid hauling in or hauling out of excess earth cut or fill. Avoid rounding and/or warping slopes. Retain existing rock formations, vegetation, and drainage. Tone down freshly broken rock faces with emulsions or stains. Use retaining walls to reduce the amount and extent of earthwork. Retain existing vegetation by using retaining walls or fill slopes, reducing surface disturbance, and protecting roots from damage during excavations. Avoid soil types that generate strong color contrasts. Reduce dumping or sloughing of excess earth and rock on downhill slopes.

Vegetation Manipulation: Retain as much of the existing vegetation as possible. Use existing vegetation to screen the development from public viewing. Use scalloped, irregular cleared edges to reduce line contrast. Use irregular clearing shapes to reduce form contrast. Feather and thin the edges of cleared areas and retain a representative mix of plant species and sizes.

Structures: Minimize the number of structures and combine different activities in one structure. Use natural, self-weathering materials and chemical treatments on surfaces to reduce color contrast. Bury all or part of the structure. Use natural appearing forms to complement the characteristic landscape. Screen the structure from view by using natural land forms and vegetation. Reduce the line contrast created by straight edges.

Linear Alignments: Use existing topography to hide induced changes associated with roads, lines, and other linear features. Select alignments that follow landscape contours. Avoid fall-line cuts and bisecting ridge tops. Hug vegetation lines and avoid open areas such as valley bottoms. Cross highway corridors at less sharp angles.

Reclamation and Restoration: Reduce the amount of disturbed area and blend the disturbed areas into the characteristic landscape. Replace soil, brush, rocks, and natural debris over disturbed area. Newly introduce plant species should be of a form, color, and texture that blends with the landscape.

Verification: As early as possible in the site and facility design, the project owner shall meet with BLM's Authorized Office and the CPM to discuss incorporation of these above factors into the design plans. At least 90 days prior to final site and facility design, the project owner shall contact BLM's Authorized Officer and the CPM to review the incorporation of the above factors into the final facility and site design plans. If BLM's Authorized Officer and the CPM determine that the site and facility plans require revision, the project owner shall provide to BLM's Authorized Officer and the CPM a revised plan for review and approval by BLM's Authorized Officer and the CP.

APPENDIX VR-1

STAFF'S VISUAL RESOURCES EVALUATION METHODOLOGY

Staff evaluates the visual characteristics of the existing physical setting, the proposed project, the circumstances affecting the viewer, and the degree of visual change that a proposed project may introduce using the elements generally accepted criteria for determining substantial environment impact significance identified below.

ELEMENTS OF THE METHODOLOGY

Key Observation Points

Staff evaluates the existing visible physical environmental setting from a fixed vantage point, called a *key observation point* (KOP) that provides a view of the visual change introduced by the proposed project to the view from that KOP. The view as seen from the KOP is referred to as the *viewshed*. Staff uses a KOP[1] to represent a location(s) from which to conduct detailed analyses of the proposed project and to obtain existing condition photographs and prepare photo simulations. KOPs are selected to be representative of the most critical viewshed locations from which the project would be seen. Because it is not feasible to analyze all the views in which a proposed project would be seen, it is necessary to select a KOP that would most clearly display the visual effects of the proposed project. A KOP may also represent primary viewer groups that would potentially be affected by the project. In addition to KOP photo(s), staff reviews landscape character photos that help provide a visual overview of a project site, its vicinity, and the selected KOP area, as appropriate. Prior to application submittal, staff participates in the selection of appropriate KOP(s) for the analysis.

LORS Consistency

Energy Commission staff considers federal, state, and local laws, ordinances, regulations, and standards (LORS) relevant to aesthetics or protection and preservation of visual sensitive resources. Conflicts with such LORS can constitute significant visual impacts. For example, visual staff examines land use planning documents, such as a local government's General Plan, Specific Plan, and zoning ordinances applicable to the project site and surrounding area to gain insight as to the type of land uses intended for the area, and the guidelines given for aesthetics, or protection and preservation of visual sensitive resources.

California Environmental Quality Act Guidelines

The CEQA Guidelines define a "significant effect on the environment" to mean a "substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including . . . objects of historic or aesthetic significance" (California Code of Regulations, Title 14, section 15382).

[1]The use of KOPs or similar view locations is common in visual resource analysis. The U.S. Bureau of Land Management (USDI BLM 1986a, 1986b, 1984) and the U.S. Forest Service (USDA Forest Service 1995) use such an approach.

Appendix G Environmental Checklist Form of the CEQA Guidelines, under “Aesthetics,” lists the following four questions to be addressed regarding whether the potential impacts of a project are significant:

A. Would the project have a substantial adverse effect on a scenic vista?

B. Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

C. Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

D. Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Staff answers each of the four checklist questions for the proposed project, including any related facility such as a transmission line or gas pipeline, for both construction and operation phases.

Visible Water Vapor Plume Frequency

When a proposed power plant is operated at times of low temperature and highhumidity, the potential exists for the exhaust from its cooling towers to condense and water vapor plumes (steam plume). The formed plume potentially could have an adverse effect on visual sensitive resources in the vicinity of the project.

The severity of the visual impacts created by a project’s visible plumes depends on fivefactors: 1) the frequency of the plumes, 2) the physical size of the plumes (dimensions), 3) the sensitivity of the viewers who would see the plumes, 4) the distance between the plumes and the viewers, 5) the visual quality of the existing viewshed; and, 6) whether a scenic resource or vista would be blocked by the plumes.

Staff completes water vapor plume modeling of the proposed project’s cooling towers using design parameters provided by the applicant. Staff models the estimated plume frequency and dimensions for the cooling tower and turbine exhaust using the Combustion Stack Visible Plume (CSVP) model, and a multi-year meteorological data set obtained for the area where the project is proposed.

dimensions on which to base its visual impact analysis. The 20_{th} percentile plume is the smallest of the plumes that are predicted to occur zero to 20% of the time. Eighty (80) percent of the time the dimensions of the clear hour plumes would be smaller than the 20_{th} percentile plume dimensions. A one percentile clear hour plume would be extremely large, very noticeable to a wide area, but would occur very infrequently.

Staff focuses its frequency of the plumes analysis on the portion of the year when the ambient conditions (i.e., cool/cold temperatures and high relative humidity) are such that plumes are most likely to occur (typically from November through April) and when “clear” sky conditions exist because this is when the plumes would cause the most visual contrast with the sky and have the greatest potential to cause adverse visual impacts. Staff eliminates from consideration plumes that occur at night or during rain or

fog conditions because plume visibility, and overall visual quality, is typically low during those conditions. In addition, plumes that occur during specific cloudy conditions are also eliminated because under these conditions, plumes have less contrast with the background sky. A plume frequency of 20% of seasonal daylight no rain/fog high visual contrast (i.e. “clear”) hours is used to determine potential plume impact significance. If it is determined that the seasonal daylight clear hour plume frequency is greater than 20%, then plume dimensions are determined and a significance analysis is included in the Visual Resources section of the Staff Assessment for the proposed project.

Plume frequencies of less than 20% have been determined to generally have a less than significant impact. If the modeling predicts seasonal daylight clear plume frequencies greater than 20%, staff calculates the dimensions of the clear hour plumes and then conduct an assessment of the visual change (in terms of contrast, dominance and view blockage) that would be caused by the 20th percentile plume dimensions. Staff also analyzes the predicted plume’s potential luminescence (light refraction resulting in a glare or glow) and color contrast, and opacity (the degree to which light is prevented from passing through an emission plume) that may be introduced to the KOP view sheds. Considering the visual sensitivity of the existing landscape and viewing characteristics, the degree of visual change caused by the plumes may result in a significant visual impact.

Appendix VR-2: Visible Plume Modeling Analysis

William Walters

INTRODUCTION

The following provides the assessment of the Genesis Solar Project (Genesis) cooling tower exhaust stack visible plumes. Staff completed a modeling analysis for the applicant's proposed unabated cooling tower design.

PROJECT DESCRIPTION

The proposed project is a thermal solar design that requires cooling to condense the steam that is recycled. The applicant has proposed two seven-cell mechanical-draft cooling towers for project cooling. The applicant has not proposed to use any methods to abate visible plumes from the cooling towers.

The applicant has also proposed two small (30 MMBtu/hr) boilers that will be used for daily start-up and for freeze protection. Each of these boilers will be operated for a maximum of 14 hours per day, and 1,000 hours per year. During cold weather periods, such as their use during start-up and for freeze protection in winter these boilers are likely to have visible plumes. However, due to their very small size the boiler plumes are not believed to create a potentially significant visual impact and are not assessed further in this analysis.

VISIBLE PLUME MODELING METHODS

PLUME FREQUENCY AND DIMENSION MODELING

The Combustion Stack Visible Plume (CSVP) model was used to estimate plume frequency and plume dimensions for the cooling tower exhaust. This model provides conservative estimates of both plume frequency and plume size. This model uses hourly cooling tower exhaust parameters and hourly ambient condition data to determine the plume frequency. This model is based on the algorithms of the Industrial Source Complex model (Version 2), that determine temperatures at the plume centerline, but this model does not incorporate building downwash.

The modeling method combines the cooling tower cell exhausts into an equivalent single stack. This method may overestimate cooling tower plume size (particularly height) during plume hours with higher winds perpendicular to the length of the tower due to little cell interaction and the potential for building downwash, but will be more accurate during low wind and calm periods when the exhausts from the cooling tower cells will combine into one coherent body. Wind speeds are set to 1 m/s during calm hours in the modeling analysis.

CLOUD COVER DATA ANALYSIS METHOD

A plume frequency of 20 percent of seasonal (November through April) daylight high visual contrast (i.e. “clear”) hours is used to determine potential plume impact significance. The methodology used to determine high visual contrast hours is provided below:

> The Energy Commission has identified a “clear” sky category during which visible plumes have the greatest potential to cause adverse visual impacts. For this project the meteorological data set[2] used in the analysis categorizes sky cover in 10 percent increments. Staff has included in the “Clear” category a) all hours with sky cover equal to or less than 10 percent plus b) half of the hours with total sky cover 20-90 percent. The rationale for including these two components in this category is as follows: a) visible plumes typically contrast most with sky under clear conditions and, when total sky cover is equal to or less than 10 percent, clouds either do not exist or they make up such a small proportion of the sky that conditions appear to be virtually clear; and b) for a substantial portion of the time when total sky cover is 20-90 percent the opacity of sky cover is relatively low (equal to or less than 50 percent), so this sky cover does not always substantially reduce contrast with visible plumes; staff has estimated that approximately half of the hours meeting the latter sky cover criteria can be considered high visual contrast hours and are included in the “clear” sky definition.

If it is determined that the seasonal daylight clear hour plume frequency is greater than 20 percent then plume dimensions are calculated, and a significance analysis of the plumes is included in the Visual Resources section of the Staff Assessment.

COOLING TOWER VISIBLE PLUME MODELING ANALYSIS

COOLING TOWER DESIGN AND OPERATING PARAMETERS

The cooling tower design characteristics were determined through a review of the applicant’s AFC (Genesis 2009a), the air quality and visible plume modeling files (Darvin 2010a), and additional data provided by the applicant to estimate daily and seasonal cooling tower operations (Tetra Tech 2010a, Worley Parsons 2010a). The applicant’s cooling tower physical design parameters are presented in **Visible Plume Table 1**.

[2] This analysis uses meteorological data provided by the applicant. Three years of meteorological data (1989-1991) are collected from the Blythe monitoring station.

Visible Plume Table 1
Cooling Tower Physical Design Parameters

Parameter	Cooling Tower Design Parameters
Number of Cells per Tower	7 Cells (Linear Design)
Cell Height	45.3 feet (13.81 meters)
Cell Stack Diameter	31.6 feet (9.64 meters)
Tower Housing Length	294.7 feet (89.8 meters)
Tower Housing Width	42.7 feet (13.01 meters)

Source: GSEP 2010a

The applicant provided estimated average heat load data for each hour of each month (Tetra Tech 2010a), as shown in **Visible Plume Table 2**. All hours not shown in this table are assumed to have zero cooling load. The applicant provided assumptions on the numbers of cells in operation based on percentage of full heat load (Worley Parsons 2010a). Using this data staff estimated the number of cells in operation for each hour of each month, as shown in **Visible Plume Table 3**.

Visible Plume Table 2
Cooling Tower Average Heat Load per Hour for Each Month

18:00					4	6	5	4	2			

Source: Staff Interpolation based on cooling tower average heat load per hour of each month (Tetra Tech 2010a) and the number of cells in operation corresponding to the percentage of heat load, provided by the applicant (Worley Parsons 2010a).

The cooling tower operation for this project is significantly different than the dozens of cooling towers evaluated for siting cases from 2001 to present. Specifically, the heat rejection load to the cooling tower is specifically related to the sun angle (time of day and year) that impacts the total power production capacity of the facility. Therefore, the cooling tower operation starts at low heat rejection loads each morning and building until the afternoon when the heat rejection load drops as the sun sets. Staff has attempted to mimic, in a simple and conservative way, the complex operating profile of the cooling tower exhaust modeling inputs. Additionally, the hourly cooling tower exhaust conditions are interpolated for the hourly ambient conditions (temperature and relative humidity) based on the assumed heat rejection for each operating cooling tower cell.

COOLING TOWER VISIBLE PLUME MODELING RESULTS

Visible Plume Table 5 provides the CSVP model visible plume frequency results for daytime operations using a three-year (1989 to 1991) meteorological data set compiled from the Blythe monitoring station.

Visible Plume Table 5
Predicted Hours with Cooling Tower Visible Plumes
Blythe 1989-1991 Meteorological Data

Case	Available (hr)	Plume (hr)	Percent
All Hours	26,280	1,189	4.52%
Daylight Hours	13,425	903	6.73%
Daylight No Rain No Fog	13,260	848	6.39%
Seasonal Daylight No Rain No Fog*	5,967	689	11.50%
Seasonal Daylight Clear*	4,145	395	10.75%

*Seasonal conditions occur during November through April.

The results noted above are based on the data and assumptions shown in **Visible Plume Tables 2** through **4**, and do not include night time operation as the heat load for the cooling tower is a function of the solar radiation.

A visible plume frequency of 20 percent of seasonal (November through April) daylight clear hours is used as a plume impact study threshold trigger, therefore plume dimension modeling and additional impact analysis for the cooling tower visible plumes is not required for this project.

APPLICANT'S PLUME ANALYSIS

The applicant prepared a plume modeling analysis using the Seasonal/Annual Cooling Tower Impact (SACTI) model. Due to the way the SACTI model over simplifies the modeling by only allowing one operating case to be modeled at a time and its grouping of the hourly meteorological data into a couple dozen cases, among a few other significant issues, staff does not use this model for plume frequency and size prediction.

Staff did not find any significant issues with the applicant's SACTI model inputs (Darvin 2010a). However, the applicant's SACTI modeling analysis conservatively assumed high heat rejection and cooling tower cell use for all hours, which would over predict cooling tower plume frequency and size. Therefore, staff has not compared the applicant's plume modeling results with staff's CSVP plume modeling results.

GROUND FOGGING ANALYSIS

Staff also reviewed the applicant's ground fogging modeling results, which is part of the output from the applicant's SACTI modeling analysis. Using very conservative operating assumptions, ground fogging was predicted to occur less than two hours during the three years of meteorological data modeled, and only extend 300 meters from the cooling tower. This is a very low frequency for ground fogging potential and there are no public roads that could be impacted with these ground fogging plumes. Therefore, the proposed project cooling towers would not cause ground traffic safety impacts on public roads.

CONCLUSIONS

Visible water vapor plumes from the proposed Genesis Solar cooling tower would not occur more than 20 percent of seasonal daylight clear hours. Therefore plume dimension modeling and additional impact analysis for the cooling tower visible plumes is not required for this project.

The ground fogging plume analysis indicates that the cooling tower will only create minimal hours of the ground fogging plume that would not impact any public roads. Therefore, there would be no impact on ground traffic safety.

Due to their small size and limited operation significant visible water vapor plumes are not expected from the two small Genesis auxiliary boilers.

C.13 - WASTE MANAGEMENT

Testimony of James Thurber

C.13.1 SUMMARY OF CONCLUSIONS

U.S. Bureau of Land Management (BLM) and the California Energy Commission staff (hereafter jointly referred to as staff) conclude that management of the waste generated during construction, operation, and closure/decommissioning of the Genesis Solar Energy Project (GSEP) would not result in any significant adverse impacts under CEQA or NEPA, and would comply with applicable waste management laws, ordinances, regulations, and standards if the measures proposed in the Application for Certification (AFC) and staff's proposed conditions of certification are implemented. Conditions of Certification referred to herein serve the purpose of both the Energy Commission's Conditions of Certification for purposes of the California Environmental Quality Act (CEQA) and BLM's Mitigation Measures for purposes of the national Environmental Policy Act (NEPA).

C.13. INTRODUCTION

This Staff Assessment/Draft Environmental Impact Statement (SA/DEIS) presents an analysis of issues associated with wastes generated from the proposed construction and operation of the GSEP. The technical scope of this analysis encompasses solid wastes existing on site and those to be generated during facility construction and operation. Management and discharge of wastewater is addressed in the **Soil and Water Resources** section of this document. Additional information related to waste management may also be covered in the **Worker Safety** and **Hazardous Materials Management** sections of this document.

The Energy Commission and BLM's staff's objectives in conducting this waste management analysis are to ensure that:

- the management of project wastes would be in compliance with all applicable laws, ordinances, regulations, and standards (LORS). Compliance with LORS ensures that wastes generated during the construction and operation of the proposed project would be managed in an environmentally safe manner.
- the disposal of project wastes would not result in significant adverse impacts to existing waste disposal facilities.
- during project construction, operation, and closure/decommissioning the site is managed in such a way that project wastes and waste constituents would not pose a significant risk to humans or the environment.

C.13.3 METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

The analysis of the proposed project effects must comply with both CEQA and NEPA requirements given the respective power plant licensing and land jurisdictions of the California Energy Commission and U.S. Bureau of Land Management (BLM). CEQA requires that the significance of individual effects be determined by the Lead Agency; however, the use of specific significance criteria is not required by NEPA.

Because this document is intended to meet the requirements of both NEPA and CEQA, the methodology used for determining environmental impacts of the proposed project includes a consideration of guidance provided by both laws.

CEQA requires a list of criteria that are used to determine the significance of identified impacts. A significant impact is defined by CEQA as "a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project" (State CEQA Guidelines Section 15382).

In comparison, the Council on Environmental Quality Regulations for Implementing the Procedural Provisions of the NEPA (CEQ NEPA Regulations) states that "'Significantly' as used in NEPA requires considerations of both context and intensity…" (40 CFR 1508.27). Therefore, thresholds serve as a benchmark for determining if a project action will result in a significant adverse environmental impact when evaluated against the baseline. CEQA NEPA Regulations requires that an Environmental Impact Statement (EIS) be prepared when a proposed major federal action (project) as a whole has the potential to "significantly affect the quality of the human environment."

Thresholds for determining significance in this section are based on Appendix G of the CEQA Guidelines (CCR 2006) and performance standards or thresholds identified by the Energy Commission staff. In addition, staff's evaluation of the environmental effects of the proposed project on waste management (i.e., those listed below) includes an assessment of the context and intensity of the impacts, as defined in the NEPA implementing regulations 40 CFR Part 1508.27.

The following federal, state, and local environmental laws, ordinances, regulations, and standards (LORS) have been established to ensure the safe and proper management of both solid and hazardous wastes in order to protect human health and the environment. Project compliance with the various LORS is a major component of staff's determination regarding the significance and acceptability of the GSEP with respect to management of waste. Absent any unusual circumstances, staff considers project compliance with LORS to be sufficient to ensure that no significant impacts would occur as a result of project waste management.

WASTE MANAGEMENT Table 1
Laws, Ordinances, Regulations, and Standards (LORS)

Applicable LORS	Description
Federal	
Title 42, United States Code, §§ 6901, et seq. Solid Waste Disposal Act of 1965 (as amended and revised by the Resource Conservation and Recovery Act of 1976, et al.)	The Solid Waste Disposal Act, as amended and revised by the Resource Conservation and Recovery Act (RCRA) et al., establishes requirements for the management of solid wastes (including hazardous wastes), landfills, underground storage tanks, and certain medical wastes. The statute also addresses program administration, implementation, and delegation to states, enforcement provisions, and responsibilities, as well as research, training, and grant funding provisions. RCRA Subtitle C establishes provisions for the generation, storage, treatment, and disposal of hazardous waste, including requirements addressing: • Generator record keeping practices that identify quantities of hazardous wastes generated and their disposition; • Waste labeling practices and use of appropriate containers; • Use of a manifest when transporting wastes; • Submission of periodic reports to the United States Environmental Protection Agency (U.S. EPA) or other authorized agency; and • Corrective action to remediate releases of hazardous waste and contamination associated with RCRA-regulated facilities. RCRA Subtitle D establishes provisions for the design and operation of solid waste landfills. RCRA is administered at the federal level by U.S. EPA and its 10 regional offices. The Pacific Southwest regional office (Region 9) implements U.S. EPA programs in California, Nevada, Arizona, and Hawaii.
Title 42, United States Code, §§ 9601, et seq. Comprehensive Environmental Response, Compensation and Liability Act	The Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), also known as Superfund, establishes authority and funding mechanisms for cleanup of uncontrolled or abandoned hazardous waste sites, as well as cleanup of accidents, spills, or emergency releases of pollutants and contaminants into the environment. Among other things, the statute addresses: • Reporting requirements for releases of hazardous substances; • Requirements for remedial action at closed or abandoned hazardous waste sites, and brownfields; • Liability of persons responsible for releases of hazardous substances or waste; and • Requirements for property owners/potential buyers to conduct “all appropriate inquiries” into previous ownership and uses of the property to 1) determine if hazardous substances have been or may have been released at the site, and 2) establish that the owner/buyer did not cause or contribute to the release. A Phase I Environmental Site Assessment is commonly used to satisfy

Applicable LORS	Description
	CERCLA “all appropriate inquiries” requirements.
Title 40, Code of Federal Regulations (CFR), Subchapter I – Solid Wastes	These regulations were established by U.S. EPA to implement the provisions of the Solid Waste Disposal Act and RCRA (described above). Among other things, the regulations establish the criteria for classification of solid waste disposal facilities (landfills), hazardous waste characteristic criteria and regulatory thresholds, hazardous waste generator requirements, and requirements for management of used oil and universal wastes. • Part 246 addresses source separation for materials recovery guidelines. • Part 257 addresses the criteria for classification of solid waste disposal facilities and practices. • Part 258 addresses the criteria for municipal solid waste landfills. • Parts 260 through 279 address management of hazardous wastes, used oil, and universal wastes (i.e., batteries, mercury-containing equipment, and lamps). U.S. EPA implements the regulations at the federal level. However, California is an authorized state so most of the solid and hazardous waste regulations are implemented by state agencies and authorized local agencies in lieu of U.S. EPA.
Title 49, CFR, Parts 172 and 173 Hazardous Materials Regulations	U.S. Department of Transportation established standards for transport of hazardous materials and hazardous wastes. The standards include requirements for labeling, packaging, and shipping of hazardous materials and hazardous wastes, as well as training requirements for personnel completing shipping papers and manifests. Section 172.205 specifically addresses use and preparation of hazardous waste manifests in accordance with Title 40, CFR, Section 262.20.
Clean Water Act (CWA)	Controls discharge of wastewater to the surface waters of the U.S. Genesis Solar Energy Project will discharge sanitary wastewater to one onsite septic tank and leach field wastewater treatment system that will comply with CWA requirements.
State	
California Health and Safety Code, Chapter 6.5, §§ 25100, et seq. Hazardous Waste Control Act of 1972, as amended	This California law creates the framework under which hazardous wastes must be managed in California. The law provides for the development of a state hazardous waste program that administers and implements the provisions of the federal RCRA program. It also provides for the designation of California-only hazardous wastes and development of standards (regulations) that are equal to or, in some cases, more stringent than federal requirements. The California Environmental Protection Agency (Cal/EPA), Department of Toxic Substances Control (DTSC) administers and implements the provisions of the law at the state level. Certified Unified Program Agencies (CUPAs) implement some elements of the law at the local level.
Title 22, California Code of Regulations (CCR),	These regulations establish requirements for the management and disposal of hazardous waste in accordance with the provisions of the California Hazardous Waste Control Act and federal RCRA. As with the federal requirements, waste generators must determine if their wastes

Applicable LORS	Description
Division 4.5 Environmental Health Standards for the Management of Hazardous Waste	are hazardous according to specified characteristics or lists of wastes. Hazardous waste generators must obtain identification numbers, prepare manifests before transporting the waste off site, and use only permitted treatment, storage, and disposal facilities. Generator standards also include requirements for record keeping, reporting, packaging, and labeling. Additionally, while not a federal requirement, California requires that hazardous waste be transported by registered hazardous waste transporters. The standards addressed by Title 22, CCR include: • Identification and Listing of Hazardous Waste (Chapter 11, §§ 66261.1, et seq.) • Standards Applicable to Generators of Hazardous Waste (Chapter 12, §§ 66262.10, et seq.) • Standards Applicable to Transporters of Hazardous Waste (Chapter 13, §§ 66263.10, et seq.) • Standards for Universal Waste Management (Chapter 23, §§ 66273.1, et seq.) • Standards for the Management of Used Oil (Chapter 29, §§ 66279.1, et seq.) • Requirements for Units and Facilities Deemed to Have a Permit by Rule (Chapter 45, §§ 67450.1, et seq.) The Title 22 regulations are established and enforced at the state level by DTSC. Some generator standards are also enforced at the local level by CUPAs.
California Health and Safety Code, Chapter 6.11 §§ 25404– 25404.9 Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (Unified Program)	The Unified Program consolidates, coordinates, and makes consistent the administrative requirements, permits, inspections, and enforcement activities of the six environmental and emergency response programs listed below. • Aboveground Storage Tank Program • Business Plan Program • California Accidental Release Prevention (CalARP) Program • Hazardous Material Management Plan / Hazardous Material Inventory Statement Program • Hazardous Waste Generator / Tiered Permitting Program • Underground Storage Tank Program The state agencies responsible for these programs set the standards for their programs while local governments implement the standards. The local agencies implementing the Unified Program are known as Certified Unified Program Agencies (CUPAs). Riverside County Department of Environmental Health is the area CUPA. Note: The Waste Management analysis only considers application of the Hazardous Waste Generator/Tiered Permitting element of the Unified Program. Other elements of the Unified Program may be addressed in the **Hazardous Materials** and/or **Worker Health and Safety** analysis sections.

Applicable LORS	Description
Title 27, CCR, Division 1, Subdivision 4, Chapter 1, §§ 15100, et seq. Unified Hazardous Waste and Hazardous Materials Management Regulatory Program	While these regulations primarily address certification and implementation of the program by the local CUPAs, the regulations do contain specific reporting requirements for businesses. • Article 9 – Unified Program Standardized Forms and Formats (§§ 15400–15410). • Article 10 – Business Reporting to CUPAs (§§ 15600–15620).
Public Resources Code, Division 30, §§ 40000, et seq. California Integrated Waste Management Act of 1989	The California Integrated Waste Management Act of 1989 (CIWMA) (as amended) establishes mandates and standards for management of solid waste. Among other things, the law includes provisions addressing solid waste source reduction and recycling, standards for design and construction of municipal landfills, and programs for county waste management plans and local implementation of solid waste requirements.
Title 14, CCR, Division 7, § 17200, et seq. California Integrated Waste Management Board	These regulations further implement the provisions of the California Integrated Waste Management Act and set forth minimum standards for solid waste handling and disposal. The regulations include standards for solid waste management, as well as enforcement and program administration provisions. • Chapter 3 – Minimum Standards for Solid Waste Handling and Disposal. • Chapter 3.5 – Standards for Handling and Disposal of Asbestos • Containing Waste. • Chapter 7 – Special Waste Standards. • Chapter 8 – Used Oil Recycling Program. • Chapter 8.2 – Electronic Waste Recovery and Recycling.
California Health and Safety Code, Division 20, Chapter 6.5, Article 11.9, §25244.12, et seq. Hazardous Waste Source Reduction and Management Review Act of 1989 (also known as SB 14).	This law was enacted to expand the state's hazardous waste source reduction activities. Among other things, it establishes hazardous waste source reduction review, planning, and reporting requirements for businesses that routinely generate more than 12,000 kilograms (~ 26,400 pounds) of hazardous waste in a designated reporting year. The review and planning elements are required to be done on a 4-year cycle, with a summary progress report due to DTSC every 4th year.
Title 22, CCR,	These regulations further clarify and implement the provisions of the

Applicable LORS	Description
§67100.1 et seq. Hazardous Waste Source Reduction and Management Review.	Hazardous Waste Source Reduction and Management Review Act of 1989 (noted above). The regulations establish the specific review elements and reporting requirements to be completed by generators subject to the act.
Title 23, CCR Division 3, Chapters 16 and 18	These regulations relate to hazardous material storage and petroleum UST cleanup, as well as hazardous waste generator permitting, handling, and storage. The DTSC Riverside County CUPA is responsible for local enforcement.
California Fire Code	Controls storage of hazardous materials and wastes and the use and storage of flammable/combustible liquids. Waste will be accumulated and stored in accordance with Fire Code requirements. Permits for storage containers will be obtained, as needed, from the Riverside County Fire Department.
Local	
County of Riverside General Plan	The General Plan ensures all new development complies with applicable provisions of the County Integrated Solid Waste Management Plan. In addition, Safety Element, Policy S 6.1 describes the County's policies and siting criteria identified in the County of Riverside Hazardous Waste Management Plan including coordination of hazardous waste facility responsibilities on a regional basis through the Southern California Hazardous Waste Management Authority.
Riverside County Code Title 8 Chapters 8.60, 8.84, and 8.132, Health and Safety	Establishes requirements for the use, generation, storage, and disposal of hazardous and non-hazardous materials and wastes within the County.
Riverside County, Countywide Integrated Waste Management Plan	This document sets forth the county's goals, policies, and programs for reducing dependence on landfilling solid wastes and increasing source reduction, recycling, and reuse of products and waste, in compliance with the CIWMA. The plan also addresses the siting and development of recycling and disposal facilities and programs within the county.

C.13.4 PROPOSED PROJECT

C.13.4.1 SETTING AND EXISTING CONDITIONS

Proposed Project

The proposed GSEP site is approximately 4,640 acres of public land administered by the Bureau of Land Management (BLM). The project site is located in east Riverside County about 25 miles west of Blythe and 27 miles east of Desert Center. The completed site will occupy an estimated 1,800 acres at the main facility located approximately 2 miles north of Interstate 10 (I-10). An additional 90 acres of right-of-way is required for the linear facilities that extend south and east from the site to reach I-10; the transmission line will continue south of I-10 to connect with the Blythe Energy Project Transmission Line.

The Project is located in the central part of Chuckwalla Valley, an east-southeast trending valley that gently slopes southeast toward the Colorado River. The Project site lies on alluvial fans formed at the base of the Palen Mountains to the north and the McCoy Mountains to the east, and the eastern portion of the Project site is underlain by a broad valley-axial drainage that extends southward between these mountains and drains to the Ford Dry Lake playa located about one mile south of the Project site. The Project site is relatively flat and generally slopes from north to south with elevations of approximately 400 to 370 feet above mean sea level. The GSEP site is undeveloped desert with creosote and bursage scrub vegetation. The area has historically been used for both off-highway vehicle use and sheep grazing; however, neither activity currently occurs (GSEP 2009a). Historic military training is known to have occurred in the local area (General Patton's tank corps) and further east at Blythe Air Field.

The proposed project consists of two independent 125MW power blocks and solar collector fields designated Unit 1 and Unit 2. The two project power blocks and solar arrays will occupy about 1,360 acres. Physically between Unit 1 and Unit 2 will be two evaporation pond areas, a land treatment unit (LTU), and the administration and warehouse building. These areas along with access roads, ancillary facilities, and some open areas combine for the total 1,800 acre fenced area (GSEP 2009a). Construction parking, trailers, laydown areas, and solar collector assembly areas will be located within the project foot print.

The principal project elements include:

- Each solar collector field is made up of multiple single-axis-tracking parabolic trough solar collectors aligned on a north-south axis. Each solar collector has a parabolic-shaped reflector that focuses the sun's direct normal radiation on a receiver known as a heat collection element (HCE) located at the focal point of the parabola. The collectors track the sun from east to west during the diurnal cycle to ensure the sun is continuously focused on the HCE. The heat transfer fluid (HTF) is heated up to approximately 740°F as it circulates through the HCEs and returns to the solar steam generator (SSG) where the fluid is used to generate high-pressure steam. The north-south oriented multiple tracking parabolic solar collectors will occupy cover 1,360 acres.
- Each 125MW power block contains a solar steam generator (SSG), steam turbine generator (STG), wet cooling towers, natural gas-fired auxiliary boilers, HTF surge tanks, emergency diesel generators, raw and treated water storage tanks, demineralized waster storage tank, water treatment unit, and control/warehouse building.
- Two 24-acre double-lined (three 8-acre cells each) evaporation ponds for management of cooling tower blowdown water. The evaporation ponds will be permitted as Class II Surface Impoundments in accordance with requirements of the Colorado River Regional Water Quality Control Board (CRRWQCB) and the California Integrated Waste Management Board (CIWMB).
- One 10 acre land treatment unit (LTU) for bioremediation of HTF contaminated soil classified as non-hazardous (<10,000 mg/Kg). The unit will be designed and permitted as a Class II LTU in accordance with CRRWQCB and CIWMB requirements. Once the soil has been treated to a concentration of less than 100

mg/kg HTF, it will be moved from the LTU to another portion of the site until it is reused at the facility as fill material. Soil classified as hazardous (>10,000 mg/Kg HTF) will not be treated in the LTU but will be hauled to a Class I disposal facility.

- One on-site 230kV switchyard located near power block Unit 2 measuring 270 feet by 400 feet.
- An 8-mile long generation-tie (gen-tie) line will be routed in a southeasterly ROW eventually connecting to the proposed Southern California Edison (SoCal Edison) 500-230 kV Colorado River substation via the Blythe Energy Project Transmission Line (BEPTL).
- A 6-mile long natural gas supply line will serve the project from a SoCal Gas Company high-pressure pipeline located on the north side of I-10.
- On-site groundwater wells will supply the project and require on-site treatment consisting of a pre-treatment system upstream of the cooling tower, and a post-treatment system downstream of the cooling tower. Water treatment will include a multi-media filter (MMF) and two-stage reverse osmosis (RO) unit for pre-treatment upstream of the cooling tower. The waste stream from the MMF unit is discharged into the on-site evaporation ponds and the waste stream from the second RO unit is discharged into the wastewater storage tank. Post-treatment will also consist of an MMF and RO unit and the waste stream from the MMF and second RO unit will be discharged into the on-site evaporation ponds. Finally, treated water will be further processed through a mixed-bed demineralizer and used for the steam generator cycle and mirror washing.
- Approximately 26 miles of paved and unpaved site access roads.

Surrounding Area

The proposed project site is located in eastern Riverside County. The surrounding area consists of undeveloped desert land with the small rural community of Desert Center located 27 miles to the west and the larger city of Blythe located 25 miles to the east. Interstate 10 passes two miles south of the southernmost border of the project site and connects the project with the local communities.

The Palen/McCoy Wilderness Area lies adjacent to the north site boundary and the Ford Dry Lake lakebed is one mile to the south. The Ironwood and Chuckwalla State Prisons are located 9 miles southeast of the GSEP site.

C.13.4.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

This waste management analysis addresses: a) existing project site conditions and the potential for contamination associated with prior activities on or near the project site, and b) the impacts from the generation and management of wastes during project construction and operation.

Existing Project Site Conditions and Potential for Contamination

For any site in California proposed for the construction of a power plant, the applicant must provide documentation about the nature of any potential or existing releases of

hazardous substances or contamination at the site. If potential or existing releases or contamination at the site are identified, the significance of the release or contamination would be determined by site-specific factors, including, but not limited to: the amount and concentration of contaminants or contamination; the proposed use of the area where the contaminants/contamination is found; and any potential pathways for workers, the public, or sensitive species or environmental areas to be exposed to the contaminants. Any unmitigated contamination or releases of hazardous substances that pose a risk to human health or environmental receptors would be considered significant by Energy Commission staff.

As a first step in documenting existing site conditions, the Energy Commission's power plant site certification regulations require that a Phase I Environmental Site Assessment (ESA) be prepared[1] and submitted as part of an AFC. The Phase I ESA is conducted to identify any conditions indicative of releases and threatened releases of hazardous substances at the site and to identify any areas known to be contaminated (or a source of contamination) on or near the site.

In general, the Phase I ESA uses a qualified environmental professional to conduct inquiries into past uses and ownership of the property, research hazardous substance releases and hazardous waste disposal at the site and within a certain distance of the site, and visually inspect the property, making observations about the potential for contamination and possible areas of concern. After conducting all necessary file reviews, interviews, and site observations, the environmental professional then provides findings about the environmental conditions at the site. In addition, since the Phase I ESA does not include sampling or testing, the environmental professional may also give an opinion about the potential need for any additional investigation. Additional investigation may be needed, for example, if there were significant gaps in the information available about the site, an ongoing release is suspected, or to confirm an existing environmental condition.

If additional investigation is needed to identify the extent of possible contamination, a Phase II ESA may be required. The Phase II ESA usually includes sampling and testing of potentially contaminated media to verify the level of contamination and the potential for remediation at the site.

In conducting its assessment of a proposed project, staff will review the project's Phase I ESA and work with the appropriate oversight agencies as necessary to determine if additional site characterization work is needed and if any mitigation is necessary at the site to ensure protection of human health and the environment from any hazardous substance releases or contamination identified.

Impacts from Generation and Management of Wastes during Construction, Operation and Project Closure/Decommissioning

Regarding the management of project-related wastes generated during construction, operation, and closure/decommissioning of the proposed project, staff reviewed the

[1] Title 20, California Code of Regulations, section 1704(c) and Appendix B, section (g)(12)(A). Note that the Phase I ESA must be prepared according to American Society for Testing and Materials protocol or an equivalent method agreed upon by the applicant and the Energy Commission staff.

applicant's proposed solid and hazardous waste management methods and determined the methods proposed are consistent with the LORS identified for waste disposal and recycling. As mentioned previously, staff considers project compliance with LORS to be sufficient to ensure that no significant impacts would occur as a result of project waste management. Staff then reviewed the capacity available at off-site treatment and disposal sites and determined whether or not the proposed power plant's waste would impact the available capacity.

DIRECT/INDIRECT IMPACTS AND MITIGATION

Existing Site Conditions

A Phase I ESA, dated August 2009, was prepared by Tetra Tech EC, Inc., in accordance with the American Society for Testing and Materials Standard Practice E 1527-05 for ESAs. The Phase I ESA addressed conditions on portions or most of 13 sections in Township 6 South, Range 19 East, and parts of four sections in Township 6 South, Range 20 East; the Phase I ESA is included as Appendix F of the project's AFC. The ESA did not identify any Recognized Environmental Conditions (RECs) in connection with historic or current site operations. A REC is the presence or likely presence of any hazardous substances or petroleum products on a property under the conditions that indicate an existing release, past release, or a material threat of a release of any hazardous substance or petroleum products into structures on the property or in the ground, groundwater, or surface water of the property.

The 1,800 acre project site and 90 acres of linear access road consists of undeveloped BLM land only used for recreation. There are no existing roads, structures on the project site or adjoining lands. In addition, the site is not listed on the Environmental First Search (EFS) Site Information Report (GSEP 2009a, Appendix E).

No RECs were identified within the one-mile radius search of offsite areas. However, the project area was within General Patton's World War II (WWII) Desert Training Center, California-Arizona Maneuver Area region (1942 to 1944). The region surrounding the Project Area was considered a suitable location for training troops that would be deployed in the North Africa Campaign. After 2 years in operation and the training of one million troops, the desert training camps were closed in 1944. Military trash scatter including ration containers, military-issue utensils, and one 50-caliber cartridge were identified during the Tetra Tech site visits (GSEP 2009a, Appendix E). There is potential for unexploded ordnance (UXO) at the project site.

In the event that contamination is identified during any phase of construction, staff proposes Condition of Certification **Waste-1** requiring that any additional work must be conducted under the oversight of DTSC, with Energy Commission Compliance Project Manager (CPM) involvement. Furthermore, staff recommends proposed Conditions of Certification **Waste-2** and **Waste-3** be adopted to address any soil contamination contingency that may be encountered during project construction. **Waste-2** would require that an experienced and qualified Professional Engineer or Professional Geologist be available for consultation in the event contaminated soil is encountered. If contaminated soil is identified, **Waste-3** would require that the Professional Engineer or Professional Geologist inspect the site, determine what is required to characterize the

nature and extent of contamination, and provide a report to the CPM and DTSC with findings and recommended actions.

Proposed Project

Proposed Project - Construction Impacts and Mitigation

Site preparation and construction of the proposed solar project and its associated facilities would last approximately 37 months and generate both non-hazardous and hazardous wastes in solid and liquid forms. Before construction can begin, the project owner will be required to develop and implement a Construction Waste Management Plan per proposed Condition of Certification **Waste-4** to ensure that the waste will be recycled when possible and properly landfilled when necessary. In addition, the project owner will be required to develop a UXO identification training and reporting procedures program per proposed Condition of Certification **Waste-5** to ensure site workers are properly trained to recognize, avoid, and report UXO. The UXO training program should include the identification of trained UXO ordnance experts that are available to complete removal of UXO and supplemental geophysical surveys to search for additional or buried ordnance.

Non-Hazardous Wastes

Construction activities would generate an estimated 40 cubic yards per week of non-hazardous solid wastes, consisting of scrap wood, steel, glass, plastic, and paper, and another 1 cubic yard per week of office-related waste. Of these items, recyclable materials would be separated and removed as needed to recycling facilities. Non-recyclable materials (insulation, other plastics, food waste, roofing materials, vinyl flooring and base, carpeting, paint containers, packing materials, etc.) would be disposed at a Class III landfill.

Non-hazardous liquid wastes would be generated during construction, and would include 200 gallons of sanitary waste per day. Sanitary wastes would be pumped to tanker trucks by licensed contractors for transport to a sanitary water treatment plant. Please see the **Soil and Water Resources** section of this document for more information on the management of project wastewater.

Hazardous Wastes

During construction, anticipated hazardous wastes include waste paint, spent construction solvents, waste cleaners, waste oil, oily rags, and waste batteries. Estimated amounts are 1 cubic yard of empty containers (per week), 175 gallons of oils, solvents, paint, and oily rags (every 90 days), and 10 batteries (per year). Empty hazardous material containers would be returned to the vendor or disposed at a hazardous waste facility; solvents, used oils, paint, oily rags, and adhesives would be recycled or disposed at a hazardous waste facility; and spent batteries would be disposed at a recycling facility. In addition, a one-time generation of 1,000 gallons of Heat Exchanger cleaning solvent (chelant type solution) would require disposal at a permitted hazardous waste facility (GSEP 2009a, pages 5.13-5).

The generation of hazardous waste requires a unique hazardous waste generator identification number. The hazardous waste generator number is determined based on

site location and therefore, both the construction contractor and the project owner/operator could be considered the generator of hazardous wastes at the site. Therefore, the project owner would be required to obtain a unique hazardous waste generator identification number for the site prior to starting construction, pursuant to proposed Condition of Certification **Waste-6**. This would ensure compliance with California Code of Regulation Title 22, Division 4.5.

Hazardous waste would be collected in hazardous waste accumulation containers and stored in a laydown area, warehouse/shop area, or storage tank on equipment skids for less than 90 days. The accumulated wastes would then be properly manifested, transported, and disposed of at a permitted hazardous waste management facility by licensed hazardous waste collection and disposal companies. Staff reviewed the disposal methods and concluded that all wastes would be disposed of in accordance with all applicable LORS. Should any construction waste management-related enforcement action be taken or initiated by a regulatory agency, the project owner would be required by the proposed Condition of Certification **Waste-7** to notify the Compliance Project Manager (CPM) whenever the owner becomes aware of this action.

Staff has reviewed the proposed waste management methods described in AFC section 5.13.2.1, and in the responses to data requests, and concludes that project construction wastes would be managed in accordance with all applicable LORS. Absent any unusual circumstances, staff considers project compliance with LORS to be sufficient to ensure that no significant impacts would occur as a result of project waste management activities.

In the event that construction excavation, grading, or trenching activities for the proposed project encounter potentially contaminated soils, specific waste handling, disposal, or other precautions may be necessary pursuant to hazardous waste management LORS. Staff finds that proposed Conditions of Certification **Waste-1** through **-3** would be adequate to address any soil contamination contingency that may be encountered during construction of the project and would further support compliance with LORS.

Proposed Project - Construction and Demolition (C&D) Waste Diversion and Mitigation

The Integrated Waste Management Act of 1989 [Assembly Bill (AB) 939, Sher, Chapter 1095, Statutes of 1989] set landfill waste diversion goals of 50 percent (by 2000) for local jurisdictions. To meet this goal, many jurisdictions require applicants for construction and demolition projects to submit a reuse/recycling plan for at least 50 percent of C&D materials prior to the issuance of a building or demolition permit. The GSEP project is required to complete the Riverside County Waste Management Department (RCWMD) Construction and Demolition Waste Diversion Program Reporting Form C (GSEP 2009f, page WM-6). RCWMD and staff will require the applicant to meet the 50 percent waste diversion rate. Adoption of Condition of Certification **Waste-8** will ensure the GSEP owner meet the waste diversion goals of the C&D program. Staff believes that compliance with proposed Condition of Certification **Waste-8** would also help ensure that project wastes are managed properly and further reduce potential impacts to local landfills from project wastes.

Proposed Project - Operation Impacts and Mitigation

The proposed GSEP project would generate both non-hazardous and hazardous wastes in solid and liquid forms under normal operating conditions. Table 5.13-3 of the project AFC gives a summary of the anticipated operation waste streams, estimated waste volumes and generation frequency, and proposed management methods. Before operations can begin, the project owner would be required to develop and implement an Operations Waste Management Plan as required in the proposed Condition of Certification **Waste-9**. This would ensure that an accurate record is maintained of the project's waste storage, generation, and disposal, and compliance with waste regulations is maintained during operation.

Non-Hazardous Solid Wastes

Non-hazardous solid wastes generated during project operations would consist of paper, wood, plastic, cardboard, deactivated equipment and parts, defective or broken electrical materials, empty non-hazardous containers, and other miscellaneous solid wastes. The GSEP AFC does not estimate the volume of these non-hazardous waste generated by the project; similar solar generating projects estimate approximately 10 cubic yards of non-hazardous solid waste per week (SES 2008a). GSEP estimates less than 10 spent household batteries per month, and approximately 50 spent fluorescent bulbs per year would be recycled (GSEP 2009a page 5.13-6). All non-hazardous wastes would be recycled to the greatest extent possible, and the remainder would be removed on a regular basis for disposal in a Class III landfill. Sanitary wastewater solids would be treated with an onsite septic system, and sludge would be delivered to an off-site disposal facility.

Soil may become contaminated with Heat Transfer Fluid (HTF) from spills and leaks within the HTF system. HTF concentrations in soil measured at <10,000 mg/Kg would be placed in the on site bioremediation land treatment unit (LTU), pending approval of the Department of Toxic Substances Control (DTSC) (GSEP 2009a page 5.13-8). On site treatment of contaminated soil may require a permit from DTSC and the project owner will initiate pre-application discussions and determine the permitting process applicable to the facility. An estimated 750 cubic yards per year of contaminated soil would be remediated at the LTU with an irregular frequency (GSEP 2009a page 5.13-6). Following treatment and confirmation sampling and laboratory testing documenting acceptable residual concentrations of HTF, the bioremediated soil will be reused as fill on the project site.

Non-hazardous solid waste will be periodically generated during maintenance of the water treatment filters. Replacement of the spent media (sand, gravel, garnet, anthracite) from the multi-media filters is estimated to produce 2100 cubic feet (78 cubic yards) every 5 years (GSEP 2009f page WM-3). Maintenance of the reverse osmosis filters would generate approximately 440 cartridges (2 inch diameter, 20 inch long) every few months and about 160 RO membrane elements (4 inch diameter by 40 inches long) every 3 to 5 years (GSEP 2009f page WM-3). These non-hazardous waste streams will be taken off site for recycling or disposal at a Class III landfill.

Approximately 50,000 tons of evaporative residue would be removed from the evaporation ponds every seven years or 214,500 tons during the 30-year project life

(see also Non-Hazardous Liquid Wastes) (GSEP 2009a page 5.13-8). This material is anticipated to be non-hazardous solids, possibly requiring on-site dewatering before transport, consisting primarily of salt (sodium, chloride and sulfate) that would be disposed of at a Class II landfill facility (GSEP 2009a; GSEP 2009f page WM-4).

Non-Hazardous Liquid Wastes

Non-hazardous liquid wastes would be generated at the pre- and post- water treatment systems consisting of brine or high TDS water. During facility operation these liquid (brackish water) waste streams combine for an average flow of 182 gpm that would be sent to the RWQCB permitted 24-acre double-lined (three 8-acre cells each) evaporation ponds.

Hazardous Wastes

The project owner/operator would be considered the generator of hazardous wastes at the site during facility operations. Therefore, the project owner's unique hazardous waste generator identification number, obtained prior to construction in accordance with proposed Condition of Certification **Waste-6**, would be retained and used for hazardous waste generated during facility operation.

Hazardous wastes that may be generated during routine project operation include used hydraulic fluid, oils and grease (50,000 gallons per year) from the HTF system, turbine, and other hydraulic equipment, lead-acid batteries (10 per year), and oily rags, oily absorbent and spent oil filters (five 55-gallon drums per month) (GSEP 2009a, page 5.13-6). Plant washdown areas will generate an estimated 3,000 gallons per year of oily water from the oil-water separation system.

Soil contaminated with HTF measured at concentrations >10,000 mg/Kg is anticipated to approved as Non-RCRA hazardous waste. An estimated 10 cubic yards per year of HTF contaminated soil (>10,000 mg/Kg) will require off site disposal at a Class I landfill (GSEP 2009a page 5.13-6; GSEP 2009f page WM-4 to WM-5).

In addition, spills and unauthorized releases of hazardous materials or hazardous wastes may generate contaminated soils or cleanup materials that may also require management and disposal as hazardous waste. Proper hazardous material handling and good housekeeping practices would help keep spill wastes to a minimum. However, to ensure proper cleanup and management of any contaminated soils or waste materials generated from hazardous materials spills, staff proposes Condition of Certification **Waste-10,** requiring the project owner/operator to document, clean up, and properly manage and dispose of wastes from any hazardous materials spills or releases in accordance with all applicable federal, state, and local requirements. More information on project hazardous materials management spill reporting, containment, and spill control and countermeasures plan provisions for the project are provided in the **Hazardous Materials Management** section of this document.

The amount of hazardous wastes generated during the operation of the GSEP project would not be minor, however with source reduction and recycling of wastes implemented whenever possible the waste requiring Class I disposal would be small. The hazardous wastes would be temporarily stored on site, transported off site by

licensed hazardous waste haulers, and recycled or disposed of at authorized disposal facilities in accordance with established standards applicable to generators of hazardous waste (Title 22, CCR, §66262.10 et seq.). Should any operations waste management-related enforcement action be taken or initiated by a regulatory agency, the project owner would be required by proposed Condition of Certification **Waste-7** to notify the CPM when advised of any such action.

Proposed Project - Closure and Decommissioning Impacts and Mitigation

The closure or decommissioning of the GSEP project would produce both hazardous and non-hazardous solid and liquid waste. The project's General Compliance Conditions of Certification, including Compliance Monitoring and Closure Plan (Compliance Plan) have been established as required by Public Resources Code section 25532, and are specifically detailed in **General Conditions**. The plan provides a means for assuring that the facility is constructed, operated and closed in compliance with public health and safety, environmental and other applicable regulations, guidelines, and conditions adopted or established by the California Energy Commission. Required elements of a facility's closure would be outlined in a facility closure plan as specified in Conditions of Certification **Compliance 11, 12 and 13**. To ensure adequate review of a planned project closure, the project owner shall submit a proposed facility closure plan to the Energy Commission for review and approval at least 12 months (or other period of time agreed to by the CPM) prior to commencement of closure activities. The facility closure plan will document non-hazardous and hazardous waste management practices including: the inventory, management, and disposal of hazardous materials and wastes, and permanent disposal of permitted hazardous materials and waste storage units.

The handling and management of waste generated by GSEP will follow the hierarchical approach of source reduction, recycling, treatment, and disposal as specified in California Public Resources Code Sections 40051 and 40196. The first priority of the project owner will be to use materials that reduce the waste that is generated. The next level of waste management will involve reusing or recycling wastes, particularly the disassembly and reuse/recycling of the parabolic trough components. For wastes that cannot be recycled, treatment will be used, if possible, to make the waste nonhazardous. Finally, waste that cannot be reused, recycled or treated would be transported off site to a permitted treatment, storage, or disposal facility. Staff expects that there will be adequate landfill capacity available to dispose of both non-hazardous and hazardous waste from the closure or decommissioning of the proposed project. Conditions of Certification **WASTE-6** through **-10** would continue to apply to GSEP during closure or decommissioning of the project.

Proposed Project - Impact on Existing Waste Disposal Facilities

Non-Hazardous Solid Wastes

Construction and operation of the proposed project would respectively generate 40 cubic yards and 10 cubic yards per week of nonhazardous solid waste (wood, paper/cardboard, glass, plastic, insulation, and concrete), respectively. The waste would be stored onsite for less than 30 days, and then recycled or disposed of in a Class III landfill.

Table 5.13-1 of the project AFC identifies five waste disposal facilities in Riverside County (excluding Desert Center Landfill which is scheduled for closure in 2011) that could potentially take the non-hazardous construction and operation wastes generated by the GSEP project. The remaining combined capacity of the five landfill facilities that are expected to be operating in 2011 is over 160 million cubic yards. The total amount of non-hazardous solid waste generated from project construction is estimated to be 6,400 cubic yards (40 cubic yards per week for 37 months), and the total amount from lifetime operations is estimated to be 15,600 cubic yards (10 cubic yards per week for 30 years). These quantities include both recyclable and non-recyclable wastes; the non-recyclable component would contribute much less than 1 percent of the available landfill capacity. Staff finds that disposal of the solid wastes generated by the GSEP project can occur without significantly impacting the capacity or remaining life of any of these facilities.

Hazardous Wastes

AFC Table 5.13-1 lists landfills and recycling facilities that could be used to manage project wastes. Two hazardous waste (Class I) disposal facilities are currently accepting waste and could be used to manage GSEP wastes: the Clean Harbors Buttonwillow Landfill in Kern County and the Chemical Waste Management Kettleman Hills Landfill in Kings County. The Kettleman Hills facility also accepts Class II and Class III wastes. In total, there is a combined excess of 15.5 million cubic yards of remaining hazardous waste disposal capacity at these landfills, with at least 28 to 30 years remaining in their operating lifetimes (EEC2006a, Section 8.14.3.5.2). In addition, the Kettleman Hills facility is in the process of permitting an additional 4.6 to 4.9 million cubic yards of disposal capacity (Waste Management 2009), and the Buttonwillow facility has 40 years to reach its capacity at its current disposal rate (CEC2008aa).

Hazardous wastes generated during construction and operation would be recycled to the extent possible and practical. Those wastes that cannot be recycled would be transported off site to a permitted treatment, storage, or disposal facility. As calculated from waste streams presented in AFC Table 5.13-2 (GSEP 2009a), approximately 1550 cubic yards of recyclable and non-recyclable hazardous waste would be generated over the 37 month construction period. Less than 300 cubic yards of hazardous non-recyclable waste would be generated over the 30-year operating lifetime. Thus hazardous wastes from the GSEP project requiring off-site disposal would be significantly less than the remaining capacity of either Class 1 waste facility.

C.13.4.3 CEQA Level of Significance

Absent any unusual circumstances, staff considers project compliance with LORS and staff's conditions of certification to be sufficient to ensure that no significant impacts would occur as a result of project waste management.

C.13.5 REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would be a single solar field (Unit 1) of the proposed Genesis Solar Energy Project (GESP), resulting in a 125 MW solar facility located within the boundaries of the proposed project, as defined by the applicant (NextEra). This alternative is analyzed for two major reasons: (1) it eliminates about 50 percent of the

proposed project area, so certain impacts are reduced, and (2) by eliminating the eastern solar field, which is located on flowing desert washes, impacts to the sand dune and playa areas and to the Mojave Fringe-toed Lizard habitat would be reduced. The alternative would also help reduce impacts to wildlife movement by reducing an obstruction to the Palen wash. Moreover, it would maintain, thru both fluvial and Aeolian processes, the dune and sandy habitats. The boundaries of the Reduced Acreage Alternative are shown in **Alternatives Figure 1**.

C.13.5.1 Setting and Existing Conditions

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates effects to the eastern 125 MW solar field and relocates the gas yard approximately 1.75 miles northwest of its present location. As a result, the environmental setting consists of the western portion of the proposed project, as well as the area affected by the linear project components.

C.13.5.2 Assessment of Impacts and Discussion of Mitigation

The Reduced Acreage Alternative would generate similar types of hazardous and non-hazardous wastes from construction, demolition and operation of the project. However, the quantities of waste would be reduced by approximately 50 percent. The location of the Reduced Acreage Alternative is the same as the proposed project and would be no closer to any unidentified RECs. Similar to the proposed project, staff will not require investigation and remediation of soil and groundwater contamination. Disposal methods would remain the same as for the proposed project and the same Conditions of Certification (**WASTE 1-10)** would apply. Smaller quantities of waste would require landfill or treatment; waste levels would remain well below 1 percent of expected disposal facility capacity.

C.13.5.3 CEQA Level of Significance

Similar to the proposed project, staff considers project compliance with LORS and staff's conditions of certification to be sufficient to ensure that no significant impacts would occur as a result of waste management associated with the Reduced Acreage Alternative.

C.13.6 DRY COOLING ALTERNATIVE

This section identifies the potential impacts of using air-cooled condenser (ACC) systems rather than the cooling towers proposed by NextEra for the Genesis project. It is assumed that the ACC systems would be located where the cooling towers are currently proposed for each of the two 125 MW power block, as illustrated in **Alternatives Figure 2** (see Section B.3).

Approximately 18 ACC fans would be required for each of the two solar fields. The 18 fans, or ACC's, would operate when the ambient temperature is above 50 degrees Fahrenheit. When the temperature is below 50 degrees Fahrenheit, only 10 of the fans would be used (GSEP 2009f). The 18 ACC fans described in the GSEP cooling study would have a length of approximately 279 feet, a width of approximately 127 feet, and a height of 98 feet (GSEP 2009f). However, based on the ACC preliminary designs for nearby solar thermal projects in similar ambient temperatures, an additional 11,690

square feet could be required for siting of the fans and the fans would be up to 120 feet in height. In addition to the ACC fans, NextEra would use a small Wet Surface Air Cooler when needed to provide auxiliary cooling during extremely hot days (GSEP 2009f). This alternative is analyzed because it would reduce the amount of water required for steam turbine cooling from 822 acre-feet per year (AFY) to 66 AFY. This reduction in water use would reduce impacts to water and biological resources.

C.13.6.1 Setting and Existing Conditions

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates the use of wet-cooling towers and incorporated the use of air-cooled condensers (ACC) in the same location. As a result, the environmental setting would be the same as for the proposed project.

C.13.6.2 Assessment of Impacts and Discussion of Mitigation

Wet-cooling maximizes power plant fuel efficiency by providing a continuous source of effective cooling for the plant's steam condensers. Dry cooling will typically provide less effective cooling of the condensers, reducing the efficiency of the steam cycle portion of the power plant, and thus the overall fuel efficiency of the facility. Since only about one-third of the power from a combined cycle power plant is produced by the steam cycle, however, this negative impact on fuel efficiency is diluted.

The FSA for the Beacon Solar Energy Project (08-AFC-2; BSEP 2009) showed that annual average fuel efficiency would be reduced 5-7 percent compared to a wet cooling system. The Genesis applicant stated that use of dry cooling would result in a 7.4 percent decrease in total annual net MWh compared with a wet cooling system (GSEP 2009a). In order to counter the reduction in generation that would result from dry cooling, the Beacon Solar Energy Project applicant proposed expanding the solar field by 12 percent.

The GSEP applicant states that the proposed project has been optimized for the land available, and therefore solar field expansion is infeasible (GSEP 2009a). However, the power block and solar arrays would occupy approximately 1,360 acres of the 1,800-acre site. Evaporation ponds, access roads, administration buildings, and other support facilities would require a portion of the 1,800-acre site, and there is also remaining open space (GSEP 2009a). Additionally, use of dry-cooling would require smaller evaporation ponds opening up additional land for solar field expansion. A 12 percent increase in the solar field would require approximately 150 additional acres. While it is uncertain whether the entire 150 acres is available for use, and would also comply with the engineering requirements for GSEP, it is clear from the site plan that there is some available land immediately adjacent to existing solar trough rows and this land could be used to offset all or a portion of the efficiency loss due to the use of dry-cooling.

C.13.6.3 CEQA Level of Significance

The dry cooling option would significantly reduce the volume of non-hazardous evaporation pond residue estimated to be 50,000 tons every seven years requiring disposal using the wet cooling option. In addition, the non-hazardous solid waste generated during periodic maintenance of the water treatment filters (spent media of sand, gravel, garnet, anthracite, about 2100 cubic feet every 5 years) and disposal or

recycling of the reverse osmosis filters (approximately 440 cartridges every few months and about 160 RO membrane elements every 3 to 5 years) would be significantly reduced. Consequently, the overall impacts of the project with dry cooling related to waste management (waste generation and disposal) would be reduced compared to the proposed project.

C.13.7 NO PROJECT/NO ACTION ALTERNATIVES

No Project/No Action Alternative #1:

No Action on Genesis Solar Energy Project application and on CDCA land use plan amendment

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and BLM would not amend the CDCA Plan. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, no new wastes would be generated. This No Project/No Action Alternative would not result in impacts to waste management at this location. However, the land on which the project is proposed would become available to other uses that are consistent with BLM's land use plan, including another solar project requiring a land use plan amendment. In addition, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

No Project/No Action Alternative #2:

No Action on Genesis Solar Energy Project and amend the CDCA land use plan to make the area available for future solar development

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and BLM would amend the CDCA Land Use Plan of 1980, as amended, to allow for other solar projects on the site. As a result, it is possible that another solar energy project could be constructed on the project site.

Because the CDCA Plan would be amended, it is possible that the site will be developed with another solar technology. Different solar technologies would create different amounts and types of wastes based on the technology components and requirements; however, it is expected that the construction of all solar technologies at the site would generate waste. As such, impacts to waste management from the solar project would likely be similar to impacts to waste management from the proposed project. Therefore, this No Project/No Action Alternative could result in waste management impacts similar to the impacts under the proposed project.

No Project/No Action Alternative #3:

No Action on Genesis Solar Energy Project application and amend the CDCA land use plan to make the area unavailable for future solar development

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and the BLM would amend the CDCA Plan to make the proposed site unavailable for future solar development. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because the CDCA Plan would be amended so no solar projects can be approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, no wastes would be generated from the construction or operation of the proposed project under this alternative. Therefore, this No Project/No Action Alternative would not result in impacts to waste management. However, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

C.13.8 CUMULATIVE IMPACT ANALYSIS

Section B.3, Cumulative Scenario, provides detailed information on the potential cumulative solar and other development projects in the project area. Together, these projects comprise the cumulative scenario which forms the basis of the cumulative impact analysis for the proposed project. In summary, these projects are:

- Renewable energy projects on BLM, State, and private lands, as shown on **Cumulative Figure 1** and in **Cumulative Tables 1A and 1B.** Although not all of those projects are expected to complete the environmental review processes, or be funded and constructed, the list is indicative of the large number of renewable projects currently proposed in California.
- Foreseeable future projects in the eastern Riverside County, are shown on **Cumulative Impacts Figure 2,** I-10 Corridor Existing and Future/Foreseeable Projects, and **Cumulative Tables 2 and 3**. Table 2 presents existing projects in this area and Table 3 presents future foreseeable projects in the I-10 Corridor Area. Both tables indicate project name and project type, its location and its status.

These projects are defined within a geographic area that has been identified by the CEC and BLM as covering an area large enough to provide a reasonable basis for evaluating cumulative impacts for all resource elements or environmental parameters. Most of these projects have, are, or will be required to undergo their own independent environmental review under CEQA and/or NEPA. Even if the cumulative projects described in Section B.3 have not yet completed the required environmental processes, they were considered in the cumulative impacts analyses in this SA/Draft EIS.

Geographic Scope of Analysis

The geographic area considered for cumulative impacts on waste management is Riverside County where implementation of the GSEP project could combine with those impacts of other local or regional projects. Cumulative impacts could also occur as a result of development of some of the many proposed solar and wind development projects that have been or are expected to be under consideration by the BLM and the Energy Commission in the near future. Many of these projects are located within the California Desert Conservation Area.

The geographic extent for the analysis of the cumulative impacts associated with the GSEP project includes Riverside County. This geographic scope is appropriate because Class III waste disposal facilities in Riverside County could easily handle all waste generated by the GSEP project. There are no Class I/Class II landfills in Riverside County, but the two nearest hazardous waste disposal sites (Buttonwillow Landfill and Kettleman Hills Landfill) routinely except hazardous waste from throughout California and both have large capacity and expected life to year 2038-2040.

Effects of Past and Present Projects

For this analysis, the following projects or developments are considered most relevant to effects on waste management. Existing projects currently generating non-hazardous solid waste along the I-10 Corridor include Chuckwalla Valley State Prison, Ironwood State Prison, and Blythe Energy Project. Non-hazardous waste is also generated by the residential and commercial activities in Blythe and Desert Center.

Waste management in the geographic area has been impacted by past and currently approved projects by requiring additional landfill capacity. The Blythe Sanitary Landfill, the closest landfill, is anticipated to have adequate capacity for municipal waste through the year 2134 (GSEP 2009a) accepting about 400 tons per day; there are several other large capacity landfills in the region. The GSEP project wastes would be generated in modest quantities (10 cubic yards or 1 to 2 tons per week), waste recycling would be employed wherever practical, and sufficient capacity is available at several disposal facilities to handle the volumes of wastes that would be generated by the project. The project's incremental effective of solid waste disposal is not cumulatively considerable and would have no cumulative impact on existing projects.

Effects of Reasonably Foreseeable Future Projects

Waste management is also expected to be affected by the following reasonably foreseeable future projects as follows: (1) future projects along the I-10 corridor, and (2) future renewable energy projects in the California desert.

Foreseeable Projects in the Project Area

The GSEP project waste disposal volumes will combine with the waste volumes from four commercial projects, 15 residential projects, and 16 renewable projects along the I-10 Corridor (Cumulative Impacts Table 3). Although the waste volumes would be greatest during construction the actual construction schedule of each project would not likely be coincident such that local landfill daily disposal limitations would be exceeded. Operation waste volumes of transmission line, substation, and solar photovoltaic

projects (not solar-thermal) would be far less than the three solar-thermal energy projects (Palen, Blythe, Mojave Solar Park/Desert Lily Project) and the Blythe Energy Project II Power Plant. Routine (operation) waste disposal of all foreseeable commercial, residential, and energy projects along the I-10 Corridor may combine to occasionally exceed the 400 ton per day limit at the Blythe Sanitary Landfill without adversely impacting the 2.2 million cubic yards of remaining capacity. The Blythe Landfill is the nearest Class III disposal site for these I-10 Corridor Projects and would likely be the first choice for disposal. However, several other landfills are located within 100 miles of GSEP with much larger daily disposal limits. The total amount of available solid waste landfill capacity in Riverside County exceeds 160 million cubic yards. Therefore, even if all 35 of these reasonably foreseeable projects along the I-10 Corridor were constructed, staff concludes that the waste generated by the GSEP project would not result in significant cumulative waste management impacts.

Foreseeable Renewable Projects in the California Desert

As shown on **Figure 1** and **Table 1A** (Cumulative Impacts) solar and wind applications for use of BLM and private land cover approximately 1 million acres of the California Desert Conservation Area. Most of the projects are located outside of the Geographic Extent identified for the waste management cumulative impact analysis. The remaining projects are within the BLM Palm Springs/South Coast Field Office area, and include all of the local I-10 Corridor projects discussed above. Four wind energy projects within the BLM's Palm Springs/South Coast Field Office region are not anticipated to generate significant volumes of solid waste. Implementation of the multiple solar and wind projects proposed to be developed in California desert area would result in an increase in generation of hazardous and non-hazardous solid and liquid waste and would add to the total quantity of waste generated in California and Nevada. However, project wastes would be generated in modest quantities, waste recycling would be employed wherever practical, and sufficient capacity is available at several treatment and disposal facilities to handle the volumes of wastes that would be generated by the project. Therefore, the incremental effect of GSEP project waste disposal impacts, when combined with the effects of waste management impacts created by other reasonably foreseeable regional impacts would be less than significant because the project related waste volumes would not exceed the regional Class I, II, and III waste disposal capacities.

Contribution of the Genesis Solar Energy Project to Cumulative Impacts

Construction. The construction of the Genesis Solar Energy Project (GSEP) is not expected to result in short term adverse impacts related to construction activities. It is expected that some of the cumulative projects described above which are not yet built may be under construction the same time as the GSEP. As a result, there may be substantial short term impacts during construction of those cumulative projects related to waste management.

The GSEP would be expected to contribute only a small amount to the possible short term cumulative impacts related to waste management because the anticipated maximum volume of 40 cubic yards per week (4-10 tons) is readily accommodated by the local and regional landfills.

Operation. The operation of the GSEP is not expected to result in long term adverse impacts during operation of the project related to waste management. It is expected that some of the cumulative projects described above may be operational at the same time as the GSEP. As a result, there may be substantial long term impacts during operation of those cumulative projects related to waste management.

The GSEP would be expected to contribute only a small amount to these possible long term operational cumulative impacts related to waste management because of the small volume of waste requiring landfill disposal.

Decommissioning. The decommissioning of the GSEP is not expected to result in adverse impacts related to waste management similar to construction impacts. It is unlikely that the construction or decommissioning of any of the cumulative projects would occur concurrently with the decommissioning of this project, because the decommissioning is not expected to occur for approximately 40 years. As a result, there may not be impacts related to waste management during decommissioning of the GSEP generated by the cumulative projects. As a result, the impacts of the decommissioning of the GSEP would not be expected to contribute to cumulative impacts related to waste management because most components (metal, concrete, asphalt, wood) would be recycled and the volume requiring Class I or Class III landfill disposal would be disposed of over several months.

C.13.9 COMPLIANCE WITH LORS

Energy Commission staff concludes that the proposed GSEP project would comply with all applicable LORS regulating the management of hazardous and non-hazardous wastes during both facility construction and operation. The applicant is required to recycle and/or dispose hazardous and non-hazardous wastes at facilities licensed or otherwise approved to accept the wastes. Because hazardous wastes would be produced during both project construction and operation, the GSEP project would be required to obtain a hazardous waste generator identification number from U.S. EPA. The GSEP project would also be required to properly store, package, and label all hazardous waste; use only approved transporters; prepare hazardous waste manifests; keep detailed records; and appropriately train employees, in accordance with state and federal hazardous waste management requirements.

C.13.10 NOTEWORTHY PUBLIC BENEFITS

The specific objectives and purpose of the GESP are:

- To develop a utility-scale solar energy project utilizing parabolic trough technology;
- To construct and operate an environmentally friendly, economically sound, and operationally reliable solar power generation facility; that will contribute to the State of California’s renewable energy goals;
- To locate the project in an area with high solar insolation (i.e., high intensity of solar energy);
- To interconnect directly to the CAISO Grid through BEPTL and the SCE electrical transmission system; and

- To commence construction in 2010 to qualify for the American Recovery and Reinvestment Act (ARRA) of 2009's Renewable Energy Grant Program.

C.13.11 PROPOSED CONDITIONS OF CERTIFICATION/MITIGATION MEASURES

WASTE-1 In the event that contamination is identified during assessment of the project site, during any phase of GSEP construction, any additional work to assess and/or remediate any contamination shall be conducted under the oversight of DTSC, with CPM involvement.

Verification: The project owner shall consult with the Department of Toxic Substances Control, and enter into a consent agreement as necessary to ensure oversight of any additional site assessment and remediation work needed to reevaluate the site or address contamination found during any phase of SES Solar Two site construction. The project owner shall ensure that the CPM is involved and appraised of all discussions with Department of Toxic Substances Control, and CPM concurrence shall be required for project decisions addressing site remediation.

WASTE-2 The project owner shall provide the resume of an experienced and qualified professional engineer or professional geologist, who shall be available for during site characterization (if needed), demolition, excavation, and grading activities, to the CPM for review and approval. The resume shall show experience in remedial investigation and feasibility studies.

The professional engineer or professional geologist shall be given authority by the project owner to oversee any earth moving activities that have the potential to disturb contaminated soil and impact public health, safety and the environment.

Verification: At least 30 days prior to the start of site mobilization, the project owner shall submit the resume to the CPM for review and approval.

WASTE-3 If potentially contaminated soil is identified during site characterization, demolition, excavation or grading at either the proposed site or linear facilities, as evidenced by discoloration, odor, detection by handheld instruments, or other signs, the professional engineer or professional geologist shall inspect the site, determine the need for sampling to confirm the nature and extent of contamination, and provide a written report to the project owner, representatives of Department of Toxic Substances Control or Regional Water Quality Control Board, and the CPM stating the recommended course of action.

Depending on the nature and extent of contamination, the professional engineer or professional geologist shall have the authority to temporarily suspend construction activity at that location for the protection of workers or the public. If in the opinion of the professional engineer or professional geologist, significant remediation may be required, the project owner shall

contact the CPM and representatives of the Department of Toxic Substances Control or Regional Water Quality Control Board for guidance and possible oversight.

Verification: The project owner shall submit any reports filed by the professional engineer or professional geologist to the CPM within 5 days of their receipt. The project owner shall notify the CPM within 24 hours of any orders issued to halt construction.

WASTE-4 The project owner shall prepare a Construction Waste Management Plan for all wastes generated during construction of the facility and shall submit the plan to the CPM for review and approval prior to the start of construction. The plan shall contain, at a minimum, the following:

- A description of all construction waste streams, including projections of frequency, amounts generated, and hazard classifications; and
- Management methods to be used for each waste stream, including temporary on-site storage, housekeeping and best management practices to be employed, treatment methods and companies providing treatment services, waste testing methods to assure correct classification, methods of transportation, disposal requirements and sites, and recycling and waste minimization/source reduction plans.

Verification: The project owner shall submit the Construction Waste Management Plan to the CPM for approval no less than 30 days prior to the initiation of construction activities at the site.

WASTE-5 The project owner shall prepare a UXO Identification, Training and Reporting Plan to properly train all site workers in the recognition, avoidance and reporting of military waste debris and ordnance. The project owner shall submit the plan to the CPM for review and approval prior to the start of construction. The plan shall contain, at a minimum, the following:

- A description of the training program outline and materials, and the qualifications of the trainers; and
- Identification of available trained experts that will respond to notification of discovery of any ordnance (unexploded or not); and
- Work plan to recover and remove discovered ordnance, and complete additional field screening, possibly including geophysical surveys to investigate adjacent areas for surface, near surface or buried ordnance in all proposed land disturbance areas.

Verification: The project owner shall submit the UXO Identification, Training and Reporting Plan to the CPM for approval no less than 30 days prior to the initiation of construction activities at the site.

WASTE-6 The project owner shall obtain a hazardous waste generator identification number from the United States Environmental Protection Agency (USEPA) prior to generating any hazardous waste during project construction and operations.

Verification: The project owner shall keep a copy of the identification number on file at the project site and provide documentation of the hazardous waste generation and notification and receipt of the number to the CPM in the next scheduled Monthly Compliance Report after receipt of the number. Submittal of the notification and issued number documentation to the CPM is only needed once unless there is a change in ownership, operation, waste generation, or waste characteristics that requires a new notification to USEPA. Documentation of any new or revised hazardous waste generation notifications or changes in identification number shall be provided to the CPM in the next scheduled compliance report.

WASTE-7 Upon notification of any impending waste management-related enforcement action by any local, state, or federal authority, the project owner shall notify the CPM of any such action taken or proposed against the project itself, or against any waste hauler or disposal facility or treatment operator with which the owner contracts, and describe how the violation will be corrected.

Verification: The project owner shall notify the CPM in writing within 10 days of becoming aware of an impending enforcement action. The CPM shall notify the project owner of any changes that will be required in the way project-related wastes are managed.

WASTE-8 The project owner shall provide a reuse/recycling plan for at least 50 percent of construction and demolition materials prior to any building or demolition. The project owner shall ensure compliance and shall provide proof of compliance documentation to the CPM, including a recycling and reuse summary report, receipts, and records of measurement. Project mobilization and construction shall not proceed until the CPM issues an approval document.

Verification: At least 60 days prior to the start of any construction or demolition activities, the project owner shall submit a reuse recycling plan to the CPM for review and approval. The project owner shall ensure that project activities are consistent with the approved reuse/recycling plan and provide adequate documentation of the types and volumes of wastes generated, how the wastes were managed, and volumes of wastes diverted. Project mobilization and construction shall not proceed until CPM issues an approval document. Not later than 60 days after completion of project construction, the project owner shall submit documentation of compliance with the diversion program requirements to the CPM. The required documentation shall include a recycling and reuse summary report along with all necessary receipts and records of measurement from entities receiving project wastes.

WASTE-9 The project owner shall prepare an Operation Waste Management Plan for all wastes generated during operation of the Genesis Solar Energy facility and shall submit the plan to the CPM for review and approval. The plan shall contain, at a minimum, the following:

- A detailed description of all operation and maintenance waste streams, including projections of amounts to be generated, frequency of generation, and waste hazard classifications;

- Management methods to be used for each waste stream, including temporary on-site storage, housekeeping and best management practices to be employed, treatment methods and companies providing treatment services, waste testing methods to assure correct classification, methods of transportation, disposal requirements and sites, and recycling and waste minimization/source reduction plans;
- Information and summary records of conversations with the local Certified Unified Program Agency and the Department of Toxic Substances Control regarding any waste management requirements necessary for project activities. Copies of all required waste management permits, notices, and/or authorizations shall be included in the plan and updated as necessary;
- A detailed description of how facility wastes will be managed, and any contingency plans to be employed, in the event of an unplanned closure or planned temporary facility closure; and
- A detailed description of how facility wastes will be managed and disposed of upon closure of the facility.

Verification: The project owner shall submit the Operation Waste Management Plan to the CPM for approval no less than 30 days prior to the start of project operation. The project owner shall submit any required revisions to the CPM within 20 days of notification from the CPM that revisions are necessary.

The project owner shall also document in each Annual Compliance Report the actual volume of wastes generated and the waste management methods used during the year; provide a comparison of the actual waste generation and management methods used to those proposed in the original Operation Waste Management Plan; and update the Operation Waste Management Plan as necessary to address current waste generation and management practices.

WASTE-10 The project owner shall ensure that all spills or releases of hazardous substances, hazardous materials, or hazardous waste are documented and cleaned up and that wastes generated from the release/spill are properly managed and disposed of, in accordance with all applicable federal, state, and local requirements.

Verification: The project owner shall document management of all unauthorized releases and spills of hazardous substances, hazardous materials, or hazardous wastes that occur on the project property or related linear facilities. The documentation shall include, at a minimum, the following information: location of release; date and time of release; reason for release; volume released; how release was managed and material cleaned up; amount of contaminated soil and/or cleanup wastes generated; if the release was reported; to whom the release was reported; release corrective action and cleanup requirements placed by regulating agencies; level of cleanup achieved and actions taken to prevent a similar release or spill; and disposition of any hazardous wastes and/or contaminated soils and materials that may have been generated by the release. A copy of the unauthorized release/spill documentation shall be provided to the CPM within 30 days of the date the release was discovered.

C.13.12 CONCLUSIONS

Consistent with the three main objectives for staff's waste management analysis (as noted in the Introduction section of this analysis), staff provides the following conclusions:

After review of the applicant's proposed waste management procedures, staff concludes that project wastes would be managed in compliance with all applicable waste management LORS. Staff notes that construction, demolition, and operation wastes would be characterized and managed as either hazardous or non-hazardous waste. All non-hazardous wastes would be recycled to the extent feasible, and nonrecyclable wastes would be collected by a licensed hauler and disposed of at a permitted solid waste disposal facility. Hazardous wastes would be accumulated onsite in accordance with accumulation time, and then properly manifested, transported to, and disposed of at a permitted hazardous waste management facility by licensed hazardous waste collection and disposal companies.

However, to help ensure and facilitate ongoing project compliance with LORS, staff proposes Conditions of Certification **WASTE-1** through **10**. These conditions would require the project owner to do all of the following:

- Ensure the project site is investigated and any contamination identified is remediated as necessary, with appropriate professional and regulatory agency oversight (**WASTE 1**, **2**, and **3**).
- Prepare Construction Waste Management and Operation Waste Management Plans detailing the types and volumes of wastes to be generated and how wastes will be managed, recycled, and/or disposed of after generation (**WASTE-4** and **9**).
- Prepare and implement a UXO Identification, Training and Reporting Plan and work plan outlining procedures to recover and dispose of ordnance, as well as complete additional field surveys **(WASTE-5)**.
- Obtain a hazardous waste generator identification number (**WASTE-6**).
- Report any waste management-related LORS enforcement actions and how violations will be corrected (**WASTE-7**).
- Comply with waste recycling and diversion requirements (**WASTE-8**).
- Ensure that all spills or releases of hazardous substances are reported and cleaned-up in accordance with all applicable federal, state, and local requirements (**WASTE-10**).

The existing available capacity for the Class III landfills that may be used to manage nonhazardous project wastes exceeds 160 million cubic yards. The total amount of non-hazardous wastes generated from construction, demolition and operation of the GSEP project would contribute much less than 1 percent of the projected landfill capacity. Therefore, disposal of project generated non-hazardous wastes would have a less than significant impact on Class III landfill capacity.

In addition, the two Class I disposal facilities that could be used for hazardous wastes generated by the construction and operation of GSEP have a combined remaining

capacity of 15 million cubic yards, with another 4.6 to 4.9 million cubic yards of proposed capacity. The total amount of hazardous wastes generated by the GSEP project would be less than significant in relation to the remaining permitted capacity. Therefore, impacts from disposal of GSEP generated hazardous wastes would also have a less than significant impact on the remaining capacity at Class I landfills.

Staff concludes that management of the waste generated during construction and operation of the GSEP project would not result in any significant adverse impacts, and would comply with applicable LORS, if the waste management practices and mitigation measures proposed in the GSEP project AFC and staff's proposed conditions of certification are implemented.

C.14 – WORKER SAFETY AND FIRE PROTECTION

Testimony of Alvin Greenberg, Ph.D.

C.14.1 SUMMARY OF CONCLUSIONS

U.S. Bureau of Land Management and Energy Commission staff (hereafter jointly referred to as staff) concludes that if the applicant for the proposed Genesis Solar Energy Project (GSEP) provides a Project Construction Safety and Health Program and a Project Operations and Maintenance Safety and Health Program, as required by Conditions of Certification **WORKER SAFETY-1**and **-2** and fulfils the requirements of Conditions of Certification **WORKER SAFETY-3** through **-9**, the project would incorporate sufficient measures to ensure adequate levels of industrial safety and comply with applicable laws, ordinances, regulations, and standards. The proposed conditions of certification provide assurance that the Construction Safety and Health Program and the Operations and Maintenance Safety and Health Program proposed by the applicant would be reviewed by the appropriate agencies before implementation. The conditions also require verification that the proposed plans adequately assure worker safety and fire protection and comply with applicable laws, ordinances, regulations, and standards.

Staff has considered the position of the Riverside County Fire Department (RCFD) and all relevant information as well as past experience at other solar power plants in California and has determined that the project would cause a significant individual and cumulative impact on local fire protection services. Therefore, staff is proposing mitigation to reduce these impacts to less than significant by requiring payment to the RCFD for capital and personal support (see proposed Conditions of Certification **WORKER SAFETY-7** and **8).**

C.14.2 INTRODUCTION

Worker safety and fire protection is regulated through laws, ordinances, regulations, and standards (LORS), at the federal, state, and local levels. Industrial workers at the facility operate equipment and handle hazardous materials daily and may face hazards that can result in accidents and serious injury. Protection measures are employed to eliminate or reduce these hazards or to minimize the risk through special training, protective equipment, and procedural controls.

The purpose of this Preliminary Staff Assessment/Plan Amendment/Draft Environmental Impact Statement (PSA/DPA/DEIS) is to assess the worker safety and fire protection measures proposed by the GSEP and to determine whether the applicant has proposed adequate measures to:

- comply with applicable safety LORS;
- protect the workers during construction and operation of the facility;
- protect against fire; and
- provide adequate emergency response procedures.

C.14.3 METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

Two issues are assessed in **Worker Safety-Fire Protection**:

1. the potential for impacts on the safety of workers during demolition, construction, and operations activities, and

2. fire prevention/protection, emergency medical response, and hazardous materials spill response during demolition, construction, and operations.

Worker safety issues are thoroughly addressed by Cal/OSHA regulations. If all LORS are followed, workers will be adequately protected. Thus, the standard for staff's review and determination of significant impacts on workers is whether or not the applicant has demonstrated adequate knowledge about and dedication to implementing all pertinent and relevant Cal/OSHA standards.

Regarding fire prevention matters, staff reviews and evaluates the on-site fire-fighting systems proposed by the applicant and the time needed for off-site local fire departments to respond to a fire, medical, or hazardous material emergency at the proposed power plant site. If on-site systems do not follow established codes and industry standards, staff recommends additional measures. Staff reviews and evaluates the local fire department capabilities and response time in each area and interviews the local fire officials to determine if they feel adequately trained, manned, and equipped to respond to the needs of a power plant. Staff then determines if the presence of the power plant would cause a significant impact on a local fire department. If it does, staff will recommend that the applicant mitigate this impact by providing increased resources to the fire department.

Staff has also established a procedure when a local fire department has identified either a significant incremental project impact to the local agency or a significant incremental cumulative impact to a local agency. Staff first conducts an initial review of the position and either agrees or disagrees with the fire department's determination that a significant impact would exist if the proposed power plant is built and operated. A process then starts whereby the project applicant can either accept the determination made by staff or refute the determination by providing a Fire Needs Assessment and a Risk Assessment. The Fire Needs Assessment would address fire response and equipment/staffing/location needs while the Risk Assessment would be used to establish that while an impact to the fire department may indeed exist, the risk (chances) of that impact occurring and causing injury or death is less than significant.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

Worker Safety and Fire Protection Table 1
Laws, Ordinances, Regulations, and Standards (LORS)

Applicable Law	Description
Federal	
Title 29 U.S. Code (USC) section 651 et seq (Occupational Safety and Health Act of 1970)	This act mandates safety requirements in the workplace with the purpose of "[assuring] so far as possible every working man and woman in the nation safe and healthful working conditions and to preserve our human resources" (29 USC § 651).
Title 29 Code of Federal Regulation (CFR) sections 1910.1 to 1910.1500 (Occupational Safety and Health Administration Safety and Health Regulations)	These sections define the procedures for promulgating regulations and conducting inspections to implement and enforce safety and health procedures to protect workers, particularly in the industrial sector.
29 CFR sections 1952.170 to 1952.175	These sections provide federal approval of California's plan for enforcement of its own Safety and Health requirements, in lieu of most of the federal requirements found in 29 CFR sections 1910.1 to 1910.1500.
State	
Title 8 California Code of Regulations (Cal Code Regs.) all applicable sections (Cal/OSHA regulations)	These sections require that all employers follow these regulations as they pertain to the work involved. This includes regulations pertaining to safety matters during construction, commissioning, and operations of power plants, as well as safety around electrical components, fire safety, and hazardous materials use, storage, and handling.
24 Cal Code Regs. section 3, et seq.	This section incorporates the current addition of the Uniform Building Code.
Health and Safety Code section 25500, et seq.	This section presents Risk Management Plan requirements for threshold quantity of listed acutely hazardous materials at a facility.
Health and Safety Code sections 25500 to 25541	These sections require a Hazardous Material Business Plan detailing emergency response plans for hazardous materials emergency at a facility.
Local (or locally enforced)	
Riverside County Ordinance 457	Adopts specific building, mechanical, plumbing, and electrical codes from sources such as the California Building Standards Commission with county-specific modifications.
Riverside County Ordinance 787	Adopts the 2007 edition of the California Fire Code and portions of the 2007 edition of the California Building Code with county-specific modifications.

Riverside County Ordinance 615	Establishes requirements for the use, generation, storage and disposal of hazardous materials within the County.
Riverside County Dept. of Environmental Health, Hazardous Materials Releases	Adopts State requirements and guidelines to govern hazardous materials release response plans and inventories.

C.14.4 PROPOSED PROJECT

C.14.4.1 SETTING AND EXISTING CONDITIONS

The proposed facility would be located in Riverside County approximately 25 miles west of the City of Blythe and 27 miles east of Desert Center, and would consist of two units producing a total output of 250 MW. Fire support services to the site would be under the jurisdiction of the Riverside County Fire Department (RCFD). The closest RCFD fire station would be Blythe Air Base Station #45, located about 15 miles east of the GSEP. The estimated response time from the moment of dispatch is about 23 minutes. The next closest station would be Lake Tamarisk Station #49, located about 35 miles west of the GSEP with a response time of about 35 minutes. RCFD fire stations are staffed full-time with a minimum of three personnel per shift which include paramedics (RCFD 2010).

The applicant has stated that certain plant personnel would be trained as a hazardous materials response team and that one or more spill response kits would be available on-site (GSEP 2009a, Section 5.12.3.2). In the event of a large incident involving hazardous materials, backup support would be provided by the RCFD which has a hazmat response unit capable of handling any incident at the proposed GSEP. The nearest hazmat response team is located in Palm Desert, about 90 miles west of the project site, and would respond within 1.5-2 hours (GSEP 2009a, Section 5.8.1.6 and RCFD 2010).

Worker Safety and Fire Protection Table 2
Fire and Emergency Response for the GSEP*

RCFD Station	Response Time**	Distance to GSEP	EMS/HazMat Capability***
Blythe Air Base Station #45	~28 minutes	~15 miles	Y/Y
Lake Tamarisk Station #49	~40 minutes	~35 miles	Y/Y

*Source: E-mail communications with the RCFD (RCFD 2010a)
**Response times are estimated from the moment of dispatch.
***All personnel are trained to Emergency Medical Technician (EMT-1) level and first responder for hazardous materials incidents.

In addition to construction and operations worker safety issues, the potential exists for exposure to contaminated soil during site preparation. The Phase I Environmental Site

Assessment conducted for this site in 2009 found no “Recognized Environmental Conditions” per the American Society for Testing and Materials Standards (ASTM) definition. That is, there was no evidence or record of any use, spillage, or disposal of hazardous substances on the site, nor was there any other environmental concern that would require remedial action (GSEP 2009a, Section 5.13.1.3). To address the unlikely possibility that soil contamination would be encountered during construction of the GSEP, proposed Conditions of Certification **Waste-1** and **Waste-2** require a registered professional engineer or geologist to be available during soil excavation and grading to ensure proper handling and disposal of contaminated soil. See the staff assessment section on **WASTE MANAGEMENT** for a more detailed analysis of this topic.

Another potential hazard present at this site is the likelihood of encountering unexploded ordnance (UXOs) left over from large scale military training exercises conducted near the California-Arizona border between 1942 and 1945 and in 1964. The applicant stated that a geophysical survey to identify UXO may be conducted (GSEP 2009a, Section 5.13.1.3). In response the Data Requests 226 and 227, the applicant stated that during the biological and cultural resource surveys conducted over several weeks at the GSEP site, a large number of staff combed the surface of the entire GSEP site and found only one 50 caliber cartridge. Therefore the applicant does not believe additional investigations or a UXO Neutralization/Removal Plan are necessary. The applicant noted that a training program for identifying UXO would be implemented during construction which would be sufficient to ensure proper handling of UXO in the unlikely event of encountering any (GSEP 2009f, Data Response Items 226 and 227).

C.14.4.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Worker Safety

Industrial environments are potentially dangerous during construction and operation of facilities. Workers at the proposed GSEP would be exposed to loud noises, moving equipment, trenches, and confined space entry and egress problems. The workers may experience falls, trips, burns, lacerations, and numerous other injuries. They have the potential to be exposed to falling equipment or structures, chemical spills, hazardous waste, fires, explosions, and electrical sparks and electrocution. It is important for the GSEP to have well-defined policies and procedures, training, and hazard recognition and control at its facility to minimize such hazards and protect workers. If the facility complies with all LORS, workers will be adequately protected from health and safety hazards.

A Safety and Health Program would be prepared by the applicant to minimize worker hazards during construction and operation. Staff uses the phrase “Safety and Health Program” to refer to the measures that would be taken to ensure compliance with the applicable LORS during the construction and operational phases of the project.

Construction Safety and Health Program

Workers at the GSEP would be exposed to hazards typical of construction and operation of a solar thermal electric power generating facility.

Construction Safety Orders are published at Title 8 California Code of Regulations sections 1502, et seq. These requirements are promulgated by Cal/OSHA and would be applicable to the construction phase of the project. The Construction Safety and Health Program would include the following:

- Construction Injury and Illness Prevention Program (8 Cal Code Regs. § 1509)
- Construction Fire Prevention Plan (8 Cal Code Regs. § 1920)
- Personal Protective Equipment Program (8 Cal Code Regs. §§ 1514 — 1522)
- Emergency Action Program and Plan

Additional programs under General Industry Safety Orders (8 Cal Code Regs. §§ 3200 to 6184), Electrical Safety Orders (8 Cal Code Regs. §§2299 to 2974) and Unfired Pressure Vessel Safety Orders (8 Cal Code Regs. §§ 450 to 544) would include:

- Electrical Safety Program
- Motor Vehicle and Heavy Equipment Safety Program
- Forklift Operation Program
- Excavation/Trenching Program
- Fall Protection Program
- Scaffolding/Ladder Safety Program
- Articulating Boom Platforms Program
- Crane and Material Handling Program
- Housekeeping and Material Handling and Storage Program
- Respiratory Protection Program
- Employee Exposure Monitoring Program
- Hand and Portable Power Tool Safety Program
- Hearing Conservation Program
- Back Injury Prevention Program
- Hazard Communication Program
- Heat and Cold Stress Monitoring and Control Program
- Pressure Vessel and Pipeline Safety Program

The Application for Certification (AFC) includes adequate outlines of each of the above programs (GSEP 2009a, Section 5.14.1.2). Prior to the start of construction of GSEP, detailed programs and plans would be provided to the California Energy Commission Compliance Project Manager (CPM) and to the RCFD pursuant to the Condition of Certification **WORKER SAFETY-1**.

Operations and Maintenance Safety and Health Program

Prior to the start of operations at GSEP, the Operations and Maintenance Safety and Health Program would be prepared. This operational safety program would include the following programs and plans:

- Injury and Illness Prevention Program (8 Cal Code Regs. § 3203)
- Fire Protection and Prevention Program (8 Cal Code Regs. § 3221)
- Personal Protective Equipment Program (8 Cal Code Regs. §§ 3401 to 3411)
- Emergency Action Plan (8 Cal Code Regs. § 3220)

In addition, the requirements under General Industry Safety Orders (8 Cal Code Regs. §§ 3200 to 6184), Electrical Safety Orders (8 Cal Code Regs. §§2299 to 2974) and Unfired Pressure Vessel Safety Orders (8 Cal Code Regs. §§ 450 to 544) would be applicable to the project. Written safety programs for GSEP, which the applicant would develop, would ensure compliance with the above-mentioned requirements.

The AFC includes adequate outlines of the Injury and Illness Prevention Program, Emergency Action Plan, Fire Prevention Program, and Personal Protective Equipment Program (GSEP 2009a, Sections 5.14.1.2 and 5.14.1.3). Prior to operation of GSEP, all detailed programs and plans would be provided to the CPM and RCFD pursuant to Condition of Certification **WORKER SAFETY-2**.

Safety and Health Program Elements

As mentioned above, the applicant provided the proposed outlines for both a Construction Safety and Health Program and an Operations Safety and Health Program. The measures in these plans are derived from applicable sections of state and federal law. Both safety and health programs would be comprised of six more specific programs and would require major items detailed in the following paragraphs.

Injury and Illness Prevention Program

The IIPP would include the following components as presented in the AFC (GSEP 2009a, Section 5.14.1.2):

- identity of person(s) with authority and responsibility for implementing the program;
- safety and health policy of the plan;
- definition of work rules and safe work practices for construction activities;
- system for ensuring that employees comply with safe and healthy work practices;
- system for facilitating employer-employee communications;
- procedures for identifying and evaluating workplace hazards and developing necessary program(s);
- methods for correcting unhealthy/unsafe conditions in a timely manner;
- safety procedures; and
- training and instruction.

Fire Prevention Plan

California Code of Regulations requires an Operations Fire Prevention Plan (8 Cal Code Regs. § 3221). The AFC outlines a proposed Fire Prevention Plan which is acceptable to staff (GSEP 2009a, Section 5.14.1.3). The plan would accomplish the following:

- determine general program requirements (scope, purpose, and applicability);
- determine potential fire hazards;
- develop good housekeeping practices and proper handling and materials storage;
- determine potential ignition sources and control measures for these sources;
- determine persons responsible for equipment and system maintenance;
- locate portable and fixed fire-fighting equipment in suitable areas;
- establish and determine training and instruction requirements; and
- define recordkeeping requirements.

Staff proposes that the applicant submit a final Fire Prevention Plan to the CPM for review and approval and to the RCFD for review and comment to satisfy proposed Conditions of Certification **WORKER SAFETY-1** and **WORKER SAFETY-2**.

Personal Protective Equipment Program

California regulations require Personal Protective Equipment (PPE) and first aid supplies whenever hazards are present that, due to process, environment, chemicals or mechanical irritants, can cause injury or impair bodily function as a result of absorption, inhalation, or physical contact (8 Cal Code Regs. §§ 3380 to 3400). The GSEP operational environment would require PPE.

All safety equipment must meet National Institute of Safety and Health (NIOSH) or American National Standards Institute (ANSI) standards and would carry markings, numbers, or certificates of approval. Respirators must meet NIOSH and Cal/OSHA standards. Each employee must be provided with the following information pertaining to the protective clothing and equipment:

- proper use, maintenance, and storage;
- when to use the protective clothing and equipment;
- benefits and limitations; and
- when and how to replace the protective clothing and equipment.

The PPE Program ensures that employers comply with the applicable requirements for PPE and provides employees with the information and training necessary to protect them from potential workplace hazards.

Emergency Action Plan

California regulations require an Emergency Action Plan (8 Cal Code Regs. § 3220). The AFC contains a satisfactory outline for an emergency action plan (GSEP 2009a, Section 5.14.1.3).

The outline lists plans to accomplish the following:

- establish scope, ,purpose, and applicability;
- identify roles and responsibilities;
- determine emergency incident response training;
- develop emergency response protocols;
- specify evacuation protocols;
- define post emergency response protocols; and
- determine notification and incident reporting.

Written Safety Program

In addition to the specific plans listed above, additional LORS called *safe work practices* apply to the project. Both the Construction and the Operations Safety Programs would address safe work practices under a variety of programs. The components of these programs include, but are not limited to, the programs found under the heading "Construction Safety and Health Program" in this **Worker Safety and Fire Protection** section.

Safety Training Programs

Employees would be trained in the safe work practices described in the above-referenced safety programs.

Additional Safety Issues

This solar power plant will present a unique work environment that includes a solar field located in the high desert. The solar field features thousands of mirrors that heat a heat transfer fluid (HTF) to approximately 750°F. The pipe containing the HTF will reach temperatures at the mirror focal point as high as 1100 °F. Experience at existing solar generating stations shows that these mirrors break, the pipes age, and HTF can leak and catch fire from ball joints or frayed flex hoses. The area under the solar arrays must be kept free from weeds and thus herbicides will be applied as necessary. Exposure to workers via inhalation and ingestion of dusts containing herbicides poses a health risk. Finally, workers will inspect the solar array for HTF leaks and broken mirrors at least once each day by driving up and down dirt paths between the rows of mirrors and even under the mirrors. Cleaning the mirrors will also be conducted on a routine schedule. All these activities will take place year-round and especially during the summer months of peak solar power generation, when outside ambient temperatures routinely reach 115 °F and above.

The applicant has indicated that workers will be adequately trained and protected, but has not included precautions against heat stress and exposure to herbicides. Therefore,

to ensure that workers are indeed protected, staff has proposed additional requirements to proposed Conditions of Certification **WORKER SAFETY-1** and **2**. These requirements consist of the following provisions:

- A worker heat stress protection plan that implements and expands on existing Cal OSHA regulations (8 CCR 3395) requiring heat illness prevention; and
- The development and implementation of Best Management Practices (BMP) for the storage and application of herbicides used to control weeds beneath and around the solar array.

Staff believes that effective implementation of a Heat Stress Protection Plan will mitigate the potential for significant risks to workers from heat during both construction and operations. A BMP requiring proper herbicide storage and application will mitigate potential risks to workers from exposure to herbicides and reduce the chance that herbicides will contaminate either surface water or groundwater. Staff suggests that a BMP follow either the guidelines established by the U.S. EPA (EPA 1993), or more recent guidelines established by the State of California or U.S. EPA.

Additional Mitigation Measures

Protecting construction workers from injury and disease is among the greatest challenges in occupational safety and health. The following facts are reported by the National Institute for Occupational Safety and Health (NIOSH):

- More than 7 million persons work in the construction industry, representing 6 percent of the labor force. Approximately 1.5 million of these workers are self-employed.
- Of approximately 600,000 construction companies, 90 percent employ fewer than 20 workers. Few have formal safety and health programs.
- From 1980 to 1993, an average of 1,079 construction workers were killed on the job each year—more fatal injuries than in any other industry.
- Falls caused 3,859 construction worker fatalities (25.6 percent) between 1980 and 1993.
- Construction injuries account for 15 percent of workers' compensation costs.
- Assuring safety and health in construction is complex, involving short-term work sites, changing hazards, and multiple operations and crews working in close proximity.
- In 1990, Congress directed NIOSH to undertake research and training to reduce diseases and injuries among construction workers in the United States. Under this mandate, NIOSH funds both intramural and extramural research projects.

The hazards associated with the construction industry are thus well documented. These hazards increase in complexity in the multi-employer worksites typical of large, complex, industrial-type projects such as the construction of solar power plants. In order to reduce and/or eliminate these hazards, it has become standard industry practice to hire a Construction Safety Supervisor to ensure a safe and healthful environment for all personnel. That this standard practice has reduced and/or eliminated hazards has been evident in the audits staff recently conducted of power plants under construction. The

federal Occupational Safety and Health Administration (OSHA) has also entered into strategic alliances with several professional and trade organizations to promote and recognize safety professionals trained as Construction Safety Supervisors, Construction Health and Safety Officers, and other professional designations. The goal of these partnerships is to encourage construction subcontractors in four areas:

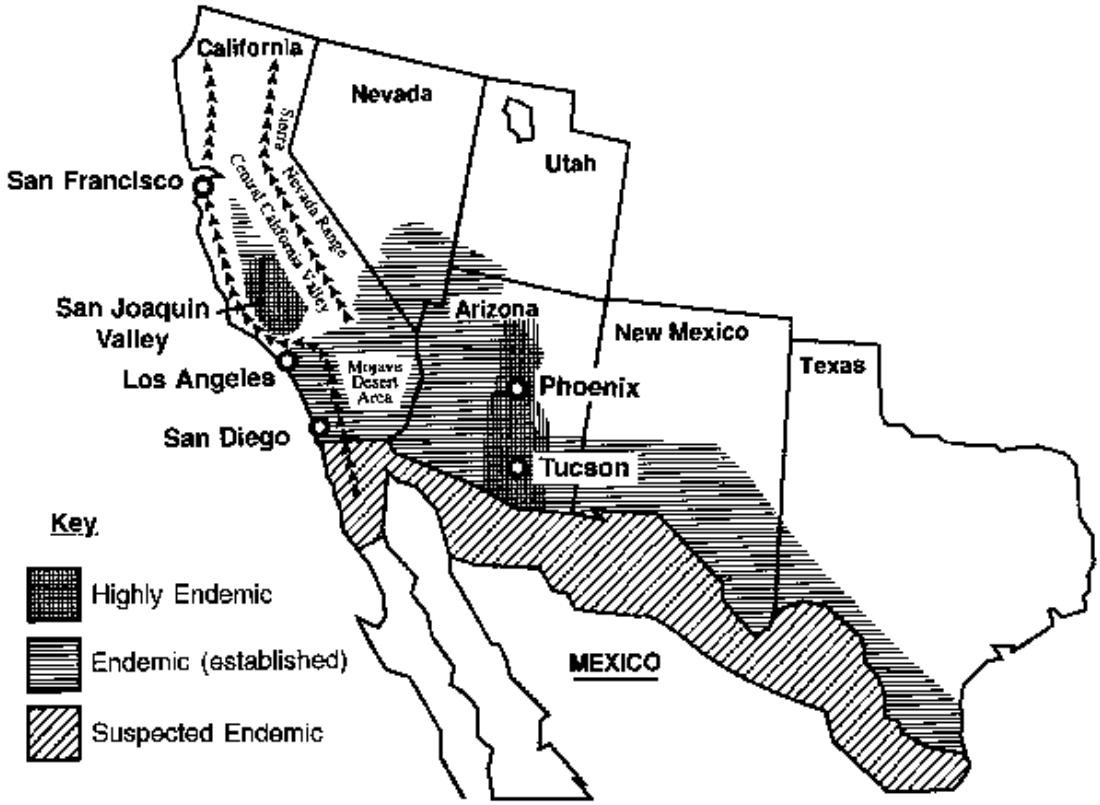
- to improve their safety and health performance;
- to assist them in striving for the elimination of the four hazards (falls, electrical, caught in/between and struck-by hazards), which account for the majority of fatalities and injuries in this industry and have been the focus of targeted OSHA inspections;
- to prevent serious accidents in the construction industry through implementation of enhanced safety and health programs and increased employee training; and
- to recognize those subcontractors with exemplary safety and health programs.

To date, there are no OSHA or Cal/OSHA requirements that an employer hire or provide for a Construction Safety Officer. OSHA and Cal/OSHA regulations do, however, require that safety be provided by an employer and the term *Competent Person* is used in many OSHA and Cal/OSHA standards, documents, and directives. A Competent Person is usually defined by OSHA as an individual who, by way of training and/or experience, is knowledgeable of standards, is capable of identifying workplace hazards relating to the specific operations, is designated by the employer, and has authority to take appropriate action. Therefore, in order to meet the intent of the OSHA standard to provide for a safe workplace during power plant construction, staff proposes Condition of Certification **WORKER SAFETY-3,** which would require the applicant/project owner to designate and provide for a power plant site Construction Safety Supervisor.

As discussed above, the hazards associated with the construction industry are well documented. These hazards increase in complexity in the multi-employer worksites typical of large, complex, industrial-type projects such as the construction of solar power plants.

Accidents, fires, and a worker death have occurred at Energy Commission-certified power plants in the recent past due to the failure to recognize and control safety hazards and the inability to adequately supervise compliance with occupational safety and health regulations. Safety problems have been documented by Energy Commission staff in safety audits conducted in 2005 at several power plants under construction. The findings of the audit staff include, but are not limited to, such safety oversights as:

- lack of posted confined space warning placards/signs;
- confusing and/or inadequate electrical and machinery lockout/tagout permitting and procedures;
- confusing and/or inappropriate procedures for handing over lockout/tagout and confined space permits from the construction team to commissioning team and then to operations;
- dangerous placement of hydraulic elevated platforms under each other;



- inappropriate placement of fire extinguishers near hotwork;
- dangerous placement of numerous power cords in standing water on the site, thus increasing the risk of electrocution;
- construction of an unsafe aqueous ammonia unloading pad;
- inappropriate and unsecure placement of above-ground natural gas pipelines inside the facility but too close to the perimeter fence; and
- lack of adequate employee- or contractor-written training programs addressing proper procedures to follow in the event of finding suspicious packages or objects either on or off site.

In order to reduce and/or eliminate these hazards, it is necessary for the Energy Commission to have a professional Safety Monitor on site to track compliance with Cal/OSHA regulations and periodically audit safety compliance during construction, commissioning, and the hand-over to operational status. These requirements are outlined in Condition of Certification **WORKER SAFETY-4**. A Safety Monitor, hired by the project owner, yet reporting to the Chief Building Official (CBO) and CPM, will serve as an “extra set of eyes” to ensure that safety procedures and practices are fully implemented at all power plants certified by the Energy Commission. During the audits conducted by staff, most site safety professionals welcomed the audit team and actively engaged it in questions about the team’s findings and recommendations. These safety professionals recognized that safety requires continuous vigilance and that the presence of an independent audit team provided a fresh perspective of the site.

Valley Fever (Coccidioidomycosis)

Coccidioidomycosis or "Valley Fever" (VF) is primarily encountered in southwestern states, particularly in Arizona and California. It is caused by inhaling the spores of the fungus Coccidioides immitis, which are released from the soil during soil disturbance (e.g., during construction activities) or wind erosion. The disease usually affects the lungs and can have potentially severe consequences, especially in at-risk individuals such as the elderly, pregnant women, and people with compromised immune systems. Trenching, excavation, and construction workers are often the most exposed population. Treatment usually includes rest and antifungal medications. No effective vaccine currently exists for Valley Fever. VF is endemic to the San Joaquin Valley in California, which presumably gave this disease its common name. In California, the highest VF rates are recorded in Kern, Kings, and Tulare Counties, followed by Fresno and San Luis Obispo Counties. LA County, San Diego County, San Bernardino County, and Riverside County also have reported VF cases although much fewer.

Worker Safety and Fire Protection Figure 1. The geographic distribution of coccidioidomycosis*

*Source: CDC 2006, Figure 2

A 2004 CDC report found that the number of reported cases of coccidioidomycosis in the US increased by 32% during 2003-2004, with the majority of these cases occurring in California and Arizona. The report attributed these increases to changes in land use, demographics, and climate in endemic areas, although certain cases might be attributable to increased physician awareness and testing (CDC 2006). According to the CDC Morbidity and Mortality Weekly Report of February 2009, incidences of valley fever have increased steadily in Arizona and California in the past decade. Cases of coccidioidomycosis averaged about 2.5 per 100,000 population annually from 1995 to 2000 and increased to 8.0 per 100,000 population between 2000 and 2006 (incident rates tripled). In 2007 there was a slight drop in cases, but the rate was still the highest it has been since 1995. The report identified Kern County as having the highest incidence rates (150.0 cases per 100,000 population), and non-Hispanic blacks having the highest hospitalization rates (7.5 per 100,000 population). In addition, between the years 2000 and 2006, the number of valley fever related hospitalizations climbed from 1.8 to 4.3 per 100,000 population (611 cases in 2000 to 1,587 cases in 2006) and then decreased to 1,368 cases in 2007 (3.6 per 100,000 population). Overall in California, during 2000-2007, a total of 752 (8.7%) of the 8,657 persons hospitalized for coccidioidomycosis died (CDC 2009).

A 2007 study published in the Emerging Infectious Diseases journal of the Center for Disease Control and Prevention (CDC), found the frequency of hospitalization for coccidioidomycosis in the entire state of California to be 3.7 per 100,000 residents per year for the period between 1997 and 2002 (see Table 1 below). There were 417 deaths from VF in California in those years, resulting in a mortality rate of 2.1 per 1 million California residents annually.

Worker Safety and Fire Protection Table 3: Hospitalizations for coccidioidomycosis, California, 1997–2002*

Category	Total hospitalizations	Total person-yrs (× 10^6)	Frequency of hospitalization**	Frequency of hospitalization for coccidioidal meningitis**
Total	7,457	203.0	3.67	0.657
Year				
1997	1,269	32.5	3.90	0.706
1998	1,144	32.9	3.50	0.706
1999	1,167	33.4	3.5	0.61
2000	1,100	34.0	3.23	0.62
2001	1,291	34.7	3.7	0.58
2002	1,486	35.3	4.2	0.71
Highest incidence counties				
Kern	1,700	3.97	42.8	
Tulare	479	2.21	21.7	
Kings	133	0.77	17.4	
SLO	170	1.48	11.5	

*Source: Flaherman 2007 **Per 100,000 residents per year

Riverside County has approximately 50 cases of VF per year (population is roughly 2 million) while nearby San Diego County has about 120 cases per year (population roughly 3 million). In comparison, an average of over 1,000 cases have been reported annually in Kern County during the last five years. Cases of VF in Riverside County have remained steady in the past several years, fluctuating only slightly between 48 and

55 cases per year. Nine deaths related to VF have been reported in Riverside County between 2005 and 2008 (Williams 2009). A rate of 50 cases per year per 2,000,000 persons corresponds to a risk of about 25 in one million and a rate of 2.5 cases per 100,000 persons, which is lower than the average rate for the entire state of California (~3.6 cases per 100,000 residents). Data received from the Riverside County Department of Public Health indicates that the crude VF rate in Riverside County between 1999 and 2006 has been even lower, about 15 per 100,000 residents. The region in which the GSEP project would be located (between Blythe and Dessert Center) has recorded 5 or fewer cases between 1999 and 2006 (RCDPH 2007).

Worker Safety and Fire Protection Table 4: Valley Fever rates in Riverside County

11/19/2007			

A 1996 paper that tried to explain the sudden increase in Coccidioidomycosis cases that began in the early 90s found that the San Joaquin Valley in California has the largest population of C. immitis, which is found to be distributed unevenly in the soil and seems

to be concentrated around animal burrows and ancient Indian burial sites. It is usually found 4 to 12 inches below the surface of the soil. The paper also reported that incidences of coccidioidomycosis vary with the seasons; with highest rates in late summer and early fall when the soil is dry and the crops are harvested. Dust storms are frequently followed by outbreaks of coccidioidomycosis (Kirkland 1996). A modeling attempt to establish the relationship between fluctuations in VF incident rates and weather conditions in Kern County found that there is only a weak connection between weather and VF cases (weather patterns correlate with up to 4% of outbreaks). The study concluded that the factors that cause fluctuations in VF cases are not weather-related but rather biological and anthropogenic (i.e. human activities, primarily construction on previously undisturbed soil) (Talamantes 2007).

During correspondence with Dr. Michael MacLean of the Kings County Health Department, he noted that according to his experience and of those who study VF, it is very hard to find the fungus in soil that was previously farmed and irrigated, which greatly reduces the risk of infection resulting from disturbance of farmed lands. This does not apply to previously undisturbed lands where excavation, grading, and construction may correlate with increases in VF cases. Dr. MacLean feels that with the current state of knowledge, we can only speculate on the causes and trends influencing VF cases and he does not feel that construction activities are necessarily the cause of VF outbreaks (KCEHS 2009).

Valley Fever is spread through the air. If soil containing the fungus is disturbed by construction, natural disasters, or wind, the fungal spores get into the air where people can breathe in the spores. The disease is not spread from person to person. Occupational or recreational exposure to dust is an important consideration. Agricultural workers, construction workers, or others (such as archeologists) who dig in the soil in the disease-endemic area of the Central Valley are at the highest risk for the disease (CDC 2006; CDHS 2010). The risk for disseminated coccidioidomycosis is much higher among some ethnic groups, particularly African-Americans and Filipinos. In these ethnic groups, the risk for disseminated coccidioidomycosis is tenfold that of the general population (CDC 2006).

Worker Safety and Fire Protection Table 5: Disease Forms of Valley Fever

CATEGORIES	NOTES
Asymptomatic	• Occurs in about 50% of patients
Acute Symptomatic	• Pulmonary syndrome that combines cough, chest pain, shortness of breath, fever, and fatigue. • Diffuse pneumonia affects immunosuppressed individuals • Skin manifestations include fine papular rash, erythema nodosum, and erythema multiforme • Occasional migratory arthralgias and fever
Chronic Pulmonary	• Affects between 5 to 10% of infected individuals • Usually presents as pulmonary nodules or peripheral thin-walled cavities
Extrapulmonary/Disseminated Varieties	
Chronic skin disease	• Keratotic and verrucose ulcers or subcutaneous fluctuant abscesses
Joints / Bones	• Severe synovitis and effusion that may affect knees, wrists, feet, ankles, and/or pelvis • Lytic lesions commonly affecting the axial skeleton
Meningeal Disease	• The most feared complication • Presenting with classic meningeal symptoms and signs • Hydrocephalus is a frequent complication
Others	• May affect virtually any organ, including thyroid, GI tract, adrenal glands, genitourinary tract, pericardium, peritoneum

Given the available scientific and medical literature on Valley Fever, it is difficult for staff to assess the potential for VF to impact workers during construction and operation of the

proposed GSEP with a reasonable degree of certainty. To minimize potential exposure of workers and also the public to coccidioidomycosis during soil excavation and grading, extensive wetting of the soil prior to and during construction activities should be employed and dust masks should be worn at certain times during these activities. The dust (PM10) control measures found in the Air Quality section of this SA/DPA/DEIS should be strictly adhered to in order to adequately reduce the risk of workers contracting VF. To provide additional protection to workers that could experience elevated exposure during construction activities, staff proposes Condition of Certification **WORKER SAFETY-9** which would require that the dust control measures found in proposed Conditions **AQ-SC3** and **AQ-SC4** be supplemented with additional requirements.

Fire Hazards

During construction and operation of the proposed GSEP project, there is the potential for both small fires and major structural fires. Electrical sparks, combustion of fuel oil, hydraulic fluid, mineral oil, insulating fluid at the power plant switchyard or flammable liquids, explosions, and over-heated equipment, may cause small fires. Major structural fires in areas without automatic fire detection and suppression systems are unlikely to develop at power plants. Fires of heat transfer fluid such as that proposed for use in the solar panels at GSEP are rare. Compliance with all LORS would be adequate to assure protection from all fire hazards.

Staff reviewed the information provided in the AFC and spoke to representatives of the RCFD to determine if available fire protection services and equipment would adequately protect workers and to determine the project's impact on fire protection services in the area. The project will rely on both on-site fire protection systems and local fire protection services. The on-site fire protection system provides the first line of defense for small fires. In the event of a major fire, fire support services, including trained firefighters and equipment for a sustained response, would be provided by the RCFD (RCFD 2010).

Construction

During construction, the permanent fire protection systems proposed for the GSEP would be installed as soon as practical; until then portable fire extinguishers would be placed throughout the site at appropriate intervals and periodically maintained. Safety procedures and training would be implemented according to the guidelines of the Construction Fire Protection and Prevention Plan (GSEP 2009a, Section 5.14.1.2).

Operation

The information in the AFC indicates that the project intends to meet the fire protection and suppression requirements of the 2007 California Fire Code, all applicable recommended NFPA standards (including Standard 850 addressing fire protection at electric generating plants), and all Cal/OSHA requirements, with the exception of providing a secondary access point for emergency response vehicles. Both the California Fire Code (24 CCR Part 9, chapter 5, section 503.1.2) and the Uniform Fire Code (sections 901 and 902) require that access to the site be reviewed and approved by the fire department. All power plants licensed by the Energy Commission have more than one access point to the power plant site. This is sound fire safety procedure and allows for fire department vehicles and personal to access the site should the main gate

be blocked. The proposed GSEP has only one access point, that being through the main gate located near the southeast corner of Unit 2 (via a new public road from I-10), and the AFC makes no mention of a secondary access point through the perimeter fence (GSEP 2009a, Section 3.5.5 and Figure 3.4-1). Staff finds that a second access point is necessary to ensure fire department access. This access point can be restricted to emergency use only and, if possible, should be equipped with the fire department's Opticom System for remote keyless entry. Therefore, in order to comply with the requirements of LORS, staff proposes a Condition of Certification **WORKER SAFETY-6** that would require the project owner to identify and provide a second access point to the site for emergency vehicles and equip this secondary gate with either the Opticom System or a keypad for fire department personnel to open the gate.

Fire suppression elements in the proposed plant would include both fixed and portable fire extinguishing systems. The fire water would be supplied from on-site wells and stored in two water storage tanks (one per unit) with a dedicated fire protection supply of 360,000 gallons in each. One electric and one diesel-fueled backup firewater pump would supply water to each unit's fire protection loop and two electric jockey pumps would maintain pressure in the systems (GSEP 2009a, Section 5.14.1.3).

Fire hydrants would be installed throughout the site per NFPA requirements and a sprinkler deluge system would be installed in areas of risk including each unit's transformer, HTF expansion tank, and HTF circulating pump area. A sprinkler system would be installed at the STG and in administrative buildings. In addition to the fixed fire protection system, appropriate class of service portable extinguishers and fire hydrants/hose stations would be located throughout the facility at code-approved intervals. The solar fields would be protected by isolation valves that would allow only a finite amount of HTF to burn before extinguishing (GSEP 2009a, Section 5.14.1.3).

According to NFPA standards and UFC requirements, the fire protection system must have fire detection sensors and monitoring equipment that would trigger alarms and automatically actuate the suppression systems. Staff has determined that these systems will ensure adequate fire protection.

The applicant would be required by Conditions of Certification **WORKER SAFETY-1** and**-2** to provide the final Fire Protection and Prevention Program to staff and to the RCFD prior to construction and operation of the project to confirm the adequacy of the proposed fire protection measures.

In two letters from the RCFD (RCFD 2010a and 2010b), Captain Neuman of the RCFD has stated that the GSEP would have an impact on Riverside County Fire Department's ability to respond to fire, HazMat, and EMS emergencies at the GSEP. He also stated that the three solar projects proposed for the I-10 corridor (Blythe, Genesis, and Palen) would also have a cumulative adverse impact on the RCFD's ability to provide an acceptable level of service. The RCFD based its analysis on their categories of industrial facilities, the type and level of service needed for projects in each category, the appropriate response times needed for each category, and the level of response required for the GSEP. The RCFD determined that, due to the remote location of the GSEP and the other two solar power plants and the expansive nature of solar arrays at the GSEP, the response time from the RCFD's existing facilities would be inadequate

and that a new fire station more closely located to these solar power plants and adequately equipped and staffed would be necessary.

Staff has considered the position of the RCFD and all relevant information as well as past experience at existing solar power plants that are similar to the proposed project. The proposed facility would be located in an area that is currently served by the Riverside County Fire Department (RCFD). The fire, HazMat, and EMS needs at the proposed plant are real and would pose significant added demands on local fire protection services. In addition, staff finds that the RCFD's Hazmat Response Team is not adequately equipped and staffed to respond to hazardous materials incidents at the proposed facility with an adequate response time. Staff concurs with the assessment of the RCFD and has determined that the GSEP would cause a significant individual and cumulative impact on the local fire department.

Regarding potential mitigation, Captain Neuman implied that, in general, the impacts could be mitigated at least in part to a level of insignificance if the developers of all three proposed solar projects participate in the "Development Impact Fee Programs" adopted by the Riverside County Board of Supervisors. In two personal communications via telephone (February 10, 2010), staff discussed these impacts and the potential for mitigation with Captain Neuman and Mr. Ross of the Riverside County Planning Department. It appears uncertain whether the solar power plants located on Federal BLM land would be required to participate in the County's fee program. Therefore, staff is proposing that the GSEP be required to fund fire department capital improvements in the amount of $350,000 and to make an annual payment of $100,000 to mitigate both its individual impact on the fire department and its share of a cumulative impact on the fire department. Staff is proposing that the other two solar projects make the same payments.

Emergency Medical Services Response

Staff conducted a statewide survey to determine the frequency of Emergency Medical Services (EMS) response and off-site fire-fighter response for natural gas-fired power plants in California. The purpose of the analysis was to determine what impact, if any, power plants may have on local emergency services. Staff has concluded that incidents at power plants that require fire or EMS response are infrequent and represent an insignificant impact on the local fire departments, except for rare instances where a rural fire department has mostly volunteer fire-fighting staff. However, staff has determined that the potential for both work-related and non-work-related heart attacks exists at power plants. In fact, staff's research on the frequency of EMS response to gas-fired power plants shows that many of the responses for cardiac emergencies involved non-work-related incidences, including those involving visitors.

The need for prompt response within a few minutes is well documented in the medical literature. Staff believes that the quickest medical intervention can only be achieved with the use of an on-site automatic external defibrillator (AED); the response from an off-site provider would take longer regardless of the provider location. This fact is also well documented and serves as the basis for many private and public locations (e.g., airports, factories, government buildings) maintaining on-site cardiac defibrillation devices. Therefore, staff concludes that, with the advent of modern cost-effective

cardiac defibrillation devices, it is proper in a power plant environment to maintain such a device on site in order to treat cardiac arrhythmias resulting from industrial accidents or other non-work related causes.

Staff proposes Condition of Certification **WORKER SAFETY-5,** which would require that a portable AED be located on site, that all power plant employees on site during operations be trained in its use, and that a representative number of workers on site during construction and commissioning also be trained in its use.

Closure and Decommissioning Impacts and Mitigation

Closure of the proposed GSEP (temporary or permanent) would follow a facility closure plan prepared by the applicant and designed to minimize public health and environmental impacts. Staff expects that impacts from the closure and decommissioning process would represent a fraction of the impacts associated with the construction or operation of the proposed GSEP. Therefore based on staff's analysis for the construction and operation phases of this project, staff concludes that hazardous materials-related impacts from closure and decommissioning of the GSEP would be insignificant.

C.14.4.3 CEQA LEVEL OF SIGNIFICANCE

Staff's analysis of Worker Safety and Fire Protection impacts from the proposed GSEP has determined that impacts would be below the level of significance if the proposed mitigation is implemented.

C.14.5 REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would essentially be Unit 1 of the proposed project, including a 125 MW solar facility located within the boundaries of the proposed project as defined by NextEra. This alternative is analyzed for two major reasons: (1) it eliminates about 50 percent of the proposed project area so impacts are reduced, and (2) by eliminating the eastern solar field, which is located on flowing desert washes, it would reduce impacts to the sand dune and playa areas and to the Mojave Fringe-toed Lizard habitat. The alternative would also reduce impacts to wildlife movement by reducing obstruction of the Palen wash and would maintain, thru both fluvial and Aeolian processes, the dune and sandy habitats. The boundaries of the Reduced Acreage Alternative are shown in **Alternatives Figure 1**.

C.14.5.1 SETTING AND EXISTING CONDITIONS

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates effects to the eastern 125 MW solar field and relocates the gas yard approximately 1.75 miles northwest of its present location. As a result, the environmental setting consists of the western portion of the proposed project, as well as the area affected by the linear project components.

C.14.5.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Construction of the Reduced Acreage Alternative is likely to require fewer employees which would reduce the impacts to worker safety. Similarly, this alternative may have reduced impacts in the area of fire protection due to the smaller amounts of flammable/hazardous materials and potential ignition sources that would exist with this alternative. However, the reduced impacts in the area of Worker Safety and Fire Protection would be minor, and staff has determined that the project as proposed would have less than significant impacts in the area of Worker Safety and Fire Protection if the proposed mitigation is implemented. Therefore the Reduced Acreage Alternative is not preferable over the project as proposed.

C.14.5.3 CEQA LEVEL OF SIGNIFICANCE

Staff has determined that impacts in the area of Worker Safety and Fire Protection associated with either the GSEP as proposed or the Reduced Acreage Alternative would be below the CEQA level of significance. The same conditions of certification would be required for the Reduced Acreage Alternative and the project as proposed.

C.14.6 DRY COOLING ALTERNATIVE

This section identifies the potential impacts of using air-cooled condenser (ACC) systems rather than the cooling towers proposed by NextEra for the Genesis project. It is assumed that the ACC systems would be located where the cooling towers are currently proposed for each of the two 125 MW power block, as illustrated in **Alternatives Figure 2** (see Section B.3).

Approximately 18 ACC fans would be required for each of the two solar fields. The 18 fans, or ACC's, would operate when the ambient temperature is above 50 degrees Fahrenheit. When the temperature is below 50 degrees Fahrenheit, only 10 of the fans would be used (GSEP 2009f). The 18 ACC fans described in the GSEP cooling study would have a length of approximately 279 feet, a width of approximately 127 feet, and a height of 98 feet (GSEP 2009f). However, based on the ACC preliminary designs for nearby solar thermal projects in similar ambient temperatures, an additional 11,690 square feet could be required for siting of the fans and the fans would be up to 120 feet in height. In addition to the ACC fans, NextEra would use a small Wet Surface Air Cooler when needed to provide auxiliary cooling during extremely hot days (GSEP 2009f). This alternative is analyzed because it would reduce the amount of water required for steam turbine cooling from 822 acre-feet per year (AFY) to 66 AFY. This reduction in water use would reduce impacts to water and biological resources but not have any impact on worker safety and fire protection.

C.14.6.1 Setting and Existing Conditions

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates the use of wet-cooling towers and incorporated the use of air-cooled condensers (ACC) in the same location. As a result, the environmental setting would be the same as for the proposed project.

C.14.6.2 Assessment of Impacts and Discussion of Mitigation

The risk to workers and the impacts on fire protection would not change significantly with any of the cooling technologies. This is mostly due to the generic nature of worker and fire protection required at a power plant licensed by the Energy Commission.

C.14.6.3 CEQA Level of Significance

The overall impacts of the project with dry cooling would be the same as those of the proposed project; both would have less than significant impacts in the area of worker safety and fire protection.

C.14.7 NO PROJECT/NO ACTION ALTERNATIVE

There are three (3) No Project/No Action Alternatives evaluated in this section, as follows:

C.14.7.1 NO ACTION ON PROPOSED PROJECT APPLICATION AND ON CDCA LAND USE PLAN AMENDMENT

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and BLM would not amend the CDCA Plan. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a result, no construction safety and health and project operations and maintenance safety and health programs would be required and no impacts on local fire protection services would be created. However, the land on which the project is proposed would become available to other uses that are consistent with BLM's land use plan, including another solar project requiring a land use plan amendment. In addition, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

C.14.7.2 NO ACTION ON PROPOSED PROJECT APPLICATION AND AMEND THE CDCA LAN USE PLAN TO MAKE THE AREA AVAILABLE FOR FUTURE SOLAR DEVELOPMENT

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and BLM would amend the CDCA Land Use Plan of 1980, as amended, to allow for other solar projects on the site. As a result, it is possible that another solar energy project could be constructed on the project site.

Because the CDCA Plan would be amended, it is possible that the site will be developed with another solar technology. Construction and operation requirements for solar technologies vary. However, it is expected that construction safety and health and project operations and maintenance safety and health programs would be required for

all solar technologies and impacts to local fire protection services would be potentially generated. As such, it is expected that the impacts to worker safety and fire protection from a different solar technology would likely be similar to impacts from the proposed project.

C.14.7.3 NO ACTION ON PROPOSED PROJECT APPLICATION AND AMEND THE CDCA LAND USE PLAN TO MAKE THE AREA UNAVAILABLE FOR FUTURE SOLAR DEVELOPMENT

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM and the BLM would amend the CDCA Plan to make the proposed site unavailable for future solar development. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because the CDCA Plan would be amended so no solar projects can be approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no construction or operation of a solar facility. No construction safety and health and no maintenance safety and health programs would be required and no demands on local fire protection services would be made. Therefore, this No Project/No Action Alternative would not result in impacts to worker safety and fire protection. However, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

C.14.8 CUMULATIVE IMPACTS

Section B.3, Cumulative Scenario, provides detailed information on the potential cumulative solar and other development projects in the project area. Together, these projects comprise the cumulative scenario which forms the basis of the cumulative impact analysis for the proposed project. In summary, these projects are:

- Renewable energy projects on BLM, State, and private lands, as shown on **Cumulative Figure 1** and in **Cumulative Tables 1A and 1B.** Although not all of those projects are expected to complete the environmental review processes, or be funded and constructed, the list is indicative of the large number of renewable projects currently proposed in California.
- Foreseeable future projects in the immediate area as shown on **Cumulative Impacts Figure 2, I-10 Corridor Existing and Future/Foreseeable Projects, and Cumulative Tables 2 and 3**. Table 2 presents existing projects in this area and Table 3 presents future foreseeable projects in the I-10 Corridor Area. Both tables indicate project name and project type, its location and its status.

These projects are defined within a geographic area that has been identified by the CEC and BLM as covering an area large enough to provide a reasonable basis for evaluating cumulative impacts for all resource elements or environmental parameters. Most of these projects have, are, or will be required to undergo their own independent environmental review under CEQA and/or NEPA. Even if the cumulative projects

described in Section B.3 have not yet completed the required environmental processes, they were considered in the cumulative impacts analyses in this SA/DPA/DEIS.

C.14.8.1 GEOGRAPHIC SCOPE OF ANALYSIS

The geographic areas considered for cumulative impacts on Worker Safety/Fire Protection are within the project boundaries and regional impacts.

C.14.8.2 EFFECTS OF PAST AND PRESENT PROJECTS

For this analysis, there are three projects or developments in the area or region that would require the response from off-site fire departments for fire, HazMat, or EMS emergencies that staff has found to have an impact on the region. The need for fire department response to solar power plants may not be frequent but past experience has shown that there is a significant chance that it will occur. Two power plants in the area - the Blythe Power plants I and II - are not considered by staff to have had an impact on the area.

Staff has analyzed the potential for **Worker Safety/Fire Protection** cumulative impacts at many other power plant projects in California. A significant cumulative Worker Safety/Fire Protection impact is defined as the simultaneous need for a fire department to respond to multiple locations such that its resources and those of the mutual aid fire departments (which routinely respond in every-day situations to emergencies at residences, commercial buildings, and heavy industry) are over-whelmed and cannot effectively respond. Existing locations that might require a fire department response along with those facilities which might likely be built were considered. Staff believes that cumulative impacts are both possible and probable because despite the many safeguards implemented to prevent and control fires, HazMat releases, and injuries/accidents, the locations of the existing facilities are distant from the GSEP site and the RCFD fire stations such that the response times and equipment are not adequate. Staff therefore believes the cumulative impacts from existing facilities on the local fire department would be significant should the GSEP be built and operated.

C.14.8.3 EFFECTS OF REASONABLY FORESEEABLE FUTURE PROJECTS

Worker Safety/Fire Protection at the proposed project is also expected to be affected by reasonably foreseeable future projects, including the proposed Blythe and Palen solar projects proposed for the I-10 corridor.

Contribution of the Genesis Solar Energy Project to Cumulative Impacts

Construction. The construction of the GSEP is expected to result in short term adverse impacts related to Worker Safety/Fire Protection during construction activities. It is expected that some of the cumulative projects described above which are not yet built may be under construction the same time as the GSEP and therefore short term impacts related to Worker Safety/Fire Protection during construction of those cumulative projects may occur.

Operation. The operation of the GSEP is expected to result in long term adverse impacts during operation of the project related to Worker Safety/Fire Protection. Staff has analyzed the

potential for Worker Safety/Fire Protection cumulative impacts at many other power plant projects in California. A significant cumulative Worker Safety/Fire Protection impact is defined as the simultaneous need for a fire department to respond to multiple locations such that its resources and those of the mutual aid fire departments (which routinely respond in every-day situations to emergencies at residences, commercial buildings, and heavy industry) are over-whelmed and cannot effectively respond. Existing locations that might require a fire department response along with those facilities which might likely be built were considered. Staff believes that cumulative impacts are possible and although they are not highly probable because of the many safeguards implemented to both prevent and control fires, HazMat releases, and injuries/accidents, due to their distant locations and wide expansive sites, cumulatively they present a significant impact. Additionally, even though the chances of two or more solar power plants requiring emergency response simultaneously may be low, once again a response to one distant site would preclude a simultaneous response to another solar plant or even a residential or commercial location in a timely and adequate manner due to the great distances involve. Staff therefore believes the impacts on the local fire department would be cumulatively significant.

The applicant will develop and implement a fire prevention program for the GSEP independent of any other projects considered for potential cumulative impacts and will be required to fund capital improvements and staffing for the RCFD. Staff believes that the facility, as proposed by the applicant and with the additional mitigation measures proposed by staff, will then have an insignificant impact on fire, HazMat, or EMS response. Therefore, staff concludes that with mitigation, the GSEP's contribution to a Worker Safety/Fire Protection cumulative impact would be less than significant.

Decommissioning. The decommissioning of the GSEP is not expected to result in adverse impacts related to Worker Safety/Fire Protection. It is unlikely that the construction or decommissioning of any of the cumulative projects would occur concurrently with the decommissioning of this project, because the decommissioning is not expected to occur for approximately 40 years. As a result, it is not expected that significant impacts related to Worker Safety/Fire Protection during decommissioning of the GSEP generated by the cumulative projects will occur.

C.14.9 COMPLIANCE WITH LORS

Staff concludes that construction and operation of the GSEP project would be in compliance with all applicable laws, ordinances, regulations, and standards (LORS) regarding long-term and short-term project impacts in the area of worker safety and fire protection.

C.14.10 NOTEWORTHY PUBLIC BENEFITS

Staff is unable to describe any noteworthy pubic benefit in the area of Worker Safety/Fire Protection.

C.14.11 PROPOSED CONDITIONS OF CERTIFICATION/MITIGATION MEASURES

WORKER SAFETY-1 The project owner shall submit to the Compliance Project Manager (CPM) a copy of the Project Construction Safety and Health Program containing the following:

- a Construction Personal Protective Equipment Program;
- a Construction Exposure Monitoring Program;
- a Construction Injury and Illness Prevention Program;
- a Construction heat stress protection plan that implements and expands on existing Cal OSHA regulations as found in 8 CCR 3395;
- a Construction Emergency Action Plan; and
- a Construction Fire Prevention Plan.

The Personal Protective Equipment Program, the Exposure Monitoring Program, the Heat Stress Protection Plan, and the Injury and Illness Prevention Program shall be submitted to the CPM for review and approval concerning compliance of the program with all applicable safety orders. The Construction Emergency Action Plan and the Fire Prevention Plan shall be submitted to the Riverside County Fire Department for review and comment prior to submittal to the CPM for approval.

Verification: At least 30 days prior to the start of construction, the project owner shall submit to the CPM for review and approval a copy of the Project Construction Safety and Health Program. The project owner shall provide a copy of a letter to the CPM from the Riverside County Fire Department stating the fire department's comments on the Construction Fire Prevention Plan and Emergency Action Plan.

WORKER SAFETY-2 The project owner shall submit to the CPM a copy of the Project Operations and Maintenance Safety and Health Program containing the following:

- an Operation Injury and Illness Prevention Plan;
- an Operation heat stress protection plan that implements and expands on existing Cal OSHA regulations (8 CCR 3395);
- a Best Management Practices (BMP) for the storage and application of herbicides;
- an Emergency Action Plan;
- Hazardous Materials Management Program;
- Fire Prevention Plan (8 Cal Code Regs. § 3221); and
- Personal Protective Equipment Program (8 Cal Code Regs, §§ 3401—3411).

The Operation Injury and Illness Prevention Plan, Emergency Action Plan, Heat Stress Protection Plan, BMP for Herbicides, and Personal Protective Equipment Program shall be submitted to the CPM for review and comment concerning compliance of the programs with all applicable safety orders. The Fire Prevention Plan and the Emergency Action Plan shall also be submitted to the Riverside County Fire Department for review and comment.

Verification: At least 30 days prior to the start of first-fire or commissioning, the project owner shall submit to the CPM for approval a copy of the Project Operations and Maintenance Safety and Health Program. The project owner shall provide a copy of a letter to the CPM from the Riverside County Fire Department stating the fire department's comments on the Operations Fire Prevention Plan and Emergency Action Plan.

WORKER SAFETY-3 The project owner shall provide a site Construction Safety Supervisor (CSS) who, by way of training and/or experience, is knowledgeable of power plant construction activities and relevant laws, ordinances, regulations, and standards; is capable of identifying workplace hazards relating to the construction activities; and has authority to take appropriate action to assure compliance and mitigate hazards. The CSS shall:

- have overall authority for coordination and implementation of all occupational safety and health practices, policies, and programs;
- assure that the safety program for the project complies with Cal/OSHA and federal regulations related to power plant projects;
- assure that all construction and commissioning workers and supervisors receive adequate safety training;
- complete accident and safety-related incident investigations and emergency response reports for injuries and inform the CPM of safety-related incidents; and
- assure that all the plans identified in Conditions of Certification Worker Safety-1 and -2 are implemented.

Verification: At least 60 days prior to the start of site mobilization, the project owner shall submit to the CPM the name and contact information for the Construction Safety Supervisor (CSS). The contact information of any replacement CSS shall be submitted to the CPM within one business day.

The CSS shall submit in the Monthly Compliance Report a monthly safety inspection report to include:

- record of all employees trained for that month (all records shall be kept on site for the duration of the project);
- summary report of safety management actions and safety-related incidents that occurred during the month;
- report of any continuing or unresolved situations and incidents that may pose danger to life or health; and

- report of accidents and injuries that occurred during the month.

WORKER SAFETY-4 The project owner shall make payments to the Chief Building Official (CBO) for the services of a Safety Monitor based upon a reasonable fee schedule to be negotiated between the project owner and the CBO. Those services shall be in addition to other work performed by the CBO. The Safety Monitor shall be selected by and report directly to the CBO and will be responsible for verifying that the Construction Safety Supervisor, as required in Condition of Certification Worker Safety-3, and for implementing all appropriate Cal/OSHA and Energy Commission safety requirements. The Safety Monitor shall conduct on-site (including linear facilities) safety inspections at intervals necessary to fulfill those responsibilities.

Verification: At least 60 days prior to the start of construction, the project owner shall provide proof of its agreement to fund the Safety Monitor services to the CPM for review and approval.

WORKER SAFETY-5 The project owner shall ensure that a portable automatic external defibrillator (AED) is located on site during construction and operations and shall implement a program to ensure that workers are properly trained in its use and that the equipment is properly maintained and functioning at all times. During construction and commissioning, the following persons shall be trained in its use and shall be on site whenever the workers that they supervise are on site: the Construction Project Manager or delegate, the Construction Safety Supervisor or delegate, and all shift foremen. During operations, all power plant employees shall be trained in its use. The training program shall be submitted to the CPM for review and approval.

Verification: At least 60 days prior to the start of site mobilization, the project owner shall submit to the CPM proof that a portable automatic external defibrillator (AED) exists on site and a copy of the training and maintenance program for review and approval.

WORKER SAFETY-6 The project owner shall identify and provide a second access point for emergency personnel to enter the site. This access point and the method of gate operation shall be submitted to the Riverside County Fire Department for review and comment and to the CPM for review and approval.

Verification: At least sixty (60) days prior to the start of site mobilization, the project owner shall submit to the Riverside County Fire Department and the CPM preliminary plans showing the location of a second access point to the site and a description of how the gate will be opened by the fire department. At least thirty (30) days prior to the start of site mobilization, the project owner shall submit final plans to the CPM review and approval. The final plan submittal shall also include a letter containing comments from the Riverside County Fire Department or a statement that no comments were received.

WORKER SAFETY-7 The project owner shall either (1) reach an agreement with the Riverside County Fire Department regarding funding of its project-related share of capital costs to build fire protection/response infrastructure and provide appropriate equipment as mitigation of project-related impacts on fire

protection services, **or**, if no agreement can be reached shall (2) fund its share of the capital costs in the amount of $350,000.

Verification: At least sixty (60) days prior to the start of site mobilization, the project owner shall provide the CEC CPM with a copy of the agreement with the RCFD or documentation that the amount of $350,000 has been paid to the RCFD.

WORKER SAFETY-8 The project owner shall provide an annual payment of $100,000 to the RCFD for the support of three fire department staff commencing with the date of site mobilization and continuing annually thereafter on the anniversary until the final date of power plant decommissioning.

Verification: At least 30 days prior to the start of site mobilization the project owner shall provide documentation of the payment described above to the CEC CPM.

WORKER SAFETY-9 The project owner shall develop and implement an enhanced Dust Control Plan that includes the requirements described in **AQ-SC3** and additionally requires:

i. site worker use of dust masks (NIOSH N-95 or better) whenever visible dust is present;

ii. site monitoring for the presence of Coccidioides immitis in soil before site mobilization and monthly thereafter; and

iii. implementation of enhanced dust control methods (increased frequency of watering, use of dust suppression chemicals, etc. consistent with **AQ-SC4**) immediately whenever visible dust comes from or onto the site.

After three consecutive months of not finding significant soil levels of Coccidioides immitis, the project owner may ask the CPM to re-evaluate and revise this testing requirement.

Verification: At least 60 days prior to the commencement of site mobilization, the enhanced Dust control Plan shall be provided to the CPM for review and approval.

C.14.12 CONCLUSIONS

Staff concludes that if the applicant for the proposed GSEP project provides a Project Construction Safety and Health Program and a Project Operations and Maintenance Safety and Health Program as required by Conditions of Certification **WORKER SAFETY-1**, and **-2** and fulfils the requirements of Condition of Certification **WORKER SAFETY-3** through**-9**, the project would incorporate sufficient measures to ensure adequate levels of industrial safety and comply with applicable LORS. Staff also concludes that the operation of this power plant, with mitigation, would not significantly impact the local fire department.

D. ENGINEERING ANALYSIS

D.1 - FACILITY DESIGN

Testimony of Shahab Khoshmashrab

D.1.1 SUMMARY OF CONCLUSIONS

The California Energy Commission staff concludes that the design, construction, and eventual closure of the project and its linear facilities would likely comply with applicable engineering laws, ordinances, regulations and standards. The proposed conditions of certification, below, would ensure compliance with these laws, ordinances, regulations and standards.

D.1.2 INTRODUCTION

Facility design encompasses the civil, structural, mechanical, and electrical engineering design of the Genesis Solar Energy Project (GSEP) and is not intended as a California Environmental Quality (CEQA) or National Environmental Policy Act (NEPA) analysis. The purpose of this analysis is solely to:

- Verify that the laws, ordinances, regulations and standards (LORS) that apply to the engineering design and construction of the project have been identified;
- Verify that both the project and its ancillary facilities are sufficiently described, including proposed design criteria and analysis methods, in order to provide reasonable assurance that the project would be designed and constructed in accordance with all applicable engineering LORS, in a manner that also ensures the public health and safety;
- Determine whether special design features should be considered during final design to address conditions unique to the site which could influence public health and safety; and
- Describe the design review and construction inspection process and establish the conditions of certification used to monitor and ensure compliance with the engineering LORS, in addition to any special design requirements.

Subjects discussed in this analysis include:

- Identification of the engineering LORS that apply to facility design;
- Evaluation of the applicant's proposed design criteria, including identification of criteria essential to public health and safety;
- Proposed modifications and additions to the application for certification (AFC) necessary for compliance with applicable engineering LORS; and
- Conditions of certification proposed by staff to ensure that the project would be designed and constructed to ensure public health and safety and comply with all applicable engineering LORS.

D.1.3 LAWS, ORDINANCES, REGULATIONS AND STANDARDS

Lists of LORS applicable to each engineering discipline (civil, structural, mechanical, and electrical) are described in the AFC (Solar Millennium 2009a, § 3.11). Key LORS are listed in **Facility Design Table 1,** below:

FACILITY DESIGN Table 1
Key Engineering Laws, Ordinances, Regulations and Standards (LORS)

Applicable LORS	Description
Federal	Title 29 Code of Federal Regulations (CFR), Part 1910, Occupational Safety and Health standards
State	2007 California Building Standards Code (CBSC) (also known as Title 24, California Code of Regulations)
Local	Riverside County regulations and ordinances
General	American National Standards Institute (ANSI) American Society of Mechanical Engineers (ASME) American Welding Society (AWS) American Society for Testing and Materials (ASTM)

D.1.4 PROPOSED PROJECT

D.1.4.1 SETTING AND EXISTING CONDITIONS

The GSEP would be built on a site located in Riverside County, California. For more information on the site and its related project description, please see the **Project Description** section of this document. Additional engineering design details are contained in the AFC (GSEP 2009a, AFC § 3.11).

D.1.4.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

The purpose of this analysis is to ensure that the project would be built to applicable engineering codes and ensure public health and life safety. This analysis further verifies that applicable engineering LORS have been identified and that the project and its ancillary facilities have been described in adequate detail. It also evaluates the applicant's proposed design criteria, describes the design review and construction inspection process, and establishes conditions of certification that would monitor and ensure compliance with engineering LORS and any other special design requirements. These conditions allow both the California Energy Commission (Energy Commission) compliance project manager (CPM) and the applicant to adopt a compliance monitoring scheme that would verify compliance with these LORS.

SITE PREPARATION AND DEVELOPMENT

Staff has evaluated the proposed design criteria for grading, flood protection, erosion control, site drainage, and site access, in addition to the criteria for designing and

constructing linear support facilities such as natural gas and electric transmission interconnections. The applicant proposes the use of accepted industry standards (see GSEP 2009a, Section 3.11 for a representative list of applicable industry standards), design practices, and construction methods in preparing and developing the site. Staff concludes that this project, including its linear facilities, would most likely comply with all applicable site preparation LORS, and proposes conditions of certification (see below and the **Geology and Paleontology** section of this document) to ensure that compliance.

MAJOR STRUCTURES, SYSTEMS, AND EQUIPMENT

Major structures, systems, and equipment are structures and their associated components or equipment that are necessary for power production, costly or time consuming to repair or replace, are used for the storage, containment, or handling of hazardous or toxic materials, or could become potential health and safety hazards if not constructed according to applicable engineering LORS. Major structures and equipment are identified in the proposed Condition of Certification **GEN-2**, below. Typically, **Facility Design Table 2** in Condition of Certification **GEN-2** lists the major structures and equipment identified in the AFC and other project related information available before project licensing; this list is based on the preliminary design of the project. The master drawing and master specifications lists described in Condition of Certification **GEN-2**, however, include the project-related documents based on the project's detailed design and may include additional documents for structures and equipment not identified in **Facility Design Table 2**. (Detailed project design typically occurs after project licensing and is not available at this time.)

GSEP shall be designed and constructed to the 2007 California Building Standards Code (CBSC), also known as Title 24, California Code of Regulations, which encompasses the California Building Code (CBC), California Building Standards Administrative Code, California Electrical Code, California Mechanical Code, California Plumbing Code, California Energy Code, California Fire Code, California Code for Building Conservation, California Reference Standards Code, and other applicable codes and standards in effect when the design and construction of the project actually begin. If the initial designs are submitted to the chief building official (CBO) for review and approval after the update to the 2007 CBSC takes effect, the 2007 CBSC provisions shall be replaced with the updated provisions.

Certain structures in a power plant may be required, under the CBC, to undergo dynamic lateral force (structural) analysis; others may be designed using the simpler static analysis procedure. In order to ensure that structures are analyzed according to their appropriate lateral force procedure, staff has included condition of certification **STRUC-1**, below, which, in part, requires the project CBO's review and approval of the owner's proposed lateral force procedures before construction begins.

PROJECT QUALITY PROCEDURES

The project's AFC (GSEP 2009a, Appendix A and Sections 3.5 and 5.5.6) describes a quality program intended to inspire confidence that its systems and components will be designed, fabricated, stored, transported, installed, and tested in accordance with all

appropriate power plant technical codes and standards. Compliance with design requirements will be verified through specific inspections and audits. Implementation of this quality assurance/quality control (QA/QC) program will ensure that GSEP is actually designed, procured, fabricated, and installed as described in this analysis.

COMPLIANCE MONITORING

Under Section 104.2 of the CBC, the CBO is authorized and directed to enforce all provisions of the CBC. The Energy Commission itself serves as the building official, and has the responsibility to enforce the code, for all of the energy facilities it certifies. In addition, the Energy Commission has the power to interpret the CBC and adopt and enforce both rules and supplemental regulations that clarify application of the CBC's provisions.

The Energy Commission's design review and construction inspection process conforms to CBC requirements and ensures that all facility design conditions of certification are met. As provided by Section 104.2.2 of the CBC, the Energy Commission appoints experts to perform design review and construction inspections and act as delegate CBOs on behalf of the Energy Commission. These delegates typically include the local building official and/or independent consultants hired to provide technical expertise that is not provided by the local official alone. The applicant, through permit fees provided by the CBC, pays the cost of these reviews and inspections. While building permits in addition to Energy Commission certification are not required for this project, the applicant pays in lieu of CBC permit fees to cover the costs of these reviews and inspections.

Engineering and compliance staff will invite Riverside County or a third-party engineering consultant to act as CBO for this project. When an entity has been assigned CBO duties, Energy Commission staff will complete a memorandum of understanding (MOU) with that entity to outline both its roles and responsibilities and those of its subcontractors and delegates.

Staff has developed proposed conditions of certification to ensure public health and safety and compliance with engineering design LORS. Some of these conditions address the roles, responsibilities, and qualifications of the engineers who will design and build the proposed project (conditions of certification **GEN-1** through **GEN-8**). These engineers must be registered in California and sign and stamp every submittal of design plans, calculations, and specifications submitted to the CBO. These conditions require that every element of the project's construction (subject to CBO review and approval) be approved by the CBO before it is performed. They also require that qualified special inspectors perform or oversee special inspections required by all applicable LORS.

While the Energy Commission and delegate CBO have the authority to allow some flexibility in scheduling construction activities, these conditions are written so that no element of construction (of permanent facilities subject to CBO review and approval) which could be difficult to reverse or correct can proceed without prior CBO approval. Elements of construction that are not difficult to reverse may proceed without approval of the plans. The applicant bears the responsibility to fully modify construction elements

in order to comply with all design changes resulting from the CBO's subsequent plan review and approval process.

D.1.4.3 CEQA LEVEL OF SIGNIFICANCE

As described in the **Introduction** above, the Facility Design section addresses LORS consistency and provides the agencies a vehicle for verifying compliance with these LORS during construction and operation of power generating facilities. This section is not intended to address environmental impacts under either CEQA or NEPA.

D.1.5 REDUCED ACREAGE ALTERNATIVE

The Facility Design section is not intended to address environmental impacts under either CEQA or NEPA.

D.1.6 DRY COOLING ALTERNATIVE

The Facility Design section is not intended to address environmental impacts under either CEQA or NEPA.

D.1.8 NO PROJECT / NO ACTION ALTERNATIVE

The Facility Design section is not intended to address environmental impacts under either CEQA or NEPA.

D.1.9 CUMULATIVE IMPACT ANALYSIS

The Facility Design section is not intended to address environmental impacts under either CEQA or NEPA.

D.1.10 COMPLIANCE WITH LORS

A detailed discussion of the proposed project's compliance with LORS applicable to facility design is provided above in subsection D.1.4.2.

D.1.11 NOTEWORTHY PUBLIC BENEFITS

Staff has not identified any noteworthy public benefits associated with this Facility Design section.

D.1.12 PROPOSED CONDITIONS OF CERTIFICATION/MITIGATION MEASURES

GEN-1 The project owner shall design, construct, and inspect the project in accordance with the 2007 California Building Standards Code (CBSC), also known as Title 24, California Code of Regulations, which encompasses the California Building Code (CBC), California Building Standards Administrative Code, California Electrical Code, California Mechanical Code, California

Plumbing Code, California Energy Code, California Fire Code, California Code for Building Conservation, California Reference Standards Code, and all other applicable engineering LORS in effect at the time initial design plans are submitted to the CBO for review and approval (the CBSC in effect is the edition that has been adopted by the California Building Standards Commission and published at least 180 days previously). The project owner shall ensure that all the provisions of the above applicable codes are enforced during the construction, addition, alteration, moving, demolition, repair, or maintenance of the completed facility. All transmission facilities (lines, switchyards, switching stations and substations) are covered in the conditions of certification in the **Transmission System Engineering** section of this document.

In the event that the initial engineering designs are submitted to the CBO when the successor to the 2007 CBSC is in effect, the 2007 CBSC provisions shall be replaced with the applicable successor provisions. Where, in any specific case, different sections of the code specify different materials, methods of construction or other requirements, the most restrictive shall govern. Where there is a conflict between a general requirement and a specific requirement, the specific requirement shall govern.

The project owner shall ensure that all contracts with contractors, subcontractors, and suppliers clearly specify that all work performed and materials supplied comply with the codes listed above.

Verification: Within 30 days following receipt of the certificate of occupancy, the project owner shall submit to the CPM a statement of verification, signed by the responsible design engineer, attesting that all designs, construction, installation, and inspection requirements of the applicable LORS and the Energy Commission's decision have been met in the area of facility design. The project owner shall provide the CPM a copy of the certificate of occupancy within 30 days of receipt from the CBO.

Once the certificate of occupancy has been issued, the project owner shall inform the CPM at least 30 days prior to any construction, addition, alteration, moving, demolition, repair, or maintenance to be performed on any portion(s) of the completed facility that requires CBO approval for compliance with the above codes. The CPM will then determine if the CBO needs to approve the work.

GEN-2 Before submitting the initial engineering designs for CBO review, the project owner shall furnish the CPM and the CBO with a schedule of facility design submittals, and master drawing and master specifications lists. The schedule shall contain a list of proposed submittal packages of designs, calculations, and specifications for major structures and equipment. To facilitate audits by Energy Commission staff, the project owner shall provide specific packages to the CPM upon request.

Verification: At least 60 days (or a project owner- and CBO-approved alternative time frame) prior to the start of rough grading, the project owner shall submit to the CBO and to the CPM the schedule, the master drawing and master specifications lists of documents to be submitted to the CBO for review and approval. These documents shall

be the pertinent design documents for the major structures and equipment listed in **Facility Design Table 2**, below. Major structures and equipment shall be added to or deleted from the table only with CPM approval. The project owner shall provide schedule updates in the monthly compliance report.

Facility Design Table 2
Major Structures and Equipment List

Equipment/System	Quantity (Plant)
Steam Turbine Generator Foundation and Connections	2
Start-up Boilers Foundations and Connections	2
Generator Step-up Transformer Foundation and Connections	2
Unit Auxiliary Transformer Foundation and Connections	2
Station Service Transformer Foundation and Connections	6
Surface Condenser Foundation and Connections	2
Cooling Tower Chemical Feed/Storage Area Structure, Foundation and Connections	2
Cooling Tower Electrical Enclosure Structure, Foundation and Connections	2
Cooling Tower Structure, Foundation and Connections	2
Raw/Fire Tank Structure, Foundation and Connections	2
Demineralized Water Tank and Pump Skid Structure, Foundation and Connections	2
Control Room/Warehouse Building Structure, Foundation and Connections	2
Water Treatment Area Structure, Foundation and Connections	2
Deaerator/Storage Tank Structure, Foundation and Connections	2
Feedwater Heaters Foundation and Connections	2
Gland Steam Condenser Foundation and Connections	2
Economizers Foundation and Connections	10
Re-heaters Foundation and Connections	8
Evaporators Foundation and Connections	8
Superheaters Foundation and Connections	4
Expansion Tanks Structure, Foundation and Connections	2 Lots
Blowdown Tanks Structure, Foundation and Connections	2
Auxiliary Boiler Foundation and Connections	2
Generator Circuit Breaker Foundation and Connections	2
Main Electrical Enclosure Structure, Foundation and Connections	2
Ullage System Area Foundation and Connections	2
Waste Water Tank Structure, Foundation and Connections	2
Closed Cooling Water Heat Exchanger Foundation and Connections	4
Fire Pump House Structure, Foundation and Connections	2
Fire Protection Sprinkler House Structure, Foundation and Connections	6
Start Diesel Generator Foundation and Connections	2
Above Ground Diesel Fuel Storage Tank Structure, Foundation and Connections	2

Equipment/System	Quantity (Plant)
Excitation Transformer Foundation and Connections	2
Turbine Area Flash Tank Structure, Foundation and Connections	2
Lube Oil and EHC Skid Structure, Foundation and Connections	2
Oil/Water Separator Foundation and Connections	2
Closed Cooling Water Expansion Tank Structure, Foundation and Connections	2
Nitrogen Bulk Storage and Vaporizer Structure, Foundation and Connections	2
Emergency Diesel Generator Foundation and Connections	2
Pipe Racks	1 Lot
Pumps Skid Structure, Foundation and Connections	1 Lot
Solar Field Reflectors and Receivers Foundations and Connections	1 Lot
Drainage Systems (including sanitary drain and waste)	1 Lot
High Pressure and Large Diameter Piping and Pipe Racks	1 Lot
HVAC and Refrigeration Systems	1 Lot
Temperature Control and Ventilation Systems (including water and sewer connections)	1 Lot
Building Energy Conservation Systems	1 Lot
Substation, Switchboards, Transformers, Buses and Towers	1 Lot
Electrical Cables/Duct Banks	1 Lot
Prefabricated Assemblies	1 Lot

GEN-3 The project owner shall make payments to the CBO for design review, plan checks, and construction inspections, based upon a reasonable fee schedule to be negotiated between the project owner and the CBO. These fees may be consistent with the fees listed in the 2007 CBC, adjusted for inflation and other appropriate adjustments; may be based on the value of the facilities reviewed; may be based on hourly rates; or may be otherwise agreed upon by the project owner and the CBO.

Verification: The project owner shall make the required payments to the CBO in accordance with the agreement between the project owner and the CBO. The project owner shall send a copy of the CBO's receipt of payment to the CPM in the next monthly compliance report indicating that applicable fees have been paid.

GEN-4 Prior to the start of rough grading, the project owner shall assign a California-registered architect, or a structural or civil engineer, as the resident engineer (RE) in charge of the project. All transmission facilities (lines, switchyards, switching stations, and substations) are addressed in the conditions of certification in the **Transmission System Engineering** section of this document.

The RE may delegate responsibility for portions of the project to other registered engineers. Registered mechanical and electrical engineers may be delegated responsibility for mechanical and electrical portions of the project, respectively. A project may be divided into parts, provided that each part is

clearly defined as a distinct unit. Separate assignments of general responsibility may be made for each designated part.

The RE shall:

1. Monitor progress of construction work requiring CBO design review and inspection to ensure compliance with LORS;

2. Ensure that construction of all facilities subject to CBO design review and inspection conforms in every material respect to applicable LORS, these conditions of certification, approved plans, and specifications;

3. Prepare documents to initiate changes in approved drawings and specifications when either directed by the project owner or as required by the conditions of the project;

4. Be responsible for providing project inspectors and testing agencies with complete and up-to-date sets of stamped drawings, plans, specifications, and any other required documents;

5. Be responsible for the timely submittal of construction progress reports to the CBO from the project inspectors, the contractor, and other engineers who have been delegated responsibility for portions of the project; and

6. Be responsible for notifying the CBO of corrective action or the disposition of items noted on laboratory reports or other tests when they do not conform to approved plans and specifications.

The resident engineer (or his delegate) must be located at the project site, or be available at the project site within a reasonable period of time, during any hours in which construction takes place.

The RE shall have the authority to halt construction and to require changes or remedial work if the work does not meet requirements.

If the RE or the delegated engineers are reassigned or replaced, the project owner shall submit the name, qualifications and registration number of the newly assigned engineer to the CBO for review and approval. The project owner shall notify the CPM of the CBO's approval of the new engineer.

Verification: At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of rough grading, the project owner shall submit to the CBO for review and approval, the resume and registration number of the RE and any other delegated engineers assigned to the project. The project owner shall notify the CPM of the CBO's approvals of the RE and other delegated engineer(s) within five days of the approval.

If the RE or the delegated engineer(s) is subsequently reassigned or replaced, the project owner has five days to submit the resume and registration number of the newly

assigned engineer to the CBO for review and approval. The project owner shall notify the CPM of the CBO's approval of the new engineer within five days of the approval.

GEN-5 Prior to the start of rough grading, the project owner shall assign at least one of each of the following California registered engineers to the project: a civil engineer; a soils, geotechnical, or civil engineer experienced and knowledgeable in the practice of soils engineering; and an engineering geologist. Prior to the start of construction, the project owner shall assign at least one of each of the following California registered engineers to the project: a design engineer who is either a structural engineer or a civil engineer fully competent and proficient in the design of power plant structures and equipment supports; a mechanical engineer; and an electrical engineer. (California Business and Professions Code section 6704 et seq., and sections 6730, 6731 and 6736 require state registration to practice as a civil engineer or structural engineer in California). All transmission facilities (lines, switchyards, switching stations, and substations) are handled in the conditions of certification in the **Transmission System Engineering** section of this document.

The tasks performed by the civil, mechanical, electrical, or design engineers may be divided between two or more engineers, as long as each engineer is responsible for a particular segment of the project (for example, proposed earthwork, civil structures, power plant structures, equipment support). No segment of the project shall have more than one responsible engineer. The transmission line may be the responsibility of a separate California registered electrical engineer.

The project owner shall submit, to the CBO for review and approval, the names, qualifications, and registration numbers of all responsible engineers assigned to the project.

If any one of the designated responsible engineers is subsequently reassigned or replaced, the project owner shall submit the name, qualifications and registration number of the newly assigned responsible engineer to the CBO for review and approval. The project owner shall notify the CPM of the CBO's approval of the new engineer.

A. The civil engineer shall:

1. Review the foundation investigations, geotechnical, or soils reports prepared by the soils engineer, the geotechnical engineer, or by a civil engineer experienced and knowledgeable in the practice of soils engineering;

2. Design (or be responsible for the design of), stamp, and sign all plans, calculations, and specifications for proposed site work, civil works, and related facilities requiring design review and inspection by the CBO. At a minimum, these include: grading, site preparation, excavation, compaction, construction of secondary containment, foundations, erosion and sedimentation control structures, drainage facilities,

underground utilities, culverts, site access roads and sanitary sewer systems; and

3. Provide consultation to the RE during the construction phase of the project and recommend changes in the design of the civil works facilities and changes to the construction procedures.

B. The soils engineer, geotechnical engineer, or civil engineer experienced and knowledgeable in the practice of soils engineering, shall:

1. Review all the engineering geology reports;

2. Prepare the foundation investigations, geotechnical, or soils reports containing field exploration reports, laboratory tests, and engineering analysis detailing the nature and extent of the soils that could be susceptible to liquefaction, rapid settlement or collapse when saturated under load;

3. Be present, as required, during site grading and earthwork to provide consultation and monitor compliance with requirements set forth in the 2007 CBC (depending on the site conditions, this may be the responsibility of either the soils engineer, the engineering geologist, or both); and

4. Recommend field changes to the civil engineer and RE.

This engineer shall be authorized to halt earthwork and to require changes if site conditions are unsafe or do not conform to the predicted conditions used as the basis for design of earthwork or foundations.

C. The engineering geologist shall:

1. Review all the engineering geology reports and prepare a final soils grading report; and

2. Be present, as required, during site grading and earthwork to provide consultation and monitor compliance with the requirements set forth in the 2007 CBC (depending on the site conditions, this may be the responsibility of either the soils engineer, the engineering geologist, or both).

D. The design engineer shall:

1. Be directly responsible for the design of the proposed structures and equipment supports;

2. Provide consultation to the RE during design and construction of the project;

3. Monitor construction progress to ensure compliance with engineering LORS;

4. Evaluate and recommend necessary changes in design; and

5. Prepare and sign all major building plans, specifications, and calculations.

E. The mechanical engineer shall be responsible for, and sign and stamp a statement with, each mechanical submittal to the CBO, stating that the proposed final design plans, specifications, and calculations conform to all of the mechanical engineering design requirements set forth in the Energy Commission's decision.

F. The electrical engineer shall:

1. Be responsible for the electrical design of the project; and

2. Sign and stamp electrical design drawings, plans, specifications, and calculations.

Verification: At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of rough grading, the project owner shall submit to the CBO for review and approval, resumes and registration numbers of the responsible civil engineer, soils (geotechnical) engineer and engineering geologist assigned to the project.

At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of construction, the project owner shall submit to the CBO for review and approval, resumes and registration numbers of the responsible design engineer, mechanical engineer, and electrical engineer assigned to the project.

The project owner shall notify the CPM of the CBO's approvals of the responsible engineers within five days of the approval.

If the designated responsible engineer is subsequently reassigned or replaced, the project owner has five days in which to submit the resume and registration number of the newly assigned engineer to the CBO for review and approval. The project owner shall notify the CPM of the CBO's approval of the new engineer within five days of the approval.

GEN-6 Prior to the start of an activity requiring special inspection, including prefabricated assemblies, the project owner shall assign to the project, qualified and certified special inspector(s) who shall be responsible for the special inspections required by the 2007 CBC. All transmission facilities (lines, switchyards, switching stations, and substations) are handled in conditions of certification in the **Transmission System Engineering** section of this document.

A certified weld inspector, certified by the American Welding Society (AWS), and/or American Society of Mechanical Engineers (ASME) as applicable,

shall inspect welding performed on-site requiring special inspection (including structural, piping, tanks and pressure vessels).

The special inspector shall:

1. Be a qualified person who shall demonstrate competence, to the satisfaction of the CBO, for inspection of the particular type of construction requiring special or continuous inspection;

2. Inspect the work assigned for conformance with the approved design drawings and specifications;

3. Furnish inspection reports to the CBO and RE. All discrepancies shall be brought to the immediate attention of the RE for correction, then, if uncorrected, to the CBO and the CPM for corrective action; and

4. Submit a final signed report to the RE, CBO, and CPM, stating whether the work requiring special inspection was, to the best of the inspector's knowledge, in conformance with the approved plans, specifications, and other provisions of the applicable edition of the CBC.

Verification: At least 15 days (or project owner- and CBO-approved alternative time frame) prior to the start of an activity requiring special inspection, the project owner shall submit to the CBO for review and approval, with a copy to the CPM, the name(s) and qualifications of the certified weld inspector(s), or other certified special inspector(s) assigned to the project to perform one or more of the duties set forth above. The project owner shall also submit to the CPM a copy of the CBO's approval of the qualifications of all special inspectors in the next monthly compliance report.

If the special inspector is subsequently reassigned or replaced, the project owner has five days in which to submit the name and qualifications of the newly assigned special inspector to the CBO for approval. The project owner shall notify the CPM of the CBO's approval of the newly assigned inspector within five days of the approval.

GEN-7 If any discrepancy in design and/or construction is discovered in any engineering work that has undergone CBO design review and approval, the project owner shall document the discrepancy and recommend required corrective actions. The discrepancy documentation shall be submitted to the CBO for review and approval. The discrepancy documentation shall reference this condition of certification and, if appropriate, applicable sections of the CBC and/or other LORS.

Verification: The project owner shall transmit a copy of the CBO's approval of any corrective action taken to resolve a discrepancy to the CPM in the next monthly compliance report. If any corrective action is disapproved, the project owner shall advise the CPM, within five days, of the reason for disapproval and the revised corrective action to obtain CBO's approval.

GEN-8 The project owner shall obtain the CBO's final approval of all completed work that has undergone CBO design review and approval. The project owner shall

request the CBO to inspect the completed structure and review the submitted documents. The project owner shall notify the CPM after obtaining the CBO's final approval. The project owner shall retain one set of approved engineering plans, specifications, and calculations (including all approved changes) at the project site or at another accessible location during the operating life of the project. Electronic copies of the approved plans, specifications, calculations, and marked-up as-builts shall be provided to the CBO for retention by the CPM.

Verification: Within 15 days of the completion of any work, the project owner shall submit to the CBO, with a copy to the CPM, in the next monthly compliance report, (a) a written notice that the completed work is ready for final inspection, and (b) a signed statement that the work conforms to the final approved plans. After storing the final approved engineering plans, specifications, and calculations described above, the project owner shall submit to the CPM a letter stating both that the above documents have been stored and the storage location of those documents.

Within 90 days of the completion of construction, the project owner shall provide to the CBO three sets of electronic copies of the above documents at the project owner's expense. These are to be provided in the form of "read only" (Adobe pdf 6.0) files, with restricted (password-protected) printing privileges, on archive quality compact discs.

CIVIL-1 The project owner shall submit to the CBO for review and approval the following:

1. Design of the proposed drainage structures and the grading plan;

2. An erosion and sedimentation control plan;

3. Related calculations and specifications, signed and stamped by the responsible civil engineer; and

4. Soils, geotechnical, or foundation investigations reports required by the 2007 CBC.

Verification: At least 15 days (or project owner- and CBO-approved alternative time frame) prior to the start of site grading the project owner shall submit the documents described above to the CBO for design review and approval. In the next monthly compliance report following the CBO's approval, the project owner shall submit a written statement certifying that the documents have been approved by the CBO.

CIVIL-2 The resident engineer shall, if appropriate, stop all earthwork and construction in the affected areas when the responsible soils engineer, geotechnical engineer, or the civil engineer experienced and knowledgeable in the practice of soils engineering identifies unforeseen adverse soil or geologic conditions. The project owner shall submit modified plans, specifications, and calculations to the CBO based on these new conditions. The project owner shall obtain approval from the CBO before resuming earthwork and construction in the affected area.

Verification: The project owner shall notify the CPM within 24 hours, when earthwork and construction is stopped as a result of unforeseen adverse geologic/soil

conditions. Within 24 hours of the CBO's approval to resume earthwork and construction in the affected areas, the project owner shall provide to the CPM a copy of the CBO's approval.

CIVIL-3 The project owner shall perform inspections in accordance with the 2007 CBC. All plant site-grading operations, for which a grading permit is required, shall be subject to inspection by the CBO.

If, in the course of inspection, it is discovered that the work is not being performed in accordance with the approved plans, the discrepancies shall be reported immediately to the resident engineer, the CBO, and the CPM. The project owner shall prepare a written report, with copies to the CBO and the CPM, detailing all discrepancies, non-compliance items, and the proposed corrective action.

Verification: Within five days of the discovery of any discrepancies, the resident engineer shall transmit to the CBO and the CPM a non-conformance report (NCR), and the proposed corrective action for review and approval. Within five days of resolution of the NCR, the project owner shall submit the details of the corrective action to the CBO and the CPM. A list of NCRs, for the reporting month, shall also be included in the following monthly compliance report.

CIVIL-4 After completion of finished grading and erosion and sedimentation control and drainage work, the project owner shall obtain the CBO's approval of the final grading plans (including final changes) for the erosion and sedimentation control work. The civil engineer shall state that the work within his/her area of responsibility was done in accordance with the final approved plans.

Verification: Within 30 days (or project owner- and CBO-approved alternative time frame) of the completion of the erosion and sediment control mitigation and drainage work, the project owner shall submit to the CBO, for review and approval, the final grading plans (including final changes) and the responsible civil engineer's signed statement that the installation of the facilities and all erosion control measures were completed in accordance with the final approved combined grading plans, and that the facilities are adequate for their intended purposes, along with a copy of the transmittal letter to the CPM. The project owner shall submit a copy of the CBO's approval to the CPM in the next monthly compliance report.

STRUC-1 Prior to the start of any increment of construction of any major structure or component listed in **Facility Design Table 2** of condition of certification **GEN-2**, above, the project owner shall submit to the CBO for design review and approval the proposed lateral force procedures for project structures and the applicable designs, plans and drawings for project structures. Proposed lateral force procedures, designs, plans and drawings shall be those for the following items (from **Table 2**, above):

1. Major project structures;

2. Major foundations, equipment supports, and anchorage; and

3. Large field-fabricated tanks.

Construction of any structure or component shall not begin until the CBO has approved the lateral force procedures to be employed in designing that structure or component.

The project owner shall:

1. Obtain approval from the CBO of lateral force procedures proposed for project structures;

2. Obtain approval from the CBO for the final design plans, specifications, calculations, soils reports, and applicable quality control procedures. If there are conflicting requirements, the more stringent shall govern (for example, highest loads, or lowest allowable stresses shall govern). All plans, calculations, and specifications for foundations that support structures shall be filed concurrently with the structure plans, calculations, and specifications;

3. Submit to the CBO the required number of copies of the structural plans, specifications, calculations, and other required documents of the designated major structures prior to the start of on-site fabrication and installation of each structure, equipment support, or foundation;

4. Ensure that the final plans, calculations, and specifications clearly reflect the inclusion of approved criteria, assumptions, and methods used to develop the design. The final designs, plans, calculations, and specifications shall be signed and stamped by the responsible design engineer; and

5. Submit to the CBO the responsible design engineer's signed statement that the final design plans conform to applicable LORS.

Verification: At least 60 days (or project owner- and CBO-approved alternative time frame) prior to the start of any increment of construction of any structure or component listed in **Facility Design Table 2** of condition of certification **GEN-2**, above, the project owner shall submit to the CBO the above final design plans, specifications and calculations, with a copy of the transmittal letter to the CPM.

The project owner shall submit to the CPM, in the next monthly compliance report, a copy of a statement from the CBO that the proposed structural plans, specifications, and calculations have been approved and comply with the requirements set forth in applicable engineering LORS.

STRUC-2 The project owner shall submit to the CBO the required number of sets of the following documents related to work that has undergone CBO design review and approval:

1. Concrete cylinder strength test reports (including date of testing, date sample taken, design concrete strength, tested cylinder strength, age of test, type and size of sample, location and quantity of concrete placement

from which sample was taken, and mix design designation and parameters);

2. Concrete pour sign-off sheets;

3. Bolt torque inspection reports (including location of test, date, bolt size, and recorded torques);

4. Field weld inspection reports (including type of weld, location of weld, inspection of non-destructive testing (NDT) procedure and results, welder qualifications, certifications, qualified procedure description or number (ref: AWS); and

5. Reports covering other structural activities requiring special inspections shall be in accordance with the 2007 CBC.

Verification: If a discrepancy is discovered in any of the above data, the project owner shall, within five days, prepare and submit an NCR describing the nature of the discrepancies and the proposed corrective action to the CBO, with a copy of the transmittal letter to the CPM. The NCR shall reference the condition(s) of certification and the applicable CBC chapter and section. Within five days of resolution of the NCR, the project owner shall submit a copy of the corrective action to the CBO and the CPM.

The project owner shall transmit a copy of the CBO's approval or disapproval of the corrective action to the CPM within 15 days. If disapproved, the project owner shall advise the CPM, within five days, the reason for disapproval, and the revised corrective action to obtain CBO's approval.

STRUC-3 The project owner shall submit to the CBO design changes to the final plans required by the 2007 CBC, including the revised drawings, specifications, calculations, and a complete description of, and supporting rationale for, the proposed changes, and shall give to the CBO prior notice of the intended filing.

Verification: On a schedule suitable to the CBO, the project owner shall notify the CBO of the intended filing of design changes, and shall submit the required number of sets of revised drawings and the required number of copies of the other above-mentioned documents to the CBO, with a copy of the transmittal letter to the CPM. The project owner shall notify the CPM, via the monthly compliance report, when the CBO has approved the revised plans.

STRUC-4 Tanks and vessels containing quantities of toxic or hazardous materials exceeding amounts specified in the 2007 CBC shall, at a minimum, be designed to comply with the requirements of that chapter.

Verification: At least 30 days (or project owner- and CBO-approved alternate time frame) prior to the start of installation of the tanks or vessels containing the above specified quantities of toxic or hazardous materials, the project owner shall submit to the CBO for design review and approval final design plans, specifications, and calculations, including a copy of the signed and stamped engineer's certification.

The project owner shall send copies of the CBO approvals of plan checks to the CPM in the following monthly compliance report. The project owner shall also transmit a copy of the CBO's inspection approvals to the CPM in the monthly compliance report following completion of any inspection.

MECH-1 The project owner shall submit, for CBO design review and approval, the proposed final design, specifications and calculations for each plant major piping and plumbing system listed in **Facility Design Table 2**, condition of certification **GEN-2**, above. Physical layout drawings and drawings not related to code compliance and life safety need not be submitted. The submittal shall also include the applicable QA/QC procedures. Upon completion of construction of any such major piping or plumbing system, the project owner shall request the CBO's inspection approval of that construction.

The responsible mechanical engineer shall stamp and sign all plans, drawings, and calculations for the major piping and plumbing systems, subject to CBO design review and approval, and submit a signed statement to the CBO when the proposed piping and plumbing systems have been designed, fabricated, and installed in accordance with all of the applicable laws, ordinances, regulations and industry standards, which may include, but are not limited to:

- American National Standards Institute (ANSI) B31.1 (Power Piping Code);
- ANSI B31.2 (Fuel Gas Piping Code);
- ANSI B31.3 (Chemical Plant and Petroleum Refinery Piping Code);
- ANSI B31.8 (Gas Transmission and Distribution Piping Code);
- Title 24, California Code of Regulations, Part 5 (California Plumbing Code);
- Title 24, California Code of Regulations, Part 6 (California Energy Code, for building energy conservation systems and temperature control and ventilation systems);
- Title 24, California Code of Regulations, Part 2 (California Building Code); and
- Riverside County codes.

The CBO may deputize inspectors to carry out the functions of the code enforcement agency.

Verification: At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of any increment of major piping or plumbing construction listed in **Facility Design Table 2**, condition of certification **GEN-2,** above, the project owner shall submit to the CBO for design review and approval the final plans, specifications, and calculations, including a copy of the signed and stamped statement from the responsible mechanical engineer certifying compliance with applicable LORS, and shall send the CPM a copy of the transmittal letter in the next monthly compliance report.

The project owner shall transmit to the CPM, in the monthly compliance report following completion of any inspection, a copy of the transmittal letter conveying the CBO's inspection approvals.

MECH-2 For all pressure vessels installed in the plant, the project owner shall submit to the CBO and California Occupational Safety and Health Administration (Cal-OSHA), prior to operation, the code certification papers and other documents required by applicable LORS. Upon completion of the installation of any pressure vessel, the project owner shall request the appropriate CBO and/or Cal-OSHA inspection of that installation.

The project owner shall:

1. Ensure that all boilers and fired and unfired pressure vessels are designed, fabricated, and installed in accordance with the appropriate section of the American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel Code, or other applicable code. Vendor certification, with identification of applicable code, shall be submitted for prefabricated vessels and tanks; and

2. Have the responsible design engineer submit a statement to the CBO that the proposed final design plans, specifications, and calculations conform to all of the requirements set forth in the appropriate ASME Boiler and Pressure Vessel Code or other applicable codes.

Verification: At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of on-site fabrication or installation of any pressure vessel, the project owner shall submit to the CBO for design review and approval, the above listed documents, including a copy of the signed and stamped engineer's certification, with a copy of the transmittal letter to the CPM.

The project owner shall transmit to the CPM, in the monthly compliance report following completion of any inspection, a copy of the transmittal letter conveying the CBO's and/or Cal-OSHA inspection approvals.

MECH-3 The project owner shall submit to the CBO for design review and approval the design plans, specifications, calculations, and quality control procedures for any heating, ventilating, air conditioning (HVAC) or refrigeration system. Packaged HVAC systems, where used, shall be identified with the appropriate manufacturer's data sheets.

The project owner shall design and install all HVAC and refrigeration systems within buildings and related structures in accordance with the CBC and other applicable codes. Upon completion of any increment of construction, the project owner shall request the CBO's inspection and approval of that construction. The final plans, specifications and calculations shall include approved criteria, assumptions, and methods used to develop the design. In addition, the responsible mechanical engineer shall sign and stamp all plans, drawings and calculations and submit a signed statement to the CBO that the

proposed final design plans, specifications and calculations conform with the applicable LORS.

Verification: At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of construction of any HVAC or refrigeration system, the project owner shall submit to the CBO the required HVAC and refrigeration calculations, plans, and specifications, including a copy of the signed and stamped statement from the responsible mechanical engineer certifying compliance with the CBC and other applicable codes, with a copy of the transmittal letter to the CPM.

ELEC-1 Prior to the start of any increment of electrical construction for all electrical equipment and systems 480 Volts or higher (see a representative list, below), with the exception of underground duct work and any physical layout drawings and drawings not related to code compliance and life safety, the project owner shall submit, for CBO design review and approval, the proposed final design, specifications, and calculations. Upon approval, the above listed plans, together with design changes and design change notices, shall remain on the site or at another accessible location for the operating life of the project. The project owner shall request that the CBO inspect the installation to ensure compliance with the requirements of applicable LORS. All transmission facilities (lines, switchyards, switching stations, and substations) are handled in conditions of certification in the **Transmission System Engineering** section of this document.

A. Final plant design plans shall include:

1. one-line diagrams for the 13.8 kV, 4.16 kV and 480 V systems; and

2. system grounding drawings.

B. Final plant calculations must establish:

1. short-circuit ratings of plant equipment;

2. ampacity of feeder cables;

3. voltage drop in feeder cables;

4. system grounding requirements;

5. coordination study calculations for fuses, circuit breakers and protective relay settings for the 13.8 kV, 4.16 kV and 480 V systems;

6. system grounding requirements; and

7. lighting energy calculations.

C. The following activities shall be reported to the CPM in the monthly compliance report:

1. Receipt or delay of major electrical equipment;

2. Testing or energization of major electrical equipment; and

3. A signed statement by the registered electrical engineer certifying that the proposed final design plans and specifications conform to requirements set forth in the Energy Commission decision.

Verification: At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of each increment of electrical construction, the project owner shall submit to the CBO for design review and approval the above listed documents. The project owner shall include in this submittal a copy of the signed and stamped statement from the responsible electrical engineer attesting compliance with the applicable LORS, and shall send the CPM a copy of the transmittal letter in the next monthly compliance report.

D.1.13 CONCLUSIONS

1. The laws, ordinances, regulations and standards (LORS) identified in the Genesis Solar Energy Project (GSEP) AFC and supporting documents directly apply to the project.

2. Staff has evaluated the proposed engineering LORS, design criteria, and design methods in the record, and concludes that the design, construction, and eventual closure of the project will likely comply with applicable engineering LORS.

3. The proposed conditions of certification will ensure that GSEP is designed and constructed in accordance with applicable engineering LORS. This will be accomplished through design review, plan checking, and field inspections that will be performed by the CBO or other Energy Commission delegate. Staff will audit the CBO to ensure satisfactory performance.

4. Though future conditions that could affect decommissioning are largely unknown at this time, it can reasonably be concluded that if, the project owner submits a decommissioning plan as required in the **General Conditions** portion of this document prior to decommissioning, decommissioning procedures will comply with all applicable engineering LORS.

Energy Commission staff recommends that:

1. The proposed conditions of certification be adopted to ensure that the project is designed and constructed in a manner that protects the public health and safety and complies with all applicable engineering LORS;

2. The project be designed and built to the 2007 CBSC (or successor standards, if in effect when initial project engineering designs are submitted for review); and

3. The CBO reviews the final designs, checks plans, and performs field inspections during construction. Energy Commission staff shall audit and monitor the CBO to ensure satisfactory performance.

GSEP 2009a – Genesis Solar Energy Project/T. Bernhardt (tn: 53083). Application for Certification for the Genesis Solar Energy Project. 08/31/2009

D.2 – GEOLOGY, PALEONTOLOGY, AND MINERALS

Testimony of Dal Hunter, Ph.D. CEG.

D.2.1 SUMMARY OF CONCLUSIONS

The proposed Genesis Solar Energy Project site is located in a moderately active geological area of the eastern Mojave Desert geomorphic province in eastern Riverside County in southeastern California. Because of its geological setting, the site could be subject to moderate levels of earthquake-related ground shaking. The preliminary geotechnical and geological hazards investigation also indicates a potential for expansive soils and hydrocompaction (GSEP 2009a). The effects of ground shaking would need to be mitigated through structural designs required by the California Building Code (CBC 2007) and a site-specific, design-level project geotechnical report. The CBC (2007) requires that structures be designed to resist seismic stresses from ground acceleration and, to a lesser extent, liquefaction. A site-specific, design-level geotechnical investigation would also present standard engineering design recommendations for mitigation of site soil conditions.

There are no known viable geological or mineralogical resources at the proposed Genesis Solar Energy Project site. Locally, paleontological resources have been documented within lacustrine sediments in Ford Dry Lake, and regionally in older Quaternary alluvium. Older alluvium and lacustrine deposits may underlie younger Quaternary alluvium at an undetermined depth beneath the site surface. Potential impacts to paleontological resources would be mitigated through worker training and monitoring by qualified paleontologists, as required by Conditions of Certification, **PAL-1** through **PAL-7**.

Based on its independent research and review, the United States Bureau of Land Management (BLM) and California Energy Commission (Energy Commission) staffs (hereafter jointly referred to as "staff") believe that the potential is low for significant adverse impacts to the proposed project from geological hazards during its design life and to potential geological, mineralogical, and paleontological resources from the construction, operation, and closure of the proposed project. It is staff's opinion that the proposed GSEP facility could be designed and constructed in accordance with all applicable laws, ordinances, regulations, and standards and in a manner that both protects environmental quality and assures public safety. Conditions of certification referred to herein serve the purpose of both the Energy Commission's Conditions of Certification for purposes of the California Environmental Quality Act and BLM's Mitigation Measures for purposes of the National Environmental Policy Act.

D.2.2 INTRODUCTION

U.S. Bureau of Land Management and Energy Commission staff (hereafter jointly referred to as staff), in this section, discuss the potential impacts of geological hazards on the proposed Genesis Solar Energy Project (GSEP) site as well as the project's potential impacts on geological, mineralogical, and paleontological resources. Staff's objective is to ensure that there will be no consequential adverse impacts to significant geological and paleontological resources during the project construction, operation, and

closure and that operation of the plant will not expose occupants to high-probability geological hazards. A brief geological and paleontological overview is provided. The section concludes with staff's proposed monitoring and mitigation measures for geological hazards and geological, mineralogical, and paleontological resources, with proposed conditions of certification.

D.2.3 METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

Federal agencies are required to review major federal actions such as the GSEP project under the National Environmental Policy Act (NEPA). This document has been prepared in consultation and coordination with the BLM to also address federal environmental issues. The BLM and CEC have conducted a joint environmental review of the project in a single NEPA/California Environmental Quality Act (CEQA) process. The Federal Land Policy and Management Act of 1976 (FLPMA) establishes the agency's multiple-use mandate to serve present and future generations.

The CEQA Guidelines, Appendix G, provide a checklist of questions that lead agencies typically address.

- Section (V) (c) includes guidelines that determine if a project will either directly or indirectly destroy a unique paleontological resource or site or a unique geological feature.
- Sections (VI) (a), (b), (c), (d), and (e) focus on whether or not the project would expose persons or structures to geological hazards.
- Sections (X) (a) and (b) concern the project's effects on mineral resources.

The California Building Standards Code (CBSC) and CBC (2007) provide geotechnical and geological investigation and design guidelines, which engineers must follow when designing a facility. As a result, the criteria used to assess the significance of a geological hazard include evaluating each hazard's potential impact on the design and construction of the proposed facility. Geological hazards include faulting and seismicity, volcanic eruptions, liquefaction, dynamic compaction, hydrocompaction, subsidence, expansive soils, landslides, tsunamis, and seiches. Of these, dynamic compaction, hydrocompaction, subsidence, and expansive soils are geotechnical engineering issues but are not normally associated with concerns for public safety.

Staff has reviewed geological and mineral resource maps for the surrounding area, as well as site-specific information provided by the applicant, to determine if any geological and mineralogical resources exist in the area and to determine if operations could adversely affect such geological and mineralogical resources.

To evaluate whether the proposed project and alternatives would generate a potentially significant impact as defined by CEQA on mineral resources, the staff evaluated them

against checklist questions posed in the 2006 CEQA Guidelines, Appendix G, Environmental Checklist established for Mineral Resources. These questions are:

A. Would the project result in the loss of availability of a known mineral resource that would be of value to the region and residents of the state?

B. Would the project result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

Under NEPA, the impact of the proposed project and alternatives on mineral resources would be considered significant if they would directly or indirectly interfere with active mining claims or operations, or would result in reducing or eliminating the availability of important mineral resources. The staff's evaluation of the significance of the impact of the proposed project on mineral resources includes an assessment of the context and intensity of the impacts, as defined in the NEPA implementing regulations 40 CFR Part 1508.27.

Staff reviewed existing paleontological information and requested records searches from the Natural History Museum of Los Angeles County (NHMLA) and the University of California Museum of Paleontology at Berkeley (UCMP) for the site area. Site-specific information generated by the applicant for the proposed GSEP project was also reviewed. All research was conducted in accordance with accepted assessment protocol (SVP 1995) to determine whether any known paleontological resources exist in the general area. If present or likely to be present, conditions of certification which outline required procedures to mitigate impacts to potential resources, are proposed as part of the project's approval.

The Antiquities Act of 1906 (16 United States Code [USC]) requires that objects of antiquity be taken into consideration for federal projects and the California Environmental Quality Act, Appendix G, also requires the consideration of paleontological resources. The Paleontological Resources Preservation Act of 2009 requires the Secretaries of the United States Department of the Interior and Agriculture to manage and protect paleontological resources on Federal land using scientific principles and expertise. The potential for discovery of significant paleontological resources or the impact of surface disturbing activities to such resources is assessed using the Potential Fossil Yield Classification (PYFC) system. This system includes three conditions (Condition 1 [areas known to contain vertebrate fossils]; Condition 2 [areas with exposures of geological units or settings that have high potential to contain vertebrate fossils]; and Condition 3 [areas that are very unlikely to produce vertebrate fossils]). The PYFC class ranges from Class 5 (very high) to Class 1 (very low) (USDI 2007).

The proposed conditions of certification allow BLM's Authorized Officer, the Energy Commission's compliance project manager (CPM) and the applicant to adopt a compliance monitoring scheme ensuring compliance with laws, ordinances, regulations, and standards (LORS) applicable to geological hazards and the protection of geological, mineralogical, and paleontological resources.

Based on the information below, it is staff's opinion that the potential for significant adverse impacts to the project from geological hazards, and to potential geological, mineralogical, and paleontological resources from the proposed project, is low.

D.2.3.1 LAWS, ORDINANCES, REGULATIONS, AND STANDARDS (LORS)

Applicable laws, ordinances, regulations, and standards (LORS) are listed in the application for certification (AFC) (GSEP 2009a). The following briefly describes the current LORS for both geological hazards and resources and mineralogical and paleontological resources.

Geology and Paleontology Table 1
Laws, Ordinances, Regulations, and Standards (LORS)

Applicable Law	Description
Federal	
Antiquities Act of 1906 (16 United States Code [USC], 431-433)	The proposed GSEP facility site is located entirely on land currently administered by the Bureau of Land Management (BLM). Although there is no specific mention of natural or paleontological resources in the Act itself, or in the Act's uniform rules and regulations (Title 43 Part 3, Code of Federal Regulations [43 CFR Part 3], 'objects of antiquity' has been interpreted to include fossils by the Federal Highways Act of 1956, the National Park Service (NPS), the BLM, the Forest Service (USFS), and other Federal agencies.
National Environmental Policy Act (NEPA) of 1970 (42 USC 4321, et. seq.)	Established the Council on Environmental Quality (CEQ), which is charged with preserving 'important historic, cultural, and natural aspects of our national heritage'.
Federal Land Policy and Management Act (FLPMA) of 1976 (43 USC 1701-1784)	Authorizes the BLM to manage public lands to protect the quality scientific, scenic, historical, archeological, and other values, and to develop 'regulations and plans for the protection of public land areas of critical environmental concern', which include 'important historic, cultural or scenic values'. Also charged with the protection of 'life and safety from natural hazards'.
Paleontological Resources Preservation Act (PRPA) (Public Law [PL] 111-011)	Authorizes Departments of Interior and Agriculture Secretaries to manage the protection of paleontological resources on Federal lands.
National Historic Preservation Act of 1966 (NHPA) (16 USC 470)	Establishes policies for the 'preservation of the prehistoric and historic resources of the United States', under the direction of the Secretary of the Interior and the BLM.
State	
California Building Code (CBC), 2007	The CBC (2007) includes a series of standards that are used in project investigation, design, and construction (including grading and erosion control).

Applicable Law	Description
Alquist-Priolo Earthquake Fault Zoning (APEFZ) Act, Public Resources Code (PRC), section 2621–2630	Mitigates against surface fault rupture of known active faults beneath occupied structures. Requires disclosure to potential buyers of existing real estate and a 50-foot setback for new occupied buildings. Portions of the site and proposed ancillary facilities are located within designated Alquist-Priolo Fault Zones. The proposed site layout places occupied structures outside of the 50-foot setback zone.
The Seismic Hazards Mapping Act, PRC Section 2690–2699	Areas are identified that are subject to the effects of strong ground shaking, such as liquefaction, landslides, tsunamis, and seiches.
PRC, Chapter 1.7, sections 5097.5 and 30244	Regulates removal of paleontological resources from state lands, defines unauthorized removal of fossil resources as a misdemeanor, and requires mitigation of disturbed sites.
Warren-Alquist Act, PRC, sections 25527 and 25550.5(i)	The Warren-Alquist Act requires the Energy Commission to "give the greatest consideration to the need for protecting areas of critical environmental concern, including, but not limited to, unique and irreplaceable scientific, scenic, and educational wildlife habitats; unique historical, archaeological, and cultural sites…" With respect to paleontological resources, the Energy Commission relies on guidelines from the Society for Vertebrate Paleontology, indicated below.
California Environmental Quality Act (CEQA), PRC sections 15000 et seq., Appendix G	Mandates that public and private entities identify the potential impacts on the environment during proposed activities. Appendix G outlines the requirements for compliance with CEQA and provides a definition of significant impacts on a fossil site.
Society for Vertebrate Paleontology (SVP), 1995	The "Measures for Assessment and Mitigation of Adverse Impacts to Non-Renewable Paleontological Resources: Standard Procedures" is a set of procedures and standards for assessing and mitigating impacts to vertebrate paleontological resources. The measures were adopted in October 1995 by the SVP, a national organization of professional scientists.
Local	
Riverside County General Plan, Safety Element	Adopts the Uniform Building Code (UBC) (1997), which provides design criteria for buildings and excavations. The UBC is superseded by the CBC (2007). Requires mitigation measures for geological hazards, including seismic shaking, surface rupture (adopts APEFZ Act), liquefaction, unstable soils and slopes, and flooding.
Riverside County General Plan, Multipurpose Open Space Element	Provides for 'preservation of cultural, historical, archaeological, paleontological, geological and educational resources'. Also provides a map showing paleontological sensitivity in the county.

D.2.4 PROPOSED PROJECT

D.2.4.1 SETTING AND EXISTING CONDITIONS

Applicant has applied for a right-of-way (ROW) grant for approximately 4,640 acres (7¼ square miles) currently administered by the BLM (GSEP 2009a). The property is divided into two elongate, roughly rectangular, unconnected portions along the northeast side of Chuckwalla Valley. The proposed GSEP would be constructed on approximately 1,800 acres (2¾ square miles) of the eastern portion, which is located north of Interstate Highway 10 and Ford Dry Lake roughly 23 miles west-southwest of the town of Genesis in Riverside County, California. An additional 90 acres will be utilized for off-site linear construction. Future power-generating facilities are presumably planned for construction on the western portion of the property, which is included in staff's current assessment.

The proposed GSEP would be a primary concentrated solar electric power generating facility capable of producing 250 megawatts (MW) of electricity from two independent plants (GSEP 2009a). Each plant will employ parabolic trough solar thermal technology, which utilizes an array of mirrors that focus solar energy towards a centralized power block. The power block contains a heat transfer fluid (HTF) which supplies heat to solar steam generators (SSG) that drive steam turbine generators (STG). Water for the project would be provided from ground water supply wells. The water would be treated to potable standards by an onsite packaged water treatment system, cooling water blow down would be disposed of by evaporation from lined ponds, and an on-site sanitary septic system would treat sewer waste water. On-site facilities associated with the solar plant would include control, warehouse and administration buildings, a bioremediation land treatment unit, raw, treated and deionized water storage tanks, HTF surge tanks, back-up diesel generators, cooling towers, and natural gas-fired auxiliary boilers. An access road, buried natural gas pipe line, and new 230 kilovolt (kV) electrical transmission line would occupy a 6.5-mile corridor extending from the southeast end of the GSEP site to Interstate 10. The generated electrical power from the Project switchyard will be transmitted through a generation-tie (gen-tie) line that will be routed in a southeasterly ROW eventually connecting to the proposed Southern California Edison (SoCal Edison) 500-230 kV Colorado River substation via the Blythe Energy Project Transmission Line (BEPTL)

Depending on the published reference, the proposed GSEP site is located in either the southeastern portion of the Mojave Desert geomorphic province (CGS 2002a), or the northeastern quarter of the Colorado Desert geomorphic province (Norris and Webb 1990), in the Mojave Desert of Southern California near the Arizona border. The region is more characteristic of the Mojave Desert geomorphic province in terms of geology, structure and physiography.

The Mojave Desert is a broad interior region of isolated mountain ranges which separate vast expanses of desert plains and interior drainage basins. The physiographic province is wedge-shaped, and separated from the Sierra Nevada and Basin and Range geomorphic provinces by the northeast-striking Garlock Fault on the northwest side. The northwest-striking San Andreas fault defines the southwestern boundary, beyond which lie the Transverse Ranges and Colorado Desert geomorphic provinces. The topography and structural fabric in the Mojave Desert is predominately southeast to

northwest, and is associated with faulting oriented similar to the San Andreas Fault. A secondary east to west orientation correlates with structural trends in the Transverse Ranges geomorphic province.

The proposed GSEP facility would be constructed on 1,800 acres (roughly 2¾ square miles) of land north of Interstate 10. The proposed site is located approximately 23 miles west-northwest of the town of Blythe, California, and about 24 miles east-southeast of the town of Desert Center in Riverside County, California. The proposed GSEP site would be situated on a broad alluvial plain within the northwest-trending Chuckwalla Valley between the McCoy Mountains to the northeast, the Palen Mountains to the northwest, and Ford Dry Lake to the south. Overall the proposed site slopes at very shallow grades south and southwest toward the local topographic low at Ford Dry Lake.

Quaternary age alluvial, lacustrine and eolian sedimentary deposits are mapped in the vicinity of the proposed GSEP site (CDMG 1967; USGS 1989; USGS 1990; USGS 2006; GSEP 2009a, c and f). Marine and transitional sediments of the Pliocene Age Bouse Formation are presumed to underlie alluvial fan deposits (USGS 1968; GSEP 2009a, c and f), and metasedimentary bedrock of the McCoy Mountains Formation outcrop in the McCoy and Palen Mountains (Harding and Coney 1985). The local stratigraphy as interpreted by numerous authors, is presented in **Geology and Paleontology Table 2**.

Geology and Paleontology Table 2
Correlation and Ages of Stratigraphic Units

Age	Unit/Description	Jennings (CDMG 1967)	Stone and Pelka (USGS 1989)	Stone (USGS 1990)	Stone (USGS 2006)	Worley Parsons (GSEP 2009f)

* - Interpreted as mid-Holocene in age based on suggested age of ancient shoreline, and moderate development of desert varnish and pavement
** - Transitional between older, dissected alluvial fan deposits and younger sediments in a depositional setting

Holocene units, which include eolian sands, younger alluvium, and playa lake deposits, are mapped over nearly the entire proposed GSEP site surface. Eolian sands consist of unconsolidated deposits of well sorted, wind blown sand in dunes and sheets. Younger alluvium is composed of sand, pebbly sand and sandy pebble-gravel, and is generally coarser grained closer to mountain ranges. Desert varnish is not well developed in the mostly unconsolidated and undissected sediments. Playa lake deposits are also unconsolidated, and are comprised of clay, silt and sand. Older alluvium is present at the surface along the northern edge of both the western (entire length) and eastern (west end only) portion and the proposed GSEP site. The exposures of older alluvium occur as north-south oriented ridges of material protruding into the site from the north, with the intervening areas occupied by drainages filled with younger alluvium. Older alluvium is composed of consolidated gravel and sand that is moderately dissected with moderately developed desert pavement and varnish.

The approximate transition from Pleistocene to Holocene age sediments is marked by the change from older alluvium with an erosional, dissected surface, to a setting in which neither deposition nor erosion is occurring (intermediate alluvium), to areas undergoing active fan deposition (younger alluvium) (GSEP 2009f). A prominent east-west-trending linear feature observed on aerial photos that roughly corresponds to this transitional area is interpreted to be an ancient shoreline. Although the age of the shoreline is not well established, it is postulated in the Geological Resources and Hazards section of the AFC (GSEP 2009a) that the pluvial highstand of Ford Lake could have occurred approximately 4000 years before present (bp). This suggests a Holocene age of deposition for intermediate alluvium (Qiaf, Unknown Reference, GSEP 2009a), which is shown in areas mapped as younger alluvium by others (Qal , CDMG 1967; Qva, USGS 1989; and Qa_6, USGS 2006).

Interbedded clay, silt, sand, limestone and tufa of the Bouse Formation were deposited in a marine to brackish-water environment during the Pliocene epoch in Coachella Valley (USGS 1968; USGS 2006). The sediments were deposited in a marine embayment of the Gulf of California that encroached northward into the Colorado River valley during the late Tertiary. The nearest exposure relative to the proposed GSEP site is mapped at the north end of the Mule Mountains approximately 8 miles southeast of the southeastern end of the project linears (USGS 1968). The geotechnical investigation attached to the AFC indicates that the unit underlies the proposed site at a depth of 245 to 275 feet beneath Quaternary alluvium, and extends several thousand feet (GSEP 2009a). Weakly metamorphosed sandstone and conglomerate, and lesser shale, mudstone and siltstone, of the Cretaceous age McCoy Mountains Formation are the predominant lithologies in the McCoy and Palen Mountains (CDMG 1967; USGS 1968; USGS 1990; USGS 2006). The nearest exposures are located roughly 2½ miles north of the western portion of the property in the Palen Mountains and 3 miles northeast of the project linears in the McCoy Mountains.

One reverse circulation drill hole was advanced to a depth of 900 feet for the preliminary geotechnical investigation attached to the AFC (GSEP 2009f). The drill hole was located at the east end of the western portion of the GSEP site, approximately 1.5 miles from the western limit of proposed construction on the eastern portion of the site. The upper 12 feet of the drill hole consisted of gravelly sand with silt that contained 16 to 17 percent fines passing the number 200 sieve. Between 12 and 75 feet (limit of presented

data), the soils consisted of interbedded silty sand, clayey sand, sandy lean clay and fat clays interpreted to have been deposited in alternating alluvial and lacustrine environments. Penetration resistance blow counts, obtained by driving a Modified California split spoon sampler at regular intervals in the upper 75 feet of the drill hole, indicate the consistency of the site soils are very dense or very hard (GSEP 2009f). A summary of laboratory testing in the preliminary geotechnical investigation reported plasticity indices for the clay soils that range from 23 to 39, and free swells ranging from 130 to 270 percent (GSEP 2009f). The test results indicate the clay soils are moderately to highly expansive. The upper 12 feet of granular materials is considered to be younger alluvium, and underlying granular and clay soils are interpreted to be older alluvial fan and lacustrine deposits (GSEP 2009f). The depth to older alluvium beneath younger alluvium across the portion of the GSEP site proposed for construction, however, is unknown and likely varies greatly. Shallow excavations encountered weakly carbonate-cemented sediments and soil development, which could be intermediate or older alluvium, at depths just beneath 18 inches below the surface (GSEP 2009f). This suggests that only a thin veneer of younger alluvium may be present locally, or in large areas, across the proposed site.

Geophysical testing, which included seismic refraction, electromagnetic soundings, and surface and down hole shear wave velocity profiles, were also conducted in the vicinity of proposed construction. Depth to ground water and the top of the Bouse Formation, relative density of the alluvial soils, and the project location site class (CBC 2007), were estimated using geophysical methods.

The proposed GSEP plant site is not crossed by any known active faults or designated Alquist-Priolo Earthquake Fault Zone (EFZ, formerly called Special Studies Zones) (CGS 2002b). A number of major, active faults lie within 62 miles of the site. These faults are discussed in detail under the **Geological Hazards** section later in this section. Several northwest-striking, south-dipping basement thrust faults are mapped at the extreme south ends of the Palen and McCoy Mountains, and are inferred beneath Quaternary and Tertiary sediments in Chuckwalla Valley (Harding and Coney 1985; CDMG 1967; USGS 1990; USGS 2006). The faults are part of a major Mesozoic terrain-bounding structural zone that was active during late Jurassic time, and are associated with folding and metamorphism of the McCoy Mountains Formation. The basement faults are no longer active, and are not exposed anywhere on the surface of the proposed site.

The site-specific geotechnical investigation performed for the proposed GSEP (GSEP 2009a) estimated a depth to the ground water table of 61 to 81 feet below the surface in the vicinity of proposed construction, based on geophysical methods. Ground water was encountered at approximately 77 feet below ground surface (bgs) in the reverse circulation drill hole 1.5 miles west of proposed construction. Water level monitoring at wells 006S019E28R001S, 006S019E32K001S, and 006S019E32K002S, located 1½ to 4½ miles southwest of the eastern portion of the proposed site near Ford Dry Lake, yielded water levels of 81 to 110 bgs feet from 1992 to 2000 (CDWR 2009; USGS 2009). Measured ground water levels at the southeast end of the proposed project linears ranged from 125 to 151 feet bgs between 1979 and 2002 in wells 006S020E33C001S, 006S020E33L001S, and 007S04E33R001S. Water levels beneath the site would vary seasonally and with pumping frequency of nearby irrigation wells.

Existing grade at the proposed power plant site slopes between 0.5 and 1.5 percent to the south and southwest towards Ford Dry Lake. Site drainage is probably by a combination of infiltration, overland sheet flow and shallow drainages. A more complete discussion of on-site drainage is included in the **Water Resources** section of this staff assessment

D.2.4.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

This section considers two types of impacts. The first is geological hazards, which could impact the proper functioning of the proposed facility and create life/safety concerns. The second is the potential impacts the proposed facility could have on existing geological, mineralogical, and paleontological resources in the area.

D.2.4.2.1 Direct/Indirect Impacts and Mitigation

Ground shaking, expansive soils, and hydrocompaction represent the main geological hazards at the proposed site. These potential hazards could be effectively mitigated through facility design by incorporating recommendations contained in the project geotechnical evaluation. Proposed Conditions of Certification **GEN-1, GEN-5,** and **CIVIL-1** in the **Facility Design** section should also mitigate these impacts to a less than significant level.

The proposed GSEP site is located within Mineral Resource Zone 4 (MRZ-4), which denotes “areas of no known mineral occurrences where geological information does not rule out either the presence or absence of significant mineral resources” (CDMG 1994a). No economically viable mineral deposits are known to be present at the site (CDMG 1994a; Kohler 2006). Many inactive mines and mineral prospects are hosted by in metamorphic and intrusive basement rocks within 10 miles of the proposed project boundaries and project linears. These have produced a number of precious and base metals, including iron (magnetite) from the Iron King, Iron Queen and Iron Cap mines in the Palen Mountains1½ to the north (CDMG 1994a). Minor gold, silver, copper and uranium prospects are located in the Palen Mountains 2½ miles to the north, and in the McCoy Mountains 4½ miles to the east. The Roosevelt and Hodge Mining Districts produced gold and silver from quartz veins and shear zones in the Mule Mountains approximately 6 to 9 miles southeast of the proposed project linears. Pyrophyllite, an industrial mineral used in the manufacturing of dry lubricants, paper, rubber, fabric and soap, has been mined from the Palen Mountains 3½ miles north of the site. Several borrow pits are present along Interstate 10. No mines are known to have existed within the proposed project boundaries (USGS 2008b).

Near-surface geology beneath the proposed GSEP site consists primarily of Quaternary alluvium, eolian and lacustrine sediments which increases in age with depth from Holocene at the surface to Pleistocene and older at depth (CDMG 1967;USGS 1989; USGS 1990; USGS 2006). Coarse-grained sediments grade laterally and are likely interbedded with lakebed deposits of similar ages to the south and southwest towards Ford Dry Lake. Pleistocene age older alluvium, which is exposed along the northern boundary of the site, underlies younger alluvium and lacustrine sediments. Pleistocene age deposits may be within a few feet of the surface along the northern border, and at an unknown but progressively deeper depth to the south across the proposed site and

project linears. Pliocene age marine and transitional sediments of the Bouse Formation underlie Quaternary deposits at depths of 245 to 275 feet, but are not exposed at the surface (GSEP 2009a). Similarly, metamorphosed sediments of the Cretaceous age McCoy Mountains Formation make up nearly all basement rocks in the McCoy and Palen Mountains (CDMG 1967; USGS 1968; USGS 1990; USGS 2006), but are not present on the proposed site.

Staff reviewed correspondence from the NHMLA (McLeod, 2009), the UCMP, and the Riverside County Land Information System (RCLIA 2009), for information regarding known fossil localities and stratigraphic unit sensitivity within the proposed project area. The paleontological resources section of the AFC (GSEP 2009a) indicates there are no recorded fossil collection sites within the proposed project boundaries based on reports submitted by the NHMLA or the UCMP. The only known fossil remains on the proposed site and project linears were observed during a four-day field survey. Fragments of tortoise carapace and bones, which were partly replaced with calcite, gypsum and opaline silica, were found in stream beds. The fragmental condition indicates the specimens were transported a significant distance to their current location, probably post-mortem, and the mineralization suggests an age on the order of several thousand years (GSEP 2009a). Microfossils, including diatoms and ostracods, were also found in sediments during a preliminary field survey. The paleontological assessment report concludes that fossils observed on the proposed site are indicative of late Pleistocene/early Holocene environment, and that there is only limited potential for the observed specimens to add to the current body of scientific knowledge. It should be noted that "*a complete pedestrian survey of the entire Project area of potential effect for paleontological resources was considered unnecessary and no subsurface exploration was conducted. A more detailed survey was considered unnecessary because the Project site is located in a lowland, depositional environment consisting of the surface of very recent Holocene alluvium*" (GSEP 2009a).

Several fossil localities have been documented by the NHMLC in the local region in geological units that may be encountered during construction of the proposed GESP site (McLeod 2009). The nearest is a pocket mouse specimen recovered from lacustrine sediments in the southwest part of the Ford Dry Lake, within roughly 4 miles southwest of proposed construction. A site in older alluvium approximately 20 to 25 miles to the northwest has produced fossil remains of tortoise, horse and two species of camel.

Based on the recorded fossil finds, staff concludes the paleontological resource sensitivity of Quaternary age sediments varies from low in Holocene age younger alluviual, lacustrine and eolian deposits at shallow depths to high as Pleistocene age older alluvium and lacustrine deposits are encountered at deeper depths. The depth to Pleistocene age sediments is unknown and may vary significantly across the site. Older alluvium is mapped at the surface along the northern border of the site, and would likely be buried at progressively deeper depths beneath Holocene sediments southward across the site. The geomorphic reconnaissance report for the proposed project encountered a weathered horizon that may be older alluvium within only two or three feet of the surface beneath younger alluvium (GSEP 2009f). McLeod (2009) indicated that older lacustrine deposits may be encountered in excavations along the southwest margins of the site nearest Ford Dry Lake.

The Riverside County Transportation and Land Management Agency (TLMA) has produced a paleontological sensitivity map of the county (RCLIS 2009). The mapping indicates that areas underlain by playa lake, eolian and younger alluvial deposits within and around the Ford Dry Lake basin have a high paleontological sensitivity rating. Younger alluvium upslope from the lakebed has a low sensitivity rating, and older alluvium is assigned an undetermined sensitivity rating, according to the TLMA.

Staff concludes that all subsurface older Quaternary age alluvial and lacustrine sediments are highly sensitive. Where these units are mapped at the surface or may be present near the surface adjacent to these mapped areas, specifically along the northern and southern (adjacent to Ford Dry Lake) borders of the proposed GESP site, paleontological monitoring should be conducted for any excavation from the surface. Since the depth to Pleistocene age alluvial and lacustrine deposits is undetermined at present for the remainder of the site, any excavations that penetrate below 1.5 feet of the existing ground surface should be treated as having a high potential for impacting significant paleontological resources and would require paleontological monitoring. This depth is based on observations of possible older alluvium encountered in excavations advanced for the geomorphic reconnaissance report (GSEP 2009f).

As monitoring of grading and trenching activities during proposed construction of the site progresses, a qualified professional paleontologist may determine a more appropriate depth above which the coarse and fine grained soils are Holocene in age, have a low sensitivity, and low potential for adverse impacts on paleontological resources. This depth would likely increase from the northern and southern boundaries towards the center of the proposed GESP site. Recommendations for increased, decreased, or unchanged levels of monitoring could be proposed as well based on increased information and experience gained as proposed construction progresses.

The Pliocene age Bouse Formation is known to have produced fossil specimens in the Colorado River Valley area (USGS 1968). However, the unit is not exposed at the surface of the proposed site, and a minimum depth of 245 feet bgs was determined in the project geotechnical investigation (GSEP 2009a). Similarly, bedrock present in the McCoy Mountains Formation is expected to lie at even greater depths beneath the site, and metamorphic rocks are generally considered to have little or no potential for containing significant fossil remains. Therefore, staff considers the potential for impacting significant paleontological resources in the Bouse and McCoy Mountains Formations during proposed construction to be minimal.

Staff considers the probability for significant paleontological resources to be encountered during proposed site construction activities to be low in Holocene age deposits on most of the proposed GSEP site surface. However, proposed mass grading, deep foundation excavation and utility trenching may penetrate underlying Pleistocene age soils at undetermined depths, particularly in the northern portions of the site. Overall, the potential for exposure of paleontological resources would be considered as high, until determined otherwise by a qualified professional paleontologist. Low and high paleontological sensitivity roughly corresponds to PYFC Condition 3, Class 1 or 2 and Condition 2, Class 4a and 4b, respectively.

This assessment is based on SVP (1995) criteria and the paleontological report appended to the AFC (GSEP 2009a). Proposed Conditions of Certification **PAL-1** to **PAL-7** are designed to mitigate paleontological resource impacts, as discussed above, to less than significant levels. These conditions essentially require a worker education program in conjunction with the monitoring of earthwork activities by a qualified professional paleontologist (a paleontological resource specialist, or PRS).

The proposed conditions of certification allow the BLM Authorized Office and the Energy Commission's CPM and the applicant to adopt a compliance monitoring scheme ensuring compliance with LORS applicable to geological hazards and the protection of geological, mineralogical, and paleontological resources.

Based on the information below, it is staff's opinion that the potential for significant adverse, direct or indirect impacts to the project, from geological hazards, and to potential geological, mineralogical, and paleontological resources, from the proposed project, is low.

Geological Hazards

The AFC provides documentation of potential geological hazards at the proposed GSEP plant site, including some site-specific subsurface information (GSEP 2009a). Review of the AFC, coupled with staff's independent research, indicates that the potential for geological hazards to impact the proposed plant site during its practical design life would be low if recommendations for mitigation of seismic shaking, expansive soils, and hydrocompaction are followed. Geological hazards should be addressed in a project-specific, design-level geotechnical report per CBC (2007) requirements (GSEP 2009a).

Staff's independent research included the review of available geological maps, reports, and related data of the proposed GSEP plant site. Geological information was available from the California Geological Survey (CGS), California Division of Mines and Geology (CDMG, now know as CGS), the U.S. Geological Survey (USGS), the American Geophysical Union, the Geological Society of America, the Southern California Earthquake Data Center (SCEDC), and other organizations.

Faulting and Seismicity

Energy Commission staff reviewed numerous CGS, CDMG and USGS publications as well as informational websites in order to gather data on the location, recency, and type of faulting in the proposed project area. Type A and B faults within 63 miles (100 kilometers) of the proposed GSEP site are listed in **Geology and Paleontology Table 3**. Type A faults have slip-rates of $\geq$5 mm per year and are capable of producing an earthquake of magnitude 7.0 or greater. Type B faults have slip-rates of 2 to 5 mm per year and are capable of producing an earthquake of magnitude 6.5 to 7.0. The fault type, potential magnitude, and distance from the site are summarized in **Geology and Paleontology Table 3**. Because of the large size of the proposed site the distances to faults are measured from a point between the two proposed power blocks within the site.

Geology and Paleontology Table 3
Active Faults Relative to the Proposed Genesis Solar Energy Project Site

Fault Name	Distance from Site (miles)	Maximum Earthquake Magnitude (Mw)	Estimated Peak Site Acceleration (g)	Fault Type and Strike	Fault Class
Brawkey Seismic Zone	47.5	6.4	0.058	Right-Lateral Strike Slip (Northwest)	A
San Andreas: Coachella	47.6	7.2	0.089	Right-Lateral Strike Slip (Northwest)	A
San Andreas: Whole	47.6	8.0	0.136	Right-Lateral Strike Slip (Northwest)	A
Elmore Ranch	49.6	6.6	0.063	Left-Lateral Strike Slip (Northeast)	B
Pinto Mountain	61.8	7.2	0.073	Left-Lateral Strike Slip (East-West)	B
Imperial	62.9	7.0	0.064	Right-Lateral Strike Slip (Northwest)	A

Other Type C and otherwise undifferentiated faults which are more than 20 miles from the proposed site are not discussed here because they are unlikely to undergo movement or generate seismicity which could affect the project.

Six Type A and B faults and fault segments were identified within 63 miles of the proposed GSEP site (**Geology and Paleontology Table 3).** Of these, none are within 45 miles of the site. Four of the faults are Type A right-lateral, northwest-trending strike-slip fault systems that are subparallel to the San Andreas Fault System. The remaining two faults are Type B, are east-west to northeast striking, and are left-lateral strike-slip faults with characteristics similar to the Garlock Fault, which bounds the northwestern side of the Mojave Desert geomorphic province (CGS 2002a). All fault zones in **Geology and Paleontology Table 3** lie within designated Alquist-Priolo Earthquake Fault Zones (CDMG 2003)

The proposed GSEP site is located just southwest of the Mojave-Sonoran Belt a roughly 60-mile-wide structural belt that has been correlated with the southern extension of the Walker Lane Fault Zone (USGS 1991). The western boundary for the structural zone, located 5 to10 miles northeast of the proposed site, is marked by an abrupt termination of north- and northeast-trending mountain ranges and basins to the east that are characteristic of the San Andreas Fault Zone, and northwest-trending strike-slip faulting to the west. The Mojave-Sonoran Belt is notable for its relative lack of seismicity and recent faulting (USGS 1991). The region has experienced a low frequency of Pliocene faulting, and Pleistocene faults are nearly absent. These characteristics are unusual given its proximity to areas of intense faulting and frequent seismicity, such as the Eastern California Shear Zone (Dokka and Travis 1990) to the northwest and the Salton Trough to the west.

All of the faults listed in **Geology and Paleontology Table 3** could generate some level of ground shaking at this site. Since there are no known faults of any age through the site, the potential for actual seismic ground surface rupture is negligible.

The close proximity of the proposed GSEP site to the Mojave-Sonoran belt and relatively great distance from more seismically active areas to the west and northwest would suggest a relatively low to moderate probability of intense ground shaking in the project area. However, events such as the Landers earthquake (7.6 Mw), which

occurred on June 28, 1992 approximately 90 miles from the proposed site (Blake 2000b), demonstrate that the proposed site could be subject to moderate levels of earthquake-related ground shaking in the future. The effects of ground shaking would need to be mitigated, to the extent practical, through structural designs required by the California Building Code (CBC 2007) and a site-specific project geotechnical report.

The estimated bedrock peak horizontal ground acceleration (Site Class B) for the power plant is 0.20 times the acceleration of gravity (0.20g) (USGS 2008a). Based on weight averaged down hole shear wave velocities of 1210 feet/sec, and supported by Modified California penetration resistance blow counts, the soils at the proposed GSEP site were determined to be Site Class C (CBC 2007; GSEP 2009f). Buildings and structures are required to be designed with adequate strength to resist the effects of Design Earthquake Ground Motion, as defined by the CBC (2007). This motion is calculated using the site classification, occupancy categories and site coefficients, which in turn are used to determine the design spectral response acceleration parameters at short and 1-second periods. These parameters are generally provided in the design-level geotechnical report for the specific project site.

The potential for strong ground shaking will be addressed in proposed Facility Design Condition of Certification **GEN-1**. Proper design in accordance with this condition, as well as with requirements presented in the site-specific, design-level geotechnical evaluation, should adequately mitigate seismic hazards to the current standards of practice.

Liquefaction

Liquefaction is a condition in which a saturated cohesionless soil may lose shear strength because of sudden increase in pore water pressure caused by an earthquake. However, the potential for liquefaction of strata deeper than approximately 40 feet below surface is considered negligible due to the increased confining pressure and because geological strata at this depth are generally too compact to liquefy.

The preliminary geotechnical investigation at the proposed site estimated current depths to ground water determined by geophysical methods and supported by a single boring 1.5 miles west of proposed construction ranges from 61 to 81 feet bgs (GSEP 2009f). Ground water levels recorded in the nearest wells south of the site and in the vicinity of the southern end of the project linears range from 81 to 151 feet bgs (CDWR 2009; USGS 2009). The geotechnical report also indicated that the granular soils encountered in borings were generally very dense. Because the ground water table is greater than 40 feet deep across the property, and the shallow granular soils are very dense, the potential for liquefaction-induced settlement beneath the site during moderate seismic events is considered to be very low. Measures to mitigate significant damage due to liquefaction should be presented in a design-level, site-specific geotechnical report. Liquefaction potential on the proposed GSEP site is also addressed in the proposed Condition of Certification **GEN-1** requirements.

Lateral Spreading

Lateral spreading of the ground surface can occur within liquefiable beds during seismic events. Lateral spreading generally requires an abrupt change in slope—that is, a

nearby steep hillside or deeply eroded stream bank. Other factors such as distance from the epicenter, magnitude of the seismic event, and thickness and depth of liquefiable layers also affect the amount of lateral spreading. Because the proposed GSEP site is not subject to catastrophic liquefaction-induced settlement, the potential for lateral spreading during seismic events would be negligible due to the low relief and very shallow slopes at the proposed site surface. Lateral spreading potential on the proposed GSEP site should be addressed in a design-level project geotechnical report per CBC (2007).

Dynamic Compaction

Dynamic compaction of soils results when relatively unconsolidated granular materials experience vibration associated with seismic events. The vibration causes a decrease in soil volume, as the soil grains tend to rearrange into a more dense state (an increase is soil density). The decrease in volume can result in settlement of overlying structural improvements. The preliminary geotechnical investigation indicates there would be a potential for minor and localized dynamic compaction during an earthquake (GSEP 2009f). The final geotechnical site evaluation should further investigate the potential for dynamic compaction within the proposed project site and along its linears and, if necessary, provide design parameters necessary to mitigate dynamic compaction issues.

Hydrocompaction

Hydrocompaction (also known as hydro-collapse) is generally limited to young soils that were deposited rapidly in a saturated state, most commonly by a flash flood. The soils dry quickly, leaving an unconsolidated, low density deposit with a high percentage of voids. Foundations built on these types of compressible materials can settle excessively, particularly when landscaping irrigation dissolves the weak cementation that is preventing the immediate collapse of the soil structure. The initial site geotechnical investigation indicates that subsurface alluvial deposits which underlie the proposed project linears contain soils that may experience hydrocompaction (GSEP 2009f). The final geotechnical site evaluation should further investigate the potential for hydrocompaction within the proposed project site and along its linears and, if necessary, provide design parameters necessary to mitigate hydrocompaction issues.

Subsidence

The Riverside County General Plan indicates the basin fill sediments in Chuckwalla Valley are susceptible to subsidence (RCLIA 2008; GSEP 2009f). Regional ground subsidence is typically caused by petroleum or ground water withdrawal that increases the effective unit weight of the soil profile, which in turn increases the effective stress on the deeper soils. This results in consolidation or settlement of the underlying soils. However, even during the 1980’s and 1990’s when regional ground water extraction was at its historic maximum of approximately 48,000 acre-feet per year (AFY) no localized or regional subsidence was recorded. Current ground water withdrawals are reportedly only approximately 2,000 AFY and even the proposed project demand of an additional 1,600 AFY will not approach historic pumping demands. In addition, no petroleum or natural gas withdrawals are taking place in the proposed site vicinity. Therefore, the potential for local or regional ground subsidence resulting from petroleum, natural gas, or ground water extraction is considered to be very low.

Local subsidence or settlement may also occur when areas containing compressible soils are subjected to foundation or fill loads. The relative density of site granular soils was determined to be very dense based on available penetration resistance blow counts in the preliminary geotechnical investigation (GSEP 2009f). Very dense soils are unlikely to experience significant subsidence due to foundation loading.

Expansive Soils

Soil expansion occurs when clay-rich soils with an affinity for water exist in place at a moisture content below their plastic limit. The addition of moisture from irrigation, precipitation, capillary tension, water line breaks, etc. causes the clay soils to absorb water molecules into their structure, which in turn causes an increase in the overall volume of the soil. This increase in volume can correspond to excessive movement (heave) of overlying structural improvements. The preliminary geotechnical evaluation indicates near-surface soils at the proposed site are composed of granular soils with a low content of non-plastic fines, which are not considered to be expansive (GSEP 2009a). However, expansive clay soils were encountered at relatively shallow depths in the single boring located 1.5 miles west of proposed construction and could be present at shallow depths beneath the site. A site-specific, design-level geotechnical site investigation would further evaluate the presence of expansive soils within the proposed project site and along its linears and, if necessary, will provide routine design recommendations to mitigate expansive soil issues (GSEP 2009a).

Landslides

Due to the low site gradient and the absence of topographically high ground in the site vicinity, the potential for landslide impacts to the site is considered to be negligible.

Flooding

The proposed GSEP area has not been mapped by the Federal Emergency Management Agency for flood potential (FEMA 2009). Because the proposed site is topographically higher than Ford Dry Lake to the south, it is staff's opinion that the potential for flooding at the site is limited to infrequent high volume (flash flood) events which may occur due to heavy rainfall in the Palen and McCoy Mountains northeast and northwest of the site. Storm waters would be carried across the proposed site from roughly north to south via existing drainages. Site drainage would be modified during project construction to mitigate potential impacts due to catastrophic flooding (GSEP 2009a).

Tsunamis and Seiches

The proposed GSEP site and associated linear facilities are not located near any significant surface water bodies, and therefore the potential for impacts due to tsunamis and seiches is considered to be negligible.

Volcanic Hazards

The proposed GSEP site is located approximately 42 miles west of the Lavic Lake volcanic hazard area (VHA), an approximately 14 square mile area within the Mojave Desert comprised of Miocene to Holocene age dacitic to basaltic flows, pyroclastic rocks, and volcaniclastic sediments (Glazner et al. 2000). The Lavic Lake VHA has

been designated by the USGS as an area subject to lava flows and tephra deposits associated with basalt or basaltic andesite vents (Miller 1989). The Amboy Crater – Lavic Lake VHS is also considered to be subject to future formation of cinder cones, volcanic ash falls, and phreatic explosions. The recurrence interval for eruptions has not been determined, but is likely to be in the range of one thousand years or more. Because the proposed GSEP site is not located within a designated volcanic hazard area, staff considers the likelihood of significant impacts to the project resulting from volcanic activity would be low.

Geological, Mineralogical, and Paleontological Resources

Geological and Mineralogical Resources

Staff has reviewed applicable geological maps, reports, and on-line resources for this area (Blake 2000a and b; CDMG 1990; CDMG 1994a and b; CDMG 1998; CDMG 1999; CDMG 2003; CGS 2002a, b and c; CGS 2007; Jennings and Saucedo 2002; SCEDC 2008; USGS 2003; USGS 2008a and b). Staff did not identify any geological or mineralogical resources at the proposed GSEP facility location.

The proposed GSEP site is located within MRZ-4 and no economically viable mineral deposits are known to be present (CDMG 1994a; Kohler 2006). Numerous mines and mineral prospects, which have produced iron, gold, silver, copper, uranium, and pyropyllite, are present within 10 miles of the proposed project. No mines are known to have existed within the proposed project boundaries (USGS 2008b).

Paleontological Resources

Staff reviewed the Paleontological Resources Assessments in Section 5.9 and Appendix E of the AFC (GSEP 2009a). Staff has also reviewed paleontological literature and records searches conducted by the NHMLA (McLeod 2009) and the UCMP. These reports document several recorded fossil localities in Holocene to Pleistocene age alluvium and lakebed sediments on and within 25 miles of the proposed GSEP site. Based on these recorded fossil finds and the age of the sediments which may be encountered during construction, the paleontological resource sensitivity of undisturbed Quaternary alluvium and lacustrine sediments varies from low at shallow depths to high at deeper depths. The depth to Pleistocene age sediments beneath Holocene deposits is unknown for most of the proposed site. Staff concludes that all sedimentary units below a depth of 1.5 feet of the ground surface where Holocene age sediments are mapped should initially be treated as highly sensitive. Where Pleistocene age deposits are mapped along the northern and southern borders, staff considers the highly sensitive sedimentary units to be present at the surface. Highly sensitive roughly corresponds to PYFC Condition 2, Class 4a or 4b. After monitoring of grading and trenching activities during proposed construction of the site, a qualified professional paleontologist may determine the appropriate depth above which the coarse grained soils are Holocene in age, have a low sensitivity, and low potential for adverse impacts on paleontological resources (PYFC Condition 3, Class 1 or 2).

These conclusions are based on SVP criteria, the Paleontological Resource Assessments in the AFC (GSEP 2009a), and the independent records searches and paleontological review provided by McLeod (2009) and the UCMP. Proposed Conditions

of Certification **PAL-1** to **PAL-7** are designed to mitigate paleontological resource impacts, as discussed above, to less than significant levels. These conditions would essentially require a worker education program in conjunction with the monitoring of earthwork activities by a qualified professional paleontologist (a paleontological resource specialist, or PRS).

The proposed conditions of certification would allow the BLM Authorized Office, the Energy Commission's CPM, and the applicant to adopt a compliance monitoring scheme ensuring compliance with LORS applicable to geological hazards and the protection of geological, mineralogical, and paleontological resources.

D.2.4.2.2 Construction Impacts and Mitigation

The design-level geotechnical evaluation, required for the project by the CBC (2007) and proposed Condition of Certification **GEN-1** should provide standard engineering design recommendations for mitigation of earthquake ground shaking, expansive soils, and hydrocompaction (see **Proposed Conditions of Certification, Facility Design**).

As noted above, no viable geological or mineralogical resources are known to exist in the vicinity of the proposed GSEP site. Construction of the proposed project will include grading, foundation excavation, and utility trenching. Based on the soils profile, SVP assessment criteria, and recorded fossil localities within 25 miles of the proposed site, staff considers the probability of encountering paleontological resources to be negligible in the upper 1.5 feet of most of the site. Sediments at the surface along the northern and southern borders of the site, as well as all sediments below 1.5 feet of the remainder of the site, should be treated as highly sensitive (PYFC Condition 2, Class 4a, 4b).

Proposed Conditions of Certification **PAL-1** to **PAL-7** are designed to mitigate any paleontological resource impacts, as discussed above, to a less than significant level. Essentially, Conditions of Certification **PAL-1** to **PAL-7** would require a worker education program in conjunction with monitoring of earthwork activities by qualified professional paleontologists (paleontological resource specialist, or PRS). Earthwork would be halted any time potential fossils are recognized by either the paleontologist or the worker. For finds deemed significant by the PRS, earthwork cannot restart until all fossils in that strata, including those below the design depth of the excavation, are collected. When properly implemented, the conditions of certification would yield a net gain to the science of paleontology since fossils that would not otherwise have been discovered can be collected, identified, studied, and properly curated. A paleontological resource specialist would be retained, for the project by the applicant, to produce a monitoring and mitigation plan, conduct the worker training, and provide the monitoring.

During the monitoring, the PRS can and often does petition the Energy Commission for a change in the monitoring protocol. Most commonly, this is a request for less monitoring after sufficient monitoring has been performed to ascertain that there is little chance of finding significant fossils. In other cases, the PRS can propose increased monitoring due to unexpected fossil discoveries or in response to repeated out-of-compliance incidents by the earthwork contractor. In the case of the GSEP site, the PRS would determine an appropriate depth above which undisturbed alluvial and

lacustrine sediments are Holocene in age, have a low paleontological sensitivity, and have little chance of containing significant fossils. The PRS could then recommend decreased monitoring for excavations above that depth. Paleontological sensitivity of Pleistocene age sediments below the determined depth would remain high and would require continued monitoring.

Based upon the literature and archives search, field surveys, and compliance documentation for the proposed GSEP, the applicant has proposed monitoring and mitigation measures to be followed during the construction of the project. Energy Commission staff agrees with the applicant that the facility can be designed and constructed to minimize the effect of geological hazards and impacts to potential paleontological resources at the site during project design life.

D.2.4.2.3 Operation Impacts and Mitigation

Operation of the proposed new solar energy generating facility should not have any adverse impact on geological, mineralogical, or paleontological resources.

D.2.4.2.4 Project Closure and Decommissioning

The future decommissioning and closure of the project should not negatively affect geological, mineralogical, or paleontological resources since the ground disturbed during plant decommissioning and closure would have been already disturbed, and mitigated as required, during construction and operation of the project.

D.2.4.3 CEQA LEVEL OF SIGNIFICANCE

CEQA and NEPA guidelines strive to assure projects on public lands will not:

- Block access to a geological or mineralogical resource, a source of industrial minerals, or construction aggregates.
- Damage, destroy or block access to a natural geological feature with aesthetic and/or scientific value.
- Damage, destroy, or block access to a significant paleontological resource (primarily but not always, vertebrate fossils).
- Increase or initiate regional ground subsidence through extraction of ground water, petroleum, or natural gas.
- Construct structures that would be dangerous to workers or the general public as the result of natural geological hazards of the site.

Independent research conducted by CEC staff geologists verifies that there are no known geological or mineralogical resources or unusual geological features near or within the boundary of the proposed GSEP site. The CEQA level of significant from these areas of concern is “no impact.” Since major ground water withdrawal is not anticipated and regional subsidence is not a known geological hazard in this area, staff concludes that ground water withdrawal for this project would result in an impact of “less than significant.”

All structures on this site must be constructed to the standards of the current California Building Code (CBC 2007), as specified in proposed Condition of Certification **GEN-1** under **Facility Design**. The building code standards are based on both theoretical design and observation of component failures over many years. The intent of the building code is to minimize the risk to human life from natural hazards, including those inherent in the geological environment (earthquake-related, landslides, tsunamis/seiches, volcanic eruptions) and those from other sources, primarily high wind loading. Implementation of these design standards, per **GEN-1**, should result in geological hazards being "less than significant with mitigation" (mitigation being proper design for the site-specific hazards).

Energy Commission staff concludes that the GSEP site is situated in a geological environmental with a high potential to encounter significant paleontological resources, particularly in deeper excavations required for the large structures. Potential impacts to paleontological resources, within the proposed project, can be mitigated to a (CEQA) less than significant level by adopting and enforcing the proposed Conditions of Certification **PAL-1** through **PAL-7**.

D.2.5 REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would essentially be Unit 1 of the proposed project, including a 125 MW solar facility located within the boundaries of the proposed project as defined by NextEra. This alternative is analyzed for two major reasons: (1) it eliminates about 50 percent of the proposed project area so impacts are reduced, and (2) by eliminating the eastern solar field, which is located on flowing desert washes, it would reduce impacts to the sand dune and playa areas and to the Mojave Fringe-toed Lizard habitat. The alternative would also reduce impacts to wildlife movement by reducing obstruction of the Palen wash and would maintain, thru both fluvial and Aeolian processes, the dune and sandy habitats. The boundaries of the Reduced Acreage Alternative are shown in **Alternatives Figure 1**.

D.2.5.1 SETTING AND EXISTING CONDITIONS

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates effects to the eastern 125 MW solar field and relocates the gas yard approximately 1.75 miles northwest of its present location. As a result, the environmental setting consists of the western portion of the proposed project, as well as the area affected by the linear project components.

D.2.5.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Reduced acreage alternative proposes construction and operation of a 125 MW facility. The 125 MW facility under this Alternative would create no additional impacts and would lower the potential to encounter fossils by virtue of a reduced construction footprint.

D.2.5.3 CEQA LEVEL OF SIGNIFICANCE

Like the proposed project, the potential is low for significant adverse impacts to the Reduced Average Alternative from geological hazards during its design life and

moderate to high paleontological resources from the construction, operation, and closure of the proposed project. It is staff's conclusion that the alternative will be designed and constructed in accordance with all applicable laws, ordinances, regulations, and standards and in a manner that both protects environmental quality and assures public safety. The CEQA level of significance would remain unchanged from the proposed project.

D.2.6 DRY COOLING ALTERNATIVE

This section identifies the potential impacts of using air-cooled condenser (ACC) systems rather than the cooling towers proposed by the applicant (NextEra) for the Genesis project. It is assumed that the ACC systems would be located where the cooling towers are currently proposed for each of the two 125 MW power block, as illustrated in **Alternatives Figure 2** (see Section B.3).

Approximately 18 ACC fans would be required for each of the two solar fields. The 18 fans, or ACC's, would operate when the ambient temperature is above 50 degrees Fahrenheit. When the temperature is below 50 degrees Fahrenheit, only 10 of the fans would be used (GSEP 2009f). The 18 ACC fans described in the GSEP cooling study would have a length of approximately 279 feet, a width of approximately 127 feet, and a height of 98 feet (GSEP 2009f). However, based on the ACC preliminary designs for nearby solar thermal projects in similar ambient temperatures, an additional 11,690 square feet could be required for siting of the fans and the fans would be up to 120 feet in height. In addition to the ACC fans, NextEra would use a small Wet Surface Air Cooler when needed to provide auxiliary cooling during extremely hot days (GSEP 2009f). This alternative is analyzed because it would reduce the amount of water required for steam turbine cooling from 822 acre-feet per year (AFY) to 66 AFY. This reduction in water use would reduce impacts to water and biological resources.

D.2.6.1 SETTING AND EXISTING CONDITIONS

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates the use of wet-cooling towers and incorporated the use of air-cooled condensers (ACC) in the same location. As a result, the environmental setting would be the same as for the proposed project.

D.2.6.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Because the ACC system would be located at the same location as the proposed cooling towers within the proposed GSEP site and would not require any additional grading, impacts to geological and paleontological resources from use of the ACC system are expected to be similar as with the proposed wet-cooling system. No additional ground disturbance would be required and as such, no additional disturbance to paleontological or geological resources would be expected. As with the wet-cooling towers, the ACC system would be subject to the 2007 California Building Code and would be required to incorporate the seismic design parameters appropriate for the GSEP site. Additionally, construction of the ACC system would be required to comply with all applicable LORS as for the proposed wet-cooling system and would incorporate similar mitigation as for the proposed wet-cooling system.

No localized or regional subsidence was recorded during the 1980's and 1990's, when regional ground water extraction was at its historic maximum of approximately 48,000 AFY. Current ground water withdrawals are reportedly only approximately 2,000 AFY and the reduced proposed project demand of 66 AFY (from 822 AFY) will not approach historic pumping demands. Therefore, the potential for local or regional ground subsidence resulting from additional ground water extraction is still considered to be very low.

D.2.6.3 CEQA LEVEL OF SIGNIFICANCE

Like the proposed project, the potential is low for significant adverse impacts to the dry cooling alternative from geological hazards during its design life and to potential geological, mineralogical, and paleontological resources from the construction, operation, and closure of the proposed project. It is staff's conclusion that the alternative use of ACCs in place of cooling towers can be designed and constructed in accordance with all applicable laws, ordinances, regulations, and standards and in a manner that both protects environmental quality and assures public safety. The CEQA level of significance would remain unchanged from the proposed project.

D.2.7 NO PROJECT/NO ACTION ALTERNATIVES

D.2.7.1 NO PROJECT/NO ACTION ALTERNATIVE #1:

D.2.7.1.1 No Action on Genesis Solar Energy Project Application and on CDCA Land Use Plan Amendment

The No Project Alternative under CEQA or the No Action Alternative under NEPA defines the scenario that would exist if the proposed Genesis Solar Energy Project were not constructed. The CEQA Guidelines state that "the purpose of describing and analyzing a 'no project' alternative is to allow decision makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project" (Cal. Code Rags., tit. 14 § 15126.6(l)). The No Project analysis in this SA/DEIS considers existing conditions and "what would be reasonably expected to occur in the foreseeable future if the project were not approved…" (Cal. Code Rags, tit. 14 § 15126.6(e)(2)). Under NEPA, the No Action Alternative is used as a benchmark of existing conditions by which the public and decision makers can compare the environmental effects of the proposed action and the alternatives.

If the No Project/No Action Alternative were selected, the construction and operational impacts of the Genesis project would not occur. There would be no grading of the site, no loss of resources or disturbance of approximately 4,640 acres of desert habitat, no potential impacts to paleontological resources, and no installation of power generation and transmission equipment. The No Project/No Action Alternative would also eliminate contributions to cumulative impacts on a number of resources and environmental parameters in Riverside County and in the Mojave Desert and Colorado/Sonora Desert as a whole.

In the absence of the Genesis project, however, other power plants, both renewable and non-renewable, would have to be constructed to serve the demand for electricity

and to meet RPS. If the No Project/No Action Alternative were chosen, other utility-scale solar power facilities may be built, and the impacts to the environment may be similar to those of the proposed project because these technologies require large amounts of land like that required for the Genesis project. The No Project/No Action Alternative may also lead to sitting of other non-solar renewable technologies to help achieve the California RPS.

Paleontological resources have been documented in the general area of the project. As the value of paleontological resources is predicated on their discovery within a specific geological host unit, construction of the project could result in a net gain to the science of paleontology by allowing fossils that would not otherwise have been found to be recovered, identified, studied, and preserved. The No Project/No Action Alternative would preclude this potential net gain.

D.2.7.2 NO PROJECT/NO ACTION ALTERNATIVE #2:

D.2.7.2.1 No Action on Genesis Solar Energy Project Application and Amend the CDCA Land Use Plan to Make the Area Available for Future Solar Development

Under this alternative, the proposed GSEP would not be approved by the CEC and BLM and BLM would amend the CDCA Land Use Plan of 1980, as amended, to allow for other solar projects on the site. As a result, it is possible that another solar energy project could be constructed on the project site.

Because the CDCA Plan would be amended, it is possible that the site would be developed with the same or a different solar technology. As a result, impacts related to geology, minerals, and paleontology would result from the construction and operation of the solar technology and would likely be similar to the impacts from the proposed project. Different solar technologies require different amounts of grading and maintenance; however, it is expected that all the technologies would require some grading and maintenance. As such, this No Project/No Action Alternative could result in impacts and benefits related to geology, minerals, and paleontology similar to the impacts under the proposed project.

D.2.7.3 NO PROJECT/NO ACTION ALTERNATIVE #3:

D.2.7.3.1 No Action on Genesis Solar Energy Project Application and Amend the CDCA Land Use Plan to Make the Area UNAvailable for Future Solar Development

Under this alternative, the proposed GSEP would not be approved by the CEC and BLM and the BLM would amend the CDCA Plan to make the proposed site unavailable for future solar development. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because the CDCA Plan would be amended to make the area unavailable for future solar development, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site. As a

result, the geological conditions of the site are not expected to change noticeably from existing conditions and, as such, this No Project/No Action Alternative would not result in impacts to geological features, minerals, or paleontological resources, nor would it result in the potential benefits of additional knowledge about local paleontological resources that could occur during construction of the proposed project. However, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

D.2.8 COMPARISON OF ALTERNATIVES AND PROPOSED PROJECT

Geology and Paleontology Table 4
Comparison of Proposed Project and Alternatives

Impact	Proposed Project (250 MW)	Reduced Acreage Alternative (125 MW)	Dry Cooling Alternative	No Project/No Action*
No. of Acres	1,800	900	1,800	0
Geological Hazards	Ground shaking – Less than significant with mitigation	Ground shaking – Less than significant with mitigation	Ground shaking – Less than significant with mitigation	Not Applicable (N/A)
Geological Resources	None identified – No impact	None identified – No impact	None identified – No impact	N/A
Mineralogical Resources	None identified – No impact	None identified – No impact	None identified – No impact	N/A
Paleontological Resources	High sensitivity – No impact with mitigation	High sensitivity – No impact with mitigation	High sensitivity – No impact with mitigation	N/A

D.2.9 CUMULATIVE IMPACTS

Section B.3, Cumulative Scenario, provides detailed information on the potential cumulative solar and other development projects in the project area. Together, these projects comprise the cumulative scenario which forms the basis of the cumulative impact analysis for the proposed project. In summary, these projects are:

- Renewable energy projects on BLM, State, and private lands, as shown on **Cumulative Figures 1 and 2** and in **Cumulative Tables 1A and 1B.** Although not all of those projects are expected to complete the environmental review processes, or be funded and constructed, the list is indicative of the large number of renewable projects currently proposed in California.

- Foreseeable future projects in the immediate project area, as shown on **Cumulative Impacts Figure 3,** Plaster City Existing and Future/Foreseeable Projects, and **Cumulative Tables 2 and 3**. Table 2 presents existing projects in this area and Table 3 presents future foreseeable projects in the project. Both tables indicate project name and project type, its location and its status.

These projects are defined within a geographic area that has been identified by the CEC and BLM as covering an area large enough to provide a reasonable basis for evaluating cumulative impacts for all resource elements or environmental parameters. Most of these projects have, are, or will be required to undergo their own independent environmental review under CEQA and/or NEPA. Even if the cumulative projects described in Section B.3 have not yet completed the required environmental processes, they were considered in the cumulative impacts analyses in this SA/Draft EIS.

D.2.9.1 GEOGRAPHIC SCOPE OF ANALYSIS

The geographic area considered for cumulative impacts on geology and paleontology is the Chuckwalla Valley in the southeastern area of the Mojave Desert geomorphic province. The potential impacts are limited to those involving paleontological resources since no geological or mineralogical resources have been identified within the boundaries of the proposed project. There are no geological hazards with potential cumulative effects, other than regional subsidence from ground water withdrawal. Significant ground water withdrawal (relative to past, discontinued withdrawal rates) is not part of the proposed project.

D.2.9.2 EFFECTS OF PAST AND PRESENT PROJECTS

Any previously completed project involving subsurface excavation without the benefit of paleontological monitoring might already have had a detrimental effect on paleontological resources in the area defined above under **Geographic Scope of Analysis**. Given the general scarcity of fossils, even within known fossil bearing strata, the possibility of prior damage is real but modest and unavoidable, after the fact.

D.2.9.3 EFFECTS OF REASONABLY FORESEEABLE FUTURE PROJECTS

D.2.9.3.1 Foreseeable Projects in the Project Area

A number of future foreseeable projects identified in **Cumulative Table 3 (Section B.3)** are located within the Chuckwalla Valley. Such projects could include ground water pumping of similar magnitude to the GSEP; however, the combined effect of these projects would still result in much less than the historic rate of 48,000 AFY, which did not cause any documented regional subsidence, such that significant impacts to regional subsidence would not be expected from the ground water pumping needed for the GSEP. Therefore, there would be no significant cumulative contribution to regional subsidence from foreseeable renewable projects in the Chuckwalla Valley.

D.2.9.3.2 Foreseeable Renewable Projects in the California Desert

As shown in **Section B.3, Cumulative Scenario Table 1A**, the El Centro office of the BLM is aware of 9 solar energy and 8 wind energy potential projects totaling 112,495

acres of land under their jurisdiction. All energy projects on BLM land would be subject to paleontological monitoring and mitigation during construction. When properly implemented and enforced, these safeguards would provide adequate protection of paleontological resources, reducing potential impacts to a (CEQA) less than significant level.

In addition to potential renewable energy projects on BLM land, a large number of renewable energy projects are proposed for the Mojave and Colorado Desert regions of Southern California on State and private lands. These projects are summarized in **Table 1B** and **Table 3** of **Section B.3, Cumulative Scenario**. Of all the proposed renewable energy projects within the geographic scope of this analysis, the following, by virtue of size and location, have the greatest potential to affect paleontological resources within the geographic scope of this analysis:

- Palen Solar Power Project (5,200 acres)
- Genesis Solar Energy Project (4,460 acres)
- Desert Quartzite (7,724 acres)
- Mule Mountain Solar Project (2,684 acres)
- Big Maria Vista Solar Project (2,684 acres)
- Chuckwalla Solar 1 (4,097 acres)

These projects would be subject to CEC and/or CEQA environmental review which would include requirements for construction monitoring and mitigation of potential paleontological resources. When properly implemented and enforced, these safeguards should provide adequate protection of paleontological resources, reducing potential impacts to a (CEQA) less than significant level.

These projects would most likely include ground water pumping of similar magnitude to the GSEP; however, the combined effect of these projects would still result in much less than the historic rate of 48,000 AFY, which did not result in any documented regional subsidence, such that significant impacts to regional subsidence would not be expected. Therefore, there would be no significant cumulative contribution to regional subsidence from foreseeable renewable projects in the California Desert.

D.2.9.3.3 Contribution of the Genesis Solar Energy Project to Cumulative Impacts

Construction

The construction of the GSEP is not expected to require any significant amount of ground water pumping such that impacts to regional subsidence are not expected. Construction of the project would require localized excavation over a very large area. Because the project area lies within geological units with moderate to high paleontological sensitivity, the required excavation could, potentially, damage paleontological resources. Any damage could be cumulative to damage from other projects within the same geological formations. Implementation and enforcement of a properly designed Paleontological Resource Monitoring and Mitigation Plan (PRMMP)

at this GSEP site should result in a net gain to the science of paleontology by allowing fossils that would not otherwise have been found to be recovered, identified, studied, and preserved. Cumulative impacts from GSEP, in consideration with other nearby similar projects, should therefore be either neutral (no fossils encountered) or positive (fossils encountered, preserved, and identified).

Operation

The operation of the GSEP is expected to result in minor increased annual ground water pumping, from the current 2,000 AFY to approximately 3,600 AFY. Historic ground water withdrawals on the order of 48,000 AFY did not result in any documented subsidence in the proposed project area. Since operation of the GSEP would only contribute a minor amount of additional ground water withdrawal to the overall amount in the Chuckwalla Valley and since this cumulative amount is only a fraction of historic pumping levels that did not result in any documented subsidence, operation of the GSEP is not expected to impact regional subsidence.

The operation of the GSEP Project would not present additional risk to geological resources (none identified) or paleontological resources. Once ground disturbing activity is complete plant operation has no real potential to further affect paleontological resources. Therefore, routine plant operation would not increase potential cumulative affects on paleontological resources. The longer the plant operates, however, the more likely it is to be damaged by geological hazards, primarily earthquake-related ground shaking. Construction and operation of the plant does not increase the potential of geological hazards at the site, just their potential to damage civil improvements.

Decommissioning

The decommissioning of the GSEP is not expected to require any significant amount of ground water pumping such that impacts to regional subsidence are not expected. The decommissioning of the Genesis Solar Project is expected to result in no adverse impacts related to geology or paleontology. Any potential impact to geological resources (none identified) or paleontological resources would have occurred and been completed during the ground disturbing phase of project construction.

D.2.9.4 OVERALL CONCLUSION

Potential impacts, as they pertain to geological hazards, are essentially limited to regional subsidence due to ground water withdrawal. Historic ground water withdrawals on the order of 48,000 AFY did not result in any documented subsidence in the proposed project area. The proposed GSEP project would result in increased annual ground water pumping, from the current 2,000 AFY to approximately 3,600 AFY. However, this is still only a fraction of historic withdrawals and therefore, the proposed GSEP project would not contribute to any increase of this potential hazard. In addition, a significant number of large-scale ground water pumping operations would have to be constructed to have any measurable impact on the proposed facility.

Paleontological resources have been documented in the general area of the project. As the value of paleontological resources is associated with their discovery within a specific geological host unit, the potential impacts to paleontological resources due to

construction activities will be mitigated as required by proposed Conditions of Certification **PAL-1** through **PAL-7**. Implementation of these conditions should result in a net gain to the science of paleontology by allowing fossils that would not otherwise have been found to be recovered, identified, studied, and preserved. Cumulative impacts, in consideration with other nearby similar projects, should be either neutral (no fossils encountered) or positive (fossils encountered, preserved, and identified).

Based on the above discussion, staff believes that the potential for significant adverse cumulative impacts to the proposed project from geological hazards during the project's design life is negligible and that the potential for impacts to geological, mineralogical, and paleontological resources is very low.

The proposed conditions of certification allow the BLM Authorized Office and the Energy Commission CPM and the applicant to adopt a compliance monitoring scheme ensuring compliance with applicable LORS for geological hazards and geological, mineralogical, and paleontological resources.

D.2.10 COMPLIANCE WITH LORS

Federal, state, or local/county laws, ordinances, regulations, and standards (LORS) applicable to this project or alternatives other than the No Action alternative, were detailed in **Geology and Paleontology Table 1**. Staff anticipates that the project will be able to comply with applicable LORS.

D.2.11 NOTEWORTHY PUBLIC BENEFITS

The science of paleontology is advanced by the discovery, study and curation of new fossils. These fossils can be significant if they represent a new species, verify a known species in a new location and/or if they include structures of similar specimens that had not previously been found preserved. Most fossil discoveries are the result of excavations, either purposeful in known or suspected fossil localities or as the result of excavations made during earthwork for civil improvements or mineral extraction. Proper monitoring of excavations at the proposed GSEP facility, in accordance with an approved Paleontological Monitoring and Mitigation Plan, could result in fossil discoveries which would enhance our understanding of the prehistoric climate, geology, and geographic setting of the region for the benefit of current and future generations.

D.2.12 PROPOSED CONDITIONS OF CERTIFICATION/MITIGATION MEASURES

General conditions of certification with respect to engineering geology are proposed under Conditions of Certification **GEN-1, GEN-5, and CIVIL-1** in the **FACILITY DESIGN** section. Proposed paleontological conditions of certification follow. It is staff's opinion that the likelihood of encountering paleontological resources is moderate at the plant site.

PAL-1 The project owner shall provide BLM's Authorized Officer and the Compliance Project Manager (CPM) with the resume and qualifications of its PRS for review and approval. If the approved PRS is replaced prior to completion of project mitigation and submittal of the Paleontological Resources Report, the project owner shall obtain BLM's Authorized Officer and CPM approval of the replacement PRS. The project owner shall keep resumes on file for qualified Paleontological Resource Monitors (PRMs). If a PRM is replaced, the resume of the replacement PRM shall also be provided to BLM's Authorized Officer and the CPM.

The PRS resume shall include the names and phone numbers of references. The resume shall also demonstrate to the satisfaction of BLM's Authorized Officer and the CPM the appropriate education and experience to accomplish the required paleontological resource tasks.

As determined by BLM's Authorized Officer and the CPM, the PRS shall meet the minimum qualifications for a vertebrate paleontologist as described in the Society of Vertebrate Paleontology (SVP) guidelines of 1995. The experience of the PRS shall include the following:

1. Institutional affiliations, appropriate credentials, and college degree;

2. Ability to recognize and collect fossils in the field;

3. Local geological and biostratigraphic expertise;

4. Proficiency in identifying vertebrate and invertebrate fossils; and

5. At least three years of paleontological resource mitigation and field experience in California and at least one year of experience leading paleontological resource mitigation and field activities.

The project owner shall ensure that the PRS obtains qualified paleontological resource monitors to monitor as he or she deems necessary on the project. Paleontological Resource Monitors (PRMs) shall have the equivalent of the following qualifications:

- BS or BA degree in geology or paleontology and one year of experience monitoring in California; or
- AS or AA in geology, paleontology, or biology and four years' experience monitoring in California; or
- Enrollment in upper division classes pursuing a degree in the fields of geology or paleontology and two years of monitoring experience in California.

Verification: (1) At least 60 days prior to the start of ground disturbance, the project owner shall submit a resume and statement of availability of its designated PRS for on-site work.

(2) At least 20 days prior to ground disturbance, the PRS or project owner shall provide a letter with resumes naming anticipated monitors for the project, stating that the identified monitors meet the minimum qualifications for paleontological resource monitoring required by the condition. If additional monitors are obtained during the project, the PRS shall provide additional letters and resumes to BLM's Authorized Officer and the CPM. The letter shall be provided to BLM's Authorized Officer and the CPM no later than one week prior to the monitor's beginning on-site duties.

(3) Prior to the termination or release of a PRS, the project owner shall submit the resume of the proposed new PRS to BLM's Authorized Officer and the CPM for review and approval.

PAL-2 The project owner shall provide to the PRS, BLM's Authorized Officer and the CPM, for approval, maps and drawings showing the footprint of the power plants, construction lay down areas, and all related facilities. Maps shall identify all areas of the project where ground disturbance is anticipated. If the PRS requests enlargements or strip maps for linear facility routes, the project owner shall provide copies to the PRS, BLM's Authorized Officer and CPM. The site grading plan and plan and profile drawings for the utility lines would be acceptable for this purpose. The plan drawings should show the location, depth, and extent of all ground disturbances and be at a scale of 1 inch = 40 feet to 1 inch = 100 feet range. If the footprint of the project or its linear facilities change, the project owner shall provide maps and drawings reflecting those changes to the PRS, BLM's Authorized Officer and CPM.

If construction of the ISEGS project proceeds in phases, maps and drawings may be submitted prior to the start of each power plant. A letter identifying the proposed schedule of each project power plant shall be provided to the PRS, BLM's Authorized Officer and CPM. Before work commences on affected power plants, the project owner shall notify the PRS, BLM's Authorized Officer and CPM of any construction phase scheduling changes.

At a minimum, the project owner shall ensure that the PRS or PRM consults weekly with the project superintendent or construction field manager to confirm area(s) to be worked the following week, and until ground disturbance is completed.

Verification: (1) At least 30 days prior to the start of ground disturbance, the project owner shall provide the maps and drawings to the PRS, BLM's Authorized Officer and CPM.

(2) If there are changes to the footprint of the project, revised maps and drawings shall be provided to the PRS, BLM's Authorized Officer and CPM at least 15 days prior to the start of ground disturbance.

(3) If there are changes to the scheduling of the construction phases of each power plant, the project owner shall submit a letter to BLM's Authorized Officer and the CPM within 5 days of identifying the changes.

PAL-3 If after review of the plans provided pursuant to **PAL-2**, the PRS determines that materials with moderate, high, or unknown paleontological sensitivity could be impacted, the project owner shall ensure that the PRS prepares, and the project owner submits to BLM's Authorized Officer and the CPM for review and approval, a paleontological resources monitoring and mitigation plan (PRMMP) to identify general and specific measures to minimize potential impacts to significant paleontological resources. Approval of the PRMMP by BLM's Authorized Officer and the CPM shall occur prior to any ground disturbance. The PRMMP shall function as the formal guide for monitoring, collecting, and sampling activities, and may be modified with BLM's Authorized Officer and CPM approval. This document shall be used as the basis of discussion when on-site decisions or changes are proposed. Copies of the PRMMP shall reside with the PRS, each monitor, the project owner's on-site manager, BLM's Authorized Officer and the CPM.

The PRMMP shall be developed in accordance with the guidelines of the Society of Vertebrate Paleontology (SVP 1995) and shall include, but not be limited, to the following:

1. Assurance that the performance and sequence of project-related tasks, such as any literature searches, pre-construction surveys, worker environmental training, fieldwork, flagging or staking, construction monitoring, mapping and data recovery, fossil preparation and collection, identification and inventory, preparation of final reports, and transmittal of materials for curation will be performed according to PRMMP procedures;

2. Identification of the person(s) expected to assist with each of the tasks identified within the PRMMP and the conditions of certification;

3. A thorough discussion of the anticipated geological units expected to be encountered, the location and depth of the units relative to the project when known, and the known sensitivity of those units based on the occurrence of fossils either in that unit or in correlative units;

4. An explanation of why, how, and how much sampling is expected to take place and in what units. Include descriptions of different sampling procedures that shall be used for fine-grained and coarse-grained units;

5. A discussion of the locations of where the monitoring of project construction activities is deemed necessary, and a proposed plan for monitoring and sampling;

6. A discussion of procedures to be followed in the event of a significant fossil discovery, halting construction, resuming construction, and how notifications will be performed;

7. A discussion of equipment and supplies necessary for collection of fossil materials and any specialized equipment needed to prepare, remove, load, transport, and analyze large-sized fossils or extensive fossil deposits;

8. Procedures for inventory, preparation, and delivery for curation into a retrievable storage collection in a public repository or museum, which meet the Society of Vertebrate Paleontology's standards and requirements for the curation of paleontological resources;

9. Identification of the institution that has agreed to receive data and fossil materials collected, requirements or specifications for materials delivered for curation, and how they will be met, and the name and phone number of the contact person at the institution; and

10. A copy of the paleontological conditions of certification.

Verification: At least 30 days prior to ground disturbance, the project owner shall provide a copy of the PRMMP to BLM's Authorized Officer and the CPM. The PRMMP shall include an affidavit of authorship by the PRS, and acceptance of the PRMMP by the project owner evidenced by a signature.

PAL-4 If after review of the plans provided pursuant to **PAL-2**, the PRS determines that materials with moderate, high, or unknown paleontological sensitivity could be impacted then, prior to ground disturbance and for the duration of construction activities involving ground disturbance, the project owner and the PRS shall prepare and conduct weekly BLM Authorized Officer- and CPM-approved training for the following workers: project managers, construction supervisors, foremen and general workers involved with or who operate ground-disturbing equipment or tools. Workers shall not excavate in sensitive units prior to receiving BLM Authorized Officer- and CPM-approved worker training. Worker training shall consist of an initial in-person PRS training during the project kick-off, for those mentioned above. Following initial training, a CPM-approved video or in-person training may be used for new employees. The training program may be combined with other training programs prepared for cultural and biological resources, hazardous materials, or other areas of interest or concern. No ground disturbance shall occur prior to BLM's Authorized Officer and CPM approval of the Worker Environmental Awareness Program (WEAP), unless specifically approved by the CPM.

The WEAP shall address the possibility of encountering paleontological resources in the field, the sensitivity and importance of these resources, and legal obligations to preserve and protect those resources.

The training shall include:

1. A discussion of applicable laws and penalties under the law;

2. Good quality photographs or physical examples of vertebrate fossils for project sites containing units of high paleontological sensitivity;

3. Information that the PRS or PRM has the authority to halt or redirect construction in the event of a discovery or unanticipated impact to a paleontological resource;

4. Instruction that employees are to halt or redirect work in the vicinity of a find and to contact their supervisor and the PRS or PRM;

5. An informational brochure that identifies reporting procedures in the event of a discovery;

6. A WEAP certification of completion form signed by each worker indicating that he/she has received the training; and

7. A sticker that shall be placed on hard hats indicating that environmental training has been completed.

Verification: (1) At least 30 days prior to ground disturbance, the project owner shall submit the proposed WEAP, including the brochure, with the set of reporting procedures for workers to follow.

(2) At least 30 days prior to ground disturbance, the project owner shall submit the script and final video to BLM's Authorized Officer and the CPM for approval if the project owner is planning to use a video for interim training.

(3) If the owner requests an alternate paleontological trainer, the resume and qualifications of the trainer shall be submitted to BLM's Authorized Officer and the CPM for review and approval prior to installation of an alternate trainer. Alternate trainers shall not conduct training prior to BLM's Authorized Officer and CPM authorization.

(4) In the monthly compliance report (MCR, the project owner shall provide copies of the WEAP certification of completion forms with the names of those trained and the trainer or type of training (in-person or video) offered that month. The MCR shall also include a running total of all persons who have completed the training to date.

PAL-5 The project owner shall ensure that the PRS and PRM(s) monitor consistent with the PRMMP all construction-related grading, excavation, trenching, and augering in areas where potential fossil-bearing materials have been identified, both at the site and along any constructed linear facilities associated with the project. In the event that the PRS determines full-time monitoring is not necessary in locations that were identified as potentially fossil-bearing in the PRMMP, the project owner shall notify and seek the concurrence of BLM's Authorized Officer and the CPM.

The project owner shall ensure that the PRS and PRM(s) have the authority to halt or redirect construction if paleontological resources are encountered. The project owner shall ensure that there is no interference with monitoring activities unless directed by the PRS. Monitoring activities shall be conducted as follows:

1. Any change of monitoring from the accepted schedule in the PRMMP shall be proposed in a letter or email from the PRS and the project owner to BLM's Authorized Officer and the CPM prior to the change in monitoring and will be included in the monthly compliance report. The letter or email shall include the justification for the change in monitoring and be

submitted to BLM's Authorized Officer and the CPM for review and approval.

2. The project owner shall ensure that the PRM(s) keep a daily monitoring log of paleontological resource activities. The PRS may informally discuss paleontological resource monitoring and mitigation activities with BLM's Authorized Officer and the CPM at any time.

3. The project owner shall ensure that the PRS notifies BLM's Authorized Officer and the CPM within 24 hours of the occurrence of any incidents of non-compliance with any paleontological resources conditions of certification. The PRS shall recommend corrective action to resolve the issues or achieve compliance with the conditions of certification.

4. For any significant paleontological resources encountered, either the project owner or the PRS shall notify BLM's Authorized Officer and the CPM within 24 hours, or Monday morning in the case of a weekend event where construction has been halted because of a paleontological find.

The project owner shall ensure that the PRS prepares a summary of monitoring and other paleontological activities placed in the monthly compliance reports. The summary will include the name(s) of PRS or PRM(s) active during the month, general descriptions of training and monitored construction activities, and general locations of excavations, grading, and other activities. A section of the report shall include the geological units or subunits encountered, descriptions of samplings within each unit, and a list of identified fossils. A final section of the report will address any issues or concerns about the project relating to paleontological resource monitoring, including any incidents of non-compliance or any changes to the monitoring plan that have been approved by BLM's Authorized Officer and the CPM. If no monitoring took place during the month, the report shall include an explanation in the summary as to why monitoring was not conducted.

Verification: The project owner shall ensure that the PRS submits the summary of monitoring and paleontological activities in the MCR. When feasible, BLM's Authorized Officer and the CPM shall be notified 10 days in advance of any proposed changes in monitoring different from the plan identified in the PRMMP. If there is any unforeseen change in monitoring, the notice shall be given as soon as possible prior to implementation of the change.

PAL-6 The project owner, through the designated PRS, shall ensure that all components of the PRMMP are adequately performed including collection of fossil materials, preparation of fossil materials for analysis, analysis of fossils, identification and inventory of fossils, the preparation of fossils for curation, and the delivery for curation of all significant paleontological resource materials encountered and collected during project construction.

Verification: The project owner shall maintain in his/her compliance file copies of signed contracts or agreements with the designated PRS and other qualified research specialists. The project owner shall maintain these files for a period of three years after

project completion and approval of BLM Authorized Officer- and CPM-approved paleontological resource report (see **PAL-7**). The project owner shall be responsible for paying any curation fees charged by the museum for fossils collected and curated as a result of paleontological mitigation. A copy of the letter of transmittal submitting the fossils to the curating institution shall be provided to BLM's Authorized Officer and the CPM.

PAL-7 The project owner shall ensure preparation of a Paleontological Resources Report (PRR) by the designated PRS. The PRR shall be prepared following completion of the ground-disturbing activities. The PRR shall include an analysis of the collected fossil materials and related information, and submit it to the CPM for review and approval.

The report shall include, but is not limited to, a description and inventory of recovered fossil materials; a map showing the location of paleontological resources encountered; determinations of sensitivity and significance; and a statement by the PRS that project impacts to paleontological resources have been mitigated below the level of significance.

Verification: Within 90 days after completion of ground-disturbing activities, including landscaping, the project owner shall submit the PRR under confidential cover to BLM's Authorized Officer and the CPM.

D.2.13 CONCLUSIONS

The applicant should easily be able to comply with applicable LORS, provided that the proposed conditions of certification are implemented and followed. The design and construction of the project should have no adverse impact with respect to geological, mineralogical, and paleontological resources. Staff proposes to ensure compliance with applicable LORS through the adoption of the proposed conditions of certification listed above.

Certification of Completion
Worker Environmental Awareness Program
Genesis Solar Energy Project (09-AFC-8)

This is to certify these individuals have completed a mandatory California Energy Commission-approved Worker Environmental Awareness Program (WEAP). The WEAP includes pertinent information on cultural, paleontological, and biological resources for all personnel (that is, construction supervisors, crews, and plant operators) working on site or at related facilities. By signing below, the participant indicates that he/she understands and shall abide by the guidelines set forth in the program materials. Include this completed form in the Monthly Compliance Report.

D.3 – POWER PLANT EFFICIENCY

Testimony of Shahab Khoshmashrab

D.3.1 Summary of Conclusions

The Genesis Solar Energy Project (GSEP), if constructed and operated as proposed, would generate 250 megawatts (MW) (nominal net output) of electricity. GSEP would be a solar thermal power plant employing parabolic trough technology and would occupy approximately 1,800 acres (plant facilities and solar field) in Riverside County, California. The project would consist of two independent concentrated solar electric generating plants with a nominal net electrical output of 125 MW each. The plants would use natural gas-fueled auxiliary boilers to reduce startup time and provide heat transfer fluid freeze protection. GSEP would use solar energy to generate most all of its capacity; fossil fuel (natural gas) would be used for power production during startup only.

The project would decrease reliance on fossil fuel, and would increase reliance on renewable energy resources. It would not create significant adverse effects on fossil fuel energy supplies or resources, would not require additional sources of energy supply, and would not consume significant quantities of fossil fuel energy (compared to a fossil fuel power plant of equal electrical output) in a wasteful or inefficient manner. No efficiency standards apply to this project. U.S. Bureau of Land Management (BLM) and Energy Commission staff (hereafter jointly referred to as staff) therefore concludes that this project would present no significant adverse impacts on fossil fuel energy resources.

GSEP, if constructed and operated as proposed, would occupy nearly seven acres per MW of power output, a figure roughly 30 percent higher than some other solar power technologies and roughly 20 percent lower than, yet, some other solar power technologies (see **Efficiency Table 1**).

D.3.2 Introduction

Fossil Fuel Use Efficiency

One of the responsibilities of the California Energy Commission (Energy Commission) is to make findings on whether the energy use by a power plant, including the proposed GSEP, would result in significant adverse impacts on the environment, as defined in the California Environmental Quality Act (CEQA). If the Energy Commission finds that GSEP's energy consumption creates a significant adverse impact, it must further determine if feasible mitigation measures could eliminate or minimize that impact. In this analysis, staff addresses the inefficient and unnecessary consumption of energy.

In order to support the Energy Commission's findings, this analysis will:

- examine whether the facility would likely present any adverse impacts upon energy resources;

- examine whether these adverse impacts are significant; and if so,
- examine whether feasible mitigation measures or alternatives could eliminate those adverse impacts or reduce them to a level of insignificance.

Solar Land Use Efficiency

Solar thermal power plants typically consume much less fossil fuel (usually in the form of natural gas) than other types of thermal power plants. Therefore, common measures of power plant efficiency such as those described above are less meaningful. So far as Energy Commission staff can determine, methods for determining the efficiency of a solar power plant have yet to be standardized; research has uncovered no meaningful attempt to quantify efficiency. The solar power industry appears to have begun discussing the issue, and, a consensus is forthcoming (CEC 2008a). In the absence of accepted standards, staff proposes the following approach.

Solar thermal power plants convert the sun's energy into electricity in three basic steps:

- Mirrors and/or collectors capture the sun's rays.
- This solar energy is converted into heat.
- This heat is converted into electricity, typically in a heat engine such as a steam turbine generator or a Stirling Engine-powered generator.

The effectiveness of each of these steps depends on the specific technology employed; the product of these three steps determines the power plant's overall solar efficiency. The greater the project's solar efficiency, the less land the plant must occupy to produce a given power output.

The most significant environmental impacts caused by solar power plants result from occupying large expanses of land. The extent of these impacts is likely in direct proportion to the number of acres affected. For this reason, staff will evaluates the land use efficiency of proposed solar power plant projects. This efficiency will be expressed in terms of power produced, or MW per acre, and in terms of energy produced, or MW-hours per acre-year. Specifically:

- Power-based solar land use efficiency is calculated by dividing the maximum net power output in MW by the total number of acres impacted by the power plant, including roads and electrical switchyards and substations.
- Energy-based solar land use efficiency is calculated by dividing the annual net electrical energy production in MW-hours per year by the total number of acres impacted by the power plant. Since different solar technologies consume differing quantities of natural gas for morning warm-up, cloudy weather output leveling and heat transfer fluid freeze protection (and some consume no gas at all), this effect will be accounted for. Specifically, gas consumption will be calculated out by reducing the plant's net energy output by the amount of energy that could have been produced by consuming the project's annual gas consumption in a modern

combined cycle power plant. This reduced energy output will then be divided by acres impacted.

D.3.3 Methodology and Thresholds for Determining Environmental Consequences

The project would consist of arrays of parabolic mirrors, solar steam generator heat exchangers, two steam turbine generators, and two wet cooling towers (GSEP 2009a, AFC §3.4.2).

The project's power cycle would be based on a steam cycle (also known as the Rankine cycle) (GSEP 2009a, AFC §3.4). The solar steam generator heat exchangers would receive heated heat transfer fluid from the solar thermal equipment comprised of arrays of parabolic mirrors that collect energy from the sun. The heated heat transfer fluid would be used to generate steam in the heat exchangers. This steam would then expand through the steam turbine generators to produce electrical power.

The project would utilize two auxiliary boilers fueled by natural gas to reduce startup time and to keep the temperature of the heat transfer fluid above its relatively high freezing point (54 degrees Fahrenheit [°F]). Except during startup, the project would not use fossil fuel to generate electricity.

There are currently no legal or industry standards for measuring the efficiency of solar thermal power plants (CEC 2008a).

Adverse Effects On Energy Supplies and Resources

The applicant has described its sources of natural gas for the project (GSEP 2009a AFC §3.4.6). Natural gas would be delivered to the project site via a new six-mile long, eight-inch diameter pipeline connected to an existing Southern California Edison (SCE) pipeline connection located north of Interstate 10. SCE's natural gas supply system is currently plentiful and California's access to natural gas resources from the Rocky Mountains, Canada and the southwest represent considerable energy resources in California. Therefore, it appears highly unlikely that the project would create a substantial increase in fossil fuel demand.

Additional Energy Supply Requirements

Since supplying the project with natural gas would consume such an insignificant amount of energy, there is no likelihood that additional energy supplies would be required.

Compliance With Energy Standards

No standards apply to the efficiency of this project or other non-cogeneration projects.

Alternatives To Reduce Wasteful, Inefficient, and Unnecessary Energy Consumption

Staff evaluates the project alternatives to determine if alternatives exist that could reduce the project's fuel use. The evaluation of alternatives to the project (that could reduce wasteful, inefficient, or unnecessary energy consumption) requires the examination of the project's energy consumption. The project's fuel consumption would be negligible, therefore staff need not evaluate alternatives that could reduce or eliminate the use of natural gas.

Efficiency of Alternatives to the Project

The project's objectives include the generation of electricity using the concentrated parabolic trough solar thermal technology (GSEP 2009a, AFC §2.1).

Alternative Generating Technologies

Alternative generating technologies for GSEP are considered in the AFC (GSEP 2009a, AFC §3.10.8). For purposes of this analysis, natural gas, oil, coal, nuclear, geothermal, biomass, hydroelectric, wind and other solar technologies are all considered. Given the project objectives, location, air pollution control requirements, and the commercial availability of the above technologies, staff agrees with the applicant that the selected solar thermal technology is a reasonable selection.

Staff, therefore, believes that GSEP would not constitute a significant adverse impact on fossil fuel energy resources compared to feasible alternatives.

D.3.4 Proposed Project

D.3.4.1 SETTING AND EXISTING CONDITIONS

The project would consist of arrays of parabolic mirrors, solar steam generator heat exchangers, two steam turbine generators, and two wet cooling towers (GSEP 2009a, AFC §3.4.2).

The project's power cycle would be based on a steam cycle (also known as the Rankine cycle) (GSEP 2009a, AFC §3.4).The solar steam generator heat exchangers would receive heated heat transfer fluid from the solar thermal equipment comprised of arrays of parabolic mirrors that collect energy from the sun. The heated heat transfer fluid would be used to generate steam in the heat exchangers. This steam would then expand through the steam turbine generators to produce electrical power.

The project would utilize two auxiliary boilers fueled by natural gas to reduce startup time and to keep the temperature of the heat transfer fluid above its relatively high freezing point (54 degrees Fahrenheit [°F]). Except during startup, the project would not use fossil fuel to generate electricity.

D.3.4.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Project Energy Requirements and Energy Use Efficiency

The project would consist of arrays of parabolic mirrors, solar steam generator heat exchangers, two steam turbine generators, and two wet cooling towers (GSEP 2009a, AFC §3.4.2).

The project's power cycle would be based on a steam cycle (also known as the Rankine cycle) (GSEP 2009a, AFC §3.4).The solar steam generator heat exchangers would receive heated heat transfer fluid from the solar thermal equipment comprised of arrays of parabolic mirrors that collect energy from the sun. The heated heat transfer fluid would be used to generate steam in the heat exchangers. This steam would then expand through the steam turbine generators to produce electrical power.

The project would utilize two auxiliary boilers fueled by natural gas to reduce startup time and to keep the temperature of the heat transfer fluid above its relatively high freezing point (54 degrees Fahrenheit [°F]). Except during startup, the project would not use fossil fuel to generate electricity.

Due to the project's negligible consumption of natural gas, staff considers the impact of the project's fuel consumption on energy supplies and energy efficiency to be less than significant.

Adverse Effects on Energy Supplies and Resources

The applicant has described its sources of natural gas for the project (GSEP 2009a AFC §3.4.6). Natural gas would be delivered to the project site via a new six-mile long, eight-inch diameter pipeline connected to an existing SCE pipeline connection located north of Interstate 10. SCE's natural gas supply system is currently plentiful and California's access to natural gas resources from the Rocky Mountains, Canada and the southwest represent considerable energy resources in California. Therefore, it appears highly unlikely that the project would create a substantial increase in fossil fuel demand.

Additional Energy Supply Requirements

Since supplying the project with natural gas would consume such an insignificant amount of energy, there is no likelihood that additional energy supplies would be required.

Compliance with Energy Standards

No standards apply to the efficiency of this project or other non-cogeneration projects.

Alternatives to Reduce Wasteful, Inefficient, and Unnecessary Energy Consumption

Staff evaluates the project alternatives to determine if alternatives exist that could reduce the project's fuel use. The evaluation of alternatives to the project (that could

reduce wasteful, inefficient, or unnecessary energy consumption) requires the examination of the project's energy consumption. The project's fuel consumption would be negligible, therefore staff is not evaluating alternatives that could reduce or eliminate the use of natural gas.

Alternative Generating Technologies

Alternative generating technologies for GSEP are considered in the AFC (GSEP 2009a, AFC §3.10.8). For purposes of this analysis, natural gas, oil, coal, nuclear, geothermal, biomass, hydroelectric, wind and other solar technologies are all considered. Given the project objectives, location, air pollution control requirements, and the commercial availability of the above technologies, staff agrees with the applicant that the selected solar thermal technology is a reasonable selection.

Staff, therefore, believes that the GSEP Project would not constitute a significant adverse impact on fossil fuel energy resources compared to feasible alternatives.

Method and Threshold for Determining the Significance of Solar Land Use Energy Resources

The solar insolation falling on the earth's surface can be regarded as an energy resource. Since this energy is inexhaustible, its consumption does not present the concerns inherent in fossil fuel consumption. What is of concern, however, is the extent of land area required to capture this solar energy and convert it to electricity. Setting aside hundreds or thousands of acres of land for solar power generation removes it from alternative uses. Constructing buildings and solar collector foundations can disturb environmental resources.

Staff tabulates the land use efficiency of the project (described above) and compares it to similar measures for other solar power plant projects that have passed through, or are passing through the Energy Commission's licensing process.

As this is written, several solar power plant projects have progressed significantly through the Energy Commission siting process. Several of these projects' power and energy output, and the extent of the land occupied by them, are summarized in **Efficiency Table 1**, below. The solar land use efficiency for a typical natural gas-fired combined cycle power plant is shown only for comparison.

Adverse Effects on Land Use

A solar power project that occupies more land than another project holds the potential to produce more land use-related environmental impacts.

Project Land Use

GSEP would produce power at the rate of 250 MW net, and would generate energy at the rate of 600,000 MW-hours net per year, while occupying 1,800 acres (GSEP 2009a, AFC §§3.4.1, 3.4.2, 3.10). Staff calculates power-based land use efficiency thus:

Power-based efficiency: 250 MW ÷ 1,800 acres = **0.14 MW/acre** or **7.2 acres/MW**

Staff calculates energy-based land use efficiency thus:

600,000 MWh/year ÷ 1,800 acres = **333 MWh/acre-year**

As seen in **Efficiency Table 1**, GSEP, employing parabolic trough technology, is more efficient in use of land than the SES Solar One and SES Solar Two projects, which would employ the Stirling Energy Systems SunCatcher technology, and the Ivanpah Solar Electric Generating System project, which would employ BrightSource's power tower technology. GSEP, if constructed and operated as proposed, would occupy nearly seven acres per MW of power output, a figure roughly 30 percent higher than some other solar power technologies and roughly 20 percent lower than, yet, some other solar power technologies (see **Efficiency Table 1**).

Alternatives to Reduce Solar Land Use Impacts

Building and operating a natural gas-fired combined cycle power plant would yield much greater land use efficiency than any solar power plant; see **Efficiency Table 1**. However, this would not achieve the basic project objective, to generate electricity from the renewable energy of the sun and would not further the state's renewable energy development and green-house gas reduction goals.

Efficiency Table 1 demonstrates that the land use efficiency figure of GSEP nearly equates the median figure for all the solar thermal technologies currently passing through the Energy Commission's licensing process.

Alternative Heat Rejection System

The applicant proposes to employ wet cooling systems (evaporative cooling towers) as the means for rejecting power cycle heat from the steam turbine (GSEP 2009a, AFC §§1.0, 3.4.1). An alternative heat rejection system would utilize an air-cooled condenser.

The local climate in the project area is characterized by high temperatures and low relative humidity (low wet-bulb temperature). In low temperatures and high relative humidity (low dry-bulb temperature), the air-cooled condenser performs slightly more efficiently than the evaporative cooling tower. In high temperatures and low relative humidity, typical of the project area, the evaporative cooling tower performs slightly more efficiently than the air-cooled condenser. However, such an improvement may be less significant compared to the adverse environmental impacts of wet cooling over dry cooling, such as those identified in the **Soil and Water Resources** section of this document.

Efficiency Table 1 — Solar Land Use Efficiency

Project	Generating Capacity (MW net)	Footprint (Acres)	Annual Energy Production (MWh net)	Annual Fuel Consumption (MMBtu LHV)	Land Use Efficiency (Power-Based) (MW/acre)	Land Use Efficiency (Energy – Based) (MWh/acre-year)	
						Total	Solar Only[1,2]
Genesis Solar	250	1,800	600,000	60,000	0.14	333	329
Ridgecrest Solar	250	1,440	500,000	44,818	0.17	347	343
Beacon Solar (08-AFC-2)	250	1,321	600,000	36,000	0.19	454	450
Ivanpah SEGS (07-AFC-5)	400	3,744	960,000	432,432	0.11	256	238
SES Solar One (08-AFC-13)	850	8,200	1,840,000	0	0.11	224	224
SES Solar Two (08-AFC-5)	750	6,500	1,620,000	0	0.12	249	249
San Joaquin Solar Hybrid	106 106	640 640	286,978 774,000	25,180 5,899,500	0.17 0.17	448 1209	443 415
Solar Millenium (Blythe)	1000	5,950	2,100,000	172,272	0.17	353	349

Mojave Solar	250	1684	630,000	94,280	0.15	374	366
Rice Solar	150	1,410	450,000	0	0.11	319	319
Avenal Energy (08-AFC-1)[3]	600	25	3,023,388	24,792,786	24.0	120,936	N/A

[1] Similar to another Solar Millenium (Palen).
[2] Net energy output is reduced by natural gas-fired combined cycle proxy energy output; see **Efficiency Appendix A**.
[3] Example natural gas-fired combined cycle plant.

Project Closure

GSEP is expected to have a lifespan of 30 years (GSEP 2009a, AFC §3.9.2). At any point during this time, temporary or permanent closure of the solar facility could occur. Temporary closure would be a result of necessary maintenance, hazardous weather conditions, or damage due to a natural disaster. Permanent closure would be result of damage that is beyond repair, adverse economic conditions, or other significant reasons.

Both temporary and permanent closures would require the applicant to submit to the CEC a contingency plan or a decommissioning plan, respectively. A contingency plan would be implemented to ensure compliance with applicable LORS, and appropriate shutdown procedures depending on the length of the cessation. A decommissioning plan would be implemented to ensure compliance with applicable LORS, removal of equipment and shutdown procedures, site restoration, potential decommissioning alternatives, and the costs and source of funds associated with decommissioning activities.

D.3.4.3 CEQA LEVEL OF SIGNIFICANCE

CEQA guidelines state that the environmental analysis "…shall describe feasible measures which could minimize significant adverse impacts, including where relevant, inefficient and unnecessary consumption of energy" (Title 14 CCR §15126.4[a][1]). Appendix F of the guidelines further suggests consideration of such factors as the project's energy requirements and energy use efficiency; its effects on local and regional energy supplies and energy resources; its requirements for additional energy supply capacity; its compliance with existing energy standards; and any alternatives that could reduce the wasteful, inefficient, and unnecessary consumption of energy (Title 14, CCR §15000 et seq., Appendix F).

The inefficient and unnecessary consumption of energy, in the form of non-renewable fuels such as natural gas and oil, constitutes an adverse environmental impact. An adverse impact can be considered significant if it results in:

- adverse effects on local and regional energy supplies and energy resources;
- a requirement for additional energy supply capacity;
- noncompliance with existing energy standards; or
- the wasteful, inefficient, and unnecessary consumption of fuel or energy.

D.3.5 REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would essentially be Unit 1 of the proposed project, including a 125 MW solar facility located within the boundaries of the proposed project as defined by NextEra. This alternative is analyzed for two major reasons: (1) it eliminates about 50% percent of the proposed project area so all impacts are reduced, and (2) by retaining the eastern solar field, which is located on flowing desert washes, it would reduce impacts to the sand dune and playa areas and to the Mojave Fringe-toed

Lizard habitat. The alternative would also reduce impacts to wildlife movement by reducing obstruction of the Palen wash and would maintain, thru both fluvial and Aeolian processes, the dune and sandy habitats. The boundaries of the Reduced Acreage Alternative are shown in **Alternatives Figure 1**.

D.3.5.1 Setting and Existing Conditions

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates effects to the eastern 125 MW solar field and relocates the gas yard approximately 1.75 miles northwest of its present location. As a result, the environmental setting consists of the western portion of the proposed project, as well as the area affected by the linear project components.

D.3.5.2 Assessment of Impacts and Discussion of Mitigation

Since the Reduced Acreage plant output would produce only 125 MW (50 percent of the proposed project), its impacts on the San Diego Gas & Electric grid would be proportionately less. Since the Reduced Acreage plant would produce 125 MW while occupying approximately 50 percent of the land needed for the proposed project, its power-based land use efficiency would be about the same as the proposed project.

D.3.5.3 CEQA Level of Significance

If the Reduced Acreage alternative were constructed, the CEQA Level of Significance, as measured by land use efficiency, would amount to approximately the same levels described for the proposed project.

D.3.6 DRY COOLING ALTERNATIVE

This section identifies the potential impacts of using air-cooled condenser (ACC) systems rather than the cooling towers proposed by NextEra for the Genesis project. It is assumed that the ACC systems would be located where the cooling towers are currently proposed for each of the two 125 MW power blocks, as illustrated in **Alternatives Figure 2** (see Section B.3).

According to the applicant, approximately 18 ACC fans would be required for each of the two solar fields. The 18 fans would operate when the ambient temperature is above 50 degrees Fahrenheit (GSEP 2009f). When the temperature is below 50 degrees Fahrenheit, only 10 of the fans would be used (GSEP 2009f). The 18 fans described in the GSEP cooling study would have a length of approximately 279 feet, a width of approximately 127 feet, and a height of 98 feet (GSEP 2009f). However, based on the ACC preliminary designs for nearby solar thermal projects in similar ambient temperatures, an additional 11,690 square feet could be required for siting of the fans and the fans would be up to 120 feet in height. In addition to the ACC fans, NextEra would use a small Wet Surface Air Cooler when needed to provide auxiliary cooling during extremely hot days (GSEP 2009f). This alternative is analyzed because it would reduce the amount of water required for steam turbine cooling from 822 acre-feet per year (AFY) to 66 AFY. This reduction in water use would reduce impacts to water and biological resources.

D.3.6.1 Setting and Existing Conditions

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates the use of wet-cooling towers and incorporates the use of air-cooled condensers (ACC) in the same location. As a result, the environmental setting would be the same as for the proposed project.

D.3.6.2 Assessment of Impacts and Discussion of Mitigation

The local climate in the project area is characterized by high temperatures and low relative humidity (low wet-bulb temperature). In low temperatures and high relative humidity (low dry-bulb temperature), the air-cooled condenser performs slightly more efficiently than the evaporative cooling tower. In high temperatures and low relative humidity, typical of the project area, the evaporative cooling tower performs slightly more efficiently than the air-cooled condenser. However, such an improvement may be less significant compared to the adverse environmental impacts of wet cooling over dry cooling, such as those identified in the **Soil and Water Resources** section of this document.

D.3.6.3 CEQA Level of Significance

In weather conditions typical of the project area the evaporative cooling tower performs slightly more efficiently than the air-cooled condenser. However, such an improvement may be less significant compared to the adverse environmental impacts of wet cooling over dry cooling, such as those identified in the **Soil and Water Resources** section of this document.

D.3.7 NO PROJECT / NO ACTION ALTERNATIVE

The No Project Alternative under CEQA or the No Action Alternative under NEPA defines the scenario that would exist if the proposed Genesis Project were not constructed. The CEQA Guidelines state that “the purpose of describing and analyzing a ‘no project’ alternative is to allow decision makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project” (Cal. Code Regs., tit. 14 § 15126.6(i)). The No Project analysis in this SA/DEIS considers existing conditions and “what would be reasonably expected to occur in the foreseeable future if the project were not approved…” (Cal. Code Regs, tit. 14 § 15126.6(e)(2)). Under NEPA, the No Action Alternative is used as a benchmark of existing conditions by which the public and decision makers can compare the environmental effects of the proposed action and the alternatives.

If the No Project/No Action Alternative were selected, the construction and operational impacts of the GSEP would not occur. There would be no grading of the site, no loss of resources or disturbance of approximately 1,800 acres of desert habitat, no impacts to cultural resources, and no installation of power generation and transmission equipment. The No Project/No Action Alternative would also eliminate contributions to cumulative impacts on a number of resources and environmental parameters in Riverside County and in the Colorado Desert as a whole.

In the absence of the Genesis Project, however, other power plants, both renewable and non-renewable, would have to be constructed to serve the demand for electricity and to meet RPS. If the No Project/No Action Alternative were chosen, other utility-scale solar power facilities may be built, and the impacts to the environment may be similar to those of the proposed project because these technologies require large amounts of land like that required for the GSEP. The No Project/No Action Alternative may also lead to licensing of other non-solar renewable technologies to help achieve the California RPS.

Additionally, if the No Project/No Action Alternative were chosen, it is likely that additional gas-fired power plants would be built or that existing gas-fired plants could operate longer. If the proposed project were not built, California would not benefit from the reduction in greenhouse gases that this facility would provide, and PG&E would not receive the 250 MW contribution to its renewable state-mandated energy portfolio. If a fossil-fueled power plant is built in place of GSEP, adverse impacts on energy resources and supply would occur. However, the extent of those impacts would have to be analyzed at the time of project licensing.

D.3.8 CUMULATIVE IMPACT ANALYSIS

Geographic Extent

The geographic scope for considering cumulative impacts on electric system efficiency for this project is the SCE grid.

Existing Cumulative Conditions

The SCE grid includes many natural gas-fired power plants and a growing number of solar and wind power plants. The ratio of gas-fired to renewable energy power plants is currently high. GSEP, when combined with the other power plants in the SCE grid system would create no cumulative impacts on power plant efficiency.

Future Foreseeable Projects

Future projects on the SCE grid will likely include numerous solar and wind power plants, as well as more natural gas-fired peaking plants. The ratio of gas-fired to renewable energy power plants is likely to drop as SCE acquires more solar and wind power energy in response to government mandates to increase the portion of energy produced from renewable sources.

Foreseeable Projects in the Project Area

No new power plant projects, gas-fired or renewable, are projected in the project area.

Foreseeable Renewable Projects in the California and Arizona Desert

Numerous solar, wind power and geothermal projects are foreseeable in the deserts of California and Arizona. However, the efficiency of GSEP will neither affect, nor be affected by, the efficiency of these projects. Each project's efficiency affects only that project, and could not produce a cumulative effect that could involve other projects.

D.3.9 Compliance with LORS

No federal, state, or local/county laws, ordinances, regulations, and standards (LORS) apply to the efficiency of this project.

D.3.10 Noteworthy Public Benefits

The GSEP project would employ an advanced solar thermal technology. Solar energy is renewable and unlimited. The project would have a less than significant adverse impact on nonrenewable energy resources (natural gas). Consequently, the project would help in reducing California's dependence on fossil fuel-fired power plants.

D.3.11 Proposed Conditions of Certification/Mitigation Measures

No conditions of certification are proposed.

D.3.12 Conclusions

Fossil fuel energy use

GSEP, if constructed and operated as proposed, would use solar energy to generate most of its capacity, consuming insignificant amounts of natural gas for power production only during startup. The project would decrease reliance on fossil fuel, and would increase reliance on renewable energy resources. It would not create significant adverse effects on energy supplies or resources, would not require additional sources of energy supply, and would not consume energy in a wasteful or inefficient manner. No energy standards apply to this project. Staff therefore concludes that this project would present no significant adverse impacts on energy resources. No cumulative impacts on energy resources are likely. Facility closure would not likely present significant impacts on electric system efficiency.

Land use

GSEP, if constructed and operated as proposed, would occupy nearly seven acres per MW of power output, a figure roughly 30 percent higher than some other solar power technologies and roughly 20 percent lower than, yet, some other solar power technologies (see **Efficiency Table 1**).

D.4 - POWER PLANT RELIABILITY

Testimony of Shahab Khoshmashrab

D.4.1 SUMMARY OF CONCLUSIONS

The applicant predicts an equivalent availability factor of 96-98 percent, which staff believes is achievable. (The availability factor of a power plant is the percentage of time it is available to generate power; both planned and unplanned outages subtract from this availability.) Based on a review of the proposal, staff concludes that the Genesis Solar Energy Project (GSEP) would be built and would operate in a manner consistent with industry norms for reliable operation. No conditions of certification are proposed.

D.4.2 INTRODUCTION

In this analysis, California Energy Commission (Energy Commission) staff addresses the reliability issues of the GSEP project to determine if the power plant is likely to be built in accordance with typical industry norms for reliable power generation. Staff uses this norm as a benchmark because it ensures that the resulting project would not be likely to degrade the overall reliability of the electric system it serves (see the "Setting" subsection, below).

The scope of this power plant reliability analysis covers:

- equipment availability;
- plant maintainability;
- fuel and water availability; and
- power plant reliability in relation to natural hazards.

Staff examined the project design criteria to determine if the project is likely to be built in accordance with typical industry norms for reliable power generation. While the applicant has predicted an equivalent availability factor of 96-98 percent for the GSEP (see below), staff uses typical industry norms as the benchmark, rather than the applicant's projection, to evaluate the project's reliability.

D.4.3 METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

METHOD FOR DETERMINING RELIABILITY

The Energy Commission must make findings as to how a project is designed, sited, and operated in order to ensure its safe and reliable operation (Title 20, CCR §1752[c]). Staff takes the approach that a project is acceptable if it does not degrade the reliability of the utility system to which it is connected. This is likely the case if a project is at least as reliable as other power plants on that system.

The availability factor of a power plant is the percentage of time it is available to generate power; both planned and unplanned outages subtract from this availability.

Measures of power plant reliability are based upon both the plant's actual ability to generate power when it is considered to be available and upon starting failures and unplanned (or forced) outages. For practical purposes, reliability can be considered a combination of these two industry measures, making a reliable power plant one that is available when called upon to operate. Throughout its intended 30-year life, the GSEP is expected to operate reliably (GSEP 2009a, AFC § 3.9.2). Power plant systems must be able to operate for extended periods without shutting down for maintenance or repairs. Achieving this reliability requires adequate levels of equipment availability, plant maintainability with scheduled maintenance outages, fuel and water availability, and resistance to natural hazards. Staff examines these factors for a project and compares them to industry norms. If the factors compare favorably for this project, staff will then conclude that the GSEP would be as reliable as other power plants on the electric system and would not degrade system reliability.

D.4.4 PROPOSED PROJECT

D.4.4.1 SETTING AND EXISTING CONDITIONS

In the restructured competitive electric power industry, the responsibility for maintaining system reliability falls largely to the state's control area operators, such as the California Independent System Operator (California ISO), that purchase, dispatch, and sell electric power throughout the state. Determining how the California ISO and other control area operators would ensure system reliability has been an ongoing effort. Protocols have been developed and put in place that allow sufficient reliability to be maintained under the competitive market system. "Must-run" power purchase agreements and "participating generator" agreements are two mechanisms that have been employed to ensure an adequate supply of reliable power.

In September 2005, California AB 380 (Núñez, Chapter 367, Statutes of 2005) became law. This modification to the Public Utilities Code requires the California Public Utilities Commission to consult with the California ISO to establish resource adequacy requirements for all load-serving entities (basically, publicly and privately owned utility companies). These requirements include maintaining a minimum reserve margin (extra generating capacity to serve in times of equipment failure or unexpected demand) and maintaining sufficient local generating resources to satisfy the load-serving entity's peak demand and operating reserve requirements.

In order to fulfill this mandate, the California ISO has begun to establish specific criteria for each load-serving entity under its jurisdiction. These criteria guide each load-serving entity in deciding how much generating capacity and ancillary services to build or purchase, after which the load-serving entity issues power purchase agreements to satisfy these needs.

The California ISO's mechanisms to ensure adequate power plant reliability apparently were devised under the assumption that the individual power plants that compete to sell power into the system will each exhibit a level of reliability similar to that of power plants of past decades. However, there has been valid cause to believe that, under free market competition, financial pressures on power plant owners to minimize capital

outlays and maintenance expenditures may act to reduce the reliability of many power plants, both existing and newly constructed (McGraw-Hill 1994). It is possible that, if significant numbers of power plants were to exhibit individual reliability sufficiently lower than this historical level, the assumptions used by California ISO to ensure system reliability would prove invalid, with potentially disappointing results. Accordingly, staff has recommended that power plant owners continue to build and operate their projects to the level of reliability to which all in the industry are accustomed.

As part of its plan to provide needed reliability, the applicant proposes to operate the 250-megawatt (MW) (net power output) GSEP, a solar thermal power plant facility employing advanced solar power technology. This project, using renewable solar energy, would provide dependable power to the grid, generally during the hours of peak power consumption by the interconnecting utility(s). This project would help serve the need for renewable energy in California, as all its generated electricity would be produced by a reliable source of energy that is available during the hot summer afternoons, when power is needed most.

The project is expected to achieve an equivalent availability factor in the range of 96-98 percent. The project is anticipated to operate at an annual capacity factor of approximately 27 percent (GSEP 2009a, AFC § 3.4.2).

D.4.4.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

EQUIPMENT AVAILABILITY

Equipment availability would be ensured by adoption of appropriate quality assurance/quality control (QA/QC) programs during the design, procurement, construction, and operation of the plant and by providing for the adequate maintenance and repair of the equipment and systems discussed below.

Quality Control Program

The applicant describes a QA/QC program (GSEP 2009a, AFC § 3.4) that is typical of the power industry. Equipment would be purchased from qualified suppliers based on technical and commercial evaluations. Suppliers' personnel, production capability, past performance, QA programs, and quality history would be evaluated. The project owner would perform receipt inspections, test components, and administer independent testing contracts. Staff expects that implementation of this program would result in standard reliability of design and construction. To ensure this implementation, staff has proposed appropriate conditions of certification in the section of this document entitled **Facility Design**.

PLANT MAINTAINABILITY

Equipment Redundancy

The project, as proposed in the AFC, would be able to operate only when the sun is shining. Maintenance or repairs could be done when the plant is shut down at night. This would help to enhance the project's reliability. Also, the applicant proposes to provide redundant pieces of equipment for those that are most likely to require service

or repair (GSEP 2009a, AFC §§ 3.4.3, 3.4.4, 3.11.6). This redundancy would allow service or repair to be done during sunny days when the plant is in operation, if required.

Major plant systems are designed with adequate redundancy to ensure their continued operation if equipment fails.

Maintenance Program

Equipment manufacturers provide maintenance recommendations for their products, and the applicant would base the project's maintenance program on those recommendations (GSEP 2009a, AFC §§ 3.4, 3.11). The program would encompass both preventive and predictive maintenance techniques. Maintenance outages would probably be planned for periods of low electricity demand. Staff expects that the project would be adequately maintained to ensure an acceptable level of reliability.

FUEL AND WATER AVAILABILITY

The long-term availability of fuel and of water for cooling or process use is necessary to ensure the reliability of any power plant. The need for reliable sources of fuel and water is obvious; lacking long-term availability of either source, the service life of the plant could be curtailed, threatening both the power supply and the economic viability of the plant.

Fuel Availability

The GSEP would consume insignificant amounts of natural gas for power generation. The sole consumption of natural gas would be to reduce startup time and to keep the temperature of the heat transfer fluid above its freezing point.

Natural gas would be delivered to the GSEP site by a six-mile-long, eight-inch-diameter natural gas pipeline that will be connected to an existing Southern California Edison (SCE) pipeline (GSEP 2009a, AFC § 3.4.6). The SCE natural gas supply system draws from extensive supplies originating in the Rocky Mountains, in the southwest, and in Canada, and is capable of delivering the required amount of gas to this project. Staff believes that there will be adequate fuel supply to meet the project's needs.

Water Supply Reliability

The GSEP has proposed to use groundwater water from on-site wells for domestic and industrial water needs, including steam cycle makeup, mirror washing, service water and fire protection water. This source of water supply appears to be sufficient for the project (see **Soil and Water Resources** section of this document). Therefore, staff concludes that this source of water supply is a reliable source of water for the project.

POWER PLANT RELIABILITY IN RELATION TO NATURAL HAZARDS

Natural forces can threaten the reliable operation of a power plant. Tsunamis (tidal waves) and seiches (waves in inland bodies of water) are not likely to present hazards for this project, but seismic shaking (earthquakes) and flooding could present credible threats to the project's reliable operation (GSEP 2009a, AFC §§1.2, 2.5.6.6).

Seismic Shaking

The project will be designed and constructed to the latest applicable LORS (please see the section of this document entitled **Facility Design**). Compliance with current seismic design LORS represents an upgrading of performance during seismic shaking compared to older facilities since these LORS have been continually upgraded. Because it would be built to the latest seismic design LORS, this project would likely perform at least as well as, and perhaps better than, existing plants in the electric power system. Staff has proposed conditions of certification to ensure this; see the section of this document entitled **Facility Design**. In light of the general historical performance of California power plants and the electrical system in seismic events, staff has no special concerns with the power plant's functional reliability during earthquakes. Please also see the "Faulting and Seismicity" portion of the **Geology and Paleontology** section of this document

Flooding

The project site is relatively flat and generally slopes from north to south with elevations of approximately 400 to 370 feet above mean sea level. The Federal Emergency Management Agency has not mapped the site for the presence of floodplains, but for the vast majority of the time, the area is dry and devoid of any surface flow anywhere in the project area (GSEP 2009a, AFC §§ 3.3, 4.1.1.1). With proper plant design (ensured by adherence to the proposed **Facility Design** conditions of certification), staff believes there should be no significant concerns with power plant functional reliability due to flooding. For further discussion, see **Soil and Water Resources** and **Geology and Paleontology**.

COMPARISON WITH EXISTING FACILITIES

The North American Electric Reliability Corporation (NERC) maintains industry statistics for availability factors (as well as other related reliability data). The NERC regularly polls North American utility companies on their project reliability through its Generating Availability Data System and periodically summarizes and publishes those statistics on the Internet at <http://www.nerc.com>. Because no statistics are available for solar power plants, staff compares the project's availability factor to the average availability factor of fossil fuel-fired units. Also because the project's total net power output would be 250 MW, staff uses the NERC statistics for 200–299 MW units. The NERC reported an availability factor of 86.01 percent as the generating unit average for the years 2002 through 2006 for fossil fuel units of 200-299 MW (NERC 2007).

The concentrated parabolic trough solar thermal technology is not new. This technology has been employed for over 20 years at the nearby Solar Electric Generating System facilities in the Mojave Desert. Staff believes that the parabolic trough technology is likely to exhibit the projected reliability.

The project would use multi-pressure condensing steam turbine technology. Steam turbines incorporating this technology have been on the market for many years now and are expected to exhibit typically high availability. Also, because solar-generated steam is cleaner than burnt fossil fuel, the GSEP steam cycle units would likely require less frequent maintenance than units that burn fossil fuel. Therefore, the applicant's

expectation of an annual availability factor of 96-98 percent (GSEP 2009a, AFC § 3.4.2) appears reasonable when compared with the NERC figures throughout North America (see above). In fact, these machines might well be expected to outperform the fleet of various turbines (mostly older and smaller) that make up NERC statistics. Additionally, the project, as proposed, would be able to operate only when the sun is shining. Maintenance or repairs could be done when the plant is shut down at night.

The applicant's estimate of plant availability, therefore, appears to be realistic. Stated procedures for assuring the design, procurement, and construction of a reliable power plant appear to be consistent with industry norms, and staff believes they are likely to ultimately produce an adequately reliable plant.

D.4.4.3 CEQA LEVEL OF SIGNIFICANCE

A discussion of the CEQA level of significance is not necessary because the CEQA guidelines do not apply to power plant reliability.

D.4.5 REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would essentially be Unit 1 of the proposed project, a 125 MW solar facility located within the boundaries of the proposed project as defined by NextEra. This alternative is analyzed for two major reasons: (1) it eliminates about 50% percent of the proposed project area so all environmental impacts are reduced, and (2) by retaining the eastern solar field, which is located on flowing desert washes, it would reduce impacts to the sand dune and playa areas and to the Mojave Fringe-toed Lizard habitat. The alternative would also reduce impacts to wildlife movement by reducing obstruction of the Palen wash and would maintain, thru both fluvial and Aeolian processes, the dune and sandy habitats. The boundaries of the Reduced Acreage Alternative are shown in **Alternatives Figure 1**.

D.4.5.1 Setting and Existing Conditions

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates effects to the eastern 125 MW solar field and relocates the gas yard approximately 1.75 miles northwest of its present location. As a result, the environmental setting consists of the western portion of the proposed project, as well as the area affected by the linear project components.

D.4.5.2 Assessment of Impacts and Discussion of Mitigation

The impacts of this alternative on reliability would be the same as those described above for the proposed project

D.4.5.3 CEQA Level of Significance

A discussion of the CEQA level of significance is not necessary because the CEQA guidelines do not apply to power plant reliability.

D.4.6 DRY COOLING ALTERNATIVE

This section identifies the potential impacts of using air-cooled condenser (ACC) systems rather than the cooling towers proposed by NextEra for the Genesis project. It

is assumed that the ACC systems would be located where the cooling towers are currently proposed for each of the two 125 MW power blocks, as illustrated in **Alternatives Figure 2** (see Section B.3).

According to the applicant, approximately 18 ACC fans would be required for each of the two solar fields. The 18 fans would operate when the ambient temperature is above 50 degrees Fahrenheit (GSEP 2009f). When the temperature is below 50 degrees Fahrenheit, only 10 of the fans would be used (GSEP 2009f). The 18 fans described in the GSEP cooling study would have a length of approximately 279 feet, a width of approximately 127 feet, and a height of 98 feet (GSEP 2009f). However, based on the ACC preliminary designs for nearby solar thermal projects in similar ambient temperatures, an additional 11,690 square feet could be required for siting of the fans and the fans would be up to 120 feet in height. In addition to the ACC fans, NextEra would use a small Wet Surface Air Cooler when needed to provide auxiliary cooling during extremely hot days (GSEP 2009f). This alternative is analyzed because it would reduce the amount of water required for steam turbine cooling from 822 acre-feet per year (AFY) to 66 AFY.

D.4.6.1 Setting and Existing Conditions

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates the use of wet-cooling towers and incorporates the use of air-cooled condensers (ACC) in the same location. As a result, the environmental setting would be the same as for the proposed project.

D.4.6.2 Assessment of Impacts and Discussion of Mitigation

The local climate in the project area is characterized by high temperatures and low relative humidity (low wet-bulb temperature). In low temperatures and high relative humidity (low dry-bulb temperature), the air-cooled condenser performs slightly more efficiently than the evaporative cooling tower. In high temperatures and low relative humidity, typical of the project area, the evaporative cooling tower performs slightly more efficiently than the air-cooled condenser. However, such an improvement may be less significant compared to the adverse environmental impacts of wet cooling over dry cooling, such as those identified in the **Soil and Water Resources** section of this document.

D.4.7 NO PROJECT / NO ACTION ALTERNATIVE

The No Project Alternative under CEQA or the No Action Alternative under NEPA defines the scenario that would exist if the proposed Genesis Project were not constructed. The CEQA Guidelines state that “the purpose of describing and analyzing a ‘no project’ alternative is to allow decision makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project” (Cal. Code Regs., tit. 14 § 15126.6(i)). The No Project analysis in this SA/EIR considers existing conditions and “what would be reasonably expected to occur in the foreseeable future if the project were not approved…” (Cal. Code Regs, tit. 14 § 15126.6(e)(2)). Under NEPA, the No Action Alternative is used as a benchmark of existing conditions

by which the public and decision makers can compare the environmental effects of the proposed action and the alternatives.

If the No Project/No Action Alternative were selected, the construction and operational impacts of the GSEP would not occur. There would be no grading of the site, no loss of resources or disturbance of approximately 1,800 acres of desert habitat, no impacts to cultural resources, and no installation of power generation and transmission equipment. The No Project/No Action Alternative would also eliminate contributions to cumulative impacts on a number of resources and environmental parameters in Riverside County and in the Colorado Desert as a whole.

In the absence of the Genesis Project, however, other power plants, both renewable and non-renewable, would have to be constructed to serve the demand for electricity and to meet RPS. If the No Project/No Action Alternative were chosen, other utility-scale solar power facilities may be built, and the impacts to the environment may be similar to those of the proposed project because these technologies require large amounts of land like that required for the GSEP. The No Project/No Action Alternative may also lead to licensing of other non-solar renewable technologies to help achieve the California RPS.

Additionally, if the No Project/No Action Alternative were chosen, it is likely that additional gas-fired power plants would be built or that existing gas-fired plants could operate longer. If the proposed project were not built, California would not benefit from the reduction in greenhouse gases that this facility would provide, and PG&E would not receive the 250 MW contribution to its renewable state-mandated energy portfolio.

D.4.8 CUMULATIVE IMPACT ANALYSIS

Geographic Extent

Any reliability impacts caused by the project would act upon the SCE power system.

Existing Cumulative Conditions

The SCE system is projected to serve a peak load, in the year 2013 of nearly 24,000 MW (CEC 2007). SCE currently acquires power from numerous sources, chiefly fossil fuel-fired and nuclear.

Future Foreseeable Projects

The power to serve the SCE system demand would be acquired from numerous sources, some of which would be solar power plants. The GSEP project would contribute up to 250 MW of the total of 24,000 MW, or 1.0 percent. This comprises an insignificant portion of the total; insufficient reliability of GSEP would be unlikely to adversely impact SCE's ability to serve its load.

Foreseeable Renewable Projects in the California and Arizona Desert

Numerous solar, wind power and geothermal projects are foreseeable in the deserts of California and Arizona. The GSEP project would contribute up to 250 MW of the total of 24,000 MW, or 1.0 percent. This comprises an insignificant portion of the total; insufficient reliability of GSEP would be unlikely to adversely impact SCE's ability to

serve its load when combined with the adverse effect of other projects within the SCE system.

D.4.9 COMPLIANCE WITH LORS

No federal, state, or local/county laws, ordinances, regulations, and standards (LORS) apply to the efficiency of this project.

D.3.10 NOTEWORTHY PUBLIC BENEFITS

This project would help serve the need for renewable energy in California, as most of the electricity generated would be produced by a reliable source of energy that is available during the hot summer afternoons, when power is needed most.

D.3.11 PROPOSED CONDITIONS OF CERTIFICATION/MITIGATION MEASURES

No conditions of certification are proposed.

D.3.12 CONCLUSIONS

The applicant predicts an equivalent availability factor of 96-98 percent, which staff believes is achievable. Based on a review of the proposal, staff concludes that the plant would be built and operated in a manner consistent with industry norms for reliable operation. No conditions of certification are proposed.

D.5- TRANSMISSION SYSTEM ENGINEERING

Testimony of Sudath Arachchige and Mark Hesters

D.5.1 SUMMARY OF CONCLUSIONS

The proposed interconnecting facilities including the Genesis Solar Energy Project (GSEP) 230 kV switchyard, the generator 230 kV overhead tie line and termination to the proposed Southern California Edison (SCE) Colorado River 500/230kV substation are adequate and in accordance with industry standards and good utility practices, and are acceptable to staff according to engineering Laws, Ordinances, Regulations and Standards (LORS).

The Phase I Interconnection Study (Phase I Study) does not provide a meaningful forecast of the transmission reliability impacts of the GSEP. The Phase I Study analyzed the impacts of 9,690 MW of generation in the GSEP cluster; however, after a December 2009 milestone most of the generation dropped out of the interconnection process and only 2,200 MW remained. Staff expects that the reliability impacts of 2,200 MW would be significantly smaller than the impacts of 9,690 MW. The California Independent System Operator (California ISO) Phase II Interconnection Study (Phase II Study) will be performed based on the 2,200 MW in the GSEP cluster, which includes the GSEP. The Phase II Study will not be available until September 2010 and thus not incorporated into the staff analysis of the GSEP at this time. Condition of Certification TSE-5 requires that the Phase II Study be provided to the California Energy Commission (Energy Commission) before the start of transmission facility construction.

The GSEP would, therefore, meet the requirements and standards of all applicable LORS upon satisfactory compliance of the proposed TSE Conditions of Certification.

D.5.2 INTRODUCTION

The Transmission System Engineering (TSE) analysis examines whether or not the facilities associated with the proposed interconnection conforms to all applicable LORS required for safe and reliable electric power transmission. Staff's analysis evaluates the power plant switchyard, outlet line, termination and downstream facilities identified by the applicant. Additionally, under the California Environmental Quality Act (CEQA), the Energy Commission must conduct an environmental review of the "whole of the action," which may include facilities not licensed by the Energy Commission (California Code of Regulations, title 14, §15378). Therefore, the Energy Commission must identify the system impacts and necessary new or modified downstream transmission facilities (beyond the first point of the proposed interconnection) that are required for interconnection and represent the "whole of the action." The downstream network upgrade mitigation measures that will be required to maintain system reliability for the addition of the power plant, are used to identify the requirement for any additional CEQA analysis for potential indirect impacts.

According to the previous guidelines, staff relied on the System Impact Study (SIS) and Facility Study (FS) as well as the review of these studies by the agencies responsible for ensuring the adjacent interconnecting grid meets reliability standards. The proposed GSEP would interconnect to the SCE transmission network and requires analysis by SCE and approval by the California ISO. However, the California ISO's generator interconnection study process under the new Large Generator Interconnection Process (LGIP) Tariff is in transition from a queue or serial process to a cluster window process and now uses Phase I and Phase II Studies. The Phase I Study is similar to the former SIS except it is now performed for a group of projects in the same geographical area of a utility that apply for interconnection in the same request window. The Phase II Study is performed after generators in each cluster meet specific milestones required to stay in the generator interconnection queue. The Phase II Study is then performed based on those generators left in the queue. The interconnection studies analyze the effect of the proposed project on the ability of the transmission network to meet reliability standards (California ISO 2009a).

SCE'S ROLE

SCE is responsible for ensuring electric system reliability in the SCE system for addition of the proposed generating plant. SCE will provide the analysis and reports in their Phase I and Phase II Studies, and their approval for the facilities and changes required in the SCE system for addition of the proposed transmission modifications.

CALIFORNIA ISO'S ROLE

The California ISO is responsible for ensuring electric system reliability for all participating transmission owners and is also responsible for developing the standards necessary to achieve system reliability. The California ISO is responsible for completing the studies of the SCE system to ensure adequacy of the proposed transmission interconnection. The California ISO will determine the reliability impacts of the proposed transmission modifications on the SCE transmission system in accordance with all applicable reliability criteria. According to the California ISO Tariff, the California ISO will determine the "Need" for transmission additions or upgrades downstream from the interconnection point to ensure reliability of the transmission grid. The California ISO will, therefore, review the Phase I Study performed by SCE and/or any third party provide their analysis, conclusions and recommendations. Upon completion of the SCE Phase II Study based on the expected mid-2013 commercial operation date (COD) or current COD the California ISO would execute Large Generator Interconnection Agreement (LGIA) between the California ISO and the project owner. If necessary, the California ISO may provide written and verbal testimony on their findings at the Energy Commission hearings.

D.5.3 LAWS, ORDINANCES, REGULATIONS AND STANDARDS

- California Public Utilities Commission (CPUC) General Order 95 (GO-95), "Rules for Overhead Electric Line Construction," formulates uniform requirements for construction of overhead lines. Compliance with this order ensures adequate service and safety to persons engaged in the construction, maintenance and operation or use of overhead electric lines and to the public in general.

- California Public Utilities Commission (CPUC) General Order 128 (GO-128), “Rules for Construction of Underground Electric Supply and Communications Systems,” formulates uniform requirements and minimum standards to be used for underground supply systems to ensure adequate service and safety to persons engaged in the construction, maintenance and operation or use of underground electric lines and to the public in general.
- The National Electric Safety Code, 1999 provides electrical, mechanical, civil and structural requirements for overhead electric line construction and operation.
- NERC/WECC Planning Standards: The Western Electricity Coordinating Council (WECC) Planning Standards are merged with the North American Electric Reliability Council (NERC) Planning Standards and provide the system performance standards used in assessing the reliability of the interconnected system. These standards require the continuity of service to loads as the first priority and preservation of interconnected operation as a secondary priority. Certain aspects of the NERC/WECC standards are either more stringent or more specific than the NERC standards alone. These standards provide planning for electric systems so as to withstand the more probable forced and maintenance outage system contingencies at projected customer demand and anticipated electricity transfer levels, while continuing to operate reliably within equipment and electric system thermal, voltage and stability limits. These standards include the reliability criteria for system adequacy and security, system modeling data requirements, system protection and control, and system restoration. Analysis of the WECC system is based to a large degree on Section I.A of the standards, “NERC and WECC Planning Standards with Table I and WECC Disturbance-Performance Table” and on Section I.D, “NERC and WECC Standards for Voltage Support and Reactive Power”. These standards require that the results of power flow and stability simulations verify defined performance levels. Performance levels are defined by specifying the allowable variations in thermal loading, voltage and frequency, and loss of load that may occur on systems during various disturbances. Performance levels range from no significant adverse effects inside and outside a system area during a minor disturbance (loss of load or a single transmission element out of service) to a level that seeks to prevent system cascading and the subsequent blackout of islanded areas during a major disturbance (such as loss of multiple 500 kV lines along a common right of way, and/or multiple generators). While controlled loss of generation or load or system separation is permitted in certain circumstances, their uncontrolled loss is not permitted (WECC 2006).
- North American Reliability Council (NERC) Reliability Standards for the Bulk Electric Systems of North America provide national policies, standards, principles and guidelines to assure the adequacy and security of the electric transmission system. The NERC Reliability Standards provide for system performance levels under normal and contingency conditions. With regard to power flow and stability simulations, while these Reliability Standards are similar to NERC/WECC Standards, certain aspects of the NERC/WECC Standards are either more stringent or more specific than the NERC Standards for Transmission System Contingency Performance. The NERC Reliability Standards apply not only to interconnected system operation but also to individual service areas (NERC 2006).

- California ISO Planning Standards also provide standards, and guidelines to assure the adequacy, security and reliability in the planning of the California ISO transmission grid facilities. The California ISO Grid Planning Standards incorporate the NERC/WECC and NERC Reliability Planning Standards. With regard to power flow and stability simulations, these Planning Standards are similar to the NERC/WECC or NERC Reliability Planning Standards for Transmission System Contingency Performance. However, the California ISO Standards also provide some additional requirements that are not found in the WECC/NERC or NERC Standards. The California ISO Standards apply to all participating transmission owners interconnecting to the California ISO controlled grid. They also apply when there are any impacts to the California ISO grid due to facilities interconnecting to adjacent controlled grids not operated by the California ISO (California ISO 2002a).
- California ISO/FERC Electric Tariff provides guidelines for construction of all transmission additions/upgrades (projects) within the California ISO controlled grid. The California ISO determines the “Need” for the proposed project where it will promote economic efficiency or maintain system reliability. The California ISO also determines the Cost Responsibility of the proposed project and provides an Operational Review of all facilities that are to be connected to the California ISO grid (California ISO 2007a).

D.5.4 PROJECT DESCRIPTION

D.5.4.1 SETTING AND EXISTING CONDITIONS

The GSEP will consist of two independent concentrated solar electric generating facilities with a nominal net electrical output of 125 MW each, for a total net electrical output of 250MW. The auxiliary load for each generator would be 20MW, resulting in a maximum net output of 250MW at an 85 percent power factor. The project‘s planned operational date is summer of 2013. Each generating unit would be connected to the low side of its dedicated 13.8/230kV generator step-up (GSU) transformer through 15kV, 8000A isolated phase bus duct and an 8000A circuit breaker. The step-up transformer for the steam turbine generating unit would be rated at 13.8/230kV and 90/120/150 MVA at 65 centigrade. The 230kV side of the step-up transformer would be connected through a 1200A disconnect switch to the new Genesis 230kV switchyard. The plant will use parabolic through solar thermal technology to produce electrical power using steam turbine generators (STG) fed from solar steam generators (SSG). The SSG receives heated heat transfer fluid (HTF) from solar thermal equipment comprised of arrays of parabolic mirrors that collect energy from the sun. (GSEP project, 2009b section 3.0, pages 3-8 to 3-9 and Figure 3.4-7). Please see the **Project Description** section of this document for associated graphs and depictions.

SWITCHYARD AND INTERCONNECTION FACILITIES

The project will interconnect to the proposed SCE Colorado River 230/500kV substation as the primary point of interconnection. The plant site switchyard will be located near the unit two power block, and will require an overhead 795 kcmil, steel-reinforced, aluminum conductor unit tie line to interconnect the GSU transformers of each unit. The switchyard will be designed with a ring bus configuration and consist of three breakers and three line take off structures. The power from the switchyard will be transmitted

through a generator tie line that will be routed in a southeasterly ROW eventually connecting to the proposed Southern California Edison 230/500kV Colorado River substation. The 230kV single circuit transmission line will be constructed with 795 kcmil, steel-reinforced, aluminum conductor with a continuous ampacity rating of approximately 906 Amps per conductor or 1816 Amps per bundle. The generator tie line will travel in a southeasterly direction to a point where it will cross the existing Imperial Irrigation District's Blythe to Eagle-Mountain 161 kV transmission line. From the I-10 crossing, the generator tie line will continue south, where it will eventually intersect with the Blythe Energy Project Transmission (BEPTL) line. From that point, the generator tie line will travel east and share a portion of the double circuit transmission poles with the BEPTL where it will eventually terminate at the interconnection point within the proposed Colorado River substation. Each circuit will be supported by mono-pole structures at approximately 800 feet intervals with final heights as determined during detailed design (GSEP project, 2009a section 3.11, page 3-71 and figure 3.4-7 and, 3.6-1, 3.6-2).

D.5.4.2 ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

For the interconnection of a proposed generating unit or transmission facility to the grid, the interconnecting utility and the control area operator are responsible for ensuring grid reliability. For the GSEP, SCE and the California ISO are responsible for ensuring grid reliability.

The California ISO's generator interconnection study process is in transition from a serial process to an interconnection window cluster study process. The GSEP was studied under the window cluster process and the transmission reliability impacts of the proposed project are studied in the Phase I and Phase II Studies. The Phase I Study is similar to the former System Impact Study except it is now performed for a group of projects in the same geographical area of a utility that apply for interconnection in the same request window. The Phase II Study is performed after generators in each cluster meet specific milestones required to stay in the generator interconnection queue. The Phase II Study is then performed based on the number of generators left in each cluster.

The Phase I Studies for projects in the transition cluster were conducted to determine the preferred and alternative generator interconnection methods and to identify any mitigation measures required to ensure system conformance with utility reliability criteria, NERC planning standards, WECC reliability criteria, and California ISO reliability criteria. Staff relies on the studies and any review conducted by the responsible agencies to determine the effect of the projects on the transmission grid and to identify any necessary downstream facilities or indirect project impacts required to bring the transmission network into compliance with applicable reliability standards (NERC2006, WECC 2006, California ISO 2002a, 2007a & 2009a).

The Phase I Study analyzes the grid with and without the generator or generators in a cluster under conditions specified in the planning standards and reliability criteria. The standards and criteria define the assumptions used in the study and establish the thresholds by which grid reliability is determined. The studies must analyze the impact

of the projects for their proposed first year(s) of operation and thus are based on a forecast of loads, generation and transmission. Load forecasts are developed by the interconnected utility, which would be SCE in this case. Generation and transmission forecasts are based on the interconnection queue. The studies are focused on thermal overloads, voltage deviations, system stability (excessive oscillations in generators and transmission system, voltage collapse, loss of loads or cascading outages), short circuit duties and substation evaluation

Under the new California ISO LGIP, generators are able to choose between either “full capacity” or “energy only” depending on whether or not the generator wants to have the right to generate energy 24-hours per day. A generator that chooses the full capacity option will be required to pay for transmission network upgrades that are needed to allow the generator to operate under virtually any system conditions and as such could sign contracts that allowed them to provide capacity to utilities. Energy only generators would not pay for network transmission upgrades, and essentially would have access to as available transmission capacity, and would likely not be able to sign capacity contracts.

If the studies show that the interconnection of the project or cluster of projects causes the grid to be out of compliance with reliability standards, the study will then identify mitigation alternatives or ways in which the grid could be brought into compliance with reliability standards. If the interconnecting utility determines that the only feasible mitigation includes transmission modifications or additions which require CEQA review as part of the “whole of the action,” the Energy Commission must analyze those modifications or additions according to CEQA requirements. Where the Phase I Study identifies transmission modifications required for the reliable interconnection of a cluster of generators, staff will analyze the proposed generating project’s impact on individual reliability criteria violations to determine whether or not the identified mitigation measures are a reasonably foreseeable consequence of the proposed project.

D.5.4.3 SCOPE OF THE TRANSITION CLUSTER PHASE 1 INTERCONNECTION STUDY

The July 28, 2009, Transition Cluster Phase I Study was prepared by the California ISO in coordination with SCE. The Phase I Study includes 15 queue generation projects in the Eastern Riverside County area totaling 9,690 MW net generation output, including the proposed 250 MW GSEP. As of December 4, 2009 only five projects (2,200 MW) of the original 15 projects remain in the interconnection queue. Reducing the size of the cluster by 10 projects and 7,490 MW means the Phase I Study results no longer provide a reasonable forecast of the reliability impacts of the proposed project or the other projects in the cluster. Since the Transition Cluster Phase I Study does not provide an accurate forecast of the reliability impacts of the cluster or the proposed GSEP, staff cannot rely on the study results to show project compliance with LORS and identify the transmission facilities required to reliably interconnect a generator to the existing transmission grid.

CEQA requires the analysis of reasonably foreseeable consequences of proposed projects based on the best available information. The California ISO is the reliability authority for generator interconnections and its Phase I Study for the GSEP provides

the best available information on the reliability impacts of the proposed project. However, the significant reduction in the number of generators studied in the cluster with the GSEP reduces the study results to idle speculation. It is not possible to determine the impacts of the proposed project or even the cluster of generators because the size of the cluster has decreased so dramatically. The revised 2,200 MW cluster will be analyzed in the Phase II Study and will provide a much better forecast of the reliability impacts of the GSEP and its associated cluster of generators.

The Phase II Study for the Transition Cluster is currently scheduled to be completed by September of 2010 and would not be available in time to be incorporated in staff's analysis of the GSEP. If the Phase II Study finds that the GSEP and the remaining projects in its cluster would require the construction or upgrade of transmission facilities in order to maintain grid reliability, those transmission facilities would require a license from the California Public Utilities Commission or other permitting authority. Staff anticipates that future clusters will likely include fewer generators and the Phase I Studies which are not part of the Transition Cluster will provide less speculative study results and a better forecast of the reasonably foreseeable transmission impacts of a specific generator.

D.5.4.4 CEQA Level of Significance

Generally staff relies on the California ISO Phase I /System Impact Study to determine whether or not the proposed generation project will likely comply with reliability and to identify the transmission facilities required for reliable interconnection. For the Transition Cluster projects the Phase I Study does not provide an accurate forecast of impacts of the GSEP on the SCE transmission grid. The transmission upgrades identified in the Phase I Study are not reasonably foreseeable consequences of the proposed generating project. Relying on available information, staff is unable to identify any likely indirect project transmission impacts. Upon completion of the Phase II Study and the execution of the LGIA, the impacts of the GSEP on grid reliability will be identified. In order to ensure compliance with reliability LORS, Condition of Certification TSE-5 requires the submittal of the Phase II Study and the executed LGIA prior to the start of construction of transmission facilities (2009d, Phase I Interconnection Study report).

D.5.4.4.1 DOWNSTREAM FACILITIES

The Phase II Study will determine what, if any, downstream reliability upgrades outside the existing substation fence lines will be needed to accommodate the proposed GSEP. The study will include the California ISO's approved transmission projects in the SCE east of Lugo area network. The California Public Utilities Commission would be the lead agency for the CEQA analysis of any downstream transmission facilities identified in the Phase II Study. Major facilities would require a Certificate of Public Convenience and Necessity (CPCN) and any facilities impacting federal lands could also require an environmental analysis consistent with the National Environmental Policy Act.

D.5.5 REDUCED ACREAGE ALTERNATIVE

The Reduced Acreage Alternative would essentially be Unit 1 of the proposed project, including a 125 MW solar facility located within the boundaries of the proposed project

as defined by NextEra. This alternative is analyzed for two major reasons: (1) it eliminates about 50 percent of the proposed project area so all impacts are reduced, and (2) by eliminating the eastern solar field, it would reduce the water required for wet cooling by 50 percent. The boundaries of the Reduced Acreage Alternative are shown in **Alternatives Figure 1**.

D.5.5.1 Setting and Existing Conditions

This alternative is located entirely within the boundaries of the proposed project. It simply eliminates effects to the eastern 125 MW solar field and relocates the gas yard approximately 1.75 miles northwest of its present location. As a result, the environmental setting consists of the western portion of the proposed project, as well as the area affected by the linear project components.

D.5.5.2 Assessment of Impacts and Discussion of Mitigation

A smaller, 125 MW, project would likely have fewer impacts on existing transmission facilities than the proposed project but these impacts would be identified through the California ISO's LGIP.

D.5.5.3 CEQA Level of Significance

As stated above, the Reduced Acreage Alternative is evaluated in this SA/DEIS because it would reduce some impacts of the project. Additionally, the Reduced Acreage Alternative would allow the applicant to contribute clean, renewable energy to help meet the State's energy goals, while minimizing impacts to the desert environment.

D.5.6 DRY COOLING ALTERNATIVE

D.5.7 NO PROJECT/NO ACTION ALTERNATIVES

D.5.7.1 NO PROJECT/NO ACTION ALTERNATIVE #1:

No Action on Genesis Solar Energy Project application and on California Desert Conservation Area land use plan amendment

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM, and BLM would not amend the California Desert Conservation Area (CDCA) Plan. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because there would be no amendment to the CDCA Plan and no solar project approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no new structures or facilities constructed or operated on the site and no ground disturbance. Because the project would not be built, the proposed interconnection would not be required and no impacts to safe and reliable electric power transmission would occur. However, the land on which the project is proposed would become available for other uses that are consistent with BLM's land use plan, including another solar project requiring a land use plan amendment. In

addition, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations

D.5.7.2 NO PROJECT/NO ACTION ALTERNATIVE #2:

No Action on Genesis Solar Energy Project and amend the CDCA land use plan to make the area available for future solar development

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM, and BLM would amend the CDCA Land Use Plan of 1980, as amended, to allow for other solar projects on the site. As a result, it is possible that another solar energy project could be constructed on the project site.

Because the CDCA Plan would be amended, it is possible that the site will be developed with another solar technology. The different solar technology would require a transmission line and laws, ordinances, regulations, and standards required for safe and reliable electric power transmission would be similar to those under the proposed project.

D.5.7.3 NO PROJECT/NO ACTION ALTERNATIVE #3:

No Action on Genesis Solar Energy Project application and amend the CDCA land use plan to make the area unavailable for future solar development

Under this alternative, the proposed Genesis Solar Energy Project would not be approved by the CEC and BLM, and the BLM would amend the CDCA Plan to make the proposed site unavailable for future solar development. As a result, no solar energy project would be constructed on the project site and BLM would continue to manage the site consistent with the existing land use designation in the CDCA Land Use Plan of 1980, as amended.

Because the CDCA Plan would be amended so no solar projects can be approved for the site under this alternative, it is expected that the site would continue to remain in its existing condition, with no construction of a solar facility. Therefore, the proposed transmission line would not be required and no impacts to safe and reliable electric power transmission would occur. However, in the absence of this project, other renewable energy projects may be constructed to meet State and Federal mandates, and those projects would have similar impacts in other locations.

D.5.8 CUMULATIVE IMPACTS

Staff has reviewed the lists of existing and foreseeable projects as presented in the Cumulative Scenario section of this SA/DEIS. Staff's review considers whether the interconnection of GSEP to SCE's transmission system along with other existing and foreseeable generation projects would conform to all LORS required for safe and reliable electric power transmission. The analysis described above under the heading Proposed Project - Scope of System Impact Studies is conducted in coordination with, and the approval of, the California ISO to consider existing and proposed generator

interconnections to the transmission grid and their potential safety and reliability impacts under a number of conservative contingency conditions.

The cumulative marginal impacts to the safe and reliable operation of the transmission system due to the GSEP project, as identified in the Phase II Study, would be mitigated with the Energy Commission's and BLM's incorporation of the mitigation measures and COC's set forth in this section.

D.5.9 COMPLIANCE WITH LORS

The proposed interconnection facilities including the GSEP 230 kV switchyard, generator 230 kV overhead tie line to the new SCE Genesis 230 kV substation and its termination at the new 230 kV substation are adequate in accordance with industry standards and good utility practices, and are acceptable to staff according to engineering LORS.

The Phase I Study results were found very speculative and inaccurate due to inclusion of 9,690 MW cluster generation projects including the GSEP. The Phase II Study would be performed with only 2,200 MW active cluster generation projects including the GSEP.

Consequently after execution of the LGIA with the applicant, the California ISO/SCE would proceed through the California Public Utility Commission's Certificate of Public Convenience and Necessity (CPCN) permit process for construction of facilities, which would include necessary CEQA analysis.

The GSEP would, therefore, meet the requirements and standards of all applicable LORS upon satisfactory compliance of the proposed TSE Conditions of Certification.

D.5.10 PROPOSED CONDITIONS OF CERTIFICATIONS/MITIGATION MEASURES

TSE-1 The project owner shall furnish to the CPM and to the CBO a schedule of transmission facility design submittals, a Master Drawing List, a Master Specifications List, and a Major Equipment and Structure List. The schedule shall contain a description and list of proposed submittal packages for design, calculations, and specifications for major structures and equipment. To facilitate audits by Energy Commission staff, the project owner shall provide designated packages to the CPM when requested.

Verification: Prior to the start of construction, the project owner shall submit the schedule, a Master Drawing List, and a Master Specifications List to the CBO and to the CPM. The schedule shall contain a description and list of proposed submittal packages for design, calculations, and specifications for major structures and equipment (see a list of major equipment in Table 1: Major Equipment List below). Additions and

deletions shall be made to the table only with CPM and CBO approval. The project owner shall provide schedule updates in the Monthly Compliance Report.

Table 1: Major Equipment List
Breakers
Step-up transformer
Switchyard
Busses
Surge arrestors
Disconnects
Take-off facilities
Electrical control building
Switchyard control building
Transmission pole/tower
Grounding system

TSE-2 Before the start of construction, the project owner shall assign to the project an electrical engineer and at least one of each of the following:

a) a civil engineer;

b) a geotechnical engineer or a civil engineer experienced and knowledgeable in the practice of soils engineering;

c) a design engineer who is either a structural engineer or a civil engineer and fully competent and proficient in the design of power plant structures and equipment supports; or

d) a mechanical engineer (Business and Professions Code Sections 6704 et seq. require state registration to practice as either a civil engineer or a structural engineer in California).

The tasks performed by the civil, mechanical, electrical, or design engineers may be divided between two or more engineers as long as each engineer is responsible for a particular segment of the project, e.g., proposed earthwork, civil structures, power plant structures, or equipment support. No segment of the project shall have more than one responsible engineer. The transmission line may be the responsibility of a separate California registered electrical engineer. The civil, geotechnical, or civil and design engineer, assigned as required by Facility Design Condition **GEN-5**, may be responsible for design and review of the TSE facilities.

The project owner shall submit to the CBO, for review and approval, the names, qualifications, and registration numbers of all engineers assigned to the project. If any one of the designated engineers is subsequently reassigned or replaced, the project owner shall submit the name, qualifications, and registration number of the newly assigned engineer to the CBO for review and approval. The project owner shall notify the CPM of the CBO's approval of the new engineer. This engineer shall be authorized to halt earth work and require changes; if site conditions are unsafe or do not

conform with the predicted conditions used as the basis for design of earth work or foundations.

The electrical engineer shall:

1. be responsible for the electrical design of the power plant switchyard, outlet, and termination facilities; and

2. sign and stamp electrical design drawings, plans, specifications, and calculations.

Verification: Prior to the start of rough grading, the project owner shall submit to the CBO for review and approval, the names, qualifications, and registration numbers of all the responsible engineers assigned to the project. The project owner shall notify the CPM of the CBO's approvals of the engineers within five days of the approval.

If the designated responsible engineer is subsequently reassigned or replaced, the project owner has five days in which to submit the name, qualifications, and registration number of the newly assigned engineer to the CBO for review and approval. The project owner shall notify the CPM of the CBO's approval of the new engineer within five days of the approval.

TSE-3 If any discrepancy in design and/or construction is discovered in any engineering work that has undergone CBO design review and approval, the project owner shall document the discrepancy and recommend corrective action (2001 California Building Code, Chapter 1, section 108.4, approval required; Chapter 17, section 1701.3, *Duties and Responsibilities of the Special Inspector;* Appendix Chapter 33, section 3317.7, *Notification of Noncompliance*). The discrepancy documentation shall become a controlled document and shall be submitted to the CBO for review and approval and refer to this condition of certification.

Verification: The project owner shall submit a copy of the CBO's approval or disapproval of any corrective action taken to resolve a discrepancy to the CPM within 15 days of receipt. If disapproved, the project owner shall advise the CPM, within five days, the reason for the disapproval, along with the revised corrective action required to obtain the CBO's approval.

TSE-4 For the power plant switchyard, outlet line and termination, the project owner shall not begin any construction until plans for that increment of construction have been approved by the CBO. These plans, together with design changes and design change notices, shall remain on the site for one year after completion of construction. The project owner shall request that the CBO inspect the installation to ensure compliance with the requirements of applicable LORS. The following activities shall be reported in the monthly compliance report:

a) receipt or delay of major electrical equipment;

b) testing or energization of major electrical equipment; and

c) the number of electrical drawings approved, submitted for approval, and still to be submitted.

Verification: Prior to the start of each increment of construction, the project owner shall submit to the CBO for review and approval the final design plans, specifications and calculations for equipment and systems of the power plant switchyard, and outlet line and termination, including a copy of the signed and stamped statement from the responsible electrical engineer verifying compliance with all applicable LORS, and send the CPM a copy of the transmittal letter in the next monthly compliance report.

TSE-5 The project owner shall ensure that the design, construction, and operation of the proposed transmission facilities will conform to all applicable LORS, and the requirements listed below. The project owner shall submit the required number of copies of the design drawings and calculations, as determined by the CBO.

a) The power plant outlet line shall meet or exceed the electrical, mechanical, civil, and structural requirements of CPUC General Order 95 or National Electric Safety Code (NESC); Title 8 of the California Code and Regulations (Title 8); Articles 35, 36 and 37 of the *High Voltage Electric Safety Orders*, California ISO standards, National Electric Code (NEC) and related industry standards.

b) Breakers and busses in the power plant switchyard and other switchyards, where applicable, shall be sized to comply with a short-circuit analysis.

c) Outlet line crossings and line parallels with transmission and distribution facilities shall be coordinated with the transmission line owner and comply with the owner's standards.

d) The project conductors shall be sized to accommodate the full output of the project.

e) Termination facilities shall comply with applicable SCE interconnection standards.

f) The project owner shall provide to the CPM:

i) The Special Protection System (SPS) sequencing and timing if applicable,

ii) A letter stating that the mitigation measures or projects selected by the transmission owners for each reliability criteria violation, for which the project is responsible, are acceptable,

iii) The final Phase II Interconnection Study, including a description of facility upgrades, operational mitigation measures, and/or special protection system sequencing and timing if applicable; and

iv) A copy of the executed LGIA signed by the California ISO and the project owner.

Verification: Prior to the start of construction of transmission facilities (or fewer days if mutually agreed upon by the project owner and CBO), the project owner shall submit to the CBO for approval:

a) Design drawings, specifications, and calculations conforming with CPUC General Order 95 or National Electric Safety Code (NESC); Title 8 of the California Code and Regulations (Title 8); Articles 35, 36 and 37 of the *High Voltage Electric Safety Orders*, CA ISO standards, National Electric Code (NEC) and related industry standards, for the poles/towers, foundations, anchor bolts, conductors, grounding systems, and major switchyard equipment;

b) For each element of the transmission facilities identified above, the submittal package to the CBO shall contain the design criteria, a discussion of the calculation method(s), a sample calculation based on "worst case conditions"[1] and a statement signed and sealed by the registered engineer in responsible charge, or other acceptable alternative verification, that the transmission element(s) will conform with CPUC General Order 95 or National Electric Safety Code (NESC); Title 8 of the California Code and Regulations (Title 8); Articles 35, 36 and 37 of the *High Voltage Electric Safety Orders*, California ISO standards, National Electric Code (NEC), and related industry standards;

c) Electrical one-line diagrams signed and sealed by the registered professional electrical engineer in charge, a route map, and an engineering description of the equipment and configurations covered by requirements **TSE-5** a) through f), above;

d) The Special Protection System (SPS) sequencing and timing if applicable shall be provided concurrently to the CPM.

e) A letter stating that the mitigation measures or projects selected by the transmission owners for each reliability criteria violation, for which the project is responsible, are acceptable,

f) The final Phase II Interconnection Study, including a description of facility upgrades, operational mitigation measures, and/or special protection system sequencing and timing if applicable, and

g) A copy of the executed LGIA signed by the California ISO and the project owner.

TSE-6 The project owner shall inform the CPM and CBO of any impending changes that may not conform to requirements **TSE-5** a) through f), and have not received CPM and CBO approval, and request approval to implement such changes. A detailed description of the proposed change and complete engineering, environmental, and economic rationale for the change shall accompany the request. Construction involving changed equipment or substation configurations shall not begin without prior written approval of the changes by the CBO and the CPM.

[1] Worst-case conditions for the foundations would include for instance, a dead-end or angle pole.

Verification: Prior to the construction of transmission facilities, the project owner shall inform the CBO and the CPM of any impending changes that` may not conform to requirements of **TSE-5** and request approval to implement such changes.

TSE-7 The project owner shall provide the following Notice to the California Independent System Operator (California ISO) prior to synchronizing the facility with the California Transmission system:

1. At least one week prior to synchronizing the facility with the grid for testing, provide the California ISO a letter stating the proposed date of synchronization; and

2. At least one business day prior to synchronizing the facility with the grid for testing, provide telephone notification to the California ISO Outage Coordination Department.

Verification: The project owner shall provide copies of the California ISO letter to the CPM when it is sent to the California ISO one week prior to initial synchronization with the grid. The project owner shall contact the California ISO Outage Coordination Department, Monday through Friday, between the hours of 0700 and 1530 at (916) 351-2300 at least one business day prior to synchronizing the facility with the grid for testing. A report of conversation with the California ISO shall be provided electronically to the CPM one day before synchronizing the facility with the California transmission system for the first time.

TSE-8 The project owner shall be responsible for the inspection of the transmission facilities during and after project construction, and any subsequent CPM and CBO approved changes thereto, to ensure conformance with CPUC GO-95 or NESC, Title 8, CCR, Articles 35, 36 and 37 of the, "High Voltage Electric Safety Orders", applicable interconnection standards, NEC and related industry standards. In case of non-conformance, the project owner shall inform the CPM and CBO in writing, within 10 days of discovering such non-conformance and describe the corrective actions to be taken.

Verification: Within 60 days after first synchronization of the project, the project owner shall transmit to the CPM and CBO:

a) "As built" engineering description(s) and one-line drawings of the electrical portion of the facilities signed and sealed by the registered electrical engineer in responsible charge. A statement attesting to conformance with CPUC GO-95 or NESC, Title 8, California Code of Regulations, Articles 35, 36 and 37 of the, "High Voltage Electric Safety Orders", and applicable interconnection standards, NEC, related industry standards, and these conditions shall be provided concurrently.

b) An "as built" engineering description of the mechanical, structural, and civil portion of the transmission facilities signed and sealed by the registered engineer in responsible charge or acceptable alternative verification. "As built" drawings of the electrical, mechanical, structural, and civil portion of the transmission facilities shall be maintained at the power plant and made available, if requested, for CPM audit as set forth in the "Compliance Monitoring Plan".

c) A summary of inspections of the completed transmission facilities, and identification of any nonconforming work and corrective actions taken, signed and sealed by the registered engineer in charge.

D.5.11 CONCLUSIONS

1. The proposed interconnection facilities including the GSEP 230 kV switchyard, generator 230 kV overhead tie line and termination at the proposed SCE Colorado River 230 kV are adequate, in accordance with industry standards and good utility practices, and are acceptable to staff according to engineering LORS.

2. The Phase I Study does not provide a meaningful forecast of the transmission reliability impacts of the GSEP. The Phase I Study analyzed the impacts of 9,690 MW of generation in the GSEP cluster; however, after a December 2009 milestone most of the generation dropped out of the interconnection process and only 2,200 MW remained. Staff expects that the reliability impacts of 2,200 MW would be significantly smaller than the impacts of 9,690 MW. The California ISO Phase II Study will be performed based on the 2,200 MW in the GSEP cluster, which includes the GSEP. The Phase II Study will not be available until September 2010 and thus not incorporated into the staff analysis of the GSEP. Consequently after completion of the Phase II Study and execution of the LGIA with applicant, the California ISO/SCE would proceed through the California Public Utilities Commission's CPCN permit process for construction of facilities, which would include necessary CEQA analysis.

3. The GSEP would, therefore, meet the requirements and standards of all applicable LORS upon satisfactory compliance of the proposed TSE Conditions of Certification.

4. The GSEP, as local solar generation, would provide clean renewable energy towards meeting state mandate and goals.

D.5.13 DEFINITION OF TERMS

AAC All aluminum conductor

ACSR Aluminum conductor steel-reinforced

ACSS Aluminum conductor steel-supported

Ampacity Current-carrying capacity, expressed in amperes, of a conductor at specified ambient conditions, at which damage to the conductor is nonexistent or deemed acceptable based on economic, safety, and reliability considerations

Ampere The unit of current flowing in a conductor

Bundled Two wires, 18 inches apart

Bus Conductors that serve as a common connection for two or more circuits

Conductor The part of the transmission line (the wire) that carries the current.

Congestion Management
A scheduling protocol that ensures dispatched generation and transmission loading (imports) will not violate criteria

Double Contingency
Also known as emergency or N-2 condition, occurs when a forced outage of two system elements occurs -- usually (but not exclusively) caused by one single event. Examples of an N-2 contingency include loss of two transmission circuits on single tower line or loss of two elements connected by a common circuit breaker due to the failure of that common breaker

Emergency Overload
See Single Contingency condition. This is also called an N-1.

Kcmil or KCM
Thousand circular mil. A unit of the conductor's cross sectional area; when divided by 1,273, the area in square inches is obtained.

Kilovolt (kV)
A unit of potential difference, or voltage, between two conductors of a circuit, or between a conductor and the ground

Loop An electrical cul de sac. A transmission configuration that interrupts an existing circuit, diverts it to another connection, and returns it back to the interrupted circuit, thus forming a loop or cul de sac

Megavar One megavolt ampere reactive

Megavars Mega-volt-ampere-reactive. One million volt-ampere-reactive. Reactive power is generally associated with the reactive nature of motor loads that must be fed by generation units in the system

Megavolt Ampere (MVA)

A unit of apparent power, equals the product of the line voltage in kilovolts, current in amperes, the square root of 3, divided by 1,000

Megawatt (MW)

A unit of power equivalent to 1,341 horsepower

N-0 Condition

See Normal Operation/Normal Overload, below

Normal Operation/ Normal Overload (N-0)

When all customers receive the power they are entitled to without interruption and at steady voltage, and no element of the transmission system is loaded beyond its continuous rating

N-1 Condition

See Single Contingency, below

N-2 Condition

See Double Contingency, above

Outlet Transmission facilities (circuit, transformer, circuit breaker, etc.) linking generation facilities with the main grid

Power Flow Analysis

A power flow analysis is a forward-looking computer simulation of essentially all generation and transmission system facilities that identifies overloaded circuits, transformers, and other equipment and system voltage levels

Reactive Power

Reactive power is generally associated with the reactive nature of motor loads that must be fed by generation units in the system. An adequate supply of reactive power is required to maintain voltage levels in the system

Remedial Action Scheme

A remedial action scheme is an automatic control provision that, as one example, will trip a selected generating unit when a circuit overloads

SF6 Sulfur hexafluoride is an insulating medium

Single Contingency

Also known as emergency or N-1 condition, occurs when one major transmission element (circuit, transformer, circuit breaker, etc.) or one generator is out of service

Solid Dielectric Cable

Copper or aluminum conductors that are insulated by solid polyethylene type insulation and covered by a metallic shield and outer polyethylene jacket

Special Protection Scheme/System

Detects a transmission outage (either a single or credible multiple contingency) or an overloaded transmission facility and then trips or runs back generation output to avoid potential overloaded facilities or other criteria violations

Switchyard A power plant switchyard is an integral part of a power plant that is used as an outlet for one or more electric generators

Thermal Rating See ampacity.

TSE Transmission System Engineering

Tap A transmission configuration that creates an interconnection through a short single circuit to a small or medium-sized load or generator. The new single circuit line is inserted into an existing circuit by utilizing breakers at existing terminals of the circuit, rather than installing breakers at the interconnection in a new switchyard.

Undercrossing A transmission configuration where a transmission line crosses below the conductors of another transmission line, generally at 90 degrees.

Underbuild A transmission or distribution configuration where a transmission or distribution circuit is attached to a transmission tower or pole below (under) the principle transmission line conductors.

E - JOINT AGENCY GENERAL CONDITIONS INCLUDING COMPLIANCE MONITORING AND CLOSURE PLAN

Testimony of Mary Dyas

E.1 INTRODUCTION

The project's General Compliance Conditions of Certification, including Compliance Monitoring and Closure Plan (Compliance Plan) have been established as required by Public Resources Code section 25532. The plan provides a means for assuring that the facility is constructed, operated and closed in compliance with public health and safety, environmental and other applicable regulations, guidelines, and conditions adopted or established by the California Energy Commission and specified in the written decision on the Application for Certification or otherwise required by law. The Compliance Plan will be integrated with a U.S. Bureau of Land Management (BLM) Compliance Monitoring Plan (hereafter referred to as the Compliance Plan) to assure compliance with the terms and conditions of any approved Right-of-Way (ROW) grant including the approved Plan of Development (POD).

The Compliance Plan is composed of elements that:

- set forth the duties and responsibilities of BLM's Authorized Officer, the Compliance Project Manager (CPM), the project owner, delegate agencies, and others;
- set forth the requirements for handling confidential records and maintaining the compliance record;
- state procedures for settling disputes and making post-certification changes;
- state procedures for requesting and approving ROW Grant or POD changes;
- state the requirements for periodic compliance reports and other administrative procedures that are necessary to verify the compliance status for all BLM and Energy Commission approved conditions of certification/mitigation measures;
- establish requirements for modifications or amendments to facility closure, revegetation, and restoration plans; and
- specify conditions of certification for each technical area containing the measures required to mitigate any and all potential adverse project impacts associated with construction, operation and closure below a level of significance. Each specific condition of certification also includes a verification provision that describes the method of assuring that the condition has been satisfied.

Conditions of Certification referred to herein serve the purpose of both the Energy Commission's Conditions of Certification for purposes of the California Environmental Quality Act (CEQA) and BLM's Mitigation Measures for purposes of the National Environmental Policy Act (NEPA).

E.2 DEFINITIONS

The following terms and definitions are used to establish when Conditions of Certification are implemented.

BLM AUTHORIZED OFFICER:

The BLM Authorized Officer for the Project is the BLM Palm Springs-South Coast Field Manager or his designated Compliance Inspector that is responsible for oversight and inspection of all construction and operational related activities on BLM-administered land.

PRE-CONSTRUCTION SITE MOBILIZATION

Site mobilization is limited preconstruction activities at the site to allow for the installation of fencing, construction trailers, construction trailer utilities, and construction trailer parking at the site. Limited ground disturbance, grading, and trenching associated with the above mentioned pre-construction activities is considered part of site mobilization. Walking, driving or parking a passenger vehicle, pickup truck and light vehicles is allowable during site mobilization.

CONSTRUCTION

Onsite work to install permanent equipment or structures for any facility.

Ground Disturbance

Construction-related ground disturbance refers to activities that result in the removal of top soil or vegetation at the site beyond site mobilization needs, and for access roads and linear facilities.

Grading, Boring, and Trenching

Construction-related grading, boring, and trenching refers to activities that result in subsurface soil work at the site and for access roads and linear facilities, e.g., alteration of the topographical features such as leveling, removal of hills or high spots, moving of soil from one area to another, and removal of soil.

Notwithstanding the definitions of ground disturbance, grading, boring and trenching above, construction does not include the following:

1. the installation of environmental monitoring equipment;
2. a soil or geological investigation;
3. a topographical survey;
4. any other study or investigation to determine the environmental acceptability or feasibility of the use of the site for any particular facility; and
5. any work to provide access to the site for any of the purposes specified in “Construction” 1, 2, 3, or 4 above.

START OF COMMERCIAL OPERATION

For compliance monitoring purposes, “commercial operation” begins after the completion of start-up and commissioning, when each of the power plants has reached reliable steady-state production of electricity at the rated capacity. At the start of commercial operation, plant control is usually transferred from the construction manager to the plant operations manager.

E.3 BLM’S AUTHORIZED OFFICER AND COMPLIANCE PROJECT MANAGER RESPONSIBILITIES

BLM’s Authorized Officer (AO) and the Compliance Project Manager (CPM) shall oversee the compliance monitoring and is responsible for:

1. Ensuring that the design, construction, operation, and closure of the project facilities are in compliance with the terms and conditions of BLM’s ROW Grant and the Energy Commission Decision
2. Resolving complaints
3. Processing post-certification changes to the conditions of certification, project description (petition to amend), and ownership or operational control (petition for change of ownership) (See instructions for filing petitions)
4. Documenting and tracking compliance filings
5. Ensuring that compliance files are maintained and accessible

BLM’s AO is the contact person for BLM and will consult with appropriate responsible agencies, Energy Commission, and Energy Commission staff when handling disputes, complaints, and amendments. The CPM is the contact person for the Energy Commission and will consult with appropriate responsible agencies, BLM, Energy Commission, and Energy Commission staff when handling disputes, complaints, and amendments.

All project compliance submittals are submitted to BLM’s AO and the CPM for processing. Where a submittal required by a condition of certification requires BLM’s AO and/or CPM approval, the approval will involve all appropriate BLM personnel, Energy Commission staff and management. All submittals must include searchable electronic versions (pdf or word files).

E.4 CHIEF BUILDING OFFICIAL RESPONSIBILITIES

The Chief Building Official (CBO) shall serve as BLM's and the Energy Commission's delegate to assure the project is designed and constructed in accordance with BLM's Right-of-Way Grant, the Energy Commission's Decision including Conditions of Certification, California Building Standards Code, local building codes and applicable laws, ordinances, regulations and standards to ensure health and safety. The CBO is

typically made-up of a team of specialists covering civil, structural, mechanical and electrical disciplines whose duties include the following:

1. Performing design review and plan checks of all drawings, specifications and procedures;
2. Conducting construction inspection;
3. Functioning as BLM's and the Energy Commission's delegate including reporting noncompliance issues or violations to the BLM Authorized Officer for action and taking any action allowed under the California Code of Regulations, including issuing a Stop Work Order, to ensure compliance;
4. Exercising access as needed to all project owner construction records, construction and inspection procedures, test equipment and test results; and
5. Providing weekly reports on the status of construction to BLM's Authorized Officer and the CPM.

PRE-CONSTRUCTION AND PRE-OPERATION COMPLIANCE MEETING

BLM's AO and the CPM shall schedule pre-construction and pre-operation compliance meetings prior to the projected start-dates of construction, plant operation, or both. The purpose of these meetings is to assemble BLM's, the Energy Commission's and project owner's technical staff and construction contractor to review the status of all pre-construction or pre-operation requirements, contained in BLM's Right-of-Way Grant and the Energy Commission's conditions of certification. This is to confirm that all applicable conditions of certification have been met, or if they have not been met, to ensure that the proper action is taken. In addition, these meetings ensure, to the extent possible, that BLM and Energy Commission conditions will not delay the construction and operation of the plant due to oversight and to preclude any last minute, unforeseen issues from arising. Pre-construction meetings held during the certification process must be publicly noticed unless they are confined to administrative issues and processes.

BLM AND ENERGY COMMISSION RECORD

BLM and the Energy Commission shall maintain the following documents and information as a public record, in either the Energy Commission's Compliance file or Dockets file, and the BLM Case File for the life of the project (or other period as required):

- All documents demonstrating compliance with any legal requirements relating to the construction and operation of the facility;
- All monthly and annual compliance reports filed by the project owner;
- All complaints of noncompliance filed with BLM and the Energy Commission; and
- All petitions/requests for project or condition of certification changes and the resulting BLM, Energy Commission staff or Energy Commission action.

E.5 PROJECT OWNER RESPONSIBILITIES

The project owner is responsible for ensuring that the compliance conditions of certification and all other conditions of certification that appear in BLM's ROW Grant and the Energy Commission Decision are satisfied. The compliance conditions regarding post-certification changes specify measures that the project owner must take when requesting changes in the project design, conditions of certification, or ownership. Failure to comply with any of the conditions of certification or the compliance conditions may result in reopening of the case and revocation of the Energy Commission certification; an administrative fine; or other action as appropriate. A summary of the Compliance Conditions of Certification is included as Compliance Table 1 at the conclusion of this section. The BLM ROW grant holder will comply with the terms, conditions, and special stipulations of the ROW grant. Failure to comply with applicable laws or regulations or any of the terms and conditions of a BLM ROW grant may result in the suspension or termination of the ROW grant (43 CFR 2807.17). Prior to suspending or terminating a ROW grant, BLM will provide written notice to the holder stating it intends to suspend or terminate and will provide reasonable opportunity to correct any noncompliance.

E.6 COMPLIANCE MITIGATION MEASURES/CONDITIONS OF CERTIFICATION

UNRESTRICTED ACCESS (COMPLIANCE-1)

BLM's AO, responsible BLM staff, the CPM, responsible Energy Commission staff, and delegated agencies or consultants shall be guaranteed and granted unrestricted access to the power plant site, related facilities, project-related staff, and the records maintained on-site, for the purpose of conducting audits, surveys, inspections, or general site visits. Although BLM's AO and the CPM will normally schedule site visits on dates and times agreeable to the project owner, BLM's AO and the CPM reserve the right to make unannounced visits at any time.

COMPLIANCE RECORD (COMPLIANCE-2)

The project owner shall maintain project files on-site or at an alternative site approved by BLM's AO and the CPM for the life of the project, unless a lesser period of time is specified by the conditions of certification. The files shall contain copies of all "as-built" drawings, documents submitted as verification for conditions, and other project-related documents. As-built drawings of all facilities including linear facilities shall be provided to the BLM AO for inclusion in the BLM administrative record within 90-days of completion of that portion of the facility or project.

BLM and Energy Commission staff and delegate agencies shall, upon request to the project owner, be given unrestricted access to the files maintained pursuant to this condition.

COMPLIANCE VERIFICATION SUBMITTALS (COMPLIANCE-3)

Each condition of certification is followed by a means of verification. The verification describes the Energy Commission's procedure(s) to ensure post-certification

compliance with adopted conditions. The verification procedures, unlike the conditions, may be modified as necessary by BLM's AO and the CPM.

Verification of compliance with the conditions of certification can be accomplished by the following:

1. Monthly and/or annual compliance reports filed by the project owner or authorized agent, reporting on work done and providing pertinent documentation, as required by the specific conditions of certification;
2. Appropriate letters from delegate agencies verifying compliance;
3. BLM and Energy Commission staff audits of project records; and/or
4. BLM and Energy Commission staff inspections of work, or other evidence that the requirements are satisfied.

Verification lead times associated with start of construction may require the project owner to file submittals during the certification process, particularly if construction is planned to commence shortly after certification.

A cover letter from the project owner or authorized agent is required for all compliance submittals and correspondence pertaining to compliance matters. The cover letter subject line shall identify the project by AFC and BLM case file numbers, the appropriate condition(s) of certification by condition number(s), and a brief description of the subject of the submittal. The project owner shall also identify those submittals not required by a condition of certification with a statement such as: "This submittal is for information only and is not required by a specific condition of certification." When submitting supplementary or corrected information, the project owner shall reference the date of the previous submittal and BLM/CEC submittal number.

The project owner is responsible for the delivery and content of all verification submittals to the BLM's AO and CPM, whether such condition was satisfied by work performed by the project owner or an agent of the project owner.

All hardcopy submittals shall be addressed to each of the following:

John Kalish, Field Manager
CACA-48811
U.S. Bureau of Land Management
Palm Springs-South Coast Field Office
1201 Bird Center Drive
Palm Springs, CA 92262

Mary Dyas, CPM
(09-AFC-9C)
California Energy Commission
1516 Ninth Street, MS-2000
Sacramento, CA 95814

Those submittals shall be accompanied by a searchable electronic copy, on a CD or by e-mail, as agreed upon by BLM's AO and the CPM.

If the project owner desires BLM and/or Energy Commission staff action by a specific date, that request shall be made in the submittal cover letter and shall include a detailed explanation of the effects on the project if that date is not met.

PRE-CONSTRUCTION MATRIX AND TASKS PRIOR TO START OF CONSTRUCTION (COMPLIANCE-4)

Prior to commencing construction, a compliance matrix addressing only those conditions that must be fulfilled before the start of construction shall be submitted by the project owner to BLM's AO and the CPM. This matrix will be included with the project owner's first compliance submittal or prior to the first pre-construction meeting, whichever comes first. It will be submitted in the same format as the compliance matrix described below. In order to begin any on-site mobilization or surface disturbing activities on public land, the BLM AO must approve a written Notice to Proceed (NTP). NTPs will be phased as appropriate to facilitate timely implementation of construction.

Construction shall not commence until the pre-construction matrix is submitted, all pre-construction conditions have been complied with, and BLM's AO and the CPM have issued a letter and BLM has issued a NTP to the project owner authorizing construction. Various lead times for submittal of compliance verification documents to BLM's AO and the CPM for conditions of certification are established to allow sufficient BLM and Energy Commission staff time to review and comment and, if necessary, allow the project owner to revise the submittal in a timely manner. This will ensure that project construction may proceed according to schedule.

Failure to submit compliance documents within the specified lead-time may result in delays in authorization to commence various stages of project development.

If the project owner anticipates commencing project construction as soon as the project is certified, it may be necessary for the project owner to file compliance submittals prior to project certification. Compliance submittals should be completed in advance where the necessary lead time for a required compliance event extends beyond the date anticipated for start of construction. The project owner must understand that the submittal of compliance documents prior to project certification is at the owner's own risk. Any approval by Energy Commission staff is subject to change, based upon BLM's ROW Grant and the Energy Commission Decision.

Compliance Reporting

There are two different compliance reports that the project owner must submit to assist BLM's AO and the CPM in tracking activities and monitoring compliance with the terms and conditions of BLM's ROW Grant and the Energy Commission Decision. During construction, the project owner or authorized agent will submit monthly compliance reports. During operation, an annual compliance report must be submitted. These reports, and the requirement for an accompanying compliance matrix, are described below. The majority of the conditions of certification require that compliance submittals be submitted to BLM's AO and the CPM in the monthly or annual compliance reports.

POSTING OF A SURETY BOND (COMPLIANCE-5)

Prior to site disturbance and each increment of construction, the project owner shall post a surety bond adequate to cover the cost of decommissioning and restoration, including the removal of the project features that have been constructed for that that portion of the site and restoring the native topography and vegetation. An “increment of construction” shall mean a significant feature of construction, such as site grading, a building, a fluid storage tank, a water treatment facility, a hydrogen production facility, a switchyard, or a group of solar collectors connected to an electrical transformer (including that transformer). This Surety bond will apply to all site disturbance features.

The project owner shall provide the surety bond to the BLM AO for approval and to the CPM for review with written evidence indicating that the surety bond is adequate to cover the cost of decommissioning and removing the project features constructed, allowing for site restoration. The written evidence shall include a valid estimate showing that the amount of the bond is adequate to accomplish such work. The timing for the submittal of the surety bond and approval of this document shall be coordinated with the BLM AO and CPM. Over the life of the project, the surety bond will be updated as necessary to account for any changes to the project description and/or decommissioning costs.

COMPLIANCE MATRIX (COMPLIANCE-6)

A compliance matrix shall be submitted by the project owner to BLM’s AO and the CPM along with each monthly and annual compliance report. The compliance matrix is intended to provide BLM’s AO and the CPM with the current status of all conditions of certification in a spreadsheet format. The compliance matrix must identify:

1. the technical area;
2. the condition number;
3. a brief description of the verification action or submittal required by the condition;
4. the date the submittal is required (e.g., 60 days prior to construction, after final inspection, etc.);
5. the expected or actual submittal date;
6. the date a submittal or action was approved by the Chief Building Official (CBO), BLM’s AO, CPM, or delegate agency, if applicable; and
7. the compliance status of each condition, e.g., “not started,” “in progress” or “completed” (include the date).
8. if the condition was amended, the date of the amendment.

Satisfied conditions shall be placed at the end of the matrix.

MONTHLY COMPLIANCE REPORT (COMPLIANCE-7)

The first monthly compliance report is due one month following the Energy Commission business meeting date upon which the project was approved, unless otherwise agreed to by BLM’s AO and the CPM. The first monthly compliance report shall include the AFC

and BLM case file numbers and an initial list of dates for each of the events identified on the Key Events List. The Key Events List Form is found at the end of this section.

During pre-construction and construction of each power plant, the project owner or authorized agent shall submit an original and an electronic searchable version of the monthly compliance report within 10 working days after the end of each reporting month or other period of time agreed to by BLM's AO and the CPM. Monthly compliance reports shall be clearly identified for the month being reported. The reports shall contain, at a minimum:

1. A summary of the current project construction status, a revised/updated schedule if there are significant delays, and an explanation of any significant changes to the schedule;
2. Documents required by specific conditions to be submitted along with the monthly compliance report. Each of these items must be identified in the transmittal letter, as well as the conditions they satisfy and submitted as attachments to the monthly compliance report;
3. An initial, and thereafter updated, compliance matrix showing the status of all conditions of certification (fully satisfied conditions do not need to be included in the matrix after they have been reported as completed);
4. A list of conditions that have been satisfied during the reporting period, and a description or reference to the actions that satisfied the condition;
5. A list of any submittal deadlines that were missed, accompanied by an explanation and an estimate of when the information will be provided;
6. A cumulative listing of any approved changes to conditions of certification;
7. A listing of any filings submitted to, or permits issued by, other governmental agencies during the month;
8. A projection of project compliance activities scheduled during the next two months. The project owner shall notify BLM's AO and the CPM as soon as any changes are made to the project construction schedule that would affect compliance with conditions of certification;
9. A listing of the month's additions to the on-site compliance file; and
10. A listing of complaints, notices of violation, official warnings, and citations received during the month, a description of the resolution of the resolved actions, and the status of any unresolved actions.

All sections, exhibits, or addendums shall be separated by tabbed dividers or as acceptable by BLM's AO and the CPM.

ANNUAL COMPLIANCE REPORT (COMPLIANCE-8)

After construction of each power plant is complete or when a power plant goes into commercial operations, the project owner shall submit annual compliance reports instead of monthly compliance reports. The reports are for each year of commercial operation and are due to BLM's AO and the CPM each year at a date agreed to by BLM's AO and the CPM. Annual compliance reports shall be submitted over the life of

the project unless otherwise specified by BLM's AO and the CPM. Each annual compliance report shall include the AFC and BLM case file numbers, identify the reporting period and shall contain the following:

1. An updated compliance matrix showing the status of all conditions of certification (fully satisfied conditions do not need to be included in the matrix after they have been reported as completed);
2. A summary of the current project operating status and an explanation of any significant changes to facility operations during the year;
3. Documents required by specific conditions to be submitted along with the annual compliance report. Each of these items must be identified in the transmittal letter, with the condition it satisfies, and submitted as attachments to the annual compliance report;
4. A cumulative listing of all post-certification changes by the Energy Commission or changes to the BLM ROW grant or approved POD by BLM , or cleared by BLM's AO and the CPM;
5. An explanation for any submittal deadlines that were missed, accompanied by an estimate of when the information will be provided;
6. A listing of filings submitted to, or permits issued by, other governmental agencies during the year;
7. A projection of project compliance activities scheduled during the next year;
8. A listing of the year's additions to the on-site compliance file;
9. An evaluation of the on-site contingency plan for unplanned facility closure, including any suggestions necessary for bringing the plan up to date [see Compliance Conditions for Facility Closure addressed later in this section]; and
10. A listing of complaints, notices of violation, official warnings, and citations received during the year, a description of the resolution of any resolved matters, and the status of any unresolved matters.

CONFIDENTIAL INFORMATION (COMPLIANCE-9)

Any information that the project owner deems confidential shall be submitted to the Energy Commission's executive director with an application for confidentiality pursuant to Title 20, California Code of Regulations, section 2505(a). Any information that is determined to be confidential shall be kept confidential as provided for in Title 20, California Code of Regulations, section 2501 et. seq.

Any information the ROW holder deems confidential shall be submitted to the BLM AO with a written request for said confidentiality along with a justification for the request in accordance with 43 CFR 2804.13. All confidential submissions to BLM should be clearly stamped "proprietary information" by the holder when submitted.

ANNUAL ENERGY FACILITY COMPLIANCE FEE (COMPLIANCE-10)

Pursuant to the provisions of Section 25806(b) of the Public Resources Code, the project owner is required to pay an annual compliance fee, which is adjusted annually. Current compliance fee information is available on the Energy Commission's website

http://www.energy.ca.gov/siting/filing_fees.html. You may also contact the CPM for the current fee information. The initial payment is due on the date the Energy Commission adopts the final decision. All subsequent payments are due by July 1 of each year in which the facility retains its certification. The payment instrument shall be made payable to the California Energy Commission and mailed to: Accounting Office MS-02, California Energy Commission, 1516 9th St., Sacramento, CA 95814.

REPORTING OF COMPLAINTS, NOTICES, AND CITATIONS (COMPLIANCE-11)

Prior to the start of construction, the project owner must send a letter to property owners living within one mile of the project notifying them of a telephone number to contact project representatives with questions, complaints or concerns. If the telephone is not staffed 24 hours per day, it shall include automatic answering with date and time stamp recording. All recorded complaints shall be responded to within 24 hours. The telephone number shall be posted at the project site and made easily visible to passersby during construction and operation. The telephone number shall be provided to BLM's AO and the CPM who will post it on the Energy Commission's web page at:

http://www.energy.ca.gov/sitingcases/power_plants_contacts.html.

Any changes to the telephone number shall be submitted immediately to BLM's AO and the CPM, who will update the web page.

In addition to the monthly and annual compliance reporting requirements described above, the project owner shall report and provide copies to BLM's AO and the CPM of all complaint forms, including noise and lighting complaints, notices of violation, notices of fines, official warnings, and citations, within 10 days of receipt. Complaints shall be logged and numbered. Noise complaints shall be recorded on the form provided in the **NOISE** conditions of certification. All other complaints shall be recorded on the complaint form (Attachment A).

E.7 FACILITY CLOSURE

At some point in the future, the project will cease operation and close down. At that time, it will be necessary to implement the Closure, Revegetation and Restoration Plan to ensure that the closure occurs in such a way that public health and safety and the environment are protected from adverse impacts. Although the project setting for this project does not appear, at this time, to present any special or unusual closure problems, it is impossible to foresee what the situation will be in 30 years or more when the project ceases operation. Therefore, provisions must be made that provide the flexibility to deal with the specific situation and project setting that exist at the time of closure. Laws, ordinances, regulations and standards (LORS) pertaining to facility closure are identified in the sections dealing with each technical area. Facility closure will be consistent with LORS in effect at the time of closure. Closure would be conducted in accordance with Condition of Certification **BIO-14** that requires the project owner to develop and implement a Closure, Revegetation and Rehabilitation Plan.

There are at least three circumstances in which a facility closure can take place: planned closure, unplanned temporary closure and unplanned permanent closure.

CLOSURE AND DECOMMISSIONING DEFINITIONS

Planned Closure

A planned closure occurs when the facility is closed in an anticipated, orderly manner, at the end of its useful economic or mechanical life, or due to gradual obsolescence.

Unplanned Temporary Closure

An unplanned temporary closure occurs when the facility is closed suddenly and/or unexpectedly, on a short-term basis, due to unforeseen circumstances such as a natural disaster or an emergency. Short-term is defined as cessation of construction activities or operations of a power plant for a period less than 6-months long. Cessation of construction of operations for a period longer than 6 months in considered a permanent closure.

Unplanned Permanent Closure

An unplanned permanent closure occurs if the project owner closes the facility suddenly and/or unexpectedly, on a permanent basis. This includes unplanned closure where the owner implements the on-site contingency plan. It can also include unplanned closure where the project owner fails to implement the contingency plan, and the project is essentially abandoned.

E.8 COMPLIANCE CONDITIONS FOR FACILITY CLOSURE

PLANNED CLOSURE (COMPLIANCE-12)

In order to ensure that a planned facility closure does not create adverse impacts, a closure process that provides for careful consideration of available options and applicable laws, ordinances, regulations, standards, and local/regional plans in existence at the time of closure, will be undertaken. To ensure adequate review of a planned project closure, the project owner shall submit a revision or update to the approved Closure, Revegetation and Rehabilitation Plan to BLM and the Energy Commission for review and approval at least 12 months (or other period of time agreed to by BLM's AO and the CPM) prior to commencement of closure activities. The project owner shall file 50 copies and 50 CDs with the Energy Commission and 10 copies and 10 CDs with BLM (or other number of copies agreed upon by BLM's AO and the CPM) of a proposed facility closure plan/Closure, Revegetation and Rehabilitation Plan.

The plan shall:

1. identify and discuss any impacts and mitigation to address significant adverse impacts associated with proposed closure activities and to address facilities, equipment, or other project related materials that must be removed from the site;
2. identify a schedule of activities for closure of the power plant site, transmission line corridor, and all other appurtenant facilities constructed as part of the project;
3. address conformance of the plan with all applicable laws, ordinances, regulations, standards, and local/regional plans in existence at the time of facility closure, and applicable conditions of certification; and.

4. Address any changes to the site revegetation, rehabilitation, monitoring and long-term maintenance specified in the existing plan that are needed for site revegetation and rehabilitation to be successful.

Prior to submittal of an amended or revised Closure, Revegetation and Restoration Plan, a meeting shall be held between the project owner, BLM's AO and the Energy Commission CPM for the purpose of discussing the specific contents of the plan.

In the event that there are significant issues associated with the proposed facility Closure, Revegetation and Restoration plan's approval, or the desires of local officials or interested parties are inconsistent with the plan, BLM's AO the CPM shall hold one or more workshops and/or BLM and the Energy Commission may hold public hearings as part of its approval procedure.

As necessary, prior to or during the closure ~~plan~~ process, the project owner shall take appropriate steps to eliminate any immediate threats to public health and safety and the environment, but shall not commence any other closure activities until BLM and the Energy Commission approve the facility Closure, Revegetation and Restoration plan.

UNPLANNED TEMPORARY CLOSURE/ON-SITE CONTINGENCY PLAN (COMPLIANCE-13)

In order to ensure that public health and safety and the environment are protected in the event of an unplanned temporary facility closure, it is essential to have an On-Site Contingency Plan in place. The On-Site Contingency Plan will help to ensure that all necessary steps to mitigate public health and safety impacts and environmental impacts are taken in a timely manner.

The project owner shall submit an On-Site Contingency Plan for BLM's AO and CPM review and approval. The plan shall be submitted no less than 60 days (or other time agreed to by BLM's AO and the CPM) after approval of any NTP or letter granting approval to commence construction for each phase of construction. A copy of the approved plan must be in place during commercial operation of the facility and shall be kept at the site at all times.

The project owner, in consultation with BLM's AO and the CPM, will update the On-Site Contingency Plan as necessary. BLM's AO and the CPM may require revisions to the On-Site Contingency Plan over the life of the project. In the annual compliance reports submitted to the Energy Commission, the project owner will review the On-Site Contingency Plan, and recommend changes to bring the plan up to date. Any changes to the plan must be approved by BLM's AO and the CPM.

The On-Site Contingency Plan shall provide for taking immediate steps to secure the facility from trespassing or encroachment. In addition, for closures of more than 90 days, unless other arrangements are agreed to by BLM's AO and the CPM, the plan shall provide for removal of hazardous materials and hazardous wastes, draining of all chemicals from storage tanks and other equipment, and the safe shutdown of all equipment. (Also see specific conditions of certification for the technical areas of Hazardous Materials Management and Waste Management.)

In addition, consistent with requirements under unplanned permanent closure addressed below, the nature and extent of insurance coverage, and major equipment warranties must also be included in the On-Site Contingency Plan. In addition, the status of the insurance coverage and major equipment warranties must be updated in the annual compliance reports.

In the event of an unplanned temporary closure, the project owner shall notify BLM's AO and the CPM, as well as other responsible agencies, by telephone, fax, or e-mail, within 24 hours and shall take all necessary steps to implement the On-Site Contingency Plan. The project owner shall keep BLM's AO and the CPM informed of the circumstances and expected duration of the closure.

If BLM's AO and the CPM determine that an unplanned temporary closure is likely to be permanent, or for a duration of more than six months, a Closure Plan consistent with the requirements for a planned closure shall be developed and submitted to BLM's AO and the CPM within 90 days of BLM's AO and the CPM's determination (or other period of time agreed to by BLM's AO and the CPM).

UNPLANNED PERMANENT CLOSURE/ON-SITE CONTINGENCY PLAN (COMPLIANCE-14)

The On-Site Contingency Plan required for unplanned temporary closure shall also cover unplanned permanent facility closure. All of the requirements specified for unplanned temporary closure shall also apply to unplanned permanent closure. In addition, the On-Site Contingency Plan shall address how the project owner will ensure that all required closure steps will be successfully undertaken in the event of abandonment.

In the event of an unplanned permanent closure, the project owner shall notify BLM's AO and the CPM, as well as other responsible agencies, by telephone, fax, or e-mail, within 24 hours and shall take all necessary steps to implement the On-Site Contingency Plan. The project owner shall keep BLM's AO and the CPM informed of the status of all closure activities.

To ensure that public health and safety and the environment are protected in the event of an unplanned permanent closure, the project owner shall submit an On-Site Contingency Plan no less than 60 days after a NTP is issued for each phase of development.

POST CERTIFICATION CHANGES TO BLM'S ROW GRANT AND/OR THE ENERGY COMMISSION DECISION: AMENDMENTS, OWNERSHIP CHANGES, STAFF APPROVED PROJECT MODIFICATIONS AND VERIFICATION CHANGES (COMPLIANCE-15)

The project owner must petition the Energy Commission pursuant to Title 20, California Code of Regulations, section 1769, in order to modify the project (including linear facilities) design, operation or performance requirements, and to transfer ownership or operational control of the facility. The BLM ROW holder must file a written request in the form of an application to the BLM AO in order to change the terms and conditions of their ROW grant or POD. Written requests will be in a manner prescribed by the BLM

AO. Implementation of a project modification without first securing BLM approval may result in financial and other liabilities in accordance with 43 CFR 2808.

It is the responsibility of the project owner to contact BLM's AO and the CPM to determine if a proposed project change should be considered a project modification pursuant to section 1769. Implementation of a project modification without first securing Energy Commission staff approval, may result in enforcement action that could result in civil penalties in accordance with section 25534 of the Public Resources Code.

A petition is required for amendments and for staff approved project modifications as specified below. Both shall be filed as a "Petition to Amend." Staff will determine if the change is significant or insignificant. For verification changes, a letter from the project owner is sufficient. In all cases, the petition or letter requesting a change should be submitted to BLM's AO and the CPM, who will file it with the Energy Commission's Dockets Unit in accordance with Title 20, California Code of Regulations, section 1209.

The criteria that determine which type of approval and the process that applies are explained below. They reflect the provisions of Section 1769 at the time this condition was drafted. If the Commission's rules regarding amendments are amended, the rules in effect at the time an amendment is requested shall apply.

Amendment

The project owner shall petition the Energy Commission, pursuant to Title 20, California Code of Regulations, Section 1769(a), when proposing modifications to the project (including linear facilities) design, operation, or performance requirements. If a proposed modification results in deletion or change of a condition of certification, or makes changes that would cause the project not to comply with any applicable laws, ordinances, regulations or standards, the petition will be processed as a formal amendment to the Energy Commission's final decision, which requires public notice and review of the BLM-Energy Commission staff analysis, and approval by the full Energy Commission. The petition shall be in the form of a legal brief and fulfill the requirements of Section 1769(a). Upon request, the CPM will provide you with a sample petition to use as a template.

The ROW holder shall file an application to amend the BLM ROW grant for any substantial deviation or change in use in accordance with the regulations at 43 CFR 2807.20. The requirements to amend a ROW grant are the same as when filing a new application including paying processing and monitoring fees and rent.

Staff Approved Project Modification

Modifications that do not result in deletions or changes to conditions of certification, and that are compliant with laws, ordinances, regulations and standards, may be authorized by BLM's AO and the CPM as a staff approved project modification (SAPM) pursuant to section 1769(a)(2). Once staff files an intention to approve the proposed project modifications, any person may file an objection to staff's determination within 14 days of service on the grounds that the modification does not meet the criteria of section 1769 (a)(2). If a person objects to staff's determination, the petition must be processed as a formal amendment to the decision and must be approved by the full commission at a

noticed business meeting or hearing. BLM and the Energy Commission intend to integrate a process to jointly approve SAPMs to avoid duplication of approval processes and ensure appropriate documentation for the public record.

Change of Ownership

Change of ownership or operational control also requires that the project owner file a petition pursuant to section 1769(b). This process requires public notice and approval by the full Commission and BLM. The petition shall be in the form of a legal brief and fulfill the requirements of Section 1769(b). Upon request, the CPM will provide you with a sample petition to use as a template. The transfer of ownership of a BLM ROW grant must be through the filing of an application for assignment of the grant in accordance with 43 CFR 2807.21.

Verification Change

A verification may be modified by BLM's AO and the CPM without requesting an amendment to the ROW Grant or Energy Commission decision if the change does not require modifying any conditions of certification and provides an effective alternate means of verification.

E.9 CBO DELEGATION AND AGENCY COOPERATION

In performing construction and operation monitoring of the project, BLM and Energy Commission staff act as, and have the authority of, the Chief Building Official (CBO). BLM and Energy Commission staff may delegate CBO responsibility to either an independent third party contractor or the local building official. BLM and the Energy Commission intend to avoid duplication by integrating the responsibilities of the CBO with those of a BLM compliance inspector and will work jointly in the selection of a CBO. BLM and Energy Commission staff retain CBO authority when selecting a delegate CBO, including enforcing and interpreting federal, state and local codes, and use of discretion, as necessary, in implementing the various codes and standards.

BLM and Energy Commission staff may also seek the cooperation of state, regional and local agencies that have an interest in environmental protection when conducting project monitoring.

E.10 ENFORCEMENT

BLM's legal authority to enforce the terms and conditions of its ROW Grant is specified in 43 CFR 2807.16 ~~to~~ through 2807.19. BLM may issue an immediate temporary suspension of activities it they determine a holder has violated one or more of the terms, conditions, or stipulations of the grant. BLM may also suspend or terminate a ROW grant if a holder does not comply with applicable laws and regulation or any terns, conditions, or special stipulations contained in the grant. Prior to suspending or terminating a ROW grant, BLM will provide written notice to the holder stating it intends to suspend or terminate and will provide reasonable opportunity to correct any noncompliance.

The Energy Commission's legal authority to enforce the terms and conditions of its Decision is specified in Public Resources Code sections 25534 and 25900. The Energy Commission may amend or revoke the certification for any facility, and may impose a civil penalty for any significant failure to comply with the terms or conditions of the Energy Commission Decision. The specific action and amount of any fines the Energy Commission may impose would take into account the specific circumstances of the incident(s). This would include such factors as the previous compliance history, whether the cause of the incident involves willful disregard of LORS, oversight, unforeseeable events, and other factors the Energy Commission may consider.

ENERGY COMMISSION NONCOMPLIANCE COMPLAINT PROCEDURES

Any person or agency may file a complaint alleging noncompliance with the conditions of certification. Such a complaint will be subject to review by the Energy Commission pursuant to Title 20, California Code of Regulations, section 1237, but in many instances the noncompliance can be resolved by using the informal dispute resolution process. Both the informal and formal complaint procedure, as described in current state law and regulations, are described below. They shall be followed unless superseded by future law or regulations.

Informal Dispute Resolution Process

The following procedure is designed to informally resolve disputes concerning the interpretation of compliance with the requirements of this compliance plan. The project owner, the Energy Commission, or any other party, including members of the public, may initiate an informal dispute resolution process. Disputes may pertain to actions or decisions made by any party, including the Energy Commission's delegate agents.

This process may precede the more formal complaint and investigation procedure specified in Title 20, California Code of Regulations, section 1237, but is not intended to be a substitute for, or prerequisite to it. This informal procedure may not be used to change the terms and conditions of certification as approved by the Energy Commission, although the agreed upon resolution may result in a project owner, or in some cases the Energy Commission staff, proposing an amendment.

The process encourages all parties involved in a dispute to discuss the matter and to reach an agreement resolving the dispute. If a dispute cannot be resolved, then the matter must be brought before the full Energy Commission for consideration via the complaint and investigation procedure.

Request for Informal Investigation

Any individual, group, or agency may request the Energy Commission to conduct an informal investigation of alleged noncompliance with the Energy Commission's terms and conditions of certification. All requests for informal investigations shall be made to the designated CPM.

Upon receipt of a request for informal investigation, the CPM shall promptly notify the project owner of the allegation by telephone and letter. All known and relevant information of the alleged noncompliance shall be provided to the project owner, BLM's

and to the Energy Commission staff. The CPM will evaluate the request and the information to determine if further investigation is necessary. If the CPM finds that further investigation is necessary, the project owner will be asked to promptly investigate the matter. Within seven working days of the CPM's request, the project owner shall provide a written report to the CPM and BLM's AO of the results of the investigation, including corrective measures proposed or undertaken. Depending on the urgency of the noncompliance matter, the CPM and BLM's AO may conduct a site visit and/or request the project owner to also provide an initial verbal report, within 48 hours.

Request for Informal Meeting

In the event that either the party requesting an investigation or the Energy Commission staff is not satisfied with the project owner's report, investigation of the event, or corrective measures proposed or undertaken, either party may submit a written request to the CPM for a meeting with the project owner. Such request shall be made within 14 days of the project owner's filing of its written report. Upon receipt of such a request, the CPM shall:

1. immediately schedule a meeting with the requesting party and the project owner, to be held at a mutually convenient time and place;
2. secure the attendance of appropriate Energy Commission staff and staff of any other agencies with expertise in the subject area of concern, as necessary;
3. conduct such meeting in an informal and objective manner so as to encourage the voluntary settlement of the dispute in a fair and equitable manner;
4. promptly prepare and distribute copies to all in attendance, to the BLM's AO and to the project file, after the conclusion of such a meeting, a summary memorandum that fairly and accurately identifies the positions of all parties and any understandings reached. If an agreement has not been reached, the CPM shall inform the complainant of the formal complaint process and requirements provided under Title 20, California Code of Regulations, section 1230 et seq.

Formal Dispute Resolution Procedure-Complaints and Investigations

Any person may file a complaint with the Energy Commission's Dockets Unit alleging noncompliance with a Commission decision adopted pursuant to Public Resources Code section 25500. Requirements for complaint filings and a description of how complaints are processed are in Title 20, California Code of Regulations, section 1237.

COMPLIANCE TABLE 1 SUMMARY of COMPLIANCE CONDITIONS OF CERTIFICATION		
CONDITION NUMBER	**SUBJECT**	**DESCRIPTION**
COMPLIANCE-1	Unrestricted Access	The project owner shall grant BLM and Energy Commission staff, delegate agencies or consultants unrestricted access to the power plant site.
COMPLIANCE-2	Compliance Record	The project owner shall maintain project files on-site. BLM and Energy Commission staff and delegate agencies shall be given unrestricted access to the files.
COMPLIANCE-3	Compliance Verification Submittals	The project owner is responsible for the delivery and content of all verification submittals to BLM's Authorized Officer and the CPM, whether such condition was satisfied by work performed or the project owner or his agent.
COMPLIANCE-4	Pre-construction Matrix and Tasks Prior to Start of Construction	Construction shall not commence until the all of the following activities/submittals have been completed: • property owners living within one mile of the project have been notified of a telephone number to contact for questions, complaints or concerns, • a pre-construction matrix has been submitted identifying only those conditions that must be fulfilled before the start of construction, • all pre-construction conditions have been complied with, • BLM's Authorized Officer and the CPM have issued a letter to the project owner authorizing construction.
COMPLIANCE-5	Posting of A Surety Bond	The project owner shall post a surety bond adequate to cover the cost of decommissioning and restoration including the removal of the project features that have been constructed for that that portion of the site and restoring the native topography and vegetation.
COMPLIANCE-6	Compliance Matrix	The project owner shall submit a compliance matrix (in a spreadsheet format) with each monthly and annual compliance report which includes the status of all compliance conditions of certification.
COMPLIANCE-7	Monthly Compliance Report including a Key Events List	During construction, the project owner shall submit monthly compliance reports (MCRs) which include specific information. The first MCR is due the month following the Energy Commission business meeting date on which the project was approved and shall include an initial list of dates for each of the events identified on the Key Events List.

COMPLIANCE-8	Annual Compliance Reports	After construction ends and throughout the life of the project, the project owner shall submit annual compliance reports instead of monthly compliance reports.
COMPLIANCE-9	Confidential Information	Any information the project owner deems confidential shall be submitted to BLM's AO and the Energy Commission's executive director with a request for confidentiality.
COMPLIANCE-10	Annual fees	Payment of Annual Energy Facility Compliance Fee to the Energy Commission;
COMPLIANCE-11	Reporting of Complaints, Notices and Citations	Within 10 days of receipt, the project owner shall report to BLM's Authorized Officer and the CPM, all notices, complaints, and citations.
COMPLIANCE-12	Planned Facility Closure	The project owner shall submit any revisions or changes to the Closure, Revegetation and Restoration Plan to BLM's Authorized Officer and the CPM at least 12 months prior to commencement of a planned closure.
COMPLIANCE-13	Unplanned Temporary Facility Closure	To ensure that public health and safety and the environment are protected in the event of an unplanned temporary closure, the project owner shall submit an On-Site Contingency Plan no less than 60 days after a NTP is issued for each power plant.
COMPLIANCE-14	Unplanned Permanent Facility Closure	To ensure that public health and safety and the environment are protected in the event of an unplanned permanent closure, the project owner shall submit an On-Site Contingency Plan no less than 60 days after a NTP is issued for each power plant.
COMPLIANCE-15	Post-certification changes to the ROW Grant and/or Decision	The project owner must petition the Energy Commission and file an application to amend the ROW grant to delete or change a condition of certification, modify the project design or operational requirements and/or transfer ownership ~~of~~ or operational control of the facility.

G. WITNESS QUALIFICATIONS AND DECLARATIONS

DECLARATION OF
Mike Monasmith

I**,** Mike Monasmith, declare as follows:

1. I am presently employed by the California Energy Commission in the Siting, Transmission and Environmental Protection Division as a Senior Project Manager.

2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I prepared the staff testimony for the **Executive Summary and Project Description** for the Genesis Solar Energy Project based on my independent analysis of the Application for Certification and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

   I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

DECLARATION OF
Susan V. Lee

I, Susan V. Lee, declare as follows:

1. I am presently employed by Aspen Environmental Group, consultant to the California Energy Commission's Facilities Siting Office of the Systems Assessments and Facilities Siting Division as a Senior Associate/Vice President.

2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I prepared the staff testimony on Alternatives for the Genesis Solar Energy Project based on my independent analysis of the Application for Certification and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: February 19, 2010 Signed: Susan Lee

At: San Francisco, California

Aspen Environmental Group

SUSAN V. LEE

Vice President, San Francisco Operations

ACADEMIC BACKGROUND

M.S., Applied Earth Science, Stanford University, 1984
B.A., Geology, Oberlin College, 1977

PROFESSIONAL EXPERIENCE

Ms. Lee has over 25 years of technical and managerial experience in environmental assessment, and she currently manages Aspen's San Francisco Office. Her expertise is in management of environmental assessment for infrastructure and energy projects (renewable energy projects, electric transmission lines, pipelines, and gas-fired power plants) under both the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). Ms. Lee has managed preparation of several major controversial transmission line and pipeline siting EIR/EISs, including the Sunrise Powerlink, Path 15, Jefferson-Martin, Tri-Valley, and Devers–Palo Verde No. 2. Prior to employment at Aspen, Ms. Lee worked for 10 years with the Federal government [the U.S. Minerals Management Service (MMS) and the U.S. Geological Survey (USGS)].

Ms. Lee has worked for Aspen Environmental Group since 1993. She has contributed to both technical and project management aspects of Aspen's environmental projects, including the following:

- **California Energy Commission**. Ms. Lee has supported CEC staff since the fall of 2000. To date, she has prepared analyses for 14 power plants throughout the State, and she has also contributed to several special project reports. She has participated in numerous public workshops and hearings around the state, and completed the CEC's Expert Witness Training. Her major efforts for the CEC include the following:
  - Ms. Lee is managing the Alternatives and Cumulative impact analyses for several solar thermal projects on public lands, coordinating NEPA issues with BLM staff and CEQA issues with the Energy Commission's Project Manager.
  - Ms. Lee managed preparation of the CEC's first comprehensive dry cooling analysis for a coastal power plant using once-through cooling, the **Morro Bay Power Plant Modernization Project**. She managed a team of authors who developed a preliminary cooling design, and provided impact analysis.
  - Ms. Lee has prepared staff assessment **Alternatives Analyses** (consistent with CEQA and the CEC's procedures) for the CEC's staff reports considering proposed new or re-powered power plants at South Bay (San Diego), Blythe (BEP II), Morro Bay, El Segundo, Avenal, San Joaquin Valley, Potrero Unit 7 (San Francisco), Tracy, East Altamont, Henrietta, and the San Francisco Electric Reliability Project. She also prepared the alternatives analysis for the CEC's Blythe Transmission Modifications Project. In addition to preparing staff assessment sections documenting comparative impacts of alternatives, this work includes making presentations at PSA Workshops and testifying at Evidentiary Hearings.
  - Ms. Lee managed a three-year transmission corridor modeling project, **Planning Alternative Corridors for Transmission (PACT)**, in conjunction with the CEC PIER Environmental Program. The model uses Geographic Information Systems and decision modeling to assist in comparing potential alternative transmission corridors. Aspen's work included overall contract management, as well as development and management of a Project Steering Committee and six Technical Advisory Groups.
  - Ms. Lee prepared a detailed Background Report and made a presentation at an Energy Commission workshop on "**Comparative Alternatives to Transmission**" as part of the Integrated Energy Policy Report (IEPR) 2004 Update process. This project evaluated non-wires alternatives to transmission lines;

ongoing work is related to development of a methodology for consideration of these alternatives as part of the transmission planning process.

- Ms. Lee served as the CEC's **Project Manager** for the Small Power Plant Exemption (SPPE) environmental review process for the Woodland Generation Station 2, an 80-megawatt power plant proposed by the Modesto Irrigation District.
- Ms. Lee managed preparation of **Power Plant Cooling Options Reports** for the Potrero Unit 7 Project, Morro Bay, SMUD Cosumnes, and El Segundo power plants. These analyses include conceptual design of dry cooling systems, hybrid cooling systems, and water supply options including use of reclaimed water in both once through and hybrid cooling systems.
- Ms. Lee has provided management and technical support to Aspen's preparation of several reports for the CEC: the Environmental Performance Report, the Coastal Power Plant Study, and the Alternative Generation Technology study.

- **California Valley Solar Ranch EIR.** Under contract to San Luis Obispo County, Ms. Lee is managing preparation of an EIR to evaluate development of a 250 MW solar photovoltaic power facility on nearly 4,000 acres in the Carrizo Plain.
- **SDG&E Sunrise Powerlink Transmission Project EIR/EIS**. Under a $14 million contract to the CPUC, and under a Memorandum of Understanding with the Bureau of Land Management (BLM), Ms. Lee managed preparation of an EIR/EIS for a highly controversial 150-mile transmission line from Imperial County to coastal San Diego County.
- **SCE Devers–Palo Verde No. 2 Transmission Line Project EIR/EIS**. Under contract to the CPUC, Ms. Lee managed preparation of an EIR/EIS to evaluate the impacts of a constructing a 230-mile 500 kV transmission line between the Palo Verde generating hub in Arizona and SCE's Devers Substation.
- **Long-Term Procurement Planning and Barriers to Renewable Power Implementation**. For the CPUC, Ms. Lee and a team of environmental and economic specialists developed environmental and economic data and developed timelines of permitting and barriers to implementing the proposed 33 percent Renewable Portfolio Standard, including ranking and screening of available energy resources.
- **Jefferson-Martin 230 kV Transmission Line Project**. Ms. Lee managed preparation of an EIR for PG&E's proposed 27-mile transmission line through scenic San Mateo County in the Highway 280 corridor, urban Colma and Daly City, and across San Bruno Mountain for the California Public Utilities Commission (CPUC).
- **PG&E Northeast San Jose Transmission Reinforcement Project**: Ms. Lee served as the Project Manager for this CPUC contract to evaluate PG&E's proposed transmission improvements in Santa Clara and Alameda Counties.
- **PG&E Tri-Valley 2002 Capacity Increase Project.** Ms. Lee managed preparation of the Draft and Final EIRs for this controversial and complex project during 2000 and 2001, which was certified by the CPUC in May 2001. The Draft EIR (over 800 pages) evaluated proposed transmission lines and substations in the Tri-Valley area (Cities of Pleasanton, Dublin, Livermore, and San Ramon) of Alameda and Contra Costa Counties, and responded to a high level of local concern regarding electric and magnetic fields (EMFs).

DECLARATION OF

I, Joseph Hughes declare as follows:

1. I am presently employed by the California Energy Commission in the Facilities Siting Office of the Systems Assessments and Facilities Siting Division as an Air Resources Engineer.

2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I helped prepare the staff testimony and errata on **Air Quality** for the **Genesis Solar Energy Project** based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony and errata is valid and accurate with respect to the issue addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and errata and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: March 23, 2010 Signed: Joseph Hughes

Joseph Hughes

Education

Sacramento State University 2003-2008
Sacramento, Ca

***Bachelor of Science, Mechanical Engineering Technology, 3.25GPA**-May 2008*

AA degree in liberal arts and science 3.0 GPA

Experience

California Energy Commission March 2009-Present
Sacramento, Ca

Air Resources Engineer

- Currently co-authoring air quality staff assessments for thermal power plant projects in California producing more than 50 mega-watts of electricity.
- Currently working on American Recovery and Reinvestment Act (ARRA) projects, along with natural gas fired projects.
- Review and process compliance reports for multiple power plants in California.
- Currently working on project amendments and modifications requiring air quality analysis.
- Trained in CEQA and NEPA analysis, along with AERMOD air modeling.

Capital Engineering Consultants, Inc April 2008-2009
Sacramento, Ca

Mechanical Engineer

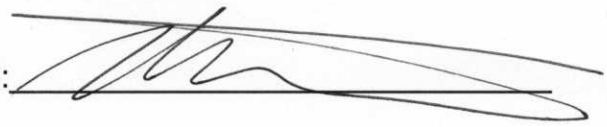
- Responsible for detailed and accurate take off calculations to ensure successful project completion.
- Completing engineering design for Heating Ventilation Air Conditioning and Plumbing by utilizing complex engineering calculations and software.
- Responsible for meeting code regulation and requirements to the degree acceptable by various organizations.
- Lead productive weekly team meetings to discuss project scheduling, cost effectiveness, request for information, and change orders.

DECLARATION OF

Testimony of William Walters, P.E.

I, **William Walters,** declare as follows:

1. I am presently employed by Aspen Environmental Group, a contractor to the California Energy Commission's Siting,Transmission and Environmental Protection Division, as a senior associate in engineering and physical sciences.



2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I helped prepare the staff testimony on **Air Quality/Greenhouse Gases**, and prepared the **Visual Resources VR-2 Appendix** for the **Genesis Solar Energy Project** (09-AFC-8) based on my independent analysis of the Application for Certification and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Mr. Walters has over 20 years of technical and project management experience in environmental compliance work, including environmental impact reports, emissions inventories, source permitting, energy and pollution control research RCRA/CERCLA site assessment and closure, site inspection, and source monitoring,.

Aspen Environmental Group 2000 to present

Responsible as lead technical and/or project manager of environmental projects. Specific responsibilities and projects include the following:

- **Engineering and Environmental Technical Assistance to Conduct Application for Certification Review for the California Energy Commission:**
  - Preparation and project management of the air quality section of the Staff Assessment and/or Initial Study and the visual plume assessment for the following California Energy Commission (CEC) licensing projects: Hanford Energy Park; United Golden Gate, Phase I; Huntington Beach Modernization Project (including Expert Witness Testimony); Woodland Generating Station 2; Ocotillo Energy Project, Phase I; Magnolia Power Project; Colusa Power Project; Inland Empire Energy Center; Rio Linda/Elverta Power Plant Project; Roseville Energy Center; Henrietta Peaker Project; Tracy Peaking Power Plant Project (including Expert Witness Testimony); Avenal Energy Project; San Joaquin Valley Energy Center (including expert witness testimony); Salton Sea Unit 6 Project (including expert witness testimony); Modesto Irrigation District Electric Generation Station (including expert witness testimony); Walnut Energy Center (including expert witness testimony); Riverside Energy Resource Center (including expert witness testimony); Pastoria Energy Facility Expansion; Panoche Energy Center; Starwood Power Plant; and Riverside Energy Resource Center Units 3 and 4 Project (in progress).
  - Preparation and project management of the visual plume assessment for the following California Energy Commission (Energy Commission) licensing projects: Metcalf Energy Center Power Project (including Expert Witness Testimony); Contra Costa Power Plant Project (including Expert Witness Testimony); Mountainview Power Project; Potrero Power Plant Project; El Segundo Modernization Project; Morro Bay Power Plant Project; Valero Cogeneration Project; East Altamont Energy Center (including expert witness testimony); Russell City Energy Center; SMUD Cosumnes Power Plant Project (including expert witness testimony); Pico Power Project; Blythe Energy Project Phase II; City of Vernon Malburg Generating Station; San Francisco Electric Reliability Project; Los Esteros Critical Energy Facility Phase II; Roseville Energy Park; City of Vernon Power Plant; South Bay Replacement Project; Walnut Creek Energy Park; Sun Valley Energy Project; Highgrove Power Plant; Colusa Generating Station; Russell City Energy Center; Avenal Energy Project; Carlsbad Energy Center; Community Power Project; Panoche Energy Center; San Gabriel Generating Station; Sentinel Energy Project; and Victorville 2 Hybrid Power Project.
  - Assistance in the aircraft safety review of thermal plume turbulence for the Riverside Energy Resources Center; Russell City Energy Center Amendment (including expert witness testimony); Eastshore Energy Power Plant (including expert witness testimony); Carlsbad Energy Center (in progress), Riverside Energy Resource Center Units 3 and 4 Project; Victorville 2 Hybrid Power Project; and the Blythe Energy Power

Plant and Blythe Energy Project Phase II (including expert witness testimony) siting cases. Assistance in the aircraft safety review of thermal and visual plumes of the operating Blythe Energy Power Plant. Preparation of a white paper on methods for the determination of vertical plume velocity determination for aircraft safety analyses.

- Preparation and instruction of a visual water vapor plume modeling methodology class for the CEC.
- Preparation and project management of the public health section of the Initial Study for the Woodland Generating Station 2 Energy Commission licensing project.
- Preparation of project amendment or project compliance assessments, for air quality or visual plume impacts, for several licensed power plants, including: Metcalf Energy Center; Pastoria Power Plant; Elk Hills Power Plant; Henrietta Peaker Project; Tracy Peaker Project; Magnolia Power Project; Delta Energy Center; SMUD Cosumnes Power Plant; Walnut Energy Center; San Joaquin Valley Energy Center; City of Vernon Malburg Generating Station; Otay Mesa Power Plant; Los Esteros Critical Energy Facility; Pico Power Project; Riverside Energy Resource Center; Blythe Energy Project Phase II; Inland Empire Energy Center; Salton Sea Unit 6 Project; and Starwood Power-Midway Peaking Power Plant.
- Preparation of the air quality section of the staff paper "A Preliminary Environmental Profile of California's Imported Electricity" for the Energy Commission and presentation of the findings before the Commission.
- Preparation of the draft staff paper "Natural Gas Quality: Power Turbine Performance During Heat Content Surge", and presentation of the preliminary findings at the California Air Resources Board Compressed Natural Gas Workshop and a SoCalGas Technical Advisory Committee meeting.
- Preparation of the staff paper "Emission Offsets Availability Issues" and preparation and presentation of the Emission Offsets Constraints Workshop Summary paper for the Energy Commission.
- Preparation of information request and data analysis to update the Energy Commission's Cost of Generation Model capital and operating cost factors for combined and simple cycle gas turbine projects. Additionally, performed a review of the presentation for the revised model as part of the CEC's 2007 Integrated Energy Policy Report workshops, and attended the workshop and answering Commissioner questions on the data collection and data analysis.

- For the **Los Angeles Department of Water and Power (LADWP)**:
  - Preparation of the Air Quality Inventory for the LADWP River Supply Pipeline Project EIR.
  - Project management and preparation of the Air Quality Section for the LADWP Valley Generating Station Stack Removal IS/MND support project.
- For the **U.S. Army Corps of Engineers (Corps)**:
  - Preparation of the Air Quality Section and General Conformity Analysis for the Matilija Dam Ecosystem Restoration Project EIS/R for the Corps.
  - Preparation of emission inventory and General Conformity Analysis of the Murrieta Creek Flood Control Project and the Joint Red Flag exercise to be conducted in the Nevada Test and Training Range.
  - Emission inventory for the construction activities forecast for the San Jose/Old San Jose Creeks Ecosystem Restoration project for the Corps.

- Other Projects:
  - Preparation of the Air Quality Section of the LAUSD New School Construction Program EIR and provided traffic trip and VMT calculation support for the Traffic and Transportation Section.

- Preparation of the draft staff paper "Natural Gas Quality: Power Turbine Performance During Heat Content Surge", and presentation of the preliminary findings at the California Air Resources Board Compressed Natural Gas Workshop and a SoCalGas Technical Advisory Committee meeting.
- Preparation of the Air Quality Section of the Environmental Information Document in support of the Coastal Consistency Determinations for the suspension of operation requests for undeveloped units and leases off the Central California Coast.
- Preparation of comments on the Air Quality, Alternatives, Marine Traffic, Public Safety, and Noise section of the Cabrillo Port Liquefied Natural Gas Deepwater Port Draft EIS/EIR for the City of Oxnard.
- Preparation of the emission estimates used in the Air Quality Sections for the DWR Tehachapi Second Afterbay Project Initial Study and EIR.

Camp Dresser & McKee, Inc. 1998 to 2000

Mr. Walters was responsible as lead technical and/or project manager of environmental projects. Specific responsibilities and projects include the following:

- Preparation of emission inventories and dispersion modeling for criteria and air toxic pollutants for the Los Angeles International Airport Master Plan (LAXMP) EIS/EIR.
- Project Manager/Technical lead for the completion of air permit applications and air compliance audits for two Desa International fireplace accessory manufacturing facilities located in Santa Ana, California.
- Project manager/technical lead for the completion of Risk Management Plans (RMPs) for four J.R. Simplot food processing facilities in Oregon, Idaho, and Washington and the Consolidated Reprographics facility located in Irvine, California.

Planning Consultants Research 1997 to 1998

Mr. Walters was responsible as lead technical and/or project manager of environmental projects. Specific responsibilities and projects include the following:

- Project Manager for a stationary source emission audit of the entire Los Angeles International Airport complex for Los Angeles World Airports (LAWA) in support of the LAXMP.
- Review of the Emission Dispersion Modeling System (EDMS) and preparation of a report with findings to the Federal Aviation Administration for LAWA in support of the LAXMP.
- Project manager for the ambient air monitoring and deposition monitoring studies performed for LAWA in support of the LAXMP, including the selection of the monitoring sites and specialty subcontractor, and review of all monitoring data.

Aspen Environmental Group/Clean Air Solutions 1995 to 1996

Mr. Walters was responsible as lead technical and/or project manager of environmental projects. Specific responsibilities and projects include the following:

- Manager of the Portland, Oregon, office of Clean Air Solutions from March 1995 to December 1995, with responsibilities including Project Management, Business Development, and Administration.
- Control technology assessment, engineering support and Notice of Intent to construct preparation for J.R. Simplot's Hermiston, Oregon, food processing facility. Review and revision of an Air Contaminant Discharge Permit application, Title V permit application, and PSD modeling analysis for J.R. Simplot's Hermiston facility.

- Air quality compliance report including an air emission inventory, regulation and permit compliance determination, and recommendations for compliance for Lumber Tech, Inc.'s Lebanon, Oregon, wood products facility.

Fluor Daniel, Inc. 1990 to 1995 and 1996 to 1997

Mr. Walters was responsible as lead technical or project manager for major environmental projects for both government and private clients. His projects included:

- Prepared several air permit applications for the ARCO Los Angeles Refinery Polypropylene Plant Project; Phase I environmental assessments for properties located in Southern California; and a site investigation and RCRA closure plan for a hazardous waste storage site in Vernon, California.
- Project manager of the Anaconda Smelter site for the U.S. Environmental Protection Agency's (EPA) Alternative Remedial Contract System (ARCS) project during the conclusion of technical activities and project closeout. Prepared a cost recovery report for the project.
- Performed environmental analysis for the Bonneville Power Authority, including air pollution BACT analysis, wastewater analysis, and evaluation of secondary environmental effects of electric power producing technologies.

Jacobs Engineering Group 1988 to 1990

Mr. Walters was responsible for a wide range of air pollution regulatory and testing projects, including the following:

- Project manager of air toxic emission inventory reports prepared for U.S. Borax's boron mining and refining facility and the Naval Aviation Depot (N. Island Naval Base, San Diego, California).
- Prepared air permit applications and regulatory correspondence for several facilities including the U.S. Department of Energy's Feed Material Production Center uranium processing facility in Fernald, Ohio; Evaluation of a sludge dewatering process at Unocal's Wilmington, California, Refinery; and United Airlines blade repair facility at the San Francisco Airport.
- Characterized and quantified air emissions for offshore oil and gas development activities associated with Federal oil and gas Lease Sale 95, offshore southern California, for the U.S. Minerals Management Service.

CERTIFICATIONS

- Chemical Engineer, California License 5973
- CARB, Fundamentals of Enforcement Seminar
- EPA Methods 1-8, 17; Training Seminar

AWARDS

- California Energy Commission Outstanding Performance Award 2001

DECLARATION OF
Carolyn Chainey-Davis

I**, Carolyn Chainey-Davis,** declare as follows:

1. I am presently under contract with Aspen Environmental Group to provide environmental technical assistance to the California Energy Commission. Under Contract No. 700-05-002, I am serving as an Associate Biological Resource Specialist, Level II, to provide Peak Workload Support for the Energy Facility Siting Program and for the Energy Planning Program.

2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I helped prepare the staff testimony on **Biological Resources** for the **Genesis Solar Energy Project** based on my independent analysis of the Application for Certification and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: March 22, 2010 Signed: _____

At: Nevada City, California

Carolyn Chainey-Davis, botanist

Over 23 years experience conducting biological inventories and impact assessments, rare plant and noxious weed surveys, large-scale vegetation mapping, wetland delineations, large-scale watershed assessments, designing and implementing mitigation & monitoring plans, habitat management plans, and restoration plans throughout California. Ms. Chainey-Davis field experience includes a diverse group of clients and projects from large transmission and hydro relicensing projects to urban and residential development projects, local, state and federal agencies, resource conservation organizations, landfill and mine reclamation projects, and many more. She led Garcia and Associates (GANDA) botanical studies for numerous FERC relicensing projects (PG&E & SCE) including Stanislaus River, Upper North Fork Feather River, Pit River, Vermillion, Bucks Lake and Poe hydro-relicensing projects, Transmission Separation project, Lower Owens River riparian monitoring, and hundreds of other large and small projects around the state.

Ms. Davis is past President of the California Native Plant Society, Nevada and Placer County Chapter and is a co-author of the recently published field guide "*Wildflowers of Nevada and Placer Counties*", published by the California Native Plant Society. Ms. Davis completed her wetland training at Portland State University and is certified for conducting wetland delineations based on the U.S. Army Corps of Engineers Wetland Delineation Manual. Ms. Chainey-Davis is skilled in the use of Trimble GeoExplorer series Global Positioning (GPS) equipment. As a botanist, she apprenticed for several years under some of the state's leading botanists, vegetation and wetland ecologists, including Robert Holland. Ms. Davis' continuing education includes several annual intensive botanical taxonomy workshops through the U.C. Berkeley Jepson Herbarium.

A Sampling of Relevant Project Experience

Project: **Beacon Solar Energy Project Rosamond Water Alternative**
Client: **California Energy Commission (CEC)**
Conducted detailed habitat assessment and vegetation mapping for a 40-mile alternative water pipeline alignment near Mojave, CA, in support of the Final Staff Assessment. CEC evaluated the feasibility of BSEP using an alternative source of water other than onsite potable groundwater and identified City of Rosamond tertiary treated wastewater as a feasible source. Prepared supplemental report describing the vegetation resources occurring along the southern 23 miles of the 39.61-mile Rosamond water pipeline alignment, including vegetation mapping and a rare plant habitat assessment. Assisted staff in the impact assessment for the proposed and preferred alternative.

Project: **Lower Owens River Monitoring Program**
Client: **Ecosystem Sciences**
Member of a team of three biologists to design long-term monitoring program for collecting and analyzing data on riparian habitat and key wildlife habitat characteristics on 62 miles of the Lower Owens River. Directed field efforts to collect baseline data at 350 sites. Future monitoring, conducted after the initiation of appropriate flow and land management practices, will be compared against the baseline to determine if changes resulting from proposed restoration efforts (augmented stream flows) are consistent with the LORP goals and objectives.

Project: **Open ended Contract for Biological Services**
Client: **Southern California Edison (SCE)**
Led Garcia and Associates (GANDA) botanical studies (vegetation mapping, habitat assessments, etc.) in support of various SCE construction and relicensing projects in the central and southern Sierras, Sierra east slope and Great Basin region, and the eastern edge of the San Joaquin Valley.

182 Grove Street Nevada City, CA 95959 [ph] 530.478.1963 [cell] 530.205.6218 bighair60@att.net

Project: **Stanislaus River Hydroelectric Project Relicensing Studies**
Client: **Pacific Gas and Electric Company, Technical and Ecological Services**
Led GANDA field efforts to conduct floristically-based botanical studies for the Federal Energy Regulatory Commission relicensing of four hydroelectric and transmission line projects located on the Stanislaus River, Stanislaus National Forest. Riparian and watershed vegetation mapping and sampling, special-status plant surveys, noxious weed mapping, and identify and map culturally significant Native American botanical resources for local tribes in support of the Federal Energy Regulatory Commission relicensing process. Prepared draft and final reports.

Project: **Owens Lake Dust Control Project**
Client: **Garcia and Associates**
Conducted two years of floristically-based special status plant surveys and wetland delineations for the Los Angeles Department of Water and Power Owens Lake Dust Control mitigation project.

Project: **Kern River Natural Gas Pipeline**
Client: **Garcia and Associates**
Conducted floristically-based special status plant surveys for the Daggett and Goodsprings segments of the interstate pipeline.

Project: **Pit River Hydroelectric Project Relicensing Studies**
Client: **Pacific Gas and Electric Company, Technical and Ecological Services**
Led field efforts to conduct floristically-based special status plant surveys, noxious weed surveys, upland habitat mapping, and riparian vegetation classification and mapping for PG&E's Pit 3, 4, and 5 hydroelectric project in Shasta County in support of the Federal Energy Regulatory Commission relicensing process. Prepared draft and final reports.

Project: **Upper North Fork Feather River and Poe Hydroelectric Projects, Lake Almanor Habitat Management Plan**
Client: **Pacific Gas and Electric Company, Technical and Ecological Services**
Led field efforts to conduct floristic surveys for special-status plant species and noxious weeds on the Upper North Fork Feather River (Plumas and Lassen National Forests) and Poe Project Included GIS-based riparian and upland vegetation mapping in support the Federal Energy Commission relicensing process. Prepared draft and final reports. Also conducted detailed mapping of the wet meadows around Lake Almanor and prepared a long-term habitat management plan for meadow resources and willow flycatcher habitat.

Project: **Transmission Separation Project**
Client: **Foster Wheeler Environmental Corporation**
Led field efforts to conduct floristically-based special-status plant surveys and noxious weed surveys for the PG&E Transmission Separation Project. GANDA botanists conducted surveys on selected transmission line segments and their associated access roads on USDA Forest Service (USFS) lands in the Plumas, Shasta-Trinity, Tahoe, and Eldorado National Forests, created GIS-based vegetation and noxious weed maps, and analyzed potential threats to special-status plant populations. Prepared draft and final reports.

Project: **Nevada and Placer County projects – large and small subdivisions, infrastructure development, etc.**
Client: **Susan Sanders Biological Consulting and Beedy Environmental Consulting**
Conducted biological inventory and impact analyses and prepared mitigation plans for over 100 large and small subdivisions and infrastructure development projects in Nevada and Placer County. Lead writer and botanist. All projects included vegetation mapping, habitat assessments, floristic surveys, and mitigation planning. Prepared detailed habitat management plans and recreation/ trail plans for over a thousand acres of open space.

Project: **Dog Ranch-Salmon Creek Conservation Project**
Client: **Robert Holland**
Conducted endangered species surveys and documented over 300 occurrences of special status plants (using Trimble data dictionary and population sampling protocol) for a proposed conservation easement/land swap on a 400+ acre ranch in Humboldt County on the Samoa Peninsula.

182 Grove Street Nevada City, CA 95959 [ph] 530.478.1963 [cell] 530.205.6218 bighair60@att.net

Project: **Field Guide to *Epilobium* in the Sierra Nevada, Tahoe National Forest**
Client: **U.S.D.A. Forest Service, Tahoe and Inyo National Forests (Open-ended Contract)**
Conducted surveys for rare *Epilobiums* at seven sites in the Tahoe and Inyo National Forests and prepared a field guide to the genus *Epilobium* in the Sierra Nevada, with illustrations and keys to identification.

Project: **Bear Valley Meadow Restoration**
Client: **American Rivers**
Sample design and long-range monitoring design and protocol for a large-scale meadow restoration project in Placer County. Included detailed vegetation mapping, conducting baseline inventory, and preparing report on sample design and results of baseline monitoring.

Project: **Shirttail Creek Conservation Easement**
Client: **Beedy Environmental Consulting for Conservation Biology Institute**
Conducted biological inventory and conservation assessment for 800-acre property on Shirttail Creek in the American River watershed using protocol developed by The Nature Conservancy for conservation planning. Lead writer and botanist.

Project: **Natural Heritage 2020 Nevada County Watershed Assessment**
Client: **County of Nevada and Sierra Business Council**
Lead botanist for a countywide watershed and ecosystem assessment. A two-year process funded by the Sierra Business Council and the County of Nevada to create a GIS database and biotic inventory of the county's natural habitats and wildlife resources, including an assessment of vegetation, special status and invasive for 98 sub-watershed basins in the county. Prepared botanical sections of the report, verified accuracy of more than 40 GIS data themes, assessed the extent and quality of each of the county's ecosystem types, potential to support special-status plants and animals.

Project: **Special Status Plant Surveys and Habitat Mapping for Rock Creek/Cresta Hydroelectric**
Client: **Pacific Gas and Electric Company, Technical and Ecological Services**
Conducted floristically-based special status plant surveys and habitat mapping for PG&E's Rock Creek-Cresta hydroelectric facility project area and 72-mile transmission line in Plumas, Butte, Yuba and Sutter counties.

Project: **Osborne Hill Open Space Habitat Management Plan**
Client: **Susan Sanders Biological Consulting**
Prepared detailed, goal-driven, long-range habitat management plan for 250 acres of open space for a residential development in Nevada County. Included guidelines for forest management to promote old-growth conditions, fuels management specifications, habitat management specifications, and designs and implementation plan for recreational trails, educational signage, and formation of an independent non-profit land trust to manage the open space. Prepared similar plans for several other residential developments in Nevada County.

Project: **Ragsdale Creek Setback Study**
Client: **Susan Sanders Biological Consulting & County of Nevada**
Identified, described, and mapped important biological resources on an urban stream in Nevada County and recommended appropriate development setbacks to avoid/minimize impacts, assessed potential impacts to the creek as a result of adjacent development, and recommended mitigation measures to reduce impacts. Coordinated with County GIS Department in production of map of sensitive resources, and presented results of study to citizen advisory committee.

Project: **Open ended Contract for Biological Services, Various Transmission Projects**
Client: **Pacific Gas & Electric Company (PG&E)**
Led Garcia and Associates (GANDA) botanical studies (rare plant surveys, vegetation mapping, habitat assessments, etc.) in support of various PG&E transmission projects throughout California, including Kern #304, Northeast San Jose Reinforcement, Atlantic-Del Mar, Butte Reinforcement, and many more.

Project: **Open ended Contract for Biological Services, Transmission Relicensing Projects**
Client: **Southern California Edison (SCE)**
Led Garcia and Associates (GANDA) botanical studies (vegetation mapping, habitat assessments, etc.) in support of various SCE construction and relicensing projects in the central and southern Sierras, Sierra east slope and Great Basin region, and the eastern edge of the San Joaquin Valley.

182 Grove Street Nevada City, CA 95959 [ph] 530.478.1963 [cell] 530.205.6218 bighair60@att.nett

DECLARATION OF
Amy Golden

I**, Amy Golden**, declare as follows:

1. I am presently employed by the California Energy Commission Facilities Siting Office of the Systems Assessments and Facilities Siting Division as a **Planner II**.

2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I helped prepared the staff testimony on **Biological Resources** for the **Genesis Solar Energy Project** based on my independent analysis of the application and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

   I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: March 23, 2010 Signed: _____

At: Sacramento, California

Amy W. Golden

Employment History

California Energy Commission

Planner II, Staff Biologist *11/2009 to present*

As a Staff Biologist with the Energy Commission, Ms. Golden analyzes the biological resource components of energy facilities siting applications to assess resource impacts, develop mitigation plans, and to evaluate compliance with applicable local, state, and federal laws, ordinances, regulations, and standards. In addition, she works closely with biological resource protection and management agencies and subject matter experts to ensure input into the Energy Commission and facility licensing process.

Foothill Associates

Wildlife Biologist *03/2005 to 10/2009*

While working as a private environmental consultant with Foothill Associates as a Wildlife Biologist, Ms. Golden assisted with ESA Section 7 Biological Assessments and Clean Water Act 404 permit applications primarily for private residential and commercial development projects. She performed field habitat assessments; focused species surveys for reptiles, amphibians, and vernal pool invertebrates; wetland delineations; raptor surveys; and arborist surveys. Ms. Golden performed the biological impact analysis for several parks master planning and proposed specific plan area projects. Amy also assisted with the preparation of riparian habitat mitigation plans pursuant to Section 1600 of California Fish and Game Codes and Wetland Mitigation Plans in support of Clean Water Act Section 404 Army Corps permit issuance and compliance. Ms. Golden also served as the biological lead on many CEQA projects and performed the biological field work and prepared the biological resources section for several CEQA documents.

Analytical Environmental Services

Biologist *09/2004 to 02/2005*

While with the environmental consulting firm Analytical Environmental Services as a Staff Biologist, Amy assisted with the preparation and analysis of many NEPA documents primarily for tribal projects. Ms. Golden prepared biological impact analyses and coordinated with local resource agencies on the development of mitigation plans to minimize impacts to sensitive biological resources. Amy also performed field biological assessments, wetland delineations, elderberry shrub impact assessments, and focused plant and wildlife surveys.

The Nature Conservancy

Biologist *04/2004 to 07/2004*

Ms. Golden worked on a field crew as a seasonal field biologist on a long-term avian monitoring project with The Nature Conservancy to monitor the use of montane meadows and forest edges by birds in the Sierra Nevada mountain range. Ms. Golden performed avian point counts utilizing the Variable Point Count method to document avian bird diversity in the Tahoe National Forest. Amy

operated a GPS unit, recorded all birds observed based on visual surveys and auditory calls and input all collected data into a Microsoft Excel database.

Sapphos Environmental, Inc.

Wildlife Biologist *05/2002 to 03/2004*

As a Wildlife Biologist with Sapphos Environmental, Inc., Ms. Golden performed field habitat assessments in support of biological technical analyses and reports. Amy assisted with dry desert wash delineations, desert tortoise habitat assessments and focused surveys, Incidental Take Permit applications, and several CEQA biological resources sections. Amy coordinated with local resource agencies on the development of appropriate mitigation plans and land acquisitions on several Section 7 ESA permitting projects.

EDUCATION

Environmental Forest Biology — *Bachelor of Science*
State University of New York, College of Environmental Science and Forestry — *May 2000*

Field Ecology
University of California Riverside Extension — *Certificate in Field Ecology*, *February 2004*

Veterinary Science Technology
State University of New York at Delhi — *Associate of Applied Science*, *May 1997*

DECLARATION OF

I, Sara Keeler declare as follows:

1. I am presently employed by the California Energy Commission in the Facilities Siting Office of the Systems Assessments and Facilities Siting Division as a Planner.

2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I helped prepare the staff testimony and errata on **Biological Resources** for the **Genesis Solar Energy Project** based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony and errata is valid and accurate with respect to the issue addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and errata and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated:_____ Signed:_____

At: Sacramento, California

Sara M. Keeler

Employment History

California Energy Commission

Planner II, Staff Biologist *12/2009 to present*

As a staff biologist with the Energy Commission, Ms. Keeler analyzes the biological resource components of energy facilities siting applications to assess resource impacts, develop mitigation, and to evaluate compliance with applicable local, state, and federal laws, ordinances, regulations, and standards. This requires working closely with biological resource protection and management agencies, subject matter experts, and Energy Commission consultants as well as with other Energy Commission staff to provide the best available information is included in staff analyses.

California Department of Transportation, District 3

Associate Environmental Planner/Environmental *11/2007 to 12/2009*

Ms. Keeler's primary duties with Caltrans were to coordinate and complete environmental documents to satisfy CEQA, NEPA, regional, and permitting requirements, and act as the Project Biologist on various transportation-related projects in California.

Entrix, Inc.

Senior Staff Scientist/Staff Scientist *01/2005 to 11/2007*

While with the environmental consulting firm Entrix, Inc., Ms. Keeler specialized in California wildlife and floristics studies. She worked throughout California including in the Lake Tahoe Basin, Great Basin, Central Valley, Sierra Nevada, in coastal California, and desert areas. Projects while at Entrix included biological resource field studies such as habitat assessments, protocol-level surveys for special-status plants and animals, wetland delineations, and riparian surveys; project, task, and budget management; and writing biological resources sections of a variety of documents including documents to satisfy NEPA and CEQA requirements, environmental assessments, and existing conditions reports.

USDA, Forest Service, Pacific Southwest Research Station

Biological Sciences Technician *05/2001 to 09/2002*

Ms. Keeler conducted breeding bird surveys and vegetation inventories and assessments on a breeding bird survey crew in the Sierra Nevada. This included conducting surveys using a variety of techniques including tree-climbing (ascenders, 3-point climbing, Swedish ladders), auditory surveys, and vegetation sampling.

EDUCATION

Biological Sciences (Evolution and Ecology) *B.S (High Honors)*
University of California, Davis *June 2004*

DECLARATION OF

I, Mark Massar, declare as follows:

1. I am presently employed by the Bureau of Land Management as a Wildlife Biologist.

2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I helped prepare the staff testimony and errata on **Biological Resources** for the **Genesis Ford Dry Lake Solar Power Project** based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony and errata is valid and accurate with respect to the issue addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and errata and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

M.S., Biological Sciences, California Polytechnic State University Pomona

Work Experience

Bureau of Land Management, Palm Springs, California. Wildlife Biologist (2005- Present). Currently serving as the overall program lead for wildlife and habitat management in the BLM Palm Springs-South Coast Field Office. Prepare and monitor wildlife habitat management plans. Participate in the preparation and review of land use and activity plans, environmental impact statements, and environmental assessments. Work with local groups to promote and sustain cooperative wildlife conservation interest and volunteerism. Provide input to the BLM Annual Work Plan and budget process regarding the wildlife habitat management program, and monitor work progress during the year. Serve as the Bighorn Sheep Program lead by planning, developing, evaluating, and monitoring the program for the Field Office. Review project proposals to assess their potential impact on wildlife and their habitats. Conduct field inventories in support of biological analyses. Facilitate compliance with the Endangered Species Act as required, by preparing Biological Assessments and working with contractors for accurate completion of Biological Assessments. Coordinate closely with the U.S. Fish and Wildlife Service to pro-actively address biological issues and facilitate timely completion of the Section 7 consultation process. Foster community relationships by participating in interagency planning efforts and activities, such as the flat-tailed horned lizard committee, the Coachella Valley fringe-toed lizard preserve committee, the Desert tortoise recovery team, the Dos Palmas Management Committee, Coachella Valley Multi-Species Habitat Conservation Plan, and the Peninsular Rangers Bighorn Sheep Recovery Team. Prepare and submit grant proposals in support of resource management projects; provide input and facilitate successful submission of office-wide grant proposals.

Charis Corporation, Fort Irwin, California. Ecologist. (2000 - 2005). Worked as an ecologist for the Directorate of Public Works, Natural Resources Division. Ensured post compliance with the Endangered Species Act, Migratory Bird Treaty Act, and the National Environmental Policy Act. Implemented Fort Irwin's Integrated Natural Resources Management Plan and Endangered Species Management Plan. Developed, conducted, and oversaw monitoring of plant and animal species, especially the desert tortoise. Conducted biological assessments and Section 7 consultations of the Endangered Species Act. Developed databases for the data generated by monitoring and survey activities insuring the data and databases conformed to appropriate standards and were accessible through the use of geographic information systems. Developed and reviewed scopes of work for university studies and surveys. Participated in numerous outreach and educational programs on desert ecology for base personnel and surrounding communities in Southern California.

Computer Sciences Corporation, Edwards Air Force Base, California. Wildlife Biologist (1998-2000). Worked as a wildlife biologist providing natural resource program support for Environmental Management on Edwards Air Force Base. Duties included ensuring Base compliance with Federal

environmental laws. Technical support included conducting biological surveys, monitoring projects for compliance with environmental laws, preparing environmental assessments and other NEPA documents by analyzing potential environmental impacts to natural and developing protection measures to minimize project impacts, conducting natural resource damage assessments by designing survey protocols, training surveyors, analyzing data, and writing damage assessment reports.

National Park Service. Biological Science Technician (1994-1997). Researched, developed, and presented interpretive programs on the natural history of the Sonoran Desert for Saguaro National Park. Was the primary coordinator of the Saguaro National Park's summer Junior Ranger program. Assisted in a bighorn sheep inventory study at Joshua Tree National Park, which involved designing the survey protocol, developing standardized data recording forms, spending 160 hours in a blind recording sheep behavior, and identifying individual sheep using photography. Assisted in a desert tortoise home range study by radio-tracking desert tortoises at Joshua Tree National Park. Organized and conducted biological surveys for amphibians, including foothill yellow-legged frog (*Rana boylii*), mountain yellow-legged frog (*R. muscosa*), red-legged frog (*R. aurora*), and Yosemite toad (*Bufo canorus*) in Yosemite, Sequoia, and Kings Canyon national parks. Fieldwork involved the location of appropriate habitat for amphibian species, measurement of aquatic habitat parameters, identification of all amphibians encountered, behavioral studies on reproduction and predation, analysis of blood samples for environmental toxin studies. Numerous reports were prepared on survey findings for the National Biological Service and cooperating Forest Service offices. Extensive planning was undertaken to organize field work into backcountry areas, with most trips lasting 10 days.

Bureau of Land Management, EI Centro, California. Biological Science Technician (1993). Organized and conducted biological surveys for threatened lizards in the California desert, including the flat-tailed horned lizard (*Phrynosoma mcalii*) and Colorado Desert fringed-toed lizard (*Uma notata*) . Work involved weighing and measuring lizards, and precisely describing habitat conditions, including vegetation structure and composition, microhabitat conditions, and human-caused disturbances. Conducted scientific literature searches for information on the natural history, distribution, and possible causes of decline for these lizards.

California Department of Fish and Game, Bishop, California. Fisheries Technician (1992). Assisted a team of fisheries biologists to accomplish diverse management objectives. Work included the operation and maintenance of a fish weir, conducting creel surveys, electroshocking fish, monitoring the status of rare amphibians in the Sierra Nevada, habitat mapping, assessing the population and breeding status of amphibians, and writing reports of findings.

United States Forest Service, Foresthill, California. Forestry Technician (1991). Inspected silvicultural contract work (i.e., planting, thinning, site preparation) for compliance with government contracts. Explained steps necessary for compliance to contractors and reported violations to supervisor. Examined sapling and larger stands to collect and record data on stocking, disease, site quality, and vegetation. Made recommendations for areas requiring remedial action. Examined plantations to assess numbers of tree seedlings present, condition, growth and survival rates, and evidence of animal damage.

DECLARATION OF
Susan D. Sanders

I, **Susan D. Sanders,** declare as follows:

1. I am presently under contract with Aspen Environmental Group to provide environmental technical assistance to the California Energy Commission. Under Contract No. 700-05-002, I am serving as a Biological Resource Specialist and Project Manager to provide Peak Workload Support for the Energy Facility Siting Program and for the Energy Planning Program.

2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I helped prepare the staff testimony on **Biological Resources** for the **Genesis Solar Energy Project** based on my independent analysis of the Application for Certification and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: March 3, 2010 Signed: Susan D. Sanders

RESUME OF SUSAN SANDERS

EDUCATION

Ph.D.	Zoology	University of California, Davis (1983)
M.A.	Zoology	University of California, Davis (1979)
B.A.	Zoology	University of California, Berkeley (1976)

PROFESSIONAL AFFILIATIONS/CERTIFICATIONS

Wildlife Society, Sacramento-Shasta Chapter
Sierra Nevada Willow Flycatcher Working Group
Certified by California Unified Certification Program as DBE/WBE firm (UCP # 25204)

CONTINUING EDUCATION (UC Davis, University Extension)

Threatened and Endangered Reptiles and Amphibians of Northern California
Wetlands Regulations, Impacts, and Mitigation
Endangered Species: Resources, Law, and Potential Solutions
Resolving Endangered Species Conflicts: Practical Approaches to Problem Solving

REGULATORY COMPLIANCE EXPERTISE in coordination with state, federal, and local agencies in the environmental review process for projects regulated by the California Environmental Quality Act, National Environmental Policy Act, Federal and State Endangered Species Acts, National Fish & Wildlife Coordination Act, Clean Water Act, and California Coastal Act. Also experienced in providing technical support and agency coordination for license and permit applications.

TECHNICAL EXPERTISE in surveys for threatened and endangered wildlife species; biological inventories; habitat management plans; raptor surveys; wildlife habitat assessment; mitigation monitoring; expert testimony, constraints analysis; sensitive species research. Prepared Biological Assessments for endangered, threatened, and candidate species, and conducted field surveys and literature reviews for willow flycatchers, tricolored blackbirds, Swainson's hawks, burrowing owls, California spotted owls, San Joaquin kit fox, bald eagles, valley elderberry longhorn beetles, and many other special-status species. Conducted surveys for raptor species of special concern, including white-tailed kite, northern goshawk, and Cooper's hawk.

PROJECT MANAGEMENT EXPERIENCE on large and complex projects, including a two-year survey of 11,000 acres in the Plumas National Forest for a proposed land exchange, involving supervision of eight technical specialists and subconsultants. Responsible for overseeing numerous transportation and revegetation projects and mitigation monitoring programs which involved budget, personnel, and subconsultant management, agency and client coordination, and preparation of technical reports. Managed long-term (five-year) revegetation/mitigation monitoring projects with annual reporting requirements.

CONSULTING EXPERIENCE (1982 - 2007)

CALIFORNIA ENERGY COMMISSION TECHNICAL ASSISTANCE

Currently assisting the CEC in evaluating the environmental aspects of new power plant applications throughout the state, and also providing technical expertise as an avian specialist. I have completed or am currently involved in the following projects:

- **California Guidelines for Reducing Impacts to Birds and Bats from Wind Energy Development in California:** Currently **s**erving as author and coordinator for a statewide effort to develop science-based protocols for pre-and post-construction monitoring to assess the effects of wind energy development on birds and bats. Worked closely with CEC and California Department of Fish and Game staff, coordinated the efforts of an eight-member Science Advisory Committee, helped organize public workshops, worked with wind energy developers, and non-governmental organizations on this collaborative guidelines effort.
- **Pastoria Energy Facility Expansion**. Worked with CEC staff in reviewing the Application for Certification and associated reference material, prepared Data Adequacy Form, Data Request, Preliminary and Final Staff Assessment.
- **San Francisco Energy Reliability Project**: Reviewed the Application for Certification and related information material, met with CEC staff and United States Fish and Wildlife Service regarding endangered species issues, prepared and Final Preliminary Staff Assessment.
- **Black Mountain Wind Energy and 69kV Transmission Line Project**: Acting as CEC's avian specialist, reviewed the extensive literature of effects of wind development on avian populations, met with the Public Interest Energy Research staff, and prepared a comment letter on behalf of CEC for the Notice of Preparation for this project.
- **Notice of Preparation Review for Proposed Wind Energy Project:** Provided comment letters on behalf of CEC for the Notice of Preparation for Shiloh II Wind Plant Project (Solano County), and WECS 20 Project (City of Desert Hot Springs).

LITIGATION SUPPORT/EXPERT WITNESS

El Portal Road Improvement Project. Conducted field surveys and reviewed the Biological Assessment, Environmental Assessment/FONSI for the El Portal Road Improvement Project litigation (Sierra Club *et al. vs.* National Park Service). Prepared declarations and response to defendants opposition briefs, and provided other technical assistance to project attorneys. (Client: Mariposans for Environmentally Responsible Growth and Sierra Club).

Merced River Plan. Conducted field surveys and reviewed the Merced Wild and Scenic River Comprehensive Management Plan and Final Environmental Impact Statement (Sierra Club *et al. vs.* National Park Service). Prepared declarations and response to defendants opposition briefs, and provided other technical assistance to project attorneys. (Client: Friends of Yosemite Valley and Sierra Club).

Lower American River Instream Flows. Conducted original research and provided declarations on the effects of reduced instream flow to wildlife for the Friends of the American River v. EBMUD, Lower American River. Provided technical assistance to project attorneys,

prepared declarations, and provided expert testimony before the State Water Resources Control Board. (Client: Sacramento County and Friends of the American River Parkway).

Putah Creek v. Solano Irrigation District. Litigation support and expert testimony regarding wildlife/fishery impacts of reduced flows in Putah Creek. Provided depositions, declarations, expert witness testimony, and other litigation support (Client: Putah Creek Council).

CEQA/NEPA Documents. Prepared biological resource sections of Environmental Impact Reports/Statements, Initial Studies, and Environmental Assessments for numerous commercial and residential developments, redevelopment projects, transportation projects, dams, and other water projects throughout northern California. Conducted wildlife and plant community surveys, habitat assessments, agency contacts, data analysis and report preparation. Secured 1602 Streambed Alteration Agreements from California Department of Fish and Game, Section 404 Permits from U.S. Army Corps of Engineers, and 401 Permits from Regional Water Quality Control Board. Some representative projects include:

- Pacific Bell Route 101 Fiber Optic Cable, Kern County (PAR Environmental Services, Inc. [PAR]);
- Higgins Corner Marketplace, Nevada County (FHK Development);
- Hinkle Creek Nature Area Biological Inventory/Impact Analysis, Folsom (PAR);
- Willow Flycatcher Surveys, Lake Isabella Project, Kern County (Jones & Stokes);
- Biological Resources Survey, Galilee and TRC Parcels, Roseville, Placer County (PAR);
- Burrowing Owl Impact Analysis/Mitigation Monitoring, Northpointe, Sacramento County (PAR);
- Laguna Creek Interceptor and Sewer Alignment Constraints Study, Sacramento County (PAR);
- Marin Public Safety and Emergency Radio System Project, Marin County (Cord Communication)
- Biological Studies for Endangered Species Compliance, Isabella Dam, Kern County (PAR);
- Granite Quarry, Placerville (The Bedrock Group);
- Pacific-Bell Rocklin Central Dialing Station, Rocklin, Placer County (PAR);
- Whitney Oaks Raptor Surveys, Placer County (Live Oak Enterprises/Pulte Homes);
- Auburn Ranch Subdivision Project, Placer County (Area West Engineers);
- Equestrian Ridge Estates, Placer County (PAR);
- Willow Creek Assessment District Swainson's Hawk Surveys, Sacramento County (PAR);
- Bucks Lake Spotted Owls Surveys, Menasha Corporation, Plumas County (PAR);
- Roseville Water Facilities Project, City of Roseville, Placer County (Geier & Geier Consulting);
- Sugar Bowl Ski Resort Expansion, Placer County (Omni-Means, Engineers/Planners);
- City of Lincoln Waste Water Treatment Plant Expansion, Placer County (City of Lincoln);
- The Heritage at Bickford Ranch, Placer County (Geobotanical Phenomenology);
- South Branch 60 kV Pole Line Project, Roseville, Placer County (PAR);
- Smith-Moulton Pipeline Project, Nevada County (PAR);
- Morada Ranch Annexation, San Joaquin County (Omni-Means);
- Clover Valley Lakes Estates EIR, Placer County (Planning Concepts);
- Turtle Island, Loomis, Placer County (Export International);
- Fort Hunter-Liggett Wildlife Resource Surveys, Monterey County (Jones & Stokes Associates);
- Superconducting Super Collider EIR/EIS, Yolo and Solano Counties (EIP Associates);
- South Lake Tahoe Redevelopment Agency EIR, El Dorado County (Wagstaff & Brady);
- Stanford Ranch EIR, Placer County (Jones & Stokes Associates);
- Northeast Roseville Specific Plan EIR, Placer County, Placer County (Jones & Stokes Associates).
- Teichert/Granite Aggregate Mining Site, Sacramento County (Holliman, Hackard, & Taylor);
- Lower Laguna Drainage Master Plan, Sacramento County (PAR);
- Natomas Ditch Abandonment and Pipeline Construction Project, Sacramento County (PAR);
- Tuolumne River Wildlife Studies for FERC License, Tuolumne County (Holton & Associates);
- Turner Creek Hydroelectric Project, Plumas County (Jones & Stokes Associates);
- Calabazas Creek Flood Control Project, Santa Clara County (Santa Clara Valley Water District).

Transportation Projects. Prepared Caltrans Natural Environment Study Reports, Biological Assessments, Categorical Exemption/Exclusions, Preliminary Environmental Study Forms, and other documentation for bridge replacements, interchange modifications, seismic retrofits, road widenings, emergency storm damage repairs, and other transportation projects in Caltrans Districts 1, 2, 3, 4, 5, 6, and 10. Representative projects include:

- Auburn Boulevard Improvement Project, Citrus Heights, Sacramento County (PAR)
- Valley Drive Bridge Replacement Project, Nevada County (Nevada County DOTS)
- SR 101/Prado Rd. Interchange Improvement Project, San Luis Obispo County, (PAR)
- I-580/Isabel Avenue Interchange Project, Livermore, Alameda County (PAR);
- Gladding Road Bridge Replacement, Coon Creek, Placer County (Planning Concepts);
- Lozanos Road Bridge Replacement, Auburn Ravine, Placer County (PAR);
- Coyote Creek Bridge Replacement Project, Calaveras County (PAR);
- Route 99/Route 120 East Interchange Project, Manteca, San Joaquin County (PAR);
- Route 99/Prado Road Interchange, San Luis Obispo County (PAR);
- Ralston Avenue/Route 101 Interchange, Belmont, San Mateo County (PAR);
- Route 1 Improvement Project, Sand City to Seaside, Monterey County, PEAR (PAR);
- Northeast Area Transportation Plan, Constraints Analysis, Sacramento (PAR);
- Wilbur Avenue Overcrossing Project, Antioch, Contra Costa (PAR);
- Alpine Road Storm Damage Repair, San Mateo County (PAR);
- Pescadero Road Storm Damage Repair, San Mateo County (PAR);
- Route 92 Widening, Half Moon Bay, San Mateo County (PAR);
- Route 99/Hammer Lane Interchange Improvements, Stockton, San Joaquin County (PAR);
- Hammer Lane Widening, Stockton, San Joaquin County (PAR);
- La Gonda Way and Paraiso Drive Bridge Seismic Retrofit, Danville, Contra Costa County (PAR);
- Highway 162 Bridge Storm Damage Repair Project, Sacramento River, Glenn County (PAR);
- Norwood Avenue Reconstruction Project, Sacramento County (Planning Center);
- HOV Lane Construction, US 50, Sunrise to El Dorado Blvd., Sacramento/El Dorado Co. (PAR);
- Dry Creek Bridge Replacement Project, Route 99, Butte County (PAR);
- Ladies Canyon Bridge Storm Damage Repair, Sierra County, (PAR);
- Emergency Storm Damage Repair, Routes 49 and 89, Sierra and Nevada Counties, (PAR);
- Emergency Storm Damage Repair Project for: Route 70/89, Feather River Canyon, Route 20, 147, Plumas, Nevada, and Butte Counties, (PAR);
- Interstate 5 - Benjamin Holt/Hammer Lane Interchange project, San Joaquin County (PAR);
- State Route 113/Interstate 5 Connector Study, City of Woodland, Yolo County, California (PAR);
- Frederickson Road Widening, Antioch, Contra Costa County (May Consulting);
- East Lime Kiln Road Reconstruction Project, Nevada County (PAR);
- Lower Sacramento Road and Bridge Widening, Stockton, San Joaquin County (May Consulting);
- Sierra College Boulevard Widening Project, Roseville, Placer County (PAR);
- State Route 50/Folsom Interchange Improvement Project, Sacramento County (PAR);
- Pico Creek Bridge Replacement Project, Route 1, San Luis Obispo County (PAR)
- Burns Creek Bridge Replacement Project, Route 1, Monterey County (PAR);
- Pajaro River Bridge Replacement Project, Monterey and San Luis Obispo Counties (PAR);
- Route 113 Widening/North 1st Street Improvements, Dixon, Solano County (Planning Concepts);
- Bridgeport School Bridge Replacement Project, El Dorado County (PAR);
- State Route 49 Widening, Auburn, Placer County (PAR);
- Claus Road Bridge Widening, Modesto, Stanislaus County (PAR);
- Interstate 80/Enterprise Boulevard Interchange, City of West Sacramento, Yolo County (PAR).

Nevada County Biological Inventories/Habitat Management Plans. Conducted site specific vegetation and wildlife surveys in accordance with Policy 13.2A of the Nevada County General Plan; prepared Management Plans in accordance with Sec. L-II 4.3.3, General Provisions of the July 27, 2000 Zoning Ordinances. Representative projects include:

- Waxman Parcel Biological Inventory, Old Wood Road (Nevada City Engineering)
- Habitat Management Plan for DesJardins Dry Creek Crossing (Cranmer Engineering)
- Gregory Creek Biological Inventory, Truckee (King Engineering)
- Landon Parcel Biological Inventory and Management Plan, Wolf Road (California Survey Company)
- Oslin-Tarkowski Biological Inventory, Peardale (Ms. Jeanette Oslin)
- Jackson Parcel, Purdon Road (Mr.
- Hyatt Property Biological Inventory and Management Plan, Dry Creek (Mr. Mike Hyatt)
- Penn Valley Community Church, Penn Valley (Mr. Keith Brown)
- Chapa-De Health Clinic, Grass Valley (Ms. Elaine. Lieske, Architect)
- Inventory and Management Plan for Agren Pond Project, Penn Valley (Mr. Ray Agren)
- Humboldt Lily Plant Preservation Plan (Sares-Regis Group)
- Moore Property, Chicago Park (American Surveys)
- Callaghan Property, Lake of the Pines (Sylvester Engineering)
- Tracy Property, Duggans Road (Cranmer Engineering)
- Ragsdale Creek Setback Study, Higgins Area (Nevada County Planning Department)
- CDFG 1603 Permit Application, Eskaton Village, Grass Valley (Sares-Regis Group)
- Cedar Ridge Baptist Church Expansion, Cedar Ridge (Cedar Ridge Baptist Church)
- Penn Valley Properties, Penn Valley (Sylvester and Creighton)
- Record Connection Property, Brunswick Basin (Daggett Design)
- Droitcour Property, Wolf Road (Mr. Gerald Stapp)
- Hyepark Estates, near Wolf Road (King Engineering)
- Bartel Property Lake Setback (Nevada City Engineering)
- KLOVE Radio Tower, Banner Mountain (Westower Communications)
- Haas-Menasha Property, Ponderosa Way, Rough and Ready (Cliff McDivitt Surveying)
- Eskaton Village, Grass Valley (Sylvester & Creighton)
- Quist Property, Higgins Corner (Sylvester & Creighton)
- Hobart Mills Industrial Park (Sylvester & Creighton)
- Milhous Ranch, North San Juan (Sylvester & Creighton)
- Extasia Workshop Project, Tyler Foote Crossing Road, San Juan Ridge (Mr. Bruce Boyd, AIA);
- Flynn Property, Retrac Way, Grass Valley (Mr. Martin Flynn);
- McGuire Property, Banner Lava Cap Road, Nevada City (Mr. Kirk McGuire);
- Biological Inventory for 240-acre parcel near Donner Lake (Mr. James Mitchell);
- Brunswick Inn Project, Grass Valley (Sylvester Engineering);
- Lopez Tentative Map, Scott's Flat Road (Sylvester Engineering);
- Sierra Knoll Estates, Higgins Corner (Mr. and Mrs. Steve Joos);
- Smallwood Property, Grass Valley (Mr. Jay Smallwood).
- Harmony Ridge Resort (Sylvester & Creighton)

Land Exchanges. Prepared Biological Assessments/Evaluations for Forest Service land exchanges in the Plumas National Forest. The largest of these was the 11,000 acre Soper-Wheeler Company land exchange, a two-year project requiring management of eight employees and several subconsultants for surveys of rare plants, California spotted owls, northern goshawks, red-legged frogs, and other sensitive species. Other projects include the Crites Mineral Fraction Land Exchange and the Saunders Land Exchange, Plumas National Forest, (PAR).

Mitigation Monitoring. Supervised the design and ongoing monitoring of wetland and sensitive species mitigation projects, including riparian revegetation, vernal pool creation, and mitigation banking. Some projects involved preparation of a Habitat Mitigation and Monitoring Plan, and long-term monitoring efforts (five years plus), as well as preparation of annual reports, and

coordination with US Army Corps of Engineers, US Fish and Wildlife Service, California Department of Fish and Game, California Department of Transportation, and the US Environmental Protection Agency. Projects include:

- Humboldt Lily Mitigation Monitoring, Eskaton Village, Nevada County (Eskaton)
- Dark Horse Mitigation Monitoring, Nevada County (Nevada City Engineering)
- Northpointe, Burrowing Owl Mitigation Monitoring, Sacramento County (PAR)
- Burrowing Owl Mitigation Monitoring, Meadowview, Sacramento County (PAR)
- Wilbur Avenue Overhead Project, Habitat Restoration for Lange's Metalmark Butterfly, Antioch, Contra Costa County, (PAR)
- Swainson's Hawk Nest Monitoring, Garden Highway, Sacramento, Sacramento County (PAR)
- Sierra College Boulevard Riparian Revegetation Monitoring, Roseville, Placer County (PAR);
- Roseville Sanitary Landfill Riparian Revegetation Project, Roseville, Placer County (PAR);
- State Route 99/Calvine Interchange Vernal Pool Vegetation and Fairy Shrimp Mitigation Monitoring, Sacramento County (PAR);
- Potrero Hills Landfill Bird Deterrence Monitoring, Solano County (Global Environmental);
- State Route 50/Folsom Boulevard Improvement Project, Beach Lakes Mitigation Bank (PAR);
- Niblick Bridge Riparian Revegetation and Mitigation Monitoring, San Luis Obispo County (PAR).

TEACHING EXPERIENCE

Lecturer. Biology 10, UCD Zoology Department (1985): Instructor - biology for non-majors.
Lab Coordinator. Zoology 2L, UCD Zoology Department (1983-1984): Trained and supervised teaching assistants, managed introductory zoology laboratories.
Teaching Assistant. UCD Zoology Department (1977-1983): General Zoology, Vertebrate Structure, Introductory Biology.
Outstanding UCD Graduate Teaching Assistant (1983).

DECLARATION OF
Elizabeth A. Bagwell

I, **Elizabeth A. Bagwell**, declare as follows:

1. I am presently employed by Aspen Environmental Group, a contractor to the California Energy Commission, **Siting, Transmission, and Environmental Protection Division**, as a cultural resources technical specialist.

2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I assisted in the preparation of the staff testimony on **Cultural Resources** for the Genesis Solar Energy Project, based on my independent analysis of the Application for Certification and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issues addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: February 23, 2010 Signed: Elizabeth A. Bagwell

At: Sacramento, California

DR. ELIZABETH A. BAGWELL

Associate, Cultural Resources

ACADEMIC BACKGROUND

PhD, Anthropology (Archaeology), University of New Mexico, 2006
MA, Anthropology (Archaeology), UC Berkeley, 1995
Certificate in Archaeological Technology, Cabrillo College, 1994
BA, Anthropology and Creative Writing, UC Santa Cruz, 1991

PROFESSIONAL EXPERIENCE

Elizabeth A. Bagwell recently joined Aspen as an Associate in Cultural Resources. She has 19 years of experience conducting field work, researching, analyzing, and writing about archaeology and anthropology. She has experience preparing environmental documents pursuant to applicable federal, state and local regulations in California, Arizona, New Mexico and internationally in Mexico. These documents emphasize compliance with the National Environmental Policy Act (NEPA), Section 106 of the National Historic Preservation Act (NHPA), Native American Graves Protection and Repatriation Act (NAGPRA), and California Environ¬mental Quality Act (CEQA). She is an expert in explaining cultural resource preservation and mitigation to rural community members in both English and Spanish. She is a specialist in the archaeology of the Sonoran and Chihuahuan Deserts of the United States and Mexico and has published several academic articles based on her studies of architecture and craft production in ancient North America.

Aspen Environmental Group — December 2009 to present

Dr. Bagwell is currently providing technical support to the following project:

California Energy Commission – Cultural Resources Assessment for the Genesis Solar Energy Project. Dr. Bagwell is currently serving as the lead technical staff for the analysis of impacts to cultural resources from the 250 MW power plant in an undeveloped area of the Mojave Desert near Dry Ford Lake. Important cultural issues include direct impacts to prehistoric Native American and historic World War II military maneouver sites and potential indirect impacts to a traditional cultural property (TCP).

Desert Archaeology, Inc. – Tucson, Arizona — 2007-2009

Dr. Bagwell served as a project manager for a variety of cultural resources mitigation projects for on-call clients – the City of Phoenix, Phoenix Aviation Department, and the Salt River Project. Some of these include:

- **Phoenix Sky Harbor International Airport Automated Train Project, Maricopa County, Arizona - City of Phoenix Aviation Department.** Co-author of the cultural resources treatment plan outlining compliance with local, state, and federal regulations for ground

disturbance at the National Register of Historic Places listed Pueblo Grande Museum and Archaeological Park. Project manager for field mitigation required in the plan.

- **Dinosaur to Hunt 12kV/69kV Transmission Line, Arizona - Salt River Project**. Supervision of the mitigation of prehistoric Native American houses and canals .
- **Palo Verde to Pinal West 500 kV Transmission Line, Arizona – Salt River Project.** Supervision of the mitigation of the Gilespie Dam Site, a large prehistoric Native American village.
- **Abel 230/69kV Substation, Queen Creek, Arizona – Salt River Project.** Lead staff on cultural resources assessment of proposed Abel Substation. Part of planning for a new double-circuit 230kV transmission line connecting two SRP-owned and previously sited sites to serve developing areas in and around Queen Creek.

University of New Mexico 2000-2002, 2005-2006

As Project Manager, lead a team of researchers studying prehistoric Native American architecture in northeastern Sonora, Mexico. Responsibilities included compliance with Mexican federal cultural resources law, research design, grant writing, report writing, budgeting and logistics, hiring and supervision of field and laboratory crew, negotiations with local land owners and politicians, data analysis and interpretation, public presentations, and publications.

Laboratory of Tree Ring Research, University of Arizona 2003-2004

As Project Manager, lead a team of researchers establishing a regional tree-ring chronology for northeastern Sonora, Mexico. Responsibilities included compliance with Mexican federal cultural resources law, supervision of field crew, negotiations with local land owners and politicians, research design, grant writing, report writing, budgeting, and logistics.

University of New Mexico 1999

As Project Manager, lead a team of researchers identifying prehistoric Native American sites in northeastern Sonora, Mexico. Responsibilities included compliance with Mexican federal cultural resources law, supervision of field crew, negotiations with local land owners and politicians, and grant writing.

Southwest Archaeological Consultants, New Mexico 1998

As a Field Supervisor, lead a team mitigating impacts to prehistoric Native American sites on coal mines in northeastern New Mexico.

University of New Mexico 1996, 1997

As a Field Supervisor, lead a team of researchers excavating late prehistoric Native American and early Spanish colonial sites in New Mexico.

BioSystems Analysis, Inc. – Santa Cruz, California 1992-1994

As a Lab Technician and Field Archaeologist, assisted with the mitigation of impacts to various prehistoric Native American sites along the central coast of California. Some of the field projects included:

- Fort Hunter-Liggett Cultural Resources On-Call
- Coastal Branch Phase II State Water Project
- Caltrans Highway 68 Rerouting, Fort Ord

MEMBERSHIPS

- Register of Professional Archaeologists
- Qualified Cultural Resources Project Manager – Arizona State Historic Preservation Office (AZ State Museum), 2008-2009
- Qualified Cultural Resources Project Manager – New Mexico State Historic Preservation Office, 2008-2009
- Society for American Archaeology
- Society for California Archaeology
- Arizona Archaeological Council
- Arizona Archaeological and Historical Society
- New Mexico Archaeological Council

HONORS AND AWARDS

- University of New Mexico Tom L. Popejoy Prize for most outstanding UNM dissertation, Domestic Architectural Production in Northwest Mexico, 2006
- National Science Foundation grant BCS-0210436: Expanding Dendroarchaeology into Northern Mexico, 2002
- National Science Foundation Dissertation Improvement Grant BCS-0121730, 2001

SELECTED PUBLICATIONS AND REPORTS

RECENT PUBLIC OUTREACH AND PARTICIPATION IN PROFESSIONAL MEETINGS

- 2010 Co-Organizer and Co-Chair. Archaeology and Society. Session organized for the 11th Annual Southwest Symposium, Hermosillo, Sonora, Mexico. January 8-10, 2010. [With Cesar Villalobos.]
- 2008 Expecting the Unexpected: Recent Excavations at the Gillespie Dam Site. Poster presented at the Advances in Hohokam Archaeology Conference. Arizona Archaeological Council, Pueblo Grande Museum, Phoenix. October 24-25, 2008. [Senior author: T. Kathleen Henderson.]
- 2008 Hohokam Architecture During the Classic Period – What's Paquimé Got to Do With It? Paper presented at the 15th Biennial Mogollon Conference, Silver City, New Mexico. October 2-4, 2008.
- 2008 An Architectural Study of Cliff-Dwellings of the Sierra Madres, Sonora, Mexico. Invited public presentation for the Arizona Archaeological Society, Phoenix Chapter, Pueblo Grande Museum. April 10, 2008.
- 2008 Co-Organizer and Co-Chair. Recent Research in the Archaeology of Northwest Mexico. Symposium organized for the 73rd Annual Meeting of the Society for American Archaeology, Vancouver, B.C. March 26-30, 2008. [With Michael Mathiowetz.]
- 2008 Medio Period Colonization of the Northern Sierra of Northwest Mexico. Paper presented at the 73rd Annual Meeting of the Society for American Archaeology, Vancouver, B.C. March 26-30, 2008.
- 2008 Specialized Architectural Production: An Example from Northwest Mexico. Poster presented at the 20th Anniversary Southwest Symposium, Tempe, Arizona. January 17-19, 2008.

DECLARATION OF
George E. Kline

I, **George E. Kline**, declare as follows:

1. I am presently employed by the **Bureau of Land Management**, as an archaeologist.

2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I assisted in the preparation of the staff testimony on **Cultural Resources** for the Genesis Solar Energy Project, based on my independent analysis of the Application for Certification and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issues addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

George E. Kline
U.S.D.O.I. Bureau of Land Management, California Desert District, Renewable Energy Coordinating Office (RECO), Palm Springs, California. 1201 Bird Center Dr. Palm Springs, CA 92262-8001
Phone: (760) 833-7135 E-mail: gkline@blm.gov

EDUCATION

M.A. Anthropology, San Diego State University, 2008

B.A. Anthropology, San Diego State University, 2005

CERTIFICATION AND PROFESSIONAL AFFILIATIONS

Member, Registry of Professional Archaeologists, since 2008.
Member, American Institute of Archaeology, since 2008.
Member, San Diego County Archaeological Society 2006 – 2009.
Member, San Bernardino County Museum, 2010
Member, Society for California Archaeology, 2006 – 2010

EMPLOYMENT HISTORY

01 – 2010 to Present	Archaeologist	USDOI Bureau of Land Management, California Desert District, Renewable Energy Coordinating Office (RECO), Palm Springs, CA
08 – 2008 to 12 – 2009	Archaeologist	USDA San Bernardino National Forest, Mountaintop Ranger District, Skyforest, CA.
11 – 1995 to 02-2005	Marine Electrician and Anthropology Student	General Dynamics NASSCO, San Diego, CA. Electrical Department
02 – 2005 to 08-2008	Employee Advisor Anthropologist	General Dynamics NASSCO, San Diego, CA. Human Resources, Training Department
04 – 1991 to 10 - 1995	Archaeological Technician	USDA Modoc National Forest, Doublehead Ranger District, Tulelake, CA

DECLARATION OF
Alvin J. Greenberg, Ph.D.

I**, Alvin J. Greenberg, Ph.D.** declare as follows:

1. I am presently a consultant to the California Energy Commission, Energy Facilities Siting and Environmental Protection Division.

2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I helped prepare the staff testimony on the **Public Health, Hazardous Materials Management, and Worker Safety/Fire Protection** sections for the **Genesis Solar Energy Project Application** based on my independent analysis of the amendment petition, supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Name & Title: **Alvin J. Greenberg, Ph.D., FAIC, REA, QEP**
Principal Toxicologist

Dr. Greenberg has had over two decades of complete technical and administrative responsibility as a team leader in the preparation of human and ecological risk assessments, air quality assessments, hazardous materials handling and risk management/prevention, infrastructure vulnerability assessments, occupational safety and health, hazardous waste site characterization, interaction with regulatory agencies in obtaining permits, and conducting lead surveys and studies. He has particular expertise in the assessment of dioxins, lead, diesel exhaust, petroleum hydrocarbons, mercury, the intrusion of subsurface contaminants into indoor air, and the preparation and review of public health/public safety sections of EIRs/EISs. Dr. Greenberg's expertise in risk assessment has led to his appointment as a member of several state and federal advisory committees, including the California EPA Advisory Committee on Stochastic Risk Assessment Methods, the US EPA Workgroup on Cumulative Risk Assessment, the Cal/EPA Peer Review Committee of the Health Risks of Using Ethanol in Reformulated Gasoline, the California Air Resources Board Advisory Committee on Diesel Emissions, the Cal/EPA Department of Toxic Substances Control Program Review Committee, and the DTSC Integrated Site Mitigation Committee. Dr. Greenberg is the former Chair of the Bay Area Air Quality Management District Hearing Board, a former member of the State of California Occupational Health and Safety Standards Board (appointed by the Governor), and former Assistant Deputy Chief for Health, California OSHA. And, since the events of 9/11, Dr. Greenberg has been the lead person for developing vulnerability assessments, power plant security programs, and conducting safety and security audits of power plants for the California Energy Commission and has assisted the CEC in the assessment of safety and security issues for proposed LNG terminals. In addition to providing security expertise to the State of California, Dr. Greenberg was the Team Leader and main consultant to the State of Hawaii on the updating of their Energy Emergency Preparedness Plan.

Years Experience: 26

Education:

B.S. 1969 Chemistry, University of Illinois Urbana

Ph.D. 1976 Pharmaceutical/Medicinal Chemistry, University of California, San Francisco

Postdoctoral Fellowship 1976-1979 Pharmacology/Toxicology, University of California, San Francisco

Postgraduate Training 1980 Inhalation Toxicology, Lovelace Inhalation Toxicology Research Institute, Albuquerque, NM

Professional Registrations:

Board Certified as a Qualified Environmental Professional (QEP)
California Registered Environmental Assessor - I (REA)
Fellow of the American Institute of Chemists (FAIC)

Professional Affiliations:

Society for Risk Analysis
Air and Waste Management Association
American Chemical Society
American Association for the Advancement of Science
National Fire Protection Association

Technical Boards and Committee Memberships - Present:

Squaw Valley Technical Review Committee
(appointed 1986)

Technical Boards and Committee Memberships - Past:

July 1996 – March 2002
Member, Bay Area Air Quality Management District Hearing Board
(Chairman 1999-2002)
September 2000 – February 2001
Member, State Water Resources Control Board Noncompliant Underground Tanks Advisory Group
January 1999 – June 2001
Member, California Air Resources Board Advisory Committee on Diesel Emissions
January 1994 - September 1999
Vice-Chairman, State Water Resources Control Board Bay Protection and Toxic Cleanup Program Advisory Committee
September 1998
Member, US EPA Workgroup on Cumulative Risk Assessment
April 1997 - September 1997
Member, Cal/EPA Private Site Manager Advisory Committee
January 1986 - July 1996
Member, Bay Area Air Quality Management District Advisory Council
(Chairman 1995-96)
January 1988 - June 1995
Member: California Department of Toxic Substance Control Site Mitigation Program Advisory Group
January 1989 - February 1995
Member: Department of Toxics Substances Control Review Committee, Cal-EPA

October 1991 - February 1992
Chair: Pollution Prevention and Waste Management Planning Task Force of the Department of Toxics Substances Control Review Committee, Cal-EPA

September 1990 - February 1991
Member: California Integrated Waste Management Board Sludge Advisory Committee

September 1987 - September 1988
ABAG Advisory Committee on Regional Hazardous Waste Management Plan

March 1987 - September 1987
California Department of Health Services Advisory Committee on County and Regional Hazardous Waste Management Plans

January 1984 - October 1987
Member, San Francisco Hazardous Materials Advisory Committee

March 1984 - March 1987
Member, Lawrence Hall of Science Toxic Substances and Hazardous Materials Education Project Advisory Board

Jan. 1, 1986 - June 1, 1986
Member, Solid Waste Advisory Committee, Governor's Task Force on Hazardous Waste

Jan. 1, 1983 - June 30, 1985
Member, Contra Costa County Hazardous Waste Task Force

Sept. 1, 1982 - Feb. 1, 1983
Member, Scientific Panel to Address Public Health Concerns of Delta Water Supplies, California Department of Water Resources

Present Position

January 1983- present
Owner and principal with Risk Sciences Associates, a Marin County, California, environmental consulting company specializing in multi-media human health and ecological risk assessment, air pathway analyses, hazardous materials management-infrastructure security, environmental site assessments, review and evaluation of EIRs/EISs, preparation of public health and safety sections of EIRs/EISs, and litigation support for toxic substance exposure cases.

Previous Positions

Jan. 2, 1983 - June 12, 1984
Member, State of California Occupational Safety and Health Standards Board (Cal/OSHA), appointed by the Governor

Aug. 1, 1979 - Jan. 2, 1983
Assistant Deputy Chief for Health, California Occupational Safety and Health Administration

Feb. 1, 1979 - Aug. 1, 1979

Administrative Assistant to Chairperson of Finance Committee, Board of Supervisors, San Francisco

Jan. 1, 1976 - Feb. 1, 1979
Research Pharmacologist and Postdoctoral Fellow, Department of Pharmacology and Toxicology, School of Medicine, University of California, San Francisco

Jan. 1, 1975 - Dec. 31, 1975
Acting Assistant Professor, Department of Pharmaceutical Chemistry, University of California, San Francisco

Experience

General

Dr. Greenberg has been a consultant in Hazardous Materials Management and Security, Human and Ecological Risk Assessment, Occupational Health, Toxicology, Hazardous Waste Site Characterization, and Toxic Substances Control Policy for over 26 years. He has broad experience in the identification, evaluation and control of health and environmental hazards due to exposure to toxic substances. His experience includes Community Relations Support and Risk Communication through experience at high-profile sites and presentations at professional society meetings.

He has considerable experience in the review and evaluation of exposure via the air pathway - particularly to emissions from power plants, refineries, and diesel exhaust - and a thorough knowledge of the regulatory requirements through his experience at Cal/OSHA, the BAAQMD Hearing Board, as a consultant to the California Energy Commission, and in preparing such assessments for local government and industry. He has assessed exposures to diesel exhaust during construction and operations of stationary and mobile sources and has testified at evidentiary hearings numerous times on this subject.

He is presently assisting the California Energy Commission in assessing the risks to workers and the public of proposed power plants and LNG terminals in the state. His experience in hazard identification, exposure assessment, risk assessment, occupational safety and health, emergency response, and Critical Infrastructure Protection has made him a valuable part of the CEC team addressing this issue. He has reviewed and commented on the DEIS/DEIR for the proposed SES LNG Port of Long Beach terminal, focusing on security issues for the CEC and on safety matters for the City of Long Beach. He has presented technical information and analysis to the State of California Interagency LNG Working Group on thermal radiation public exposure criteria and safety/security at an east coast urban LNG terminal. (Both presentations are confidential owing to the nature of the material.) He has conducted numerous evaluations of the safety and hazards of natural gas pipelines for the CEC and has presented his findings and recommendations at public meetings and evidentiary hearings.

He served for over five years as the Vice-chair of the California State Water Resources Control Board Advisory Committee convened to address toxic substances in sediments in bays, rivers, and estuaries. He has been a member of the Squaw Valley Technical Review Committee since 1986 establishing chemical application management plans at golf courses to protect surface and

groundwater quality. He has also conducted numerous ecological risk assessments and characterizations, including those for marine and terrestrial habitats.

Dr. Greenberg has extensive experience in data collection and preparation of human and ecological risk assessments on numerous military bases and industrial sites with Cal/EPA DTSC and RWQCB oversight. He has also been retained to provide technical services to the Cal/EPA Department of Toxic Substances Control (preparation of human health risk assessments) and the Office of Environmental Health Hazard Assessment (review and evaluation of air toxics health risk assessments and preparation of profiles describing the acute and chronic toxicity of toxic air contaminants). He has also conducted several surveys of sites containing significant lead contamination from various sources including lead-based paint, evaluated potential occupational exposure to lead dust and fumes in industrial settings, prepared numerous human health risk assessments of lead exposure, and prepared safety and health plans for remedial investigation of lead contaminated soils. Dr. Greenberg is also a recognized expert on the requirements of California's Proposition 65 and has served as an expert on Prop. 65 litigation.

Liquefied Natural Gas (LNG)

Dr. Greenberg assisted the CEC in the preparation of the "background" report on the risks and hazards of siting LNG terminals in California ("LNG in California: History, Risks, and Siting" July 2003) and consulted for the City of Vallejo on a proposed LNG terminal and storage facility at the former Mare Island Naval Shipyard. He has also conducted an evaluation and prepared comments on the risks, hazards, and safety analysis of the DEIS/DEIR for the City of Long Beach on a proposed LNG terminal at the Port of Long Beach (POLB) and conducted an analysis on vulnerability and critical infrastructure security for the CEC on this same proposed LNG terminal. He currently advises the CEC on the POLB LNG proposal on risks, hazards, human thresholds of thermal exposure, vulnerability, security, and represented the CEC at a U.S. Coast Guard briefing on the Waterway Suitability Assessment that included the sharing of SSI (Sensitive Security Information). He has presented technical information and analysis to the State of California LNG Interagency Working Group on thermal radiation public exposure criteria and safety/security at an east coast urban LNG terminal. (Both presentations are confidential owing to the nature of the material.) He has conducted numerous evaluations of the safety and hazards of natural gas pipelines for the CEC and has presented his findings and recommendations at public meetings and evidentiary hearings.

Infrastructure Security

Since 2002, Dr. Greenberg has been trained by and is working with the Israeli company SB Security, LTD, the most experienced and tested security planning and service company in the world. Since the events of 9/11, Dr. Greenberg has been the lead person for developing vulnerability assessments and power plant security programs for the California Energy Commission (CEC). In taking the lead for this state agency, Dr. Greenberg has interfaced with the California Terrorism Information Center (CATIC) and provided analysis, recommendations, and testimony at CEC evidentiary hearings regarding the security of power plants within the state. These analyses include the assessment of Critical Infrastructure Protection, threat assessments, criticality assessments, and the preparation of vulnerability assessments and off-site consequence analyses addressing the use, storage, and transportation of hazardous materials, recommendations for security to reduce the threat from foreign and domestic terrorist activities, perimeter security, site access by personnel and vendors, personnel background checks,

management responsibilities for facility security, and employee training in security methods. Dr. Greenberg is the lead person in developing a model power plant security plan, vulnerability assessment matrix, and a security training manual for the CEC. The model security plan is used by power plants in California as guidance in developing and implementing security measures to reduce the vulnerability of California's energy infrastructure to terrorist attack. He has testified at several evidentiary hearings for the CEC on power plant security issues. He also leads an audit team conducting safety and security audits at power plants throughout California that are under the jurisdiction of the CEC. In addition to providing security expertise to the State of California, in August 2004, a team of experts led by Dr. Greenberg was awarded an 18-month contract by the State of Hawaii to update and improve the state's Energy Emergency Preparedness Plan and make recommendations for increased security of critical energy infrastructure on this isolated group of islands.

Air Pathway Analysis

Dr. Greenberg has prepared numerous Air Pathway Analyses and human health risk assessments, evaluating exposure at numerous locations in California, Hawai'i, Oregon, Minnesota, Michigan, and New York. He is experienced in working with Region IX EPA, the State of California DTSC, and the Hawai'i Department of Health Clean Air Branch in the application of both site-specific and non site-specific health risk assessment criteria.

Examples

Human Health Risk Assessment for the Open Burn/Open Detonation Operation at McCormick Selph, Inc., Hollister, Ca. (June 2003)

Air Quality and Human Health Risk Assessment for the Royal Oaks Industrial Complex, Monrovia, Ca. (January 2003)

Human Health Risk Assessment and Indoor Vapor Intrusion Assessment for the former Pt. St. George Fisheries Site, Santa Rosa, Ca. (October 2002)

Human Health Risk Assessment for the former Sargent Industries Site, Huntington Park, Ca. (July 2001)

Ballard Canyon Air Pathway Analysis and Human Health Risk Assessment, Santa Barbara County, Ca. (September 2000)

Health Risk Assessment Due to Diesel Train Engine Emissions, Oakland, Ca. (June 1999)

The Avila Beach Health Study Phase 1: Reconnaissance Sampling Findings, Conclusions, and Recommendations. (July 1997) Volume 1: Baseline Human Health Risk Assessment. (May 1998)

The Avila Beach Health Study Phase 1, Volume 2: Environmental Monitoring. (May 1998)

Health Risk Assessment and Air Pathway Analysis for the Ballard Canyon Landfill, Santa Barbara County, Ca. (March 1999)

Human Health Risk Assessment, Teledyne Ryan Aeronautical, McCormick Selph Ordnance. Hollister, California. (December 1996)

Initial Phase Human Health Risk Assessment, Teledyne Inc., San Diego, Ca. (October 1996)

Human Health Risk Assessment for Current and Proposed Expanded Class II and Class III Operations at the Altamont Sanitary Landfill, Alameda County, Ca.
(March, 1993)

Focused Ecological Risk Characterization, Hawaiian Electric Company, Keahole Generating Station Expansion, Hawai'i (June 1993)

Human Health Risk Assessment for the Proposed Palima Point Space Launch Complex, prepared for the Hawai'i Office of Space Industry (April 1993)

Ecological Risk Assessment for the Proposed Palima Point Space Launch Complex, prepared for the Hawai'i Office of Space Industry (March 1993)

Human Health Risk Assessment Due to Emissions from a Medical Waste Incinerator, prepared for Kauai Veterans Memorial Hospital, Kauai, Hawai'i (1994)

Cancer Risk Assessment for the H-Power Generating Station, Campbell Industrial Park, Oahu, Hawai'i (1988)

Hazardous Materials Assessments, Waste Management Assessments, Worker Safety and Fire Protection Assessments, and Public Health Impacts Assessments

Dr. Greenberg also has significant experience as a consultant and expert witness for the California Energy Commission providing analysis, recommendations, and testimony in the areas of hazardous materials management, process safety management, waste management, worker safety and fire protection, and public health impacts for proposed power plant/cogeneration facilities. These analyses include the evaluation and/or preparation of the following:

- Off-site consequence analyses of the handling, use, storage, and transportation of hazardous materials,
- Risk Management Plans (required by the Cal-ARP) and Business Plans (required by H&S Code section 25503.5),
- Safety Management Plans (required by 8 CCR section 5189),
- Natural gas pipeline safety,
- Solid and hazardous waste management plans,
- Phase I and II Environmental Site Assessments,
- Construction and Operations Worker Safety and Health Programs,
- Fire Prevention Programs,
- Human health risk assessment from stack emissions and from diesel engines, and
- Mitigation measures to address PM exposure, including diesel particulates

Examples

- San Francisco Energy Reliability Project, San Francisco, Ca. 2004-present. Hazardous materials management, worker safety/fire protection, waste management, public health
- Inland Empire Energy Center, Romoland, Ca. 2002-3. hazardous materials, worker safety/fire protection, waste management, public health
- Malburg Generating Station Project, City of Vernon, Ca. 2002-3. hazardous materials, worker safety/fire protection, waste management, public health
- Blythe II, Blythe, Ca. 2002-3. hazardous materials, worker safety/fire protection,
- Palomar Energy Center, Escondido, Ca. 2002-3. hazardous materials, worker safety/fire protection, waste management, public health
- Cosumnes Power Project, Rancho Seco, Ca. 2002-3. hazardous materials, worker safety/fire protection, waste management, public health
- Tesla Power Project, Tesla, Ca. 2002-3. hazardous materials, worker safety/fire protection, waste management, public health
- San Joaquin Valley Energy Center, San Joaquin, Ca. 2002-3. hazardous materials, worker safety/fire protection, waste management

- Shell Martinez Manufacturing Complex Cogeneration Project, Martinez, Ca., 1993: hazardous materials and review and evaluation of EIR
- SFERP Project, San Francisco, Ca. 2004 – 2006. hazardous materials, worker safety/fire protection, waste management, public health

Occupational Safety and Health/Health and Safety Plans/Indoor Air Quality

Dr. Greenberg has significant experience in occupational safety and health, having directed the development, adoption, and implementation of over 50 different Cal/OSHA regulations, including airborne contaminants (>450 substances), lead, asbestos, confined spaces, and worker-right-to-know (MSDSs). He has conducted numerous occupational health surveys and has extensive experience in the sampling and analysis of indoor air quality at residences, workplaces, and school classrooms. He is currently the team leader conducting safety and security audits at power plants throughout California for the California Energy Commission. Safety issues audited include compliance with regulations addressing several safety matters, including but not limited to, confined spaces, lockout/tagout, hazardous materials, and fire prevention/suppression equipment.

Examples

Review and Evaluation of Public and Worker Safety Issues at the proposed SES LNG Facility, Port of Long Beach. prepared for the City of Long Beach. (November 2005)

Confidential safety and security audit reports for 18 power plants in California. prepared for the California Energy Commission. (January 2005 through March 2006)

Report on the Accidental release and Worker Exposure to Anhydrous Ammonia at the BEP I Power Plant, Blythe, Ca. prepared for the California Energy Commission. (October 2004)

Investigation of a Worker Death in a Confined Space, La Paloma Power plant. prepared for the California Energy Commission. (July 2004)

Preliminary Report on Indoor Air Quality in Elementary School Portable Classrooms, Marin County, Ca. (December 1999)

Health Risk Assessment Due to Diesel Train Engine Emissions, Oakland, Ca. (June 1999)

Air Pathway Analysis for the Ballard Canyon Landfill. Submitted to the County of Santa Barbara, (March 1999)

Review and Evaluation of the Health Risk Assessment for Outdoor and Indoor Exposures at the Former Golden Eagle Refinery Site, Carson, Ca. (May 1998)

The Avila Beach Health Study Phase 1: Reconnaissance Sampling Findings, Conclusions, and Recommendations. (July 1997) Volume 1: Baseline Human Health Risk Assessment. (May 1998)

The Avila Beach Health Study Phase 1, Volume 2: Environmental Monitoring. (May 1998)

Phase 2 Human Health Risk Assessment, Teledyne Inc., San Diego, Ca. (February 1997)

Determination of Occupational Lead Exposure at a Tire Shop in Placerville, Ca. (April 1993)

Development of an Environmental Code of Regulations for Hazardous Waste Treatment Facilities on La Posta Indian Tribal lands, San Diego County, Ca. (August 1992)

Sampling and Analysis Plan, Health and Safety Plan, Site Characterization of Lead Oxide Contaminated Areas, Mare Island Naval Shipyard, Vallejo, California. Prepared in conjunction with Kaman Sciences Corp. (September 2, 1988)

Sites with RWQCB and/or DTSC Oversight

Dr. Greenberg has specific experience in assessing human health and ecological risks at contaminated sites at the land/water interface, including petroleum contaminants, metals, mercury, and VOCs at several locations in California including Oxnard, Richmond, Avila Beach, Mare Island Naval Shipyard, San Diego, Hollister, San Francisco, Hayward, Richmond, the Port of San Francisco, and numerous other locations. He has used Cal/EPA methods, US EPA

methods, and ASTM Risk Based Corrective Action (RBCA) and Cal/Tox methodologies. He is extremely knowledgeable about SWRCB and SF Bay RWQCB regulations on underground storage tank sites and with ecological issues presented by contaminated sediments including sediment analysis, toxicity testing, tissue analysis, and sediment quality objectives. Dr. Greenberg served on the State Water Resources Control Board Bay Protection and Toxic Cleanup Program Advisory Committee from 1994 until the end of the program in 1999.

Dr. Greenberg experience on many of these contaminated sites has been as a consultant to local governments, state agencies, and citizen groups. He assisted the City and County of San Francisco in developing local ordinance requiring soil testing (Article 20, Maher ordinance) and hazardous materials use reporting (Article 21, Walker ordinance). He served as the City of San Rafael's consultant to provide independent review and evaluation of the site characterization and remedial action plan prepared for a former coal gasification site. He was a consultant to a citizen group in northern California regarding exposure and risks due to accidental releases from a petroleum refinery and assisted in the assessment of risks due to crude petroleum contamination of a southern California beach. He has prepared a number of risk assessments addressing crude petroleum, diesel and gasoline contamination, including coordinating site investigations, environmental monitoring, and health risk assessment for the County of San Luis Obispo regarding Avila Beach subsurface petroleum contamination. That high-profile project lasted for over one year and Dr. Greenberg managed a team of experts with a budget of $750,000. Another high-profile project included the preparation of an extensive comprehensive human and ecological risk assessment for the Hawaii Office of Space Industry on rocket launch impacts and transportation/storage of rocket fuels at the southern end of the Big Island of Hawaii. Dr. Greenberg's risk assessments were part of the EIS for the project. Dr. Greenberg also worked on another high-profile project conducting Air Pathway Analysis of off-site and on-site impacts from landfill gas constituents, including indoor and outdoor air measurements, air dispersion modeling, flux chamber investigations, and health risk assessment for the County of Santa Barbara. Dr. Greenberg has conducted RI/FS work, prepared health risk assessments, evaluated hazardous waste sites and hazardous materials use at numerous locations in California, Hawaii, Oregon, Minnesota, Michigan, and New York. He has considerable experience in the development of clean-up standards and the development of quantitative risk assessments for site RI/FS work at CERCLA sites, as well as site closures, involving toxic substances and petroleum hydrocarbon wastes. He is experienced in working with both Region IX EPA and the State of California DTSC in negotiating clean-up standards based on the application of both site-specific and non site-specific health and ecological based clean-up criteria. He has significant experience in the development of site chemicals of concern list, quantitative data quality levels, site remedial design, the site closure process, the design and execution of data quality programs and verification of data quality prior to its use in the decision making process on large NPL sites.

Examples

The Avila Beach Health Study Phase 1: Reconnaissance Sampling Findings, Conclusions, and Recommendations. (July 1997) Volume 1: Baseline Human Health Risk Assessment. (May 1998)
The Avila Beach Health Study Phase 1, Volume 2: Environmental Monitoring. (May 1998)

Health Risk Assessment and Air Pathway Analysis for the Ballard Canyon Landfill, Santa Barbara County, Ca. (March 1999)

Screening Human Health Risk Assessment, Calculation of Soil Clean-up Levels, and Aquatic Ecological Screening Evaluation, Galilee Harbor, Sausalito, Ca. (May 1998)

Health Risk Assessment Due to Diesel Train Engine Emissions, Oakland, Ca. (June 1999)

Health Risk Assessment for Residual Mercury at the Deer Creek Facility, 3475 Deer Creek Road, Palo Alto, California. (July 1997)

Phase 2 Human Health Risk Assessment, Teledyne Inc., San Diego, Ca. (February 1997)

Human Health Risk Assessment, Teledyne Ryan Aeronautical, McCormick Selph Ordnance. Hollister, California. (December 1996)

Initial Phase Human Health Risk Assessment, Teledyne Inc., San Diego, Ca. (October 1996)

Human Health Risk Assessment, Ecological Screening Evaluation, and Development of Proposed Remediation Goals for the Flair Custom Cleaners Site, Chico, California (January 1996)

Human Health Risk Assessment for the X-3 Extrudate Project at Criterion Catalyst, Pittsburg, Ca. (November 1994)

Screening Health Risk Assessment and Development of Proposed Soil Remediation Levels at Hercules Plant #3, Culver City, Ca. (July 1993)

Ecological Screening Evaluation for the Altamont Landfill, Alameda County, Ca. (June, 1993)

Focused Ecological Risk Characterization, Hawaiian Electric Company, Keahole Generating Station Expansion, Hawaii (June 1993)

Human Health Risk Assessment for the Proposed Palima Point Space Launch Complex, prepared for the Hawaii Office of Space Industry (April 1993)

Ecological Risk Assessment for the Proposed Palima Point Space Launch Complex, prepared for the Hawaii Office of Space Industry (March 1993)

Human Health Risk Assessment for Current and Proposed Expanded Class II and Class III Operations at the Altamont Sanitary Landfill, Alameda County, Ca.
(March, 1993)

Screening Health Risk Assessment for the Proposed Expansion of the West Marin Sanitary Landfill, Point Reyes Station, Ca.
(March, 1993)

Health Risk Assessment for the Proposed Expansion of the Forward, Inc. Landfill, Stockton, Ca. (September 14, 1992)

Health Risk Assessment for the Rincon Point Park Project, San Francisco, Ca. Prepared for Baseline Environmental Consulting and the San Francisco Redevelopment Agency. (August 10, 1992)

Health Risk Assessment for the South Beach Park Project, San Francisco, Ca. Prepared for Baseline Environmental Consulting and the San Francisco Redevelopment Agency. (August 10, 1992)

Screening Health Risk Assessment and Development of Proposed Soil and Groundwater Remediation Levels, Kaiser Sand and Gravel, Mountain View, Ca. Prepared for Baseline Environmental Consulting (January 30, 1992)

Development of Proposed Soil Remediation Levels for the Marine Corps Air-Ground Combat Center, 29 Palms, California (May 30, 1991)

Preliminary Health Risk Assessment for the City of Pittsburg Redevelopment Agency, Pittsburg, California (May 29, 1991)

Military Bases

Dr. Greenberg has experience in conducting assessments at DOD facilities, including RI/FS work, preparation of health risk assessments, evaluation of hazardous waste sites and hazardous materials use at the following Navy sites in California: San Diego Naval Base; Marine Corps Air-Ground Combat Center, 29 Palms; Mare Island Naval Shipyard, Vallejo; Treasure Island Naval Station, San Francisco, Hunters Point Naval Shipyard, San Francisco, and the Marine Corps Logistics Base, Barstow. He worked with the U.S. Navy and the U.S. EPA in the implementation of Data Quality Objectives (DQO's) at MCLB, Barstow.

Examples

Review and Evaluation of the Remedial Investigation Report and Human Health Risk Assessment for the U. S. Naval Station at Treasure Island, Ca. (June 1999)

Screening Health Risk Assessment for the Proposed San Francisco Police Department's Helicopter Landing Pad at Hunters Point Shipyard, San Francisco, Ca. (September 1997)

Development of Proposed Soil Remediation Levels for the Marine Corps Air-Ground Combat Center, 29 Palms, California (May 30, 1991)

Health Risk Assessment for the Chrome Plating Facility, Mare Island Naval Shipyard, Vallejo, California (October 24, 1988)

Background Levels and Health Risk Assessment of Trace Metals present at the Naval Petroleum Reserve No.1, 27R Waste Disposal Trench Area, Lost Hills, California (August 12, 1988)

RCRA Facility Investigation (RFI) Work Plan of Lead Oxide Contaminated Areas, Mare Island Naval Shipyard, Vallejo, California. Prepared in conjunction with Kaman Sciences Corp. (August 14, 1989)

Hazardous Waste and Solid Waste Audit and Management Plan, Mare Island Naval Shipyard, Vallejo, California. Prepared in conjunction with Kaman Sciences Corp. (July 3, 1989)

Water Quality Solid Waste Assessment Test (SWAT) Proposal RCRA Landfill, Mare Island Naval Shipyard, Vallejo, California. Prepared in conjunction with Kaman Sciences Corp. (October 31, 1988)

Waste Disposal Facilities, Waste Haulers, Waste Recycling Facilities Report, Mare Island Naval Shipyard, Vallejo, California. Prepared in conjunction with Kaman Sciences Corp. (September 22, 1988)

Sampling and Analysis Plan, Health and Safety Plan, Site Characterization of Lead Oxide Contaminated Areas, Mare Island Naval Shipyard, Vallejo, California. Prepared in conjunction with Kaman Sciences Corp. (September 2, 1988)

Air Quality Solid Waste Assessment Test (SWAT) Proposal, Mare Island Naval Shipyard, Vallejo, California. Prepared in conjunction with Kaman Sciences Corp. (August 25, 1988)

Mercury Contamination

Dr. Greenberg has prepared and/or reviewed several human health and ecological risk assessments regarding mercury contamination in soils, sediments, and indoor surfaces. Dr. Greenberg served on the State Water Resources Control Board Bay Protection and Toxic Cleanup Program Advisory Committee from 1994 until the end of the program in 1999.

Examples

Review and evaluation of a human health risk assessment of ingestion of sport fish caught from San Diego Bay and which contain tissue levels of mercury and PCBs (November 2004 – present)

Screening Human Health Risk Assessment, Calculation of Soil Clean-up Levels, and Aquatic Ecological Screening Evaluation, Galilee Harbor, Sausalito, Ca. (May 1998)

Health Risk Assessment for Residual Mercury at the Deer Creek Facility, 3475 Deer Creek Road, Palo Alto, California. (July 1997)

Human Health Risk Assessment Due to Emissions from a Medical Waste Incinerator, prepared for Kauai Veterans Memorial Hospital, Kauai, Hawai'i (1994)

DECLARATION OF
Testimony of Negar Vahidi

I**, Negar Vahidi,** declare as follows:

1. I am presently employed by Aspen Environmental Group, a contractor to the California Energy Commission, Siting, Transmission and Environmental Protection Division, as a **Senior Project Manager/Senior Land Use Technical Specialist**.

2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I prepared the staff testimony on **Land Use** for the **Genesis Solar Energy Project** based on my independent analysis of the Application for Certification and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: March 23, 2010 Signed: _____

At: Agoura Hills, California

NEGAR VAHIDI

Senior Associate
Land Use, Policy Analysis, and Socioeconomics

ACADEMIC BACKGROUND

Master of Public Administration, University of Southern California, 1993
B.A. (with Highest Honors), Political Science, University of California, Irvine, 1991

PROFESSIONAL EXPERIENCE

Ms. Vahidi is an environmental planner with over 15 years of experience managing and preparing a variety of federal and State of California environmental, planning, and analytical documents for large-scale infrastructure and development projects. Ms. Vahidi brings the experience of being both a public and private sector planner, specializing in the integration and completion of NEPA and CEQA documentation, joint documentation, land use, socioeconomic, and public policy analysis, environmental justice analysis, and public and community involvement programs. Her diversity and experience in preparing NEPA, CEQA, and NEPA/CEQA joint documentation can be shown through a sample of her projects.

Aspen Environmental Group 1992 to 1998 and 2001 to present

Ms. Vahidi has participated in CEQA and NEPA analyses of major utility development projects, providing public policy and land use expertise as well as managing Public Participation Programs. She has conducted land use analyses for major environmental assessments, including identification of ownership and land use types and identification of sensitive land uses and sensitive receptors. She has also gathered and analyzed information on State, federal and local laws, policies and regulations relevant to land uses and public policy. Her specific projects are described below.

- **TANC Transmission Project (TTP), several Northern California Counties.** Ms. Vahidi is currently serving as the Deputy Project Manager in charge of preparation of the EIR/EIS and guiding the CEQA/NEPA analysis. The Transmission Agency of Northern California (TANC) and Western Area Power Administration (Western), an agency of the U.S. Department of Energy (DOE), are the CEQA lead agency and NEPA lead agency, respectively. The TTP generally would consist of approximately 600 miles of new and upgraded 500 kilovolt (kV) and 230 kV transmission lines, substations, and related facilities generally extending from northeastern California near Ravendale in Lassen County to the California Central Valley through Sacramento and Contra Costa Counties and westward into the San Francisco Bay Area. Ms. Vahidi worked with TANC and Western to initiate the scoping process, including preparation of the NOP, preparing for scoping meetings, frameworking the EIR/EIS document, etc. She also led the preparation of the project scoping report.
- **Littlerock Reservoir Sediment Removal Project EIS/EIR, Palmdale, CA.** Ms. Vahidi is the Project Manager for this joint EIS/EIR evaluating the impacts of sediment removal alternatives for the Littlerock Reservoir and Dam on USFS Angeles National Forest (NEPA Lead Agency) lands in Los Angeles County. The Palmdale Water District (District) [CEQA Lead Agency] proposes to remove approximately 540,000 cubic yards of sediment from the reservoir (behind the dam) and haul it to off-site commercial gravel pits located 6 miles north of the dam site in the community of Littlerock. The project involves impacts to the arroyo toad, extensive coordination with USFWS for a Section 7 consultation, incorporation of new Forest Service Plan updates and requirements into the

analysis, preparation of the Forest Service required BE/BA, and analysis of compliance with federal air quality conformity requirements. Under Ms. Vahidi's direction, Aspen developed six different project alternatives for sediment removal, involving detailed hydraulics analysis and preparation of a hydraulics technical report. The most feasible of these alternatives (grade control structure) was chosen by the PWD as their proposed project to be evaluated in the EIS/EIR. In addition, the PWD is currently considering an additional alternative (use of a slurry line for sediment removal) presented by Aspen. Aspen is currently working on the Administrative Draft EIR/EIS and assisting the PWD with portions of their Proposition 50 grant application to the DWR.

- **El Casco System Project, Riverside, CA.** Ms. Vahidi is serving as the Project Manager for this EIR being prepared for the CPUC to evaluate SCE's application for a Permit to Construct (PTC) the El Casco System Project. The Proposed Project would be located in a rapidly growing area of northern Riverside County, which includes the Cities of Beaumont, Banning, and Calimesa. A 115 kV subtransmission line begins at Banning Substation and extends westward toward the proposed El Casco Substation site within the existing Banning to Maraschino 115 kV subtransmission line and Maraschino–El Casco 115 kV subtransmission line ROWs. Major issues of concern include impacts to existing and residential land uses, which have led to the development of a partial underground alternative and a route alternative different than the project route proposed by SCE (the Applicant). The 1,200-page Draft EIR was released for a 45-day public review and comment on December 12, 2007, and evaluates project alternatives at the same level of detail as the Proposed Project analysis.
- **Sacramento Area Voltage Support Supplemental Environmental Impact Statement (SEIS), Western Area Power Administration.** Ms. Vahidi served as the task leader for several social science sections for the SEIS for a double-circuit 230 kV circuit between Western's O'Banion/Sutter Power Plant and Elverta Substation/Natomas Substation. New transmission lines and transmission upgrades are needed to mitigate transmission line overload, reduce the frequency of automatic generation and load curtailment during the summer peak load periods, and help maintain reliability of the interconnected system operation. Ms. Vahidi directed the preparation of the land use, aesthetics, socioeconomics, and environmental justice sections of the SEIS.
- **Sunset Substation and Transmission and Distribution Project CEQA Documentation, Banning, CA.** The City of Banning proposes to construct the Sunset Substation and supporting 33-kilovolt (kV) transmission line that would interconnect with the City's existing distribution system. The purpose of this new substation and transmission is to relieve the existing overloads that are occurring within the City's electric system and to accommodate projected growth in the City. Ms. Vahidi served as the Environmental Project Manager for the initial stages of CEQA documentation prepared for the City's Utility Department.
- **San Onofre Nuclear Generating Station (SONGS) Steam Generator Replacement Project, San Clemente, CA.** Ms. Vahidi served as the Technical Senior in charge of developing the methodology and guiding the analysis for the Land Use and Recreation Section of this EIR. This project EIR addressed the environmental effects of SCE's proposed replacement of Steam Generator Units 2 & 3 at the SONGS Nuclear Power Plant located entirely within the boundaries of the U.S. Marine Corps Base Camp (MCBCP) Pendleton. Issues of concern included potential conflicts resulting from the transport of the large units through sensitive recreation areas such as beaches, and the San Onofre State Park.
- **Diablo Canyon Power Plant (DCPP) Steam Generator Replacement Project, San Luis Obispo County, CA.** Ms. Vahidi served as the Technical Senior in charge of developing the methodology and guiding the analysis for the Land Use and Recreation Section of this EIR. The EIR addressed impacts associated with the replacement of the eight original steam generators (OSGs) at DCPP Units 1 and 2 due to degradation from stress and corrosion cracking, and other maintenance difficulties. The Proposed Project would be located at the DCPP facility, which occupies 760 acres within PG&E's 12,000-acre owner-controlled land on the California coast in central San Luis Obispo County. Land

use issues of concern include impacts to agricultural lands, recreational resources, and potential Coastal Act inconsistencies.

- **Cabrillo Port Liquefied Natural Gas (LNG) Deepwater Port, Ventura County, CA.** Under contract to the City of Oxnard, Aspen was tasked to review the Draft EIS/EIR for this the proposed construction and operation of an offshore floating storage and regasification unit (FSRU) that would be moored in Federal waters offshore of Ventura County. As proposed, liquefied natural gas (LNG) from the Pacific basin would be delivered by an LNG Carrier to and offloaded onto, the FSRU; re-gasified; and delivered onshore via two new 21.1-mile (33.8-kilometer), 24-inch (0.6-meter) diameter natural gas pipelines laid on the ocean floor. These pipelines would come onshore at Ormond Beach near Oxnard, California to connect through proposed new onshore pipelines to the existing Southern California Gas Company intrastate pipeline system to distribute natural gas throughout the Southern California region. Ms. Vahidi reviewed the document for technical adequacy and assisted the City in preparing written comments for the following sections of the EIS/EIR: Aesthetics, Land Use, Recreation, Socioeconomics, and Environmental Justice.
- **Long Beach LNG Import Project, Long Beach, CA.** Under contract to the City of Long Beach, Aspen was tasked to review the Draft EIS/EIR for the proposed construction and operation of this onshore LNG facility to be located at the Port of Long Beach. Ms. Vahidi reviewed the document for technical adequacy and assisted the City in preparing written comments for the following sections of the EIS/EIR: Aesthetics, Land Use, Recreation, Socioeconomics, Environmental Justice, and Port Master Plan Amendment.
- **Post-Suspension Activities of the Nine Federal Undeveloped Units and Lease OCS-P 0409, Offshore Southern California**. Aspen assisted the U.S. Department of the Interior, Minerals Management Service (MMS) to prepare an Environmental Information Document (EID) evaluating the potential environmental effects associated with six separate suspensions for undeveloped oil and gas leases Pacific Outer Continental Shelf (OCS) located offshore Southern California. These undeveloped leases lie between 3 and 12 miles offshore Santa Barbara, Ventura and southern San Luis Obispo Counties and are grouped into nine units, with one individual lease that is not unitized. As the Senior Aspen social scientist, Ms. Vahidi guided the analysis of community characteristics and tourism resources, recreation, visual resources, social and economic environment, and military operations.
- **Otay River Watershed Management Plan (ORWMP) and Special Area Management Plan (SAMP) in San Diego County, CA.** Ms. Vahidi served as a Technical Senior for social science and land use issues. The ORWMP focused on developing strategies to protect and enhance beneficial uses within this watershed and thereby comply with the San Diego Region's NPDES permit, and the SAMP intended to achieve a balance between reasonable economic development and aquatic resource preservation, enhancement, and restoration in this 145-square-mile (93,000 acres) area through the issuance of Corps and CDFG programmatic permits.

California Energy Commission (CEC)

In response to California's power shortage, Aspen has assisted the CEC in evaluating the environmental and engineering aspects of new power plant applications throughout the State under three separate contracts. Ms. Vahidi has served as Technical Senior for land use (since 2001), and a specialist for socio-economics and environmental justice, and alternatives analyses and special studies. Her specific projects are listed below.

- Technical Assistance in Application for Certification Review (Contract # 700-99-014; 3/6/2000 through 12/31/2003)
  - **Woodland Generation Station No. 2, Modesto, CA**. As the land use Technical Specialist, prepared the Land Use and Recreation, and Agricultural Resources Staff Assessments of this 80-megawatt nominal, natural gas-fired power generating facility and associated linear facilities (i.e., gas and water pipeline and

transmission line. The Staff Assessment evaluated potential impacts on nearby residential, recreational, and agricultural land uses, including important farmlands being traversed by linear faculties.

- **Valero Cogeneration Project, Benicia, CA**. Prepared the Socioeconomics Staff Assessment for a proposed cogeneration facility at the Valero Refinery in Benicia. Issues addressed included impacts on public services and other project-related population impacts such as school impact fees.
- **Rio Linda/Elverta Power Project, Sacramento, CA**. Prepared the Socioeconomics Staff Assessment for a 560-megawatt natural gas power plant in the northern Sacramento County. Issues of importance included environmental justice and impacts on property values.
- **Magnolia Power Project, Burbank, CA**. As the Socioeconomics technical specialist, prepared the Staff Assessment for this nominal 250-megawatt natural gas combined-cycle fired electrical generating facility to be located at the site of the existing City of Burbank power plant. Environmental justice issues and potential impacts on local economy and employment were evaluated
- **Potrero Power Plant Project, San Francisco, CA**. Prepared the land use portion of the Alternatives Staff Assessment for this proposed nominal 540 MW natural gas-fired, combined cycle power generating facility. Analysis included review of several alternative sites for development of the power plant and the comparative merits of those alternatives with the proposed site located on the San Francisco Bay.
- **Los Esteros Critical Energy Facility, San Jose, CA.** Technical Senior for the Land Use Staff Assessment of this 180-megawatt natural-gas-fired simple cycle peaking facility. Issues included potential impacts resulting from loss of agricultural land, and impacts associated with the project's non-compliance with local General Plan land use and zoning designations.
- **East Altamont Energy Center, Alameda County, CA.** Technical Specialist for the Land Use Assessment for a 1,100-megawatt nominal, natural gas-fired power plant and associated linear facilities. Provided expert witness testimony on Land Use Staff Assessment. Major issues addressed in the Staff Assessment included loss of Prime Farmlands, recommendation of land preservation mitigation, and the project's non-compliance with local General Plan land use and zoning designations.
- **Tracy Peaker Project, Tracy, CA.** Technical Senior for the Land Use Staff Assessment of this 169-megawatt simple-cycle peaking facility in an unincorporated area of San Joaquin County. Provided expert witness testimony on Land Use Staff Assessment. Issues included potential impacts resulting from loss of agricultural land under Williamson Act Contract, and evaluation of cumulative development in the fast-growing surrounding area.
- **Avenal Energy Project, Kings County, CA.** Socioeconomics Technical Specialist for this 600-megawatt combined cycle electrical generating facility, and associated linear facilities.
- **Tesla Power Project, Alameda County, CA.** Land Use Technical Senior and Alternatives Technical Specialist in charge of preparation of two Staff Assessments for this project. The project will be a nominal 1,120-MW electrical generating power plant with commercial operation planned for third quarter of 2004. The Tesla Power Project will consist of a natural gas-fired combined cycle power generator, with 0.8 miles of double-circuit 230-kilovolt transmission line connected to the Tesla PG&E substation, 24-inch 2.8-mile natural gas pipeline, and 1.7-mile water line constructed along Midway Road.
- **Sacramento Municipal Utility District Consumes Power Plant Project, Sacramento, CA.** Socioeconomics and Alternatives Technical Specialist in charge of preparation of two Staff Assessments for this nominal 1,000-megawatt (MW) combined-cycle natural gas facility. Provided expert witness testimony on Socioeconomics Staff Assessment. The project would include the construction and operation of a natural gas power plant at the Rancho Seco Nuclear Plant, 25 miles southeast of the City of Sacramento, in Sacramento County. The project would be located on a 30-acre portion of an overall 2,480-acre site owned by SMUD.
- **Inland Empire Energy Center, Riverside County, CA.** Technical Specialist for the Land Use Assessment for a 670-megawatt natural gas-fired, combined-cycle electric generating facility and associated linear facilities including, a new 18-inch, 4.7-mile pipeline for the disposal of non-reclaimable wastewater, and a new 20-inch natural gas pipeline. Provided expert witness testimony on Land Use Staff Assessment. The project would be located on approximately 46-acres near Romoland, within Riverside County. Major issues addressed in the Staff Assessment included potential loss of agricultural lands, impacts to planned school uses, and the project's potential non-compliance with local General Plan land use and zoning designations.

- **Senior Technical Lead, Land Use Resources.** The California Energy Commission (CEC) requested that the Aspen Team provide Technical Seniors for the Land Use Resources area in order to help coordinate and review Land Use Resource Assessments. As a Technical Senior, Negar Vahidi was responsible for the technical review of Land Use sections for various power plants assigned to them.
- **Legislative Bill Review.** As a Land Use Technical Senior for the CEC, Ms. Vahidi conducted legislative bill review related to energy facilities siting. She conducted portions of the CEC Systems Assessment & Facilities Siting Division analysis of Senate Bill 1550 which was intended to give the Superintendent of Public Instruction/CDE approval authority over siting of power plants within one mile of existing or proposed K-12 school sites by requiring the CDE (in coordination with the State Architect, and the commission) to develop appropriate siting guidelines.

- Engineering & Environmental Technical Assistance to Support the Energy Facility Planning and Licensing Program Contract (Contract # 700-02-004; 6/30/03 through 3/30/06)
  - **Environmental Performance Report (EPR).** Ms. Vahidi managed the preparation of the Socioeconomics chapter of the EPR for the California Energy Commission, which eventually became part of the State of California's Integrated Energy Policy Report (IEPR). The Socioeconomics chapter addressed: the importance of reliable and affordable electricity supply power plant construction and operation impacts, including labor force, taxation, etc.; and trends in the energy section, including renewable power sources such as wind and solar. She also conducted the analysis of a new portion of the Land Resources Chapter, which addressed the siting and land use issues associated with renewable power. This new portion of the land use analysis compared the land use and siting constraints associated with renewable power infrastructure such as wind and solar versus other forms of power infrastructure, such as gas pipelines, transmission lines, LNG facilities, and power plants.
  - **Coastal Plant Study.** Ms. Vahidi served as the Social Sciences Task Manager for this special study being conducted as part of Aspen's contract with the California Energy Commission. The study included identification and evaluation of potential issues associated with the possible modernization, re-tooling, or expansion of California's 25 coastal power plants including: northern California power plants such as Humboldt, Potrero, Hunter's Point, Pittsburg, and Oakland; central coast power plants such as Contra Costa, Diablo Canyon Nuclear, Morro Bay, Moss Landing, Elwood, Mandalay, and Ormond Power Plants; and southern California power plants such as the Alamitos, Long Beach, Los Angeles Harbor, Haynes, Redondo Beach, Scattergood, El Segundo, Huntington Beach, Encina, Silver Gate, South Bay, and San Onofre Nuclear. As Task Manager her responsibilities included, identification of potential political, social, community, and physical land use impacts that may arise from the potential increased output of energy from plants in highly sensitive coastal communities. The intent of the study is to identify red flag items for the Energy Commission in order to streamline future licensing processes. Her task as the Social Science Task Manager also included a thorough review of applicable Local Coastal Plans, and Coastal Commission regulations associated with Coastal Development Permits and Consistency Determinations.
  - **Natural Gas Market Outlook Report (NGMOR**). Ms. Vahidi assisted the CEC's Natural Gas Unit as a technical editor in their preparation and publication of the NGMOR. She managed Aspen's efforts, including format and graphics, to edit technical sections prepared by Natural Gas Unit Staff under a condensed time frame. The Preliminary NGMOR was released for public review in June 2003.

- Peak Workload Support for the Energy Facility Siting Program and the Energy Planning Program (Contract #700-05-002; 4/11/06 through 3/30/09)
  - **Chula Vista Energy Upgrade Project, Chula Vista, CA.** Senior Technical Specialist for the Land Use Staff Assessment for MMC Energy, Inc.'s Application for Certification (AFC) to construct and operate replacements and upgrades of equipment at the Chula Vista Power Plant, located on a 3.8-acre parcel in the City of Chula Vista's Main Street Industrial Corridor and within the City's Light Industrial zoning district. Issues of concern include the impacts of the power plant on adjacent residential and open space land uses, and compliance with applicable local LORS. Provided expert witness testimony on Land Use Staff Assessment.
  - **Ivanpah Solar Electric Generating System Project, San Bernardino County, CA.** Senior Technical Specialist for the Socioeconomics Staff Assessment/BLM EIS for a 400-megawatt solar thermal electric power generating system. The project's technology would include heliostat mirror fields focusing solar energy on power tower receivers producing steam for running turbine generators. Related facilities would

include administrative buildings, transmission lines, a substation, gas lines, water lines, steam lines, and well water pumps. The proposed project would be developed entirely in the Mojave Desert region of San Bernardino County, California. The document was prepared in compliance with both NEPA and CEQA requirements.

- **Sentinel Energy Project, Riverside County, CA.** Senior Technical Specialist for the Land Use Staff Assessment for CPV Sentinel's Application for Certification (AFC) to construct and operate an 850-megawatt (MW) peaking electrical generating facility near SCE's Devers Substation. The proposed project site consists of 37 acres of land situated approximately eight miles northwest of the center of the City of Palm Springs with portions of the construction laydown area and natural gas pipeline within the Palm Springs city limits. Land use issues of concern include the project's compliance with local LORS.
- **Carrizo Energy Solar Farm, San Luis Obispo County, CA.** Senior Technical Specialist for the Land Use Staff Assessment for Carrizo Energy, LLC's Application for Certification (AFC) to build the Carrizo Energy Solar Farm (CESF), which will consist of approximately 195 Compact Linear Fresnel Reflector (CLFR) solar concentrating lines, and associated steam drums, steam turbine generators (STGs), air-cooled condensers (ACCs), and infrastructure, producing up to a nominal 177 megawatts (MW) net. The CESF is located in an unincorporated area of eastern San Luis Obispo County, west of Simmler and northwest of California Valley, California. The CESF includes the solar farm site, a minimal offsite transmission system connection, and construction laydown area. The CESF site will encompass approximately 640 acres of fenced area in an area zoned for agricultural uses as specified in the San Luis Obispo County General Land Use Plan. Issues of concern include the impacts of the power plant on adjacent land uses and compliance with applicable local LORS.
- **Carlsbad Energy Center Project, Carlsbad, CA.** Senior Technical Specialist for the Land Use and Alternatives Staff Assessments for Carlsbad Energy Center, LLC's Application for Certification (AFC) to build the Carlsbad Energy Center Project (CECP), which will consist of a 558 MW gross combined-cycle generating facility configured using two units with one natural-gas-fired combustion turbine and one steam turbine per or unit. Issues of concern include major incompatibilities with local LORS, and cumulative impacts from widening of I-5.
- **Marsh Landing Generating Station, Contra Costa County, CA.** Senior Technical Specialist for the Land Use Staff Assessment for the Mirant Marsh Landing, LLC AFC for a 930 MW natural gas-fired power plant, which would be would be sited adjacent to the existing Contra Costa Power Plant in unincorporated Contra Costa County, near the City of Antioch.
- **Canyon Power Plant, Anaheim, CA.** Senior Technical Specialist for the Socioeconomics Staff Assessments for a nominal 200 megawatt (MW) simple-cycle plant, using four natural gas-fired combustion turbines and associated infrastructure proposed by Southern California Public Power Authority (SCPPA). This project is a peaking power plant project located within the City of Anaheim, California.
- **Willow Pass Generating Station, Pittsburg, CA.** Senior Technical Specialist for the Land Use Staff Assessment for a new, approximately 550-megawatt (MW) dry-cooled, natural gas-fired electric power facility proposed by Mirant. Development of Willow Pass would entail the construction of two generating units and ancillary systems including, adjacent electric and gas transmission lines, and water and wastewater pipelines.
- **Marsh Landing Generating Station, Contra Costa County, CA.** Senior Technical Specialist for the Land Use Staff Assessment for a new, 930-megawatt (MW) gas-fired electric generating facility proposed by Mirant. Delta. The proposed 27-acre Project site would be located at the existing Contra Costa Power Plant.
- **Stirling Energy Systems Solar One, San Bernardino County, CA.** Senior Technical Specialist for the Land Use Staff Assessment/BLM EIS for a nominal 850-megawatt (MW) Stirling engine project, with construction planned to begin late 2010. The primary equipment for the generating facility would include the approximately 30,000, 25-kilowatt solar dish Stirling systems (referred to as SunCatchers), their associated equipment and systems, and their support infrastructure. Major issues of concern include the conversion of approximately 8,230 acres of open space to industrial uses, compliance with BLM's CDCA Plan, etc.
- **Stirling Energy Systems Solar Two, Imperial County, CA.** Senior Technical Specialist for the Land Use Staff Assessment/BLM EIS for a nominal 750-megawatt (MW) Stirling engine project, with construction

planned to begin either late 2009 or early 2010. The primary equipment for the generating facility would include the approximately 30,000, 25-kilowatt solar dish Stirling systems (referred to as SunCatchers), their associated equipment and systems, and their support infrastructure. Major issues of concern include conversion of 6,500 acres of public recreation land used for OHV use and camping, and compliance with the BLM's CDCA plan..

- **GWF Tracy Combined Cycle Power Plant, San Joaquin County, CA.** Senior Technical Specialist for the Land Use Staff Assessment for GWF's proposal to modify the existing TPP (see description above), a nominal 169-megawatt (MW) simple-cycle power plant, by converting the facility into a combined-cycle power plant with a nominal 145 MW, net, of additional generating capacity.
- **City of Palmdale Hybrid Power Plant Project, Palmdale, CA.** Senior Technical Specialist for the Land Use Staff Assessment for the Palmdale Hybrid Power Project (PHPP) proposed by the City of Palmdale. The PHPP consists of a hybrid of natural gas-fired combined-cycle generating equipment integrated with solar thermal generating equipment to be developed on an approximately 377-acre site in the northern portions of the City of Palmdale (City).
- **Lodi Energy Center, Lodi, CA.** Senior Technical Specialist for the Socioeconomics Staff Assessment for a combined-cycle nominal 225-megawatt (MW) power generating facility.
- **Abengoa Mojave Solar One Project, San Bernardino County, CA.** Senior Technical Specialist for the Land Use Staff Assessment of a nominal 250 megawatt (MW) solar electric generating facility to be located near Harper Dry Lake in an unincorporated area of San Bernardino County. Issues of concern include the impacts associated with the conversión of 1,765 acres of open space lands.
- **Genesis Solar Energy Project, Riverside County, CA.** Senior Technical Specialist for the Land Use Staff Assessment/BLM EIS for two independent solar electric generating facilities with a nominal net electrical output of 125 megawatts (MW) each, for a total net electrical output of 250 MW. Electrical power would be produced using steam turbine generators fed from solar steam generators. The project is located approximately 25 miles west of the city of Blythe. Major issues of conern include conversión of 4,460 acres of BLM lands to an industrial use.
- **Contra Costa Generating Station, Contra Costa County, CA.** Senior Technical Specialist for the Land Use Staff Assessment for a natural gas-fired, combined-cycle electrical generating facility rated at a nominal generating capacity of 624 megawatts (MW). The project would be located in the City of Oakley.

- **Topaz Solar Project EIR, San Luis Obispo County, CA.** (Applicant: First Solar). Aspen is managing preparation of an EIR for this 500 MW solar photovoltaic project in the Carrizo Plain area. A major issue of concern is the conversion of approximately 6,000 acres of open space (60 percent of which are under land preservation contracts) to an industrial use. Ms. Vahidi is the Senior in charge of developing the methodology, approach, and thresholds of significance for analysis of impacts related to agricultural land conversion using the CA Department of Conservation LESA Model. One major issue of concern related to agricultural resources is impacts to lands under Williamson Act contracts. She will be guiding the analysis.
- **California Valley Solar Ranch EIR, San Luis Obispo County, CA.** (Applicant: SunPower). Aspen is managing preparation of an EIR for this 250 MW solar photovoltaic project in the Carrizo Plain area. A major issue of concern is the conversion of approximately 4,000 acres of open space to an industrial use. Ms. Vahidi is the Senior in charge of developing the methodology, approach, and thresholds of significance for analysis of impacts related to agricultural land conversion using the CA Department of Conservation LESA Model. She will be guiding the analysis.
- **Santa Ana Valley Pipeline Repairs Project, San Bernardino and Riverside Counties, CA.** Under Aspen's on-going environmental services contract with the DWR, Ms. Vahidi served as the project manager for CEQA documentation and permitting efforts related to the repair of 12 sites along the pipeline portion of the East Branch of the California Aqueduct. The repair of the 12 sites was crucial because, eight of the Priority 1 sites included areas of the pipeline that were under high stress and subject to rupture. Issues of concern included, potential impacts to special status species, sensitive receptors, and traffic. As the DWR's CEQA consultant, Ms. Vahidi determined that the proposed SAPL Repairs Project would qualify for a CEQA Categorical Exemption, and recommended the preparation

of a Technical Memorandum to justify this exemption. The Technical Memorandum and supporting documentation, including a Biological Constraints Report, and analyses of proposed project potential construction-related air quality, noise, and traffic impacts, were prepared and presented to DWR as one packet to support both a Class 1 and Class 2 CEQA Exemption. Subsequent to preparation of this packet, DWR filed a Notice of Exemption on June 13, 2003 for their repair activities.

- **Piru Creek Erosion Repairs and Bridge Seismic Retrofit Project, Northern Los Angeles County, CA.** Under Aspen's on-going environmental services contract with the DWR, Ms. Vahidi served as the project manager for CEQA documentation for this project. An IS/MND was prepared to evaluate the impacts of the project, which proposed to maintain four access routes to DWR's facilities along the West Branch of the California Aqueduct downstream of the Pyramid Dam. Repair and improvement activities would occur on Osito Canyon (an intermittent tributary to Piru Creek) at Osito Adit, adjacent to Old Highway 99 at North Adit (or access tunnel), alongside an eroded section of Old Highway 99 along Piru Creek, and at Pyramid Dam Bridge. Repair activities would serve to improve conditions of access routes, as well as strengthening and reinforcing them against seismic or flood events. Project-related construction could result in potentially significant impacts to biological resources, cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, noise, and transportation and traffic.
- **Pyramid Lake Repairs and Improvements Project, northern Los Angeles County.** Under Aspen's on-going environmental services contract with the DWR, Ms. Vahidi served as the project manager for CEQA documentation, ADA (Americans with Disabilities Act) compliance, and permitting efforts for this project. DWR and the Department of Boating and Waterways (DBW) are planning repairs and improvements at various recreational sites at Pyramid Lake, which is located on the border between Los Padres National Forest and Angeles National Forest; recreation is managed by Angeles National Forest. The lake is also part of Federal Energy Regulatory Commission Project 2426. Aspen worked with DWR and DBW to determine ADA compliance components at each site. CEQA documentation in support of a Class 1 and 2 Categorical Exemption was prepared to evaluate the potential impacts of the repairs and improvements, and provide CEQA clearance for filing of required permit applications, including but not necessarily limited to 404, 401, and 1602 permits. In addition to the CEQA documentation and preparation of permit applications, Aspen coordinated DWR and DBW's efforts with the USFS, and the permitting agencies (i.e., CDFG, RWQCB, and USACE). Through coordination with the USAC, Aspen prepared the NEPA EA for Corps 404 permit process, and reviewed and coordinated revisions to the 1602 with CDFG.
- **Mulholland Pumping Station and Lower Hollywood Reservoir Outlet Chlorination Station Project, Los Angeles, CA.** Under Aspen's on-going environmental services contract with the City of Los Angeles Department of Water and Power (LADWP), Ms. Vahidi served as the Project Manager for preparation of CEQA documentation for this project. LADWP proposed to replace the existing historic pumping/chlorination station building as well as the existing lavatory and unoccupied Water Quality Laboratory buildings with a new single structure pumping/chlorination station within the LADWP's Hollywood Reservoir Complex located in the Hollywood Hills section of the City Los Angeles. These improvements were required due to the age and deterioration of the facility and the potential risk of seismic damage to existing structures. An Initial Study was prepared in support of a City of Los Angeles General Exemption.
- **River Supply Conduit (RSC) Upper Reach Project EIR, Los Angeles and Burbank, CA.** Under Aspen's on-going environmental services contract with the City of Los Angeles Department of Water and Power (LADWP), Ms. Vahidi served as the Task Leader for land use issues and is in charge of development and analysis of project alternatives for the CEQA document for this project. The RSC is a major transmission pipeline in the LADWP water distribution system. The existing RSC pipeline's purpose is to transport large amounts of water from the Los Angeles Reservoir Complex and local ground water wells to reservoirs and distribution facilities located in the central areas within of the City of Los Angeles. The LADWP proposed a new larger RSC pipeline to replace and realign the

Upper and Lower Reaches of the existing RSC pipeline, which would involve the construction of approximately 69,600 linear feet (about 13.2 miles) of 42-, 48-, 60-, 66-, 72-, 84-, and 96-inch diameter welded steel underground pipeline.

- **Valley Generating Station Site Survey & Documentation Report, Los Angeles, CA.** Ms. Vahidi managed the preparation of a comprehensive report (over 150 pages) documenting all of the structures and facilities located at the Valley Generating Station (VGS). The report includes exhibits that illustrate locations of each structure at the VGS, a detailed appendix of color photos of each structure, and a written description of each structure. The report also provides a general discussion of the history and background of the VGS and its development to provide a context for the structures on site.
- **Taylor Yard Water Recycling Project (TYWRP), Los Angeles and Glendale, CA.** Under Aspen's on-going environmental services contract with the City of Los Angeles Department of Water and Power (LADWP), Ms. Vahidi served as the Project Manager for preparation of CEQA documentation for this project. LADWP proposed to construct the TYWRP in order to provide recycled water produced by the Los Angeles–Glendale Water Reclamation Plant (LAGWRP) to the Taylor Yard. An important part of the City of Los Angeles' expanding emphasis on water conservation is the concept that water is a resource that can be used more than once. Because all uses of water do not require the same quality of supply, the City has been developing programs to use recycled water for suitable landscaping and industrial uses. The project is located in the southernmost part of the City of Glendale and northeastern part of the City of Los Angeles. The IS/MND was adopted in the Summer of 2007.
- **Devers–Palo Verde 500 kV Transmission Line Project EIS/EIR, southern California/western Arizona.** For this EIR/EIS prepared by U.S. Bureau of Land Management and CPUC, Ms. Vahidi served as the Deputy Project Manager and Social Sciences Issue Area Coordinator for SCE's proposed 250-mile transmission line project from the Palo Verde Nuclear power plant in Arizona to the northern Palm Springs area in California. Major issues of concern include EMF and visual impacts on property values, impacts on the area's vast recreational resources and tribal lands, and the development and evaluation of several route alternatives, including the Devers-Valley No. 2 Route Alternative, which eventually was approved by the CPUC.
- **Antelope-Pardee 500 kV Transmission Line Project EIR/EIS, Los Angeles County, CA.** For this EIR/EIS prepared by USFS, Angeles National Forest and CPUC, Ms. Vahidi is served as the Deputy Project Manager and Social Sciences Issue Area Coordinator for SCE's proposed 25-mile transmission line project from the Antelope Substation in the City of Lancaster, through the ANF, and terminating at SCE's Pardee Substation in Santa Clarita. Major issues of concern included impacts to biological, recreational, and cultural resources within Forest lands, EMF and visual impacts on property values, impacts on residences in the urbanized southern regions of the route, and the development and evaluation of several route alternatives.
- **Antelope Transmission Project, Segments 2 & 3 EIR, Los Angeles and Kern Counties, CA.** For this EIR being prepared by the CPUC, Ms. Vahidi served as the Deputy Project Manager and Social Sciences Issue Area Coordinator. The proposed Project includes both Segment 2 and Segment 3 of the Antelope Transmission Project, and involves construction of new transmission line infrastructure from the Tehachapi Wind Resource Area in southern Kern County, California, to SCE's existing Vincent Substation in Los Angeles County, California. The Tehachapi Wind Resource Area is one of the State's greatest potential sources for the generation of wind energy. A variety of wind energy projects are currently in development for this region. Major issues of concern include EMF and visual impacts on property values, impacts on residences and agricultural resources, and the development and evaluation of several substation and route alternatives.
- **Tehachapi Renewable Transmission Project (TRTP) EIR/EIS, Kern, Los Angeles, and San Bernardino Counties, CA.** For this EIR/EIS prepared by USFS, Angeles National Forest and CPUC,

Ms. Vahidi is served as the Deputy Project Manager in the early stages (i.e., during Scoping) of the project for SCE's proposal to construct, use, and maintain a series of new and upgraded high-voltage electric transmission lines and substations to deliver electricity generated from new wind energy projects in eastern Kern County. Approximately 46 miles of the project would be located in a 200- to 400-foot right-of-way on National Forest System land (managed by the Angeles National Forest) and approximately three miles would require expanded right-of-way within the Angeles National Forest. The proposed transmission system upgrades of TRTP are separated into eight distinct segments: Segments 4 through 11. Segments 1 (Antelope-Pardee) and Segments 2 and 3 (Antelope Transmission Project) were evaluated in separate CEQA and NEPA documents as described above.

- **Jefferson-Martin 230 kV Transmission Line Project EIR, San Francisco Bay Area, CA.** Ms. Vahidi served as the Issue Area Coordinator for the Social Science issues of the EIR, and was responsible for preparation of the socioeconomics, recreation, and public utilities sections of the EIR prepared on behalf of the California Public Utilities Commission (CPUC) to evaluate a proposed 27-mile transmission line in San Mateo County. Major issues of concern included EMF and visual impacts on property values, impacts on the area's vas recreational resources, and evaluation of several route alternatives.
- **Miguel-Mission 230 kV #2 Project EIR, San Diego, CA.** Ms. Vahidi conducted the land use, recreation, socioeconomics, and environmental justice analyses for this EIR for a proposed 230 kV circuit within an existing transmission line ROW between Miguel and Mission substations in San Diego County. The proposed project included installing a new 230 kV circuit on existing towers along the 35-mile ROW, as well as relocate 69 kV and 138 kV circuits on approximately 80 steel pole structures. In addition, the Miguel Substation and Mission Substation would be modified to accommodate the new 230 kV transmission circuit.
- **Viejo System Project, Orange County, CA.** Ms. Vahidi served as the Deputy Project Manager for the project's CEQA documentation, including and Initial Study, prepared on behalf of the CPUC to evaluate Southern California Edison's (SCE) Application for a Permit to Construct the Viejo System Project, which was in SCE's forecasted demand of electricity and goal of providing reliable electric service in southern Orange County. The Viejo System Project would serve Lake Forest, Mission Viejo, and the surrounding areas. Components of the project included, construction of the new 220/66/12 kilovolt (kV) Viejo Substation, installation of a new 66 kV subtransmission line within an existing SCE right-of-way, replacement of 19 double-circuit tubular steel poles with 13 H-frames structures, and minor modification to other transmission lines. Major issues of concern include visual impacts of transmission towers, EMF effects, and project impacts on property values.
- **MARS EIR/EIS, Monterey, CA.** Ms. Vahidi served as the technical specialist in charge of preparing the Environmental Justice analysis for this EIR/EIS, which would evaluate the effects associated with the installation and operation of the proposed Monterey Accelerated Research System (MARS) Cabled Observatory Project (Project) proposed by Monterey Bay Aquarium Research Institute (MBARI)[NEPA Lead Agency]. The goal of the Project was to install and operate, in State and Federal waters, an advanced cabled observatory in Monterey Bay that would provide a continuous monitoring presence in the Monterey Bay National Marine Sanctuary (MBNMS) as well as serve as the test bed for a state-of-the-art regional ocean observatory, currently one component of the National Science Foundation (NSF) Ocean Observatories Initiative (OOI). The Project would provide real-time communication and continuous power to suites of scientific instruments enabling monitoring of biologically sensitive benthic sites and allowing scientific experiments to be performed. The environmental justice analysis evaluated the potential for any disproportionate project impacts to both land-based populations and fisheries workers. The CEQA Lead Agency was CSLC.
- **Kinder Morgan Concord-Sacramento Pipeline EIR**. Ms. Vahidi prepared the environmental justice and utilities and service systems sections of an EIR evaluating a proposed 70-mile petroleum products pipeline for the California State Lands Commission. Analysis included consideration of potential impacts of pipeline accidents in Contra Costa, Solano, and Yolo Counties.

- **Shore Marine Terminal Lease Consideration Project EIR, Contra Costa County, CA.** Served as Aspen's Project Manager (under contract to Chambers Group, Inc.) in charge of conducting the preparation of the Land Use, Recreation, Air Quality, and Noise sections of this EIR evaluating Shore Terminal, LLC's application to the California State Lands Commission (CLSC) to exercise the first of two 10-year lease renewal options, with no change in current operations. Shore Terminals operations comprise the marine terminal and on-land storage facilities in an industrial part of the city of Martinez. The marine terminal is on public land leased from the CSLC with the upland storage facilities located on private land.
- **Looking Glass Networks Fiber Optic Cable Project IS/MND, northern and southern California.** As part of Aspen's ongoing contract with the CPUC for review of Telecommunications projects, this document encompassed the evaluation of project impacts and network upgrades in the San Francisco Bay Area and the Los Angeles Basin Area. Ms. Vahidi served as the Deputy Project Manager and Study Area Manager for the Los Angeles Basin for this comprehensive CEQA document reviewing the potential impacts of hundreds of miles of newly proposed fiber optic lines throughout northern and southern California, including Los Angeles and Orange Counties. Issues of concern focused on potential construction impacts of linear alignments in highly urbanized rights-of-way, and resultant land use, traffic and utilities conflicts.
- **U.S. Army Corps of Engineers, Los Angeles District.** Ms. Vahidi is responsible for managing Delivery Orders and conducting the analyses of the social science issue areas for 16 projects throughout southern California and Arizona as part of two environmental services contracts. Delivery orders have included:
  - **Northeast Phoenix Drainage Area Alternatives Analysis Report, Phoenix and Scottsdale, AZ.** As the project manager guided the preparation of an alternatives analysis report that evaluated the potential environmental impacts associated with channel and detention basin alternatives to control flooding problems resulting from fast rate of development in the northeast Phoenix area.
  - **Imperial Beach Shore Protection EIS/EIR, Imperial Beach, CA.** Responsible for preparing the affected environment and environmental consequences sections for the land use, recreation, aesthetics, and socioeconomics issue areas. This EIS will analyze the impacts of shore protection measures along a 4.7-mile stretch of beach in southwest San Diego County.
  - **U.S. Food and Drug Administration Laboratory EIS/EIR, Irvine, CA.** Prepared the land use and recreation; socioeconomics, public services, and utilities; and visual resources/aesthetics analyses for this proposed "mega-laboratory" on the University of California Irvine Campus. Also developed the cumulative projects scenario for analyses of cumulative impacts. As the Public Participation Coordinator for the EIS/EIR review process, prepared the NOP, set up the scoping meeting and public hearing, prepared meeting handouts, and developed the project mailing list.
  - **San Antonio Dam EIS, Los Angeles and San Bernardino Counties, CA.** Responsible for preparing the cultural resources, land use and recreation, and aesthetics sections for the analysis of impacts resulting from the re-operation of San Antonio Dam to increase flood protection.
  - **Rio Salado Environmental Restoration EIS, Phoenix and Tempe, AZ.** Conducted the land use and recreation, and aesthetics analyses for this environmental restoration project in the Salt River and Indian Bend Wash located in the Cities of Phoenix and Tempe. Incidental to the primary objective of the Proposed Action (environmental restoration) is the creation of passive recreational opportunities associated with the restored habitat areas, such as trails for walking and biking, and areas for observing wildlife and learning about the natural history of the river.
  - **Airspace Restrictions EA, Ft. Irwin, CA.** Conducted the land use, recreation, aesthetics, and socioeconomics analyses of impacts for the conversion of unrestricted airspace to restricted airspace above Ft. Irwin in the Mojave Desert.
  - **National Guard Armory Building EA, Los Angeles, CA.** Conducted the land use, aesthetics, and socioeconomics analyses and prepared the cumulative impacts and policy consistency sections.

- **Supplemental EA for the Seven Oaks Dam Woolly Star Land Exchange, San Bernardino County, CA.** Prepared the land use and recreation analyses and policy consistency section.
- **Lower Santa Ana River Operations and Maintenance EA, Orange County, CA.** Responsible for conducting the land use, recreation, aesthetics, socioeconomics, and cultural resources analyses.
- **EA for Area Lighting, Fencing, and Roadways at the International Border, San Diego, CA.** Conducted the land use, aesthetics, and socioeconomics analyses and prepared the policy consistency section.
- **Border Patrol Checkpoint Station EA, San Clemente, CA.** Analyzed the aesthetic impacts of the installation of a concrete center divider and a Pre-inspected Automated Lane adjacent to and parallel to Interstate 5.
- **Upper Newport Bay Environmental Restoration Project, Newport Beach, CA.** Prepared physical setting, socioeconomics, land and water uses, and cultural resources sections for the Baseline Conditions Report and the Environmental Planning Report.
- **Whitewater/Thousand Palms Flood Control Project, Thousand Palms, CA.** Prepared the land use and recreation, aesthetics, and socioeconomics affected environment sections for the project's Baseline Conditions Report that was incorporated into the project EIS.
- **San Antonio Creek Bridges Project, Vandenberg Air Force Base, CA.** Prepared the physical setting, land use, socioeconomics, utilities, and aesthetics sections for analyses of bridge alternative impacts for missile transport on Vandenberg Air Force Base.
- **Ft. Irwin Expansion Mitigation Plan, Mojave Desert, CA.** Responsible for developing Ft. Irwin's Public Access Policy based on mitigation measures from the Army's Land Acquisition EIS for the National Training Center. Policy includes provisions for access by research and scientific uses.

- **Los Angeles Unified School District (LAUSD), Los Angeles County, CA.** Ms. Vahidi is Program Manager for Aspen's Environmental Master Services Agreement with the LAUSD (nation's second largest school district) to prepare CEQA documents (EIRs, IS/MNDs, Categorical Exemptions) in review of the LAUSD's four-phased new school construction program intended to meet existing and projected overcrowded conditions (200,000 seat shortfall) within the LAUSD (i.e., City of Los Angeles and all or parts of 28 surrounding jurisdictions cover 700 square miles of land). As the Program Manager, she is responsible for client interface and providing CEQA expertise to the LAUSD on day-to-day basis, QA/QC activities for all Aspen documents submitted, budget tracking and allocation, staff assignments, and the general day-to-day management of this contract. Thus far, Aspen has been awarded 48 CEQA document assignments for new school projects, school expansions and additions. In addition to her duties as the contract manager, Ms. Vahidi has managed the preparation of several CEQA documents under this contract, including:

  - **East Valley Middle School No. 2 EIR.** This middle school was proposed to be located at the previous Van Nuys Drive-In site. The EIR focused on impacts associated with air quality, hazards and hazardous materials, noise, land use and planning, and traffic and transportation. Major issues of concern included traffic and noise generated by school operation activities. The EIR included LAUSD design standards and measures employed to minimize environmental impacts.
  - **Canoga Park New Elementary School IS/MND.** This elementary school would be developed on a parcel of land owned by the non-profit organization, New Economics For Women (NEW). This "Turn-Key" project consisted of a Charter Elementary School to be developed by NEW and sold to the LAUSD for operation. It was later decided that NEW would lease the school back and run it as a charter school. Issues of concern included, pedestrian safety, traffic, air quality, noise, and land use.
  - **Mt. Washington Elementary School Multi-Purpose Room Addition Project IS/MND.** This project proposed the development of a multi-purpose room facility, including a library, auditorium, and theater, to the existing Mt. Washington Elementary School campus located in Los Angeles. The surrounding residential community had concerns regarding the proposed project's impacts on aesthetics, traffic, air quality, and noise. Of particular concern, were impacts generated due to the after-hours use of the multi-purpose room facility by civic and community groups.

- **New School Construction Program EIR.** Serves as a Study Area Manager (Valley Districts), and Issue Area Coordinator (IAC) (i.e., technical lead and reviewer) for social science issues, including land use, socioeconomics, public services, population and housing, and utilities and service systems. As the IAC, she has formulated the scope of work and methodology for analysis of issues and mitigation options. In addition to her managerial duties, Ms. Vahidi is preparing the Land Use section of the EIR, and directing the preparation of the Project's Scoping Report.
- **Belmont Senior High School 20-Classroom Modular Building Addition Project.** Under Aspen's on-going master services agreement with the LAUSD, served as the project manager for CEQA documentation and permitting efforts related to the addition of modular classrooms to the existing Belmont Senior High School campus. Issues of concern included, potential impacts to sensitive receptors adjacent to the school from construction-related air quality, noise, and traffic, and operation-related noise generated by the new classrooms. As the LAUSD's CEQA consultant, Ms. Vahidi directed the preparation of technical documentation in support of a Class 32 In-Fill CEQA Categorical Exemption. This technical documentation included analyses of potential project-related air quality, noise, and traffic impacts, which were then submitted to LAUSD as one packet. Subsequent to preparation of this packet, LAUSD filed a CEQA Notice of Exemption for the classroom addition project.
- **Narbonne High School Stadium Lighting Project MND Addendum.** Served as the project manager for this project proposed to add a new stadium, lighting, and associated sport facilities needed to address existing needs at Narbonne High School. Issues of concern include lighting impacts to the surrounding neighborhood, and available parking stock.

- **SCE Calnev Power Line and Substation Project IS/MND.** Aspen was contracted to thoroughly review and analyze Southern California Edison Company's Application for a Permit to Construct and Proponent's Environmental Assessment (PEA) for the Calnev Power Line and Substation Project in the City of Colton. Ms. Vahidi served as the Deputy Project Manager for preparation of the IS/MND. Tasks include: a site visit, and evaluation of the project's compliance with the Commission's General Order 131D, Rule 17.1, and associated information submittal requirements; and preparation of a letter report identifying data deficiencies of the Application and PEA. Upon formal CPUC acceptance of the Application and PEA, Aspen prepared a CEQA Initial Study Checklist by identifying baseline data, project characteristics, and determining impact significance for each issue area. Each issue area's impact determination was supported by a paragraph or more of analysis describing the rationale for the impact identified, or for the lack of a significant impact. Upon completion of the Initial Study, the Mandatory Findings of Significance were prepared and Aspen determine that a Mitigated Negative Declaration should be prepared per CEQA Guidelines.
- **SCE Six Flags Substation and Power Line Project IS/MND.** Ms. Vahidi served as Deputy Project Manager for preparation of the IS/MND. Reviewed and provided comments on the permit application by SCE to construct a substation and power line to provide electrical service to Six Flags Amusement Park in Valencia, CA. Subsequent to the application completeness review, she prepared the project's Initial Study Checklist and Mitigated Negative Declaration for the California Public Utilities Commission (CPUC). Identified possible deficiencies and provided recommendations.
- **Industrywide Survey for the South Coast Air Quality Management District.** Ms. Vahidi coordinated Aspen's work for an Air Toxics Survey of harmful emissions by auto body and paint shops, performed in compliance with AB2588. She was responsible for development of an industrywide emission inventory for these facilities; she also performed information management, facility verifications, survey mail-outs, emissions calculations, analysis of calculated results, and preparation of the final report.
- **Technical Support to NEPA Lawsuit, Angeles National Forest, CA.** Ms. Vahidi prepared a detailed project chronology and a list of all applicable federal, State, and local laws and regulations in support of the USDA Office of General Counsel and National Forest's response to the City of Los Angeles' 1996 lawsuit on the adequacy of the Pacific Pipeline EIS.
- **Yellowstone Pipeline EIS, Lolo National Forest, Montana.** Environmental Justice and Public Services Issue Area Specialist. Responsible for conducting the analysis of project impacts on minority and

low-income populations to comply with Presidential Executive Order 12898 on Environmental Justice using Census data to determine population density, minority population percentages and unemployment rates to determine the potential for disproportionate project impacts on affected communities. Also responsible for conducting analysis of project impacts such as population inmigration and pipeline accidents on public services in western Montana. During the EIS scoping process, she served as the project public participation coordinator and was responsible for preparation of the project newsletter, setup of the first round of scoping meetings, and determination of project information centers.

- **Santa Fe Pacific Pipeline Project EIR.** Ms. Vahidi was responsible for development and screening of alternatives for a 13-mile petroleum products pipeline from Carson to Norwalk, CA. Prepared analyses of project impacts on socioeconomics, public services, utilities, and aesthetics.
- **Pacific Pipeline Project Mitigation Monitoring, Compliance, and Reporting Program (MMCRP).** Ms. Vahidi served as the expert technical reviewer for the socioeconomics and environmental justice issues. As the MMCRP Agency Liaison, was responsible for developing protocol for efficient interagency communication procedures in coordination of mitigation activities with the CPUC, USFS, Responsible Agencies, and the project proponent. Also responsible for the development and management of the MMCRP Community Outreach and Public Access Program.
- **Pacific Pipeline Project EIR.** For the California Public Utilities Commission's (CPUC) EIR on the originally proposed route of this proposed pipeline (from Santa Barbara County to Los Angeles), Ms. Vahidi developed and coordinated a public participation program to comply with CEQA's mandate for information disclosure and public involvement in decision-making. The Final EIR was certified in September 1993.
- **Pacific Pipeline Project EIS and Subsequent EIR.** Ms. Vahidi prepared the socioeconomics and public services analysis, the Environmental Justice analysis in compliance with Presidential Executive Order 12898, as well as portions of the Land Use and Public Recreation analyses, including a comprehensive comparative analysis of project alternatives on this EIS/Subsequent EIR for the U.S. Forest Service (Angeles National Forest) and the CPUC. Ms. Vahidi managed the subsequent GIS mapping of socioeconomic data relative to pipeline corridor alternatives and other industrial facilities. She also prepared the cumulative projects list (covering a five county area for the Proposed Project and its alternatives) used for the cumulative scenario analyses of the various issue areas in the EIS/SEIR. As the Public Participation Program Coordinator for the project, she developed, implemented, and managed the public involvement efforts for the NEPA and CEQA environmental review processes. This included: setup and logistics for 20 separate scoping meetings, informational workshops, and public hearings along the project route; preparation of all meeting handouts; preparation of project newsletters and public notices; placement of project documents on Internet; and maintenance of the a project telephone information hotline. She also reviewed over 2,000 public comments (written and verbal) received on the Draft EIS/SEIR, for subsequent distribution to the project team.
- **Alturas Transmission Line Project EIR/EIS.** Ms. Vahidi conducted the analysis of potential impacts on minority populations and low-income populations in compliance with Presidential Executive Order 12898 on Environmental Justice using Census data to determine population density, minority population percentages and unemployment rates, and the potential impacts of the transmission line on affected communities. She also prepared the cumulative projects list and map used for analyses of cumulative impacts. She managed development of meeting handouts; scheduling and logistics for four scoping meetings; developed and maintained project mailing list; reviewed public scoping comments and prepared the Scoping Report; coordinated four sets of informational workshops and public hearings for the Draft EIR/EIS; supervised the distribution of comments on the Draft EIR/EIS to the project team; and coordinated the distribution of the Draft and Final EIR/EIS to affected public agencies, organizations, and citizens.

EIP Associates 1998 to 2001

- **Program EIR for the Divestiture of PG&E's Hydroelectric Generation Assets.** For the CPUC's EIR evaluating the Pacific Gas & Electric Company's (PG&E) proposal to divest their hydroelectric facilities in California, served as the land use technical analyst for two watershed areas, and the Task Manager for the Socioeconomics and Transportation sections of the EIR covering five watershed areas. PG&E owns and operates the largest private hydroelectric power system in the nation. Situated in the Sierra Nevada, Southern Cascade, and Coastal mountain ranges of California, this system is strung along 16 different river basins and annually generates approximately five percent of the power consumed each year in California. The proposed sale of assets also includes approximately 140,000 acres of land proposed for sale with the hydroelectric system. The EIR analyzes the range of operational changes that could occur under new ownership, including complex integrated models that analyze power generation and water management. The land use section of the EIR examines the implications of the change in ownership of lands and the potential for impacts due to development or potential changes in use. Contributed significantly to the extensive GIS analysis, which was conducted to determine the development suitability and potential intensity of development that might occur on the lands if sold. These results served as one of the primary bases for analysis of impacts associated with the sale of the hydroelectric assets.
- **Section 108 Loan Guarantee EA/FONSI for the Waterfront Development Project.** Served as the Manager and Principal Preparer for this EA/FONSI for the City of Huntington Beach Economic Development Department. Prepared NEPA documentation evaluating the impacts resulting from the use of HUD Section 108 Loan guarantee funds for the Waterfront Resort Expansion Project in accordance with The HUD NEPA Guidelines and Format 1 (Environmental Assessments at the Community Level). Tasks included: (1) Evaluation of activities that would be categorically excluded from NEPA based on an assessment of the NEPA Implementing Guidelines for HUD Projects; (2) Evaluation of proposed actions compliance with all applicable federal statutes, regulations, and policies; and (3) Preparation of an Environmental Assessment/Mitigated Finding of No Significant Impact (EA/FONSI) for proposed actions that are not categorically excluded. Proposed actions to be evaluated consisted mainly of infrastructure improvement projects, rehabilitation and/or development of affordable housing, provision of relocation assistance, facilitation of development and/or redevelopment plans, property acquisition, provision of open space, etc.
- **MTA Mid Cities/Westside Transit Corridor Study EIS/EIR.** Served as the EIS/EIR Deputy Project Manager (DPM) for this 3-phase (including prepared the Major Investment Study (MIS), the Environmental Impact Statement (EIS), and an evaluation of the urban design implications of transit interventions on selected routes) study intended to address current and long range traffic congestion in the central and westside areas of the Los Angeles, Basin. Three east/west corridors and a range of transit alternatives ranging including Rapid Bus, light rail, and heavy rail are being evaluated. In addition to her duties as DPM for this comprehensive joint EIS/EIR, Ms. Vahidi prepared the Environmental Justice Analysis (per Executive Order 12898), the Section 4(f) Parklands discussion, and the land use and socioeconomics sections of the EIS/EIR.
- **Wes Thompson Ranch Development Project EIR.** Served as the EIR Project Manager for this hillside residential development in the City of Santa Clarita. Issues of concern included seismic and air quality impacts associated with the excavation of 2 million cubic yards of soil, the project's non-compliance with the City's hillside ordinance for innovative design, and traffic generated by project-related population growth in the area. Four different site configuration alternatives were developed as part of the EIR analysis. Other issues of concern included sensitive biological resources, the potential for hydrological impacts due to disturbance of the hillside, and cultural resources.
- **City of Santa Monica Environmental Assessments.** As one of the City's qualified CEQA consultants managed several environmental assessment documents for housing, commercial, institutional, and mixed-use developments in compliance with CEQA, including:

- **Berkeley Manor Condominium EIR and Technical Reports**. This one-issue EIR originally was a CEQA Categorical Exemption per direction of the City. During preparation of the Categorical Exemption documentation, it was determined that project-generated traffic would have potentially significant impacts. As a result, a traffic technical report was prepared as the background document for and EIR. In addition, shade and shadow impacts were evaluated in a technical report to ensure that shading impacts from the proposed structure on surrounding uses would not be significant. A simple Excel model was developed for calculation of shade and shadow angles.
- **Seaview Court Condominiums IS/MND.** This comprehensive Initial Study/Mitigated Negative Declaration included six technical reports including traffic, cultural resources, parking survey, shade and shadow analysis, and a geotechnical assessment to evaluate the level of severity of this development in the waterfront area of Santa Monica. Major issues of concern were; parking and project-generated traffic on adjacent narrow residential streets; visual obstruction and shading impacts of the proposed structure; liquefaction and seismic impacts to adjacent properties as result of the project's excavation for a subterranean parking garage; and the potential impacts of the project to impact the integrity of a historic district and the historic Seaview Walkway to the beachfront.
- **Four-Story Hotel IS/MND.** A comprehensive Initial Study/Mitigated Negative Declaration was prepared for this four-story hotel adjacent to St. John's Hospital in Santa Monica. Major issues of concern included project-generated traffic on surrounding multi-family residential uses and emergency access to the hospital.
- **Santa Monica College Parking Structure B Replacement EIR.** This focused EIR addressed issues related to traffic and neighborhood land use impacts associated with the addition of a 3-story parking structure in the center of the SMC campus. Major issues of concern included the potential for project-generated traffic to cause congestion at the school's main entrance on Pico Boulevard, and the potential for overflow traffic to impact the Sunset Community of single-family homes adjacent to the school.
- **North Main Street Mixed-Use Development Project EIR.** This EIR included evaluation of impacts resulting from the development of a mixed-use development in Santa Monica's "Commercial Corridor" on Main Street, with ground-floor residences and boutique commercial uses. Major issues of concern included traffic and parking impacts to Main Street and surrounding residential land uses, shade and shadow impacts, and neighborhood impacts.

- **Specific Plans and Redevelopment Projects.** As the senior technical lead for land use, prepared the project description, alternatives screening and development, cumulative scenario, and land use analysis for:
  - **Cabrillo Plaza Specific Plan EIR in Santa Barbara.** This project consisted of a mixed-use commercial development on Santa Barbara's waterfront on Cabrillo Boulevard. On-site uses included an aquarium, specialty retail, restaurants, and office space.
  - **Culver City Redevelopment Plan and Merger EIR.** This programmatic EIR evaluated the impacts of the City's redevelopment of its redevelopment zones. A major land use survey and calculation of acreage of redevelopment lands was conducted as part of the EIR.
  - **Dana Point Headlands Specific Plan EIR.** This EIR evaluated the development of coastal bluff in the City with hotel, single- and multi-family residential, and commercial uses. Major issues of concern included ground disturbance as a result of excavation, impacts to terrestrial and wildlife biology, recreation impacts to beachgoers, and project-generated population inducement.
  - **Blocks 104/105 Redevelopment Project EIR in Huntington Beach (Project Manager).** This EIR evaluated the development of a supermarket, retail shops, and office space in the City's Waterfront Redevelopment Zone. Issues of concern evaluated included traffic, land use, and impacts to on-site historic structures.

HONORS AND AWARDS

- 2006 American Planning Association, Los Angeles Section Environmental Award for the Los Angeles Unified School District New School Construction Program, Program EIR
- 2004 Association of Environmental Professionals Statewide Best EIR Award for the Jefferson-Martin 230 kV Transmission Project EIR.
- 2001 Outstanding Performance Award from the State of California Energy Commission.

- 1992-93 recipient of the USC Merit ("Ides of March") Scholarship from the Southern California Association of Public Administrators (SCAPA).
- University of California, Irvine, School of Social Sciences. Graduated with Highest Honors in Political Science.

PROFESSIONAL ASSOCIATIONS

- American Planning Association (APA), Los Angeles Section Executive Board Member
- Association of Environmental Professionals (AEP)

DECLARATION OF
Erin Bright

I**, Erin Bright,** declare as follows:

1. I am presently employed by the California Energy Commission in the **Engineering Office** of the Siting Transmission and Environmental Protection Division as a **Mechanical Engineer**.

2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I prepared the staff testimony on **Noise and Vibration** for the **Genesis Solar Energy Project** based on my independent analysis of the Application, supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issues addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: February 18, 2010 Signed: _____

At: Sacramento, California

Erin Bright
Mechanical Engineer

Experience Summary

Two years of experience in the electric power generation field, including analysis of noise pollution, construction/licensing of electric generating power plants, and engineering and policy analysis of thermal power plant regulatory issues. One year of experience in the alternative energy field, including analysis of alternative fuel production and use.

Education

- University of California, Davis--Bachelor of Science, Mechanical Engineering and Materials Science
- University of California, Davis Extension Program--Renewable Energy Systems

Professional Experience

2007 to Present-- Mechanical Engineer, Energy Facilities Siting Division - California Energy Commission

Performed analysis of generating capacity, reliability, efficiency, noise, and the mechanical, civil/structural and geotechnical engineering aspects of power plant siting cases.

2006 to 2007--Energy Analyst, Fuels & Transportation Division - California Energy Commission

Performed analysis of use potential and environmental effects of emerging non-petroleum fuels, including compressed natural gas, biomass, hydrogen and electricity, in heavy and light duty transportation vehicles. Contributor to Energy Commission's alternative fuels plan.

DECLARATION OF
Testimony of Scott Debauche

I**, Scott Debauche,** declare as follows:

1. I am presently employed by Aspen Environmental Group, a contractor to the California Energy Commission, Siting, Transmission and Environmental Protection Division, as a **Socioeconomic Technical Specialist**.

2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I prepared the staff testimony on **Socioeconomics** for the **Genesis Solar Energy Project** based on my independent analysis of the Application for Certification and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated: March 23, 2010 Signed: _____

At: Agoura Hills, California

SCOTT DEBAUCHE

Environmental Planner

ACADEMIC BACKGROUND

B.S., Urban & Regional Planning, University of Minnesota, 1994

PROFESSIONAL EXPERIENCE

Mr. Debauche is an environmental planner with over 14 years of experience preparing a variety of federal and State of California environmental, planning, and analytical documents for large-scale infrastructure and development projects. Mr. Debauche brings the experience of specializing in the integration and completion of NEPA and CEQA documentation joint documentation evaluating Transportation/Traffic, Noise, Socioeconomics and Environmental Justice, Air Quality, and Alternatives analyses.

Aspen Environmental Group — 2001 to present

- **TANC Transmission Project (TTP) EIR/EIS, several Northern California Counties.** Mr. Debauche is currently serving as the Technical Specialist in charge of preparation of the EIR/EIS Transportation/Traffic and Socioeconomics CEQA/NEPA analyses. The Transmission Agency of Northern California (TANC) and Western Area Power Administration (Western), an agency of the U.S. Department of Energy (DOE), are the CEQA lead agency and NEPA lead agency, respectively. The TTP generally would consist of new and upgraded 500 kilovolt (kV) and 230 kV transmission lines, substations, and related facilities generally extending from northeastern California near Ravendale in Lassen County to the California Central Valley through Sacramento and Contra Costa Counties and westward into the San Francisco Bay Area.
- **Littlerock Reservoir Sediment Removal Project EIS/EIR, Palmdale, CA.** Mr. Debauche is the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, and Socioeconomics analyses for this joint EIS/EIR evaluating the impacts of sediment removal alternatives for the Littlerock Reservoir and Dam on USFS Angeles National Forest (NEPA Lead Agency) lands in Los Angeles County. The project involves impacts to the arroyo toad, extensive coordination with USFWS for a Section 7 consultation, incorporation of new Forest Service Plan updates and requirements into the analysis, preparation of the Forest Service required BE/BA, and analysis of compliance with federal conformity requirements. Aspen is currently working on the Administrative Draft EIR/EIS and assisting the PWD with portions of their Proposition 50 grant application to the DWR.
- **Alta Wind Project EIR, Kern County, CA.** Mr. Debauche is the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, and Air Quality analyses for this EIR. The applicant, Alta Windpower Development, LLC, proposes to develop the Alta-Oak Creek Mojave Project (proposed project or project) for the commercial production of up to 800 Megawatts (MW) of electricity from wind turbines. The proposed project would result in construction of up to 350 wind turbine generators, their ancillary facilities and supporting infrastructure located on three distinct land areas comprising a total of approximately 10,750 acres located approximately 3 miles west of State Route (SR) 14 (Antelope Valley Freeway) and 3 miles south of SR-58 in the Willow Springs area of eastern Kern County.

- **Liberty Energy Power Plant EIR, Banning, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Air Quality, Public Services and Utilities, and Hazardous Materials analyses for this CEQA document. Liberty Energy is proposing to construct a new biomass power plant, located at the eastern terminus of Westward Avenue in the City of Banning, Riverside County, California. The generating facility would include three power generation units (trains) to produce 15 MW (17.5 MW gross). Each unit would utilize a bubbling fluidized bed gasifier boiler to generate heat to produce high pressure steam.
- **Baldwin Hills Oil Field Community Standards District EIR Review and Ordinance Preparation, Culver City, CA.** Mr. Debauche served as the Technical Specialist for the City of Culver City reviewing the Los Angeles County Baldwin Hills Oils Field Community Standards District EIR Noise analysis evaluating the impacts of expanding the existing Baldwin Hills oil field. Once completed, Mr. Debauche then prepared the Noise section of the newly enacted City of Culver City Community Standards District overlay zone restricting noise generation by the Baldwin Hills Oil Field on the residents of Culver City.
- **Topaz Solar Project EIR, San Luis Obispo County, CA.** Mr. Debauche is the Technical Specialist in charge of preparation of the Transportation/Traffic and Air Quality sections of this EIR for this 500 MW solar photovoltaic project in the Carrizo Plain area. This project requires the conversion of approximately 6,000 acres of open space (60 percent of which are under land preservation contracts) to an industrial use.
- **California Valley Solar Ranch EIR, San Luis Obispo County, CA.** Mr. Debauche is the technical specialist in charge of preparation of the Air Quality analysis of this EIR for this 250 MW solar photovoltaic project in the Carrizo Plain area. This project requires the conversion of approximately 4,000 acres of open space to an industrial use.
- **Long Beach LNG Import Project EIR/EIS, Long Beach, CA.** Under contract to the City of Long Beach, Aspen was tasked to review the Draft EIS/EIR for the proposed construction and operation of this onshore LNG facility to be located at the Port of Long Beach. Mr. Debauche reviewed the document for technical adequacy and assisted the City in preparing written comments for the following sections of the EIS/EIR: Transportation/Traffic and Noise.
- **Sunset Substation and Transmission and Distribution Project EIR, Banning, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives analyses for this EIR. The City of Banning proposes to construct the Sunset Substation and supporting 33-kilovolt (kV) transmission line that would interconnect with the City's existing distribution system. The purpose of this new substation and transmission is to relieve the existing overloads that are occurring within the City's electric system and to accommodate projected growth in the City.
- **MARS EIR/EIS, Monterey, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Environmental Justice analysis for this EIR/EIS, which would evaluate the effects associated with the installation and operation of the proposed Monterey Accelerated Research System (MARS) Cabled Observatory Project (Project) proposed by Monterey Bay Aquarium Research Institute (MBARI)[NEPA Lead Agency]. The goal of the Project was to install and operate, in State and Federal waters, an advanced cabled observatory in Monterey Bay that would provide a continuous monitoring presence in the Monterey Bay National Marine Sanctuary (MBNMS) as well as serve as the test bed for a state-of-the-art regional ocean observatory, currently one component of the National Science Foundation (NSF) Ocean Observatories Initiative (OOI). The Environmental Justice analysis evaluated the potential for any disproportionate project impacts to both land-based populations and fisheries workers.
- **Diablo Canyon Power Plant (DCPP) Steam Generator Replacement Project EIR, San Luis Obispo County, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation

of the Socioeconomics and Alternatives analyses sections of this EIR. The EIR addressed impacts associated with the replacement of the eight original steam generators (OSGs) at DCPP Units 1 and 2 due to degradation from stress and corrosion cracking, and other maintenance difficulties. The Proposed Project would be located at the DCPP facility, which occupies 760 acres within PG&E's 12,000-acre owner-controlled land on the California coast in central San Luis Obispo County. Land use issues of concern include impacts to agricultural lands, recreational resources, and potential Coastal Act inconsistencies.

- **Lake Canyon Dam and Detention Basin Project EIR, Ventura County, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Air Quality, and Hazardous Materials analyses for this CEQA document. The proposed project would include an earthfill dam and detention basin located in an unincorporated area of Ventura County, California. It would operate in conjunction with the existing Arundell Dam and Detention Basin, which is located an estimated 600 feet south-southwest and downstream of the proposed project site, to detain peak storm flows and capture the associated debris expected from a 100-year storm event.
- **Colton Substation Project IS/MND, Colton, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Air Quality, and Hazardous Materials analyses for this CEQA document. The City of Colton proposes to construct the 1.9 acrea North Substation and supporting 1.7 miles of 69 kV subtransmission and distribution facilities necessary to interconnect with the existing city-owned subtransmission and distribution systems.
- **San Antonio Creek Giant Reed Removal Project IS/MND, Ventura County, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of a number of technical issues area analyses for this CEQA document including: Transportation/Traffic, Noise, Air Quality, and Hazardous Materials. The purpose of the project is to remove giant reed within the upper reaches of the San Antonio Creek watershed and several tributaries to support other existing efforts to remove this invasive plant species along the main stem of the Ventura River and its watershed.

California Public Utilities Commission (CPUC). Under Aspen's environmental services contract with the CPUC, Mr. Debauche has prepared environmental analysis sections of environmental reports analyzing large-scale infrastructure projects. His project experience with the CPUC includes the following:

- **Tehachapi Renewable Transmission Project (TRTP) EIR/EIS, Kern, Los Angeles, and San Bernardino Counties, CA.** For this EIR/EIS prepared by USFS, Angeles National Forest and CPUC, Mr. Debauche is currently serving as the Technical Specialist for Noise and Alternatives evaluation for SCE's proposal to construct, use, and maintain a series of new and upgraded high-voltage electric transmission lines and substations to deliver electricity generated from new wind energy projects in eastern Kern County. Approximately 46 miles of the project would be located in a 200- to 400-foot right-of-way on National Forest System land (managed by the Angeles National Forest) and approximately three miles would require expanded right-of-way within the Angeles National Forest. The proposed transmission system upgrades of TRTP are separated into eight distinct segments: Segments 4 through 11. Segments 1 (Antelope-Pardee) and Segments 2 and 3 (Antelope Transmission Project) were evaluated in separate CEQA and NEPA documents as described below.
- **Devers–Palo Verde 500 kV Transmission Line Project EIS/EIR, southern California/western Arizona.** For this EIR/EIS prepared by U.S. Bureau of Land Management and CPUC, Mr. Debauche served as the Technical Specialist for Transportation/Traffic, Noise, Socioeconomics, and Alternatives evaluation for SCE's proposed 250-mile transmission line project from the Palo Verde Nuclear power plant in Arizona to the northern Palm Springs area in California. Major issues of concern include EMF and visual impacts on property values, impacts on the area's vast recreational resources and tribal lands, and the development and evaluation of several route alternatives, including the Devers-Valley No. 2 Route Alternative, which eventually was approved by the CPUC.

- **Antelope-Pardee 500 kV Transmission Line Project EIS/EIR, Los Angeles County, CA.** For this EIR/EIS prepared by USFS, Angeles National Forest and CPUC, Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives evaluation for SCE's proposed 25-mile transmission line project from the Antelope Substation in the City of Lancaster, through the ANF, and terminating at SCE's Pardee Substation in Santa Clarita. Major issues of concern included impacts to biological, recreational, and cultural resources within Forest lands, EMF and visual impacts on property values, impacts on residences in the urbanized southern regions of the route, and the development and evaluation of several route alternatives.
- **El Casco System Project EIR, Riverside, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives analyses for this EIR prepared for the CPUC to evaluate SCE's application for a Permit to Construct (PTC) the El Casco System Project. The Proposed Project would be located in a rapidly growing area of northern Riverside County, which includes the Cities of Beaumont, Banning, and Calimesa. A 115 kV subtransmission line begins at Banning Substation and extends westward toward the proposed El Casco Substation site within the existing Banning to Maraschino 115 kV subtransmission line and Maraschino–El Casco 115 kV subtransmission line ROWs. Major issues of concern include impacts to existing and residential land uses, which have led to the development of a partial underground alternative and a route alternative different than the project route proposed by SCE (the Applicant). The 1,200-page Draft EIR was released for a 45-day public review and comment on December 12, 2007, and evaluates project alternatives at the same level of detail as the Proposed Project analysis.
- **Antelope Transmission Project, Segments 2 & 3 EIR, Los Angeles and Kern Counties, CA.** For this EIR prepared by the CPUC, Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives evaluation. The proposed Project includes both Segment 2 and Segment 3 of the Antelope Transmission Project, and involves construction of new transmission line infrastructure from the Tehachapi Wind Resource Area in southern Kern County, California, to SCE's existing Vincent Substation in Los Angeles County, California. The Tehachapi Wind Resource Area is one of the State's greatest potential sources for the generation of wind energy. A variety of wind energy projects are currently in development for this region. Major issues of concern include EMF and visual impacts on property values, impacts on residences and agricultural resources, and the development and evaluation of several substation and route alternatives.
- **SDG&E Miguel Mission Substation Draft EIR.** The major part of the Proposed Project would include the installation of a new, bundled 230 kV circuit between Miguel and Mission Substations, which would be located entirely within SDG&E's existing 35-mile ROW. Mr. Debauche prepared social science analysis for the Initial Study, as well as the Draft EIR Project Description and several key environmental sections.
- **PG&E's Proposed Divestiture of Hydroelectric Assets Project EIR.** Mr. Debauche prepared several key sections of the Draft EIR, including Socioeconomics and Hazardous Materials analysis. PG&E owns and operates the largest private hydroelectric power system in the nation. Situated in the Sierra Nevada, Southern Cascade, and Coastal mountain ranges of California, this system is strung along 16 different river basins and annually generates approximately five percent of the power consumed each year in California. The proposed sale of assets also includes approximately 140,000 acres of land proposed for sale with the hydroelectric system. The EIR analyzes the range of operational changes that could occur under new ownership, including complex integrated models that analyze power generation and water management.
- **Viejo System Project IS/MND, Orange County, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives evaluation for the project's CEQA documentation, including and Initial Study, prepared on behalf of the CPUC to evaluate Southern California Edison's (SCE) Application for a Permit to Construct the Viejo System Project, which was in SCE's forecasted demand of electricity and goal of providing reliable electric service in southern Orange County. The Viejo System Project would serve Lake Forest, Mission Viejo, and the surrounding areas. Components of the project included, construction of the new 220/66/12 kilovolt (kV) Viejo Substation, installation of a new 66 kV subtransmission line within an existing SCE right-of-way, replacement of 19 double-circuit tubular steel poles with 13 H-frames structures, and minor modification to other transmission lines. Major issues of concern include visual impacts of transmission towers, EMF effects, and project impacts on property values.

- **Looking Glass Networks Fiber Optic Cable Project IS/MND, northern and southern California.** As part of Aspen's ongoing contract with the CPUC for review of Telecommunications projects, this document encompasses and evaluation of project impacts and network upgrades in the San Francisco Bay Area and the Los Angeles Basin Area. Prepared the socioeconomic analysis for this comprehensive CEQA document reviewing the potential impacts of hundreds of miles of newly proposed fiber optic lines throughout northern and southern California, including Los Angeles and Orange Counties. Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives evaluation for the project's CEQA documentation.

California Energy Commission (CEC), Technical Assistance in Application for Certification Review. In response to California's power shortage, Aspen is assisting the California Energy Commission in evaluating the environmental and engineering aspects of new power plant applications throughout the State. As part of this effort, Mr. Debauche works as a technical specialist for Transportation/Traffic, Socioeconomics and Environmental Justice, and Alternatives analyses for the following power plant projects:

- **Carlsbad Energy Center Project, Carlsbad, CA.** Technical Specialist in charge of preparation of the Transportation/Traffic and Alternatives Staff Assessments for Carlsbad Energy Center, LLC's Application for Certification (AFC) to build the Carlsbad Energy Center Project (CECP), which will consist of a 558 MW gross combined-cycle generating facility configured using two units with one natural-gas-fired combustion turbine and one steam turbine per or unit. Issues of concern include major incompatibilities with local LORS, and cumulative impacts from widening of I-5.
- **Hydrogen Energy California Power Plant Project, Kern County CA.** Technical Specialist in charge of preparation of the Transportation/Traffic and Socioconomics/Environmental Justice Staff Assessments for Hydrogen Energy International, LLC integrated gasification combined cycle (IGCC) power generating facility called Hydrogen Energy California (HECA) in Kern County, California. The proposed project will gasify petroleum coke (or blends of petroleum coke and coal, as needed) to produce hydrogen to fuel a combustion turbine operating in combined cycle mode. The gasification component would produce 180 million standard cubic feet per day (MMSCFD) of hydrogen to feed a 390 megawatt (MW) gross combined cycle plant providing California with low-carbon baseload power to the grid.
- **CPV Vaca Station Power Plant Project, Vacaville, CA.** Technical Specialist in charge of preparation of the Transportation/Traffic Staff Assessment prepared for the CPV Vaca Station (CPVV) project, a natural gas-fired, combined-cycle electrical generating facility rated at a nominal generating capacity of 660 megawatts (MW). The CPVV is proposed for a 24-acre site located at the intersection of Lewis and Fry roads in a rural area within the city limits of Vacaville, Solano County.
- **Ivanpah Solar Electric Generating System Project, San Bernardino County, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessment/BLM EIS for a 400-megawatt solar thermal electric power generating system. The project's technology would include heliostat mirror fields focusing solar energy on power tower receivers producing steam for running turbine generators. Related facilities would include administrative buildings, transmission lines, a substation, gas lines, water lines, steam lines, and well water pumps. The proposed project would be developed entirely in the Mojave Desert region of San Bernardino County, California.
- **Abengoa Mojave Solar Power Project, San Bernardino County, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessment for a nominal 250 megawatt (MW) solar electric generating facility to be located near Harper Dry Lake in an unincorporated area of San Bernardino County. The project will implement well-established parabolic trough technology to solar heat a heat transfer fluid (HTF) technology.
- **Rice Solar Energy Generating System Project, Riverside County, CA.** Technical Specialist in charge of preparation of the Transportation/Traffic Staff Assessment/BLM EIS for a 50,000 megawatt hours (MWh) of renewable energy annually, with a nominal net generating capacity of 150 megawatts (MW) located in an unincorporated area of eastern Riverside County, California. The proposed facility will use concentrating solar power (CSP) technology, with a central receiver tower and an integrated thermal storage system.

- **Blythe Solar Power Project, Riverside County, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessment/BLM EIS for a 1,000 MW solar thermal electric generating facility in Riverside County. The project will utilize solar parabolic trough technology to generate electricity. With this technology, arrays of parabolic mirrors collect heat energy from the sun and refocus the radiation on a receiver tube located at the focal point of the parabola.
- **GWF Henrietta Peaker Project, Kings County, CA.** Technical Specialist in charge of preparation of the Transportation/Traffic Staff Assessment for GWF's proposal to modify the existing Henrietta Power Plant. New once-through steam generators (OTSGs) will be installed to allow the plant to be operated in its current simple-cycle configuration with no steam generation but with the selective catalytic reduction (SCR) and oxidation catalyst in operation, or to operate as a combined-cycle power plant generating an additional 25 MW of power with new proposed emission limits.
- **Palen Solar Power Project, Riverside County, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessment/BLM EIS for a 500 MW solar thermal electric generating facility in Riverside County. The Project will utilize solar parabolic trough technology to generate electricity. With this technology, arrays of parabolic mirrors collect heat energy from the sun and refocus the radiation on a receiver tube located at the focal point of the parabola.
- **Watson Cogeneration Steam and Electric Reliability Project, Carson, CA**. Technical Specialist for the Transportation/Traffic Staff Assessment for a nominal 85 MW combustion turbine generator (CTG), with a single-pressure heat recovery steam generator (HRSG) to provide additional process steam to the BP Carson refinery, to the existing cogeneration facility owned by Watson. The project site is a 2.5-acre brown field site located within the boundary of the existing Watson Cogeneration Facility, which is a 21.7-acre area within BP's existing Carson Refinery (BP Refinery), in the City of Carson, Los Angeles County.
- **Oakley Generating Station Project, Oakley, CA.** Technical Specialist in charge of preparation of the Transportation/Traffic Staff Assessment for a natural gas-fired, combined-cycle electrical generating facility rated at a nominal generating capacity of 624 megawatts (MW). The proposed project would be located in the City of Oakley, in Contra Costa County.
- **Canyon Power Plant Project, Anaheim, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessments for a nominal 200 megawatt (MW) simple-cycle plant, using four natural gas-fired combustion turbines and associated infrastructure proposed by Southern California Public Power Authority (SCPPA). This project is a peaking power plant project located within the City of Anaheim, California.
- **GWF Tracy Combined Cycle Power Plant Project, San Joaquin County, CA.** Technical Specialist in charge of preparation of the Transportation/Traffic Staff Assessment for GWF's proposal to modify the existing TPP, a nominal 169-megawatt (MW) simple-cycle power plant, by converting the facility into a combined-cycle power plant with a nominal 145 MW, net, of additional generating capacity.
- **Lodi Energy Center Project, Lodi, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessment for a natural gas-fired, combined-cycle electrical generating facility rated at a nominal 225-megawatt (MW). The Lodi Energy Center is proposed for a site parcel of approximately 4.4 acres adjacent to the City of Lodi's White Slough Water Pollution Control Facility (WPCF)
- **Kings River Conservation District Community Peaker Power Plant Project, Fresno County, CA.** Technical Specialist in charge of preparation of the Transportation/Traffic Staff Assessment for the Kings Rivers Conservation District, who filed a Small Power Plant Exemption for the King River Conservation District Peaking Power Plant. The proposed 97-megawatt natural gas-fired plant will be located south of the City of Fresno and near the community of Malaga in Fresno County.
- **Valero Cogeneration Project, Benicia, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessments for a proposed cogeneration facility at the Valero Refinery in Benicia. Issues addressed included impacts on public services and other project-related population impacts such as school impact fees.
- **Rio Linda/Elverta Power Project, Sacramento, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessments for a 560-megawatt natural gas power plant in

the northern Sacramento County. Issues of importance included environmental justice and impacts on property values.

- **Magnolia Power Project, Burbank, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessments for this nominal 250-megawatt natural gas combined-cycle fired electrical generating facility to be located at the site of the existing City of Burbank power plant. Environmental justice issues and potential impacts on local economy and employment were evaluated.
- **Avenal Energy Project, Kings County, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessments for a 600-megawatt combined cycle electrical generating facility, and associated linear facilities.
- **Inland Empire Energy Center Project, Riverside County, CA.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessments for a 670-megawatt natural gas-fired, combined-cycle electric generating facility and associated linear facilities including, a new 18-inch, 4.7-mile pipeline for the disposal of non-reclaimable wastewater, and a new 20-inch natural gas pipeline. The project would be located on approximately 46-acres near Romoland, within Riverside County.
- **Coastal Plant Study.** Technical Specialist in charge of preparation of the Socioeconomics/Environmental Justice Staff Assessments for a possible modernization, re-tooling, or expansion of California's 25 coastal power plants including the Encina Power Plant and the San Onofre Nuclear Power Plant.

Los Angeles Department of Water and Power (LADWP). Responsible for conducting the analyses of the technical and social science issue areas for a variety of EISs and EAs as part of two environmental services contracts. Delivery orders have included:

- **River Supply Conduit (RSC) Upper Reach Project EIR, Los Angeles and Burbank, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives analyses for the CEQA document for this project. The RSC is a major transmission pipeline in the LADWP water distribution system. The existing RSC pipeline's purpose is to transport large amounts of water from the Los Angeles Reservoir Complex and local ground water wells to reservoirs and distribution facilities located in the central areas within of the City of Los Angeles. The LADWP proposed a new larger RSC pipeline to replace and realign the Upper and Lower Reaches of the existing RSC pipeline, which would involve the construction of approximately 69,600 linear feet (about 13.2 miles) of 42-, 48-, 60-, 66-, 72-, 84-, and 96-inch diameter welded steel underground pipeline.
- **Mulholland Pumping Station and Lower Hollywood Reservoir Outlet Chlorination Station Project IS/MND, Los Angeles, CA.** Under Aspen's on-going environmental services contract with the City of Los Angeles Department of Water and Power (LADWP), Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives analyses for this project. LADWP proposed to replace the existing historic pumping/chlorination station building as well as the existing lavatory and unoccupied Water Quality Laboratory buildings with a new single structure pumping/chlorination station within the LADWP's Hollywood Reservoir Complex located in the Hollywood Hills section of the City Los Angeles. These improvements were required due to the age and deterioration of the facility and the potential risk of seismic damage to existing structures. An Initial Study was prepared in support of a City of Los Angeles General Exemption.
- **Taylor Yard Water Recycling Project (TYWRP) IS/MND, Los Angeles and Glendale, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives analyses for this project. LADWP proposed to construct the TYWRP in order to provide recycled water produced by the Los Angeles–Glendale Water Reclamation Plant (LAGWRP) to the Taylor Yard. An important part of the City of Los Angeles' expanding emphasis on water conservation is the concept that water is a resource that can be used more than once. Because all uses of water do not require the same quality of supply, the City has been developing programs to use recycled water for suitable landscaping and industrial uses. The project is located in the southernmost part of the City of Glendale and northeastern part of the City of Los Angeles. The IS/MND was adopted in the Summer of 2007.

- **DC Electrode Project IS/MND, Los Angeles, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives analyses for this project. LADWP proposed to construct a new electrode distribution line from West Los Angeles to the Pacific Ocean stopping point in Malibu, CA up the Pacific Coast Highway.
- **District Cooling Plant Project, Los Angeles IS/MND, CA.** Mr. Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic, Noise, Socioeconomics, and Alternatives analyses for this project. LADWP proposed to construct a District Cooling Plant and Distribution System (proposed project) in order to provide a centralized system for producing chilled water for use by area users, which are generally large commercial, governmental, industrial and institutional buildings who generate their own chilled water utilizing individual chiller plants for space cooling and air-conditioning.

U.S. Army Corps of Engineers, Los Angeles District. Responsible for conducting the analyses of the social science issue areas for a variety of EISs and EAs as part of two environmental services contracts. Delivery orders have included:

- **Prado Basin/Norco Bluffs/Reach 9 of the Santa Ana River Dikes Supplemental EAs, Riverside County, CA.** Debauche served as the Technical Specialist in charge of preparation of the Transportation/Traffic analysis of two structural alternatives for the Norco Bluffs Toe Stabilization project as well as the No Action/No Project Alternative. Aspen developed the alternatives analyzed in this Supplemental NEPA Environmental Assessment document, a description of the alternatives' physical, construction, and operational characteristics, and a discussion of the potential environmental impacts.
- **Northeast Phoenix Drainage Area Alternatives Analysis Report, Phoenix and Scottsdale, AZ.** Mr. Debauche served as a Technical Specialist in charge of preparation of the Alternatives analysis report that evaluated the potential environmental impacts associated with channel and detention basin alternatives to control flooding problems resulting from fast rate of development in the northeast Phoenix area.
- **Murrieta Creek Flood Control and Environmental Restoration Project**. Mr. Debauche served as a Technical Specialist in charge of preparation of the Environmental Assessment and Mitigation Monitoring plan for Phase 1 of a flood control and restoration project in Riverside County.

California Department of Water Resources. Responsible for conducting the environmental analyses for CEQA compliance as part of two environmental services contracts. Delivery orders have included:

- **Piru Creek Stabilization and Restoration Project IS/MND, northern Los Angeles County.** The California Department of Water Resources (CDWR) proposes to repair erosion damage at a series of three locations downstream of Pyramid Dam and seismically retrofit the Pyramid Dam access bridge that crosses Piru Creek. Mr Debauche served as Technical Specialist in charge of preparation of the Initial Study Transportation/Traffic, Noise, Socioeconomics, and Alternatives analyses for the proposed project.
- **Pyramid Lake Repairs and Improvements Project IS/MND and EA, northern Los Angeles County.** Mr Debauche served as Technical Specialist in charge of preparation of the Initial Study Transportation/Traffic, Noise, Socioeconomics, and Alternatives analyses for the proposed project, which DWR and the Department of Boating and Waterways (DBW) conducted repairs and improvements at various recreational sites at Pyramid Lake, which is located on the border between Los Padres National Forest and Angeles National Forest; recreation is managed by Angeles National Forest. In addition to the CEQA documentation and preparation of permit applications, Aspen coordinated DWR and DBW's efforts with the USFS, and the permitting agencies (i.e., CDFG, RWQCB, and USACE). Through coordination with the USAC, Aspen prepared the NEPA EA for Corps 404 permit process, and reviewed and coordinated revisions to the 1602 with CDFG.

Los Angeles Unified School District (LAUSD), Los Angeles County, CA. Deputy Program manager and Technical writer for several CEQA documents (EIRs and IS/MNDs) being prepared as part of Aspen's ongoing services contract with the LAUSD to help approve school projects that would meet existing overcrowded conditions in the greater Los Angeles area. Projects have included:

- **New School Construction Program EIR.** Served as a Technical Specialist in charge of preparation of the social science issues, including Socioeconomics, Noise, Transportation/Traffic, and Alternatives analyses for this Program EIR being prepared for the LAUSD. The LAUSD 2020 Program would provide student

seats throughout the LAUSD via a combination of the addition of portable classrooms to existing campuses, modernization and reconfiguration of existing campuses, and the construction of new schools.

- **East Valley Middle School No. 2 EIR.** Served as a Technical Specialist for this middle school project proposed to be located at the previous Van Nuys Drive-In site, preparing the Transportation/Traffic and Noise analyses. The EIR focused on impacts associated with air quality, hazards and hazardous materials, noise, land use and planning, and traffic and transportation. Major issues of concern included traffic and noise generated by school operation activities. The EIR included LAUSD design standards and measures employed to minimize environmental impacts.
- **Mt. Washington Elementary School Multi-Purpose Room Addition Project IS/MND.** Served as the Technical Specialist in charge of preparation of the IS/MND for the development of a multi-purpose room facility, including a library, auditorium, and theater, to the existing Mt. Washington Elementary School campus located in Los Angeles. The surrounding residential community had concerns regarding the proposed project's impacts on aesthetics, traffic, air quality, and noise. Of particular concern, was impacts generated due to the after-hours use of the multi-purpose room facility by civic and community groups.
- **Canoga Park New Elementary School IS/MND.** Served as Served as the Technical Specialist in charge of preparation of the IS/MND for this elementary school project proposed to be developed on a parcel of land owned by the non-profit organization, New Economics For Women (NEW). This "turn-key" project consisted of a Charter Elementary School to be developed by NEW and sold to the LAUSD for operation. It was later decided that NEW would lease the school back and run it as a charter school. Issues of concern included, pedestrian safety, traffic, air quality, noise, and land use.
- **Hughes Magnet Span School IS/MND.** Served as the Technical Specialist in charge of preparation of the Socioeconomics, Hydrology, Public Services and Utilities, and Recreational analyses for the proposed re-opening of the existing Hughes Middle School as a Magnet Span School serving up to 1,620 District 6th though 12th grade students. The re-opening of the Hughes Middle School would require the relocation of the existing uses of the campus. The existing Enadia Way Elementary School and Platt Ranch Elementary School would be re-opened for the relocation of these uses.
- **Wonderland Elementary School Portable Classroom Additions IS/MND.** Served as the Technical Specialist in charge of preparation of the IS/MND for a proposed addition to the Wonderland Avenue Elementary School, located in the City of Los Angeles.
- **Pio Pico Elementary School Playground Expansion IS/MND**. Technical Specialist in charge of preparation of the Notice of Preparation, Initial Study, and Administrative Draft EIR for the expansion of a playground at the existing Pio Pico School in the LAUSD. The playground was proposed on five residential properties. One of the residences is a potentially significant historical resource because of its association with an African-American woman journalist, Fay M. Jackson. This project was cancelled by the LAUSD after completion of the administrative draft report.
- **Fairfax Senior High School Portable Classroom Addition IS/MND**. Served as Technical Specialist in charge of preparation of the IS/MND for the addition of portable classrooms at the school. Major issue areas covered were noise, hydrology, and geotechnical analysis.
- **Polytechnic Senior High School Portable Classroom Addition IS/MND**. Served Technical Specialist in charge of preparation of the IS/MND for the addition of portable classrooms at the school. Major issue areas covered were noise, hydrology, and geotechnical analysis.
- **Washington Senior High School Portable Classroom Addition IS/MND**. Technical Specialist in charge of preparation of the IS/MND for the addition of portable classrooms at the school. Major issue areas covered were noise, hydrology, and geotechnical analysis.

EIP Associates 1998 to 2001

MTA Mid Cities/Westside Transit Corridor Study EIS/EIR. Was a key Technical Specialist in charge of preparation of the EIS/EIR for this 3-phase (including prepared the Major Investment Study (MIS), the Environmental Impact Statement (EIS), and an evaluation of the urban design implications of transit interventions on selected routes) study intended to address current and long range traffic congestion in the central and westside areas of the Los Angeles Basin. Three east/west corridors and a range of transit

alternatives ranging including Rapid Bus, light rail, and heavy rail are being evaluated. In addition to preparing several issue area chapters of this comprehensive joint EIS/EIR, Mr. Debauche assisted with the Environmental Justice analysis, the Section 4(f) Parklands discussion, Transportation/Traffic, and the Land Use sections of the EIS/EIR.

Wes Thompson Ranch Development Project EIR. Served as Technical Specialist for this hillside residential development in the City of Santa Clarita. Issues of concern included seismic and air quality impacts associated with the excavation of 2 million cubic yards of soil, the project's non-compliance with the City's hillside ordinance for innovative design, and traffic generated by project-related population growth in the area. Four different site configuration alternatives were developed as part of the EIR analysis. Other issues of concern included sensitive biological resources, the potential for hydrological impacts due to disturbance of the hillside, and cultural resources. As the technical writer for socioeconomics, noise, hazardous materials, air quality, and public services, Mr. Debauche conducted the Transportation/Traffic and Alternatives analyses.

City of Santa Monica Environmental Assessments. Was key Technical Specialist in charge of preparation of several environmental assessment documents for housing, commercial, institutional, and mixed-use developments in compliance with CEQA. As the technical writer for socioeconomics, noise, hazardous materials, air quality, and public services, Mr. Debauche conducted the Transportation/Traffic, Noise, and Alternatives analyses for:

- **Seaview Court Condominiums IS/MND.** This comprehensive Initial Study/Mitigated Negative Declaration included six technical reports including traffic, cultural resources, parking survey, shade and shadow analysis, and a geotechnical assessment to evaluate the level of severity of this development in the waterfront area of Santa Monica. Major issues of concern were; parking and project-generated traffic on adjacent narrow residential streets; visual obstruction and shading impacts of the proposed structure; liquefaction and seismic impacts to adjacent properties as result of the project's excavation for a subterranean parking garage; and the potential impacts of the project to impact the integrity of a historic district and the historic Seaview Walkway to the beachfront.
- **Four-Story Hotel IS/MND.** A comprehensive Initial Study/Mitigated Negative Declaration was prepared for this four-story hotel adjacent to St. John's Hospital in Santa Monica. Major issues of concern included project-generated traffic on surrounding multi-family residential uses and emergency access to the hospital.
- **Santa Monica College Parking Structure B Replacement EIR.** This focused EIR addressed issues related to traffic and neighborhood land use impacts associated with the addition of a 3-story parking structure in the center of the SMC campus. Major issues of concern included the potential for project-generated traffic to cause congestion at the school's main entrance on Pico Boulevard, and the potential for overflow traffic to impact the Sunset Community of single-family homes adjacent to the school.
- **North Main St. Mixed-Use Development Project EIR**. This EIR included evaluation of impacts resulting from the development of a mixed-use development in Santa Monica's "Commercial Corridor" on Main Street, with ground-floor residences and boutique commercial uses. Major issues of concern included traffic and parking impacts to Main Street and surrounding residential land uses, shade and shadow impacts, and neighborhood impacts.

Specific Plans and Redevelopment Projects. As Technical Specialist for Transportation/Traffic, Socioeconomics, Noise, Hazardous Materials, Air Quality, and Public Services/Utilities, Mr. Debauche conducted analyses and prepared these environmental sections for:

- **Cabrillo Plaza Specific Plan EIR in Santa Barbara.** This project consisted a mixed-use commercial development on Santa Barbara's waterfront on Cabrillo Boulevard. On-site uses included an aquarium, specialty retail, restaurants, and office space.
- **Culver City Redevelopment Plan and Merger EIR.** This programmatic EIR evaluated the impacts of the City's redevelopment of its redevelopment zones. A major land use survey and calculation of acreage of redevelopment lands was conducted as part of the EIR.

- **Dana Point Headlands Specific Plan EIR.** This EIR evaluated the development of coastal bluff in the City with hotel, single- and multi-family residential, and commercial uses. Major issues of concern included ground disturbance as a result of excavation, impacts to terrestrial and wildlife biology, recreation impacts to beachgoers, and project-generate population inducement.
- **Triangle Gateway Redevelopment Project EIR in Beverly Hills, CA.** This EIR evaluated the development of a supermarket, retail shops, and office space in the triangle gateway portion of downtown Beverly Hills. Issues of concern evaluated by Mr. Debauche included traffic, land use, and impacts to on-site historic structures.
- **UCLA Campus Housing Expansion.** This EIR evaluated the development and expansion of campus housing within the UCLA campus. Issues of concern evaluated by Mr. Debauche included hazardous materials and population/housing.

CH2M Hill - Minneapolis, MN **1995 to 1998**

- **Minneapolis/St. Paul International Airport Expansion EIS:** Mr. Debauche was a key writer of the EIS for this $4 million technical and environmental study, including the preparation of an Environmental Impact Statement (EIS), and an evaluation of the urban design implications of a proposed $800 million expansion of the existing MSP International airport, including transit and terminal modifications and the inclusion of a new perpendicular runaway. The studies included alternatives to the project and the long-term effects on the cities of Minneapolis and St. Paul. In addition to preparing several issue area chapters of this comprehensive EIS, Mr. Debauche assisted with the Environmental Justice Analysis (per Executive Order 12898), the Section 4(f) Parklands discussion, and the socioeconomics sections of the EIS. In addition, Mr. Debauche assisted with preparation of a technical report on airport noise effects on nearby housing and mitigation programs for the impacts of the proposed runway.
- **Minneapolis/St. Paul Wastewater Treatment Facility Expansion EIS:** Was a key writer of the EIS for expansion of the existing wastewater treatment facility serving the twin cities area. The studies included alternatives to the project and the long-term effects on the cities of Minneapolis and St. Paul. Mr. Debauche prepared several issue area chapters of this comprehensive EIS, including the Environmental Justice Analysis (per Executive Order 12898), and the socioeconomics sections of the EIS.

PROFESSIONAL ASSOCIATIONS

DECLARATION OF
Michael E. Daly, P.E

I, **Michael E. Daly**, declare as follows:

1. I am presently under contract with Aspen Environmental Group to provide environmental technical assistance to the California Energy Commission. I am serving as a Senior Engineer and to provide Peak Workload Support for the Energy Facility Siting Program and for the Energy Planning Program.

2. My professional qualifications and experience are attached hereto and incorporated by reference herein.

3. I helped prepare the Staff Testimony and errata on **Soil and Water Resources** sections for the Genesis Solar Power Project based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony and errata is valid and accurate with respect to the issue addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and errata and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Experience

With Psomas for 12 years, with other firms for 5 years.

Background

Mike Daly has more than 17 years of experience in the field of water resource design. He currently manages a five-person team, which completes a variety of project types including watershed and floodplain studies, flood control mitigation studies, sanitary sewer and storm drain planning and design, potable water system planning and design, and utility coordination modifications.

Projects

North Park Improvement Plans, Town of Sahuarita Public Works Department, Sahuarita, Arizona: Mike was project manager for this effort which included preparation of improvement plans for four new effluent infiltration ponds and an adjacent public park consisting of soccer and baseball facilities, playground, and large parking area. A key component of the project was the analysis of offsite flows which were modeled using the FLO-2D due to the topography of the floodplain. The results of the analysis were used to aid the design of the improvements and a proposed conditions model was created and to verify no adverse impacts to adjacent properties due to floodplain encroachment.

Pantano Wash/Kolb Road Permanent Soil Cement Bank Protection, Pima County Regional Flood Control District, Tucson, Arizona: Mike was the Project Manager for this project to develop and compile a basis of design report with alternatives analysis for a permanent bank protection and channel stabilization on the Pantano Wash (Q_{100}=32,00 cfs) between Speedway Boulevard and Tanque Verde Road. Services included hydrologic, hydraulic, and sediment transport analysis and documentation for each alternative, as well as geotechnical and structural stability analyses. Soil cement grade control structures were also designed to mitigate and stabilize the Pantano Wash channel and invert from continued head cutting within the project area. Mike is also managing the formal soil cement bank protection design for the project which is currently 90% complete.

Mission West Wash Flood Control Study, Pima County Regional Flood Control District, Pima County, Arizona: As Project Manager, Mike oversaw the hydrologic and hydraulic analysis to assess existing flooding conditions and examine several alternatives to mitigate potential flooding of the San Xavier Estates subdivision. The existing conditions HEC-2 model developed as part of the study was modified to look at the effectiveness of such alternatives as raising an existing berm, widening an existing diversion channel, and constructing a levee to FEMA standards. The option of employing upstream detention was also addressed. Preliminary cost estimates for the various mitigation alternatives were also provided.

Alamo Wash, City of Tucson, Arizona: As Project Manager, Mike's responsibilities included overseeing the re-mapping of the existing floodplain within the project limits using revised 100-year peak discharges. Finished floor elevations (FFEs) were collected at all inhabitable structures within the existing FEMA floodplain to determine which structures could be removed from the effective floodplain based on their FFE. The results of the revised mapping and hydrologic analysis were submitted to FEMA in an application for a Letter of Map Revision (LOMR). Mike was also responsible for the preparation of formal design documents for the construction of bank protection for Alamo Wash from just upstream from the confluence with Van Buren Wash to the south side of Grant Road.

Drainage Erosion Mitigation Plan, Pima County Regional Flood Control District, Green Valley, Arizona: As Project Manager Mike contracted with Pima County Regional Flood Control District to provide an erosion mitigation plan at 16 distinct locations within Green Valley. The existing drainage system consists of numerous constructed drainage channels to convey large flows from natural upstream watersheds through developed areas and to the Santa Cruz River. Due to a lack of consideration of sediment transport characteristics during the original design, significant channel downcutting and bank mitigation has occurred in many of the drainageways. Psomas' scope of services included collection of survey data and the formulation of conceptual and formal design plans to be used by contractors to construct mitigation measures and correct existing erosion problems.

Master Drainage Plan, Phases I & II, Town of Sahuarita, Sahuarita, Arizona: As Project Manager, Mike was responsible for this multi-phased effort to identify, characterize, and establish mitigation alternatives for existing drainage problems within the town limits. The study focused on areas where development is occurring or is likely to occur and on the relationship between existing drainage patterns and the future infrastructure required to support this development. Specific tasks included peak discharge analysis, field reconnaissance, assessment of existing drainage infrastructure, conceptual plan development, and preliminary cost estimates.

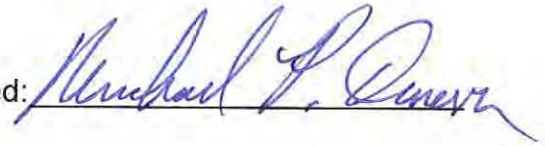
San Xavier District Master Basin Study, Tohono O'ohdam Nation Pima County Flood Control District, Pima County, Arizona: As Project Hydrologist, Mike was responsible for the cooperative effort between Pima County and the Tohono O'ohdam Nation to identify and provide alternatives to mitigate widespread flooding and erosion problems at the reservation. The project scope of work included identification and documentation of existing problems, calculation of peak discharges using HEC-1 methodology, mapping of existing floodplains using HEC-2 methodology, and the

formulation of both structural and non-structural flood control alternatives, which were consistent with the Nation's long term goals and farm rehabilitation plan.

DECLARATION OF
Michael P. Donovan, P.G., C.Hg.

I, **Michael P. Donovan**, declare as follows:

1. I am presently under contract with Aspen Environmental Group to provide environmental technical assistance to the California Energy Commission. I am serving as a Senior Hydrogeologist and to provide Peak Workload Support for the Energy Facility Siting Program and for the Energy Planning Program.



2. My professional qualifications and experience are attached hereto and incorporated by reference herein.

3. I helped prepare the Staff Testimony and errata on **Soil and Water Resources** sections for the Genesis Solar Power Project based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.

Computer Modeling of Groundwater Flow and Contaminant Transport by Jacob Bear/University of California, Irvine

Registration

1986/California Registered Geologist #4112 (Expires 06/30/11)

2000/California Certified Hydrogeologist #701 (Expires 06/30/11)

Experience

With Psomas 5 years; with other firms for 24 years.

Background

Mr. Donovan is a professional hydrogeologist with over 29 years of experience in project management, hydrology and hydrogeological assessments, conceptual model development, groundwater modeling studies, water quality assessments, and groundwater resource development. He has extensive skills with monitoring well design, water quality sampling and analytical techniques, quality assurance/quality control, CEQA, environmental impact assessment, ecohydrology, agency negotiations, risk assessment, and expert witness.

Related Projects

San Juan Basin Authority (2004-Present): Senior Hydrogeologist – Hydrogeologic characterization and monitoring of groundwater extraction as part of desalination facility. Project includes implementation of groundwater monitoring plan including water quality sampling and analytical testing, groundwater modeling, monitoring of surface and groundwater levels and flow and assessments in change in storage to the alluvial groundwater basin from ongoing extraction wells. In addition, evaluated recharge of alluvial groundwater system using diverted stream channels and percolation basins for ongoing desalination project.

Metropolitan Water District of Southern California: Senior Hydrogeologist – Hydrogeologic characterization of bedrock geology in vicinity of proposed Pipeline No. 6 water conveyance tunnel. Work included development of monitoring plan including sampling protocols, laboratory analytical techniques, and quality assurance and quality control procedures.

Private Developer, Hydrogeologic Assessment (2004 to Present): Senior Hydrogeologist - Hydrogeologic characterization of Shaver Valley (east of Indio, CA) for potential conjunctive use project as part of major residential, commercial, and golf resort development in Eastern Riverside County. Work includes workplan development, geophysical investigation, well installation, aquifer testing, water quality assessment, groundwater modeling, conceptual design of groundwater recharge/extraction program, and providing documentation for Specific Plan and EIR.

Mission Springs Water District, Groundwater Modeling Study (2005-Present): Senior Hydrogeologist –The work included potential historical impacts to regional groundwater system, potential reuse sites for recycled water, and recommendations for a Groundwater Management Plan.

Poseidon Resources, Hydrogeological Assessment: Senior Hydrogeologist – Preparation of Hydrogeological Assessment and Feasibility for the use of vertical extraction wells to supply feedwater for a desalination plant in Southern California. Evaluation included characterization of nearshore hydrogeological regime and design of extraction wells and potential drawdown field created by maximum feasible yield.

Mission Springs Water District, Preliminary Water Balance: Senior Hydrogeologist - Hydrogeologic characterization and water supply assessment for the Mission Springs Water District (MSWD) service area. The objective of this project is to develop a long term Integrated Water Resource Management Plan that can be used by MSWD to optimize the use of their groundwater basins and evaluate alternative water supplies. The alternatives developed must minimize impacts to biological and wildlife of concern by the local environmental community. As part of this project, Mr. Donovan completed a preliminary water balance study for the Mission Creek sub-basin. The results of the study would be used to direct future investigations for the Mission Creek sub-basin.

City of San Juan Capistrano (2007): Senior Hydrogeologist – Assisted the City of San Juan Capistrano in the evaluation of proposed well production sites including installation and testing of pilot test wells at two location. Evaluation included advancement of test borings using Sonic Drilling, well completion, aquifer test, water quality sampling, and preparation of Pilot Test Well Report that included suitability of each location and expected production from a production well placed at each location.

Elsinore Valley Municpal Water District (2006-2007): Senior Hydrogeologist - Meeks & Daley Water Company (M&D) and the City of Riverside constructed two new wells (in City of San Bernardino and Colton). Psomas was responsible for designing and preparing a preliminary design report, construction documents and project specifications for: two new +700-Foot deep wells with a vertical turbine pump assembly at an estimated flow rate of 3,000 GPM and associated piping. Mr. Donovan prepared a Mitigated Negative Declaration, Mitigation Monitoring and Reporting Program, required forms for submittal to State Clearing House, response letter to comments, and presentations to lead agency/public forum on the project.

East Orange County Water District (2008): Senior Hydrogeologist – EOCWD planned to construct a 900-foot deep well (in City of Tustin). Psomas was responsible for designing and preparing a preliminary design report, construction documents and project specifications for the new +900-Foot deep well with a vertical turbine pump assembly at an estimated flow rate of 2,000 GPM and associated piping. Mr. Donovan prepared a Mitigated Negative Declaration, Mitigation Monitoring and Reporting Program, required forms for submittal to State Clearing House, response letter to comments, and presentations to lead agency/public forum on the project.

Surface and Groundwater Assessment, Eastern Utah: Principal investigator for baseline surface water and groundwater assessment and impact monitoring of White

River Shale Corporation major oil shale mining project in eastern Utah. Responsible for locating over 8 surface water monitoring stations, streamflow monitoring (including static and continuous monitoring), development of rating curves for stream cross-sections, water quality sampling, reduction and analysis of data and development of a comprehensive data management system designed after the USGS WASTORE system over a period of seven years. In addition, developed a data quality management system that monitored and corrected deficiencies in the collection and reporting of the surface water quality data and later developed a statistical approach for evaluating mitigation monitoring for naturally-occurring compounds including metals and selected nutrients..

Surface Water Quality Monitoring, Southeast Alaska: Principal investigator for baseline surface water quality monitoring program for the Quartz Hill Molybdenum Project. Responsible for locating over 17 surface water monitoring stations, streamflow monitoring (including static and continuous monitoring), development of rating curves for stream cross-sections, water quality sampling (including storm-activated samplers), reduction and analysis of data and development of a comprehensive data management system designed after the USGS WASTORE system over a period of five years. In addition, developed a data quality management system that monitored and corrected deficiencies in the collection and reporting of the surface water quality data.

Surface Water Quality Monitoring, Thompson Creek Molybdenum Mine, Idaho: Principal investigator for baseline surface water quality monitoring program for a proposed fluorite mine project. Responsible for locating over 12 surface water monitoring stations, streamflow monitoring, water quality sampling, data analysis and reporting of the information over a period of two years.

Surface Water Quality Monitoring, Ima Mine, Idaho: Principal investigator for baseline surface water quality monitoring program for tungsten mine project. Responsible for locating over 5 surface water monitoring stations, streamflow monitoring, water quality sampling, data analysis and reporting of the information over a period of two years.

Surface Water Quality Monitoring, Bayhorse Creek Mine, Idaho: Principal investigator for baseline surface water quality monitoring program for a proposed fluorite mine project. Responsible for locating over 12 surface water monitoring stations, streamflow monitoring, water quality sampling, data analysis and reporting of the information over a period of two years.

Surface and Groundwater Quality Monitoring Program, Equity BX In-situ Oil Shale Mine, Colorado: Principal investigator for mitigation monitoring of surface water and groundwater quality during operation of a pilot test program for steam injection removal of oil from oil shale. Responsible for locating over 4 surface water and 8 groundwater monitoring stations, streamflow monitoring, water quality sampling, data analysis, impact evaluation and reporting of the information.

Surface Water Quality Monitoring, Creede, Colorado: Principal investigator for baseline surface water quality monitoring program for Chevron's proposed silver mine project. Responsible for locating over 12 surface water monitoring stations,

streamflow monitoring, water quality sampling, data analysis and reporting of the information.

Private Developer (2007): Principal Hydrogeologist. Evaluated the feasibility of constructing a golf course and adjacent housing complex on a closed landfill in Riverside County, California. The work included reviewing technical documents, meeting with regulators and developing issues environmental constraints list with recommendation for further study.

Valley Center Residential Project, CA (2005): Senior Hydrogeologist for hydrogeological characterization that included aquifer tests, water quality sampling and analysis, and numeric groundwater flow model development for a proposed residential development project in Valley Center. The project required analyzing the effect of wastewater effluent on the local groundwater aquifer and developing mitigation measures as required.

Sacramento Regional County Sanitation District, Peer Review – Hydrogeological Assessment: Project Manager/Senior Hydrogeologist – Conducted a review documents associated with the dewatering activities conducted during construction activities that occurred at the New Natomas Pump Station and evaluate whether "actual conditions are more adverse than baselines" were present. The evaluation included site walk, review of aquifer testing data and methods, dewatering activities, existing hydrogeological data and preparation of a report on findings.

Mission Springs Water District, Urban Water Management Plan: Senior Hydrogeologist – Preparation of the Hydrogeological portions of an Urban Water Management Plan in compliance with The California Water Management Planning Act of 1983, which required water purveyors to develop water management plans to achieve conservation and efficient use.

Remedial Investigation, Los Angeles, California: Senior Hydrogeologist and Project Manager responsible for interpreting existing information and developing a geologic and hydrogeologic evaluation program for a former chromium-plating facility. The facility is adjacent to a former major manufacturing facility that used chlorinated solvents and hexavalent chromium in its manufacturing operations. Responsibilities included reviewing historical site investigation activities, preparing a remedial investigation workplan, implementation of the workplan, commenting on adjacent facilities' workplans, California Environmental Protection Agency DTSC meetings and negotiations, and formulating arguments/briefs for impending mediation.

Superfund Oversight, City of Industry, California: Senior Hydrogeologist responsible for participating as the client's technical representative to the Puente Valley Operable Unit Steering Committee. Responsibilities included reviewing historical site investigation activities and preparing a de minimis argument for the client's facility, assessing offsite liability stemming from adjacent responsible parties, reviewing proposed activities of the Steering Committee's consultant, and formulating arguments/briefs for impending mediation.

Remedial Investigation, Redlands, California: Principal investigator for Lockheed Corporation, a rocket motor manufacturing and testing facility. The purpose was to identify potential source areas of TCE contamination. Areas evaluated included burn

pits, leachfields, vapor degreasing units, evaporation ponds, solid propellant mixing areas, rocket motor testing areas, and painting areas. The evaluation involved ranking the potential of various manufacturing activities to act as a source of TCE and evaluating available pathways into existing groundwater systems.

Site Investigation for Southern Pacific Pipeline. Palm Springs, California: Senior project manager for a site investigation of a fuel leak for this major fuel product transport line. The site investigation included developing soil sampling and field screening techniques, shallow probe installation and groundwater monitoring well installation and sampling. The initial investigation culminated in development of potential remedial alternatives.

Xerox Corporation, Pomona, California: Senior Hydrogeologist for the design, implementation, and interpretation of a remedial investigation of a 12-acre former electronics manufacturing facility. Responsibilities included design and implementation of remedial investigations at the site, operation and maintenance of groundwater treatment system, groundwater monitoring, soil and groundwater cleanup evaluation, regulatory interaction, preparation of demolition specifications, bid documents, selection of subcontractor, and monitoring execution of the demolition program. In addition, provided technical support to outside legal counsel for civil liability lawsuit filed in association with the aforementioned site.

Recovery of Past Investigation Cost Claims, San Diego, California: Senior hydrogeologist for a client who was seeking reimbursement from a previous site operator for site investigation and remedial action costs. Reviewed with legal counsel the costs associated with various activities and segregated into costs that were viable for cost recovery. Provided testimony in court case and was successful in recovering 80% of past costs.

Redevelopment Project, San Diego, California: Project Manager responsible for the environmental assessment associated with the demolition of a bus maintenance facility and construction of multi-story apartment complex at a site severely impacted with petroleum hydrocarbons. The activities included reviewing prior site investigations conducted by five previous consulting firms, delineating areas of concern for excavation activities, conducting focused site investigations on the property, and formulating proposed alternatives for handling petroleum-contaminated soils during site construction.

Xerox Corporation, Santa Clara, Sunnyvale, & Hayward, California: Senior Hydrogeologist for the successful development and implementation of a site closure plan. Responsibilities included interpretation of hydrogeology and contaminant transport, groundwater monitoring, preparation of a site closure plan including hydrogeologic evaluation, fate and transport of chlorinated volatile organic compounds, and negotiations with the regulatory agencies.

Remedial Investigation, Carson, California: Program manager for remedial investigation/feasibility study at a 30-acre chemical-manufacturing site in southern California. The activities conducted at the site included soil vapor surveys, soil sampling, and groundwater sampling (three separate aquifer systems). The program also involved development of a feasibility study work plan, risk assessment evaluation, and public participation plan.

Remedial Investigation, Sacramento, California: Principal investigator for preliminary endangerment assessment and remedial investigation at a large aerospace facility. The 4,000- acre former rocket test facility is currently undergoing soil and groundwater investigations for potential releases of chlorinated solvents and metals. Responsible for developing the remedial investigation tasks and implementation.

Remedial Investigation/Feasibility Study, San Diego, California: Senior hydrogeologist responsible for design and implementation of all site characterization activities including design and implementation of the RI/RFI at a major gas turbine manufacturing facility. The work included assessment of soil and groundwater impacted with chlorinated solvents, metals, benzene, petroleum hydrocarbons and PCBs. Assisted in preparation of a comprehensive RI/RFI work plan that included a historical summary of facility operations, site geology and hydrogeology, and contaminants of concern, and the proposed site characterization activities to be undertaken. Site characterization activities included advancement of borings and completion of wells using hollow-stem auger and casing hammer reverse air circulation drilling; soil vapor surveys; geophysical investigations including electrical and seismic; continuous water level monitoring to correct for tidal influence; and laboratory analysis using CLP protocols.

Six Flags Magic Mountain, Hydrogeological Assessment (2005-2006): Senior Hydrogeologist – Assistance with permitting requirements associated with construction of a bank protection structure along the Santa Clara River in northern Los Angeles County. Work included assessment of hydrogeological regime including water quality, preparation of creekside dewatering permit and negotiations with RWQCB.

Fate and Transport Evaluation, San Diego, California: Senior hydrogeologist for the RI/RFI fate and transport evaluation to determine the necessity for implementing interim remedial measures for the transport of chlorinated volatile organic compounds and metals off-site into marine waters.

Feasibility Study, United States Navy, British Indian Ocean Territories, Indian Ocean (1984): Principal Investigator for enhancing development of groundwater resources on the island of Diego Garcia for the U.S. Rapid Deployment Force. The study included design and placement of horizontal infiltration galleries for development of a fresh groundwater lens.

DECLARATION OF
John R. Thornton P.E.

I, **John R. Thornton**, declare as follows:

1. I am presently under contract with Aspen Environmental Group to provide environmental technical assistance to the California Energy Commission. I am serving as a Senior Water Resource Engineer and to provide Peak Workload Support for the Energy Facility Siting Program and for the Energy Planning Program.

2. My professional qualifications and experience are attached hereto and incorporated by reference herein.

3. I helped prepare the Staff Testimony and errata on **Soil and Water Resources** sections for the Genesis Solar Power Project based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony and errata is valid and accurate with respect to the issue addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and errata and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Experience

With Psomas for 14 years; with other firms for 27 years.

Background

Mr. Thornton has over 40 years of experience in the development and management of water resource projects ranging in scope and magnitude. He is an expert in the development and management of groundwater development and management projects. He has been in responsible charge of the preparation of feasibility studies and facilities master plans; preliminary and final design documents (construction drawings, specifications, and cost estimates); and construction supervision of canals, pipelines, wells, pump stations, reservoirs, reclaimed water use systems, and agricultural crop and landscaping irrigation facilities. He has also provided technical studies and expert witness testimony in complex water rights matters. The following are examples of projects he has been in principal charge:

Projects

San Juan Basin Authority, San Juan Capistrano, Ca (1990 to Present): District Engineer and Project Manager for the San Juan Basin Authority. Principal author of the 1994 groundwater management plan and water rights application that lead to obtaining a water Rights Permit to develop groundwater from the San Juan and Arroyo Trabuco Creeks and construction of the City of San Juan Capistrano's brackish water desalination plan. Successfully applied for and obtained four grants from CSWRCB. One of the grants was used to develop the Integrated Vegetation and Groundwater Monitoring Plan which was reviewed and accepted by the Division of Water Rights as meeting all of the

monitoring conditions of the water rights permit not only for the SJBA but also the requirements of the South Coast Water District Water Rights Permit. Implemented and provided overall management of the implementation of the Integrated Vegetation and Groundwater Monitoring Plan since its inception in 2004. Have successfully modified and or reduced several of the monitoring protocols as they were not applicable to the conditions within the monitoring area. Have provided water resource and engineering consulting expertise to the SJBA on numerous project since 1990.

Mission Springs Water District, Integrated Water Resource Plan: Principal in Charge to assist MSWD staff in the preparation of an Integrated Water Resource Plan and further develop a conceptual understanding of the conjunctive use and groundwater banking options potentially available in various locations within their service area. The first phase of the project focused on the development of a hydrologic water balance for the Mission Creek Sub-basin. Psomas' initial review resulted in the development of a comprehensive field investigation plan and implementation plan for a variety of alternatives that incorporated the water resource supply needs for future projected demands. The objective of the work effort was to address specific groundwater management options for the utilization and conservation of existing and potential water resources available to MSWD.

South Orange County Integrated Water Shed Management Plan: Principal in Charge of developing an IRWMP for South Orange County as part of the California Prop 50 and 84 bond financing program. The plan included the coordination of over 20 public agencies and stakeholders, the development of a plan with over 40 million dollars in projects largely related to water and wastewater development.

Antelope Valley Groundwater Banking Feasibility Study: Project Manager for investigating the feasibility of developing a conjunctive use project to facilitate the sale of State Project waters exchanged for banked groundwater in the westerly Antelope Valley of Los Angeles County. The banked groundwater would be sold to Los Angeles Department of Water and Power to replace water used for dust mitigation at the Owens Lake. The study reviewed the geologic, hydrogeologic, water supply, water quality, costs, environmental and institutional issues associates with the project; determined appropriate water supply, recharge, recovery and storage criteria; sized the facility and prepared cost estimates. A preliminary MODFLO model was developed. Operational criteria was developed for 20,000 to 40,000 acre feet per year of recharge, up to 40,000 acre feet of extraction, 200,000 acre feet of cumulative storage and service to and from both water supply facilities.

Hemet/San Jacinto Recharge and Recovery Program, Eastern Municipal Water District, CA: Project Director/Principal-in-Charge for the Eastern Municipal Water District Integrated Recharge and Recovery Program. Psomas worked with the EMWD and local stakeholders to evaluate the feasibility of using EMWD-owned property in the San Jacinto River bed as an integrated groundwater storage site. The feasibility program includes the analysis and evaluation of hydrogeologic properties, development of a regional groundwater model, preliminary design and location of proposed recharge basins and necessary facility infrastructure including extraction wells. In addition, coordination

coordination was provided for environmental support services for the EMWD overall Habitat Conservation Plan for this project and discussing the project with appropriate regulatory agencies such as the Army Corps of Engineers and United States Fish and Wildlife. The purpose of the proposed Program is to provide groundwater storage within the eastern portion of EMWD's service area (i.e., the Hemet/San Jacinto area).

Olancha Water Project, CA, Western Water Co: Project Manager for developing facilities and evaluating the feasibility of a water transfer project from the Southern Owens Valley, Owens Lake area. The project includes the development of a groundwater flow model (ModFlow) for approximately a fifty square mile area of the southern Owens Lake, evaluation of groundwater hydrogeology, evaluation of impacts to natural and cultural resources, location and preliminary design of facilities, including wells, pipelines and connection to the City of Los Angeles Owens Valley Aqueducts and overall project feasibility. Approximately 10,000 acre feet per year were estimated as feasible to extract from the groundwater without impacting farming, domestic water and natural resources. A complete EIR was developed including all necessary biological and cultural studies and initial processing through the planning department of Inyo County. A groundwater resource-monitoring plan was developed and implemented for monitoring water level and quality for over 20 wells in the surrounding area. The project was performed under careful review of the Inyo County Water Department.

Cadiz/Fenner Conjunctive Use and Storage Program, San Bernardino County, CA, Cadiz Land Co.: Project Manager for the development of preliminary engineering and economic analysis for a conjunctive use, water storage and transfer program located in Cadiz and Fenner Valleys of San Bernardino County. The project included 30 miles of large diameter pipeline. The Core Program could provide a dry-year water supply to the Metropolitan Water District of Southern California of up to 100,000-acre feet per year. The program concept is to convey Colorado River water from the Colorado River Aqueduct (CRA) to the Cadiz/Fenner area during periods of excess supply. The imported water would be stored in the local groundwater aquifer system. This water and indigenous groundwater would be extracted by wells and returned to the CRA during periods of drought.

DECLARATION OF
Candace M. Hill

I, Candace M. Hill, declare as follows:

1. I am presently employed by the California Energy Commission in the Environmental Protection Office of the Siting, Transmission, and Environmental Protection Division as a Planner II.

2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I helped prepare the staff testimony and errata on the Traffic and Transportation section for the **Genesis Solar Energy Project** based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony and errata is valid and accurate with respect to the issue addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and errata and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

CANDACE M. HILL

PROFESSIONAL EXPERIENCE

CALIFORNIA ENERGY COMMISSION - December 2009 – Present

Siting, Transmission, and Environmental Protection Division, Sacramento, California

Environmental Planner II

- Review applications for power plants and solar electric generating facilities for transportation, land use, visual, and socioeconomic impacts.
- Write environmental analysis staff assessments.
- Attend workshops on authored technical sections.

DEPARTMENT OF TRANSPORTATION - December, 2008 – December, 2009

Division of Mass Transportation, Sacramento, California

Associate Transportation Planner

- Administered two Federal Transit Administration (FTA) Grant Programs – Job Access and Reverse Commute (JARC) and New Freedom (NF).
- Reviewed and assessed grant proposals, monitored and prepared weekly and bi-weekly status reports for both Programs, managed the day-to-day operations of the grants and budgets for transportation, capital, operating and mobility management grants administered through the Department of Transportation for District 4 and District 5 which covered 14 counties.
- Responded to inquiries from grant recipients and the general public regarding the grants.

DEPARTMENT OF CONSERVATION - May, 2000 – December, 2008

California Geological Survey, Sacramento, California

Associate Planner

- Met with staff of the planning, building, public works and engineering departments of affected cities and counties throughout the State to explain the requirements and implementation of the California Seismic Hazards Mapping Act in the land use development process such as the General Plan, Zoning Code, building process and the California Environmental Quality Act.
- Analyzed and commented on General Plan Draft Safety Elements to incorporate the Seismic Hazard Zone Maps into the Element; reviewed Tribal Land Applications for seismic impacts.
- Presented the Seismic Hazard Zone Maps before the State Mining and Geology Board and coordinated with the public affairs office, legislative office and other state departments regarding the issuance of the Seismic Hazard Zone Maps.
- Maintained a database of affected cities and counties.
- Point person for outreach events.
- Responded to public inquires regarding Zone Maps and general seismic hazards.

CANDACE M. HILL

SACRAMENTO COUNTY PLANNING DEPARTMENT July, 1999– May, 2000
Current Planning, Sacramento, California
Associate Planner

- Researched, analyzed and wrote staff reports for land use development proposals.
- Presented staff reports and recommendations for the land use development proposals to the Sacramento County Planning Commission and Sacramento Board of Supervisors.
- Staff Planner for the Cosumnes Community Planning Advisory Council.
- Supervised one Assistant Planner.
- Assisted the public with zoning, planning and general questions via the public counter, telephone and e-mail.

STANISLAUS COUNTY PLANNING DEPARTMENT – December, 1996 – July1999
Current Planning, Modesto, California
Associate Planner

- Researched, analyzed and wrote staff reports for land use development proposals.
- Prepared Initial Studies and associated documents per the California Environmental Quality Act.
- Presented staff reports and recommendations for the land use development proposals to the Stanislaus County Planning Commission.
- Assisted the public with zoning, planning and general questions via the public counter and telephone.

IMPERIAL COUNTY PLANNING AND BUILDING DEPARTMENT - October, 1990 – December, 1996
Current Planning, El Centro, California
Planner III

- Researched, analyzed and wrote staff reports for land use development proposals.
- Prepared Initial Studies and associated documents per the California Environmental Quality Act.
- Assisted the public with zoning, planning and general questions via the public counter and telephone.

EDUCATION

University of California, Riverside
Bachelor of Arts in Administrative Studies – 1989

DECLARATION OF

Dr.Obed Odoemelam

I, **Obed Odoemelam** declare as follows:

1. I am presently employed by the California Energy Commission in the Facilities Siting, Transmission, and Environmental Protection Division as a Staff Toxicologist.

2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I helped prepare the staff testimony on **Transmission Line safety and Nuisance** for Genesis Solar Energy Project based on my independent analysis of the Application for Certification and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated:_____ Signed:_____

At: Sacramento, California

RESUME

DR. OBED ODOEMELAM

EDUCATION:

1979-1981 University of California, Davis, California. Ph.D., Ecotoxicology

1976-1978 University of Wisconsin, Eau Claire, Wisconsin. M.S., Biology.

1972-1976 University of Wisconsin, Eau Claire, Wisconsin. B.S., Biology

EXPERIENCE:

1989
The Present: California Energy Commission. Staff Toxicologist.

Responsible for the technical oversight of staffs from all Divisions in the Commission as well as outside consultants or University researchers who manage or conduct multi-disciplinary research in support of Commission programs. Research is in the following program areas: Energy conservation-related indoor pollution, power plant-related outdoor pollution, power plant-related waste management, alternative fuels-related health effects, waste water treatment, and the health effects of electromagnetic fields. Serve as scientific adviser to Commissioners and Commission staff on issues related to energy conservation. Serve on statewide advisory panels on issues related to multiple chemical sensitivity, ventilation standards, electromagnetic field regulation, health risk assessment, and outdoor pollution control technology. Testify as an expert witness at Commission hearings and before the California legislature on health issues related to energy development and conservation. Review research proposals and findings for policy implications, interact with federal and state agencies and industry on the establishment of exposure limits for environmental pollutants, and prepare reports for publication.

1985-1989 California Energy Commission.

Responsible for assessing the potential impacts of criteria and noncriteria pollutants and hazardous wastes associated with the construction, operation and decommissioning of specific power plant projects. Testified before the Commission in the power plant certification process, and interacted with federal and state agencies on the establishment of environmental limits for air and water pollutants.

1983-1985 California Department of Food and Agriculture.

Environmental Health Specialist.

Evaluated pesticide registration data regarding the health and environmental effects of agricultural chemicals. Prepared reports for public information in connection with the eradication of specific agricultural pests in California.

DECLARATION OF
JAMES EARL JEWELL

I, James Earl Jewell, declare as follows:

1. I am currently under contract with the Aspen Environmental Group to provide environmental technical assistance to the California Energy Commission. Under Contract No. 700-05-002 I am serving as an Illuminating Engineer to provide Peak Workload Support for the Energy Facility Siting Program and for the Energy Planning Program.

2. A copy of my professional qualifications and experience is attached hereto and incorporated herein.

3. I assisted in the preparation of the final staff testimony on Visual Resources for the Genesis Solar Energy Project based on my independent analysis of the Application for Certification and supplements thereto, data from reliable sources and documents, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony is accurate and valid with respect to the issues addressed therein.

5. I am familiar personally with the facts and conclusions applicable to matters of intrusive light and glare and relative brightnesses, and if called as a witness, could
testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of
my knowledge and belief.

EDUCATION:

BA, College of the Pacific
MFA, School of Drama, Yale University

EMPLOYMENT:

1957-67, Engineering Division, Holzmueller Corporation
1967-69, Theatre Consulting Service, Bolt, Beranek & Newman
1969-87, Lighting Services Administrator, Pacific Gas & Electric Company
1987- present, Consultant in Lighting
Since 1993 in association with Alan Lindsley, AIA, IES

PROFESSIONAL ACTIVITIES:

Illuminating Engineering Society
President – 1984-85
Vice President – 1983-84
Director – 1979-86
Office Lighting Committee – 1976 - present, Chairman, 1978-80
Roadway Lighting Committee – 1974 – present, Chairman, 1990-92
Regional Energy Committee Chairman – 1974-76, 1978-84
Energy Advisory Committee – 1973-75
Technical Missions – China – 1984, 1987, 1988

European Lighting Congress: Strasbourg, 1969; Florence, 1977; Granada, 1981; Lausanne, 1985; Budapest, 1989; Edinburgh, 1993; Berlin, 2001

Pacific Basin Lighting Congress: Chairman, Shanghai, 1989; Bangkok, 1993; Nagoya, 1997; Organizing Committee, Delhi, 2002; Cairns, 2005; Bangkok, 2009

Edison Electric Institute: Street Lighting Committee – 1971-87, Chairman 1979-81

International Commission on Illumination:
Board of Administration – 1983-87, 1987-91
Division Four (Lighting for Transport)
Technical Committee 4.34 -- 1980-95
Technical Committee 4.25 -- 1992-99

Professional Light Designers Convention: London, 2007; Berlin, 2009

EXPERT WITNESS – Admitted as an expert witness in the Superior Courts of Amador, Contra Costa, and San Francisco Counties.

AWARDS AND HONOURS:

IES Regional Technical Award – 1985
IES Distinguished Service Award – 1986
College of Fellows of the American Theatre --1988
Honourary Member, China IES – 1989
CIE Distinguished Service Award – 1991
IES Louis B. Marks Award – 1993

CERTIFICATION:

LC – Granted in 1990 by the National Council on the Qualification of Lighting Professionals

RELEVENT WORK EXPERIENCE:

With PG&E appeared before CEC Committee and Staff on lighting issues with respect to the siting and licensing of Geysers steam power plants.

On behalf of PG&E and the IES appeared before the Simonson Committee to consult on the development of the lighting portions of Title 24.

On behalf of PG&E and the IES appeared before the CEC on numerous occasions to support the development of fluorescent lamp promotional programs and to assist in developing rigorous lighting ballast standards for California and on other lighting energy management issues.

While at PG&E supported and oversaw funding for projects on daylight following and electronic ballasts. Projects supported by both the DOE and CEC.

In practice as a lighting consultant worked with private clients and jurisdictions on matters concerned with light trespass and “intrusive” lighting.

William Kanemoto

Visual Resource/Aesthetics Analyst

Academic Background:

M. Landscape Architecture, University of Michigan, Ann Arbor, 1982
B.A. Liberal Arts (Honors), University of California, Santa Cruz, 1973

Professional Experience:

Principal
William Kanemoto & Associates, Oakland, California, 1993 - Present

William Kanemoto is Principal of William Kanemoto & Associates, an environmental consulting practice specializing in visual analysis and computer visualization in the context of environmental review. In this capacity he has served as principal investigator for visual analysis and simulation on a wide range of major infrastructure and development projects, including the High Desert Power Project AFC, Port of Oakland Expansion EIS, Route 4 East/Pittsburg BART EIS, FMC Substation and Transmission Line PEA, and numerous other infrastructure and transportation projects. Mr. Kanemoto received recognition from the California Association of Environmental Professionals for visual analysis, computer simulation, animation, and video production for the Stanford Sand Hill Road Projects EIR, prepared by EIP Associates and judged 'Best State-Wide EIR of 1997'.

Associate Director
Environmental Simulation Laboratory,
Institute of Urban and Regional Development,
Center for Environmental Design Research
University of California, Berkeley, 1994 - 2000

Instructed graduate students in the College of Environmental Design, U.C. Berkeley, served as consultant on various major planning projects in the San Francisco Bay Area, and conducted design collaborations with counterparts at Keio University and ARK CyberUniversity in Tokyo, Japan via the Internet.

Principal Investigator/Project Manager
Dames & Moore, San Francisco/Oakland, California, 1988-1992

Served as principal investigator of numerous visual analyses of major infrastructure projects throughout the U.S., in Europe, and in Asia. Gained extensive familiarity with the application of a wide range of professionally accepted visual assessment techniques in the context of CEQA, NEPA, and related regulatory requirements of the CPUC, CEC, FERC, DOT, U.S. Forest Service, BLM, and other agencies.

Project Manager
LSA Associates, Pt. Richmond, California, 1987-1988

Project manager and planner on environmental impact reports for various residential and commercial development projects in northern California.

Environmental Planner
Holton Associates, Berkeley, California, 1984-1987

Preparation of various resource and regulatory studies including EIRs, FERC Exhibit E, Section 404 alternative analyses, riparian restoration studies, and cumulative impact methodology studies for EPRI and Sierra County, CA.

DECLARATION OF
James Thurber

I, James Thurber, declare as follows:

1. I am presently under contract with Aspen Environmental Group, a contractor to the California Energy Commission, Systems Assessment and Facilities Siting Division. I am serving as a Geologist to provide Peak Workload Support for the Energy Facility Siting Program and for the Energy Planning Program.

2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I prepared staff testimony on Waste Management for the **Genesis Solar Energy Project** based on my independent analysis of the Application for Certification and supplements hereto, data from documents and sources deemed to be reliable, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issues addressed therein.

5. I am personally familiar with the facts and conclusions applicable to the vapor plume simulations and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

STATEMENT OF QUALIFICATIONS

JAMES E. THURBER
Professional Hydrogeologist

Mr. Thurber is a highly qualified hydrogeologist, experienced in the development of municipal water supply resources. His expertise encompasses the ability to assess the hydrogeology of groundwater basins; define aquifer characteristics; select water well sites; design water wells; and manage construction of wells. Mr. Thurber is actively involved in water resource evaluations related to groundwater recharge and recovery and use of groundwater with impaired water quality. He is experienced with groundwater modeling and assessment of water quality issues. He is well versed in the interpretation of stratigraphic and geophysical logs for final selection of screened intervals and gravel pack during well construction to optimize sand-free groundwater production. Mr. Thurber is experienced in monitoring construction of the well to confirm accurate placement of the well screen, gravel pack and seals. He is experienced in the analysis of pumping test results to define production levels and develop recommendations for operation and maintenance as well as water quality monitoring. He is also experienced in water quality sampling by aquifer isolation methods. Mr. Thurber is experienced in hazardous waste investigations and has performed hazardous material and groundwater contamination assessments.

EXPERIENCE

GEOTECHNICAL CONSULTANTS, INC. Joined the firm in 1985. Mr. Thurber is assisting Orange County Water District with the design and construction management of new injection wells on the Talbert Seawater Intrusion Barrier. Mr. Thurber was the project hydrogeologist for the San Pasqual Groundwater Basin study performed for the City of San Diego, responsible for selection of existing agricultural wells for pump testing, construction of observation wells, pump testing, data collection and analysis to determine aquifer parameters. Mr. Thurber developed the well field design for the San Pasqual Water Resources Management Plan, a groundwater replenishment project that uses a series of injection and extraction wells to store reclaimed water and recover it for potable use. He has developed groundwater flow models for the assessment of longterm pumping, sustained yield, and water quality impacts. Mr. Thurber has performed geologic logging, well design, construction observation, development and pump testing of over 40 high-capacity supply wells. He has developed and implemented plans for rehabilitation of biologic induced well fouling. Mr. Thurber was the project manager for the Irvine Desalter Project including well design and aquifer testing of four new production wells. Mr. Thurber was project manager for drilling 18 test holes and design, construction and pump testing of 9 extraction wells and 8 monitoring wells for the Northeast Disposal Area, George Air Force Base. He has conducted aquifer characterizations at major landfills in southern California. He has participated in a number of hydrogeologic assessments to evaluate contamination from leaking underground tanks or other sources.

Shahab Khoshmashrab
Mechanical Engineer

Experience Summary

Nine years experience in the Mechanical, Civil, Structural, and Manufacturing Engineering fields involving engineering and manufacturing of various mechanical components and building structures. This experience includes QA/QC, construction/licensing of electric generating power plants, analysis of noise pollution, and engineering and policy analysis of thermal power plant regulatory issues.

Education

- California State University, Sacramento-- Bachelor of Science, Mechanical Engineering
- Registered Professional Engineer (Mechanical), California

Professional Experience

2001-2004--Mechanical Engineer, Systems Assessment and Facilities Siting– California Energy Commission

Performed analysis of generating capacity, reliability, efficiency, noise and vibration, and the mechanical, civil/structural and geotechnical engineering aspects of power plant siting cases.

1998-2001--Structural Engineer – Rankin & Rankin

Engineered concrete foundations, structural steel and sheet metal of various building structures including energy related structures such as fuel islands. Performed energy analysis/calculations of such structures and produced structural engineering detail drawings.

1995-1998--Manufacturing Engineer – Carpenter Advanced Technologies

Managed manufacturing projects of various mechanical components used in high tech medical and engineering equipment. Directed fabrication and inspection of first articles. Wrote and implemented QA/QC procedures and occupational safety procedures. Conducted developmental research of the most advanced manufacturing machines and processes including writing of formal reports. Developed project cost analysis. Developed/improved manufacturing processes.

DECLARATION OF

Testimony of Dal Hunter, Ph.D., C.E.G.

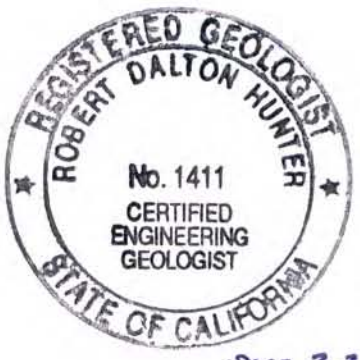
I, **Dal Hunter, Ph.D., C.E.G.,** declare as follows:

1. I am presently employed as a subcontractor to Aspen Environmental Group, a contractor to the California Energy Commission, Systems Assessment and Facilities Siting Division, as an engineering geologist.

2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I helped prepare the staff testimony on **GEOLOGY AND PALEONTOLOGY** for the proposed **Genesis Solar Energy Project** based on my independent analysis of the Application for Certification and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony and changed Condition of Certification is valid and accurate and comports with my prior written testimony in the Final Staff Assessment.



5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Robert D. Hunter, Ph.D., C.E.G.
Engineering Geologist
Vice President

Education

- Ph.D. – Geology – 1989 – University of Nevada, Reno
- M.S. – Geology – 1976 – University of California - Riverside
- B.S. – Earth Science – 1972 – California State University, Fullerton

Registrations

- Professional Geological Engineer – Nevada
- Registered Geologist – California
- Certified Engineering Geologist – California

Experience

1997 to Present: Black Eagle Consulting, Inc.; Vice President. Dr. Hunter is in charge of all phases of geochemical, geological, and geotechnical projects and is responsible for conducting, coordinating, and supervising geotechnical investigations for public and private sector clients. He is very familiar with design specifications and state and federal requirements.

Dr. Hunter has also provided geological, geotechnical, and paleontological review and written and oral testimony for California Energy Commission (CEC) power plant projects including:

- El Segundo Power Redevelopment Project (Coastal, including testimony and compliance monitoring)
- Magnolia Power Project (including compliance monitoring
- Ocotillo Energy Project (Wind Turbines)
- Vernon-Malburg Generating Station
- Inland Empire Energy Center (including testimony and compliance monitoring)
- Palomar Energy Project
- Henrietta Peaker Project
- East Altamont Energy Center
- Avenal Energy Center
- Teayawa Energy Center monitoring
- Walnut Energy Center (including compliance monitoring
- Riverside Energy Resource Center
- Salton Sea Unit 6 (Geothermal Turbines)
- National Modoc Power Plant
- Pastoria Energy Center
- Sun Valley Energy Project
- El Centro Unit 3 Repower Project
- AES Highgrove Project
- South Bay Replacement Project
- Vernon Power Plant

- Humboldt Bay Repowering Project
- Victorville Power Project
- Carlsbad Energy Center
- San Gabriel Generating Station
- Orange Grove
- Chula Vista Energy Upgrade
- Carrizo (Solar)
- Kings River
- Canyon Power Plant
- Otay Mesa Generating Project (compliance monitoring)
- Montainview Power Plant Project (compliance monitoring)
- Consumes Power Plant (compliance monitoring)
- Sunrise Power Project (compliance monitoring)
- Niland Power Project (compliance monitoring)
- Panoche Power Plant (compliance monitoring)

Attended Expert Witness Training Sponsored by CEC.

1978 to 1997: SEA, Incorporated; Geotechnical Manager, Engineering Geologist. Dr. Hunter was in charge of all phases of geotechnical projects for SEA, including project coordination and supervision, field exploration, geotechnical analysis, slope stability analysis, soil mechanics, engineering geochemistry, mineral and aggregate evaluations, and report preparation. Numerous investigations were undertaken on military, commercial, industrial, airport, residential, and roadway projects. He worked on many geothermal power plants, providing expertise in foundations design, slope stability, seismic assessment, geothermal hazard evaluation, expansive clay, and settlement problems. Project types included high-rise structures, airports, warehouses, shopping centers, apartments, subdivisions, storage tanks, roadways, mineral and aggregate evaluations, slope stability analyses, and fault studies.

1977 to 1978: Fugro (Ertec) Incorporated Consulting Engineers and Geologists; Staff Engineering Geologist; Long Beach, California.

DECLARATION OF
Mark Hesters

I, **Mark Hesters**, declare as follows:

1. I am presently employed by The California Energy Commission in the **Siting, Transmission and Environmental Protection Division** as a Senior Electrical Engineer.

2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I prepared the staff testimony on **Transmission System Engineering**, for the **Genesis Solar Energy Project**, based on my independent analysis of the Application for Certification and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issues addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Dated:_____ Signed:_____

At: Sacramento, CA_____

Mark Hesters
Associate Electrical Engineer

Mark Hesters has fourteen years of experience in electric power regulation. He worked in the Engineering Office of the California Energy Commission's Energy Facilities Siting & Environmental Protection Division since 1998 providing analysis of California transmission systems and testimony on transmission systems in several Commission power plant certification processes. Prior to that Mark worked in the CEC's Electricity Analysis Office providing lead analysis on Southern California Edison resource issues and modeling support for all areas of California. He holds a B.S. degree from the University of California at Davis in Environmental Policy Analysis and Planning.

DECLARATION OF

Sudath Edirisuriya

I, Sudath Edirisuriya declare as follows:

I am presently employed by the California Energy Commission in the Engineering Office of the Systems Assessments and Facilities Siting Division as an Electrical Engineer.

A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

I helped prepare the staff testimony on Transmission System Engineering for the Genesis Solar Energy Project based on my independent analysis and supplements thereto, data from reliable documents and sources, and my professional experience and knowledge.

It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue(s) addressed therein.

I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

Date: March 23, 2010. Signed: Sudath Edirisuriya

At: Sacramento, California

Sudath A. Edirisuriya
1916 Ackleton Way
Roseville CA 95661 **Phone 916-654-4851**

EDUCATION:

Bachelor of Science in Electrical Engineering at California State University Fullerton

ATTAINMENTS:

Member of the Professional Engineers in California Government
Vice President Electrical Engineering Society-California State University Fullerton.

EXPERIENCE:

November-2001 to Present: - Associate Electrical Engineer, System Assessment and Facilities Siting Division, California Energy Commission.
Working in the Transmission System Engineering unit on licensing generation projects. Work involves evaluating generation interconnection studies (SIS and FS), their reliability and environmental impacts on transmission system, preparing staff assessment reports, presenting testimony. Perform reliability studies and coordinating data and technical activities with utilities, California ISO and other agencies. Conduct and perform planning studies and contingency analysis including power flow, short-circuit, transient, and post-transient analysis to maintain reliable operation of the power system. Understanding of regulatory and reliability guidelines, WECC and NERC planning and operation criteria, CPUC and FERC requirements. Review technical analyses for WECC/CA ISO/PTO transmission systems and proposed system additions; and provide support for regulatory filings.

June-1998 to November-2001: - Project Electrical Engineer, Design Electrical Engineering Section, Department of Transportation, California.
Electrical Engineering knowledge and skills in the design, construction and maintenance of California state work projects involving all the public work areas; contract administration, construction management, plan checking, field engineering and provide liaison with consultants, developers, and contractors. Plan review in facility constructions, highway lighting, sign lighting, rest area lighting, preparation of project reports, cooperative agreements, review plans for compliance of construction and design guide lines for national electrical code, standards and ordinance. Review process included breaker relay coordination, detail wiring diagrams, layout details, service coordination, load, conductor sizes, derated ampacity, voltage drop calculations, harmonic and flicker determination.

June-1993 to May-1998:- Substation Electrical Engineer, City of Anaheim, California.
Performed protective relay system application, design and setting determination in Transmission & Distribution Substation. Understanding of principles of selective coordination system protection and controls for Electric Utility Equipment. Understanding of Power theory and Analysis of symmetrical components. Ability to review engineering plans, specifications, estimates and computation for Electrical

Utility Projects. Practices of Electrical Engineering design, to include application of Electro-mechanical and solid state relays in Electrical Power Systems. Software skills in RNPDC (Fuse Coordination Program), Capacitor Bank allocation program, and GE Load Flow Program. Design projects using CAD, Excel spread sheets including cost estimates, wiring diagrams, material specifications and field coordination.

Performed underground service design 12kV and 4kV duct banks; pole riser; getaway upgrade; voltage drop calculation, ampacity calculation and wiring diagrams. Design and maintenance of substations in City Electrical Utility System. Upgrade Station Light and power transformers; upgrade capacitor banks; replacement of 12kV-4kV power circuits; Breakers at Metal Clad Switchgear. Design one-line diagrams; three line diagrams; grounding circuits; schematics; coordination of relay settings; conduit and material list preparation. Calculation of derated ampacity; inrush current, short circuit current.

DECLARATION OF
MARY DYAS

I**, MARY DYAS** declare as follows:

1. I am presently employed by the California Energy Commission in the **SITING AND COMPLIANCE OFFICE** of the Siting Transmission and Environmental Protection Division as a **COMLPIANCE PROJECT MANAGER**.

2. A copy of my professional qualifications and experience is attached hereto and incorporated by reference herein.

3. I helped prepare the staff testimony on **JOINT AGENCY GENERAL CONDITIONS INCLUDING COMPLIANCE MONITORING AND CLOSURE PLAN**, for the **GENESIS SOLAR ENERGY PROJECT** based on my independent analysis of the Application for Certification and supplements hereto, data from reliable documents and sources, and my professional experience and knowledge.

4. It is my professional opinion that the prepared testimony is valid and accurate with respect to the issue addressed therein.

5. I am personally familiar with the facts and conclusions related in the testimony and if called as a witness could testify competently thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge and belief.

MARY DYAS

CALIFORNIA ENERGY COMMISSION – COMPLIANCE PROJECT MANAGER

PROFESSIONAL EXPERIENCE

Planner II/III – Energy Facilities Compliance Project Manager *05/01/2008 to Present*
Siting Unit / Siting and Compliance Office, California Energy Commission, Sacramento, California

Compliance Project Manager—Provide oversight of energy facility construction and operation activities to ensure compliance with conditions of certification. Function as team leader for all compliance monitoring activities, processing of post-certification amendments, complaints, and facility closures.

Currently acting as working team leader on projects filed with the Energy Commission including renewable energy projects (SES Solar One and Solar Two), transmission line projects (Blythe Transmission Line), and natural gas-fired energy projects (Russell City Energy Center) in the licensing, construction and operational phases of each project.

Planner I/II – Energy Facilities Siting Project Manager *01/18/2006 to 04/30/2008*
Siting Unit / Siting and Compliance Office, California Energy Commission, Sacramento, California

Siting Project Manager – Provide day-to-day management of complex and controversial energy facility siting projects and renewable solar projects, including the Carrizo Energy Solar Farm Project, Bullard Energy Center, El Centro Unit 3 Repower Project and Chevron Replacement Project. Planning, organizing and directing the work of an interdisciplinary environmental and engineering staff team engaged in the review of complex or controversial energy facility siting Applications for Certification.

Energy Analyst / Associate Energy Specialist – LNG Research *09/27/2002 to 01/17/2006*
Natural Gas Office / Transportation Division, California Energy Commission, Sacramento, California

Coordinating and assisting with the facilitation of monthly Interagency LNG Working Group meetings involving cooperative federal, state, and local agencies; assisting with report writing conducting LNG facility assessments; Organizing/facilitating public workshops and preparing status reports on LNG facility development for use by Commissioners and Governor's Office, as well as reviewing and analyzing LNG-related legislative bills in California; Creating and maintaining the Commission LNG webpage, researching and preparing numerous LNG fact sheets for public education, and gathering information on new technology, tracking new LNG projects, and LNG market information.

Office Technician / Energy Analyst - Assistant Siting Project Manager *06/27/2000 to 09/27/2002*
Siting Unit / Siting and Compliance Office, California Energy Commission, Sacramento, CA

Assisting energy facility project managers with organization of and conducting workshops and public meetings between staff and power plant developers, other governmental agencies, private organizations, and the public. Also assisting with the reviewing, evaluating and editing of project correspondence, reports, and testimony as well as assisting project secretaries, and Office Managers as needed. Also performed all the same duties in relation to the Emergency Power Plant Permitting 21-day, 4-month, 6-month and 12-month projects.

Office Technician / Energy Analyst - Assistant Siting Project Manager *06/27/2000 to 09/27/2002*
Siting Unit / Siting and Compliance Office, California Energy Commission, Sacramento, CA

Managing the Siting Peak Workload Contract, including the preparation of hundreds of work authorizations, invoices, and general coordination of work between technical staff and contractor and preparing associated budget information for office managers and executive office.

DECLARATION OF SERVICE

I, Maria Santourdjian, declare that on March 26, 2010, I served and filed copies of the attached Staff Assessment/Draft Environmental Impact Statement for Genesis Solar Energy Project (09-AFC-8), dated March 26, 2010. The original document, filed with the Docket Unit, is accompanied by a copy of the most recent Proof of Service list, located on the web page for this project at: [http://ww.energy.ca.gov/sitingcases/genesis_solar].

The documents have been sent to both the other parties in this proceeding (as shown on the Proof of Service list) and to the Commission's Docket Unit, in the following manner:

(*Check all that Apply*)

FOR SERVICE TO ALL OTHER PARTIES:

__x__ sent electronically to all email addresses on the Proof of Service list;

_____ by personal delivery;

__x__ by delivering on this date, for mailing with the United States Postal Service with first-class postage thereon fully prepaid, to the name and address of the person served, for mailing that same day in the ordinary course of business; that the envelope was sealed and placed for collection and mailing on that date to those addresses NOT marked "email preferred."

AND

FOR FILING WITH THE ENERGY COMMISSION:

__x__ sending an original paper copy and one electronic copy, mailed and emailed respectively, to the address below (***preferred method***);

OR

_____ depositing in the mail an original and 12 paper copies, as follows:

CALIFORNIA ENERGY COMMISSION
Attn: Docket No. 09-AFC-8
1516 Ninth Street, MS-4
Sacramento, CA 95814-5512
docket@energy.state.ca.us

I declare under penalty of perjury that the foregoing is true and correct, that I am employed in the county where this mailing occurred, and that I am over the age of 18 years and not a party to the proceeding.
