

# WPI

## **Phase Field Modeling of Corrosion for Next-Generation Aluminum- Magnesium Vehicle Joints**

PI and Presenter: Adam C. Powell, IV

Team members: Brajendra Mishra – WPI

Tim Skszek – Magna

Darrell Herling, Piyush Upadhyay, Erin Barker – PNNL

Michael Brady, Donovan Leonard – ORNL

DOE Vehicle Technologies Annual Merit Review  
June 11, 2019 Arlington, Virginia

Project ID# mat151

# Overview

---

## Timeline:

- Project start date: Oct 2018
- Project end date: Dec 2021
- Percent complete: 10%

## Budget:

- Total project funding
  - DOE Share \$1.5M
  - Cost share: \$400k
- Funding for FY 2018-19
  - DOE Share: \$499k
  - Cost share: \$130k

## Barriers & Technical Targets:

- Multi-Material Systems Enablers
  - High-Volume Joining (Fusion)
  - Predictive Modeling
- Magnesium
  - Galvanic Corrosion Protection

## Partners:

- WPI – Project Lead
- Magna Services of America – challenge problem relevance
- Pacific Northwest National Laboratory – welding, modeling
- Oak Ridge National Laboratory – characterization

# Relevance

---

- **Objective:** Develop and validate a phase field model of corrosion and mechanical failure in aluminum-magnesium alloy joints
  - Predict strength of corroded joints within 10% of measured performance
- **Challenge Problem:** FCA-Magna ultra-light door welds
  - 6022 Al outer, ZEK100 Mg inner
  - Model based on friction stir welded (FSW) hem welds 6022 Al–ZEK100 Mg
  - Validate model using FSW beam welds: 7xxx Al beam–ZEK100 Mg inner
- **Bigger picture goal:** Remove a key barrier to Al-Mg structures
  - Magnesium: stiffness/weight, strength/weight
  - Aluminum: paintability, energy dissipation, corrosion resistance
  - Corrosion/mech model → robust welds → performance needs at low cost
- **Weight reduction potential:**
  - Doors: Al 40% mass reduction, Al-Mg 50% vs. steel baseline
  - Other closures are similar
  - Roof, bumper: similar weight – plus safety and performance benefits
- **Energy savings benefit:**
  - Ultra-light closures → marginal vehicles meet small engine weight targets

# Challenge Problem: Ultra-Light Door

Aluminum door: 40% lighter than steel baseline

Al-Mg door: 50% lighter

Can FSW joints meet corrosion/strength needs?

Start with hem weld geometry, alloys, corrosion conditions

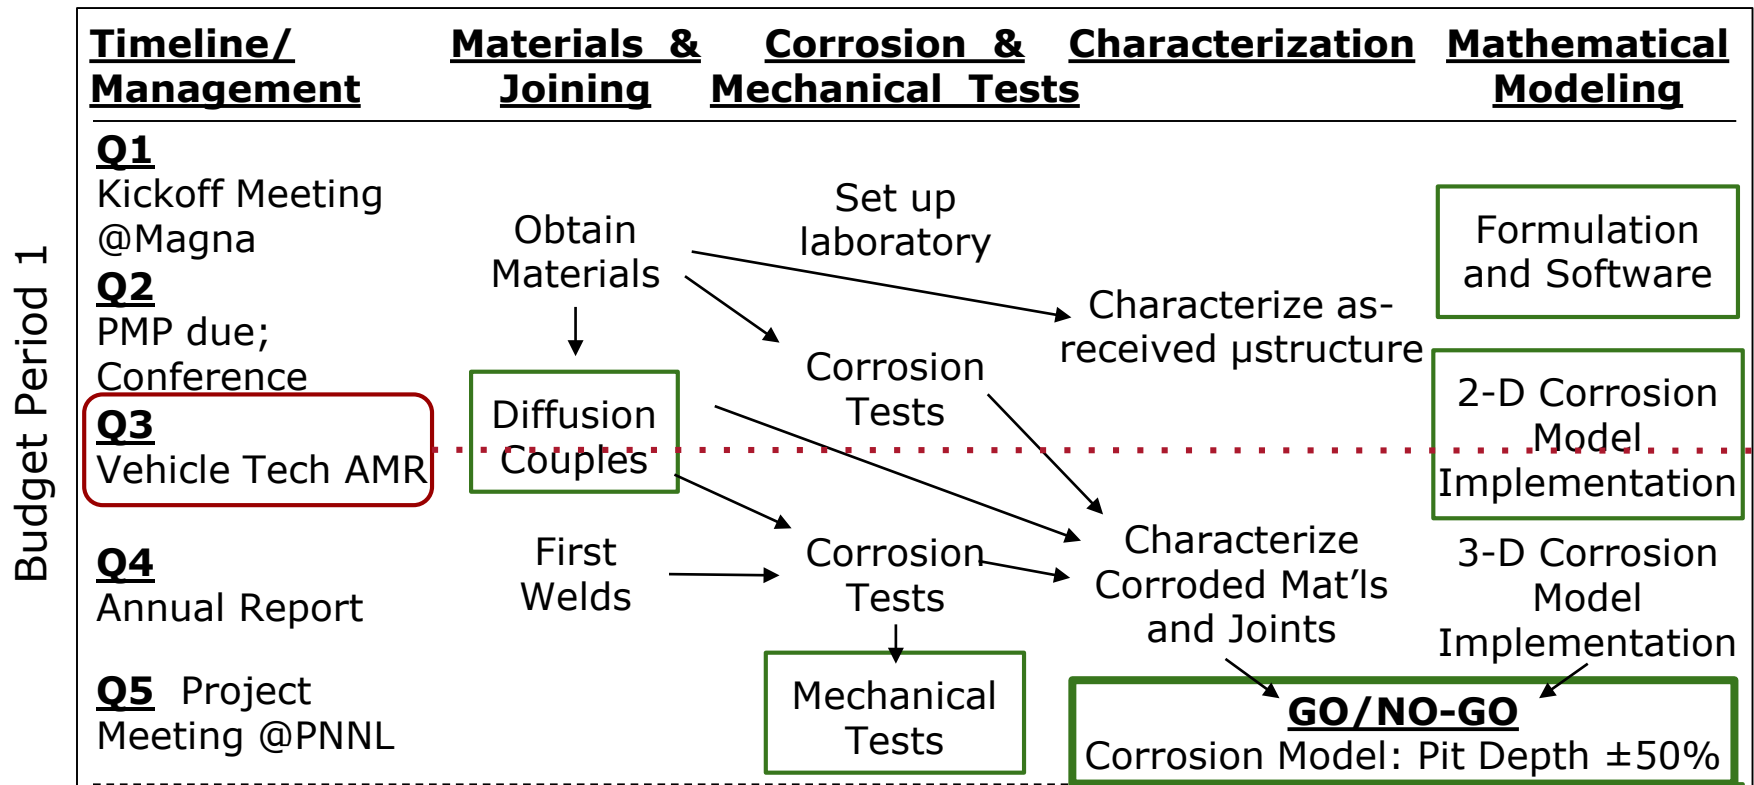

- Use/model cyclic corrosion test (CCT) protocols
- Understand corrosion initiation
- No coating – simpler model, worst-case

Validate with beam weld geometry, alloys

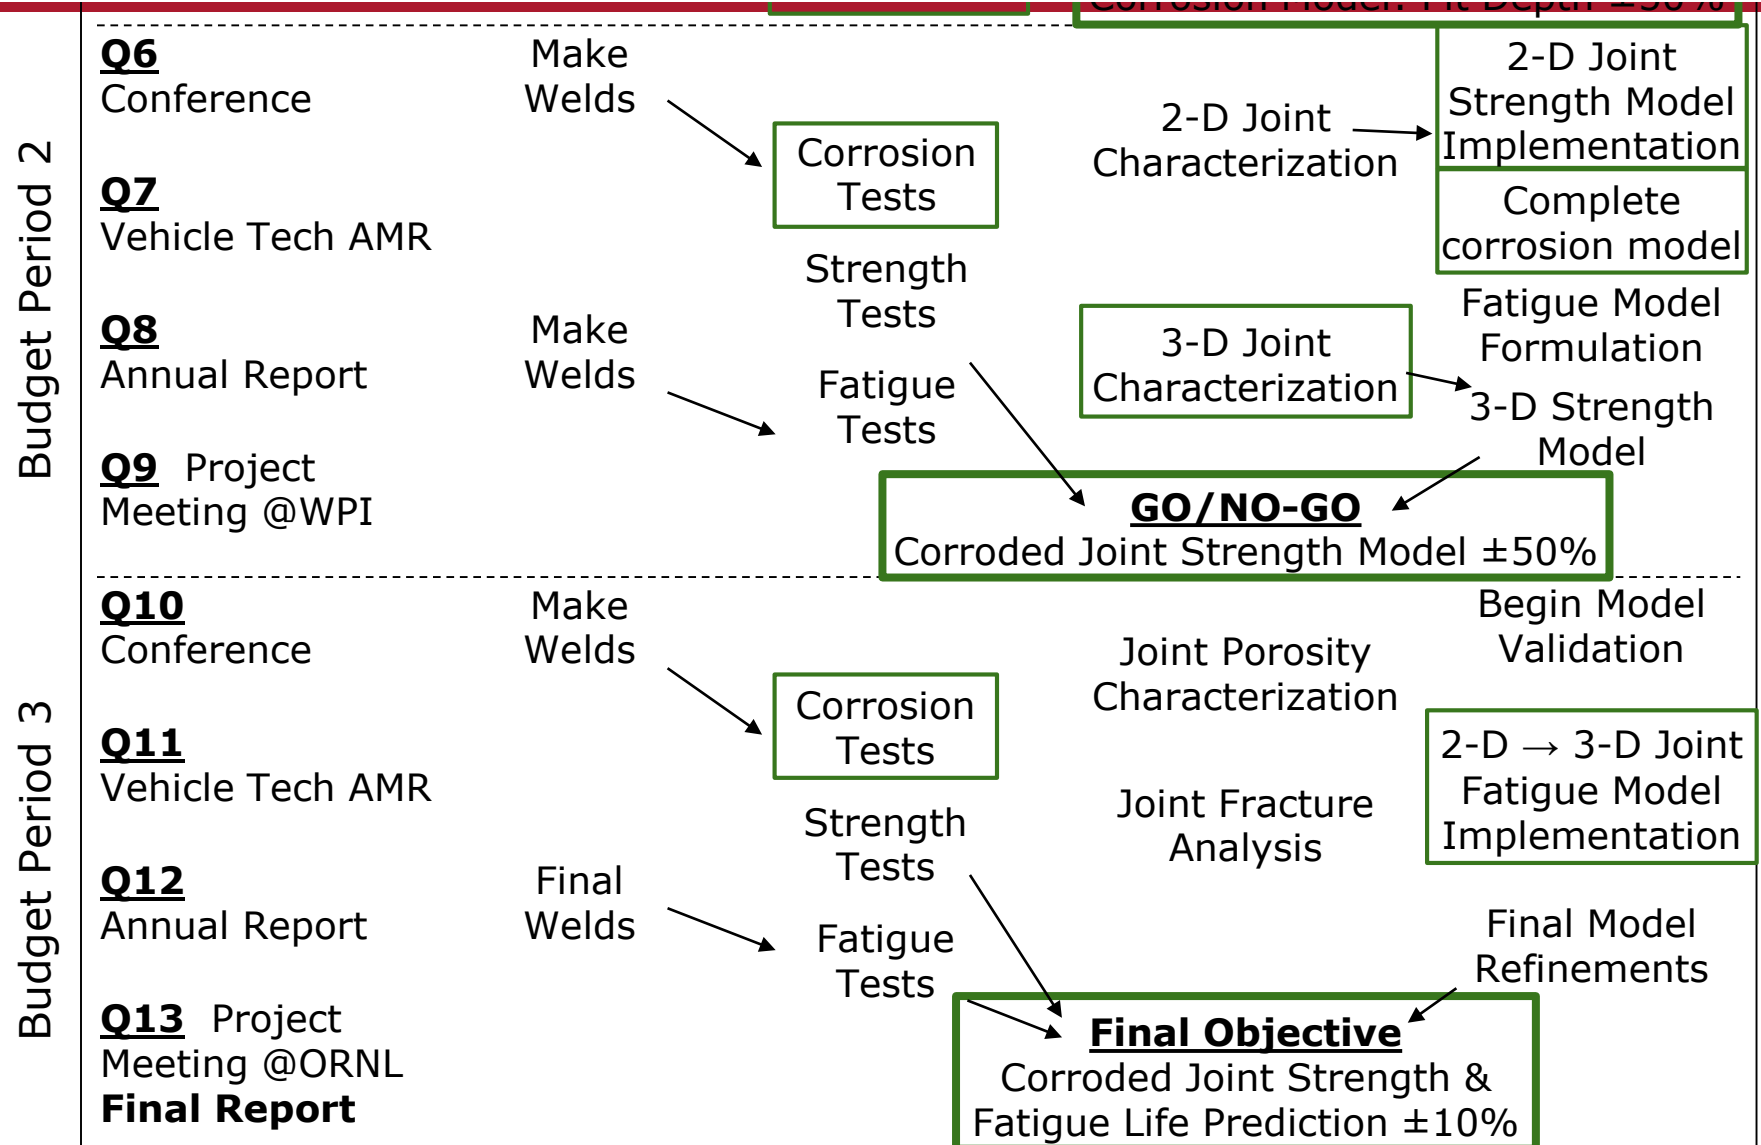

# Milestones

Tasks, activities, material/information flow; milestones in green boxes

# Milestones (cont'd)

# Approach

---

Validated modeling: corrosion  $\leftrightarrow$  mechanical failure in Mg-Al FSW

- Close coupling with experiments
- Develop understanding  $\rightarrow$  confidence in deployment
- Use findings to improve corrosion/failure performance of welds
- Assume weak (one-way) coupling corrosion  $\rightarrow$  mechanical failure

Multi-scale model: can't model 10  $\mu\text{m}$  grains in 3-5 mm weld in detail

- Microstructure as initial condition – this is not a process model
- Detailed models of clusters of  $\sim 100$  grains in FSW joint
- Reduced order models of overall joint

Work closely with PRISMS Center on scalable weakly-coupled phase field  $\rightarrow$  crystal plasticity model

- Build on existing PRISMS-PF pitting/galvanic corrosion model
- Improve phase field solvers  $\rightarrow$  high-throughput 3-D modeling

Work with Magna on options for technology transfer to industry

# Phase Field Modeling

---

Based on chemical free energy

Diffuse interface accurately models interface curvature

Solve one equation system everywhere

No explicit interface tracking

Interface topology changes handled implicitly

BUT computationally expensive!

- Nonlinear electrochem kinetics

# Phase Field Corrosion Modeling

PRISMS Group, U Michigan

- Galvanically driven pit development
- Metal and aqueous phases
- Electrical potential
- Full Butler-Volmer electrochemical interface kinetics
- Polycrystalline metal using separate field variables for each grain
- Includes grain boundary motion

Chadwick, Stewart, Enrique, Du, Thornton, *J. Electrochem. Soc.* 165(10) C633 (2018),  
DOI: [10.1149/2.0701810jes](https://doi.org/10.1149/2.0701810jes)

# Technical Accomplishments and Progress

---

- Obtained materials and developed bonding protocol for Mg-Al sheet diffusion bonding experiments
- Began developing Mg-Al sheet friction stir welding protocol, tooling selection
- Ordered cyclic corrosion testing equipment, anticipate installation by AMR meeting
- Began characterizing baseline Mg and Al sheet materials
- Started corrosion phase field model development in collaboration with U Michigan PRISMS Center

# Response to Previous Year Reviewers' Comments

---

Not reviewed last year – not applicable

# Collaboration and Coordination with Other Institutions

---

Prime: WPI Materials Science and Engineering

- Project coordination, mathematical modeling, corrosion testing
- Also WPI Math Department, Academic & Research Computing

Subcontractor: Magna Services of America

- Challenge problem relevance, material provider

Subcontractor: Pacific Northwest National Laboratory

- Mg-Al FSW development and coupon fabrication
- Model development consulting

Subcontractor: Oak Ridge National Laboratory

- Advanced characterization: electron microscopy with element and orientation mapping, ion etching → 3-D microstructure; transmission electron microscopy; neutron scattering

University of Michigan PRISMS Center

- PRISMS-PF and PRISMS Plasticity open source software
- Electrochemistry formulation, solvers

# Remaining Challenges and Barriers

---

Assumption of weak/one-way corrosion → mechanics coupling

FSW specific to this challenge problem

- Must go through hard material (6022 Al) into softer (ZEK100 Mg)

Three-dimensional nature of corrosion → mechanical failure

- Requires a computation-intensive model

# Proposed Future Research

---

Test corrosion → mechanics coupling assumption

Develop FSW method for joining 6022 Al into ZEK100 Mg

- Opportunity to tune parameters to minimize intermetallic phase formation

Subject as-received, diffusion-bonded and FSW joints to cyclic corrosion, mechanical failure

- Characterize corroded-failed joints and interpret results

Develop corrosion and mechanics detailed and coarse-grained models

- Capture macrogalvanic corrosion between sections, microgalvanic corrosion between various phases
- Computationally intensive 3-D models

Any proposed future work is subject to change based on funding levels

# Summary

---

New project with goal of addressing a key barrier to Mg-Al structures

- Build OEM confidence in understanding multi-material corrosion and mechanical failure

Mg-Al welded structures can enable weight savings beyond aluminum alone

This model of corrosion and mechanical deformation aims to advance ICME with broader vehicle technology impact
