

Perspectives and Learning(s)

Mahesh Sudhakaran
Chief Digital Officer,
IBM Energy, Environment and Utilities

Data is Oxygen.

It is breathing life into our existing energy resources and creating new opportunities.

Better use of data has visible, tangible and immediate results. It is helping energy companies become safer, reliable and more efficient.

This is good for both, our wallet and our planet.

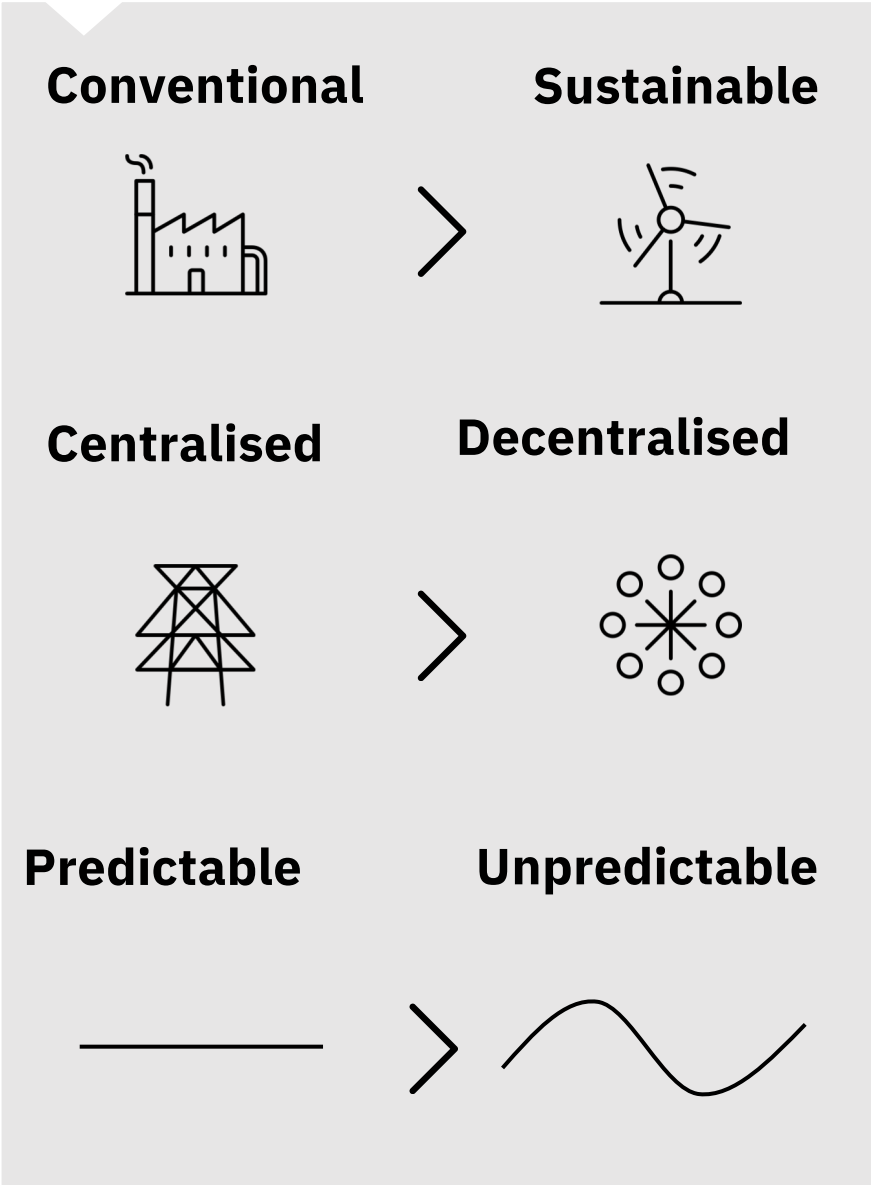

Improved forecasting: IBM's wind power forecast models demonstrated significant improvements in accuracy compared to current modeling. Increases ranged from 5-15MW improvements per wind farm which equated to \$300-400K in savings per year.

Cut equipment purchases: A fleet management company saved US \$9.5M by meeting 100% availability with fewer vehicles.

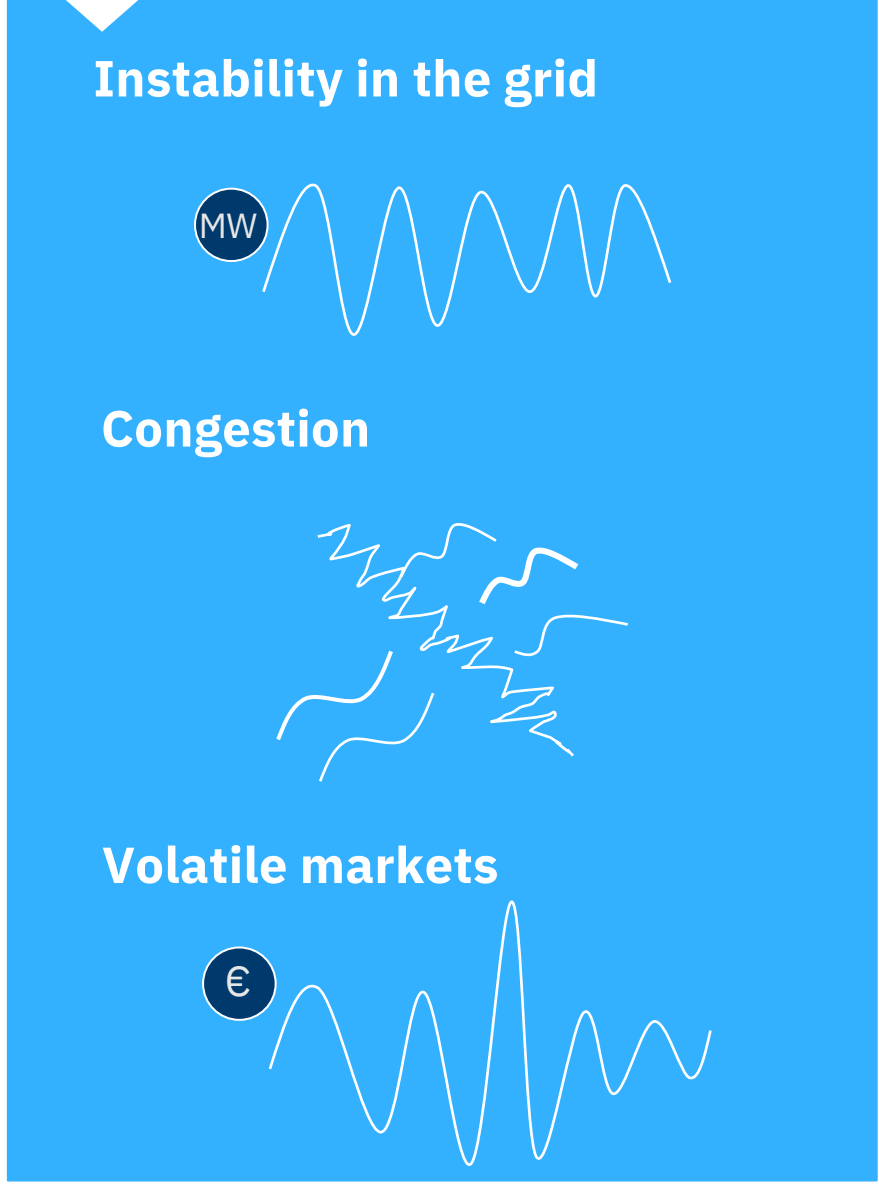

IBM is working with utilities to address key market challenges and enabling a more sustainable, reliable and affordable energy transition

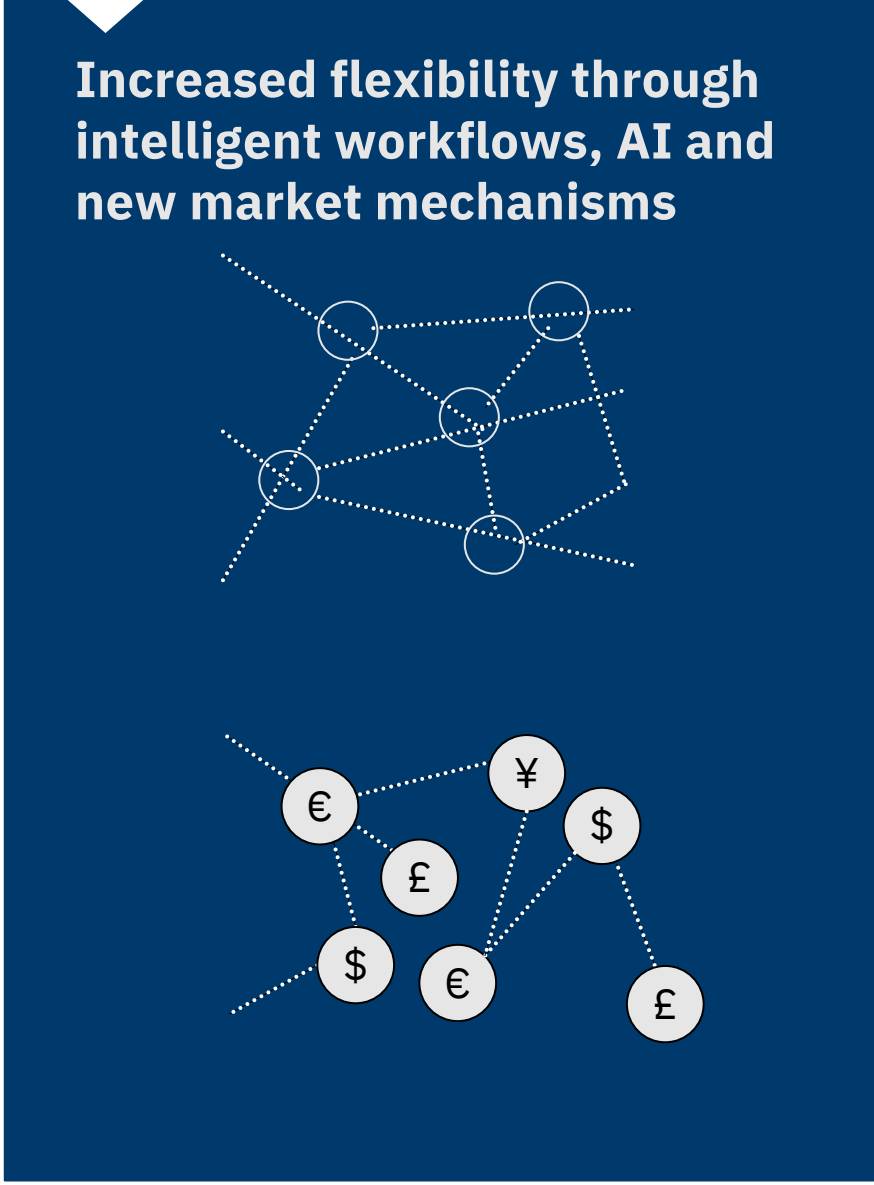

TRENDS

CHALLENGES

SOLUTION

There are many kinds of flexible loads in a city – that can be controlled (start/stop/bidirectional) to unleash flexibility of demand into the market. The key is to aggregate and optimise at scale with AI.

HVAC

Potential: ~30 %

IT & electronics

Potential: ~30 %

Cooling and freezing

Potential: ~70 %

**Battery Storage,
Pumps**

Potential: ~25 %

**Electric motors and
industrial equipment**

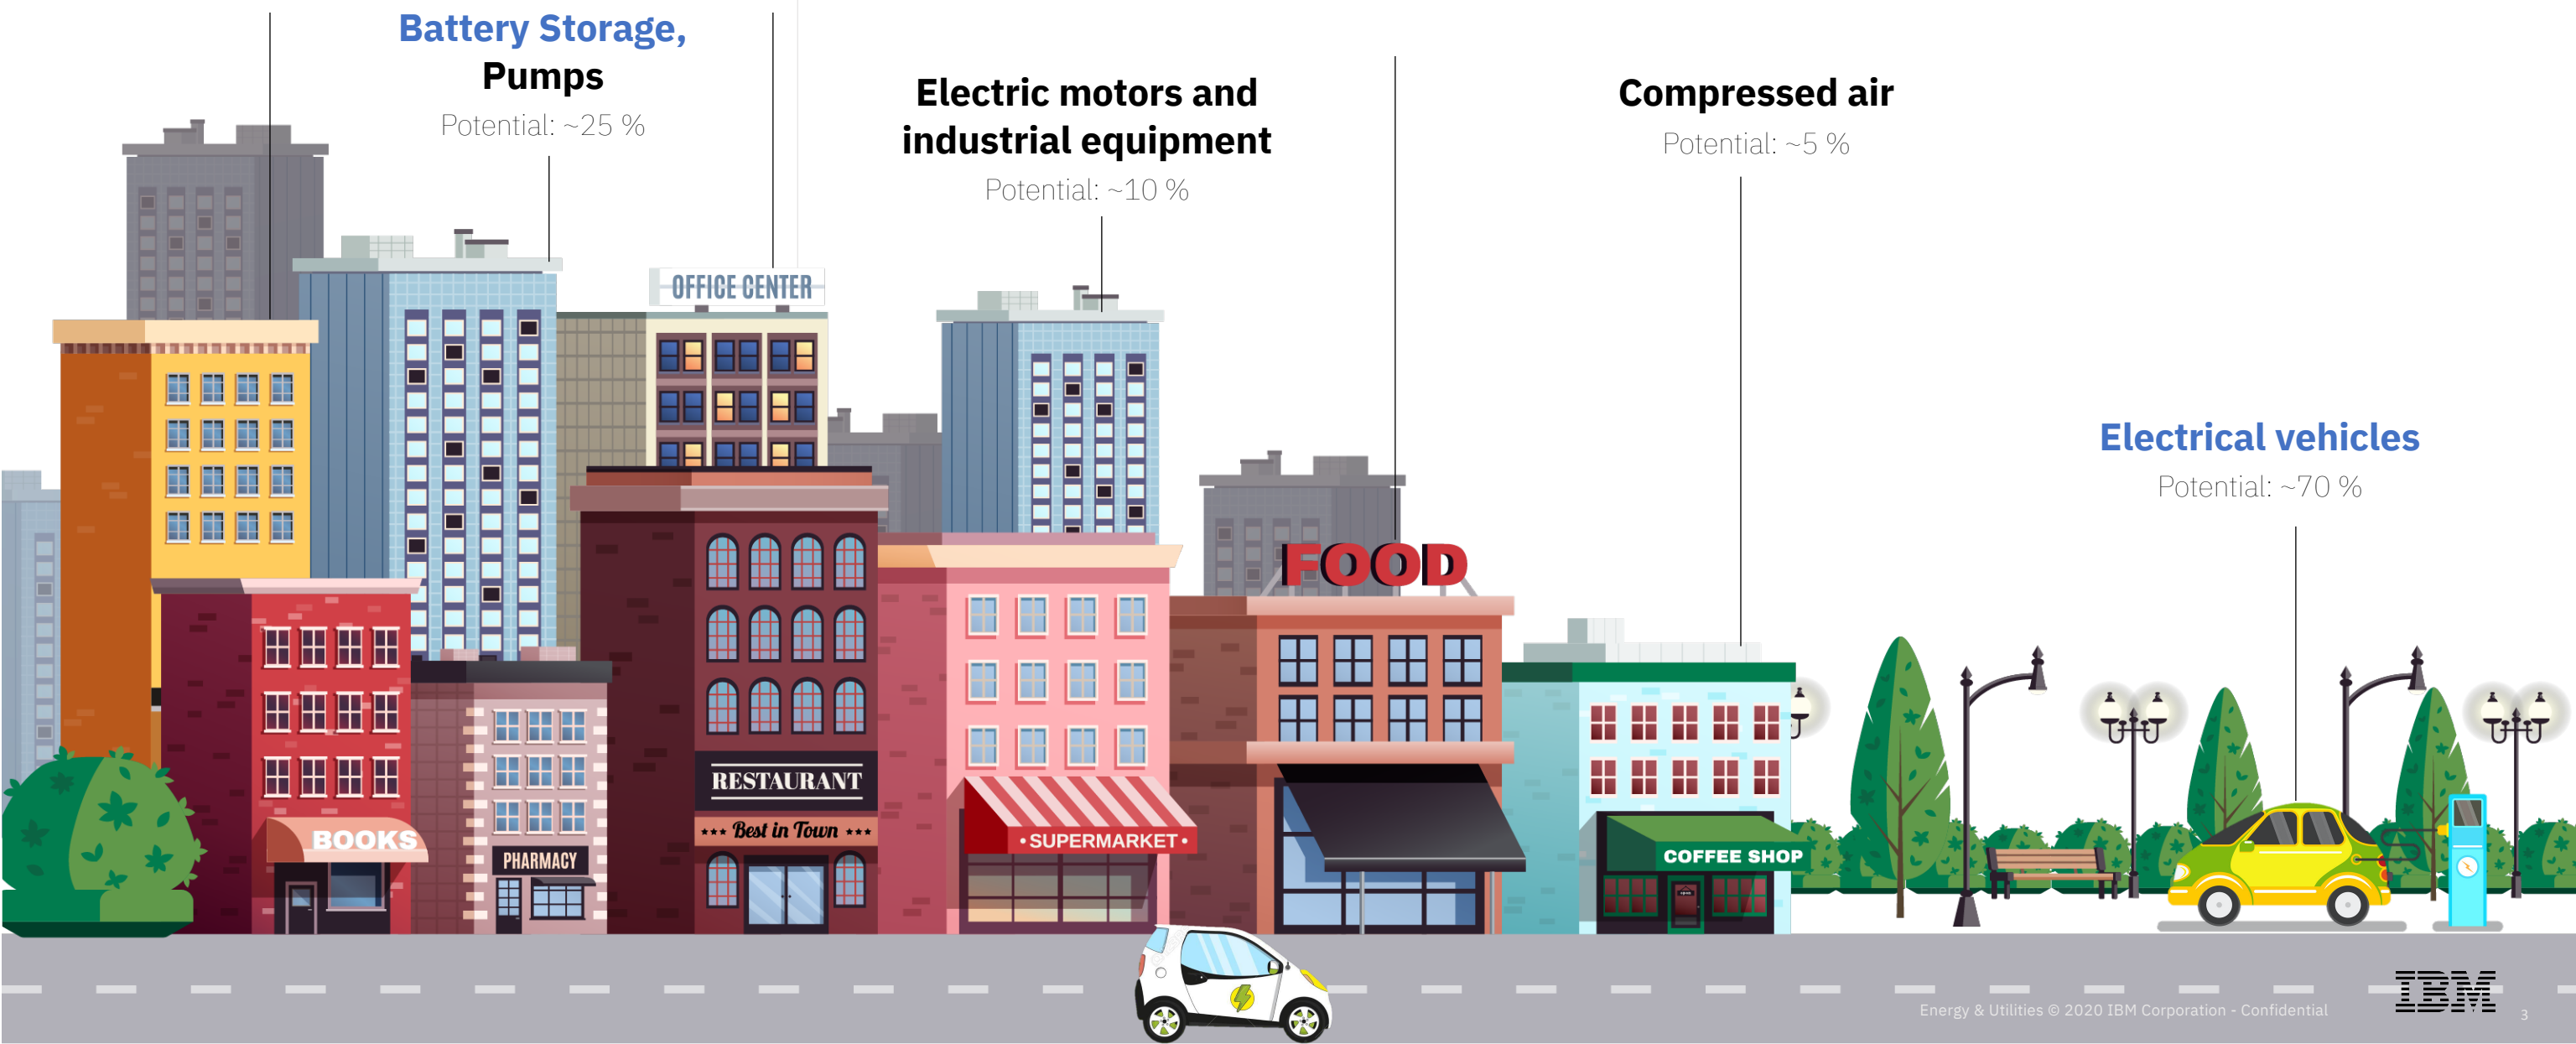

Potential: ~10 %

Compressed air

Potential: ~5 %

Electrical vehicles

Potential: ~70 %

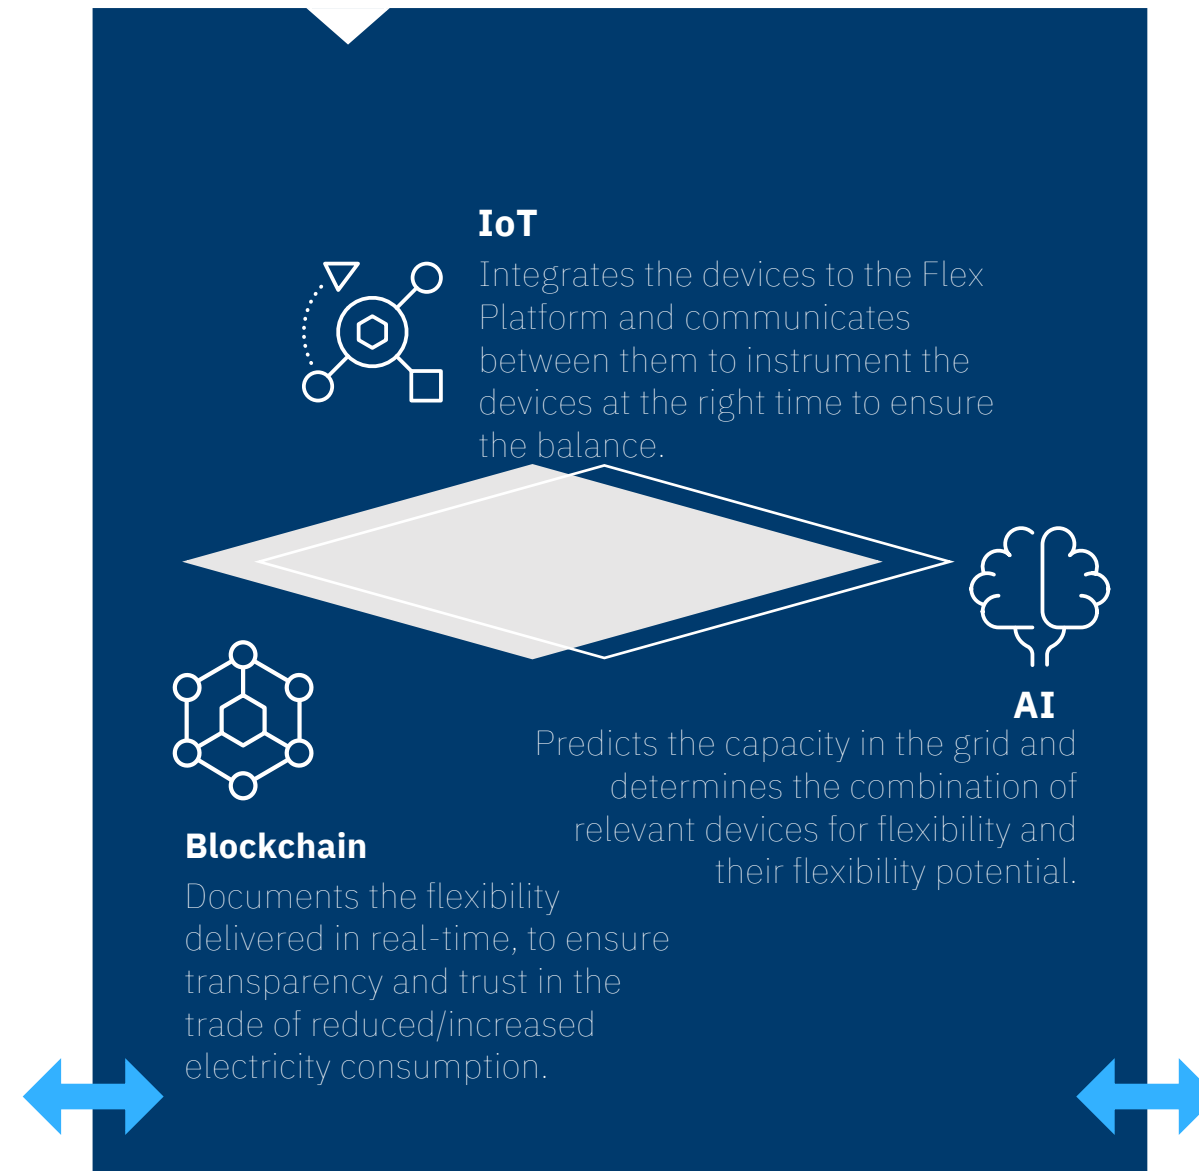

Several key technologies are used to create intelligent workflows that link the intelligent network to intelligent markets - Creating a new market platform for flexibility services

Smart Grids and Network Intelligence (Aggregation)

Network of electricity consuming devices, where each device can be instrumented to increase or reduce consumption to adjust to the balance and capacity in the grid.

Linked via Intelligent workflows (Optimisation, Orchestration)

INTELLIGENT MARKETS (Settlement)

The electricity consumption is adjusted and typically moved from expensive to cheaper periods. The flexibility is pooled together and sold by aggregators in the markets for ancillary services.

TSOs come together to form Equigy

Equigy is a joint-venture between 3 European TSOs, through which they will jointly create the Crowd Balancing Platform (CBP) on IBM Blockchain and enable the balancing of the renewable energy supply of the future. The Focus will be EV and Battery Storage initially

The Vision: Towards battery-based balancing in 2030

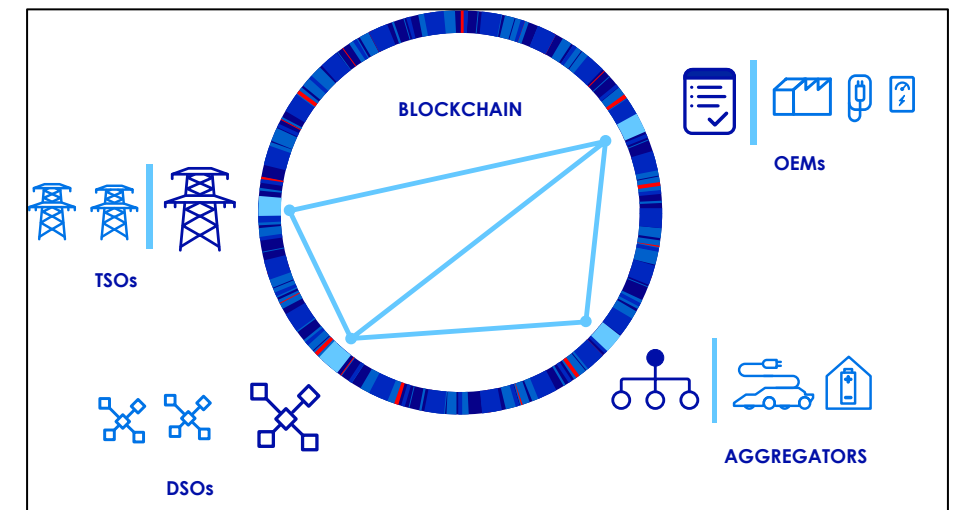

Our mission is to support the energy transition by enabling smaller distributed flexibility assets to participate in the energy system through aggregation

EQUIGY as a significant driver and enabler for the energy transition: together, we enable the balancing of the renewable energy supply of the future.
