*U.S. Department of Energy*

## Certificate of Analysis

### Certified Reference Material U900 (10 mg)

### Uranium (U<sub>3</sub>O<sub>8</sub>) Isotopic Standard, 90 % U-235, 10 mg U

**Description:** Each unit of Certified Reference Material (CRM) U900 consists of approximately 10 milligrams of uranium, in the form of highly purified U<sub>3</sub>O<sub>8</sub>, contained in a glass bottle. Certified isotope-amount and isotope-mass fractions values are reported in Table 1.

**Table 1. Certified Property Value and Uncertainty <sup>(a)</sup>**

	$n(^{234}\text{U})/n(\text{U})$	$n(^{235}\text{U})/n(\text{U})$	$n(^{236}\text{U})/n(\text{U})$	$n(^{238}\text{U})/n(\text{U})$
Isotope-Amount Fraction ( $\cdot 100$ ):	0.7777	90.196	0.3327	8.693
Uncertainty:	0.0015	0.011	0.0010	0.008
	$m(^{234}\text{U})/m(\text{U})$	$m(^{235}\text{U})/m(\text{U})$	$m(^{236}\text{U})/m(\text{U})$	$m(^{238}\text{U})/m(\text{U})$
Isotope-Mass Fraction ( $\cdot 100$ ):	0.7735	90.098	0.3337	8.795
Uncertainty:	0.0015	0.011	0.0010	0.008

<sup>(a)</sup> The indicated uncertainties for the isotope composition of the CRM are 95 % confidence intervals for a single determination. This term can be defined as an approximate two-sigma limit, where sigma is the standard deviation of the measurements data obtained from the material. The uncertainties include allowances for inhomogeneity of the material as well as measurement uncertainty.

**Intended use:** CRM U900 is intended primarily for use as an isotopic standard in mass spectrometric analysis of uranium.

**Storage:** This material should be stored in its original packaging under normal laboratory environmental conditions.

**Period of validity:** When stored in its original, unopened container, the certification of this material is valid indefinitely. The Nuclear Reference Material Program (NRMP) will notify customers should any degradation be detected.

**Minimum samples size:** The NRMP has validated that samples of 1 mg of oxide or larger are isotopically homogenous. Accordingly, NRMP does not guarantee uranium isotopic homogeneity for oxide samples smaller than 1 mg.

**Instructions for handling:** The material in the unit bottle is radioactive. This radioactive material should be handled only by qualified individuals. To minimize personnel exposure, appropriate facilities and personal protective equipment should be used. Refer to the Safety Data Sheet for further information.

**Traceability statement:** Certified isotope-amount fractions are traceable to the SI base unit of the mole. Certified isotope-mass fractions are traceable to the SI base units of the mole and the kilogram.

**Additional information:** The  $^{235}\text{U}$  and  $^{238}\text{U}$  abundance values were determined at NBS, Union Carbide Nuclear Company, Oak Ridge, Tennessee, and Goodyear Corporation, Portsmouth, Ohio; all values were given equal weight in the calculation of the certified value. NBS performed  $^{235}\text{U}/^{238}\text{U}$  measurements using a solid-sample thermal ionization mass spectrometer equipped with a Faraday cup detection system. The isotope ratios were corrected for mass discrimination effects by intercomparison with 50 % and 90 %  $^{235}\text{U}$  level SRMs. The  $^{235}\text{U}/^{238}\text{U}$  value for this standard, 10.375, is known to at least 0.1 %. The  $^{234}\text{U}$  and  $^{236}\text{U}$  abundances were determined at NBS by isotope dilution mass spectrometry using high-purity  $^{233}\text{U}$  as the spike.

This CRM was originally issued in 1970 by the National Bureau of Standards (NBS), now known as the National Institute of Standards and Technology (NIST), as Standard Reference Material (SRM) U-900. The measurements made at NBS leading to the certification were performed by E. L. Garner, L. A. Machlan, M.S. Richmond and W. R. Shields. In 1987, the technical and administrative transfer of NBS Special Nuclear SRMs to the New Brunswick Laboratory (NBL) CRM Program was coordinated by the NBS Office of Standard Reference Materials and N. M. Trahey, at NBL. In 2016 NBL transitioned to a program office within the Department of Energy and is now operating within the National Nuclear Security Administration (NNSA) as the Nuclear Reference Material Program (NRMP).

NOTE: NBS Special Publication 260-27 presents further details of the measurements made at NBS, which provided the basis for the certification, and is available from the NIST Office of Reference Materials.
