Better Buildings Neighborhood Program Multi-family/Low Income Peer Exchange Call: Strategies to Address Split Incentives in Multi-family Buildings

Call Slides and Discussion Summary

April 26, 2012
Agenda

• Call Logistics and Attendance
  ▪ How are you working with owners and tenants on multi-family upgrades?

• Program Experience and Lessons:
  ▪ Michael Croston, Repower Bremerton

• Discussion:
  ▪ What are some of the key challenges for working with rental properties?
  ▪ What are effective strategies for working with owners?
  ▪ What are effective strategies for working with tenants?

• July Workshop Meeting and Upcoming Calls
Participating Programs and Organizations

• Austin, TX
• Bainbridge Island, WA
• Chicago, IL
• Connecticut
• Eagle County, CO
• Kansas City, MO
• Lincoln, Nebraska
• New York
• Phoenix, AZ
• San Francisco, CA
Bremerton, Washington
Bremerton: Highlights and Lessons Learned

• The program has been focused more on the owner than the tenant; it is looking for ways to motivate the landlord to make energy efficiency improvements.

• The program utilizes an assessment and a 90-minute install of CFLs and low-flow showerheads as an opportunity to educate the homeowner, landlord, and/or tenant about the available rebates, financing and program overall.

• Local rental owners associations are invited to marketing events.

• The program is launching a bonus for rental property owners who do multiple upgrades for multiple units.
Discussion

- What are some of the key challenges for working with rental properties?
- What are effective strategies for working with owners?
- What are effective strategies for working with tenants?
Key Challenges

• Tenants want to pay less for utilities but do not want to make any expensive improvements to rental properties.
• Owners do not have a strong incentive to make improvements if tenants are paying utility bills.
Strategies for Working with Owners

- Repower Bremerton discusses building science with owners to support the argument about the reduced cost of maintenance and higher occupancy of the property (i.e., with a more comfortable, healthier property).
  - This works well with standard properties, but the program has not yet broken through to the low-income market as the cost-benefit can be limited (i.e., owners are limited on how much they can charge for rent, some tenants do not pay their bills).

- Austin also noted increased retention and decreased maintenance calls for supervisors (i.e., problems with air conditioners) with their program.

- San Francisco focuses on working with multi-family building owners who are early adopters that are willing to take it on because it is good business practice and a selling point for renters.
Strategies for Working with Owners

- Engage owners when they are renovating buildings or units or when there are vacancies and other upgrades are happening.
- It can be useful to emphasize that energy efficiency or other upgrades can lead to happier tenants and thus fewer problems for owners and managers.
- Upgrades can also provide additional sources of income. For example, one owner in San Francisco converted a storage room into a bike parking room and charged tenants a small fee. Tenants were happy to have the amenity, and the owner made more money and had less damage to the building.
• Bremerton markets their program to tenants based on comfort instead of savings. If the property is well insulated and/or heated appropriately, they will save money but they will also be more comfortable.
Lessons Learned

• Get involved with local apartment associations and professional property managers’ associations, which can be allies to the program.

• It is more cost-effective (and more attractive to contractors) to have multiple upgrades in a multi-family project.

• Owners who pay for central heating of a building (versus paid by individual tenants) are more likely to do upgrades. In general, it is useful to focus on the bill payer.
Lessons Learned

• “Green leases” with provisions for accessing utility data are becoming increasingly utilized.
• For areas of the country with low heating/cooling bills, bundling benefits by integrating water savings into the equation can be appealing to property owners.
• Education of maintenance staff is important to ensure that upgrades provide energy savings in the long-term.
