RESIDENTIAL ENERGY DISPATCH

Registration Open for Solar Decathlon Professionals Training®

Are you a practicing professional in architecture or engineering ready to learn how to design zero energy buildings? The U.S. Department of Energy (DOE) has partnered with the U.S. Green Building Council to offer Solar Decathlon Professionals (SD Pro), a 10-week course that includes building science education modules, weekly virtual sessions with a live instructor, and a zero-energy design practicum. [Register](#) before January 5 for a reduced rate.

Buildings Upgrade Prize Phase 1 Winning Teams Announced

The [Buildings Upgrade Prize \(Buildings UP\)](#) provides more than \$22 million in cash prizes and technical assistance to support the transformation of existing U.S. buildings into more energy-efficiency and clean energy-ready homes, commercial spaces, and communities. Forty-Five Phase 1 winners were chosen in two prize pathways: Equity-Centered Innovation and Open Innovation. View a

State Level Residential Building Stock and Energy Efficiency & Electrification Package Analysis

The National Renewable Energy Laboratory (NREL) recently launched an interactive Tableau [dashboard](#) utilizing ResStock™ for states to analyze the impacts of energy efficiency and electrification measure packages on the residential building stock. Users can explore decarbonization pathways using the new and accessible online data resource [here](#).

Home Energy Score™ Update

Ann Arbor, Michigan became the most recent U.S. city to [require sellers to obtain a Home Energy Score](#) from a Certified Assessor prior to publicly listing their homes for sale. The city's [Home Energy Rating Disclosure ordinance](#) goes into effect in March 2024.

Quiz answer: [False](#). You can use a geothermal heat pump anywhere.

The energy comes from just a few feet below ground (30 feet is average), where temperatures are constant year-round - that means lower than average air temperatures in summer and, for cold climates, higher than average air temperatures in winter - because rocks and soil can store thermal energy. Geothermal heat pumps take thermal energy removed from buildings and store it in the ground during summer to keep buildings warm in the winter. The climate in a particular region doesn't matter much, except that it can help determine the type and size of heat pump needed.
