May 22, 2002

In reply refer to: 2002RC-1929

Mr. Mike Lopez U. S. Department of Energy Oakland Operations Office 1301 Clay Street Suite 700N Oakland, CA 94612-5208

Subject: NESHAPs Report for 2001

Dear Mr. Lopez:

Enclosed is the National Emission Standards for Hazardous Air Pollutants (NESHAPs) Report for 2001 for the Department of Energy's (DOE) facility at the Santa Susana Field Laboratory (SSFL). The U.S. Environment Protection Agency (EPA) regulates airborne releases of radioactivity from DOE facilities under 40 CFR 61, Subpart H. This document reports the radiochemical analysis results of the effluent samples from all applicable emission sources. It also includes the off-site dose assessment results, which are compared against the EPA standards for compliance demonstration.

During 2001, the only applicable emission source at the DOE facility at SSFL was the operating exhaust stack at the Radioactive Materials Handling Facility (RMHF). The RMHF Pond, usually considered an area source when it is dry, contained water all year long except for one day, and the sediment in the pond was not resuspended by wind for airborne releases.

The EPA limit for a DOE site is 10 mrem/yr, as specified in 40 CFR 61, Subpart H. The regulation also specifies that radiation exposure dose to the Maximally Exposed Individual (MEI) be calculated using the EPA's CAP88PC computer model. Using the EPA's methodology, the Effective Dose Equivalent to the MEI from the RMHF exhaust during 2001 was calculated to be 3.1 x 10⁻⁶ mrem (3.1 x 10⁻⁸ mSv) per year. This result indicated that the release from the RMHF was about 3 million times less than the regulatory limit.

This report includes the Certification Statement to be signed by M. E. Lee (or designee) for The Boeing Company, Rocketdyne Propulsion & Power and by you for the DOE Site Closure Office. The Certification Statements are required for the final report.

M. Lopez 5/22/2002 Page 2

If you have any questions or comments on this report, please contact Ning Liu at (818) 586-6262.

Sincerely,

() Boeing

M. E. Lee, Program Manager

Section I. Facility Information

Site Description

The Santa Susana Field Laboratory (SSFL) is located at the boundary of Ventura and Los Angeles Counties in southern California, as shown in Figure 1. The site consists of four administrative areas and undeveloped land, with a total area of approximately 2,850 acres. A broad range of energy related research and development (R&D) projects, including nuclear technologies, were conducted in Area IV of the site. All the nuclear R&D operations in Area IV ceased in 1988, and the subsequent efforts have been directed toward decontamination and decommissioning (D&D) of the former nuclear facilities. Area IV has an area of about 290 acres, and Figure 2-1 shows the arrangement of the site.

The climate at SSFL is generally dry, with variable winds. The site is situated between Simi Valley and San Fernando Valley, and there is no significant agricultural land use within 30 km (19 miles) radius. While the land immediately surrounding Area IV is undeveloped, suburban residential areas are at greater distances.

Source Description

There are three radiological facilities or buildings remaining in Area IV of the SSFL, as shown in Figure 3. The Radioactive Materials Handling Facility (RMHF) is currently used for processing, packaging, and temporary storage of radioactive waste materials, which are eventually shipped off-site to DOE approved disposal facilities. As a result of the waste handling operations at the RMHF, radioactive effluents were released to the atmosphere through a stack in 2001. The effluents were filtered and monitored before released into the atmosphere to ensure compliance with the National Emission Standards for Hazardous Air Pollutants (NESHAP) requirements. No radioactive liquid effluents were released from the facility.

Building 4059 is the former Systems for Nuclear Auxiliary Power (SNAP) reactor ground test facility. The D&D of this facility started in the early 1990s. After the phase I remediation was completed in 1998, the ventilation system in this building was no longer needed, and the two ventilation stacks were demolished in 2000. In 2001, no radiological work requiring ventilation was performed in the building, and no effluents were released to the atmosphere from this building.

Building 4024 housed two experimental reactor systems during the 1960s. After the project was terminated, all equipment and fuel were removed from the facility. A portable HEPA filtered ventilation system was set up in the building to support the decontamination of the Hot Laboratory concrete blocks. The ventilation system has not been in operation since the decontamination work was completed in 1999. In 2001, no effluents were released to the atmosphere from this building.

Date: May 22, 2002

Page 3

The RMHF Pond (Sump 614) is a collection sump for rainfall runoff from the RMHF. This is a potential area source, because radioactivity in the sediment may become airborne when the pond is dry and the sediment is exposed to air. Similarly, the RMHF North Slope is an identified area of low-level soil contamination, and radioactivity in the soil may be resuspended by wind if the soil surface is not covered by vegetation. During 2001, the RMHF sump was covered with water except for one day (sediment was still wet during that day) and the RMHF North Slope was covered with dense brush for the entire year. No radionuclides from these two areas were resuspended by wind for airborne releases.

In 2001, the only applicable radiological emission source for the DOE facility at SSFL was the operating exhaust stack at the RMHF. Air samples from the ventilation stack were analyzed for specific radionuclides, and the results were used for the dose assessment in this report.

Section III. Dose Assessments

Description of Dose Model

Radiation doses to the Maximally Exposed Individual (MEI) as well as the population in the surrounding area resulting from the emissions of the DOE facility at SSFL during 2001 are calculated using the EPA's CAP88-PC computer code. Site-specific meteorological data, such as wind speed, direction frequency, and stability, were developed by the NRC and Argonne National Laboratory for SSFL and used for the atmospheric dispersion calculation in CAP88-PC. Other input data, such as release terms, stack height, and exhaust air velocity, were physically measured to represent the site-specific situation for dose calculations.

Demonstration of compliance with the NESHAPs standard is based on the calculation of the maximum radiation exposure dose to an offsite individual located at a residence, school, business, or office in the vicinity of the SSFL. For this purpose, the nearest such locations have been identified by review of maps, aerial photographs, and direct observations. They are the residential area of Simi Valley, the Brandeis-Bardin Institute, the Santa Monica Mountains Conservancy Sage Ranch office, the residential area in Black Canyon, and the residential area in Bell Canyon. The location with the highest estimated annual dose is considered the location of the Maximally Exposed Individual (MEI).

The RMHF stack is the only emission source in 2001. The Effective Dose Equivalent to the MEI resulting from the emission is compared against the NESHAPs standard for the demonstration of compliance. The dose was calculated using CAP88-PC with site-specific input data.

Compliance Assessment

Location of Maximally Exposed Individual (MEI): Residence in Simi Valley, 2867 m NW of RMHF.

The Effective Dose Equivalent to the MEI from the RMHF exhaust during 2001 was 3.1×10^{-6} mrem (3.1 x 10^{-8} mSv) per year. The EPA limit for a DOE site is 10 mrem/yr, as specified in 40 CFR 61, Subpart H. This result indicates that the release from the RMHF is about 3 million times less than the regulatory limit.

Supplemental Information

The collective Effective Dose Equivalent resulting from the DOE operations at SSFL during 2001 is calculated to be 7.5×10^{-04} person-rem (7.5×10^{-06} person-Sv).

The population doses were calculated using CAP88-PC in the "POPULATION" mode. The site-specific population distribution is estimated from the demographic survey performed by Claritas Inc. Claritas Inc, a leading demographic survey company, developed the demographic data around SSFL in 2000 based on the census data and modified by direct observations of nearby residential areas around the SSFL site.

The population distribution is presented in a structure utilizing 16 directions, coinciding with the wind directions, and 13 radial zones, with the distances chosen to represent the center-of-area for each zone. These zones include the population within 80 km of the site.

No operations regulated by Subparts Q and T were conducted in 2001, nor were there any emissions of Rn-220 from sources containing U-232 and Th-232. There were no non-disposal/non-storage sources of Rn-222 emission.

Potential releases from the RMHF are so low that, even assuming absence of the HEPA filters, estimated doses would be below the level that requires continuous monitoring as prescribed in 40CFR61.93(b). However, as a good practice, continuous monitoring is still being performed in accordance with ANSI N13.1 standard (1989 version). The stack effluent at RMHF is continuously sampled, counted for gross alpha and beta activities weekly, and combined annually for radiochemical analysis. In addition, tritium level in the evaporator feed water is analyzed annually to determine tritium release. This water is collected from the decontamination room at the RMHF, such as the wash down water for cleaning tools and equipment. The water is then stored in an 8000-gallon tank before evaporated through the HEPA filtered stack. Because of the very low level of tritium (lower than drinking water standards) and the large capacity of the storage tank, it is reasonable to assume that the tritium level is constant throughout the year.

There are five continuous ambient air samplers throughout the SSFL site. The purpose of this monitoring is to ensure that there is no airborne radioactivity resulted from the ongoing decontamination and decommissioning (D&D) activities at the site. Air sampling filters are collected and counted for gross alpha and beta activities on a weekly basis. The weekly samples are combined (separately by location) annually for radiochemical analysis. The QA program described by Appendix B, Method 114 are implemented for this low-level surveillance effort.

Clean Air Act Assessment Package - 1988

AND RISK DOSE EQUIVALENT SUMMARIES

Non-Radon Population Assessment Apr 16, 2002 04:46 pm

Facility: RMHF

Address: SSFL, Top of Woolsey Canyon Road, Simi Hills

City: Chatsworth

State: CA Zip: 91311-

Source Category: DOE facility

Source Type: Stack Emission Year: 2001

Comments: CAP88PC calculation for 2001 ASER and NESHAPs

Population Dose, RMHF stack

Dataset Name: RMHF01POP
Dataset Date: Apr 16, 2002 04:46 pm
Wind File: C:\CAP88PC2\WNDFILES\SSFLNRC.WND
Population File: C:\CAP88PC2\POPFILES\SSFL2000.POP

ORGAN DOSE EQUIVALENT SUMMARY

Organ	Selected Individual (mrem/y)	Collective Population (person-rem/y)
	CONTRACTOR	
GONADS	4.18E-06	8.55E-04
BREAST	3.80E-06	7.78E-04
R MAR	3.22E-06	6.59E-04
LUNGS	3.97E-06	8.58E-04
THYROID	3.95E-06	8.09E-04
ENDOST	3.57E-06	7.32E-04
RMNDR	3.18E-06	6.51E-04
EFFEC	3.66E-06	7.54E-04

PATHWAY EFFECTIVE DOSE EQUIVALENT SUMMARY
