

BIOENERGY IMPACTS

Biorefineries are helping commercialize biofuels

The Bioenergy Technologies Office provided funding to POET-DSM and Abengoa for the construction of two commercial-scale biorefineries.

POET-DSM's Project LIBERTY and Abengoa's Bioenergy Biomass of Kansas are biorefineries that convert corn stover—non-edible corn stalks, stems, and leaves—into cellulosic ethanol, a type of biofuel, which has a lower greenhouse gas impact than petroleum fuel.
