U.S. DEPARTMENT OF
ENERGY

Energy Efficiency &
Renewable Energy

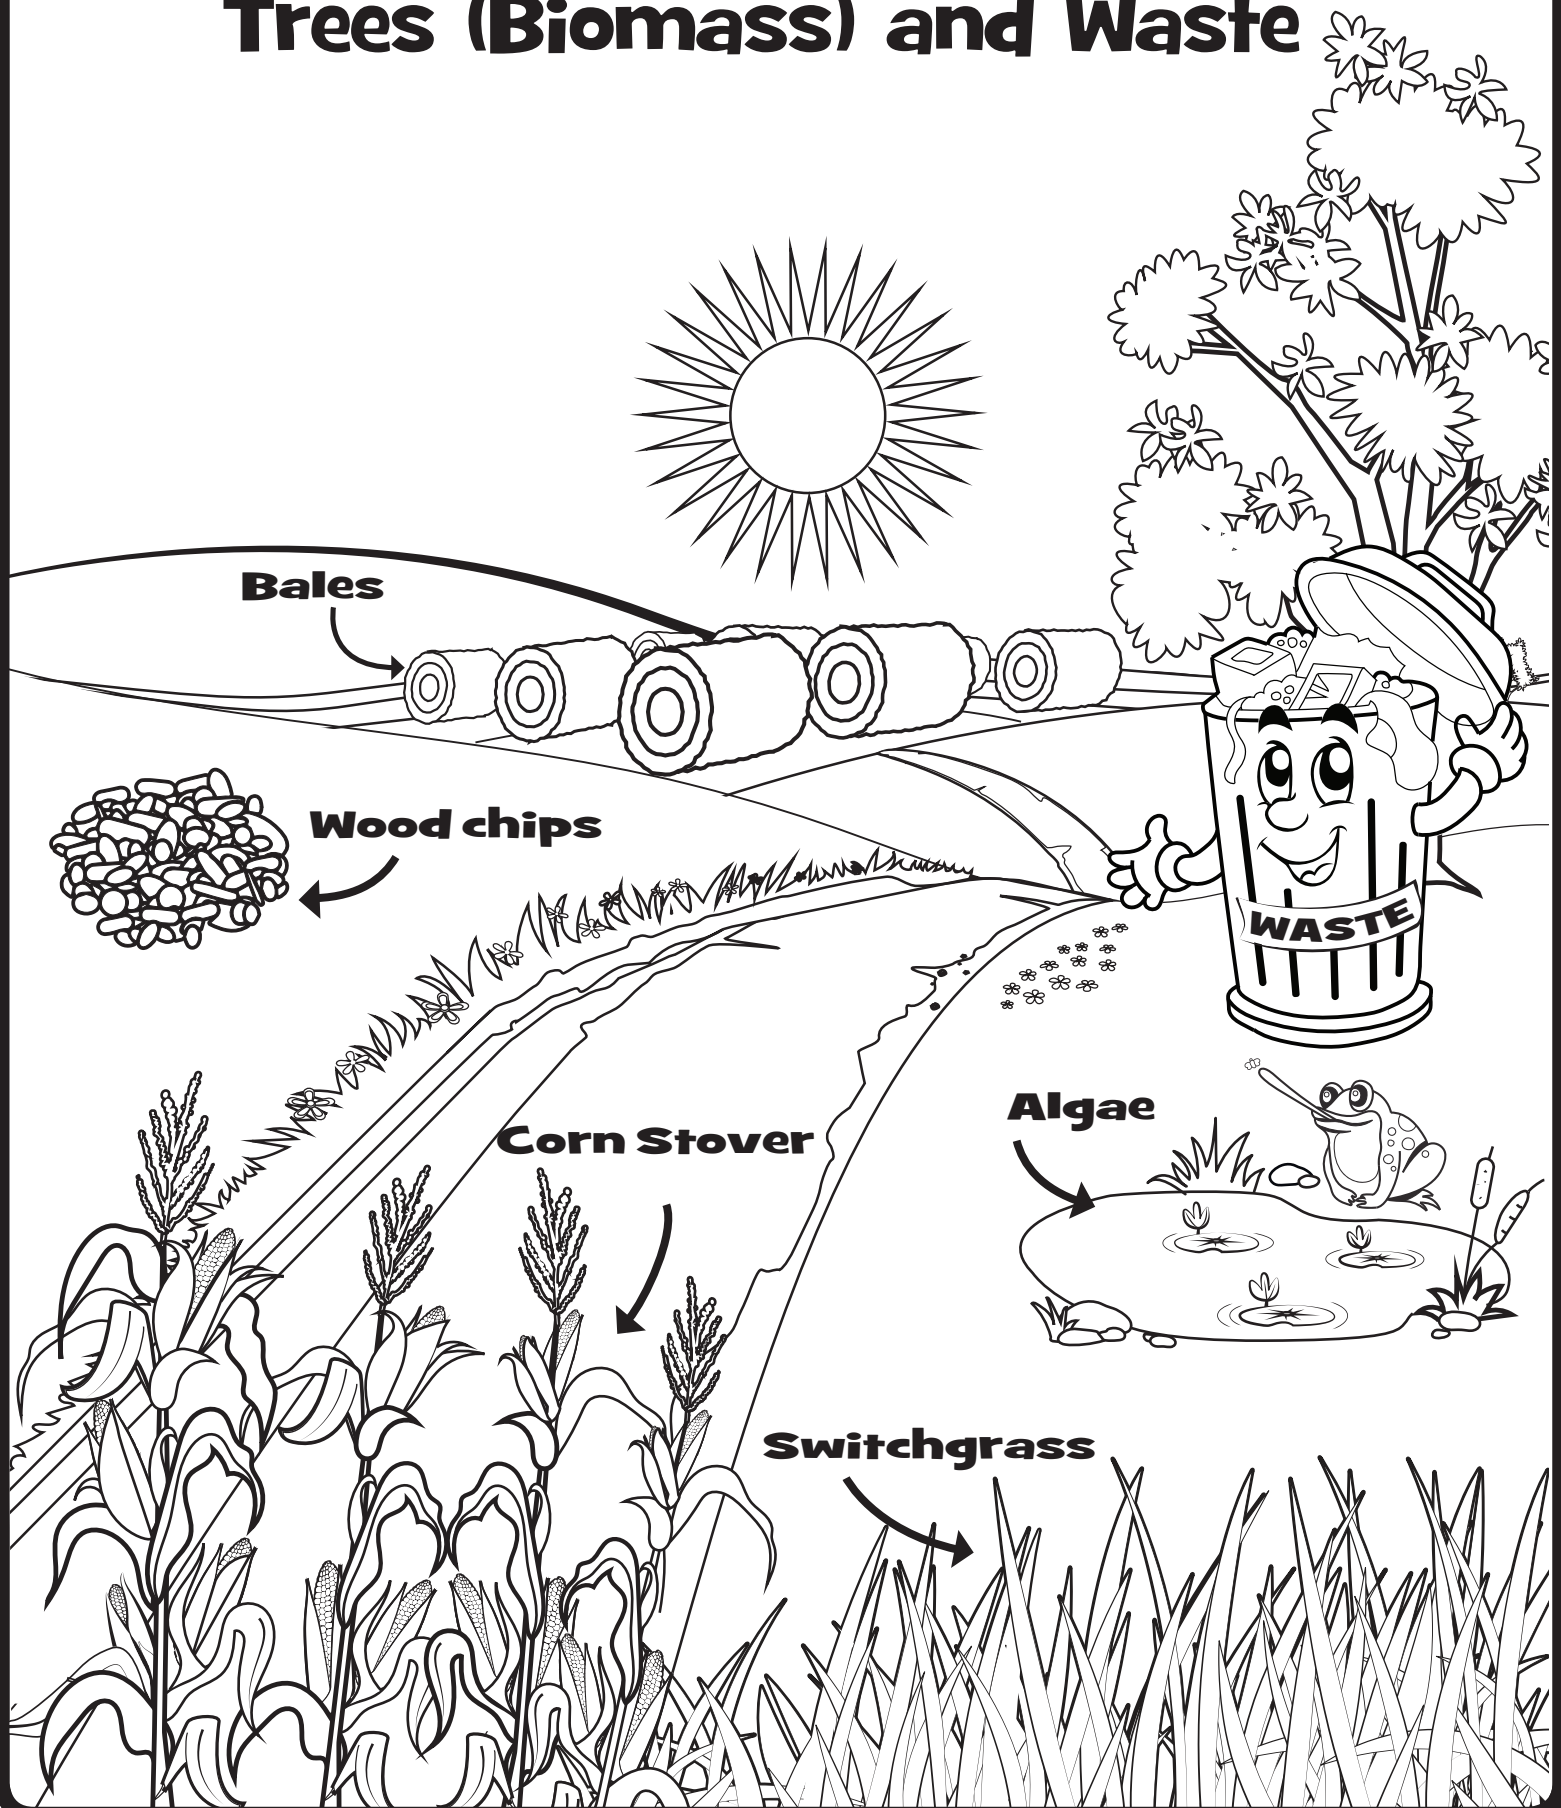

BIOENERGY TECHNOLOGIES OFFICE

What is Bioenergy and Where Does it Come From?

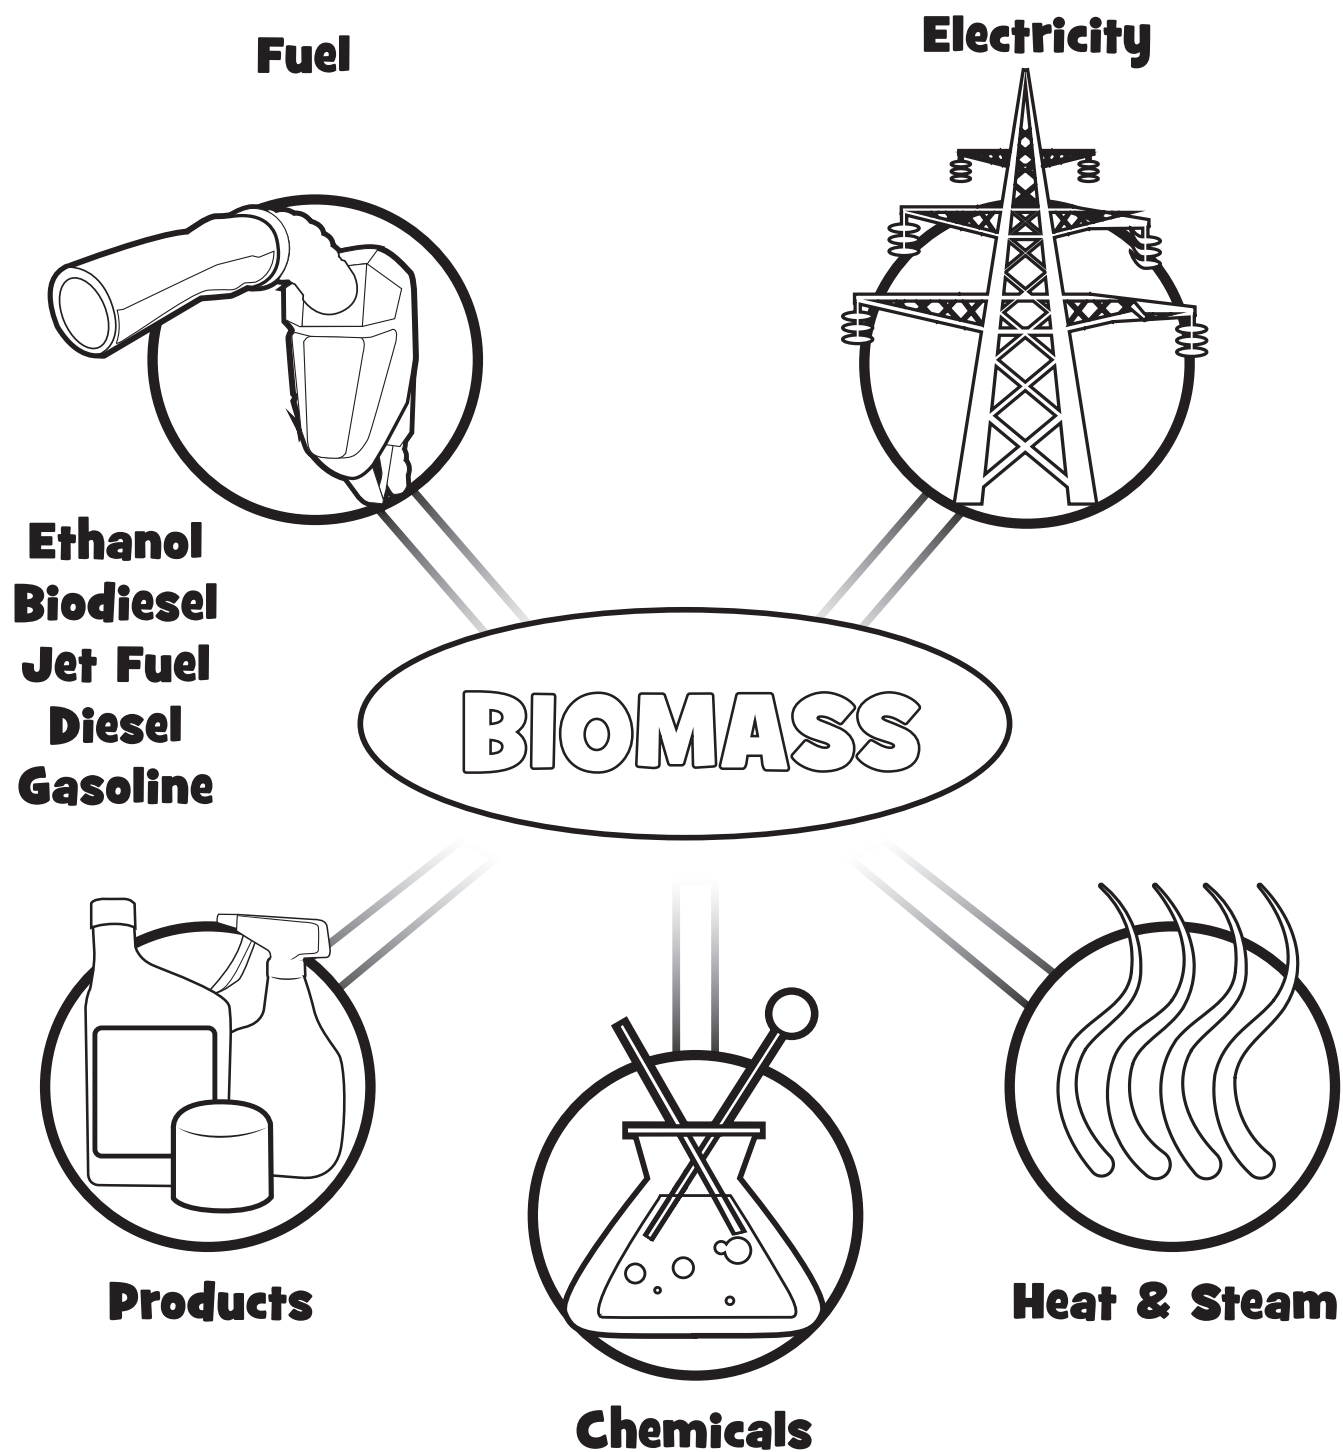

Bioenergy is a form of renewable energy derived from biomass to generate heat, electricity, renewable products, and liquid fuels for transportation.

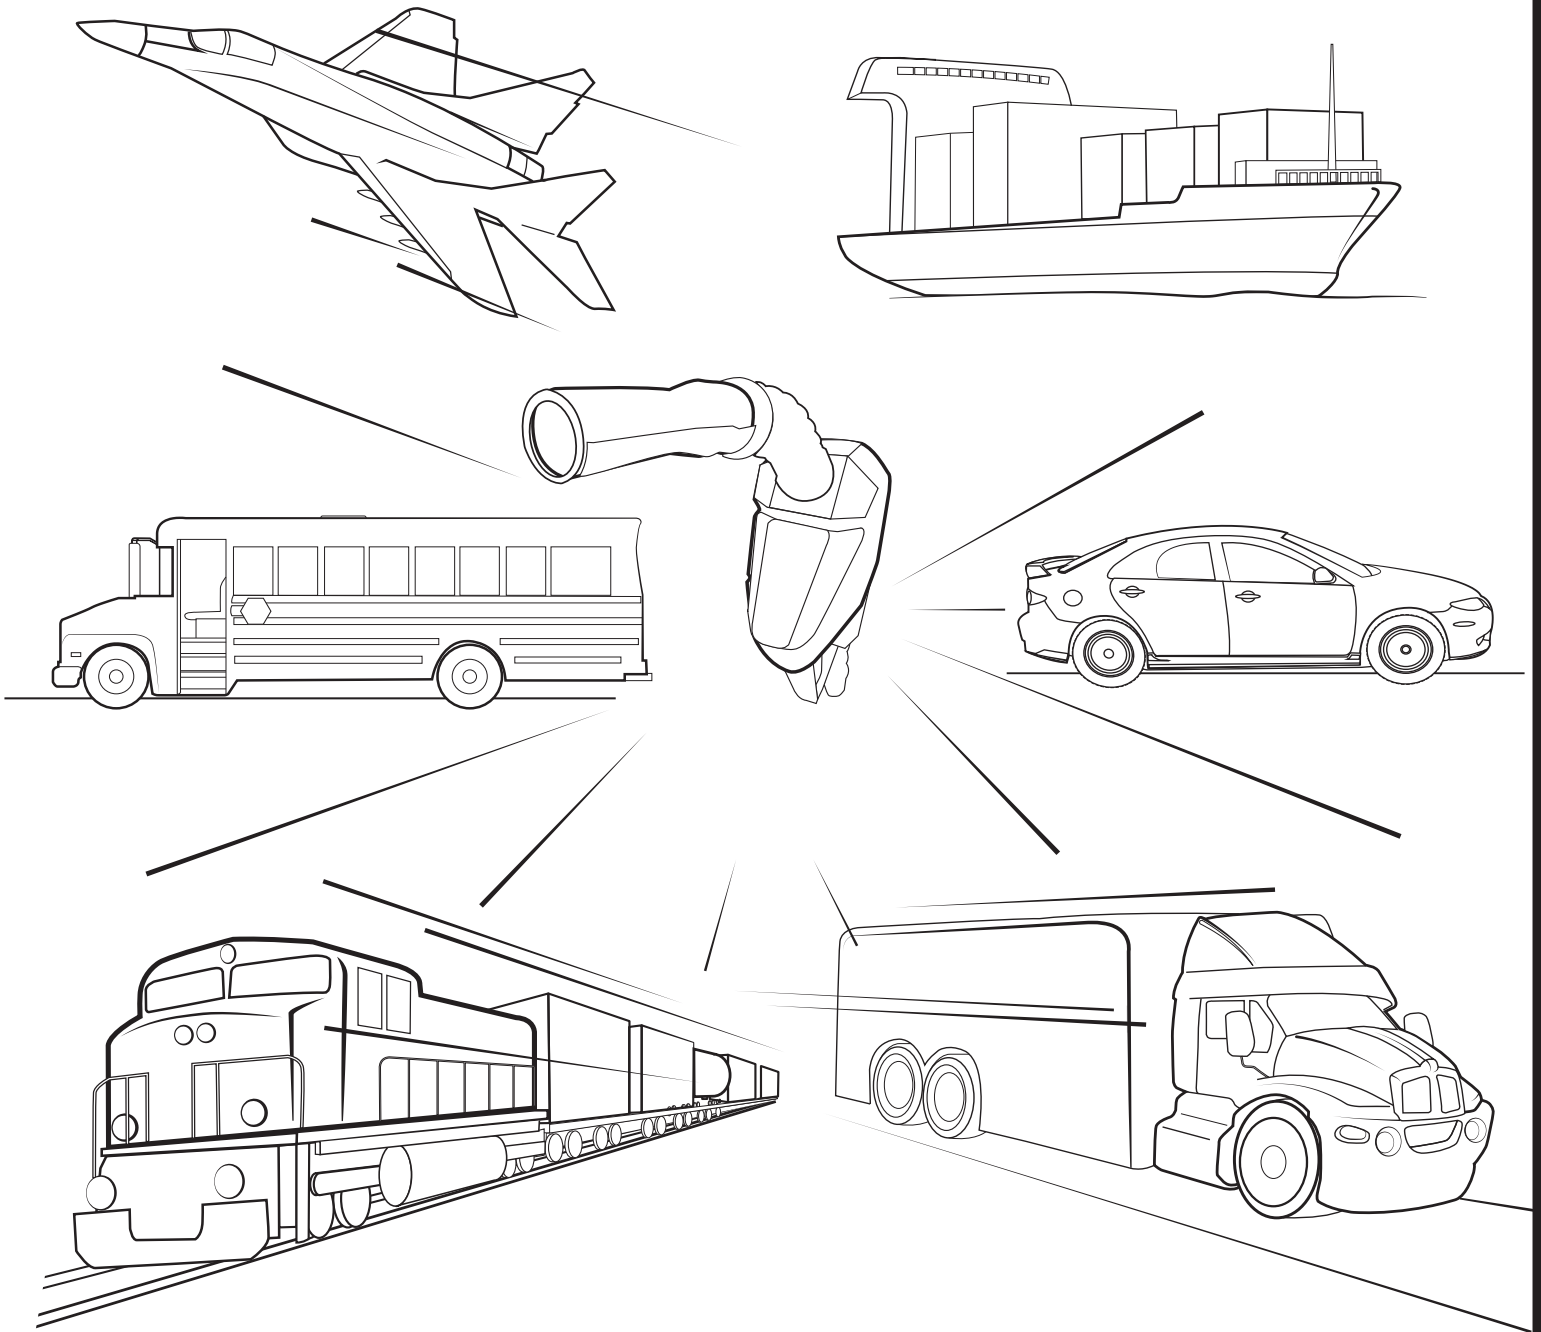

Biofuels Come From Plants and Trees (Biomass) and Waste

What can Biomass Produce?

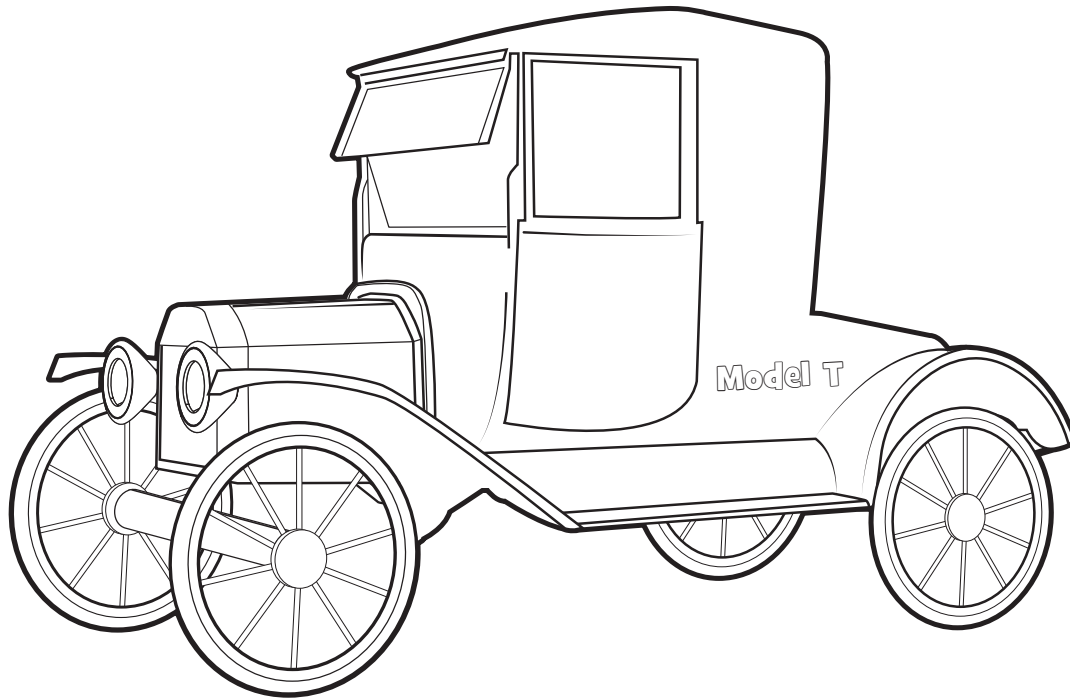

Where can Biofuels be Used?

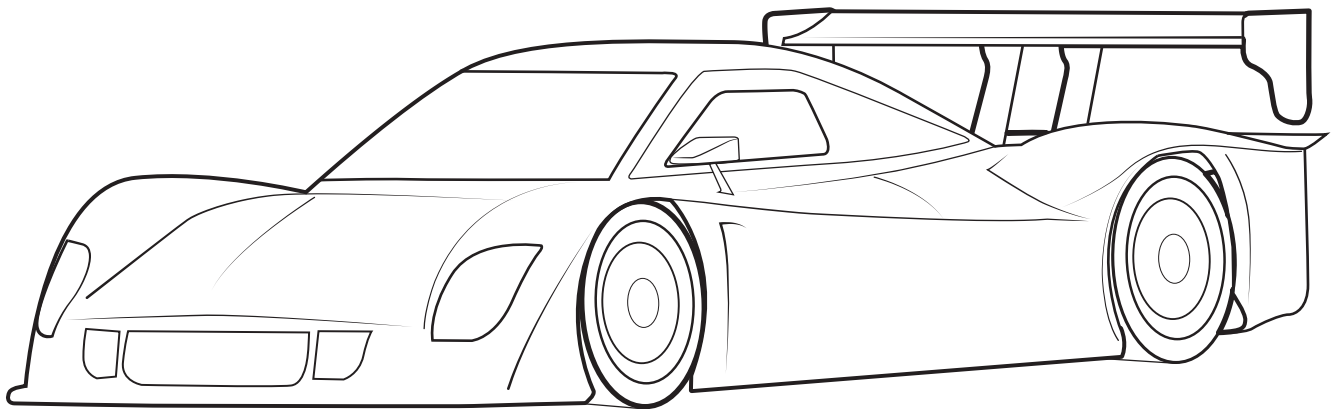

Biofuels can be used in airplanes. ships. cars. trucks. buses. and trains. Have you noticed fuel at most gas stations contains some ethanol?

Ethanol is a Biofuel

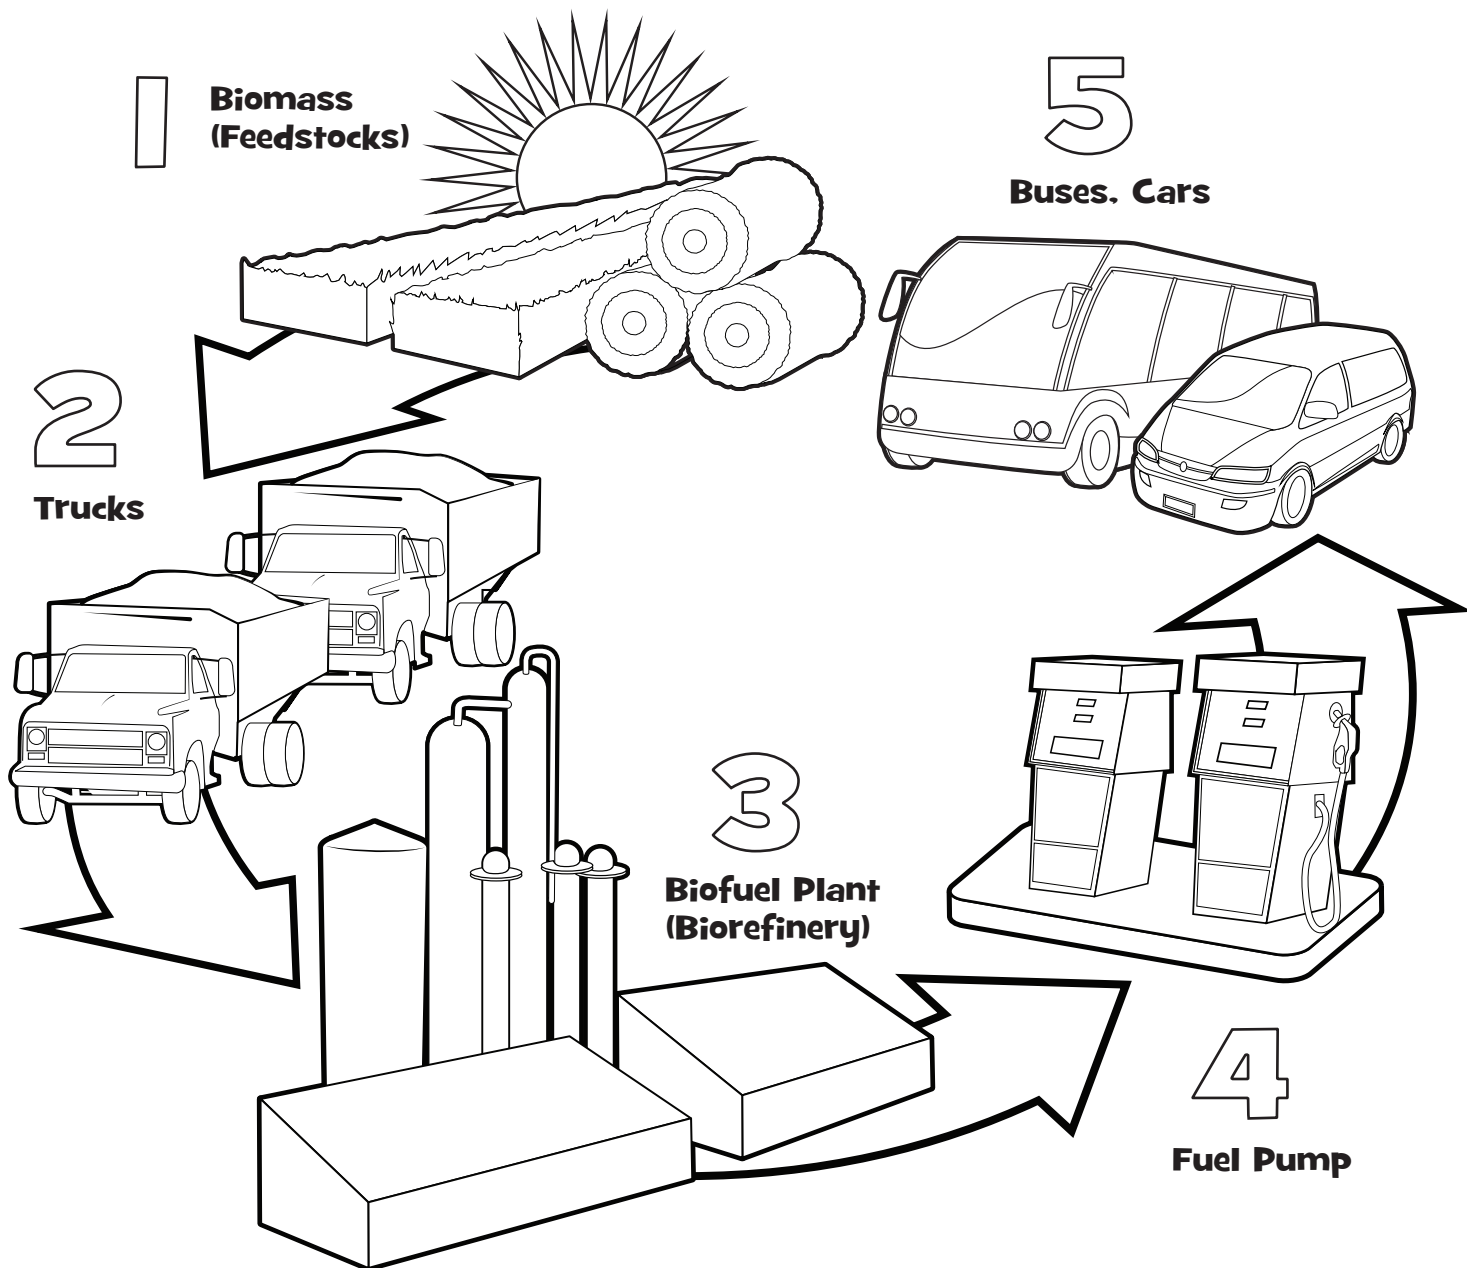

In 1908, Ford Motor Company's first car used ethanol made from corn.

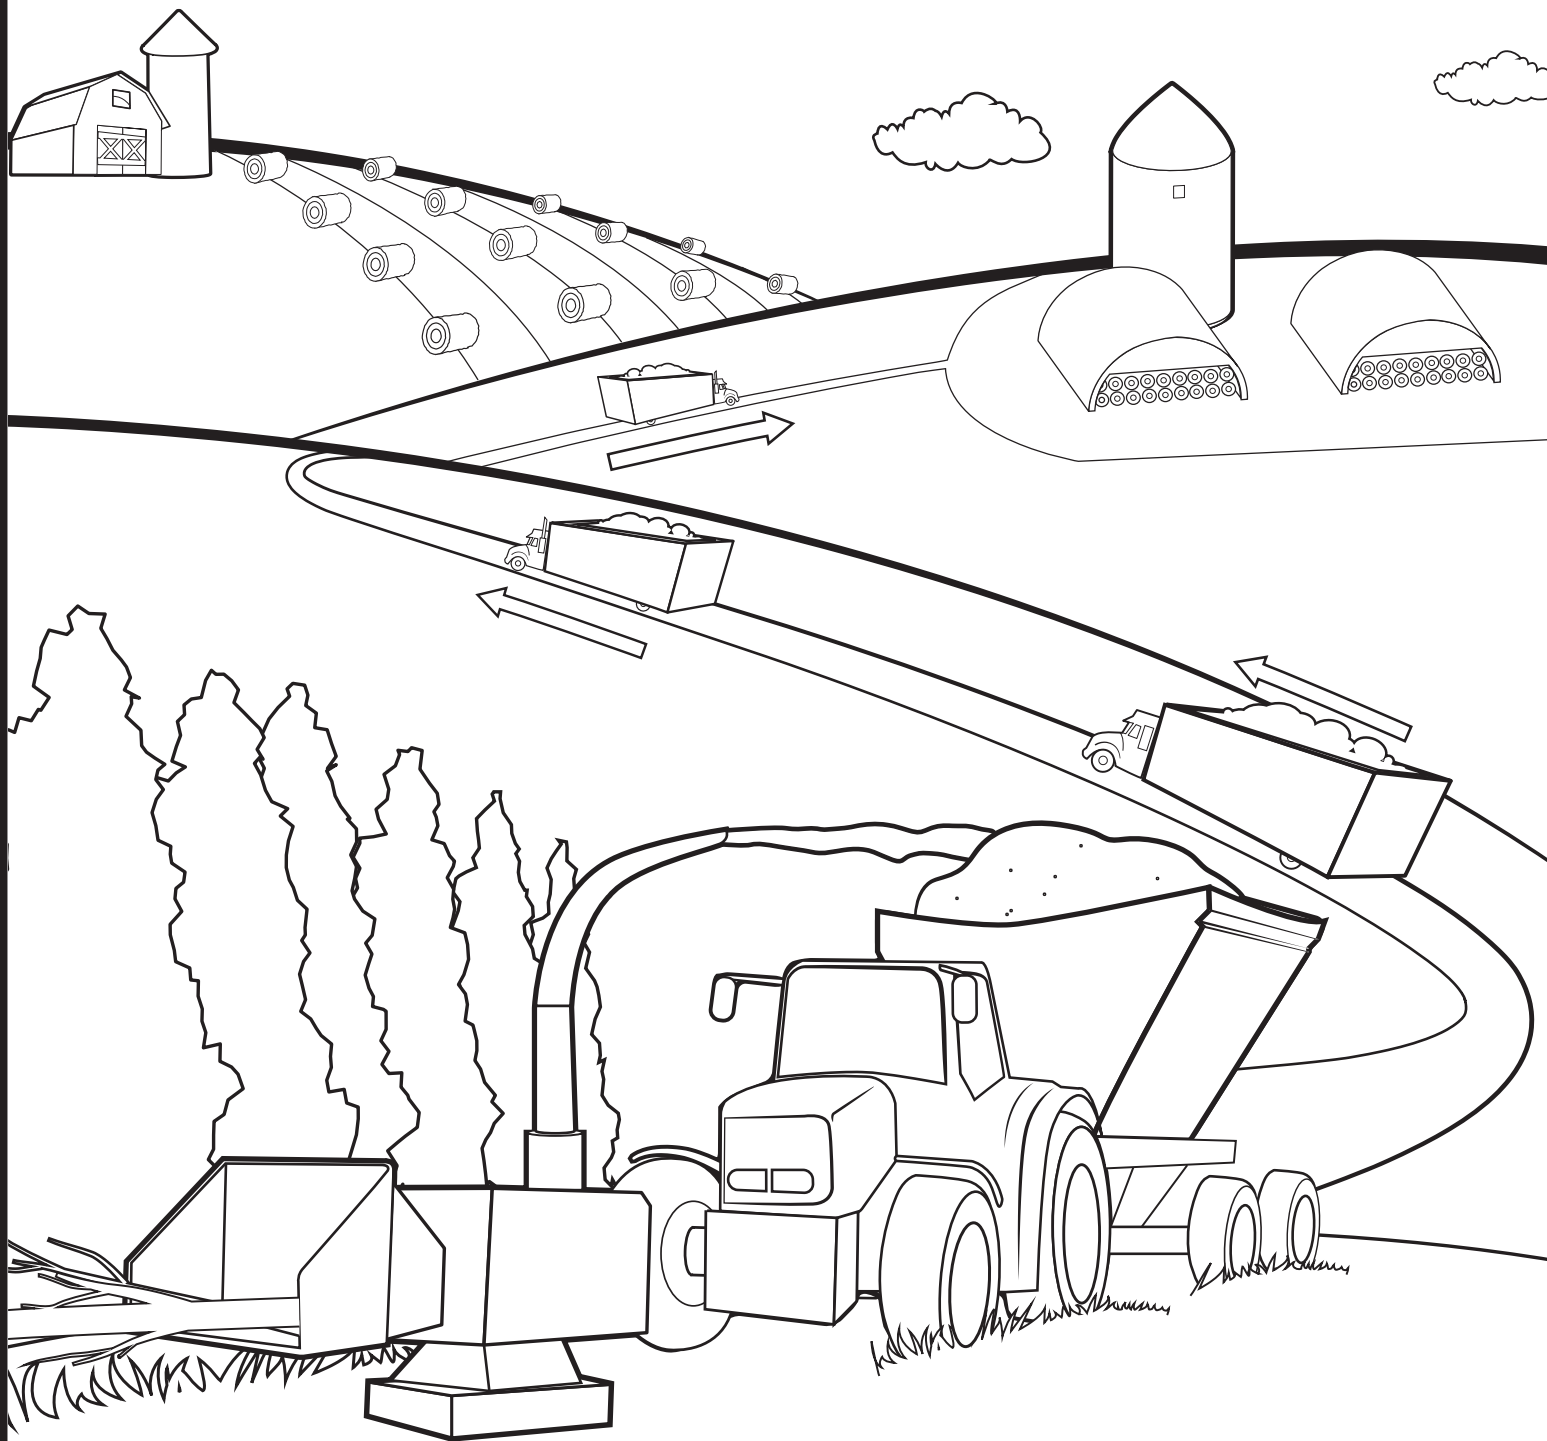

Today, race cars can run on ethanol made from biomass.

Biofuel: From Field to Fuel Pump

Plant-based biomass feedstocks include cornstalks, grasses, trees, and waste.

How is Biomass Processed?

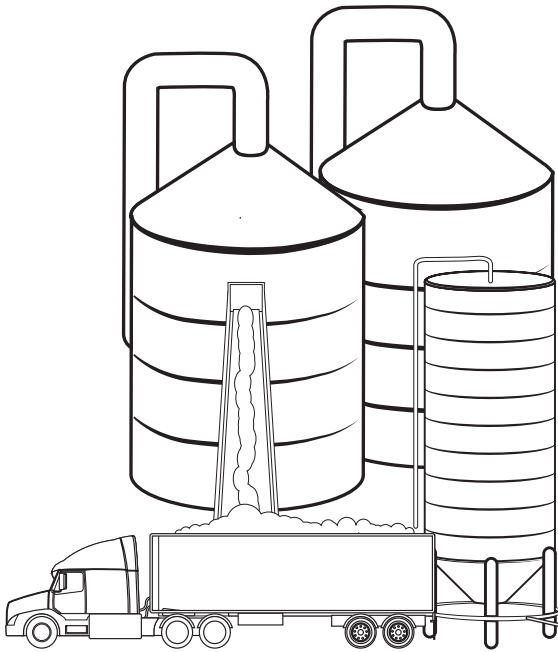

Plant-based renewable biomass is harvested, chopped into small pieces, or rolled into bales. Processed biomass is transported to a storage site at a biofuel plant or biorefinery.

How Does a Biorefinery Operate?

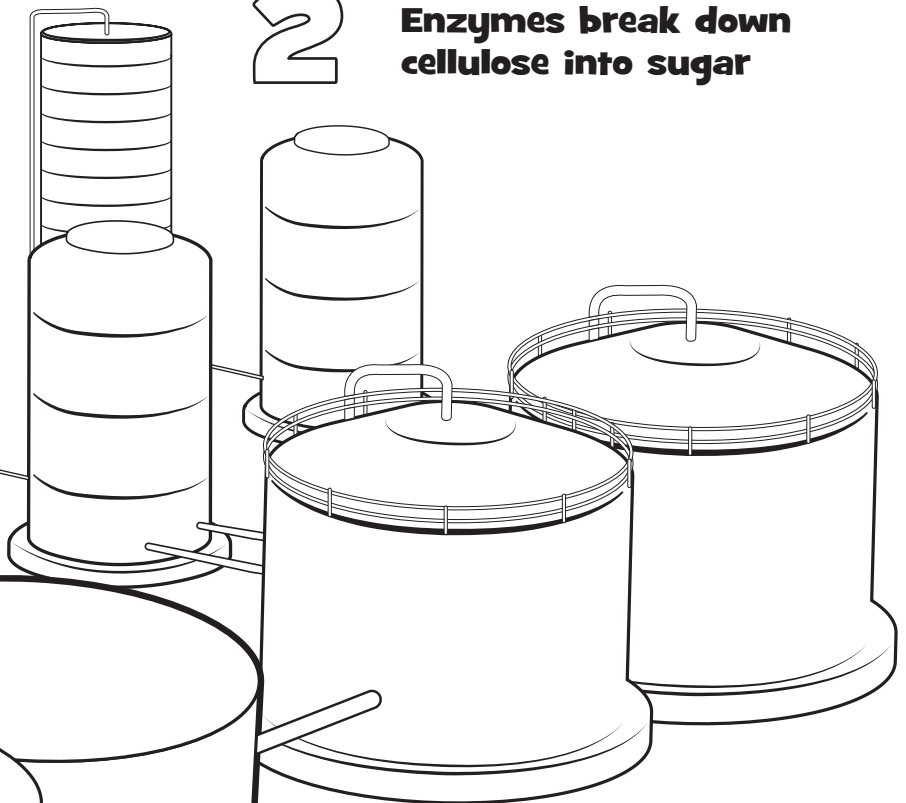

Processed biomass is treated with heat and chemicals.

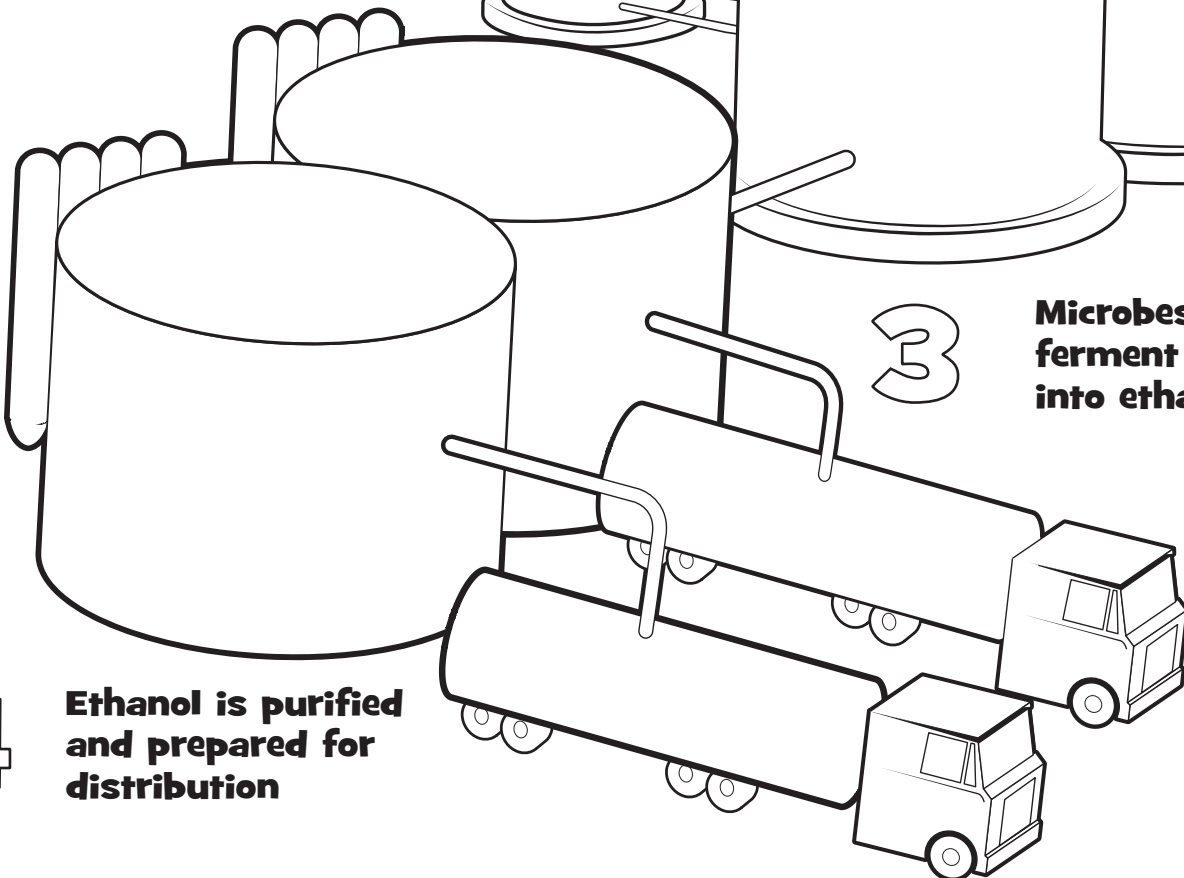

2

Enzymes break down cellulose into sugar

3

Microbes ferment sugar into ethanol

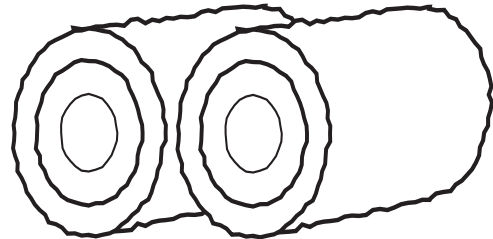

4

Ethanol is purified and prepared for distribution

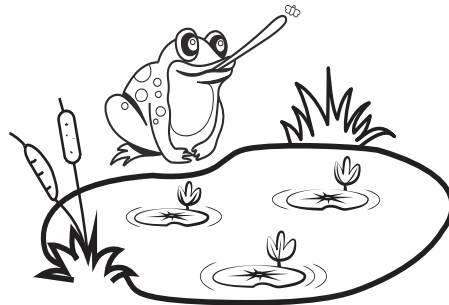

Make the Biofuels Connection

Draw a line connecting the feedstock with its name.

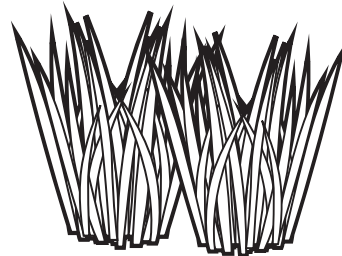

Corn stover

Bales

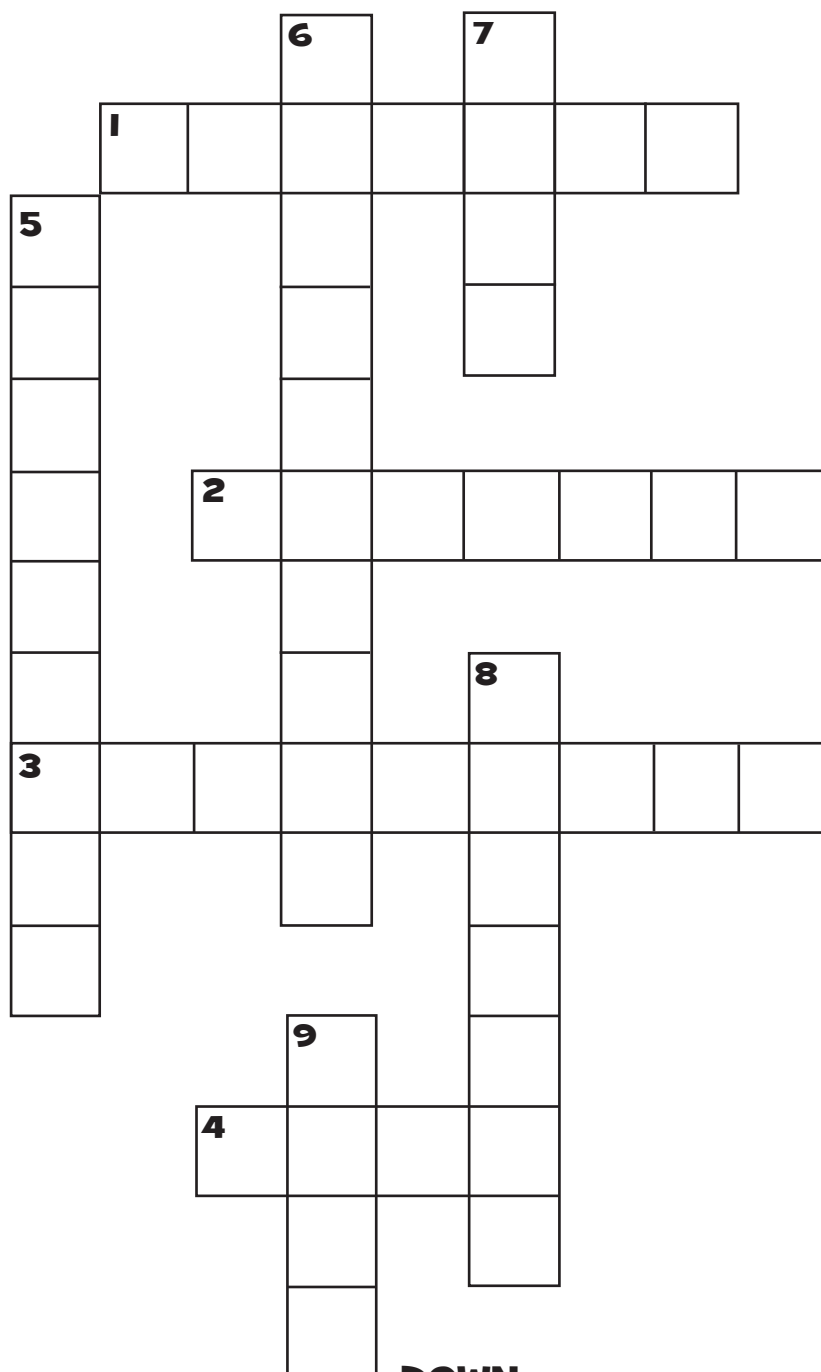

Algae

Switchgrass

Biomass Crossword Puzzle

ACROSS

1. Plants or trees for energy
2. A fuel made from biomass
3. Biomass is _____ because it can be regrown
4. What can be powered by biofuels?

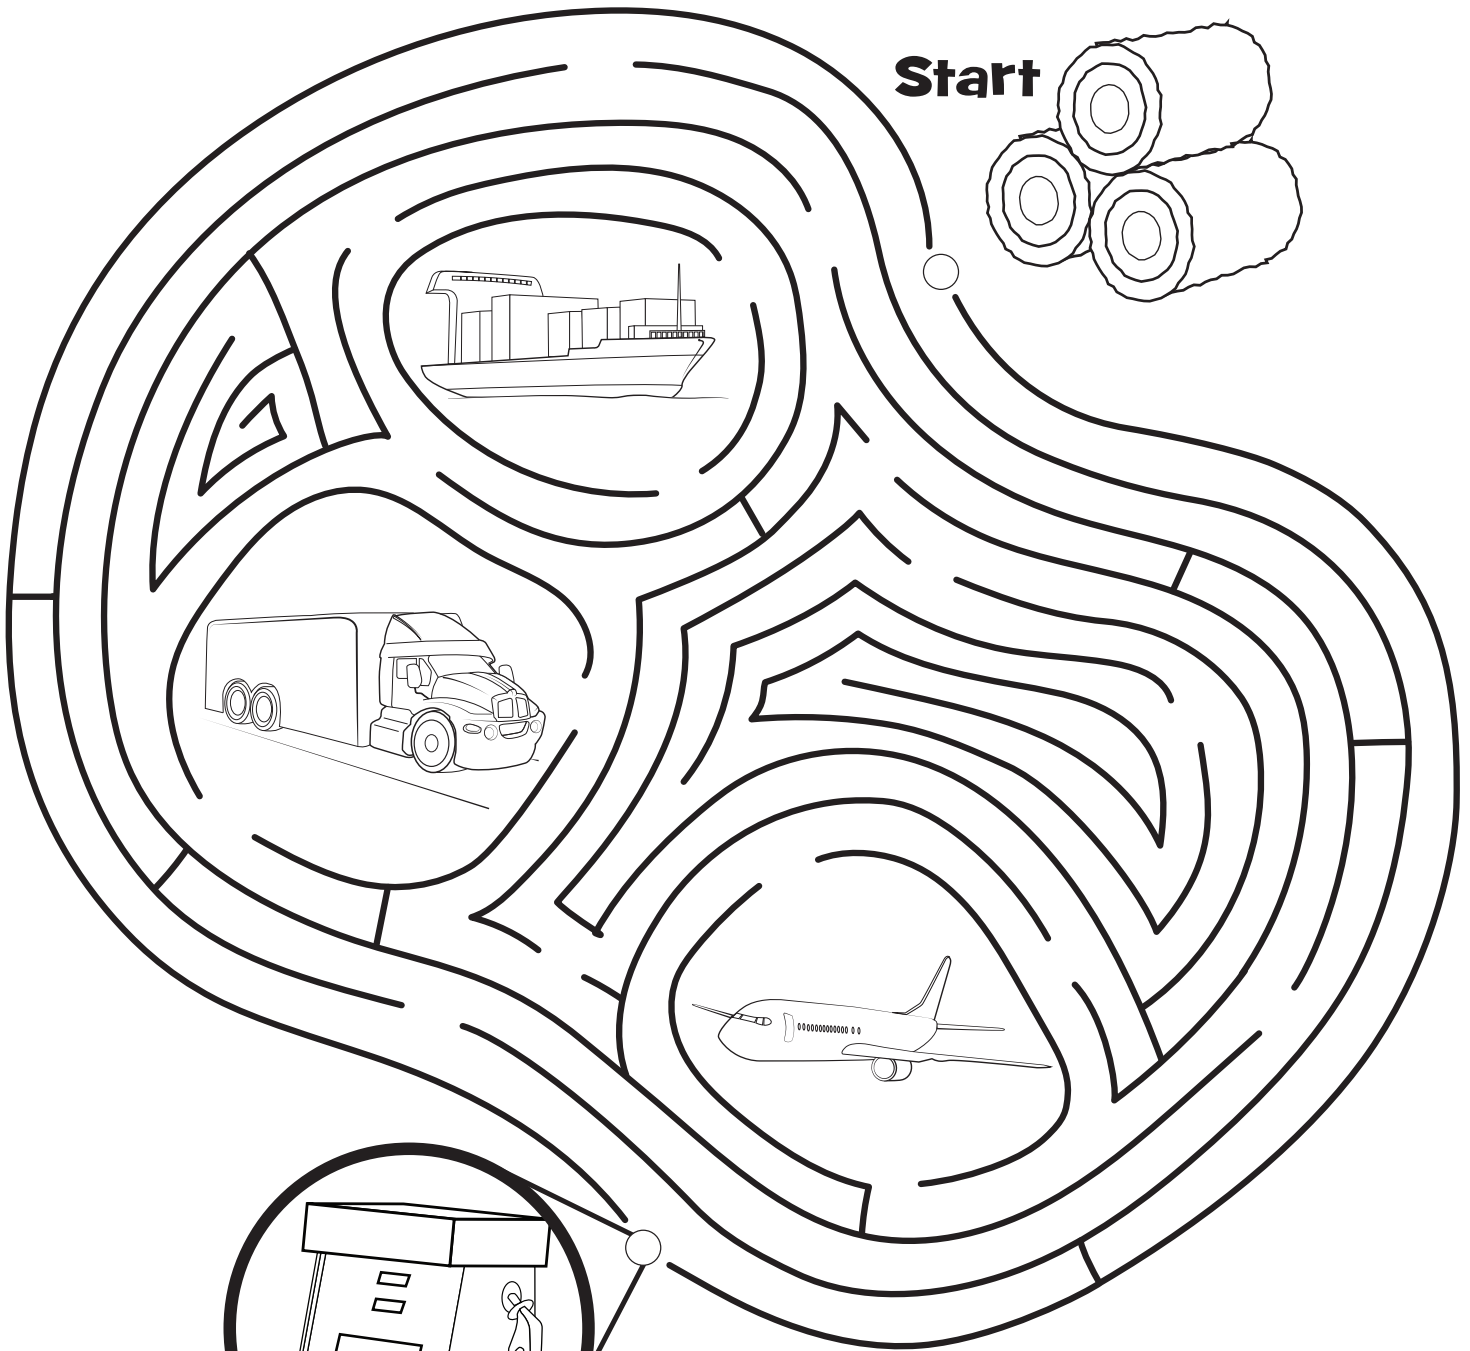

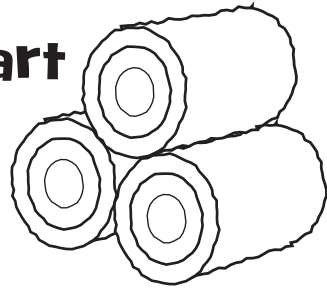

DOWN

5. Energy produced from plant-based materials
6. Crop waste that can be used to make biofuel
7. Rolled up corn stover
8. Seasonal collection of crops
9. Where biomass feedstocks can be grown?

Find the Way to the Fuel Pump

Find your way through the maze.

Some Words to Learn

Harvesting: Only an appropriate amount of biomass is removed to ensure the process is sustainable and the soil health is maintained.

Corn Stover: Stalks, leaves, and cobs that remain after removal of corn.

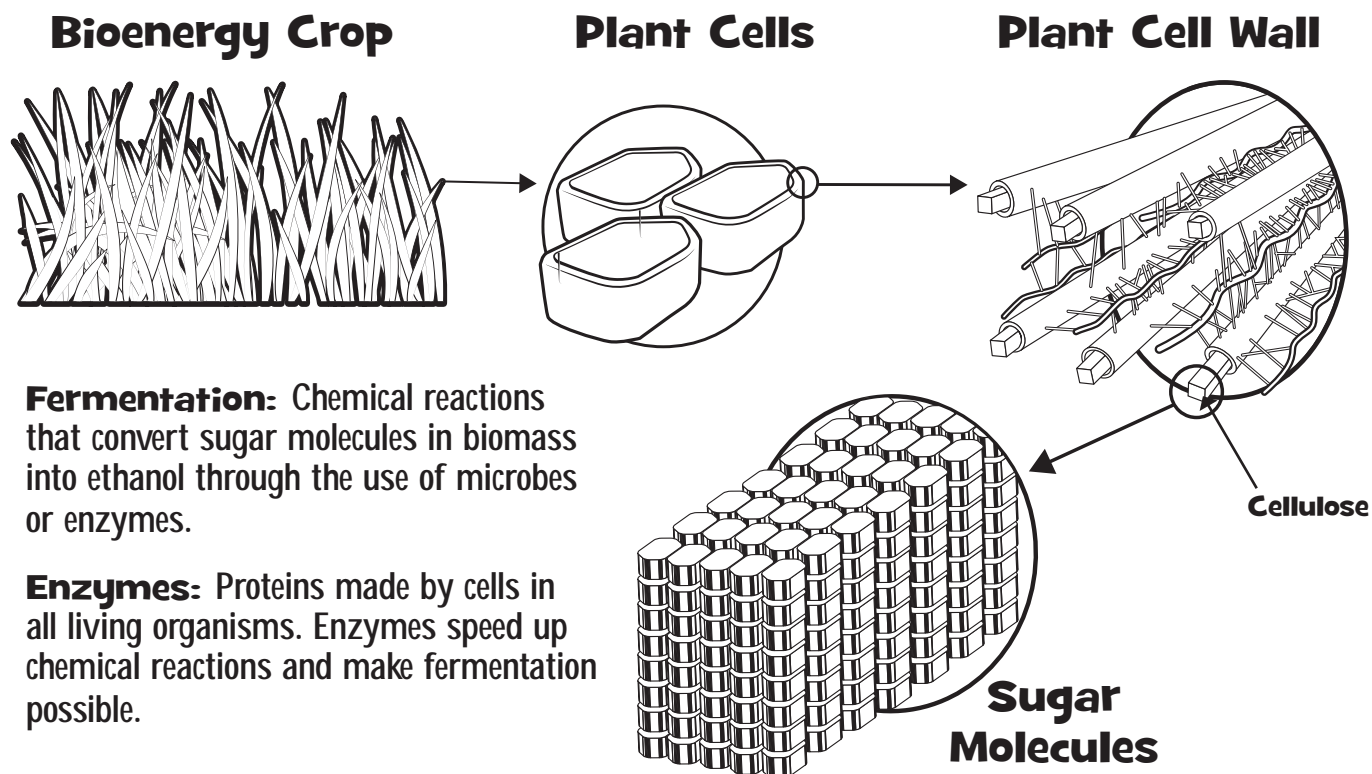

Bale: Harvested corn stover, either round or square shaped.

Cellulose: Main component of plant cell walls.

Algae: Plantlike small aquatic organisms that convert sunlight into energy – the green stuff in ponds or seaweeds in oceans or lakes. Most algae grow in freshwater or seawater.

Biodiesel: A renewable fuel that can be made from vegetable oils, animal fats, or recycled restaurant grease. For example, lipids, or oils, can be extracted from the walls of the algae cells and turned into biodiesel fuel.

Municipal Solid Waste (MSW): Trash or garbage, such as everyday items we use and then throw away, can be converted to a clean gas by using heat. With chemical processes, gas is turned into liquid alcohol fuels.

Fermentation: Chemical reactions that convert sugar molecules in biomass into ethanol through the use of microbes or enzymes.

Enzymes: Proteins made by cells in all living organisms. Enzymes speed up chemical reactions and make fermentation possible.

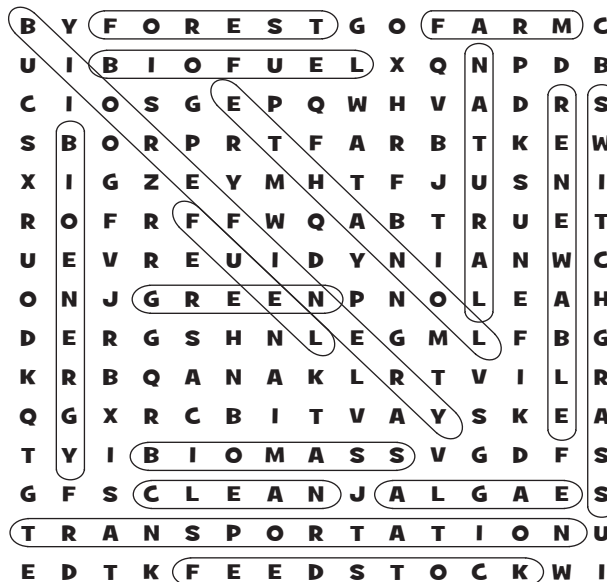

Solutions

ACROSS

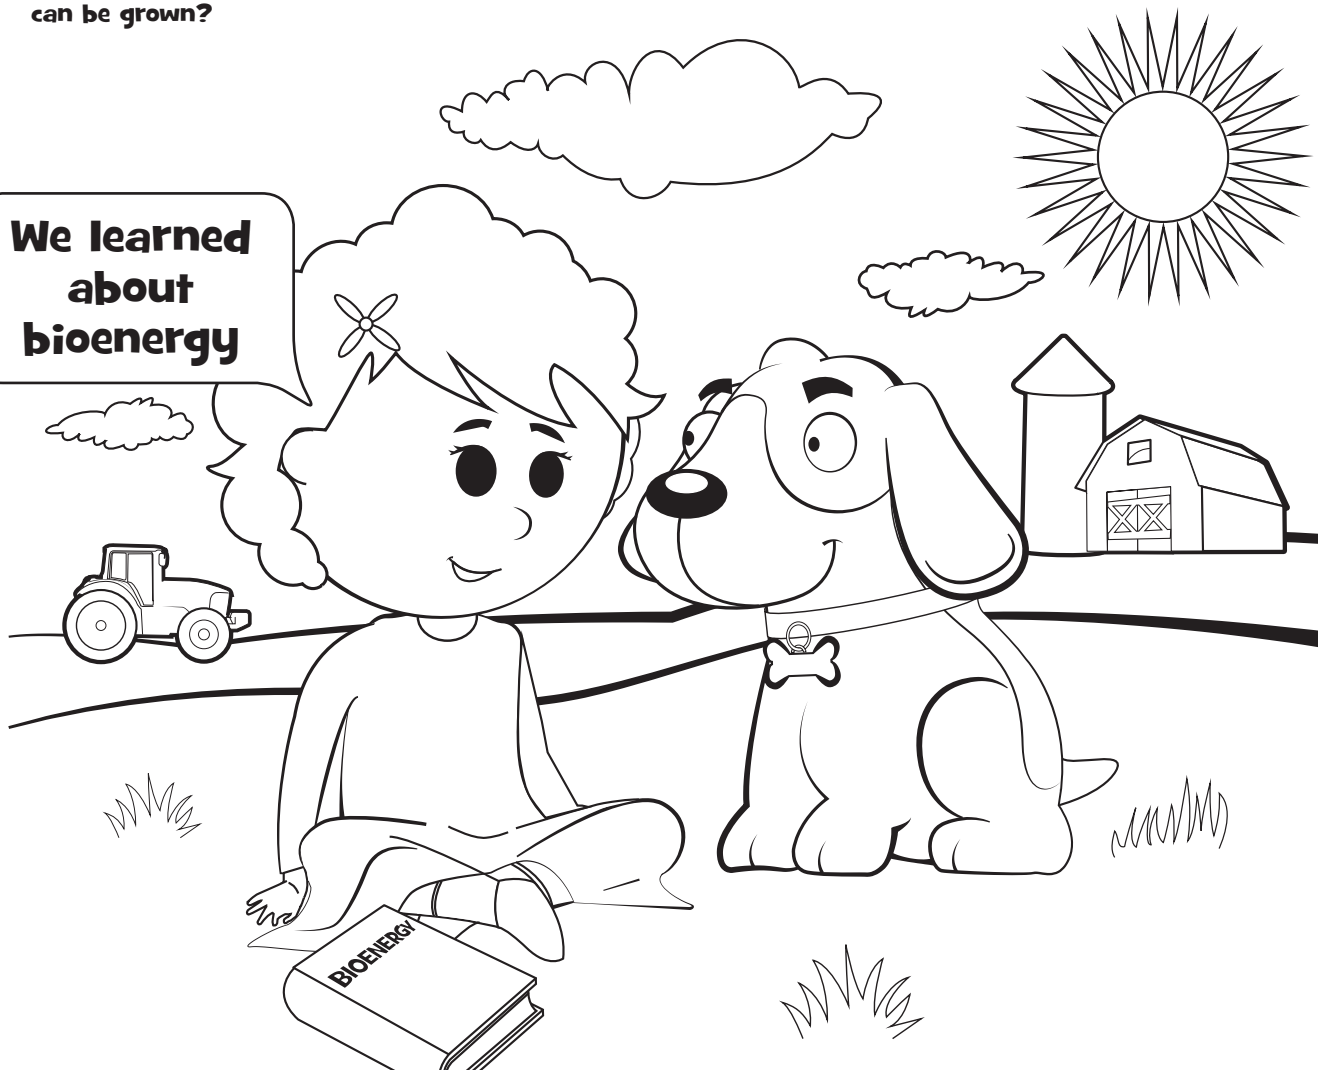

- | | |
|---|-----------|
| 1. Plants or trees for energy | Biomass |
| 2. A fuel made from biomass | Ethanol |
| 3. Biomass is _____ because it can be regrown | Renewable |
| 4. What can be powered by biofuels? | Cars |

DOWN

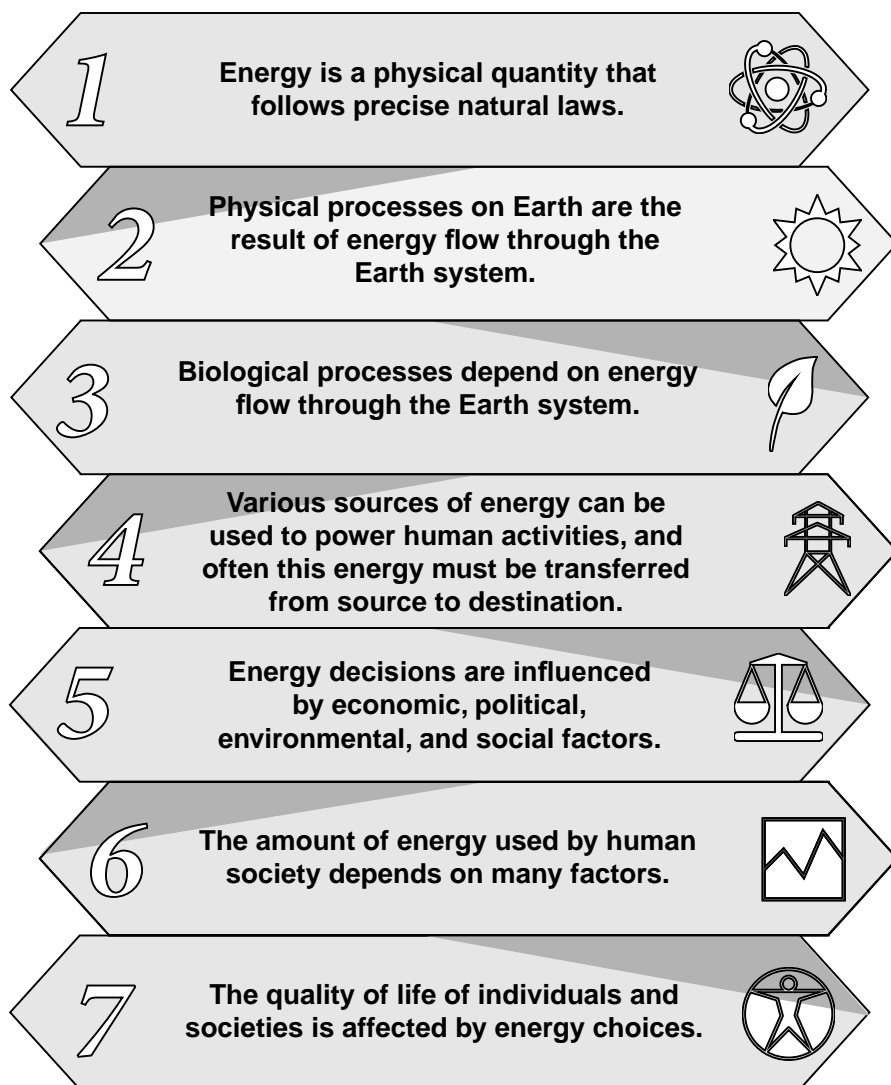

- | | |
|--|-------------|
| 5. Energy produced from plant-based materials | Bioenergy |
| 6. Crop waste that can be used to make biofuel | Corn stover |
| 7. Rolled up corn stover | Bale |
| 8. Seasonal collection of crops | Harvest |
| 9. Where biomass feedstocks can be grown? | Farm |
