Dual-Purpose – Heating & Cooling - Thermal Battery to Enable Flexible and Energy Efficient Heat Pump Systems

Performing Organizations: University of Maryland, Oak Ridge National Laboratory, Electric Power Research Institute, Rheem Manufacturing, Insolcorp, Heat Transfer Technologies Professor Reinhard Radermacher, Dr. Vikrant Aute, <u>Dr. James Tancabel</u> vikrant@umd.edu

DE-EE0009681

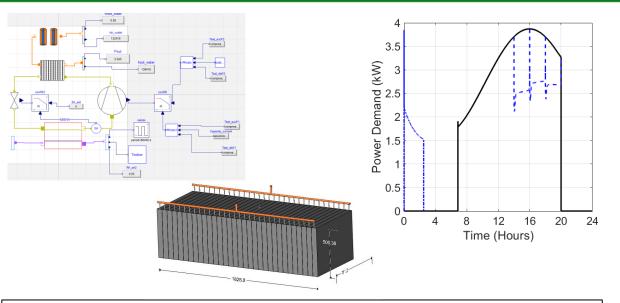

Project Summary

Objective and outcome

- Develop an integrated heat pump-thermal energy storage (HP-TES) for load shifting in cooling & heating modes
- Assessment of demand reduction potential in all US climate zones
- System model validation, laboratory testing and technology demonstration (field test & commercialization plan)

<u>Stats</u>

Performance Period: 10/2021-09/2024 DOE budget: \$3,000K, Cost Share: \$750K Milestone 1: Component & system design Milestone 2: Laboratory testing & validation Milestone 3: Technology demonstration

Problem

- HVAC&R equipment is responsible for 40-70% of residential & commercial building loads
- They are one of the main drivers of peak loads (30% peak electricity share), particularly in the summer season
- Systems in the range of 3-5 Tons correspond to the largest light commercial rooftop units market share (approximately 4 million units shipped in 2020)
- Thermal energy storage can be used in a plethora of different configurations with HVAC&R equipment and are 2-3x less costly than electrochemical batteries

Project Objectives & Opportunities

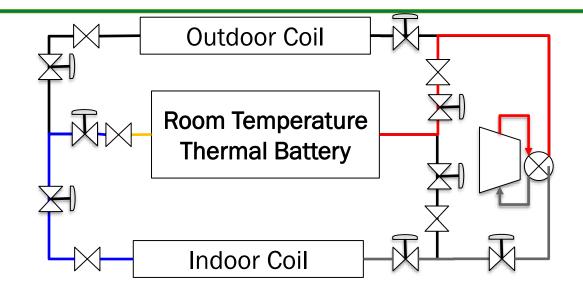

- Objective
 - Develop & validate a single integrated HP-TES operating in both cooling & heating modes
- Timeline
 - \circ Year 1
 - Component & system design
 - Prototyping & component testing
 - \circ Year 2
 - System construction & lab tests
 - \circ Year 3
 - Technology demonstration, field testing, & validation

• Opportunities

- Use a <u>single room-temperature TES</u> replacing the outdoor coil suitable for both heat pump modes
 - Reduce system (capacity) size
 - Reduce added cost
 - Possibly competitive with other highefficiency heat pumps
- Reduce demand during the peak load use, thus operating costs
- Reduce system performance degradation, e.g.,
 - Constant temperature lift (less cycling)
 - Less frost (cold climates)

Approach & Challenges

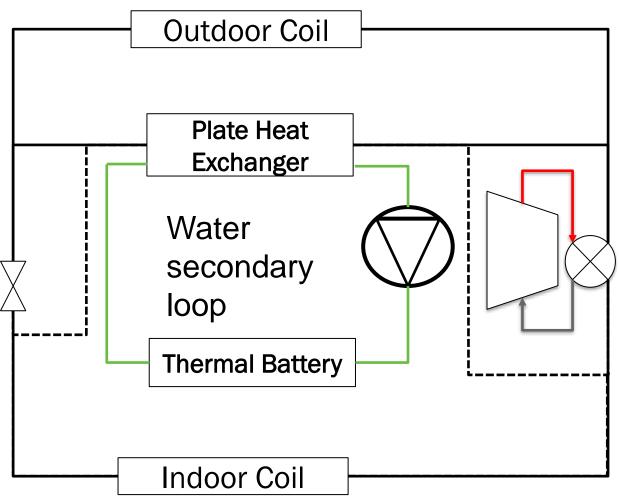

- Original approach
 - Direct refrigerant/TES system
 - TES operation: 5 tons, 4 hours
- Challenges
 - TES weight limits rooftop applications (6 x HP weight)
 - 5 x Refrigerant charge increase
 - TES aluminum HX are susceptible to corrosion from PCM salt hydrates
 - Demand reduction potential is dependent on location

| Targets | Metric | Unit | Target Values | Model-predicted performance |
|------------|--------------------------------|--------|---------------|-----------------------------|
| SOPO | System Capacity | Ton | 5 | 5 |
| | Demand Reduction | % | 50+ | 20-80 |
| SOPO & DOE | Period | hours | 4+ | 4 |
| | Volumetric Storage | kWh/m³ | 80 | 72 |
| DOE | Volume Increase | % | 10 | 40 |
| Overlooked | Weight Increase | % | No target set | Critical issue for RTUs |
| metrics | Refrigerant Charge Increase | % | No target set | 500 |

| Metric | Unit | Original | New |
|--------------------------------|--------|----------|-----|
| (Commercial) System Capacity | Ton | 5 | 4* |
| Demand Reduction | % | 50+ | 50+ |
| Period | hours | 4+ | 2+ |
| Overall COP Improvement | % | 20+ | 20+ |
| TES Cost | \$/kWh | 15- | 15- |

- Current TES weight is 3 x HP
- Lower refrigerant charge increase in PHX compared to direct ref/TES
- Water △T in PHX degrades the HPTES COP compared to direct ref/PCM

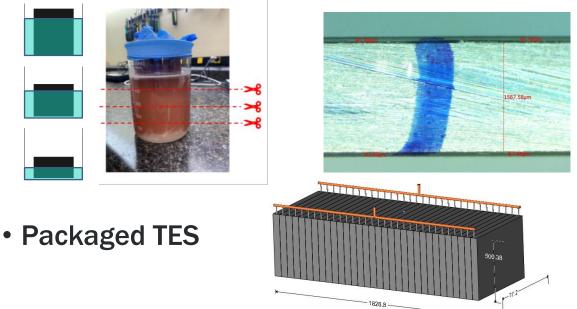

*Highest selling system by millions of unit shipped (Source: AHRI (Statistics | AHRI (ahrinet.org))

TES Design, Assembly, & Material Durability

- TES requirements
 - $_{\odot}~$ Cooling mode: 16-17 kW
 - $_{\odot}~$ Heating mode: 10-11 kW
- Storage requirement: $V_{PCM} = 0.45 \text{ m}^3$
- Discharge rate requirement: $\dot{Q} = 17 \text{ kW}$
- HXs types that meet TES requirements
 - \circ Microchannel HX
 - Small internal volume, low-cost and weight, high compactness
 - Difficult to assemble & package
 - ✓ Tube-fin HX (32 HX required)
 - Adequate compactness, low-cost and weight
 - ✓ Easy to assemble & package

- Corrosion Testing
 - All-aluminum tube-fin corrodes in salt hydrates
 - o Heresite[™] immersed coating applied and tested
- Sampling Approach & Coating Results

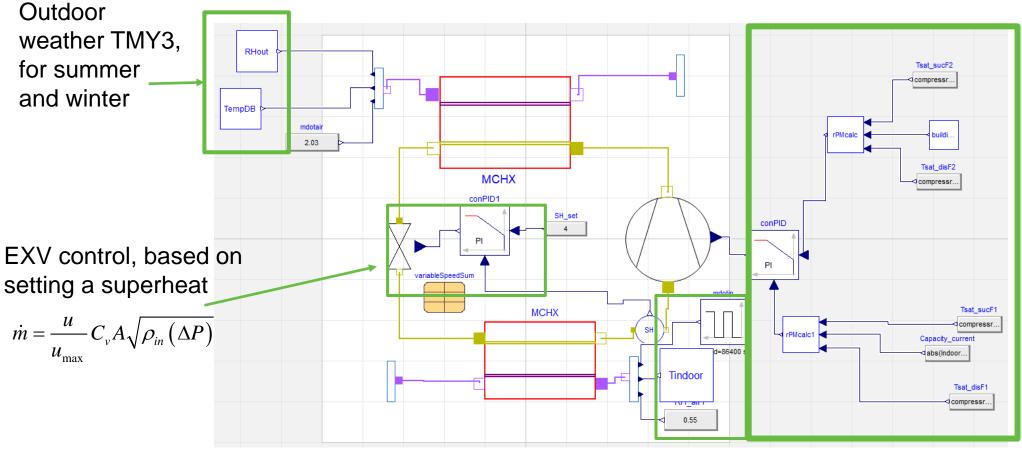

Transient Model Setup & Validation

- Baseline HP cycle was modeled & validated in Modelica at AHRI A-test conditions
- Secondary loop components in Modelica
 - Modelica results for selected plate HX in agreement with PHESim
 - Segmented TES model created using simplified resistance-capacitance model
- System level modeling
 - HP cycle: variable-speed rotary compressor with EXV
 - HP-TES cycle: created for charging and discharging, same as HP cycle

| Metric | Unit | Experiment | Modelica | Abs. Diff. |
|--------------------|------|------------|---------------------------------|------------|
| Superheat | K | 4.44 | 4.89 | 0.45 |
| Subcooling | K | 7.25 | 5.25 | 2.00 |
| Suction T | °C | 14.00 | 14.28 | 0.28 |
| Discharge T | °C | 71.11 | 74.94 | 3.83 |
| Comp. Power | kW | 3.22 | 3.18 | 1.24% |
| Indoor HX Capacity | kW | 13.97 | 13.86 | 0.79% |
| PHX | | V | Refrige Tube v Vater-side | |
| | | | PCM-s | side |
| TES | | | Tube | e wall |
| | | | Water-s | side |

System Level Model with Weather Data & Building Loads

Control of the compressor RPM, to match internal loads with the indoor HX capacity

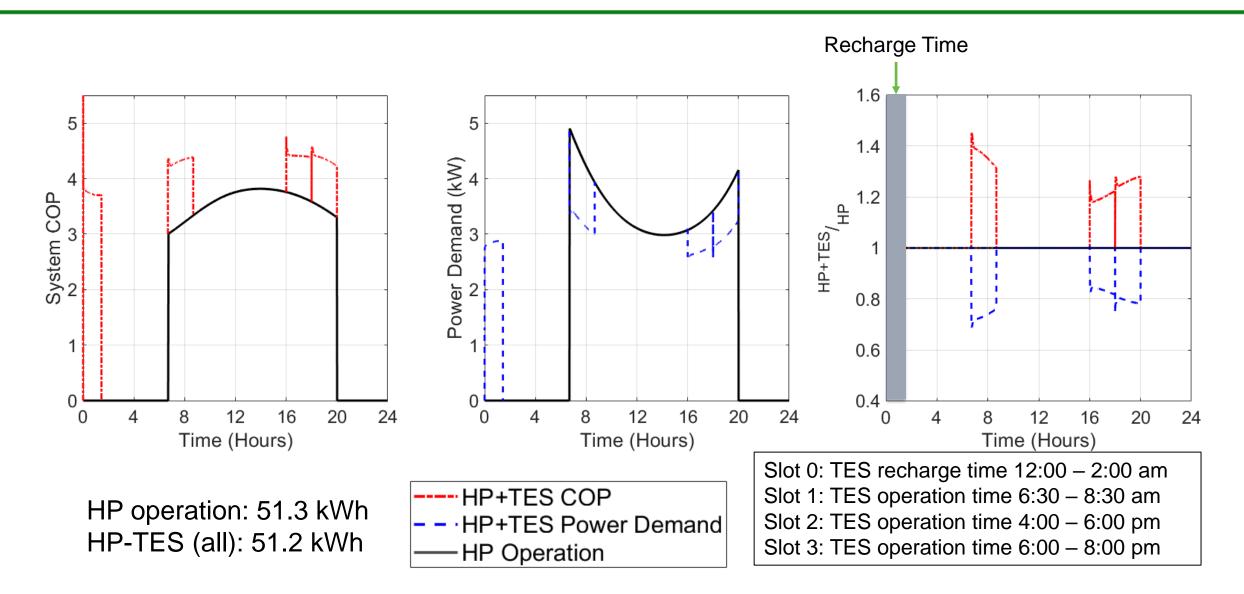

Indoor boundary conditions from building loads (Roth et al. 2022)

System Level Model with Weather Data & Building Loads

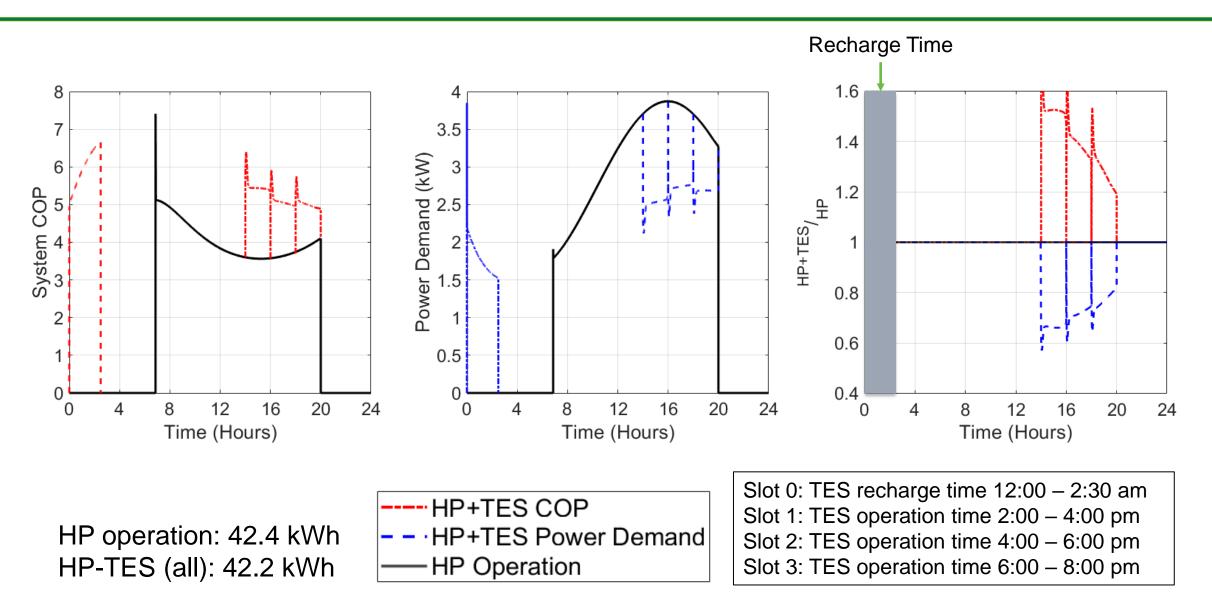

- Similar HP system level components are available with the HP-TES except
 - o Discharging
 - Outdoor HX replaced with secondary loop
 - Only indoor weather data are used
 - \circ Charging
 - Indoor HX replaced with secondary loop
 - Only outdoor weather data are used at nighttime

- Lowest COP time slots during the day
 - Cooling: 2:00 pm 4:00 pm
 - Heating: 6:30 am 8:30 am
- Time slots for peak hours in Southern California TOU
 - 4:00 pm 6:00 pm
 - 6:00 pm 8:00 pm
- Key metrics: COP improvement & demand reduction
- Key assumption: HP-TES water pump power is the same as outdoor fan power

Heating Mode

Cooling Mode

Fabrication and Test Timelines

Thermal Battery Fabrication

- Fabrication & coating of 32 all-aluminum HXs (04-05/2023) (Rheem, Rahn)
- Manifold construction & overall assembly (05-06/2023) (HTT, Insolcorp, ORNL, EPRI)
- Baseline system testing
 - ORNL Laboratory (03-04/2023)
 - EPRI Laboratory (05-06/2023)
- Integrated system testing
 - 06-09/2023 (ORNL, EPRI)
- Field test site selection
 - 09/2023

Stakeholder Engagement

- **Project partners (sub-recipients)**
 - Rheem Manufacturing
 - Baseline heat pump system hardware & test data
 - HP-TES components: all-aluminum tube-fin HXs for thermal battery, plate HX for secondary loop, compressors & expansion devices
 - Commercialization advisor
 - Insolcorp
 - PCM manufacturer
 - Thermal battery assembly
 - Commercialization advisor
- Industry involvement
 - Rahn Industries
 - All-aluminum HX coating for thermal battery

Next Steps

- Model smooth switch between HP & HP-TES operation
- Analyze the HP+TES for summer, winter, & shoulder season for all 7 climate zones
- Conduct full transient seasonal simulations
- Fabricate/assemble battery (Ongoing)
- Test baseline system (Ongoing)
- Test integrated system
- Validate model using laboratory test data

Thank You
