Improving the Efficiency of Spark Ignited, Stoichiometric Natural Gas Engines

Dan Giordano
Sturman Industries

October 3rd, 2011

Poster Location P-09
Direction
Utilization of Camless Technology to Improve the Efficiency of a Stoichiometric Natural Gas Engine

- High geometric compression ratio with late intake valve closing
- Full camless head
- Unthrottled operation
- Cylinder deactivation
- 3-way catalyst for emissions control

Results

- Demonstrated BTE > 40%
- Composite BTE > 38% on 13-mode steady-state test
- Composite NO\textsubscript{x} emissions < 0.01 g/kW-hr

Work funded by the California Energy Commission PIER program (PIR-08-023)
