Industrial Decarbonization of Energy Intensive Sectors

Industrial Decarbonization is the phasing out of atmospheric greenhouse gas (GHG) emissions from all aspects of the industrial sector. There are a number of industrial decarbonization strategies, including energy efficiency, electrification, the use of low carbon fuels, and carbon capture.

To support achieving net zero GHG emissions by 2050, EERE Advanced Manufacturing is investing in research and supporting demonstrations and deployment of new technologies across multiple industries.

EERE Advanced Manufacturing has identified five energy-intensive subsectors important for overall decarbonization:

- Chemical Manufacturing
- Petroleum Refining
- Iron and Steel
- Food and Beverage
- Cement

Chemical Manufacturing
The U.S. chemical manufacturing industry is incredibly diverse and has seen significant growth over the last decade.

To help achieve net-zero goals, the Chemical Manufacturing sector can:

- Develop low thermal budget process heating solutions and improve the effectiveness of thermal energy use to increase energy efficiency of whole systems
- Expand advanced reactions, catalysts, and reactor systems to improve reaction performance in addition to reducing carbon emissions and improving energy efficiency

Petroleum Refining
Most U.S. refinery CO₂ emissions are from five large energy-consuming processes: hydrocracking, atmospheric distillation, catalytic cracking, steam methane reforming, and regenerative catalytic reforming. These processes represent the most cost-effective RD&D opportunities for refineries to reduce CO₂ emissions.

To help achieve net-zero goals, the Petroleum Refining sector can:

- Improve energy efficiency both in processes and on-site steam and power generation
- Lower the carbon footprint of energy sources and feedstocks by using lower carbon fossil energy and introducing low-fossil carbon sources such as nuclear heat and electricity, clean electricity, clean hydrogen, or biofuels
- Capture CO₂ for either long-term storage or utilization

Iron and Steel
Iron and steel manufacturing is one of the most energy-intensive industries worldwide. The use of coal as a feedstock in production methods, the chemical reduction of iron oxide, and the sheer volume of iron and steel produced has made the industry among the highest in GHG emissions.

To help achieve net-zero goals, the Iron and Steel sector can:

- Transition to low-and no-carbon fuels and expand industrial electrification
- Pilot demonstrations for transformative technologies such as hydrogen-steel production, electrolysis of iron ore, and carbon capture and utilization storage (CCUS)

Food and Beverage
The food and beverage industry is a critical component of the U.S. economy, and one of the largest energy consuming and GHG emitting industries in the United States.

To help achieve net-zero goals, the Food and Beverage sector can:

- Improve energy efficiency by advancing the electrification of process heating, evaporation, and pasteurization processes
- Maintain strict product safety and quality control standards to decrease food loss and waste
- Pursue recycling and material efficiency through alternative packaging and package waste reduction

Cement
In the U.S. cement industry, process-related CO₂ emissions from calcination account for about 58% of total CO₂ emissions and energy-related CO₂ emissions accounted for 42% of total emissions. Cement manufacturing requires high levels of heat, with heat from coal and petroleum coke combustion accounting for 88% of total energy consumption within the sector.

To help achieve net-zero goals, the Cement sector can:

- Evolve existing processes to reduce waste, including circular economy approaches for concrete construction
- Improve materials and energy efficiency with deployment of breakthrough technologies and innovative chemistry solutions
- Expand use of CCUS technologies
- Increase use low carbon binding materials and natural supplementary cementitious materials to lower the carbon-intensity of clinker and solid materials used to create cement
