

# Validation of Connected and Automated Mobility System Modeling and Simulation

Reuben Sarkar, Principal Investigator
American Center for Mobility

Jeffrey Naber, Presenter
Michigan Technological University
June 23, 2021

2021 DOE Vehicle Technologies Office
Annual Merit Review – Project ID: EEMS082

This presentation does not contain any proprietary, confidential, or otherwise restricted information

# Overview

#### Timeline

• Start: October 1, 2019

• End: June 30, 2022\*

45% complete (milestone basis)

# Budget

| • | To | tal            | \$7,633,143 |  |  |  |
|---|----|----------------|-------------|--|--|--|
|   | •  | DOE            | \$6,103,138 |  |  |  |
|   | •  | 20% Cost Share | \$1,530,005 |  |  |  |

BP1: 2020 \$5,025,594
BP2: 2021 \$2,607,549

#### Barriers

- Real-world measurement of the energy impact of advanced controls enabled by connectivity and automation (multiplicity of noise and impact factors)
- (Accurately predicting) the energy benefits derived from new mobility technologies in a mobility system context
- Computational difficulty of accurately modeling and simulating large-scale transportation systems

#### Partners

- American Center for Mobility
- Michigan Tech Research Institute
- Michigan Technological University
- Argonne National Laboratory
- Oak Ridge National Laboratory
- California PATH

<sup>\*</sup> No cost project extension through June 30, 2022, due to COVID-19

#### Relevance

# **Objectives**

- Translate Lab algorithms into vehicle and infrastructure controls
- Conduct physical testing at a manageable scale
- Compare test results with simulation
- Interactively develop better models
- Integrate testing and simulation to expand the set of models that can be assessed

# **Impact on Barriers**

- Validated models reduces need for physical testing at large mobility system level scale
- Interactive development of models with the author improves its accuracy
- Validated models can provide an <u>evaluation</u> of proposed technology with reasonable cost and time

#### **EEMS Relevant Goal**

 Develop <u>new tools</u>, techniques, and core capabilities to understand & identify the most important levers <u>to improve the energy</u> <u>productivity</u> of future integrated mobility systems when adopted at scale

# Approach

- Build-up & configure test vehicles and infrastructure for testing of algorithms
- Translate, integrate, and refine Lab algorithms into real-time vehicle and infrastructure controls
- Test vehicles on track with 3) Lab algorithms and models in coordinated scenarios
- Compare results and modify accordingly

| Energy Efficiency – Study Cases     |    |  |  |  |  |  |
|-------------------------------------|----|--|--|--|--|--|
| Case 1:<br>Speed<br>Harmonization   | 45 |  |  |  |  |  |
| Case 2:<br>Merging                  |    |  |  |  |  |  |
| Case 3: Intersections & Eco-Driving |    |  |  |  |  |  |

# Milestones

|  | BP1 (including COVID extension) |                      |      |                |                |                              | BP2                         |                                   |              |                  |                       |   |

# **Technical Progress and Accomplishments**

0.35

0.25

0.20

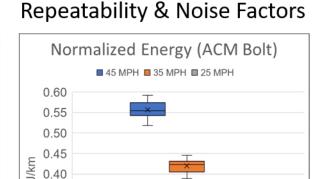

#### **Comprehensive Data Sets**

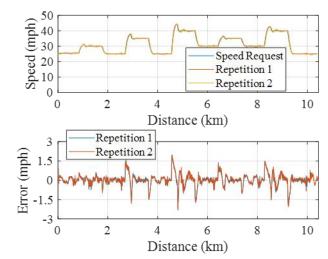

- Five automated and connected vehicles developed for model integration and testing
- Model refinement, integration, and functional testing of centralized controller (ORNL) and in-vehicle controller (ANL)
- Facility network optimized for experiments (enabled immediate routing of information without buffering)
- Designed and conducted experiments on-track using trajectories recorded in virtual twin
- On-track vehicle baselining for energy and vehicle dynamics with automated vehicles
- Speed harmonization testing with optimized and human driver comparison
- Integration and functional testing for EcoDriving

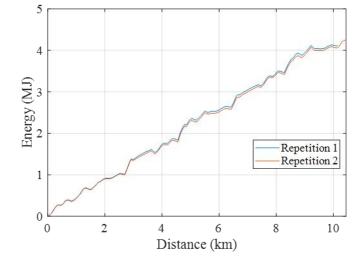

10 test programs conducted 100's of individual tests Extensive data sets shared with Labs

# 10.63 Throttle Position... 29.412 Brake Position (%) 0.784 Latitude 476.593134 N Longitude 02°29.04.029 W

#### **Speed Harmonization Optimal Profile Test Results**

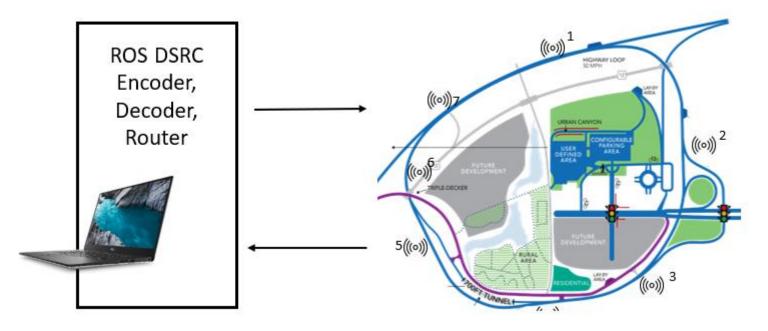

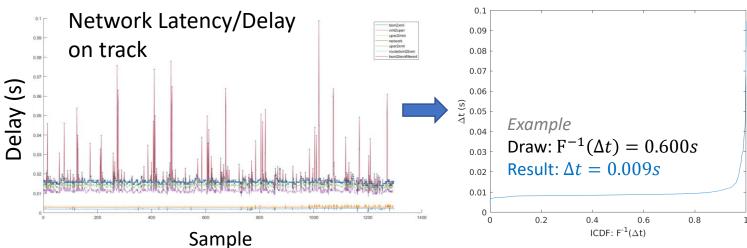

# Setup, Test, and Assessment of V2X Network

#### **Network Profiling Methodology:**

- Simulation sends out BSMs, RSU A transmits it, RSU B receives and sends it back to the simulation.
- Timestamp outgoing and incoming messages, as well as individual spots along the pipeline to profile the system.
- Network support for real time control is feasible, though traffic density will impact performance

# Test Vehicle Setup: Instrumentation and Facility

#### **ACM (Pacifica and Bolt)**

DBW and AV control

#### MTU (Bolt and 2 Volts)

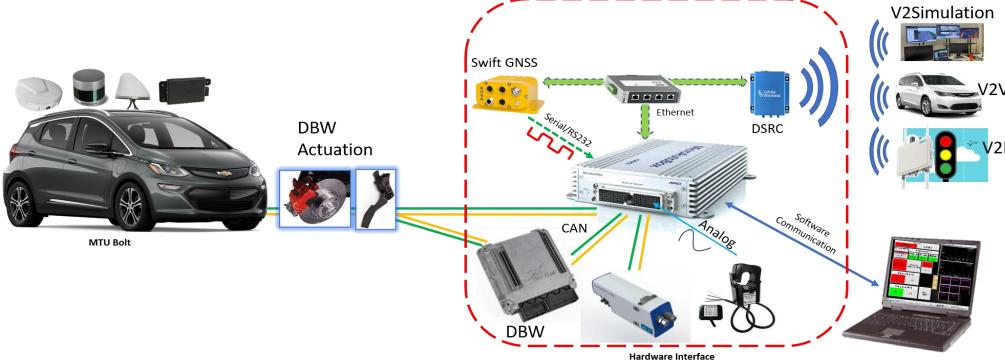

DBW control

#### All vehicles

- Instrumentation
- Comms (V2x +)
- Controls and model integration
- Realtime interface
- Data recording and logging

# **DSRC** performance improvements at ACM:

- 9 RSU's replaced and with software updates for all RSU's
- Firmware updates to 14 RSU's

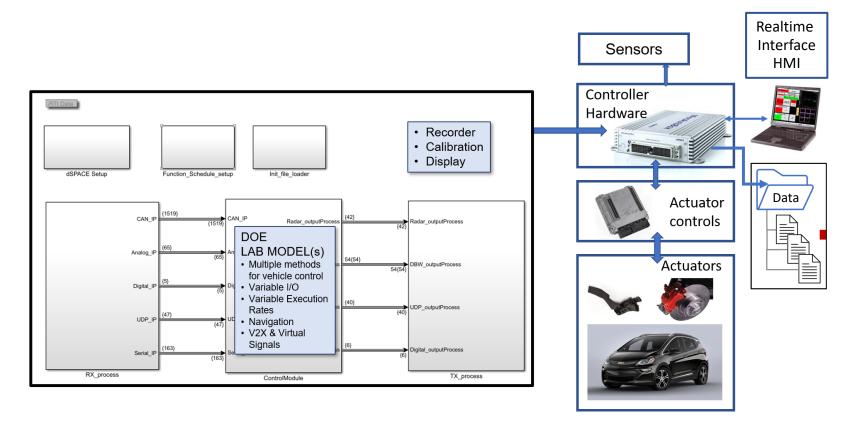

# Test Vehicle Setup – Software Architecture and Lab Model/Controller Integration

- Architected for adaptability with I/O wrapper to efficiently pass data
  - Multiple sources synced with model input requirements
  - Navigation module
- Customizable/variable update rates
- Configurable output to direct control longitudinal vehicle dynamics or high level speed control
- Scalable to expand and incorporate additional real-time control algorithms, estimators, and HMI

# **Integrate National Laboratory Algorithms**

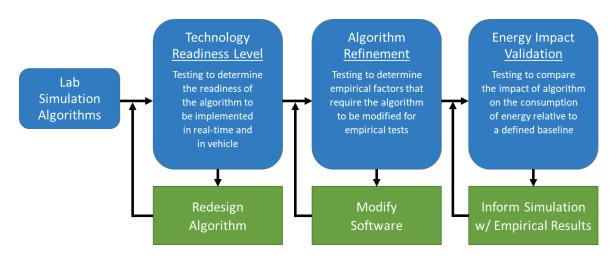

#### Oak Ridge National Labs

- Centralized controller algorithms implemented
- Speed Harmonization algorithm has been implemented and tested in simulation.
- Interfaces for VTD to communicate with ROS for testing at track, to communicate with DBW systems, has been implemented
- Network latency model implemented and demonstrated using V2X application based on BSM-C. Requires empirical data measured on ACM track
- Performance tests for Period 1
   Speed Harmonization complete

#### **Argonne National Labs**

- Control integration, refinement, and functional testing in vehicle nearing completion
- Finalize functional testing in Q1 BP2.
   Complete Model Val testing

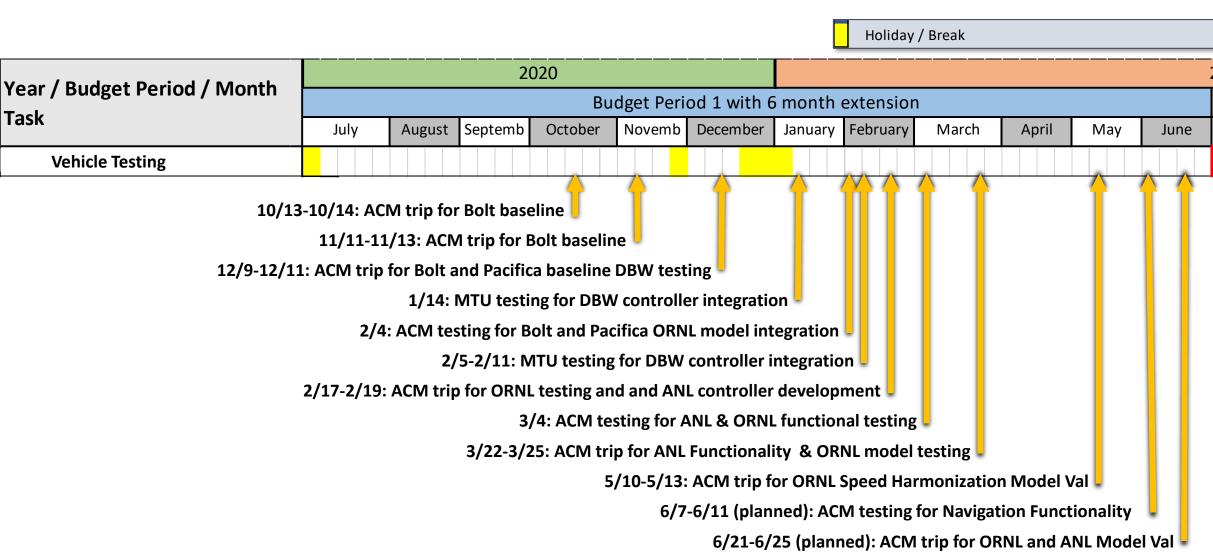

**Iterative Process** 

# Vehicle Testing Overview

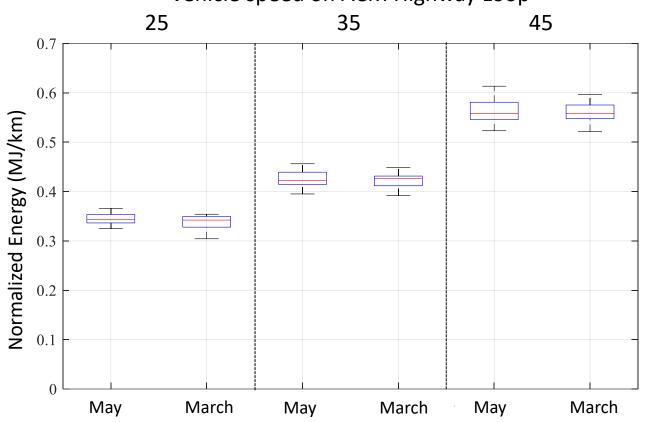

# ACM Bolt - Baseline Tests - March and May comparison

Multivariable regression analysis underway to determine noise factors

|                |                  | March                                   |            | May              |   |            |
|----------------|------------------|---|------------|------------------|---|------------|
| Speed<br>(MPH) | #<br>of<br>Tests | Mean<br>normalized<br>energy<br>(MJ/km) | COV<br>(%) | #<br>of<br>Tests | Mean<br>normalized<br>energy<br>(MJ/km) | COV<br>(%) |
| 45             | 10               | 0.558                                   | 3%         | 20               | 0.558                                   | 4%         |
| 35             | 10               | 0.427                                   | 4%         | 20               | 0.423                                   | 4%         |
| 25             | 10               | 0.342                                   | 6%         | 20               | 0.343                                   | 4%         |

Two sample t test, assuming unequal variances (Welch's t-test)

$$t = \frac{\overline{X_1} - \overline{X_2}}{\sqrt{\sigma_{X1}^2 + \sigma_{X2}^2}}, \sigma_{X1}^2 = \frac{s_{X1}^2}{n_1}$$

For 95 % confidence, → t-statistic < 1.7,

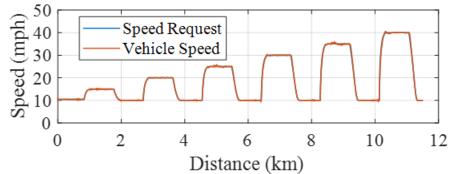

∴ 2 sample populations are the same.

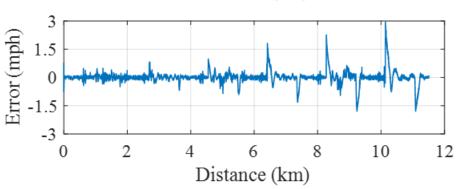

| Speed<br>(MPH) | t- Statistic |
|----------------|--------------|
| 45             | 0.4          |
| 35             | 0.3          |
| 25             | 1.1          |

# Controller Vehicle Performance Summary

| S.No           | Speed Profile Details | Mean Error<br>(mph) | RMS Error<br>(mph) | Maximum<br>Error (mph) |

| 10             | ORNL Speed Profile 6  | 0.03                | 0.2                | 0.6                    |

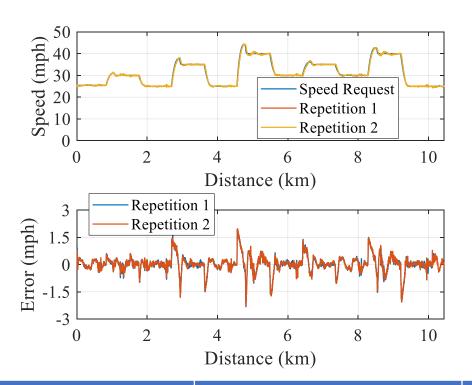

- 10 scenarios tested: combination of simple profiles (MTRI), ORNL optimized speed harmonization, and simulated human driven profiles.
- Profiles provide baseline and comparisons for energy savings for model validation.

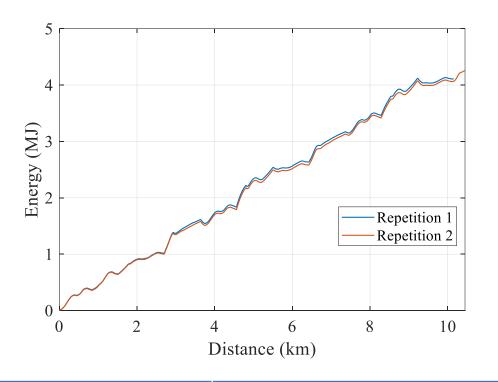

# Repeatability – ORNL Speed Profile 3

| Property     | Mean error<br>(mph) | RMS error<br>(mph) | Normalized energy<br>(MJ/km) |
|--------------|---------------------|--------------------|------------------------------|
| Repetition 1 | 0.03                | 0.41               | 0.403                        |
| Repetition 2 | 0.03                | 0.41               | 0.411                        |

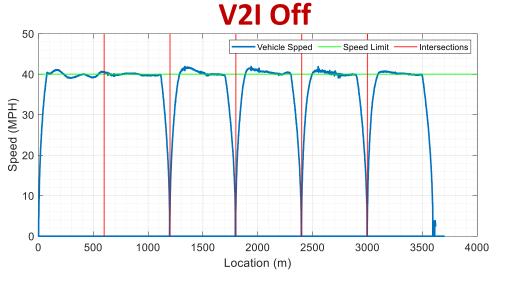

# ANL Eco-Driving Functionality Testing (5 stop light corridor)

 Vehicle accelerates to speed limit, slows and passes through green phases at traffic lights

 With V2I On, vehicle adjusts its speed to pass through Traffic Lights without stopping

# Response to Previous Years Comments

| Comment  | Response   |
|--|--|
| Ensure human drivers are properly represented in the simulation.  Calibrate VISSIM for human driver behavior, by using trajectory-level data   | Human model driving may be considered in a future extension of the project                                       |
| No performance indicators in presentation for identifying progress towards project goals   | Success criteria for each milestone have been defined upfront in the PMP and is now shown in the Milestone slide |
| Project seems slightly behind planned progress, but fairly understandable considering COVID-19   | No cost Project Extension approved through June 30, 2022 – Extensive testing in last Q's                         |
| There is a clear chart of responsibilities and regular meeting cadence; Collaboration appears to be well coordinated.  | Comments are very well appreciated by the team   |
| It is important to start validating transportation system-level benefits (e.g., can 4,000 vehicles per hour per lane capacities using CACC). This project is a huge step towards getting such data | Mixed reality systems have been developed through this project to enable getting such data                       |
| Should have an industry partner  | Consortium team was identified by DOE, without industry partner  |

# Team Collaboration and Coordination

#### **Partners**

PI, PM, Test Facility

Virtual Traffic, Data Analysis, Robotic Control

Algorithm Translation, Data Analysis, Vehicle Control

#### **Collaborating (Separately Funded)**

Algorithms, Models, Simulation, Vehicle Characterization, Livewire

- ORNL engineer representing all Labs, colocated at ACM through June 2021
- Special consultant team support appointed by U.S. DOE

- MTU/MTRI team co-located at ACM during development and testing – participation by lab members when possible
- Weekly meetings Quad chart-driven (Progress, Goals, Lessons, Help Needed)

# Remaining Challenges and Barriers

- Conversion, updating, and integration of models to work in distributed real-world environment in vehicle
- Enable message encoding-decoding across network of infrastructure, and virtual and physical vehicles utilizing standard DSRC message protocols
- Implementation of multiple realistic vehicles in simulation working in real-time with on-track vehicles
- Develop test cases for successful acceptance of algorithms in transition to test platforms
- Identify potentially confounding variables in simulation and approach to limit impact in design and conduction of experiments
- Quantify sensitivity of models to input parameters
- Determine and quantify variability and noise factors for on-track testing

# Planned and Future Research

Michigan Tach Research Institute

# **PLANNED:** Budget Period 1 (2021)

- Complete experiments related to Speed Harmonization test case
- Characterize network performance

#### PLANNED: Budget Period 2 (2021-2022)

- Complete Cases (2) Merging and (3) Intersection and EcoDriving
  - Complete Experimental Design
  - Complete Vehicle Setup and Model Integration
  - Run experiments
- Publish Results

#### **FUTURE**

- Extend scope to include new use cases:
  - Highway corridor (public smart roadway)
  - Dynamic wireless power transfer roadway
  - Traffic-aware intersection
  - Impact of congestion
  - · Multi vehicle physical testing
- Evaluation with more highly automated vehicles
- Cyber-security issues
- Integrations with vulnerable road users
- Include additional complexity related to mixed traffic, CAV penetration, and weather

Any proposed future work is subject to change based on funding levels

# Summary

# **Objectives**

- Translate Lab algorithms into vehicle and infrastructure controls
- Conduct physical testing at a manageable scale
- Compare test results with simulation
- Interactively develop better models
- Integrate testing and simulation to expand the set of models that can be assessed

# **Approach**

- Prepare Lab algorithms for implementation into vehicle and infrastructure controls
- Build physical vehicles and infrastructure for testing of algorithms
- Test vehicles with lab algorithms and models in coordinated scenarios at a specialized track
- Compare results and modify accordingly

# **Accomplishments**

- Automated vehicle controls and instrumentation
- Vehicle baselining
- Lab model refinement and integration
- Real-time implementation of lab controllers
- Speed harmonization testing
- Data generated and shared.

#### **Planned & Future**

#### Planned:

- Virtual traffic integration
- Speed harmonization, Merging, Intersection tests

#### **Future:**

- Public highway corridor
- Dynamic wireless power transfer roadway
- Traffic-aware intersection
- Congestion, Cyber, VRUs
- Weather

Any proposed future work is subject to change based on funding levels
