CONTINENTAL US SURFACE SOC STOCKS: MACHINE LEARNING PREDICTIONS IN COMPARISON TO CMIP6 ESM
Ensemble ML approach predicts SOC loss under both moderate (0.56 Pg C) and high emission scenarios (1.8 Pg C). In contrast, ensemble ESMs show relatively no change in continental US SOC stocks.

Both ML and ESMs predict SOC loss from croplands and wetlands, and agree on the direction of SOC change (net emissions or sequestration) across 43%–47% of continental U.S. land area.
BIOMASS CULTIVATION WILL HAVE SOIL AND SITE-SPECIFIC IMPACTS ON SOIL ORGANIC CARBON

(Gautam et al., 2020)
