FISCAL YEAR 2011
ANNUAL PROGRESS REPORT FOR
ENERGY STORAGE R&D

January 2012

Approved by
David Howell, Hybrid Electric Systems Team Lead
Vehicle Technologies Program, Energy Efficiency and Renewable Energy
Table of Contents

I. INTRODUCTION ................................................................................................................................................................... 1
  I.A Vehicle Technologies Program Overview ............................................................................................................................................................................ 1
  I.B Energy Storage Research & Development Overview ................................................................................................................................. 1
    I.B.1 Programmatic Structure .................................................................................................................................................................................. 1
    I.B.2 Some Recent Highlights ................................................................................................................................................................................. 3
    I.B.3 Organization of this Report.............................................................................................................................................................................. 6
II. AMERICAN RECOVERY & REINVESTMENT ACT (ARRA) OF 2009 .................................................................................. 7
  II.A Integrated Battery Materials Production, Cell Manufacturing, and Battery Assembly Facilities .................................................................................. 11
    II.A.1 ARRA-supported Production Facility Project (Johnson Controls, Inc.) .................................................................................................................. 11
    II.A.2 Vertically Integrated Mass Production of Automotive Class Lithium-ion Batteries (A123Systems) .......................................................... 15
    II.A.3 ARRA-supported Production Facility Project (Exide Technologies) .............................................................................................................. 16
    II.A.4 ARRA-supported Production Facility Project (East Penn Manufacturing Co., Inc.) ................................................................. 20
  II.B Battery Cell and Pack Assembly Facilities ......................................................................................................................................................... 23
    II.B.1 ARRA-supported Production Facility Project (Dow Kokam MI, LLC) ............................................................................................................. 23
    II.B.2 ARRA-supported Production Facility Project - Li-Ion Battery Manufacturing (LG Chem Michigan Inc.) .......................................................... 25
    II.B.3 ARRA-supported Lithium-ion Cell Production and Battery Pack Assembly (EnerDel, Inc.) ............................................................. 28
    II.B.4 Li-Ion Battery Pack Manufacturing (General Motors, LLC) ......................................................................................................................... 31
    II.B.5 Lithium-ion Cell Production and Battery Pack Assembly (Saft America, Inc.) .......................................................................................... 34
  II.C Battery Materials Production Facilities ........................................................................................................................................................................ 36
    II.C.1 ARRA-supported Production Facilities (Celgard, LLC) ................................................................................................................................. 36
    II.C.2 Advanced Cathode Materials Production Facility (Toda America Inc.) ........................................................................................................... 39
    II.C.3 ARRA-supported Production Facility Project (Chemetall Foote Corp.) ........................................................................................................... 40
    II.C.4 High-Volume Manufacturing of LiPF6 - A Critical Lithium-ion Battery Material (Honeywell) ................................................................. 42
    II.C.5 Construction of a Li-ion Battery Cathode Production Plant (BASF) ............................................................................................................ 45
    II.C.6 ARRA-supported Nanoengineered Ultracapacitor Material Production Facility Project (EnerG2, Inc.) ......................................................... 46
    II.C.7 ARRA-supported Production Facility Project (Novolyte Technologies) ......................................................................................................... 48
    II.C.8 ARRA-supported Production Facility Project (FutureFuel Chemical Company) ................................................................................................ 50
    II.C.9 ARRA-supported Production Facility Project (Pyrotek Incorporated) ........................................................................................................... 53
    II.C.10 Manufacture of Advanced Battery Components (HTTM LLC, H&T, Trans-Matic) ................................................................................ 56
  II.D Battery Recycling Facilities ....................................................................................................................................................................................... 59
    II.D.1 ARRA-supported Production Facility Project (Toxco, Inc.) ............................................................................................................................... 59
  II.E Battery Research Facilities ..................................................................................................................................................................................... 61
    II.E.1 ARRA-supported Prototype Cell Fabrication Facility (ANL) ......................................................................................................................... 61
    II.E.2 ARRA-supported Material Scale-Up Facility (ANL) ........................................................................................................................................... 63
    II.E.3 Post-test Laboratory Facility (ANL) ................................................................................................................................................................. 66
    II.E.4 High-Energy Battery Testing Facility (INL) .................................................................................................................................................... 69
    II.E.5 Battery Thermal Test Laboratory (NREL) .................................................................................................................................................. 72
    II.E.6 Battery Abuse Test Facility (SNL) ................................................................................................................................................................. 75
III. ADVANCED BATTERY DEVELOPMENT, SYSTEMS ANALYSIS, AND TESTING ............................................................................. 77
  III.A Advanced Battery Development .............................................................................................................................................................................. 80
    III.A.1 High Energy/EV Systems ................................................................................................................................................................................. 83
III.A.1.1 EV Battery Development (Envia Systems) ................................................................. 83
III.A.1.2 EV Battery Development (Cobasys) ................................................................. 88
III.A.1.3 Development of High Performance Advanced Batteries for Electric Vehicle Applications (Quallion) ................................................................. 92
III.A.2 High Energy/PHEV Systems ................................................................. 95
III.A.2.1 Advanced High-Performance Batteries for Plug-In Hybrid Electric Vehicle Applications (JCI) ................................................................. 95
III.A.2.2 Development of a High-Performance PHEV Battery Pack (LG Chem, Michigan) ................................................................. 101
III.A.2.3 PHEV Battery Development (A123 Systems) ................................................................. 103
III.A.3 High Power/HEV and LESS Systems ................................................................. 108
III.A.3.1 HEV LESS Battery Development (A123 Systems) ................................................................. 108
III.A.3.2 LESS Battery Development (Maxwell) ................................................................. 113
III.A.3.3 Capacitor Development (NSWC) ................................................................. 117
III.A.4 Technology Assessment Programs ................................................................. 122
III.A.4.1 EV Technology Assessment Program (SK Energy) ................................................................. 122
III.A.4.2 EV Technology Assessment Program (K2 Energy) ................................................................. 123
III.A.4.3 EV Technology Assessment Program (Leyden Energy) ................................................................. 124
III.A.4.4 LESS Technology Assessment Program (Actacell) ................................................................. 125
III.A.5 Development of Advanced Lithium-ion Battery Cell Materials ................................................................. 126
III.A.5.1 Next Generation Battery Materials (Amprius) ................................................................. 126
III.A.5.2 Development of Large Format Lithium-Ion Cells with Higher Energy Density (Dow Kokam, LLC) ................................................................. 128
III.A.5.3 Innovative Cell Materials and Designs for 300 mile range EVs (Nanosys) ................................................................. 130
III.A.5.4 High Energy Novel Cathode / Alloy Automotive Cell (3M) ................................................................. 132
III.A.5.5 Low Cost Manufacturing of High Capacity Prismatic Li-Ion Cell Alloy Anodes (Applied Materials) ................................................................. 135
III.A.5.6 Solid Polymer Batteries for Electric Drive Vehicles (Seeo, Inc.) ................................................................. 136
III.A.5.7 Development of High-Energy Lithium Sulfur Cells (PSU) ................................................................. 138
III.A.6 Low-cost Processing ................................................................. 140
III.A.6.1 Advanced Manufacturing Process to Reduce Manufacturing Cost of Li-ion Cells (JCI) ................................................................. 140
III.A.6.2 Ultraviolet and Electron Beam curing technology to reduce electrode manufacturing cost (Miltec UV International) ................................................................. 143
III.A.6.3 Dry Process Electrode Fabrication (A123Systems) ................................................................. 145
III.A.7 Inactive Materials/Components Reduction Techniques ................................................................. 147
III.A.7.1 Innovative Manufacturing and Materials for Low Cost Lithium Ion Batteries (Optodot Corporation) ................................................................. 147
III.A.7.2 Stand Alone Battery Thermal Management System (Denso) ................................................................. 149
III.B Advanced Materials and Processing ................................................................. 152
III.B.1 Multifunctional, Inorganic-Filled Separator Development for Large Format Li-ion Batteries (ENTEK Membranes, LLC) ................................................................. 152
III.B.2 Advanced Negative Electrode Materials for PHEV Li-Ion Batteries (3M) ................................................................. 155
III.B.3 Stabilized Lithium Metal Powder (SLMP®), Enabling Material and Revolutionary Technology for High Energy Li-ion Batteries (FMC) ................................................................. 159
III.B.4 Protection of Lithium (Li) Anodes Using Dual Phase Electrolytes (Sion Power) ................................................................. 163
III.B.5 Process for Low-Cost Domestic Production of LIB Cathode Materials (BASF) ................................................................. 170
III.B.6 Hybrid Nano Carbon Fiber/Graphene Platelet-Based High-Capacity Anodes for Lithium-Ion Batteries (Angstron) ................................................................. 174

IV.B.2.4 Functionalized Surface Modification Agents to Suppress Gassing Issue of Li4Ti5O12-Based
Lithium-Ion Chemistry (ANL) .................................................................................................................. 321
IV.B.3 Applied Battery Research on Cathodes .............................................................................................. 325
IV.B.3.1 Engineering of High Energy Cathode Material (ANL) ................................................................. 325
IV.B.3.2 Developing New High Energy Gradient Concentration Cathode Material (ANL) ......................... 330
IV.B.3.3 Design and Evaluation of Novel High Capacity Cathode Materials (ANL) ................................... 334
IV.B.3.4 Novel Composite Cathode Structures (ANL) ............................................................................... 339
IV.B.3.5 Development of High-Capacity Cathode Materials with Integrated Structures (ANL) ......... 345
IV.B.3.6 Cathode Processing Comparison Study (ANL) ............................................................................. 349
IV.B.4 Applied Battery Research on Electrolytes ......................................................................................... 354
IV.B.4.1 Novel Electrolytes and Electrolyte Additives for PHEV Applications (ANL) ................................. 354
IV.B.4.2 Develop Electrolyte Additives (ANL) .............................................................................................. 359
IV.B.4.3 High Voltage Electrolyte for Lithium-ion Battery (ANL) ............................................................ 364
IV.B.4.4 High Voltage Electrolytes for Li-ion Batteries (ARL) ................................................................... 369
IV.B.4.5 Development of Novel Electrolytes for Use in High Energy Lithium-Ion Batteries with Wide
Operating Temperature Range (JPL) ........................................................................................................... 375
IV.B.4.6 Novel Phosphazene-Based Compounds to Enhance Electrolyte Safety and Stability for High
Voltage Applications (INL) ....................................................................................................................... 382
IV.C Calendar and Cycle Life Studies ........................................................................................................... 388
IV.C.1 Diagnostics and Modeling .................................................................................................................. 388
IV.C.1.1 Electrochemistry Cell Model (ANL) ................................................................................................. 388
IV.C.1.2 Battery Design Modeling (ANL) ..................................................................................................... 393
IV.C.1.3 Diagnostic Studies on Li-Battery Cells and Cell Components (ANL) ............................................. 398
IV.C.1.4 Structural Investigations of Layered Oxide Materials for PHEV Applications (ANL) ................. 403
IV.C.1.5 Electrochemistry Diagnostics of Baseline and New Materials (LBNL) ......................................... 408
IV.C.1.6 Mechanistic, Molecular, and Thermodynamic Modeling/Diagnostics in support of ABR Cell
Performance and Aging Studies (INL) ........................................................................................................ 412
IV.C.1.7 Mechanistic, Molecular, and Thermodynamic Modeling/Diagnostics in support of ABR Cell
Performance and Aging Studies (ORNL) .................................................................................................... 417
IV.C.2 Cell Fabrication and Testing ............................................................................................................. 421
IV.C.2.1 Fabricate PHEV Cells for Testing & Diagnostics (ANL) ............................................................... 421
IV.C.2.2 Baseline PHEV Cell Life Testing (ANL) ........................................................................................ 426
IV.D Abuse Tolerance Studies ...................................................................................................................... 429
IV.D.1 Abuse Diagnostics ............................................................................................................................... 429
IV.D.1.1 Diagnostic Studies Supporting Improved Abuse Tolerance (BNL) .................................................. 429
IV.D.2 Abuse Mitigation ................................................................................................................................. 436
IV.D.2.1 Develop & Evaluate Materials & Additives that Enhance Thermal & Overcharge Abuse (ANL) ... 436
IV.D.2.2 Impact of Materials on Abuse Response (SNL) ............................................................................ 442
IV.D.2.3 Overcharge Protection for PHEV Cells (LBNL) .......................................................................... 447
IV.E Applied Research Facilities .................................................................................................................. 452
IV.E.1 Battery Materials Pilot Production Facility ......................................................................................... 452
IV.E.1.1 Process Development and Scale up of Advanced Cathode Materials (ANL) ................................. 452
IV.E.1.2 Process Development and Scale-up of Advanced Electrolyte Materials (ANL) ........................... 456
IV.E.2 Post-Test Diagnostics Facility ........................................................................................................... 458
IV.E.2.1 Post-Test Diagnostics Facility: Instrumentation and Protocol Development Activities (ANL) ..... 458
V. FOCUSED FUNDAMENTAL RESEARCH ................................................................................................................... 466

V.A Introduction ............................................................................................................................................................. 467

V.B Cathode Development ............................................................................................................................................. 470

V.B.1 First Principles Calculations and NMR Spectroscopy of Electrode Materials (MIT, SUNY) ... 470
V.B.2 Cell Analysis, High-energy Density Cathodes and Anodes (LBNL)... 475
V.B.3 Olivines and Substituted Layered Materials (LBNL) ................................................................................. 478
V.B.4 Stabilized Spinels and Nano Olivines (U. Texas) ........................................................................................... 483
V.B.5 The Synthesis and Characterization of Substituted Olivines and Manganese Oxides (SUNY) .......... 488
V.B.6 Cell Analysis-Interfacial Processes: SEI Formation and Stability on Cycling (HQ) ........................................ 492
V.B.7 The Role of Surface Chemistry on the Cycling and Rate Capability of Lithium Positive Electrode Materials (MIT) ......................................................................................................................... 495
V.B.8 Characterization of New Cathode Materials using Synchrotron-based X-ray Techniques and the Studies of Li-Air Batteries (BNL, U. Mass) .................................................................................................................................................. 503
V.B.9 Layered Cathode Materials (ANL) ................................................................................................................... 508
V.B.10 Development of High Energy Cathode (PNNL) ............................................................................................. 513
V.B.11 Crystal Studies on High-energy Density Cathodes (LBNL) ............................................................................. 518
V.B.12 Developing Materials for Lithium-Sulfur Batteries (ORNL) ........................................................................ 524
V.B.13 Studies on the Local State of Charge (SOC) and Underlying Structures in Lithium Battery Electrodes (ORNL) ...................................................................................................................................................... 529
V.B.14 New Cathode Projects (LBNL) ..................................................................................................................... 533

V.C Anode Development ................................................................................................................................................ 535

V.C.1 Nanoscale Composite Hetero-structures: Novel High Capacity Reversible Anodes for Lithium-ion Batteries (U Pitt) ......................................................................................................................................................... 535
V.C.2 Interfacial Processes – Diagnostics (LBNL)........................................................................................................ 540
V.C.3 Search for New Anode Materials (UTA) ............................................................................................................. 545
V.C.4 Nano-structured Materials as Anodes (SUNY) .................................................................................................... 548
V.C.5 Development of High Capacity Anodes (PNNL) .............................................................................................. 551
V.C.6 Advanced Binder for Electrode Materials (LBNL) ............................................................................................. 555
V.C.7 Three-Dimensional Anode Architectures and Materials (ANL) ........................................................................ 560
V.C.8 Metal-Based High-Capacity Li-Ion Anodes (SUNY) .......................................................................................... 564
V.C.9 New Layered Nanolaminates for Use in Lithium Battery Anodes (Drexel U) .................................................. 567
V.C.10 Atomic Layer Deposition for Stabilization of Amorphous Silicon Anodes (NREL, U Col) ...................... 571
V.C.11 Synthesis and Characterization of Si/SiOx-Graphene Nanocomposite Anodes and Polymer Binders (PSU) ................................................................................................................................................... 576
V.C.12 Synthesis and Characterization of Silicon Clathrates for Anode Applications in Lithium-Ion Batteries (SwRI) .................................................................................................................................................... 580
V.C.13 Wiring Up Silicon Nanoparticles for High-Performance Lithium-Ion Battery Anodes (Stanford U) .......... 585
V.C.14 Hard Carbon Materials for High-Capacity Li-ion Battery Anodes (ORNL) .................................................... 590

V.D Electrolyte Development ........................................................................................................................................ 593

V.D.1 Polymer Electrolytes for Advanced Lithium Batteries (UC, Berkeley) .......................................................... 593
V.D.2 Interfacial Behavior of Electrolytes (LBNL) ........................................................................................................ 597
V.D.3 Molecular Dynamics Simulation Studies of Electrolytes and Electrolyte/Electrode Interfaces (Univ Utah) .......................... 602
V.D.4 Bi-functional Electrolytes for Lithium-ion Batteries (CWRU) ......................................................................... 605
V.D.5 Advanced Electrolyte and Electrolyte Additives (ANL) ................................................................. 609
V.D.6 Inexpensive, Nonfluorinated (or Partially Fluorinated) Anions for Lithium Salts and Ionic Liquids for Lithium Battery Electrolytes (NCSU) ................................................................. 612
V.D.7 Development of Electrolytes for Lithium-ion Batteries (URI) ....................................................... 616
V.D.8 Sulfones with Additives as Electrolytes (ASU) .................................................................................. 621
V.D.9 Long-lived Polymer Electrolytes (ORNL) ......................................................................................... 625
V.E Cell Analysis, Modeling, and Fabrication ............................................................................................... 628
V.E.1 Electrode Fabrication and Failure Analysis (LBNL) ........................................................................ 628
V.E.2 Modeling-Thermo-electrochemistry, Capacity Degradation and Mechanics with SEI Layer (UM) .... 632
V.E.3 Intercalation Kinetics and Ion Mobility in Electrode Materials (ORNL) ............................................... 636
V.E.4 Modeling – Mathematical Modeling of Next-generation Li-ion Chemistries (LBNL) ....................... 641
V.E.5 Analysis and Simulation of Electrochemical Energy Systems (LBNL) ................................................. 644
V.E.6 Investigation of Critical Parameters in Li-ion Battery Electrodes (LBNL) .......................................... 647
V.E.7 Modeling - Predicting and Understanding New Li-ion Materials Using Ab Initio Atomistic Computational Methods (LBNL) .............................................................. 651
V.E.8 New Electrode Designs for Ultra-high Energy Density (MIT) ............................................................. 654
V.E.9 In Situ Electron Spectroscopy of Electrical Energy Storage Materials (ORNL) ............................ 658
V.F Energy Frontier Research Centers ......................................................................................................... 661
V.F.1 Energy Frontier Research Center at ANL (ANL) ................................................................................ 661
V.F.2 Novel In Situ Diagnostics Tools for Li-ion Battery Electrodes (LBNL) .................................................. 666
V.G Integrated Lab-Industry Research Program (LBNL, ANL) ................................................................. 670
Appendix A: List of Contributors and Research Collaborators .................................................................. 676
Appendix B: Acronyms ................................................................................................................................. 683
List of Figures

Figure II - 1: American Recovery and Reinvestment Act (ARRA) 2009 grants distribution for battery and electric drive manufacturing ................................................................................................................................. 9

Figure II - 2: Michigan Li-ion battery plant during construction – 1000 construction workers were employed in the construction of our Michigan plant. ......................................................................................................................................................... 13

Figure II - 3: Construction included the upfit of an existing building for Li-ion battery production, including the construction of new outbuildings to house equipment and materials. ................................................................................................................................................................. 13

Figure II - 4: This project helped fund the material characterization and test facilities that are critical to support advanced energy production programs. ......................................................................................................................................................... 13

Figure II - 5: Johnson Controls’ facilities include the equipment necessary to perform all relevant battery and cell tests, including cycle testing in controlled temperature environments. ............................................................................................................................................ 13

Figure II - 6: Pilot scale equipment installed in controlled environments support the mass production programs. .......... 13

Figure II - 7: Equipment – Pack assembly was up and running within 10 months of receiving the award from the Department of Energy................................................................................................................................................................. 14

Figure II - 8: Complete battery packs and systems are assembled domestically prior to being sent to the customer........ 14

Figure II - 9: The Ford Transit Connect Electric features a 28 kWh Li-ion pack that was built in our Michigan plant...... 14

Figure II - 10: Livonia Cell Assembly Line........................................................................................................................................................................................................................................................................................................................................... 15

Figure II - 11: New State-of-the-Art AGM Battery Assembly Operation in Columbus, Georgia Exide Battery Plant....... 16

Figure II - 12: New World-Class Continuous Plate Manufacturing Operation in Columbus, Georgia Exide Battery Plant. 17

Figure II - 13: Optimized Lead Plate Curing Operation in Columbus, Georgia Exide Battery Plant. ............................................ 17

Figure II - 14: Significant Additional Production Capacity in Battery Formation Department – Columbus, Georgia Exide Battery Plant. ........................................................................................................................................................................... 17

Figure II - 15: Product Validation Trial Production has begun on the New Advanced AGM Battery Assembly Expansion Line – Columbus, Georgia Exide Battery Plant. ............................................................................................................................................ 17

Figure II - 16: Empty Building Site was readied for the New Advanced AGM Spiral Wound Battery Production Equipment. ............................................................................................................................................. 18

Figure II - 17: New High Purity Lead Oxide Manufacturing Operation in the new AGM area in the Bristol, Tennessee Exide Battery Plant. ......................................................................................................................................... 18

Figure II - 18: State of the Art Grid Manufacturing Operation in the new AGM Battery Operation in Bristol, Tennessee Exide Plant. ......................................................................................................................................... 18

Figure II - 19: Automated Spiral Wound Plate Manufacturing Line in New Advanced AGM Battery Area in Bristol, Tennessee Exide Plant. ............................................................................................................................................... 19

Figure II - 20: Overall View of new AGM Battery Production area in Bristol, Tennessee Exide Battery Plant. .......... 19

Figure II - 21: Facility 1 – Automotive Battery Plant A4 Equipment .................................................................................. 21

Figure II - 22: Facility 2 – Injection Molding Plants IM1/IM2 Equipment ........................................................................... 21

Figure II - 23: UltraBattery Test Vehicle (on site at East Penn Mfg). ..................................................................................... 22

Figure II - 24: Midland, Michigan Manufacturing Facility – Dow Kokam, LLC ................................................................. 23

Figure II - 25: Midland, Michigan Manufacturing Facility – Dow Kokam, LLC (cont’d) ......................................................... 24

Figure II - 26: LG Chem, MI, Production Facility – Street View – Street View – Front of Main Building (1st Qtr. 2011).......... 26

Figure II - 27: LG Chem, MI, Production Facility – Street View – Rear (Electrode Building on Left) (1st Qtr. 2011)....... 26

Figure II - 28: LG Chem, MI, Production Facility – Arial View of Entire Facility (October, 2011)................................. 26

Figure II - 29: LG Chem, MI, Production Facility – Pre-Aging Area Equipment ................................................................. 26

Figure II - 30: LG Chem, MI, Production Facility – Formation Area Equipment ................................................................. 27

Figure IV - 130: HAADF-STEM image of Li1.2Co0.4Mn0.4O2, that reveal the coexistence of Li2MnO3-like (dot contrast) and LiCoO2-like (continuous contrast) areas within (0001) transition metal planes. ................................................................. 404
Figure IV - 131: (a) Schematic model structure of TM plane in Li1.2Co0.4Mn0.4O2 showing coexistence of Co and LiMn2 domains. Big blue and magenta spheres represent Co and Mn atoms, respectively; small yellow spheres represent Li atoms. In-plane sections of the rhombohedral (R) and monoclinic (M) unit cells are indicated in the figure. Periodic boundary conditions connect the top and left edges of the figure with the bottom and right edges, respectively. Therefore, the particular model shown contains only one Co and two LiMn2 separate clusters. Additionally, projected atomic columns along <1-100> (e.g. left to right) contain approximately equal amounts of Co and X atoms, where X varies across columns following a Mn-Mn-Li sequence consistent with STEM results. (b) Illustration of the early stages of model generation showing one LiMn2 and one Co cluster randomly placed on the board. Empty sites are indicated by faded colors. .................................................................................... 405

Figure V - 162: Specific capacity of LiNi$_{0.3}$Mn$_{0.7}$O$_2$ cells containing standard electrolyte and added LiBOB .............. 617
Figure V - 163: First charge-discharge curve for LiPF4(C2O4) and LiPF6 electrolytes.......................................................... 618
Figure V - 164: XPS analysis of graphite/LiFePO$_4$ cells. ......................................................................................................................................................................................................................... 618
Figure V - 165: Cycling performance of graphite/LiNi$_{0.3}$Co$_{0.7}$Mn$_{0.7}$O$_2$ cells with different electrolytes.................. 619
electrode is taken to 50% SOC from either the fully-charged state (black line) or from the fully-discharged state (red line).

Figure V - 199: Model results that show a difference in rate capability depending on the previous cycling history.

Figure V - 200: Calculated stress in graphite active material (AM) and PVdF binder (B) as a function of discharge.

Energy Storage R&D xxviii FY 2011 Annual Progress Report
Figure V - 201: Steady-state current vs. voltage after different lengths of passivation holds. Markers are measurements, dashed lines are model fits. Both the exchange current density \( i_0 \) and the through-film limiting current \( i_{\text{lim}} \) decrease. Data is measured at 900 rpm with 1.1 mM ferrocene/ferrocenium hexafluorophosphate. .......................................................... 645

Figure V - 202: Nyquist plot of electrode after different lengths of passivation holds. The high-frequency peak depends on passivation time, but the low-frequency peak does not. ........................................................................................................................................................................ 645

Figure V - 204: Comparison of through-film ferrocene impedance on the edge and basal planes of graphite. .......................... 646

Figure V - 205: (Left bottom) Bright field image of a LiNi_{0.5}Mn_{1.5}O_{4} particle containing different crystallites. (Left top) Electron diffraction patterns of each crystallite, showing the structure of a rock salt and a spinel phase, respectively. (Right) First cycle of a LiNi_{0.5}Mn_{1.5}O_{4} made at 900°C (red) and 1000°C (black). .......................................................... 649

Figure V - 206: (Top) \( \mu \)-XAS map of NiO electrodes reduced halfway at C/20 and 1C rate. (Bottom) %Ni^{3+} resulting from the linear combination fit of XANE spectra at different points on the map. .................................................................................. 650

Figure V - 207: The voltage profiles for ordered (red) and 4 different disordered’ (yellow, green, blue and magenta) versions of Li_{x}(Ni_{0.5}Mn_{1.5})O_{4}. ........................................................................................................ 652

Figure V - 208: Tuning the Li-C absorption energy as a function of Li content using the Grimme vdW formulation. ......... 655

Figure V - 209: Announcement of the Materials Project www.materialsproject.org ...................................................... 653

Figure V - 210: Cross-sections of directionally freeze-cast and sintered LiCoO\(_2\) electrodes, viewed parallel to the solidifying ice front. The left panels show additive-free samples freeze-dried at 5 and 1°C/min, in which the slower freezing rate is seen to produce greater uniaxial alignment of porosity. The right panels show the effects of 5 wt% ethanol and sugar additive, which respectively produce coarser and finer aligned microstructures. .................. 655

Figure V - 211: Cross-section of directionally freeze-cast and sintered LiNi_{0.5}Mn_{1.5}O_{4}. ............................................. 655

Figure V - 212: Specific capacity vs. C-rate for sintered LiCoO\(_2\) electrodes prepared with and without aligned low-tortuosity porosity. ........................................................................................................ 656

Figure V - 213: SEM micrograph of a MEMS-based silicon microchip used to enclose the liquid electrolyte. 659

Figure V - 214: Experimental setup of the in situ electrochemical cell TEM holder, microfluidic syringe pump to deliver liquid electrolyte to the cell and potentiostat for electrochemical testing. ........................................................................................................ 659

Figure V - 215: a) SEM micrograph of battery electrodes (HOPG anode and LiCoO\(_2\) cathode) attached to biasing microchips and across the SiN\(_x\) membrane b) charging curve, c) bright-field TEM image of HOPG anode before experiment and d) snapshot acquired during in situ electrochemistry experiment depicting the formation of the SEI on the surface of the graphite anode. ........................................... 659

Figure V - 216: Charge/discharge curve between 4.6 and 2.0 V (15 mA/g) for LNP-treated LCMO electrodes. Numbered points indicate predetermined states of charge at which cells were prepared for XAS measurements. .................. 663

Figure V - 217: (a) Co K-edge XANES showing LNP-treated LCMO at all points of charge in Figure V - 216 and untreated LCMO. The inset in (a) shows a magnified view of the Co K pre-edge region for all points of charge. (b) Magnitude of the Fourier transformed Mn K-edge data for LNP-treated LCMO, untreated LCMO, and a Li\(_2\)MnO\(_3\) reference. ................................................................................................. 663

Figure V - 218: (a) Ni K-edge XANES of LNP-treated LCMO electrodes at charge points 1 and 4 in Figure V - 216, and a Ni\(_{3+}\) reference. (b) Ni K-edge XANES at points 1, 2 and 3, and Ni\(_{3+}\) and Ni\(_{4+}\) references. .................. 664

Figure V - 219: Partially delithiated LiFePO\(_4\) below (a) and above (b) the Fe K-edge and the corresponding phasemap (c) with the distribution of phases within the crystals. ................................................................. 667

Figure V - 220: Morphology changes in a NiO particle during electrochemical cycling. ...................................................... 668

Figure V - 221: XRS data at the C K edge for pristine and lithiated HOPG. ................................................................. 668

Figure V - 222: SEM image of the a-TiO\(_2\) particles (20-25 \( \mu\)m) used for the synthesis. .............................................. 671

Figure V - 223: MAS-NMR spectra of LATP sintering as a function of temperature. .................................................... 672

Figure V - 224: (top) Sintered LATP plate, (b) close-up of sintered plate morphology. .................................................. 672

Figure V - 225: Cycling of a lithium-lithium symmetrical cell using 0.6Li_{2}PO_{4}·0.4Li_{2}SiO_{3} with boron-based sintering as solid electrolyte. The lower inset shows a Nyquist plot of the cell before and after cycling. ...................................................... 672

Figure V - 226: Nyquist plot of a 4 electrode Devanathan-Stachurski cell. All four electrodes were lithium. The electrolyte chosen was 1 M LiPF\(_6\) EC/DEC. Frequency range (1MHz - 100mHz). .............................................. 673

Figure V - 227: Nyquist plot of Li/Li cell with a Polysulfone-TFSI polyelectrolyte used as a gel with EC/EMC solvent. .......... 673

Figure V - 228: Nyquist plot of Li/LTO cells with (top) no coating on the lithium anode over 50 cycles, and (b) a TMS-based coating on the lithium metal surface. ................................................................. 674

Figure V - 229: Cycling plots of Li/LTO cells comparing two different cells with no coating on the lithium anode, and (b) two cells with a TMS-based coating on the lithium metal surface. ................................................................. 675
