OBJECTIVES

At the completion of this module, the technician will:

- understand the mandating of alternative fuel vehicles in the US
- understand the codes, regulation and guidelines concerning the use of hydrogen
- know where to look for additional information on hydrogen standards
9.1 Mandating of Alternative Fuel Vehicles In The U.S.

Alternative fuels for vehicles has been mandated through Federal and State laws in the US in response to the need to reduce air pollution, particularly in major cities. This section is a review of pertinent acts and regulations that were passed to instigate the development of alternative fuels for transportation uses. The following information is not all-inclusive since new acts, regulations and political initiatives continue to evolve.

9.1.1 Introduction

Air pollution is not a new problem in the nation or the world. In 1955, the Department of Health, Education and Welfare was authorized to begin a study of air pollution. Before this time, no one knew the extent to which automobiles contributed to the problem. By 1962, vehicle engines were determined to be responsible for over 40% of all airborne emissions—the single largest source of air pollution.

Legislation has been passed to mandate efforts to reduce these toxic and polluting emissions. A number of these regulations offer financial incentives to assist the transition to alternative fuel vehicles.

The major laws and policies are:

- Clean Air Act of 1963
- Alternative Motor Fuels Act of 1988
- Clean Air Act Amendments of 1990
- Federal Executive Order 12759-1991
- Federal Executive Order 12844-1993
- California Air Resource Board Regulations

9.1.2 The Clean Air Act, 1963

The U.S. Congress passed the original Clean Air Act (CAA) in 1963. This act required compliance with the National Ambient Air Quality Standards (NAAQS) by December 31, 1982. From then until the present, Congress has amended the act several times. Since the original Clean Air Act has failed to clean the air to the desired standard, Congress has made each new revision to the act more stringent.

9.1.2.1 1970 Clean Air Act Amendments

The Clean Air Act Amendments (CAAAs) of 1970 required that the concentration of pollutants in exhaust gases from transportation vehicles be reduced below the previously prescribed pollution limits. To ensure this
Hydrogen Fuel Cell Engines

MODULE 9: ACTS, CODES, REGULATIONS AND GUIDELINES

Key Points & Notes

reduction, specific emission standards for different types of vehicles were established under the Act for carbon monoxide, hydrocarbons, and oxides of nitrogen.

These amendments also required states that had areas in which pollutant concentrations exceeded the NAAQS (non-attainment areas) to develop State Implementation Plans (SIPs). These plans had to detail how the state planned to control emissions and reduce ambient air concentrations to the federally required levels.

9.1.2.2 1988 Clean Air Act Amendments

The 1988 amendments to the Clean Air Act were significant because they gave the Environmental Protection Agency (EPA) the power to enforce regulations such as:

- Withholding federal funds from states with non-attainment areas. These funds include federal grants, highway trust funds, and new sources of construction money.
- Preparing and enforcing a Federal Implementation Plan (FIP) where states have failed to develop an adequate SIP for attaining NAAQS.
- Requiring non-attainment states to have revised SIPs filed with the EPA by May, 1991. In 1991, nearly 100 urban areas still failed to comply with NAAQS for at least one automotive pollutant.
- Providing manufacturers with CAFE (Corporate Average Fuel Economy) incentives to develop alternative fueled vehicles.

9.1.2.3 1990 Clean Air Act Amendments

The 1990 Clean Air Act Amendments are among the most far-reaching environmental initiatives ever passed by the U.S. Congress, containing eleven separate titles under which the EPA issues regulations.

The 1990 CAAA Tier I standards began with vehicles produced in model year (MY) 1994. The proposed EPA phase-in for Tier I standards were:

<table>
<thead>
<tr>
<th>Year</th>
<th>Vehicles</th>
</tr>
</thead>
<tbody>
<tr>
<td>1994</td>
<td>40% of all new vehicles</td>
</tr>
<tr>
<td>1995</td>
<td>80% of all new vehicles</td>
</tr>
<tr>
<td>1996</td>
<td>100% of all new vehicles</td>
</tr>
</tbody>
</table>

Tier II standards are required for vehicles produced in MY 2004 and later. In order to reduce the amount of emissions from mobile sources, the only viable options are to reduce private travel or to use cleaner fuels and vehicles. Since it is nearly impossible to mandate a reduction in private travel, the Title II mobile source reduction program has three major components that deal with cleaner fuels and vehicles:

- Conventional gasoline and diesel powered vehicles sold throughout the U.S. after 1993 must meet tougher emission standards.
In the country’s nine smoggiest cities, all conventional gasoline must be replaced by reformulated gasoline. A program to promote the use of clean vehicular fuels as an alternative to gasoline is required.

The federal program also mandates that fleets in 22 urban non-attainment areas must purchase clean fuel vehicles along with a pilot alternative program for California.

The CAAA 1990 also extends the useful life requirements for passenger car emission control systems to comply with 5 years/50,000 miles to 10 years/100,000 miles. The law also establishes similar standards for all other types of vehicles.

From 1995 through 2005, the CAAA 1990 is estimated to result in 4.5 to 9.7 million vehicles operating on alternative fuels.

9.1.2.4 1990 CAAA—Fleet Requirements

Fleets covered by this mandate include those with 10 or more vehicles that are capable of central refueling. The following fleet types are excluded:

- emergency vehicles
- rental vehicles
- demonstration vehicles
- off-road vehicles
- privately garaged vehicles

The CAAA 1990 covers vehicles with weight classifications from zero to 26,000 pounds GVW (gross vehicle weight) and applies to fleets located in the serious, severe, and extreme ozone non-attainment areas with 1980 populations of over 250,000. It also includes vehicles in one CO non-attainment area—Denver. The air quality standards compliance deadlines for the 96 non-attainment areas with populations over 250,000 range from three to 20 years, depending on the severity of their air quality. The most polluted non-attainment areas have the longest amount of time to achieve compliance.

In Phase I of the program, the percentages of passenger cars and light-duty trucks (up to 6000 GVW), which must be clean fuel vehicles (CFVs) are:

- 30% by MY 1998
- 50% by MY 1999
- 70% by MY 2000

For heavy-duty trucks (above 8,500 GVW and below 26,000 GVW), 50% must be CFVs by MY 1998.

The 1990 CAAA allows fleet owners to earn credits from early or extra purchases of CFVs or by acquiring vehicles that are certified to stricter emission standards than required, beginning in MY 1998. These stricter emission standards can be met by purchasing new vehicles that meet the...
clean fuel fleet vehicle standards of LEV (low emission vehicle), ULEV (ultra low emission vehicle) or ZEV (zero emission vehicle), or by converting conventional vehicles to cleaner fuels, or by redeeming credits.

9.1.3 Alternative Motor Fuels Act, 1988 (AMFA)

The Alternative Motor Fuels Act of 1988 (AMFA) encourages the development and use of alternative transportation through the development and widespread use of natural gas, methanol, and ethanol as transportation fuels and the production of alternative fuel powered vehicles. Three programs have been established to fulfill this goal.

The **Alternative Light Duty Vehicle Program** requires the federal government to purchase a “practical number” of alternative fueled passenger automobiles and light-duty vehicles. These vehicles must be powered by natural gas, alcohol or dual energy and must be purchased from original equipment manufacturers (OEM). The Department of Energy is also designated to conduct studies between standard passenger automobiles/light-duty trucks and alternative fueled vehicles that compare fuel economy, safety, emissions, operating and maintenance cost, and performance in cold weather and at high altitude.

The **Truck Commercial Application Program** conducts commercial application projects for alternative fueled vehicles in real-world operation environments in cooperation with heavy-duty engine manufacturers and other federal agencies.

The **Alternative Fuels Bus Testing Program** assists state and local government agencies in comparison testing of natural gas and diesel buses in urban areas. These tests include emissions levels, durability, safety and fuel economy.

Data collected from these projects are submitted to the Alternative Fuels Data Center (AFDC) which is operated and managed by the National Renewable Energy Laboratory in Golden, Colorado. The data is available to the public on-line and through the National Alternative Fuels Hotline.

The Energy Policy Act of 1992 (EPACT) was designed to establish a firm energy policy for the United States to reduce America’s dependence on foreign oil and to increase energy security through the use of domestically produced alternative fuels. EPACT includes a combination of mandates, incentives, funding for research and development, public information dissemination, and purchasing requirements for alternative fueled vehicles for the nation’s largest fleets.

EPACT defines alternative fuels to include methanol, ethanol, natural gas, propane, hydrogen, coal-derived liquids, biological materials, electricity or any other fuel that the Secretary of Energy finds to be substantially not petroleum and that would yield substantial energy security benefits and
substantial environmental benefits. Under this definition traditional liquid fuels such as gasoline and diesel are not considered to be alternative fuels.

EPACT is designed to facilitate the development and implementation of alternative fuel technologies. Federal agencies and fuel providers (gas and electric utilities) are required to purchase AFVs beginning in fiscal year 1993. The law also encourages the purchase of more alternative fuel vehicles for federal fleets in order to accelerate the development of an OEM market. The goals for the following decade include:

- 5000 vehicles
- 7500 vehicles
- 10,000 vehicles
- 25% operating with clean fuels
- 33% operating with clean fuels
- 50% operating with clean fuels
- 75% operating with clean fuels

Executive Order No. 12448 (Nov. 1993) increased by 50% the number of alternative fuel vehicles mandated by the 1992 EPA for MY 1993-95.

EPACT also provides the following financial incentives:

- $25 million per year for transit and school bus fleets to develop a clean-fuels urban bus program.
- $30 million to provide low-interest loans.
- Income tax incentives including deductions from $2000 to $50,000 for buying clean-fuel vehicles.
- $100,000 for clean-fuel refueling stations.

The U.S. Department of Defense and other research and development institutions also receive financial support.
9.1.5 State Implementation Plan (SIP)

States with ozone non-attainment areas must include a Clean Fuel Vehicle Support Program that contains measures necessary to ensure the effectiveness of the Clean Fuel Vehicle Program established under Tier II of the 1990 CAAA. This program must be in their SIP.

9.1.6 California

9.1.6.1 California Federal Pilot Program, 1996

The California Pilot Program started in MY 1996. This program mandated the production and sale of 150,000 clean fuel vehicles (CFV) per year for model years 1996 through 1998. For model years 1999 and beyond, the mandate increased to 300,000 vehicles per year. In addition, other states may voluntarily opt into the program. Vehicles must comply with low emission vehicle (LEV) standards.

The California federal pilot program is postponed if the CFVs are not available from original equipment manufacturers. The fleet operators are permitted, but not required, to purchase vehicles converted by a non-OEM.

9.1.6.2 The California Air Resources Board (CARB)

California is the most proactive state in the U.S. for establishing stringent vehicle emission standards. The air quality in many regions in California is so poor that the California Air Resources Board decided not to wait until federal mandates take effect. The standards developed by CARB are more stringent than those called for by the CAAA. Many states have adopted or are adopting legislation similar to California’s. If standards have not been established by federal agencies pertaining to LPG kits and conversions, the standards adopted by the CARB are recommended. Refer to 1994 Progress.

9.1.6.3 California Non-Attainment Areas

The following California cities have been identified as non-attainment areas for ozone and/or carbon monoxide.
### Table 9-1 California Non-Attainment Areas

### Key Points & Notes

#### 9.1.6.4 California LEV Phase-In Program

California legislation allows Air Quality Management Districts (AQMDs) to mandate the purchase of LEVs by fleets having 10 or more vehicles if the state’s air quality standards are not met. The law also required retail fuel suppliers to provide 90 alternative fuel fueling locations by 1994 and 400 refueling locations by 1997. Passage of SB 135 in late 1991 required all passenger vehicles for hire in non-attainment areas to use alternative fuels. Twenty-five percent of vehicles purchased by the Department of General Services must be LEVs. AQMDs in non-attainment areas can mandate fleet purchases of LEVs.

A minimum number of LEVs, ULEVs, and ZEVs have been mandated for new car sales. The California LEV Phase-in program mandates the following percentage of vehicles for every model year.

Table 9-2 Mandated California Vehicle Types
9.2 Codes and Standards

Standards, rules, regulations and guidelines affecting alternative fuel vehicles are still changing. As a result, the following summary is not all-inclusive and may not reflect the most recent information. Transportation businesses for each country, state or county should have an understanding of the most recent codes and standards.

**US Department of Transportation (DOT) Regulations**

The US Department of Transportation establishes rules and regulations governing interstate transportation of materials. These regulations are covered by Title 49 of the Code of Federal Regulations (CFR), entitled Transportation. The DOT regulations have been adopted from specifications and regulations, which evolved from existing industry standards.

**National Fire Protection Agency (NFPA) Regulations**

The National Fire Protection Association (NFPA) is a non-profit, voluntary association devoted solely to fire prevention and safety. Since 1896, the NFPA has published guidelines for fire prevention, fire fighting procedures, and fire protection for many different industries. Motor vehicle fuel storage, fuel dispensing, and engine operation are covered by NFPA guidelines. These guidelines are generally accepted as minimum requirements.

The NFPA provides various services including fire prevention training programs for use in public education programs and technical publications on fire prevention and safety. One of the most important services provided by NFPA is the coordination of the development of fire safety codes for specific industries. The latest edition was published in 1995.

Your shop safety policy should reflect the appropriate local and state laws that apply. If there is no other standard to follow, refer to relevant National Fire Protection Association publication.

**9.2.1 Industrial Use Of Hydrogen**

Current codes, standards and guidelines for hydrogen were developed for industrial applications. The following list includes hydrogen-specific and related codes and standards used for a long time in industrial applications.

**9.2.1.1 U.S. Codes and Standards for Industrial Use of Hydrogen**

**American Petroleum Institute**

9.3 Hydrogen Publications

The Sourcebook for Hydrogen Applications

By the Canadian Hydrogen Association (CHA) and the National Hydrogen Association (NHA) for the Department of Natural Resources Canada and the U.S. Department of Energy. 1998.

This sourcebook is a single-volume reference on the safe use of hydrogen, including applicable codes, standards, regulations, guidelines and prevailing practices. It provides an outline of key safety considerations for non-industrial applications. A content outline is posted on the NHA website. The sourcebook comes as both paper and CD-ROM. It is available from the CHA, the NHA or the publisher:

Safety Standards for Hydrogen and Hydrogen Systems

By the National Aeronautics and Space Administration, Office of Mission Assurance, Washington, DC, NSS 1740.16, February 1997

These standards establish a “uniform agency process for hydrogen system design, materials selection, operation, storage and transportation.” It includes the minimum guidelines for NASA. For a copy, contact:

Director, Safety and Risk Management Division, NASA
Office of the Associate for Safety and Mission Assurance
Washington, DC 20546 USA. Phone 202-358-2406

This report presents a detailed review of the safety characteristics of a hydrogen-fueled fuel cell vehicle. Emphasis is given to on-board high-pressure gaseous hydrogen storage methods. The analysis includes the normal operation of a vehicle, its fueling, indoor storage, collisions and tunnel operation. The report identifies risks and failure modes with potential hazardous conditions, as well as potential countermeasures for prevention and harm reduction. The risks are compared to vehicles powered by gasoline, propane and natural gas. For a copy, contact:

9.5 Research Organizations

Contact the following organizations for more information on hydrogen powered and fuel cell vehicles:

**Alternative Fuels Data Center**
National Renewable Energy Laboratory
1617 Cole Blvd.
Golden, CO 80401-3393 USA
303-231-1288

**Daimler-Chrysler Corporation**
FFVs and NGVs
800 Chrysler Dr. East
Auburn Hills, MI 48326-2757 USA
313-576-4991

**Ford Motor Company**
Alternative Fuels Division
14310 Hamilton Ave.
Highland Park, MI 48203 USA
800-258-3835

**Gas Research Institute**
8600 Bryn Mawr Ave.
Chicago, IL 60631 USA
312-399-8170

**General Motors Corp.**
Alternative Fuels Division
30500 Mound Rd., ARMB 336
Warren, MI 48090 USA
313-986-5719

**Idaho National Environmental Engineering Laboratory**
Institute of Gas Technology
3424 S. State Street
Chicago, IL 60616-3896 USA
312-567-3877

**National Alternative Fuels Hotline**
P.O. Box 70879
Washington, DC 20024 USA
800-423-1363

**U.S. Department of Energy (DOE)**
Office of Domestic and Energy Policy
Mail Stop EP (PE-50)
1000 Independence Ave., SW
Washington, DC 25085 USA
