

# Solar Energy Technologies Office Overview

## MISSION

We accelerate the **advancement** and **deployment of solar technology** in support of an **equitable** transition to a **decarbonized energy system by 2050**, starting with a decarbonized power sector by 2035

## WHAT WE DO

Drive innovation in technology and soft cost reduction to make solar **affordable** and **accessible** for all Americans

Enable solar to support the **reliability, resilience**, and **security** of the grid

Support **job growth**, **manufacturing**, and the **circular economy** in a wide range of applications

# SETO Program Areas

## PHOTOVOLTAICS

## CONCENTRATING SOLAR-THERMAL POWER

## SOFT COST REDUCTION

## SYSTEMS INTEGRATION

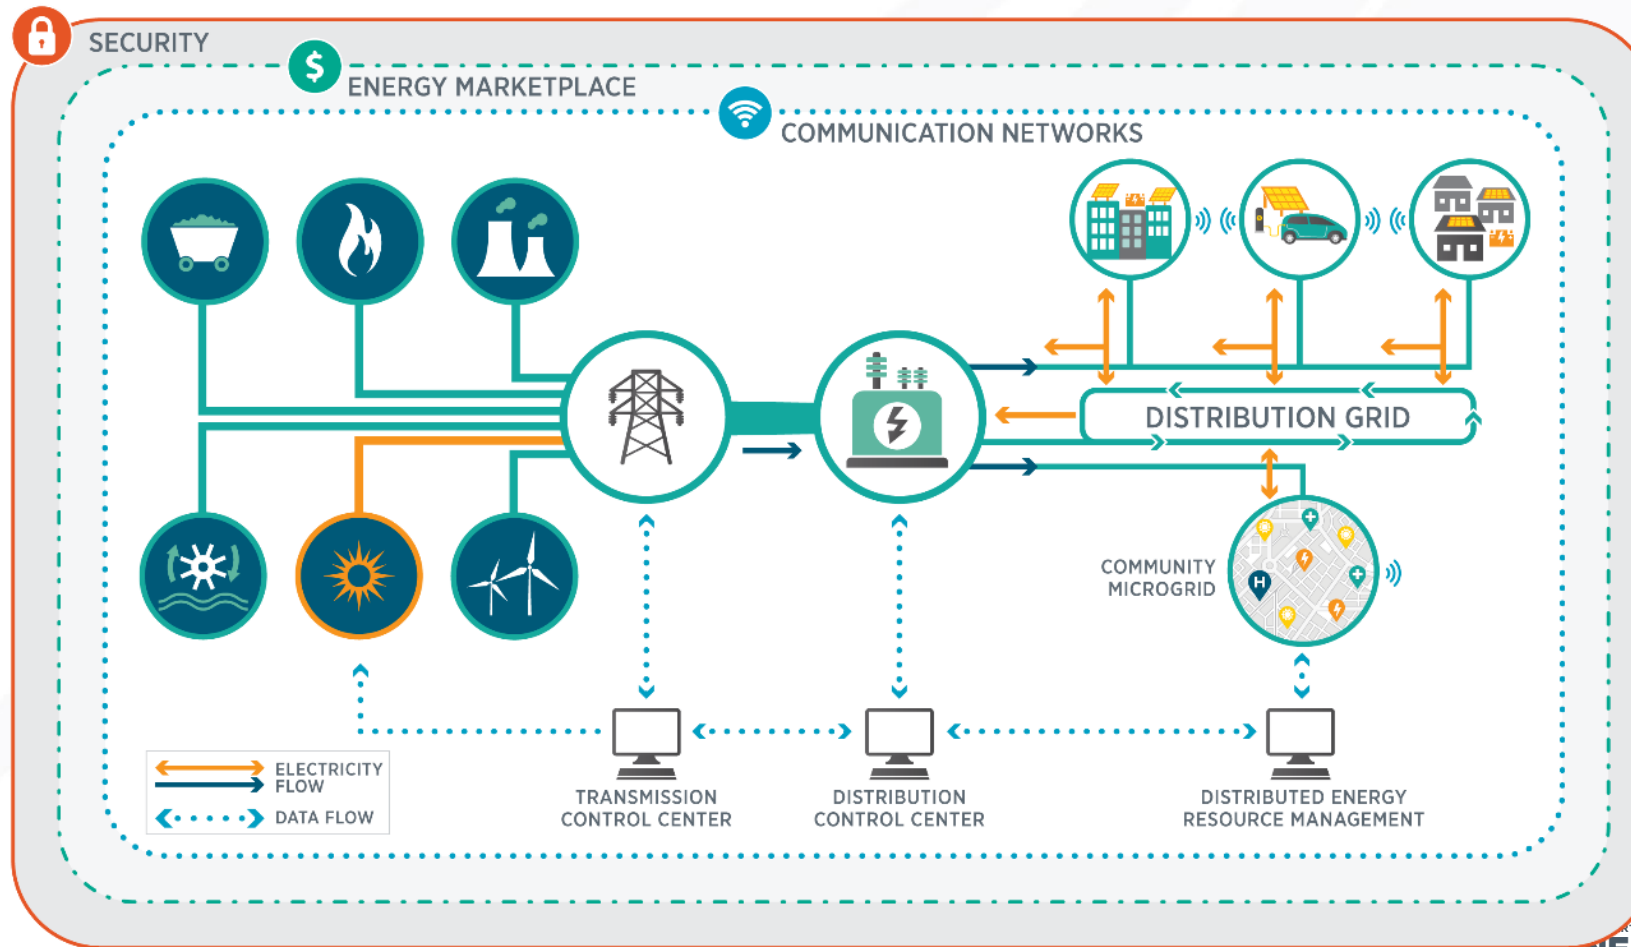

## MANUFACTURING AND COMPETITIVENESS

# SETO Systems Integration (SI) Program

The SI program supports research, development, and demonstration of data, analytics, controls, and hardware technologies that advance the **reliable, resilient, secure, and affordable** integration of solar energy onto the U.S. electric grid.

# DOE-wide Collaboration on Grid Modernization

DOE's Grid Modernization Laboratory Consortium – 14 National Labs – 100+ Partners

# Solar Supporting Reliable Grid Operation

---

**Today:** PV only contributes energy to the grid; PV doesn't support all aspects of grid stability (e.g., frequency and voltage regulation)

**Next 5 Years:** Smart PV inverters contribute essential grid reliability services like a conventional generator (e.g., frequency and voltage regulation)

**Next 10 Years:** Harness the fast-responding capabilities of power electronics-based generators to improve the efficiency and reliability of the grid in areas with high penetrations of wind and solar

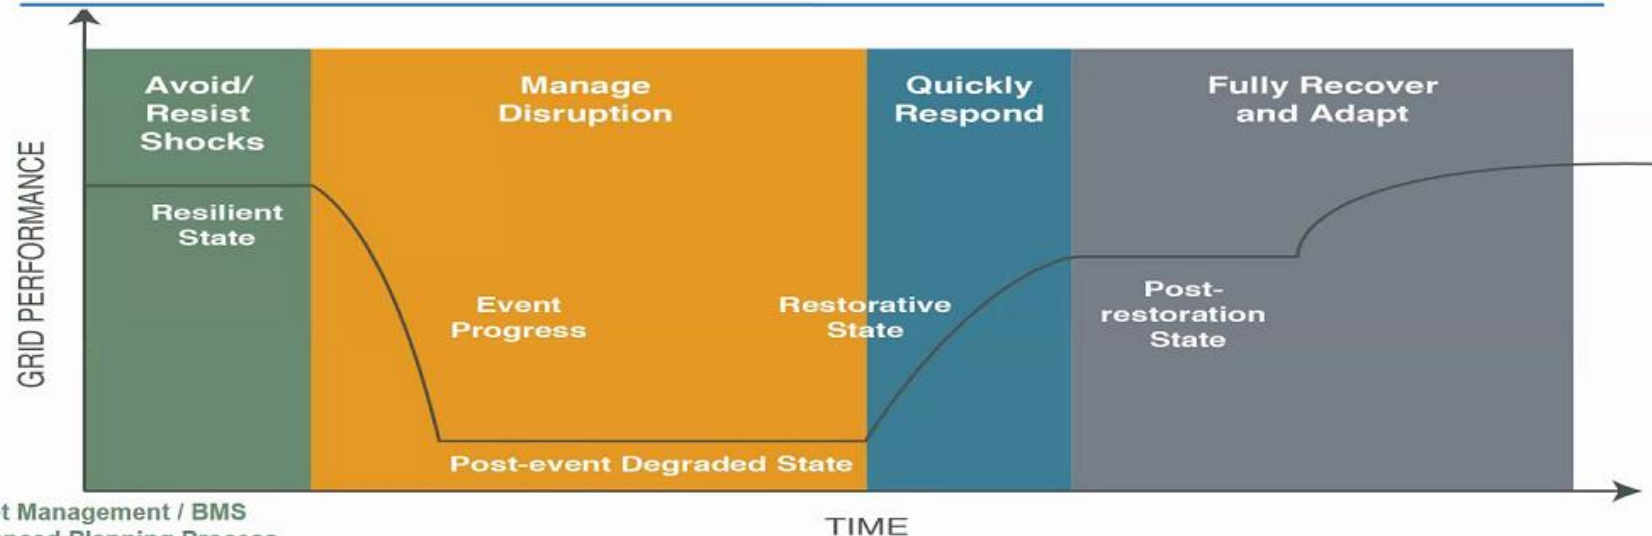

## Ongoing foundational research topics:

- PV cybersecurity
- Situational awareness
- Solar forecasting
- Integration with storage, controllable loads, and other distributed energy resources
  - Distributed energy resource management systems

# Designing for Resilient Systems

## Phases of Electric System Resilience

- Asset Management / BMS
- Advanced Planning Process
- Vegetation Management & EAB Focused Tree Trimming
- Distribution Standards Including Storm Hardening
- Inspection & Maintenance Program
- Targeted Minor Storm Hardening
- Flood Mitigation
- Side Tap Fusing
- Substation Perimeter Fence
- Intrusion Detection
- Cyber Security

- Sub-Transmission Automation
- FLISR
- Recloser Loops Scheme Programs
- Remote Terminal Units
- Line Sensors
- Mobile Transformer Fleet
- Critical Spares
- Damage Appraisal & iPads
- Emergency Response Plan
- Outage Management System
- Mutual Aid agreements

- Reliability and Emerging Risk Assessments
- Event Analysis
- Event Forensics
- Reliability Guidelines and technical reference documents
- System Operator Certification and Credential Maintenance
- System Operator Training
- Periodic Review

SNL (Jeffers, Broderick)

# Solar + Storage Enhancing Grid Resilience

## Today

- PV + storage can power simple building loads in the event of an outage for a short period
- PV can reduce need for fuel storage for back-up power

## Next 5 Years

- PV black-start capabilities validated in field trials
- PV + storage operating in microgrid mode for longer durations
- PV can provide significant fuel savings compared with back-up generators

## Next 10-15 Years

- PV + storage black-start solutions adopted to start up microgrids in the event of an electricity outage
- New design and control capabilities enable grid reconfiguration to supply critical loads during an outage

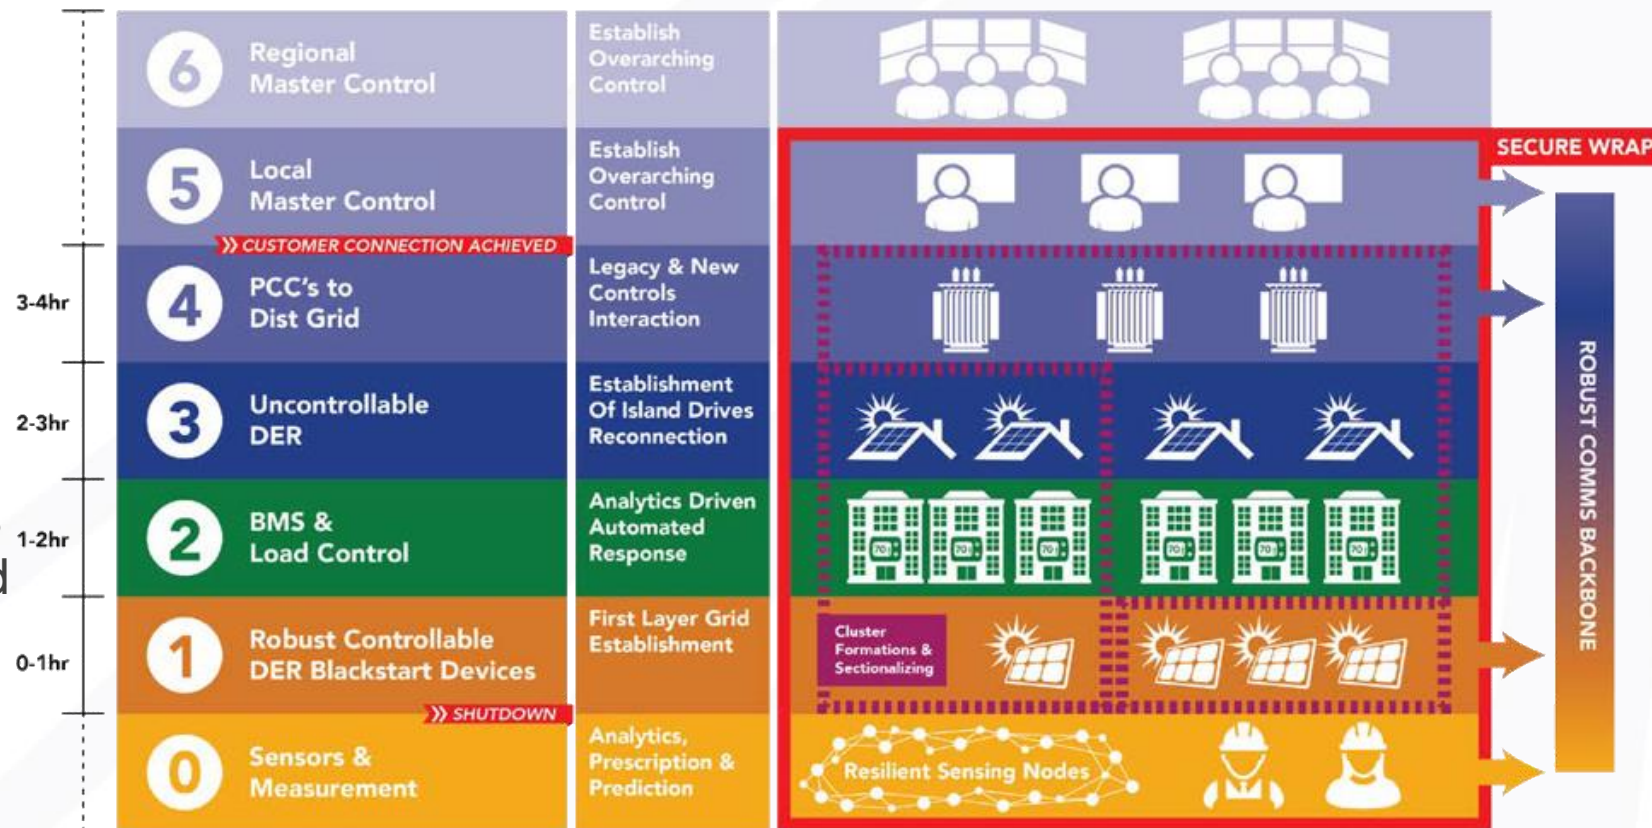

### Ongoing foundational research topics:

- PV cybersecurity
- Solar forecasting
- Control optimization algorithms
- Integration with storage, controllable loads, and other distributed energy resources
  - Distributed energy resource management systems

# GMLC-RDS: CleanStart DERMS (LLNL)

- Approach: Achieve black start and restoration objectives through combination and application of advanced co-simulation and architecture design, measurement and analytics, controls and optimization, communications and cyber security
- TD&C co-simulation planning tools will be used to design, validate and evaluate CSDERMS controls and scale up results for metrics and impact
- Distinctive characteristics
  - Development of dynamic ad-hoc microgrids, which form around resilience objectives integrating both traditional and non traditional DER
  - Solves critical problems for partner utilities yet applicable throughout the nation at similar facilities

# Building Resilient Power System in Puerto Rico

**Objective:** DOE Office of Electricity and SETO have tasked national laboratories to perform near-, medium-, and long-term modeling activities to support the rebuilding of a more resilient electric power grid system in Puerto Rico after the devastation of Hurricane Maria in late September 2017.

## Phase 2 Approach:

1. Build on insight from research in Hawaii and elsewhere
2. Develop integrated portfolio
3. Rigorous modeling and analysis
4. Broad stakeholder engagement (federal, state, local community, and industry)

### Fuels/Interdependencies

- LNG Infrastructure
- Telecom Infrastructure
- Solar Resource and Supply Curves

### Bulk Power System

- Investment Support Tools
- Capacity Expansion Modeling (AURORA)
- Production Cost Modeling (FESTIV)
- System Stability Modeling (Epfast)
- Dynamic Modeling (MAFRIT)

### Transmission

- Protection and R/T Info
- Risk-Based Contingency Analysis
- Grid Asset Benefit-Cost Evaluations

### Distribution & Edge

- System Advisory Model & PVWatts
- DER Interconnection Standards
- DER Feeder Hosting Methodology
- Contingencies, Operations, and Storage Sizing for Islandable Sections
- GIS Resiliency Improvement Tool

Lead Lab Key:

- ANL
- NREL
- ORNL
- PNNL
- SNL
