

# Chicago Energy Efficiency Planning and Analysis, and Integrated Retrofit Strategy Validation in Single Family Homes

Elevate Energy

Lawrence Kotewa, Chief Engineer

773 269 4008 / [Lawrence.Kotewa@ElevateNP.org](mailto:Lawrence.Kotewa@ElevateNP.org)

DE-EE0009077

# Project Summary

## Objective and outcome

To pair advanced technology planning and analysis with consumption data and local building characteristics and typology to develop a scalable, community-wide **Chicago single family (incl 2–4-unit) residential retrofit roadmap**. A demonstration project proving that with the right **whole-building energy retrofit packages**, in specific Chicago **housing types**, in geographic priority areas, homes can achieve at least **50% energy savings**.

## Team and Partners

- Elevate Energy
- National Renewable Energy Laboratory
- City of Chicago
- ComEd

## Stats

Performance Period: June 2020 to May 2024  
DOE budget: \$537,640 Cost Share: \$137,500  
Phase 1: Modeling  
Phase 2: Proof of Concept (fieldwork)  
Phase 3: Validation and Summary

# Problem

- **Need for deep retrofits**
- 1,064,635 Chicago households earn  $\leq 80\%$  area median income (54% of households)
- Annual avg. utility costs (gas + electric) for Chicago single family households: \$2,717 (\$1,396+ \$1,321)<sup>1</sup>
- Annual gas bills have been rising rapidly and are expected to increase by 60% over the next 10 years<sup>2</sup>
- Gas usage and costs are higher in Chicago 1382 therms (\$1,396) compared to surrounding states: IL, IN, MI, OH, and WI annual avg. 811 therms (\$1,044).
- Zip codes with higher gas burdens and higher rates of disconnection tend to be lower income areas
- **Are there whole-building energy retrofit packages for specific Chicago housing types, where homes can achieve at least 50% energy savings?**

Data Source: Elevate Energy 2020 analysis of Chicago and Cook County energy use analysis published 2014.

<sup>1</sup> Based on median gas cost of \$1,396, regional average electricity use (from 2015 EIA Residential Energy Consumption Survey), and ComEd electricity rates

<sup>2</sup> Illinois Commerce Commission v. People Gas, October 2016, ICC Docket No. 16-0376

# Alignment and Impact

- Median year of construction is 1957 82% built before energy codes
- Median home size= 1,313 sf
- Energy use is higher than national samples (2009 and 2015 RECS)
  - 1,382 therms annually (1.05 therms/sf)
  - 8,697 kWh annually (6.62 kWh/sf)
- High savings potential starting with air sealing & insulation.

# Alignment and Impact

- Develop a Chicago-specific single family retrofit prioritization strategy
- What are the retrofit packages that can achieve deep energy savings (>50%) in Chicago homes?
- What would be the energy use, utility bill, and carbon impacts from installing these retrofit packages city-wide?
- How can Chicago prioritize and achieve deep energy savings in a short timeframe, across the Chicago neighborhoods that need it most?
- Methodology: an important first step was to calibrate NREL's ResStock™ to local housing stock
  - Worked with NREL to expand and calibrate ResStock™ with Chicago 2–4-unit buildings, to represent an additional residential building stock
  - This allowed ResStock™ to model over 75% of Chicago's residential buildings, using the five predominant building types

# Approach

## City-Scale Analysis

- Identify all priority housing type buildings
- Apply ResStock™ modeled outcomes for various retrofit packages
  - Comprehensive – building envelope energy efficiency (air sealing and insulation) + heat pump HVAC (central or mini-split) + heat pump water heater + LED lighting
  - Comprehensive – with higher efficiency natural gas HVAC (not used due to less than 50% savings)
  - Full electrification – comprehensive plus induction stove and heat pump clothes dryer
- Aggregate up by summing outcomes for all priority housing type buildings in geography
- The results showed both energy savings and cost savings are possible, due in part to the unique natural gas rate structure in Chicago, as well as the existing building conditions

# Approach – Count and % of Chicago Residential Building Stock

Single family Pre-1942  
Frame construction  
83,028 (19.0%)

Baseline:  
1,350-2,300 therms  
7,320-11,500 kWh

**Savings potential:**  
**60-80%**  
**\$500-1,500**

Single family Pre-1942  
Masonry/brick construction  
60,993 (13.9%)

Baseline:  
1,230-2,110 therms,  
7,470-11,980 kWh

**Savings potential:**  
**53-77%**  
**\$200-1,300**

Single family 1942-1978  
Masonry/brick construction  
82,256 (18.8%)

Baseline:  
840-1,530 therms,  
6,690-10,220 kWh

**Savings potential:**  
**46-72%**  
**\$200-900**

# Approach - Count and % of Chicago Residential Building Stock

2-4 flat Pre 1942 frame  
43,812 (10.0%)

Baseline (per unit):  
942-1,340 therms  
5,310-7,920 kWh

Savings potential (per unit):  
57-76%  
\$200-900

2-4 flat Pre-1942 masonry  
63,732 (14.5%)

Baseline (per unit):  
860-1,240 therms  
5,430-8,400 kWh

Savings potential (per unit):  
50-72%  
\$0-700

392k

323k

110k

## Chicago Annual Savings Potential

≥ 59% MBTUs

\$130 – >\$300 million (\$400 – \$1,000 per building)

2.5M metric tons CO<sub>2</sub>-equivalent

Solar offset of ≥ 30% of post-retrofit electricity  
use

- + Air conditioning
- + Improved respiratory health
- + Improved thermal resilience
- + Home value & household wealth

+ Prioritized investment in the communities that need it most

# Approach

- Deep energy savings (>50%) can be achieved in the Chicago housing stock with off-the-shelf measures and technologies, and help reduce energy costs and energy burdens
- Heat pumps, with air sealing and insulation, are a major driver of energy savings
- Retrofit packages with high efficiency natural gas heating equipment, either forced air or boiler, did produce energy savings, but they did not meet the >50% energy savings
- Additional benefits amplify the impact:
  - Climate resilience: heat pumps add efficient cooling in homes that don't have it (~77% of Chicago's 1–4-unit buildings lack central A/C)
  - Improved indoor air quality with less natural gas burned
  - Increased thermal resilience in case of power outages, due to air sealing and insulation
- Adding solar would offset  $\geq 30\%$  of post-retrofit electricity use, reducing utility provided electricity and increasing annual cost savings

# Approach

- Electrification with heat pumps can drive significant energy and cost savings, saving Chicagoans \$ millions per year.
- And savings will increase as gas prices go up

Technical potential for packages assuming installation in all applicable Chicago homes from the 5 priority building types						
	% Energy Savings (annual MBTUs)			Utility Bill Savings (annual)		
	City-wide mean	Per-building mean	Interquartile range	City-wide mean	Per-building mean	Interquartile range
Comprehensive energy efficiency + heat pump	62%	61%	59% - 63%	\$217 million	\$670 (19%)	\$130-305 million
Full electrification	66%	66%	64% - 66%	\$442 million	\$750 (21%)	\$160-333 million

# Approach

- Long-term, electrification will have big climate benefits as the electric grid gets cleaner:

**Technical potential for packages assuming installation in all applicable Chicago homes from the 5 priority building types. Average annual carbon savings, projected to 2028-2032 grid conditions.**

	City-wide carbon savings (metric tons CO <sub>2</sub> e)		Per-building carbon savings (metric tons CO <sub>2</sub> e)	
	Mean	Interquartile range	Mean	Interquartile range
Comprehensive energy efficiency + heat pump	2.5 million	1.4 – 3.5 million	8	4 – 11
Full electrification	2.6 million	1.4 – 3.7 million	8	4 – 11

- Heat pumps will provide needed cooling: Only 23% of Chicago 1-4 buildings have central A/C

# Approach

- To retrofit all the housing types that can most benefit from energy upgrades by 2035, Chicago will need to retrofit ~30,000 buildings per year

	Year 1 (2022)	Year 2 (2023)	Year 3 (2024)	Year 4 (2025)	Year 5 (2026)	Year 6 (2027)	Year 7 (2028)	Year 8 (2029)	Year 9 (2030)	Year 10 (2031)	Year 11 (2032)	Year 12 (2033)	Year 13 (2034)	Year 14 (2035)
Annual total (buildings)	500	2,500	10,000	30,000	30,000	30,000	30,000	30,000	30,000	30,000	30,000	30,000	30,000	30,000
Priority community or household <80% AMI	450 (90%)	2250 (90%)	8000 (80%)	24000 (80%)	21000 (70%)	21000 (70%)	18000 (60%)	18000 (60%)	18000 (60%)	18000 (60%)	12000 (40%)	12000 (40%)	12000 (40%)	12000 (40%)
Anywhere	50 (10%)	250 (10%)	2000 (20%)	6000 (20%)	9000 (30%)	9000 (30%)	12000 (40%)	12000 (40%)	12000 (40%)	12000 (40%)	18000 (60%)	18000 (60%)	18000 (60%)	18000 (60%)
Cumulative total (buildings)	500	3,000	13,000	43,000	73,000	103,000	<b>133,000</b>	163,000	193,000	223,000	253,000	283,000	313,000	343,000

For comparison, New York State is proposing to upgrade 200,000 buildings per year to achieve 2050 carbon goals<sup>1</sup>

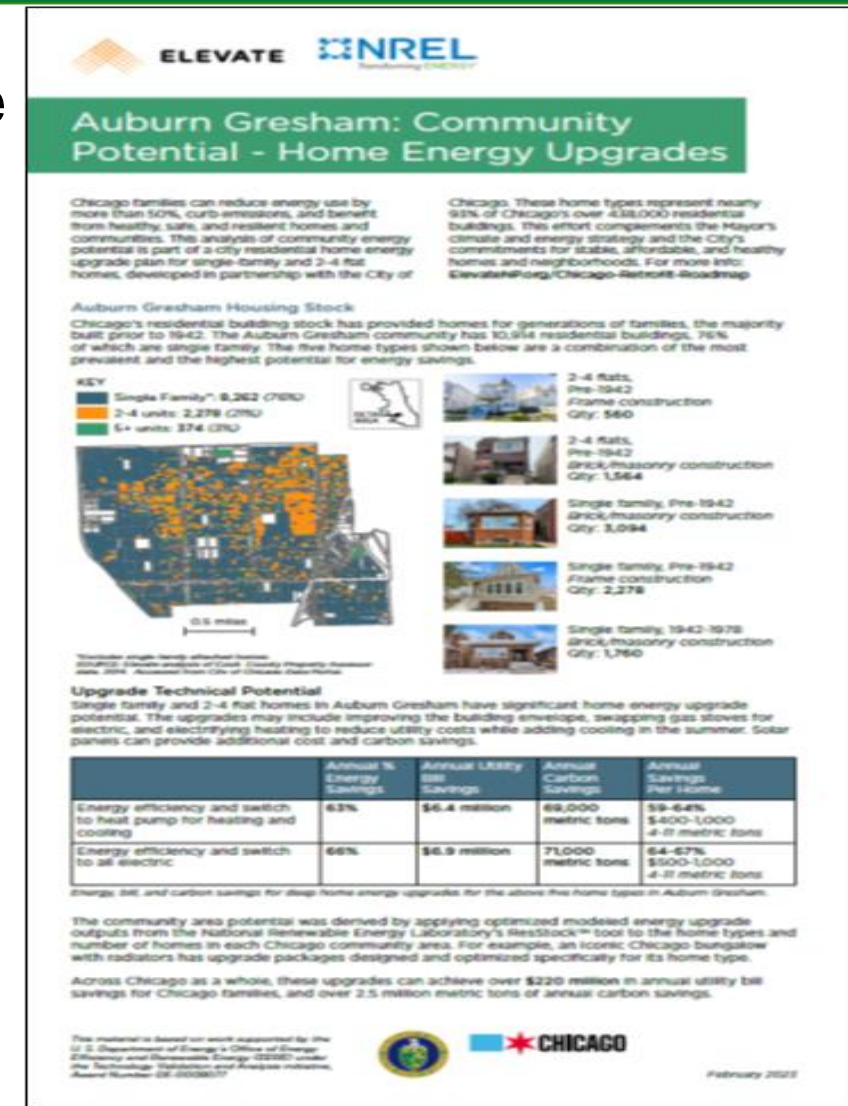

<sup>1</sup> NYSERDA Carbon Neutral Roadmap presentation, June 15, 2021, <https://www.nyserdera.ny.gov/All-Programs/Carbon-Neutral-Buildings>

# Progress and Future Work

## First Phase - Modeling w/Community Profiles - Complete

Single family 1942-1978  
Masonry/brick construction  
Full electrification

# Progress and Future Work

## Third Phase – Validation and Summary - Starting and Preliminary

- Indoor air quality and energy monitoring equipment installed
- Data collection
- Final report (some preliminary lessons learned)
  - Home infrastructure upgrades
  - Unrelated code violations
  - Implementation knowledge and installation time
  - Homeowner reluctance to switch from natural gas
  - Solar could be crucial to achieve cost savings
  - Induction stoves and heat pump water heaters and clothes dryers can be expensive and difficult to fit in to existing conditions

## The Future – Unanswered questions

- Funding for retrofit work?
- Workforce – availability and equity?
- Funding for existing conditions remediation?
- Energy burden shift on multi-family units?

---

## Conditional Probability Distributions

# Measure Packages

## Comprehensive

- Air sealing and insulation
- Higher-Efficiency upgrades to existing heating and cooling equipment
- Domestic water heater conversion to tankless water heater
- LED lighting
- Rooftop Solar Photovoltaic (PV) potential \*

## Comprehensive + heat pump:

- Air sealing and insulation
- Conversion of heating and cooling equipment to electrically fueled heat pump(s)
- Domestic water heater conversion to tankless water heater
- LED lighting
- Rooftop Solar Photovoltaic (PV) potential \*

## Electrification:

- Air sealing and insulation
- Conversion of heating and cooling equipment to electrically fueled heat pump(s)
- Domestic water heater conversion to electrically fueled heat pump water heater
- Clothes dryer conversion to electrically fueled heat pump clothes dryer
- Conversion of non-electric stove to induction
- LED lighting
- Rooftop Solar Photovoltaic (PV) potential \*

- Go/no-go decision points were May 2021 and May 2022, and in May 2022 a one-year extension was approved.
- Early slipped milestones did not affect the May 2021 go/no-go decision. But Covid-19 did affect the remainder of the milestones schedule (from both an in-home safety perspective as well as an equipment and workforce availability). This resulted in the one-year extension request for the project completion from May 2023 to May 2024.
