REGARDING: FE Docket No. 14-179-LNG Pieridae Energy application

DATE: 02-09-15

To whom it may concern:

Please do not approve.

This application is basically seeking to exploit the United States of America and most of US residents for the benefit of the Canadian economy. Indeed foreign export regulations on natural gas ensure that Canadians would be the exporting middlemen buying low from the USA and selling high overseas. Why other than greed would domestic officials ever approve an export system that will endanger the public safety, while depleting natural resources, increasing foreign energy dependency, and even drive gas prices up domestically, all to line the pockets of Canadian exporters and enrich a few of the elite?

Approval is neither in the public interest nor in the United State's national interest, and very few of in the general public have heard of this application to comment as they were not consulted nor advised. Contrary to the lax attention in notifying very few stakeholders, the impacted area is enormous as the pipeline expansion would pollute the majority of the North Eastern US with a high pressured, flammable, unlit fuse. Any economic damage from such a hazard would already harm the entire nation, even before the deal to economically favor Canadian exporters.

Additionally the proponents of proposed AIM expansion have violated the rights of North American Native tribes in the United States by failing to consult with tribal governments concerning the environmental and cultural impact of the pipeline's intrusion upon Native lands. Direct consultation was legally required; the application therefore is already shown to be both prejudiced against the law of the USA and American Tribal governments and heedless of good practice.

Approval of this bad deal would alter the course of history in the western world, to the detriment of the United States and other domestic governments, and to the remembrance of many who currently have no idea what Spectra is up to doing. Rejection of the application is highly recommended as this bad economic deal obviously damages the economic and human vitality of the nation, by approving incentive to expand explosive gas lines near children's schools, residential areas, earthquake fault lines, and the Indian Point Nuclear Power Plant. This is the worst possible economic deal and an even worse application in terms of human costs. Indeed I have read that already nuclear engineer Paul Blanch is predicting an explosion near Indian Point, (where Spectra would like to pump its explosive product a mere 1500 feet away), would prove to be more catastrophic than what occurred at Fukushima. Please do not ever scar me with your approval of a preventable disaster. In my town 6 workers lives have been lost in disaster involving natural gas at the Kleen Energy plant in Middletown CT. Now Spectra wants to expand its gas lines near a middle school in our county... this reckless greed of energy companies to profit in spite of viable, safer, and more economically independent solar and wind technologies is unacceptable and has shed human blood. This is no hum-drum day with office paperwork as your impact has huge consequences for other human beings.

Please consider the cost,

April Fawn Scheller
