

Industrial Technology Innovation Advisory Committee

Monday, May 12, 2025

12 – 5 pm ET

Virtual (Teams webinar)

Meeting Recording Announcement

This Teams call is being recorded and may be posted on DOE's website or used internally. If you do not wish to have your voice recorded, please do not speak during the call or disconnect now. If you do not wish to have your image recorded, please turn off your camera or participate only by phone. If you speak during the call or use a video connection, you are presumed to consent to recording and to the use of your voice or image.

Housekeeping Reminders

General audience does not have the ability to unmute and/or turn on camera during this presentation.

The chat has been turned off for this meeting.

Public comments:

- The deadline for submitting public comments to share during this meeting was 5:00 pm ET on May 8
- You may send a written statement to <u>ITIAC@ee.doe.gov</u>

Preliminary Recommendations

The ITIAC published 29 preliminary recommendations in Jan. 2025, addressing the topics below. While the recommendations are not expected to change substantially, the Committee expects these recommendations may be modified and/or expanded in its full report (expected Fall 2025).

- Overarching Recommendations
- Cross-cutting Technologies and Opportunities
- Industrial Subsectors
- Overcoming Barriers
- Industrial Workforce of the Future

See report for details: <u>https://www.energy.gov/sites/default/files/2025-01/itiac-preliminary-recommendations-jan2025.pdf</u>

ITIAC Nominations

- DOE is continually seeking ITIAC nominations for consideration for future membership vacancies and to maintain balance in points of view.
 - Nominations are particularly sought for individuals with expertise in one or more of the following areas: advanced nuclear technologies for the industrial sector, electric load growth in the industrial sector, and the refining industry.
 - Additionally, nominations are particularly sought for individuals who represent labor groups associated with any of the Committee's focus areas.
- Submissions should include the nominee's name, resume, biography, and any letters of support
- Committee members are appointed for a two-year term and may be reappointed for up to two
 successive terms
- Submit nominations/questions to ITIAC@ee.doe.gov

See website for more details: <u>www.energy.gov/eere/iedo/industrial-technology-innovation-advisory-</u> <u>committee#candidates</u>

Welcome & Opening Remarks

Sharon Nolen ITIAC Chair Eastman Chemical (ret.)

Dr. Zach Pritchard Technology Manager ITIAC Designated Federal Officer Industrial Technologies Office

Agenda

Agenda Item	Time (ET)
Welcome & Opening Remarks	12:00 – 12:05 pm
Discussion on Committee charge and objectives	12:05 – 12:25 pm
Remarks from DOE	12:25 – 12:40 pm
Updates on new draft recommendations	12:40 – 3:10 pm
Break	3:10 – 3:20 pm
Other discussion topics	3:20 – 4:15 pm
Committee next steps	4:15 – 4:45 pm
Public comment (none received)	4:45 – 4:55 pm
Conclusion	4:55 – 5:00 pm
Adjourn	5:00 pm

Discussion on Committee Charge and Objectives

Purpose: Advise the Secretary on a program to advance innovative industrial technologies that "increase the technological and economic competitiveness of industry and manufacturing in the United States, increase the viability and competitiveness of United States industrial technology exports, and achieve emissions reduction in nonpower industrial sectors."

Advise on technologies within defined focus areas by:

- "Identifying and evaluating technologies being developed by the private sector"
- "Identifying technology gaps in the private sector or other Federal agencies [...] and making recommendations to address those gaps"
- "Surveying and analyzing factors that prevent the adoption of emissions reduction technologies by the private sector"
- "<u>Recommending technology screening criteria</u> for technology developed under the program to encourage adoption of the technology by the private sector"
- **Propose missions and goals** and develop a strategic plan for the program
- **Produce reports to the Secretary and Congress** on findings and on evaluation of the program
 - Initial report after 2 years, updated every 3 years thereafter

Summarized from 42 U.S.C. §17114.

Remarks from DOE

Dr. Carolyn Snyder Deputy Assistant Secretary for Buildings and Industry Office of Energy Efficiency and Renewable Energy

Dr. Avi Shultz Director Industrial Technologies Office

New Draft Recommendations

- Overcoming barriers Cathy
- Carbon capture, utilization, and storage (CCUS) Jeff and Joe
- Nuclear energy and heat for industry Abigail and Joe
- Liquefied natural gas (LNG) Neal
- Data centers Neal and Jeff
- Controlled environment agriculture (CEA) Neal and Betsy
- Pulp and paper Jolene
- Aluminum Subodh
- Critical materials Sridhar and Subodh
- Coal and coke for steel production Sridhar and Sunday
- U.S. Competitiveness and Global Leadership Abigail
- Budget Abigail

Overcoming Barriers

Draft recommendation 1: Regional transmission organizations (RTOs) not fairly evaluating low load capacity (e.g., charging 35% of the time), highly flexible technologies. DOE could tell the Federal Energy Regulatory Commission (FERC) to accelerate interconnection processes for those loads because they can avoid having system impacts and should be studied as they are (i.e., not adding to the coincident peak) vs. the worst case scenarios. DOE could tell FERC that if tariffs don't do that, it's unjust and unreasonable. (FERC is dealing with a related docket now in PJM).

Draft recommendation 2: Difficulty faced by many companies in navigating DOE grant requirements / negotiating agency awards. DOE should expedite/ease the process for companies that are prior DOE grant awardees and are applying for subsequent funding opportunities. [This recommendation is related to, but different from, our preliminary report recommendation #24 re: a Fast Track program].

Overcoming Barriers (continued)

Draft recommendation 3: County level bans on the development of wind, solar and storage technologies, which are proliferating around the country, are driving up the price of key electricity technologies, and creating a barrier to industrial electrification. DOE should initiate a research report on what is going on with these ordinances and press to try and get reasonable ordinances for the protection of public health and avoiding critical lands, but not prohibiting the cheapest forms of energy from being developed.

Draft recommendation 4: Advanced clean technology adoption is challenging for companies that commercialize globally when best available technologies may be regionally dependent. To overcome this barrier, DOE should utilize local representatives around the country (e.g., in national labs, field offices, via programs such as Better Plants, etc.) to understand technologies that work best for each region and fund accordingly to help drive a smoother transition and better yield of adoption.

Carbon capture, utilization, and storage (CCUS)

Draft recommendation 1: In collaboration with academia, industry, and its national labs, DOE should continue and expand its support for technologies to achieve the following goals associated with carbon capture and storage (CCS) deployment: (a) reducing the costs of retrofitting carbon capture technology in existing industrial facilities; (b) facilitating access to CO_2 transportation to geological storage in different regions, accounting for where industrial facilities are located or clustered; (c) developing innovative solutions required for certain subindustries (such as cement-making and primary steel-making) to efficiently capture CO_2 emissions from their waste gas streams; and (d) mitigating risks of CO_2 transport and storage, such as preventing leakage.

• **Rationale:** Carbon capture and storage (CCS) has been demonstrated at commercial scale and can provide a low-cost option for mitigating emissions from otherwise difficult-to-decarbonize industrial sectors and processes.^{1,2,3} It represents an added cost, but it can sometimes provide the lowest levelized cost of CO₂ abatement, particularly for industrial processes that produce high-purity byproduct CO₂ streams (such as the synthesis of ethanol, ammonia, and ethylene oxide) and for large-scale, capital-intensive subindustries that require high stream factors (i.e., 24/7 operation) to remain economically competitive.⁴

Pathways to Commercial Liftoff: Industrial Decarbonization; 3. M. Pisciotta, S. Swett, H. Pilorgé, S. Patel, J. Wilcox, <u>U.S. CCS Ladder for Industrial Decarbonization</u>, October 25, 2024; 4. Friedl, G., Reichelstein, S., Bach, A. et al. <u>Applications of the levelized cost concept</u>. J Bus Econ 93, 1125–1148 (2023).

Carbon capture, utilization, and storage (CCUS) (continued)

Draft recommendation 2: DOE should develop and release a toolkit to enable structured evaluation of carbon capture technology versus other emissions-reducing technology options for different subindustries at the project level, to help industrial firms understand when carbon capture technology is the best fit for a specific project. The toolkit should also help firms estimate the impacts of proposed CCS projects on communities with regard to employment opportunities and environmental outcomes (such as changes in non-CO₂ pollutant emissions).

Draft recommendation 3: To facilitate carbon capture and use (CCU), DOE should continue and expand its support for improving efficiency and yields for CO_2 conversion to products using thermo-, electro-, photo-, and plasma-based chemical pathways. DOE should encourage co-location of CO_2 -using industries with carbon capture projects to make optimal use of infrastructure for CO_2 capture and transport.

• **Rationale:** CO₂ capture and utilization (CCU) can be advantageous where access to geologic storage is not feasible or where products are made that incorporate oxygen as well as carbon (such as organic and mineral carbonates, carboxylic acids, and polyols). It can also be useful in the manufacture of synthetic fuels for energy services that cannot readily be decarbonized via electrification or hydrogen.^{1,2}

National Academies of Sciences, Engineering, and Medicine. 2024. <u>Carbon Utilization Infrastructure, Markets, and Research and</u> <u>Development: A Final Report</u>.

We are on a break and will return at 1:55 pm ET

Nuclear Energy and Heat for Industry

Draft recommendation 1: DOE should directly support implementation and demonstration of advanced nuclear technology in the U.S. for gigawatt-scale industrial petrochemical and refining, clean hydrogen production, and other large industrial heat/steam users. DOE should also consider nuclear energy for data centers and for other industries with expected future growth and whose energy needs are a good match for nuclear. Where possible, DOE should explore projects that integrate new nuclear technology with other technologies (e.g., thermal energy storage) and that co-locate nuclear with industrial facilities that can take advantage of nuclear's heat and electricity output in an optimized energy system.

Rationale: First-of-a-kind costs, public acceptance, and permitting delays make industry hesitant to invest in nuclear technology, despite having the highest steam factor for 24/7 energy needed for capital-intensive industrial energy. Land-use for nuclear power is minimal, making it an attractive choice for industrial complexes embedded in major metropolitan areas challenged by growth in power demand for AI and transportation. Current deployment of new nuclear technology is primarily occurring in China; advancing capability is of strategic value to the U.S.

Nuclear Energy and Heat for Industry (continued)

Draft recommendation 2: DOE should support best practices and innovative models (such as those identified by DOE's Advanced Nuclear Pathways to Commercial Liftoff report and the Nuclear Energy Advisory Committee's January <u>2025 letter to the Secretary</u>) to ensure DOE-funded nuclear projects for industry are delivered on-time and on-budget. Recommendations include: better sharing and allocation of costs and risks across multiple roles involved in project development, utilizing consortium approaches, using an integrated project delivery model, and standardization of reactor designs and equipment. DOE should also support ongoing efforts by the Nuclear Regulatory Commission to modernize and optimize licensing reviews of advanced reactors to follow a technology-inclusive, performance-based, and risk-informed framework that could be standardized, simplified, and digitized in the future.

Liquefied Natural Gas (LNG)

Draft recommendation 1: DOE should continue and expand its support for technologies to achieve the following goals associated with liquefied natural gas (LNG): (a) improving the energy efficiency of the compression and refrigeration processes at LNG liquefaction facilities; (b) reducing methane leakage at liquefaction and export facilities; and (c) separating noble and commercially valuable gases from natural gas during the liquefaction process. Additionally, DOE should assess the economic and environmental benefits of liquefaction and export facilities relying on grid electricity rather than consuming a portion of the natural gas for their energy needs.

Rationale: Most U.S. LNG facilities are powered by electricity generated onsite from natural gas, with typical consumption rates ranging from 7% to 15% of the natural gas delivered to the facility.¹ Most of this electricity is used for cooling and compression. Several liquefaction process configurations are in use that trade off energy use and capital cost, and with additional research, further improvements are possible. A few operating facilities use grid-supplied electricity, reducing combustion by-products and improving air quality near the facilities. Methane leakage from LNG facilities can be significant (though smaller than leakage from natural gas production), so technologies to reduce leakage could recover sellable product while reducing methane emissions. Also of note, the potential exists to collect noble and rare gases that are mixed with raw natural gas and can be separated during liquefaction, potentially providing a source of gases that are important in a range of industrial applications, such as semiconductor manufacturing.²

Labarge: Helium Explained. <u>https://corporate.exxonmobil.com/what-we-do/materials-for-modern-living/labarge-helium-extraction-energy-production-wyoming</u>

Liquefied Natural Gas (LNG) (continued)

Draft recommendation 2: DOE's Office of Fossil Energy and Carbon Management (FECM) should consider the potential for LNG exports to increase natural gas prices for domestic industries and harm U.S. manufacturers' competitiveness when making public interest determinations on applications to export LNG.

• **Rationale:** DOE is legally required to determine whether applications to export LNG to a country with which the U.S. does not have a free trade agreement are in the public interest.¹ LNG exports tend to increase domestic natural gas prices by linking U.S. gas prices to international market prices, which are significantly higher. This can have negative competitiveness impacts on U.S. firms that consume natural gas. This includes most U.S. manufacturing facilities, but impacts would be greatest on major natural gas consumers with small profit margins, like U.S. chemical companies and fertilizer manufacturers.

Reference: 1. DOE Office of Fossil Energy and Carbon Management. Liquefied Natural Gas (LNG). <u>https://www.energy.gov/fecm/liquefied-natural-gas-lng</u>

Data Centers

Draft recommendation: DOE should support work to fill knowledge gaps in data center design and operation, particularly as it relates to data centers' energy efficiency and integration with communities and the electric grid. DOE should assist grid operators and regulators in developing policies and rate plans that reward data centers for operating as flexible loads that help balance the grid, avoid contributing to net peak demand, and address electricity supply adequacy by making better use of existing generation and transmission resources at off-peak times. There are a variety of spatial and temporal load shifting mechanisms that data centers can use to increase their electricity demand flexibility, especially when focusing on tasks such as AI model training or cryptocurrency mining, where no human user is waiting on an immediate response.¹

Rethinking Load Growth: Assessing the Potential for Integration of Large Flexible Loads in US Power Systems. Nicholas Institute for Energy, Environment & Sustainability, Duke University. <u>https://nicholasinstitute.duke.edu/publications/rethinking-load-growth</u>

Controlled Environment Agriculture (CEA)

Draft recommendation: DOE should continue its exploration of the market and technical challenges facing the controlled environment agriculture (CEA) industry, reflecting findings of the U.S. CEA Market Accelerator (an initiative run jointly by Resource Innovation Institute, Lawrence Berkeley National Lab, FarmTech Society, and 1% for the Planet). DOE's work should explore differences between rural and urban CEA, including both conventional greenhouses and vertical agriculture, and identify the optimal sizes of facilities in each of those modalities. DOE should also consider options for CEA space heating using alternatives to propane including hydronic heating using high-efficiency boilers and/or heat pumps and systems that recover waste heat from colocated industrial facilities or data centers. Additionally, DOE should support automation and robotics as a means of addressing workforce constraints in CEA operations.

Pulp and Paper

Draft recommendation: DOE should invest in development and deployment of mechanical vapor recompression (MVR) heat recovery technology for paper drying and Yankee hoods.

• **Rationale:** MVR uses electrically driven compressors and a working fluid to capture lowquality heat and turn it into higher quality steam suitable for pulp and paper processes. This process is efficient and does not emit air pollution. As an additional benefit, at times of peak electricity demand, a pulp and paper facility could switch to their gas-fired steam system and turn off the compressor, reducing peak load on the grid. Similar heat stacking principles could combine heat pump technologies and MVR to convert high-humidity, high-temperature vacuum exhaust into electricity.

Aluminum

Draft recommendation 1: DOE should continue and expand its support for key emissions-reducing technologies in the aluminum industry, including inert anodes that do not break down during the smelting process, mechanical vapor recompression (MVR) to produce steam for use in alumina refining, electric alumina calcination, and furnaces that use electricity, hydrogen, or other non-emitting fuels. To overcome cost barriers, DOE should support projects that aim to drive down the costs of all these types of equipment, as well as hydrogen electrolyzers.

Draft recommendation 2: DOE should help ensure the domestic supply of aluminum by funding technologies or programs to improve aluminum recycling rates, address impurities and improve recycled aluminum quality, and enable landfill mining (extracting aluminum from landfills).

Rationale: Secondary aluminum production involves only around 5% of the energy use and emissions as primary aluminum production. The U.S. is projected to generate sufficient scrap aluminum to meet its aluminum needs if issues of contamination and the mixing of different alloy grades can be addressed. U.S. landfills are estimated to contain around 90 million tons of aluminum (with a further 2.5 million tons added each year). By way of comparison, the U.S.'s <u>annual production</u> was under 1 million tons of primary aluminum and 3 million tons of secondary aluminum in 2021.

Critical Materials Supply and Demand

Draft recommendation 1: DOE should publish a comprehensive study covering the following materials-related topics. First, DOE should identify the materials critical to U.S. industry and which subindustries rely on those materials. Second, DOE should coordinate with the Department of Defense to identify materials critical to national security and the military. Third, DOE should identify materials important for the other technologies recommended in this Industrial Technology Innovation Advisory Committee report, such as materials required for grid infrastructure, thermal batteries, etc. For each of the materials so identified, the study should consider if material availability and price will be important constraints on large-scale deployment of the relevant technologies or equipment, what alternative material options exist, and ways that DOE can support technologies that alleviate any bottlenecks or address areas of concern. The Advanced Materials and Manufacturing Technologies Office (AMMTO) and the Critical Materials Innovation Hub (CMI) should lead or participate in these analyses as appropriate.

Critical Materials Supply and Demand (continued)

Draft recommendation 2: DOE should continue and expand its support for technologies that increase the supply of critical materials. This includes technologies that make the recycling of critical materials easier and more cost-effective (such as by improved separation of impurities), technologies that locate critical mineral deposits, and technologies that enable critical minerals to be extracted cost-effectively and in a way that doesn't harm the environment or nearby communities. In cases where material refining or manufacturing capacity is an important constraint (as in certain high-grade electrical steels), DOE should support technologies to improve U.S. material refining and manufacturing capacity. DOE should also continue and expand its support for technologies that allow equipment to use less of the most expensive and hardest-to-source materials, such as by substituting more accessible materials or via material efficiency (product designs that use less material without sacrificing product quality or performance). DOE should provide support through the Advanced Materials and Manufacturing Technologies Office (AMMTO), the Critical Materials Innovation Hub (CMI), the Office of Clean Energy Demonstrations (OCED), the Loan Program Office, and other offices as appropriate.

Coal and Coke Use for Steel Production

- Draft recommendation 1: Owing to the smaller sizes of blast furnaces in the United States, there is the potential to use coal blends. A suggestion is to apply artificial intelligence (AI)/machine learning (ML) to develop synthetic coals and even bio-coke blends for use as coke. Industry has plenty of data but not enough analysis tools to design new blends.
- **Draft recommendation 2:** Consideration should be given to supplying coal in composition (enriched carbon content) and physical properties (large sizes and in densified state) consistent for use as charge material with scrap to supplement the use of injection carbon in electric arc furnaces to control scrap melting and foaming.
- **Draft recommendation 3:** Consideration should be given for supplying coal or coal blends for PCI (pulverized coal injection) for use in raceway in blast furnaces.
- **Draft recommendation 4:** Specialized training courses/modules through e.g., the Association for Iron & Steel Technology (AIST) for cokemaking and with insight into process automation and repair.
- **Draft recommendation 5:** Regional/local U.S. standards are extremely stringent. Can openly available standards be used to compare with other countries to show that U.S. products are cleaner and thus more competitive (referring not only to coal but also the end product steel).

We are on a break and will return at 3:35 pm ET

U.S. Competitiveness and Global Leadership

Draft recommendation 1: DOE's laboratories should seek to license their intellectual property pertaining to clean industrial technologies to companies worldwide on competitive terms. This can further American technological leadership, guide emerging economies toward cleaner industrial development pathways, and help drive down harmful pollutant emissions globally. In some cases, technology licensing can be facilitated by engaging in partnerships with countries that have ambitions for industrial development. One example is the U.S. – Kenya Climate and Clean Energy Industrial Partnership.

U.S. Competitiveness and Global Leadership (continued)

Draft recommendation 2: DOE should promote industrial technology exports by further engaging with U.S. agencies with international remits (such as the U.S. International Development Finance Corporation (DFC), Export-Import Bank of the United States (EXIM), and the U.S. Trade and Development Agency (USTDA)) and sharing lessons learned regarding promising technologies through the labs, as well as DOE grant and loan programs. Sharing lessons learned with other agencies can help build pipelines of viable technologies and potential companies that could export their products abroad with additional support. This will also ensure that DOE programs (and federal funding more broadly) have a greater impact on global emissions reductions and lead to prolonged U.S. industrial competitiveness.

Preliminary report budget recommendations

Recommendation 1: In future budget requests, DOE should prioritize increases for the Industrial Efficiency and Decarbonization Office (IEDO), the Advanced Materials and Manufacturing Technologies Office (AMMTO), the Office of Clean Energy Demonstrations (OCED), and the Office of Manufacturing and Energy Supply Chains (MESC).

• *Rationale:* These offices' work is central to clean and competitive U.S. industry, and the technologies they support are typically beyond the laboratory stage and can be commercialized within ten years.

Recommendation 2: Some offices fund technologies across multiple sectors and should receive budget increases specifically to support an increased focus on technologies, programs, and data collection and publication important for industrial decarbonization. These include the Advanced Research Projects Agency-Energy (ARPA-E), the Loan Programs Office (LPO), the Office of Technology Transitions (OTT), and the Bioenergy Technologies Office (BETO). The Energy Information Administration (EIA) should receive a budget increase to support improved industrial data collection and publication.

• *Rationale:* The U.S. industrial sector would benefit from greater attention and focus from these offices. Budget increases would allow these offices to ratchet up their industrial work without compromising existing programs targeting other sectors.

Committee next steps

- Committee membership and appointments
- Next meeting
- Pathway to final report
- ITIAC work beyond the final report

Thank you!

Visit the ITIAC website for more information.
