Part 2: Offsite Analytical Results Figures (Electronic)

Sample Location

- Sample Location with Detected VOC Chemical Data
- Sample Location with No Detected VOC Chemical Data
- Well Sample Location

Figure Notes:

Groundwater, Spring/Seep and Surface Water results represent only the most recent sampling per location. Soil/Sediment and Soil Vapor results represent all sampling events over time at each location.

A few wells have multi-leveled, discrete interval monitoring systems installed. At these locations, discrete depth ports are indicated by "Z" number in parentheses following well identifier in each sample name [e.g. OS-9R(Z12)_052604_01].

Only compounds detected at each location are displayed.

Private residence sample locations not shown to honor request by residents to maintain confidentiality. Sample results posted in inset boxes.

- Well Sample Location

Figure Notes:

Groundwater, Spring/Seep and Surface Water results represent only the most recent sampling per location. Soil/Sediment and Soil Vapor results represent all sampling events over time at each location.

Only detected concentrations greater than soil background concentrations or groundwater comparison concentrations are displayed.

A few wells have multi-leveled, discrete interval monitoring systems installed. At these locations, discrete depth ports are indicated by "Z" number in parentheses following well identifier in each sample name [e.g. OS-9R(Z12)_052604_01].

Private residence sample locations not shown to honor request by residents to maintain confidentiality. Sample results posted in inset boxes.

The diagram illustrates the structure of a sample identifier (Sample ID) for Soil/Sediment and Groundwater Primary samples. The identifier is composed of several parts:

- Sample Location ID:** BG03
- Sample Matrix Type:** Soil/Sediment
- Sample Type:** Primary
- Sample Number:** BG03001
- Sample Date:** 7/10/2005
- Sample Units:** (ug/Kg)

The diagram also shows a box for the sample identifier BG03, which is used to identify the sample. The box is divided into three sections: Sample Location ID (BG03), Sample Matrix Type (Groundwater), and Sample Type (Primary). The box also contains the sample number BG03001, the date 7/10/2005, and the unit (ug/kg).

C-1.0 INTRODUCTION

The evaluation of the SSFL offsite database includes addressing both data completeness and data significance. The weight-of-evidence evaluation for determining offsite characterization completeness includes the comparison of individual soil sample analytical results to medium-specific environmental screening levels (SLs). This comparison, along with the other criteria (i.e., presence of potential contaminant sources, constituent concentration gradients, and locations and frequency of sampling), are used to determine if potential data gaps exist and/or additional characterization (i.e., more sampling) is needed. If characterization is deemed incomplete, then additional characterization will be recommended.

The evaluation of data significance also consists of comparing detected concentrations to SLs. These screening levels are either health-based or regulatory-published. These SLs are interpreted as a lower boundary concentration below which the risk of adverse health effects is not a concern. Concentrations above these screening levels are subject to further evaluation using the criteria described for completeness. Further evaluation, including the possibility of recommending additional sampling, is more likely when both the criteria of completeness is not met and the detected concentration is above the constituent's corresponding screening level.

This Appendix describes the development of numeric SLs to meet these objectives for the offsite characterization program.

This page intentionally left blank

C-2.0 GENERAL METHODS

Numeric SLs were developed for all media (i.e., soil, soil vapor, surface water, sediment and groundwater) that were sampled during offsite characterization investigations, and compared to sampling results for these media as described in Section 3.0. Detected radionuclide and chemical constituents with concentrations higher than SLs developed for the offsite characterization program were identified, as described in Section C-3.

SLs for chemical constituents in soil, sediment and soil vapor are risk-based, consistent with the risk-based screening levels (RBSLs) developed for chemical constituents in soil, sediment and soil vapor in support of the Santa Susana Field Laboratory (SSFL) onsite RCRA Facility Investigation (RFI) program. Methods that were used to develop RBSLs for soil, sediment and soil vapor for the onsite RFI program are described in the *Standardized Risk Assessment Methodology (SRAM) Work Plan, Santa Susana Field Laboratory, Ventura County, California Revision 2 - Final* (MWH, 2005). The RBSL defines the relationship between the concentration of a constituent in a given medium (in this case, soil and sediment) and the potential for a carcinogenic or noncarcinogenic adverse health effect to occur, under a set of exposure and risk assumptions. For individual carcinogenic constituents, RBSLs were calculated based on a target cancer risk level of 1×10^{-6} (USEPA 1991). For non-carcinogen constituents, RBSLs were calculated based on a hazard quotient (HQ) of 1.0 as the acceptable target hazard level (USEPA, 1991).

The following generalized equation was used to establish RBSLs for soil and sediment in the SRAM (MWH, 2005):

$$\text{Soil RBSL}(C_s) = \frac{BW \times AT \times TR \times 365}{IR_s \times EF \times ED} \times \text{Toxicity Value}$$

Where:

- C_s = Concentration in soil (mg/kg)
- IR_s = Ingestion rate (mg-soil/day)
- EF = Exposure frequency (days/year)
- ED = Exposure duration (years)
- BW = Body weight (kg)
- AT = Averaging time (period over which exposure is averaged – year).
- TR = Target Risk (unitless), either 1×10^{-6} cancer risk or non-cancer HQ of 1.0
- Toxicity Value = Either the RfD^{-1} (non-cancer reference dose) or SF (cancer slope factor)

Constituent-specific RBSLs for chemical constituents in soil, sediment and soil vapor were derived in the SRAM (MWH, 2005) for three land use scenarios: residential, industrial and recreational. Areas surrounding the SSFL that were sampled during the offsite characterization program include residential, commercial/retail (i.e., industrial), parkland (i.e., recreational), and undeveloped areas. The RBSLs derived based on residential land use are the lowest (i.e., most protective) RBSLs. To be maximally protective, therefore, RBSLs derived for residential land use in the SSFL RFI program were adopted as SLs for chemical constituents in the offsite characterization program, and applied to all offsite areas whether they were residential, commercial or undeveloped (i.e., open space or parkland).

Numeric SLs for screening radionuclide constituents in soil and sediment were based upon preliminary remediation goals (PRGs) for radionuclides developed by the USEPA (2000a, 2002a). Methods and procedures for deriving PRGs for radionuclide constituents are documented in *Soil Screening Guidance for Radionuclides: Technical background Document* (USEPA, 2000a), and *Soil Screening Guidance for Radionuclides: PRG Calculator* (USEPA, 2002a). Consistent with SLs adopted for chemical constituents in soil and sediment, SLs for radionuclide constituents were adopted from USEPA PRGs for radionuclides assuming residential land use and based upon a target cancer risk level of 1×10^{-6} for carcinogenic constituents, and a target HQ of 1.0 for non-carcinogenic constituents (USEPA, 2002a).

Constituent-specific RBSLs for screening chemical constituents in surface water and groundwater were not derived in the SRAM (MWH, 2005). For purposes of screening surface water and groundwater sample results collected during the offsite characterization program, SLs were compiled from available state and federal drinking water standards. Drinking water standards were deemed to be appropriate for screening chemical constituents in surface water and groundwater because they (1) are generally at or above typically achievable laboratory reporting limits (vs. risk-based values which may be lower than typically achievable reporting limits), (2) carry regulatory authority, (3) are legally enforceable, and (4) are deemed to be safe. State and federal drinking water standards include California Primary and Secondary Maximum Contaminant Levels (MCLs) and federal Primary and Secondary MCLs. Numeric SLs for screening chemical constituents in surface water and groundwater are described further in Section C-4.

Similar to chemical constituents, SLs for screening radionuclide constituents in surface water and groundwater were derived from available State and federal drinking water standards.

Numeric SLs for screening chemical constituents in surface water and groundwater are described in Section C-4.

The SLs for chemical and radiologic constituents were based on human health endpoints. Ecological-based screening criteria were considered but determined to not be appropriate for this evaluation. This is because the offsite data includes both residential developments and undeveloped land, and consistent ecological criteria could not have been applied to all offsite areas since they are not applicable to residential developed areas. In addition, for the majority of chemicals evaluated, the human health/residential-based RBSLs are more protective (i.e., lower concentration) than the ecological-based RBSLs.

This page intentionally left blank

C-3.0 SCREENING LEVELS FOR CHEMICALS

Numeric SLs derived for screening chemical constituents in soil and sediment are presented in Section C-3.1, and SLs for screening chemical constituents in surface water and groundwater are presented in Section C-3.2.

C-3.1 SLs FOR CHEMICAL CONSTITUENTS IN SOIL AND SEDIMENT

As described in Section C-2.0, SLs for chemical constituents for the purpose of screening soil and sediment were adopted from RBSLs derived for residential land use in the SSFL RFI program (MWH, 2005). Numeric SLs for chemical constituents in soil and sediment were updated in June 2007 to include the most recent toxicity factors obtained from the following sources:

- California Environmental Protection Agency (Cal-EPA) Office of Environmental Health Hazard Assessment (OEHHA) Cancer Potency Factors (Cal-EPA, 2005);
- USEPA's Integrated Risk Information System (IRIS) Database (USEPA, 2007a);
- USEPA's Health Effects Assessment Summary Tables (HEAST) (USEPA, 1995);
- National Center for Environmental Assessment (NCEA) (USEPA, 2007b); and
- Agency for Toxic Substances and Disease Registry Toxicology Profiles (ATSDR, 1990a; 1990b; 1990c).

In addition, the World Health Organization (WHO) conducted a re-evaluation of the toxic equivalency factors (TEFs) for co-planar polychlorinated biphenyls (PCBs), dioxins and furans since the SRAM (MWH, 2005) was prepared. As a result, a number of TEF values have changed; most notably for PCBs, octachlorinated congeners and pentachlorinated furans. Thus, TEFs used to assess specific coplanar PCBs, dioxins and furans listed in the SRAM (MWH 2005) were updated and used in this evaluation.

Numeric SLs for screening chemicals in soil and sediment are tabulated in Table C-1. Numeric SLs for screening chemicals in soil vapor are tabulated in Table C-3

C-3.2 SLs FOR CHEMICAL CONSTITUENTS IN SURFACE WATER AND GROUNDWATER

As described in Section C-2.0, SLs for screening chemical constituents in surface water and groundwater were adopted from State and federal drinking water standards. Sources of State and federal drinking water standards from which SLs for surface water and groundwater were derived include:

- California Primary and Secondary MCLs (22 California Code of Regulation [CCR] §64444 and 22 CCR §64449);
- California State Notification (Action) Levels (CDPH, 2007);
- California Toxics Rule Criteria to Protect Human Health for Waters Designated Sources of Drinking Water (40 Code of Federal Regulations [CFR] Part 131);
- USEPA Primary and Secondary MCLs (USEPA, 2003);
- USEPA Health Advisories (USEPA, 2006); and
- National Academy of Sciences (NAS) Health Advisories (NAS, 1977-1989).

SLs for surface and groundwater were based on a hierarchy approach. Numeric SLs for screening chemicals in surface water and groundwater are tabulated in Table C-2.

C-3.3 EXCEPTIONS TO CHEMICAL SLs

All chemical constituent SLs used in this evaluation were derived as described above with the exception of perchlorate in soil and sediment. The soil SL for perchlorate was modified to be based on cleanup levels used for interim cleanup actions at SSFL. The perchlorate soil SL of 6 µg/kg is lower than the SSFL residential RBSL of 9.1 µg/kg.

C-4.0 SCREENING LEVELS FOR RADIONUCLIDES

Numeric SLs for screening radionuclide constituents in soil and sediment are presented in Section C-4.1, and SLs for radionuclide constituents in surface water and groundwater are presented in Section C-4.2.

C-4.1 SLs FOR RADIOLOGIC CONSTITUENTS IN SOIL AND SEDIMENT

As described in Section C-2.0, SLs for radionuclide constituents in soil and sediment were adopted from USEPA PRGs for radionuclides assuming residential land use (USEPA, 2000a, 2002a). USEPA residential PRGs for radionuclide constituents are tabulated in Table C-4. Consistent with the Multi-Radiation Survey and Site Investigation Manual (MARSSIM) (USEPA, 2000c), SLs for radionuclide constituents are equivalent to the Derived Concentration Guideline Limit (DCGL) above the background concentration. For the offsite characterization program, the DCGL for radionuclide constituents is equal to the USEPA residential PRG for residential land use (USEPA, 2002a). Background levels for radionuclide constituents at the SSFL were derived from the following sources:

- *Additional Soil and Water Sampling at the Brabeis-Bardin and Santa Monica Mountains Conservancy* (McLaren Hart, 1995);
- *Area IV Radiological Characterization Survey* (Rocketdyne, 1996); and
- *Bell Canyon Area Soil Sampling Report* (Ogden Environmental Services, 1998).

Background levels for radionuclide constituents detected at the SSFL, and documented in these reports, are summarized in Table C-4. Numeric SLs for radionuclide constituents that are equivalent to USEPA residential PRGs for residential land use (USEPA, 2002a) above background concentrations derived from the above sources are also tabulated in Table C-4. Combined SLs for soil and sediment, equal to the DCGL (i.e., USEPA PRG for radionuclides) plus background concentration, are tabulated in Table C-4.

C-4.2 SLs FOR RADIOLOGIC CONSTITUENTS IN SURFACE WATER AND GROUNDWATER

As described in Section C-2.0, SLs for screening radionuclide constituents in surface water and groundwater were derived from available state and federal drinking water standards. Sources of state and federal drinking water standards from which SLs for surface water and groundwater were derived include:

- California Primary and Secondary MCLs (22 California Code of Regulation [CCR] §64441 and 22 CCR §64443);
- USEPA Primary and Secondary MCLs (USEPA, 2003);
- Derived Concentrations (pCi/L) of Beta and Photon Emitters in Drinking Water (USEPA, 2002b);
- USEPA Health Advisories (USEPA, 2006); and
- National Academy of Sciences (NAS) Health Advisories (NAS, 1977-1989).

SLs for surface and groundwater were based on a hierarchy approach. Numeric SLs for screening radionuclide constituents in surface water and groundwater are tabulated in Table C-5.

C-4.3 EXCEPTIONS FOR RADIOLOGIC CONSTITUENT SLs

All radiologic constituent SLs used in this evaluation were derived as described above. There were no exceptions.

C-5.0 LIMITATIONS AND UNCERTAINTIES

Numeric SLs described herein were developed for use in the weight-of-evidence evaluation for determining offsite characterization completeness and data significance. Specifically, comparison of offsite characterization results to SLs is one decision criterion that is used to evaluate whether or not the nature and extent of contamination has been adequately characterized. Exceedance of an SL does not necessarily imply that a significant data gap exists or that additional offsite characterization is required. This comparison, along with the other criteria (i.e., presence of potential contaminant sources, constituent concentration gradients, and locations and frequency of sampling), is used to determine if potential data gaps exist and/or additional characterization is warranted.

Similarly, in regards to significance, exceedance of an SL does not imply that a significant risk to human health or the environment exists. Comparison of sampling results collected during the offsite characterization program to SLs is not intended to constitute a risk assessment.

Numeric SLs for screening radionuclide and chemical constituents in soil and sediment were derived from residential, risk-based criteria because these criteria are inherently low and meet the objectives described above. The SLs for radionuclide and chemical constituents in soil and sediment are based on residential land use and a 1×10^{-6} target cancer risk level, or HQ of 1. Although, there may be other alternative land uses (e.g., subsistence agriculture) with higher exposures and risks than residential land use, these uses are not expected in or around the SSFL. Similarly, allowable concentrations of radiologic and chemical constituents in commercial or recreational areas may be substantially higher than the SLs presented herein. The use of site-specific risk assessments would be required to evaluate potential risks to human health and the environment, and is beyond the scope of this report.

Numeric SLs for screening radionuclide and chemical constituents in surface water and groundwater were derived from available state and federal drinking water standards. As described in Section 2.0, drinking water standards were deemed to be appropriate for screening chemical constituents in surface water and groundwater because they (1) are generally at or above typically achievable laboratory reporting limits (vs. risk-based values which may be lower than typically achievable reporting limits), (2) carry regulatory authority, (3) are legally enforceable, and (4) are deemed safe. Although state and federal drinking water standards for many radionuclide and chemical constituents are risk-based,

drinking water standards for other chemicals (e.g., arsenic and TCE) are not risk-based. Consequently, risk-based levels for specific constituents may be lower than the SLs for screening surface water and groundwater that are described herein.

Overall, the use of the SLs presented in this Appendix for the evaluation of offsite radionuclide and chemical constituents concentrations is appropriate to draw conclusions regarding data completeness and significance.

²Background concentrations for Cs-137 and Sr-90 were established in the 1992 and 1994 Brandeis-Bardin sampling events (McLaren-Hart, 1995). Background concentrations for Th-228, Th-232, U-234, U-235, and U-238 were established as the result of the Brandeis-Bardin sampling events and the 1996 Area IV Radiological Characterization Survey (Rocketdyne, 1996). Background concentrations for H-3, K-40 and Ra-226 were established based on findings of the 1996 Area IV Radiological Characterization Survey (Rocketdyne, 1996). Am-241, Co-60, Cs-134, Eu-152, Eu-154, Fe-55, Mn-54, Ni-59, Ni-63, Pu-241, Pu-242, and Na-22 do not have background concentration values and are assumed not to be present in background.

TABLE I**NOTES AND ABBREVIATIONS**

1. Depth/intervals are measured in feet below land surface.
2. Well OS-01 was converted to well RD-68B in 1997.
3. (—) = No casing installed over the borehole interval specified; open hole.
4. (v) = Top of well below land surface, installed inside zero-grade vault.
5. S = Spring; construction data not applicable.
6. UL-N = Undeveloped land in northern part of Facility.
7. UL-S = Undeveloped land in southern part of Facility.
8. OS = Off-site
