

# SHARED LEARNINGS FOR ACHIEVING HIGH- VOLUME HTE MANUFACTURING

TOPSOE

Head of Technology Development

Poul Georg Moses

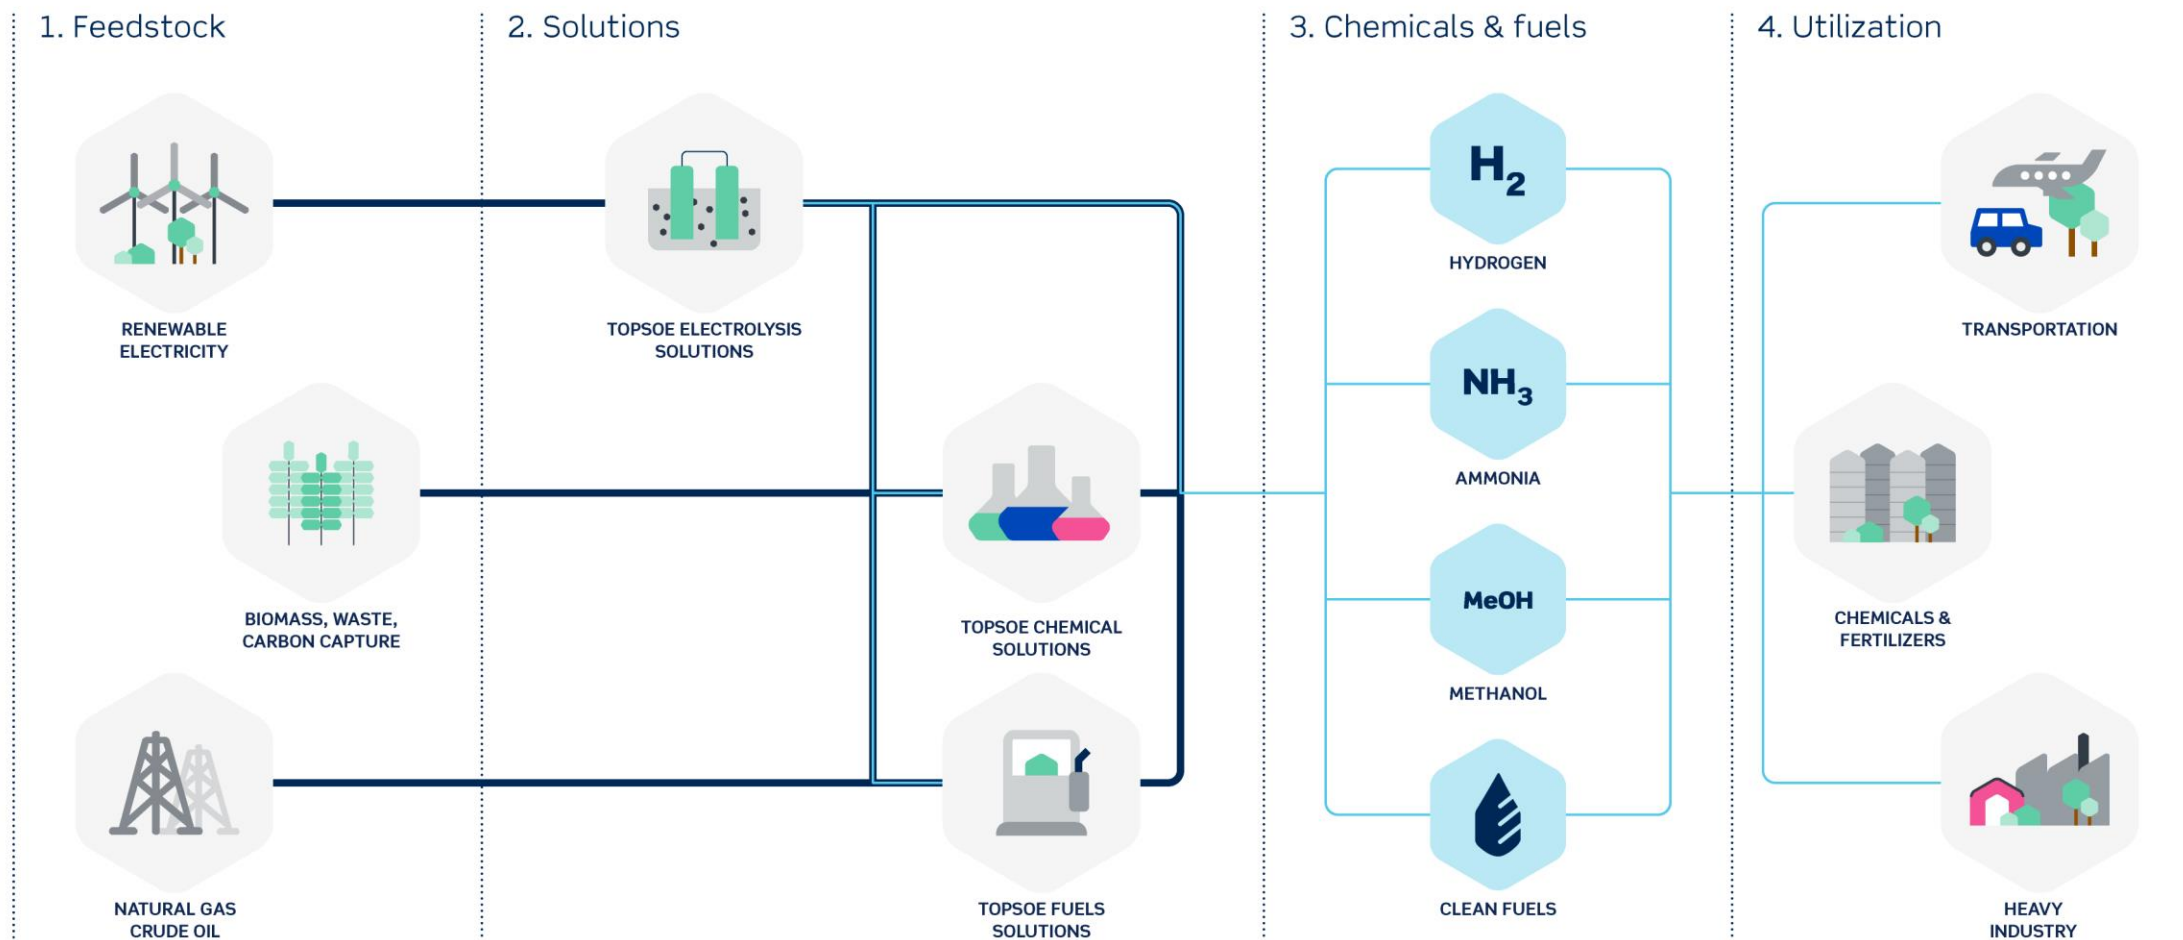

# Story line

- Learnings from Pilot production of TSP-1 and eCOs business
- Going from small scale gas supply to Power 2 X
- SOEC for Power 2 X

# Topsoe solutions accelerate the energy transition

## Topsoe Stack Platform (TSP-1)

Internal fuel manifold  
External air manifold  
**Compression free handling (cold)**

**Compact and robust casing**

The diagram illustrates the cross-section of a Solid Oxide Fuel Cell (SOFC) with the following layers from top to bottom:

- Oxy electrode contact layer, LSM** (Light blue)
- Oxy electrode, LSCF/CGO** (Light blue)
- Barrier layer, CGO** (Yellow)
- Electrolyte, YSZ** (White)
- Fuel electrode, NiO/YSZ** (Dark blue)
- Fuel electrode support, NiO/YSZ** (Dark grey)

- NiO = nickel oxide
- YSZ = yttria-stabilized zirconia, mixture of  $\text{Y}_2\text{O}_3$  &  $\text{ZrO}_2$
- CGO = gadolinia-doped ceria, mixture of  $\text{Gd}_2\text{O}_3$  &  $\text{CeO}_2$
- LSCF = lanthanum strontium cobaltite ferrite,
 
$$\text{La}_{1-x}\text{Sr}_x\text{Co}_y\text{Fe}_{1-y}\text{O}_3$$
- LSM = lanthanum strontium manganite,
 
$$\text{La}_{1-x}\text{Sr}_x\text{MnO}_3$$

[illegible]

* Lanthanide series													
lanthanum 57 La	cerium 58 Ce	praseodymium 59 Pr	neodymium 60 Nd	promethium 61 Pm	samarium 62 Sm	europium 63 Eu	gadolinium 64 Gd	terbium 65 Tb	dysprosium 66 Dy	holmium 67 Ho	erbium 68 Er	thulium 69 Tm	ytterbium 70 Yb
138.91	140.12	140.91	144.24	144.91	150.36	151.96	157.25	158.93	162.50	164.93	167.26	168.93	173.04
** Actinide series

	232.04	231.04	238.03	237.05	244.06	247.07	251.08	264.10	261.10	271.10	287.10	289.10	289.10

# Topsoe Stack Platform (TSP-1)

75 cells combined with interconnects, spacers and sealings in one stack

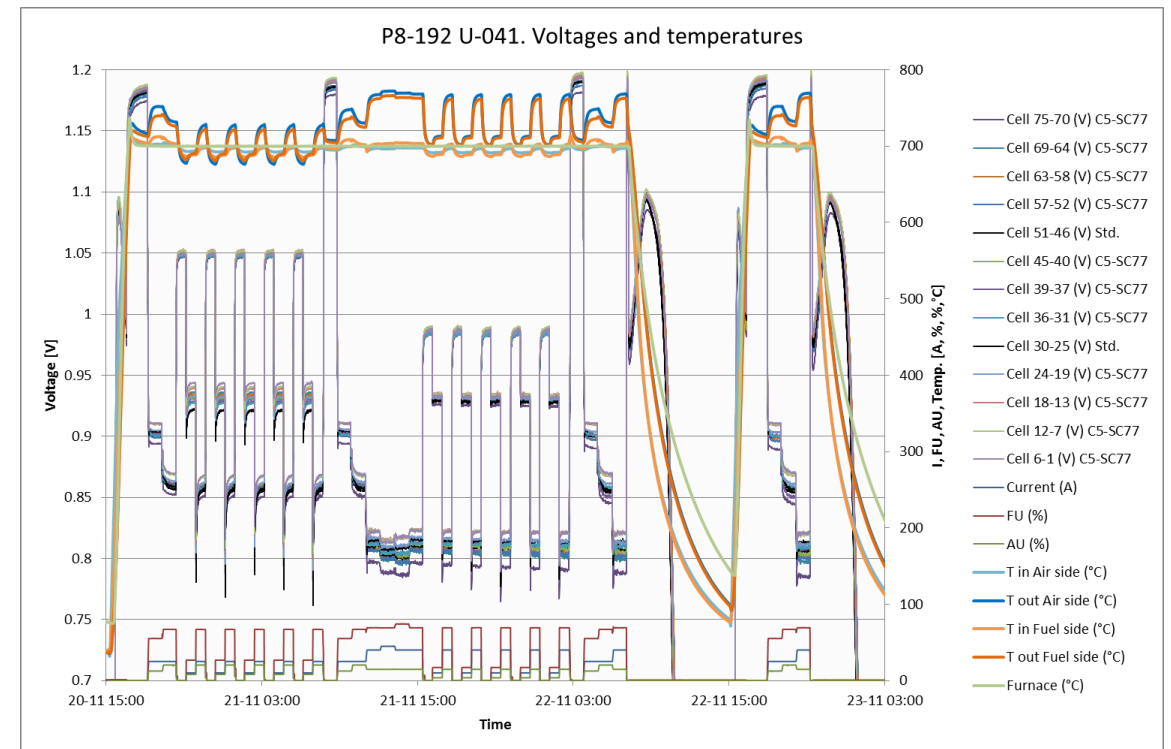

- Internal fuel manifold
- External air manifold
- Cell group voltage probing
- Compression free handling (cold)
- Robustness and leak tightness  
QA test in SOFC mode

Poul Georg

# Topsoe's COMSOL Solid Oxide Stack model

## COMSOL Solid Oxide Stack model

- Developed in Topsoe Fuel Cell (over 10 years)
- Further developed in Haldor Topsoe
  - *in cooperation with Resolvent I/S*
- Geometrically
  - Unique homogenization approach*
    - **Stack** (75 cells + interconnects)
    - **Manifolding** and casing (flow + thermal enclosure)
    - **Current** connections (power)
- Physics
  - The model couples **gas flow, thermal, electrical, and chemical physics***

Y. Elesin, M. F. Madsen, T. K. Petersen, *Topology Optimization based homogenization technique for stack designs with complex geometry*, in *EFCE*, (2014) B1102

# COMSOL Solid Oxide Stack model

## Output and evaluation possibilities

- **Operating conditions**

- Temperature
- Power, current density, voltage
- **Gas composition**
- **Fuel Conversion**

## Other evaluation possibilities

- **Stack design**

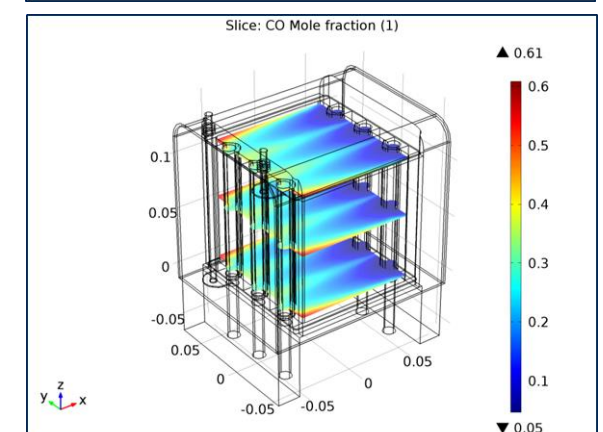

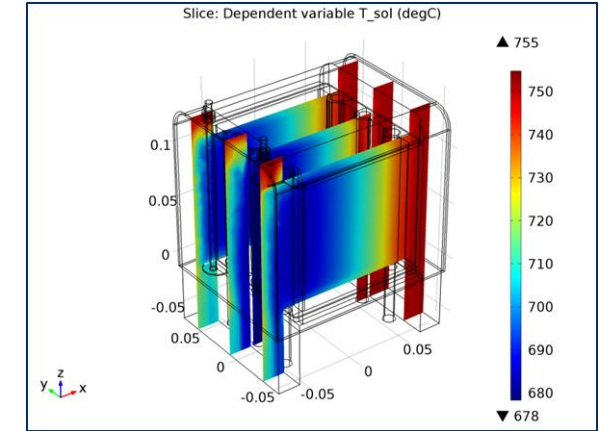

- Flow configuration
- Current paths

- **Cell design and material selection**

- Conductivities of cell materials
- Layer thicknesses and diffusion
- Catalytic activity

- **System design**

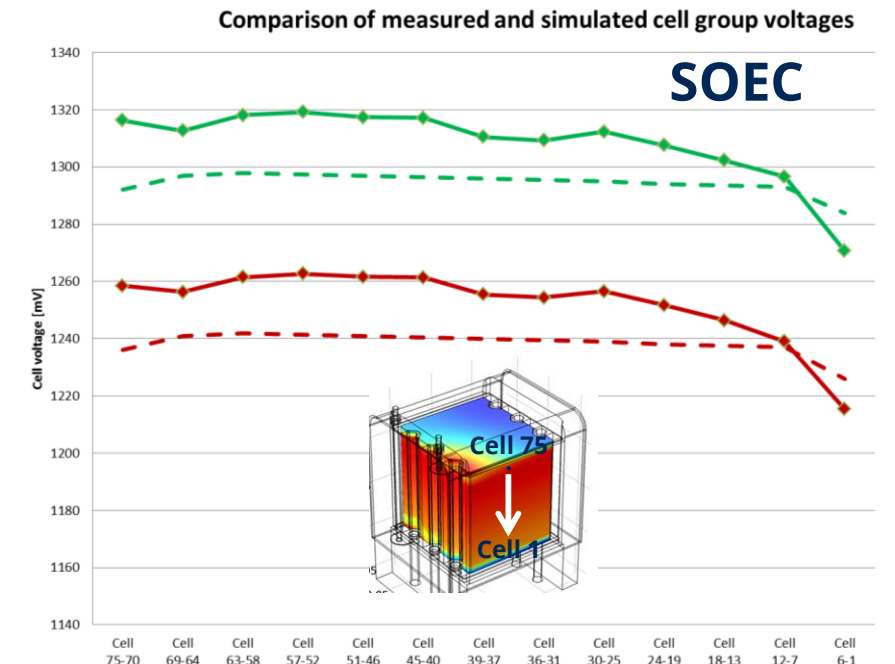

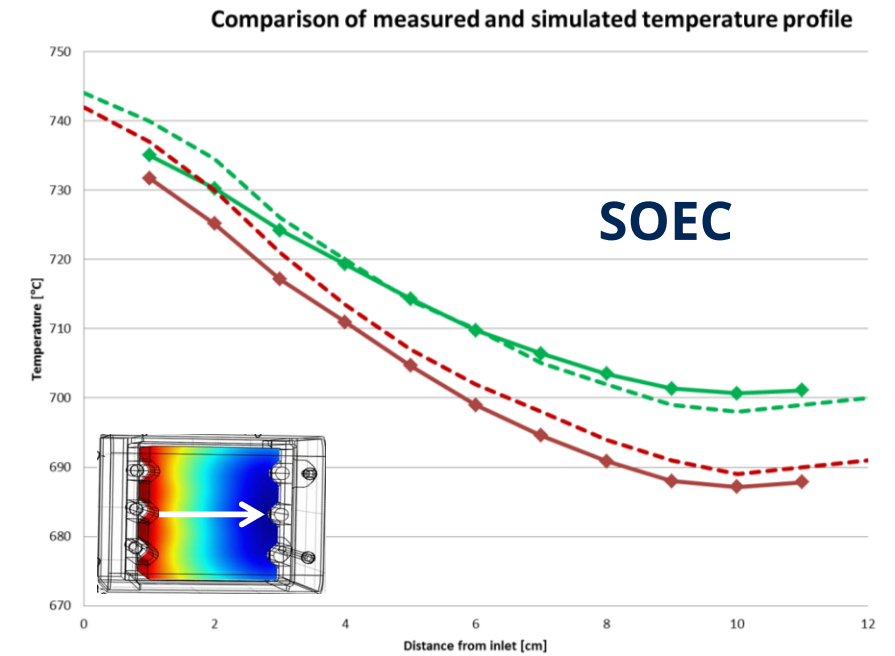

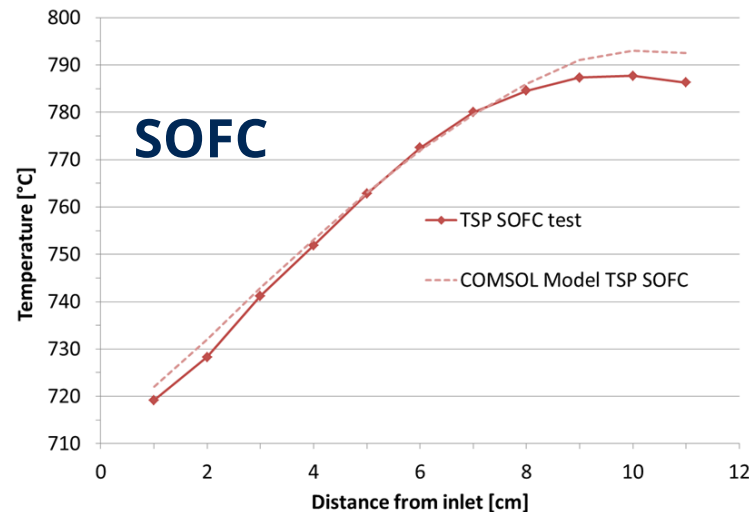

- Insulation strategies
- Effect of external hot components

# COMSOL Solid Oxide Stack model

## Verification against stack testing

- Local gas composition and current density are not possible to measure
- Verification of COMSOL simulations through comparison with test data and post mortem analysis
  - Temperatures (difference less than 5°C)
  - Voltages (difference less than 20 mV)

# Component level development

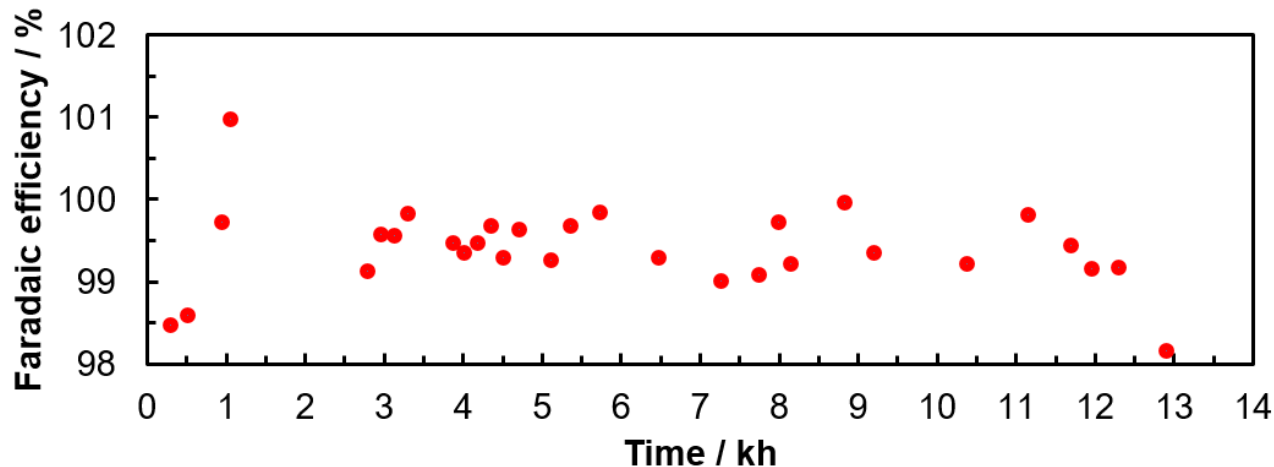

# High Temperature Contact Resistance Measurement for Interconnects

# Stack lifetime improvements in dry CO<sub>2</sub> electrolysis

**14 000 h** operation in  
CO<sub>2</sub> electrolysis

**30 000 Nm<sup>3</sup>** (35.5 t)  
CO produced

**20+** thermal cycles

**3.44 kWh** electricity  
per Nm<sup>3</sup> CO

Degradation rate:  
**7.9 mV / 1000 h**

Faradaic efficiency:  
**99 ± 1%**
