General Comment

Exporting resources will and can be a good thing to the company and country. However what it can also do is limit resources to the nearby population. By increasing exports of natural gas you are removing natural gas supply from the population of people, driving up natural gas prices when natural gas can be a required resource millions of people are dependent on to heat their homes, cook food, and other utilities.

1. If exports are being increased then there is going to be less available natural gas in the United States.
2. Less availability of natural gas will mean an increase in natural gas prices.
3. An increase in prices will mean people will be spending more money for a necessary resource, natural gas.
4. While natural gas can be used a commodity, often it is used to heat people's homes or to cook their food, and boil clean drinking water.

In conclusion, by increasing exports you are making Natural Gas more expensive for people who require it in the United States.
