Recovery Act: Nanoengineered Ultracapacitor Material Surpasses the $/kW Threshold for Use in EDVs

Chris Wheaton COO & CFO
EnerG2, Inc.
May 11, 2011

ARRAVT011

This presentation does not contain any proprietary, confidential, or otherwise restricted information
Overview

Design and build a factory for large-scale production of nano-engineered carbon materials

Timeline

- **Start**: April 2010
- **Target End**: March 2012
- ~35% Percent complete

Challenges

- **Phase I**: Finalize process design for scale
- **Phase II**: Ensure on time delivery of processing equipment
- **Phase III**: Resolve uncertainties surrounding a complex construction project
- **Phase IV**: Fine-tune process and equipment parameters

Budget

- **DOE Share**: $21.3 million
- **EnerG2 Share**: $7.4 million
- **Capital**: 77%
- **Operating**: 23%

Key Partners

- **Preliminary Design**: CH2M Hill, Portland, OR
- **Construction**: Fisher & Sons, Burlington, WA
- **Processing Equipment**:
  - Oregon Freeze Dry, Albany, OR
  - Harper Int’l, Lancaster, NY
  - Procedyne, New Brunswick, NJ
Relevance

Engineered Carbon Will Be the Key to Energy Storage
Relevance

• Technical Advancements and Unique Capabilities
  – EnerG2 NC-Series Electrode Carbon will result in a new generation ultracapacitor with significantly higher power density and much lower cost per kW
  – Enable the combining of ultracapacitors and batteries in EDVs to reduce capital and battery replacement costs while improving mileage efficiency and vehicle performance
  – The plant, when complete, will produce enough NC-Series electrode carbon to supply production of 60,000 EDVs annually

• Job Creation and Economic Growth
  – At least 50 jobs will be created or sustained in the Albany, Oregon area during the design, procurement and construction phases of this project.
  – Once the manufacturing facility is up and ready for production, it will employ at least 25 full-time positions to operate the facility.
  – When the plant is at full capacity, the headcount in the factory is expected to be at least 35 full-time employees with potentially more as final detailed designs are completed.
  – Expansion will further accelerate high-quality job creation
Relevance:
Tuned Pore Structures

We have the unique ability to tune the pore structure of the precursor and maintain that structure during manufacturing:
Our ability to engineer carbon pore distribution has enabled rapidly improved performance in our ultracapacitor carbon:
Relevance:

Unrivaled Purity

Because we start with pure precursors, EnerG2 carbon has less than 1/10th of the impurities that are found in other activated carbons.
Relevance: Exponential Storage

- Energy and Power increase with voltage squared
- Operating voltage is maxed at 2.7V for automotive
- Transition from 2.7 to 3.0V yields 23.4% increase in energy and power
- Transition to Li-ion V (3.7V) would nearly double energy and power density

![Graph showing relative energy and power density against operating voltage.]

### Key Activities

**Phase II – Equipment Procurement and Design Finalized**
- Design, specify and procure all processing equipment
- Complete process and material handling design to guide construction decisions

**Phase III – Construction**
- Hire subcontractors
- Mobilize for construction
- Demolition
- Construction
- Equipment installation
- Secure occupancy permits
- Hire initial contingency of operators

**Phase IV – Start-up**
- Tune equipment for specified process parameters
- Hire all remaining operations personnel
- Finish quality documentation and SOPs; train employees
- Commence operations
Summary

• Game-changing material will rapidly enhance energy storage technologies

• ARRA funds are helping to create a new industry in the United States

• New factory will create significant number of jobs and industrial growth in a region suffering from acute unemployment

• Cadre of domestic suppliers are helping to keep the project on time and on budget

• First products scheduled to be produced in Q1 2011, if not before
