General Comment

The Gulf of California will be severely degraded by the activity of this project and important umbrella species in the system as well as endangered species will be seriously affected by the transport, industrialization and infrastructure associated to the project. Additionally, this area is considered key to livelihoods of fisherman and tourist operators, which are two of the key activities of the region, as well as the cultural and natural value the area holds for many people in the surrounding Mexican states. Not only biodiversity will be affected regionally, but globally due to the high concentration of species this area hosts and the important migrations occurring in this marine corridor. Lastly, because of the nature and size of the project, the risks and possible environmental impacts of a failure in the operations of transportation would be irreparable and no restoration action would be sufficient to make up for the damages, both environmental and economic.
