

# Integrated Virtual Lab in Supporting Heavy Duty Engine and Vehicle Emission Rulemaking

Byron Bunker, Houshun Zhang,  
Byungho Lee and Sodik Lee  
Environmental Protection Agency  
October 6, 2011

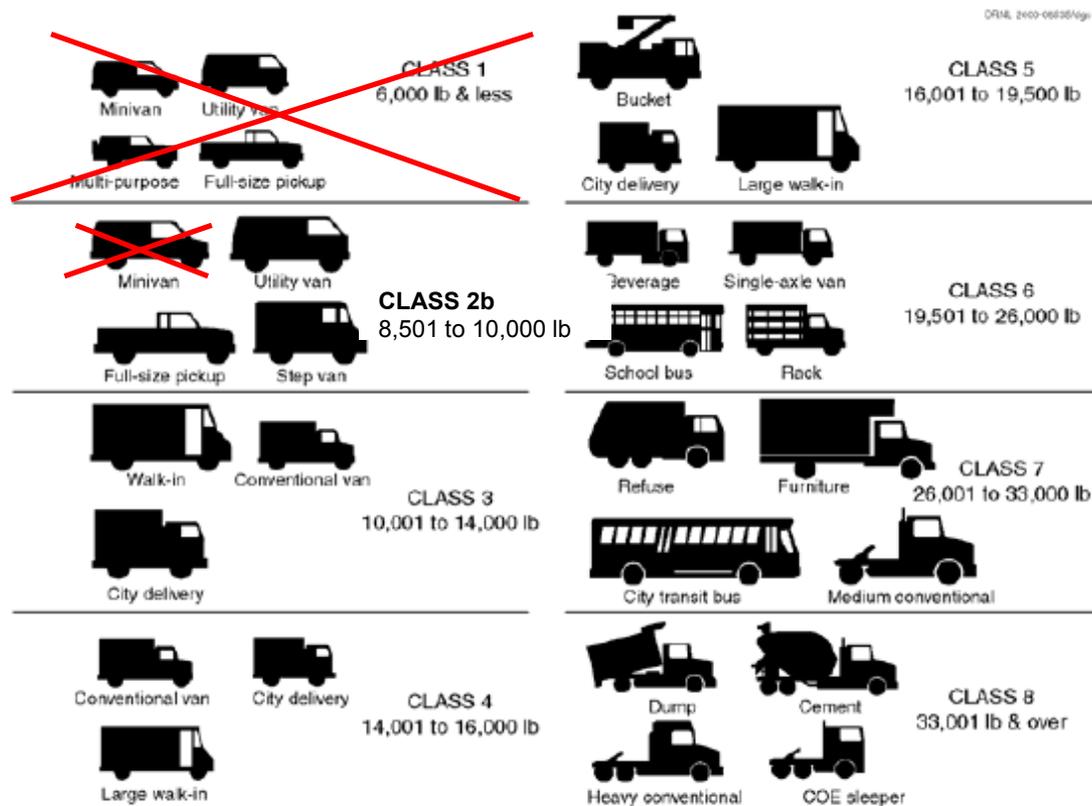

# Outline

- Greenhouse Gas Emission Regulation
- Agencies' Greenhouse Gas Emission Model (GEM)
- Integrated Virtual Lab
- Next Generation of GEM

# Medium & Heavy Duty Fuel Efficiency & GHG Rule

- ✓ First ever Medium- & Heavy-Duty Standards
- ✓ Allows manufacturers to produce a single fleet of vehicles to meet requirement
- ✓ Certifications for all vehicles except pickup and van will be conducted by the EPA simulation tool - GEM

# Greenhouse Gas Emission Model (GEM)

Energy Loss for 2010 Class 8 Trucks at 65 mph and 80,000 lb GVW

**Total Engine Loss**  
57-59%

**Aerodynamic Loss**  
15-22%

**Vehicle Auxiliary Loads**  
1-4%

**Drivetrain**  
2-4%

**Rolling Resistance**  
13-16%

EPA pre-specified

Allowed user inputs

**Greenhouse gas Emissions Model (GEM)**

Identification  
 Manufacturer Name: [ ] Vehicle Configuration: [ ] Date: 01-Jun-2011  
 Vehicle Family: [ ] Vehicle Model Year: 2013

Regulatory Subcategory  
 Class 8 Combination - Sleeper Cab - High Roof  
 Class 8 Combination - Sleeper Cab - Mid Roof  
 Class 8 Combination - Sleeper Cab - Low Roof  
 Class 8 Combination - Day Cab - High Roof  
 Class 8 Combination - Day Cab - Mid Roof  
 Class 8 Combination - Day Cab - Low Roof  
 Class 7 Combination - Day Cab - High Roof  
 Class 7 Combination - Day Cab - Mid Roof  
 Class 7 Combination - Day Cab - Low Roof  
 Heavy Heavy-Duty - Vocational Truck (Class 8)  
 Medium Heavy-Duty - Vocational Truck (Class 6-7)  
 Light Heavy-Duty - Vocational Truck (Class 2b-5)

Simulation Inputs  
 Coefficient of Aerodynamic Drag: 0.57  
 Steer Tire Rolling Resistance [kg/metric ton]: 6.54  
 Drive Tire Rolling Resistance [kg/metric ton]: 6.92  
 Vehicle Speed Limiter [mph]: 65  
 Vehicle Weight Reduction [lbs]: 400  
 Extended Idle Reduction: 5

Simulation Type  
 Single Configuration  
 Plot Output  
 Multiple Configurations

# Methodology and Motivation

- Certification tool must be capable of capturing all of the elements that are identified as important through chassis or engine dyno tests
- Systematic analytical tool box must be developed to serve the following goals
  - Identify and justify technology road maps
  - Provide reliable input parameters required by certification tool

# EPA Analytical Tool Box

- **Abundant testing data are available**
  - EPA steady and transient tests
  - Contractor chassis dyno tests and on-road vehicle tests
  - Various channels for data collection from industry

# Integrated Engine and Vehicle Model

**Greenhouse gas Emissions Model (GEM)**

# Case Study - Engine cycle simulations for Illustration Purpose

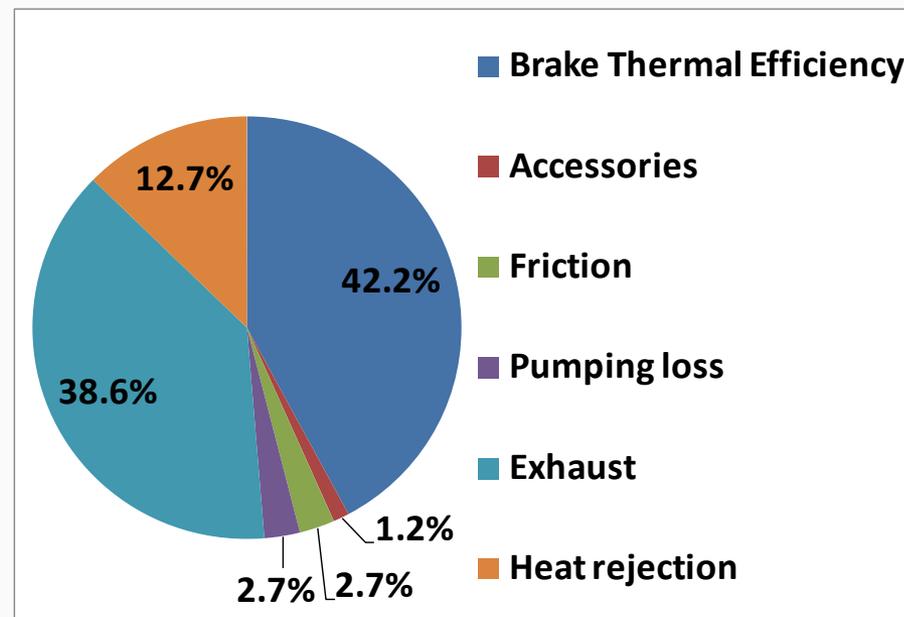

# Energy Balance in Different Methods

15L HD baseline engine: RPM = 1515 and BMEP = 17.3 bar

Control volume – entire engine

Control volume – cylinders

- Distribution of exhaust energy and heat rejection are quite different
- Difference in these losses signifies the importance of waste energy recovery
- It also shows strong interaction between heat rejection and exhaust energy
  - Improvement of heat rejection could translate increase of exhaust energy and pumping loss

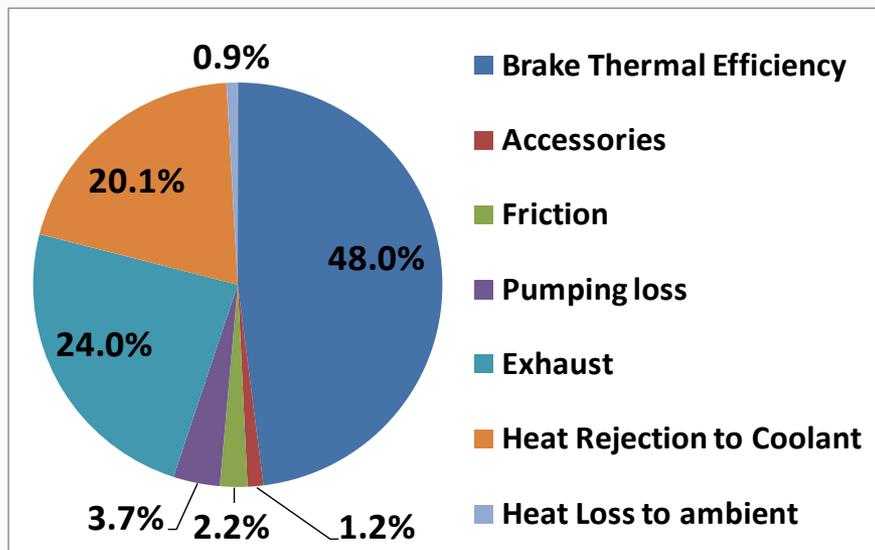

# Technology Identification for Improvement

- Potential technologies in 2020 time frame
  - Waste heat recovery (WHR)
    - Turbo compound or/and Rankine Cycle
  - Combustion optimization with more advanced fuel injection system and combustion concepts
  - Mild EGR rate
  - Back pressure reduction with more advanced aftertreatment system
  - Better insulation of cylinders and exhaust system
  - Higher turbocharger efficiency
  - Low parasitic loss and friction
  - Variable breathing system
- Synergy effects must be taken into consideration, since all technologies are not additive

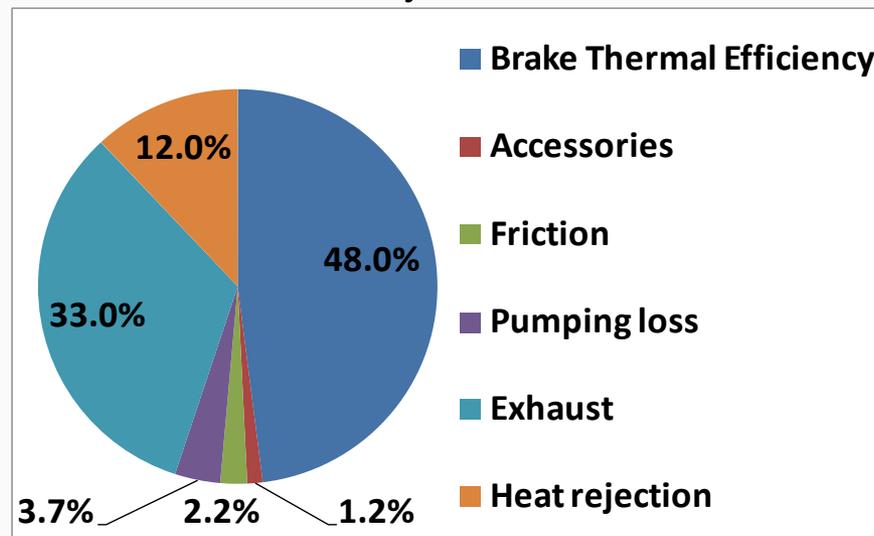

# Technology Identification and Justification

- Engine cycle simulations play critical roles in identifying the technology path with taking synergy effect into consideration
  - 15L HD baseline engine: RPM =1515 and BMEP = 17.3 bar
  - Engine only with turbo-compound

Control volume – entire engine

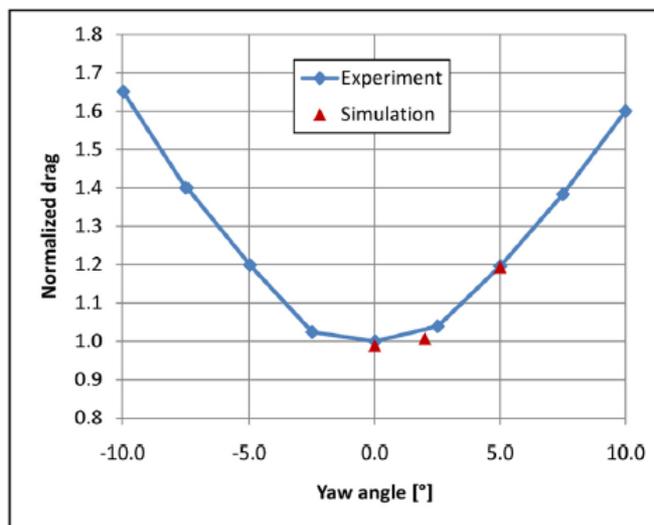

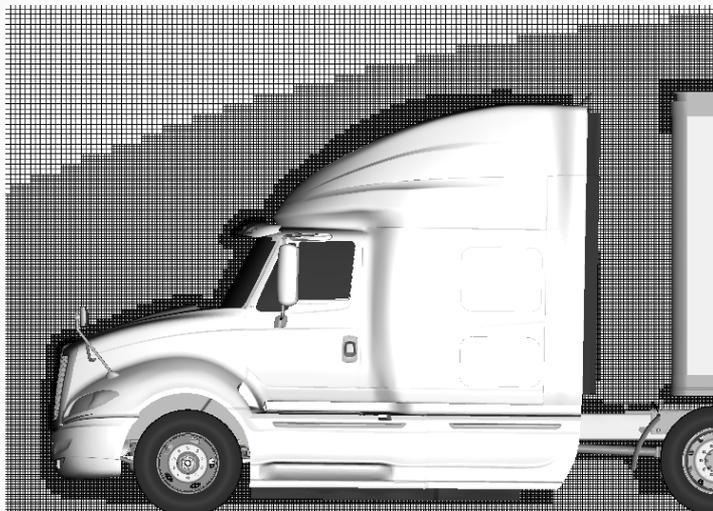

Control volume – cylinders

- Difference in heat rejection and exhaust energy between two approaches is significantly reduced, showing much lower heat rejection with more waste energy utilization
- Exhaust energy is still high, and other WHR must be used in order to approach 50% efficiency

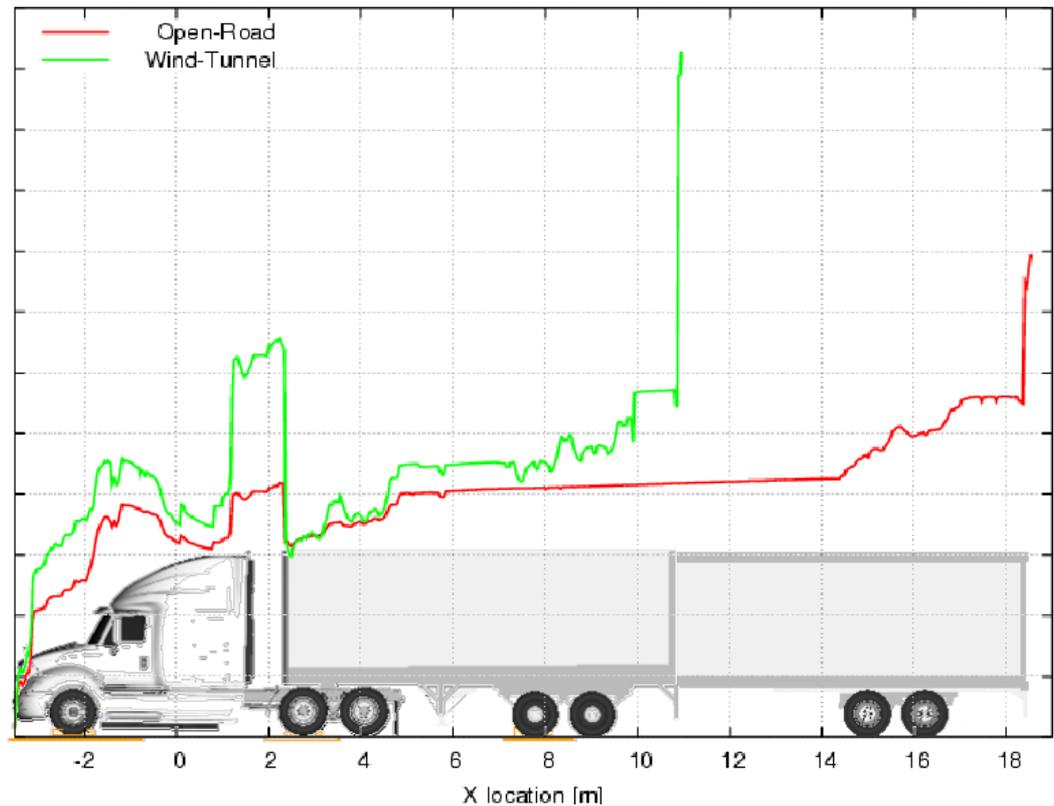

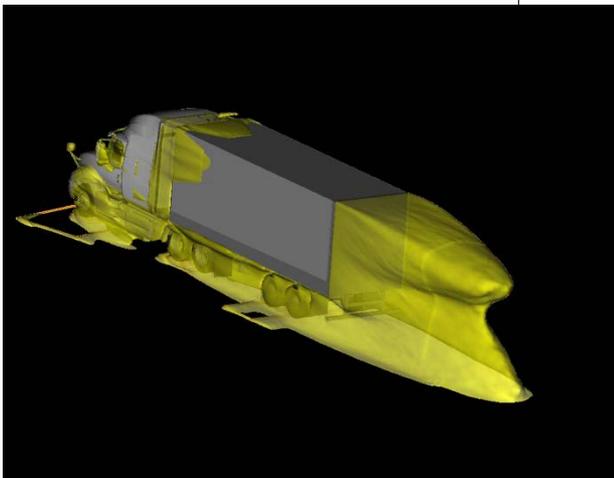

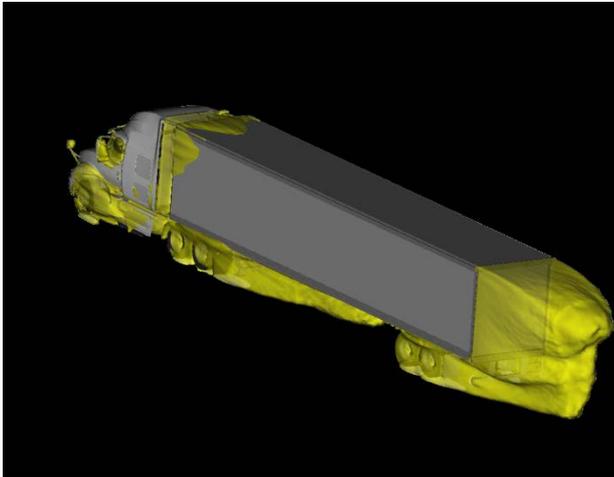

# More Comprehensive Supporting Tools

- Certification tool GEM requires aerodynamic drag coefficient ( $C_d$ ) as input
- 3D CFD is complementary to EPA specified testing approach, thus providing a powerful alternative to obtain  $C_d$
- The agency is actively evaluating different CFD approaches

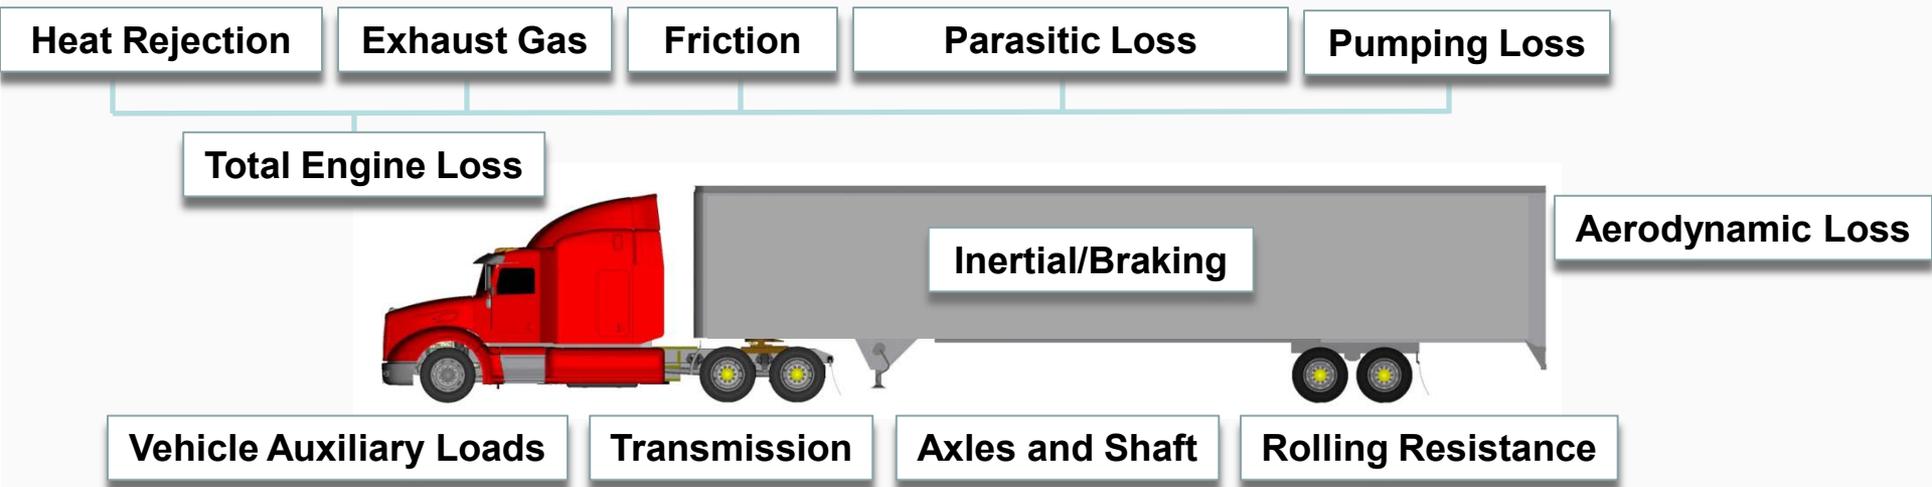

Wind Avg. Drag Coefficient

# Trailer Impacts on Aerodynamic Drag

# Next Generation GEM

- Certification will consider all possible means that can be realized in a chassis dyno cell in order to improve engine and vehicle efficiency
- GEM will continue evolving and improving, taking all losses or technologies into consideration that are identified as important
- The agency's integrated virtual lab provides the supporting base to accomplish the agency certification needs

# SuperTruck

A Systems Level Technology Development, Integration, and Demonstration for Efficient Class 8 Trucks

Goal: By 2015, a 50 percent improvement in freight efficiency (ton-miles per gallon) of Class 8 long-haul trucks compared to current models

**Trailer skirts**

*Reducing gap between tractor and trailer*  
*Tractor/trailer integration (major redesign)*  
**AERODYNAMICS**

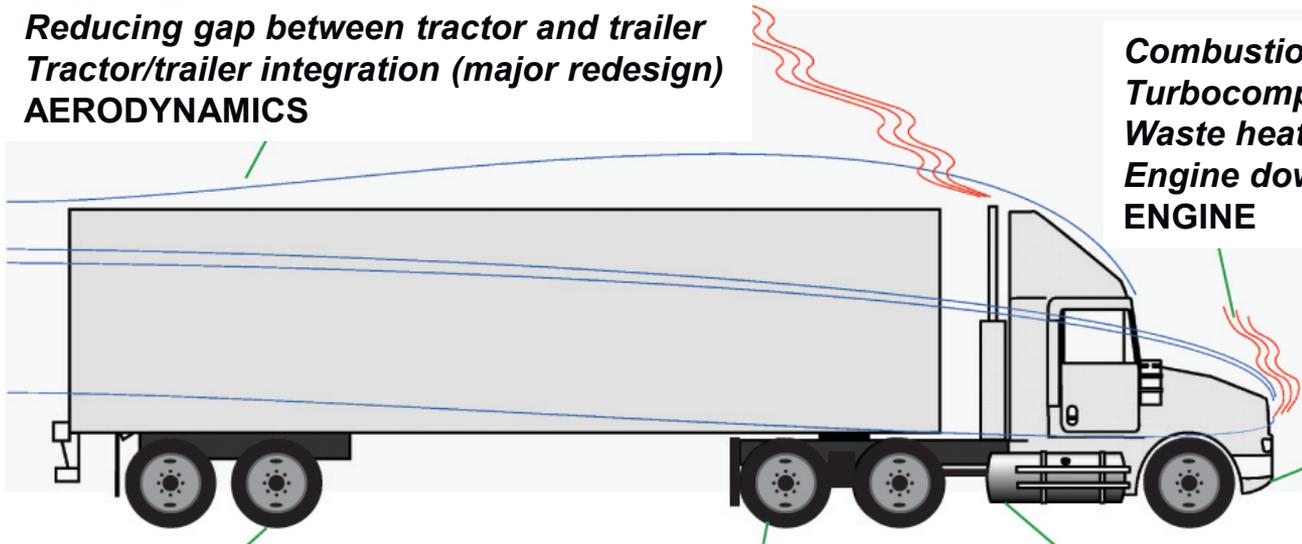

*Combustion improvements*  
*Turbocompounding*  
*Waste heat recovery*  
*Engine downsizing*  
**ENGINE**

**AUXILIARIES**  
*Electric accessories*  
*Idle reduction*

**ROLLING RESISTANCE**  
*Reduced rolling resistance tires*

**INERTIA/BRAKING**  
*Hybridization*

**DRIVETRAIN**  
*Reduced drivetrain friction*  
*Advanced transmission*

SuperTruck program lays out a foundation for next phase rulemaking
