General Comment

I do not agree with this proposal. We are facing a global climate crisis. We must do everything in our power to avert this pending mass extinction event. This includes stringently protecting environmental areas from additional, continued, increased or new destruction. It also includes increasing our efforts to improve environmental habits through restoration, sustainability, expansion of protected areas and species, and the removal and immediate ending of environmentally harmful practices including: erosion, logging, mining, removal of species from the Endangered Species Lists, deregulating industries, relaxing laws focused on environmental protection, over-fishing, and the enabling of fossil fuel use.

It also therefore is critical that we prevent environmentally-harmful products from becoming available in the consumer market. Americans should be prioritizing sustainable, renewable energy with zero to minimal harmful emission that use sustainable, renewable or actually recyclable materials to create (not materials that companies say are recyclable but very few actual facilities exist which are accessible to consumers). The products available to consumers must be regulated so they are safe for humans and the environment -- not so they are convenient for humans at the expense of the planet's health and survival.

Further, we must be engaged in actively reducing our reliance on fossil fuels, while also empowering other countries to do the same. We should not be enabling anyone's increased reliance on fossil fuels, especially given the significant environmental hazards associated with their production, transportation and use.
